3. The drainage study shall utilize the most recent edition of the San Diego County Hydrology Manual, compute rainfall runoff characteristics from the project area including, at a minimum, runoff volume, time of concentration, and retention volume. These characteristics shall be developed for the two-year and 10-year frequency, Type I storm, of six-hour or 24-hour duration (whichever is the closer approximation of the site's time of concentration), during critical hydrologic conditions for soil and vegetative cover[4]. The drainage study shall also report the project's conditions of concern based on the hydrologic and downstream conditions discussed above. Where downstream conditions of concern have been identified, the drainage study shall establish that pre-project hydrologic conditions that minimize impacts on those downstream conditions of concern would be either improved or maintained by the proposed project, satisfactory to the City Engineer, by incorporating the permanent BMP requirements identified in Section III.2, below.

2. ESTABLISH PERMANENT STORM WATER BEST MANAGEMENT PRACTICES

After identifying the project's pollutants of concern, and conditions of concern (for priority projects), in Section III.1, projects subject to standard or priority project requirements shall implement all applicable site design, source control BMPs listed below. Projects subject to priority project requirements must also implement the BMPs applicable to individual priority project categories and structural treatment control BMPs. Applicants may employ alternative comparable and equally effective site design and source control BMPs (including requirements applicable to individual priority project categories), satisfactory to the City Engineer.

Projects are encouraged to address these objectives through the creation of a hydrologically functional project design that attempts to mimic the natural hydrologic regime. Mimicking a site's natural hydrologic regime may be pursued by:

- Reducing imperviousness, conserving natural resources and areas, maintaining and using natural drainage courses in the storm water conveyance system, and minimizing clearing and grading that is necessary for the project.
- Providing runoff storage measures dispersed uniformly throughout a site's landscape with the appropriate use of a variety of detention, retention, and runoff practices.
- Implementing on-lot hydrologically functional landscape design and management practices.

4. Design storms can be found at http://www.wrcc.dri.edu/pcpnfreq.html.

These design principles offer an innovative approach to urban storm water management, one that does not rely on the conventional end-of-pipe or in-the-pipe structural methods but instead uniformly or strategically integrates storm water controls throughout the urban landscape. Useful resources for applying these principles are referenced in Appendix G. Effective source controls offer another strategy to reduce a project's need for treatment. Therefore, projects shall incorporate, where applicable, storm water BMPs into the project design, in the following progression:

- Site Design BMPs
- Source Control BMPs
- BMPs for Individual Priority Project Categories (these are site design and source control BMPs)
- Treatment Control BMPs

The series of best management practices listed in Section III.2 have been organized sequentially to allow the applicant and design professional to incorporate the site design, source control BMPs, and where necessary, requirements applicable to individual priority project categories and treatment control BMPs in this progression.

A. Site Design BMPs

Maintain Pre-Development Rainfall Runoff Characteristics

Control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development development downstream erosion by applying the following or similar concepts:

1. Minimize impervious footprint to the maximum extent practicable consistent with the General Plan, Municipal Code, and other City standards by utilization of measures of the following types: (1) Increase building density (number of stories above or below ground); (2) construct walkways, trails, patios, overflow parking lots and alleys and other low-traffic areas with permeable surfaces, such as pervious concrete, porous asphalt, unit pavers, and granular materials; (3) construct streets, sidewalks and parking lot aisles to the minimum widths required, provided that public safety and a walkable environment for pedestrians are not compromised; and (4) minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.
2. Conserve natural areas. (1) Concentrate or clustering development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural, undisturbed condition; and (2) Use natural drainage systems to the maximum extent practicable.
3. Minimize Directly Connected Impervious Areas. (1) Where landscaping is proposed, drain rooftops into adjacent landscaping prior to discharging to the storm water conveyance system; and (2) where landscaping is proposed, drain impervious parking lots, sidewalks, walkways, trails, and patios into adjacent landscaping.
4. Maximize canopy interception and water conservation consistent with the Carlsbad Landscape Manual. (1) Preserve existing native trees and shrubs; and (2) plant additional native or drought tolerant trees and large shrubs in place of non-drought tolerant exotics.

Protect Slopes and Channels

5. Convey runoff safely from the tops of slopes.
6. Vegetate slopes with native or drought tolerant vegetation where practicable consistent with the Carlsbad Landscape Manual.
7. Stabilize permanent channel crossings.
8. Install energy dissipaters, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable standards and specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.

B. Source Control BMPs

Design Outdoor Material Storage Areas to Reduce Pollution Introduction

9. Hazardous materials with the potential to contaminate urban runoff shall be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with rain, runoff or spillage to the storm water conveyance system; and (2) protected by secondary containment structures such as berms, dikes, or curbs. The storage area shall be paved and sufficiently impervious to contain leaks and spills, and have a roof or awning to minimize direct precipitation within the secondary containment area.

Design Trash Storage Areas to Reduce Pollution Introduction

10. Trash storage areas shall be: (1) paved with an impervious surface, designed not to allow run-on from adjoining areas, screened or walled to prevent off-site transport of trash; and) contain attached lids on all trash containers that exclude rain; or contain a roof or awning to minimize direct precipitation.

Limited exclusion: detached residential homes.

Use Efficient Irrigation Systems & Landscape Design

11. Employ rain shutoff devices to prevent irrigation during precipitation consistent with the Carlsbad Landscape Manual.
12. Design irrigation systems to each landscape area's specific water requirements consistent with the Carlsbad Landscape Manual.

Limited exclusion: detached residential homes.

Provide Storm Water conveyance System Stenciling and Signage

13. Provide concrete stamping, porcelain tile, inset permanent marking or equivalent as approved by the City of Carlsbad, of all storm water conveyance system inlets and catch basins within the project area with prohibitive language (e.g., "No Dumping – I Live Downstream"), satisfactory to the City Engineer.
14. Post signs and prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area, trailheads and parks.

C. BMPs Applicable to Individual Priority Project Categories

Where identified in Table 1, the following requirements shall be incorporated into applicable priority projects. Projects shall adhere to each of the individual priority project category requirements that apply to the project (e.g., a restaurant with more than 15 parking spaces would be required to incorporate the requirements for "h. Parking Areas" into the project design).

a. Private Roads

15. The design of private roadway drainage where appropriate, shall incorporate, to the extent practicable, (1) rural swale system- street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings; (2) urban curb/swale system- street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter; or (3) dual drainage system- first flush captured in street catch basins and discharged to adjacent vegetated swale or gravel shoulder, (4) other treatment control BMP methods approved by the City Engineer to reduce storm water runoff pollution.

b. Residential Driveways & Guest Parking

16. Driveways shall have, to the extent practicable, one of the following: (1) shared access; (2) flared entrance (single lane at street); (3) wheelstrips (paving only under tires); or (4) designed to drain into landscaping prior to discharging to the storm water conveyance system.
17. Uncovered temporary or guest parking on private residential lots shall be, to the extent practicable,: (1) paved with a permeable surface; or (2) designed to drain into landscaping prior to discharging to the storm water conveyance system.

c. Dock Areas

18. Loading/unloading dock areas shall include the following: (1) cover loading dock areas, or design drainage to preclude urban run-on and runoff; and (2) Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

d. Maintenance Bays

19. Maintenance bays shall include at least one of the following: (1) repair/ maintenance bays shall be indoors; or, (2) designed to preclude urban run-on and runoff.
20. Maintenance bays shall include a repair/maintenance bay drainage system to capture all wash water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm water conveyance system is prohibited. Where areas are allowed to connect to the sanitary sewer system, an Industrial Waste Permit from the Encina Water Pollution Control Facility may be required.

e. & f. Vehicle & Equipment Wash Areas

21. Areas for washing/steam cleaning of vehicles and areas for outdoor equipment/accessory washing and steam cleaning shall be: (1) self-contained to preclude run-on and run-off, covered with a roof or overhang, and equipped with a clarifier or other pretreatment facility; and (2) properly connected to a sanitary sewer if appropriate. Where areas are connected to a sanitary sewer, an Industrial Waste Permit may be required from the Encina Water Pollution Control Facility.

g. Outdoor Processing Areas

22. Outdoor processing areas shall: (1) cover or enclose areas that would be the most significant source of pollutants; or, (2) slope the area toward a dead-end sump or, (3) discharge to the sanitary sewer system
23. Grade or berm processing area to prevent run-on from surrounding areas.
24. Installation of storm drains in areas of equipment repair is prohibited.

h. Surface Parking Areas

25. Where landscaping is proposed in surface parking areas (both covered and uncovered), incorporate landscape areas into the drainage design.
26. Overflow parking (parking in excess of the project's minimum parking requirements) may be constructed with permeable paving subject to the City Engineer's approval.

i. Non-Retail Fueling Areas

Non-Retail fueling areas shall be designed with the following:

27. Fuel dispensing area that is: (1) paved with Portland cement concrete or equivalent smooth impervious surface (asphalt concrete is prohibited); (2) designed to extend 6.5 feet from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot, whichever is greater; (3) sloped to prevent ponding; (4) separated from the rest of the site by a grade break that prevents run-on of urban runoff; and (5) designed to drain to the project's treatment control BMP(s) prior to discharging to the storm water conveyance system.
28. Overhanging roof structure or canopy that is: (1) equal to or greater than the area within the fuel dispensing area's grade break; and (2) designed not to drain onto or across the fuel dispensing area.

j. Hillside Landscaping

29. Hillside areas disturbed by project development shall be landscaped with deep-rooted, drought tolerant plant species selected for erosion control, in accordance with the with the Carlsbad Landscape Manual.

D. Treatment Control BMPs

30. Where identified in Table 1, and after site design and source control BMPs have been incorporated into the project, applicants of priority projects shall design a single or combination of treatment control BMPs designed to infiltrate, filter, and/or treat runoff from the project footprint to one of the "Numeric Sizing Treatment Standards" listed in Table 3, below. Applicants must use the Structural Treatment BMP Selection Procedure outlined in Section III.2.D.i, below to select appropriate treatment control BMPs. Applicants are encouraged to design projects so that runoff is treated by site design BMPs, such as rooftop runoff treated in landscaping, so that it may be applied towards the numeric sizing treatment standards, satisfactory to the City Engineer. In addition, applicants are encouraged to apply a "drainage basin approach" in meeting the treatment requirements. Treating entire hydrologic sub-drainages, which often extend off-site, is an equitable, environmentally sound regional solution that applies treatment requirements to hydrologically defined areas, rather than legally defined parcels. When integrated with other projects, this approach can provide a more efficient and cost effective method of treatment by locating fewer, more effective BMPs to treat entire sub-drainages once. In all instances, structural treatment BMP(s) may be located on- or off-site, used singly or in combination, or shared by multiple new developments, pursuant to the following criteria:

    (a) All structural treatment control BMPs shall infiltrate, filter, and/or treat the required runoff volume or flow prior to discharging to any receiving water body supporting beneficial uses;

    (b) Multiple post-construction structural treatment control BMPs for a single priority project shall collectively be designed to comply with the numeric sizing treatment standards;

    (c) Shared BMPs shall be operational prior to the use of any dependent development or phase of development. The shared BMPs shall only be required to treat the dependent developments or phases of development that are in use;

    (d) Interim storm water BMPs that provide equivalent or greater treatment than is required may be implemented by a dependent development until each shared BMP is operational. If interim BMPs are selected, the BMPs shall remain in use until permanent BMPs are operational.

Table 3. Numeric Sizing Treatment Standards.

Volume

1. Volume-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) the volume of runoff produced from a 24-hour 85th percentile storm event, as determined from isopluvial maps contained in the County of San Diego Hydrology Manual.

OR

Flow

2. Flow-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) the maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour for each hour of a storm event.

i. Structural Treatment BMP Selection Procedure

Priority projects shall select a single or combination of treatment BMPs from the categories in Table 4 that maximize pollutant removal for the particular pollutant(s) of concern. Any pollutants the project is expected to generate that are also causing a Clean Water Act section 303(d) impairment of the downstream receiving waters of the project should be given top priority in selecting treatment BMPs.

To select a structural treatment BMP using the Structural Treatment Control BMP Selection Matrix (Table 4), each priority project shall compare the list of pollutants for which the downstream receiving waters are impaired (if any). According to the 1998 303(d) listing, the Agua Hedionda Lagoon is impaired for sediment and siltation. Buena Vista Lagoon also has impaired beneficial uses (aquatic life) due to high sedimentation/siltation. Portions of Carlsbad where construction sites have the potential to discharge into a tributary of a 303(d) or directly into a 303(d) water body or sites located within 200 feet of an ESA require additional BMP implementation. These water bodies include the Pacific Ocean, Buena Vista Lagoon, Encinas Creek, Agua Hedionda Lagoon, and Batiquitos Lagoon.

Priority projects that are not anticipated to generate a pollutant for which the receiving water is Clean Water Act Section 303(d) impaired shall select a single or combination of structural treatment BMPs from Table 4 that are effective for pollutant removal of the identified pollutants of concern determined to be most significant for the project. Selected BMPs must be effective for the widest range of pollutants of concern anticipated to be generated by a priority project (as identified in Table 1).

Alternative storm water BMPs not identified in Table 4 may be approved at the discretion of the City Engineer, provided the alternative BMP is as effective in removal of pollutants of concern as other feasible BMPs listed in Table 4.

Table 4. Structural Treatment Control BMP Selection Matrix.

Pollutant of Concern	*Treatment Control BMP Categories*						
	Biofilters	Detention Basins	Infiltration Basins(1)	Wet Ponds or Wetlands	Drainage Inserts	Filtration	Hydrodynamic Separator Systems(2)
Sediment	M	H	H	H	L	H	M
Nutrients	L	M	M	M	L	M	L
Heavy Metals	M	M	M	H	L	H	L
Organic Compounds	U	U	U	U	L	M	L
Trash & Debris	L	H	U	U	M	H	M
Oxygen Demanding Substances	L	M	M	M	L	M	L
Bacteria	U	U	H	U	L	M	L
Oil & Grease	M	M	U	U	L	H	L
Pesticides	U	U	U	U	L	U	L

(1) Including trenches and porous pavement.
(2) Also known as hydrodynamic devices and baffle boxes.

L: Low removal efficiency
M: Medium removal efficiency
H: High removal efficiency
U: Unknown removal efficiency

Sources: *Guidance Specifying Management Measures for Sources of Nonpoint Pollution in Coastal Waters* (1993), *National Stormwater Best Management Practices Database* (2001), and *Guide for BMP Selection in Urban Developed Areas* (2001).

ii. Restrictions on the Use of Infiltration Treatment BMPs

31. Treatment control BMPs that are designed to primarily function as infiltration devices shall meet the following conditions (these conditions do not apply to treatment BMPs which allow incidental infiltration and are not designed to primarily function as infiltration devices, such as grassy swales, detention basins, vegetated buffer strips, constructed wetlands, etc.): (1) urban runoff from commercial developments shall undergo pretreatment to remove both physical and chemical contaminants, such as sedimentation or filtration, prior to infiltration; (2) all dry weather flows shall be diverted from infiltration devices except for those non-storm water discharges authorized pursuant to 40 CFR 122.26(d)(2)(iv)(B)(1): diverted stream flows, rising ground waters, uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to storm water conveyance systems, uncontaminated pumped ground water, foundation drains, springs, water from crawl space pumps, footing drains, air conditioning condensation, flow from riparian habitats and wetlands, water line flushing, landscape irrigation, discharges from potable water sources other than water main breaks, irrigation water, individual residential car washing, and dechlorinated swimming pool discharges; (3) pollution prevention and source control BMPs shall be implemented at a level appropriate to protect groundwater quality at sites where infiltration structural treatment BMPs are to be used; (4) the vertical distance from the base of any infiltration structural treatment BMP to the seasonal high groundwater mark shall be at least 10 feet. Where groundwater does not support beneficial uses, this vertical distance criterion may be reduced, provided groundwater quality is maintained; (5) the soil through which infiltration is to occur shall have physical and

chemical characteristics that are adequate for proper infiltration durations and treatment of urban runoff for the protection of groundwater beneficial uses; (6) the horizontal distance between the base of any infiltration structural BMP and any water supply wells shall be 100 feet or as determined appropriate by the City Engineer.

32. Notification to neighboring jurisdictions may be required where staff determines the infiltration BMP(s) may impact the groundwater in a neighboring jurisdiction.

Structural Treatment Limited Exclusions

(a.) Proposed restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical sizing criteria requirements listed in Table 3.

(b.) Where significant redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development, and the existing development was not subject to priority project requirements, the numeric sizing criteria apply only to the addition, and not to the entire development.

IV. CONSTRUCTION STORM WATER BMP PERFORMANCE STANDARDS

Those projects that have been determined to require construction BMPs in Steps 1 and 2 of Section II, must identify the construction BMPs to be implemented in accordance with the performance standards in this section. The construction BMPs must be identified in a Storm Water Pollution Prevention Plan or Water Pollution Control Plan for projects disturbing more than 1-acre. These plans must be prepared in accordance with the guidelines in Appendix E.

It is the responsibility of the property owner and/or contractor to select, install and maintain appropriate BMPs. A list of construction BMPs is provided for reference in Appendix F. BMPs must be installed in accordance with an industry recommended standard or in accordance with the requirements of the State General Construction Permit. More information about BMPs is provided in the Model Construction Program for San Diego Copermittees, the City of Los Angeles "Reference Guide for Stormwater Best Management Practices," State Storm Water BMP Manuals, and Caltrans Standard BMP handbook.

BMP requirements differ between the rainy season(Oct. 1 – Apr. 30) and the dry season (May 1 – Sept. 30), the type of the project and topography of the site, as described below.

1. Site Management Requirements

Construction is a dynamic operation where changes are expected. Storm water BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation, revision and re-installation, particularly as project grading progresses. Therefore, owner/contractor self-inspections are required. They shall be performed by the owner's/contractor's Qualified Contact Person specifically trained in storm water pollution prevention site management and storm water BMPs, including the installation and maintenance of sediment and erosion control measures. Additional qualified persons may assist with the inspection activities under the direction of the Qualified Contact Person. A Qualified Contact Person is required for all sites during both wet and dry weather conditions.

There are four primary purposes of the self-inspections conducted by owners and contractors:

- To ensure that the owners/contractors take full responsibility for managing storm water pollution caused by their activities.
- To ensure that storm water BMPs are properly documented and implemented and are functioning effectively.
- To identify maintenance (e.g., sediment removal) and repair needs.
- To ensure that the project proponents implement their storm water management plans.

A self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested. Self-inspections must be performed by a Qualified Contact Person according to the following schedule:

- Daily weather forecasting at all times
- At 24-hour intervals during extended rainfall events
- Daily evaluations as earth moving/grading is being conducted during the wet season
- Weekly (every 7 days) in the dry season as earth moving/grading is progressing
- Self inspection checklists shall be submitted to the project inspector on a weekly basis during the rainy season.

Storm water pollution prevention site management requirements include:

A. A qualified person who is trained and competent in the use of BMPs shall be on site daily, although not necessarily full time, to evaluate the conditions of the site with respect to storm water pollution prevention. This qualified contact person shall represent the contractor/ owner on storm water issues.

B. The qualified person shall implement the conditions of the Storm Water Pollution Prevention Plan, contract documents and/or local ordinances with respect to erosion and sediment control and other waste management regulations.

C. The qualified person is responsible for monitoring the weather and implementation of any emergency plans as needed. The weather shall be monitored on a 5-day forecast plan and a full BMP protection plan shall be activated when there is a 40% chance of rain.

D. The qualified person is responsible for overseeing any site grading and operations and evaluating the effectiveness of the BMPs. This person shall modify the BMPs as necessary to keep the dynamics of the site in compliance. This person or other qualified persons are responsible for checking the BMPs routinely for maintenance and documenting the BMPs being implemented.

2. Performance Standards

The City of Carlsbad will evaluate the adequacy of the owner's/contractor's site management for storm water pollution prevention, inclusive of BMP implementation, on construction sites based on performance standards for storm water BMPs. Poor BMP practices shall be challenged. Performance standards shall include:

A. Prevent increase in pollution to the maximum extent practicable.

B. Minimize slope erosion.

C. Control discharge velocities moving offsite to limit down stream erosion potential to the pre-construction levels. .

A site will be considered inactive if construction activities have ceased for a period of 7 or more consecutive calendar days. At any time of year, an inactive site must be fully protected from erosion and discharges of sediment. It is also the owner's/contractor's responsibility at both active and inactive sites to implement a plan to address all potential non-storm water discharges.

Regardless of any inspections conducted by the City, property owners or contractors are required to prevent any construction-related materials, trash, wastes, spills or residues from entering a storm water conveyance system.

3. Seasonal Requirements

A. Dry Season Requirements (May 1 through September 30):

1. Perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
2. Sediment control BMPs must be installed and maintained to comply with performance standards (above).
3. BMPs to control sediment tracking must be installed and maintained at entrances/exits to comply with performance standards (above).
4. Material needed to install standby BMP's necessary to completely protect the exposed portions of the site from erosion, and to prevent sediment discharges, must be stored on site Areas that have already been protected from erosion using physical stabilization or established vegetation stabilization BMP's as described below are not considered to be "exposed" for purposes of this requirement.
5. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a predicted storm event is defined as a forecasted, 40% chance of rain). On request, the owner/contractor must provide proof of this capability that is acceptable to the City of Carlsbad.
6. Deployment of physical or vegetation erosion control BMP's must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
7. The area that can be cleared or graded and left exposed at one time is limited to the amount of acreage that the owner/contractor can adequately protect prior to a predicted rainstorm.

Requirement "7" will require grading to be phased at larger sites. For example, it may be necessary to deploy erosion and sediment control BMPs in areas that are not completed but are not actively being worked before additional grading is done.

B. Rainy Season Requirements (October 1 through April 30):

1. Perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
2. Sediment control BMPs must be installed and maintained to comply with performance standards (above).
3. BMPs to control sediment tracking must be installed and maintained at site entrances/exits to comply with performance standards (above).
4. Material needed to install standby BMPs necessary to completely protect the exposed portions of the site from erosion, and to prevent sediment discharges, must be stored on site. Areas that have already been protected from erosion using physical stabilization or established vegetation stabilization BMPs as described below are not considered to be "exposed" for purposes of this requirement.
5. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a predicted storm event is defined as a forecasted, 40% chance of rain). On request, the owner/contractor must provide proof of this capability that is acceptable to the City of Carlsbad.
6. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The owner/contractor may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
7. The area that can be cleared or graded and left exposed at one time is limited to the amount of acreage that the owner/contractor can adequately protect prior to a predicted rainstorm.
8. Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
9. Perimeter protection and sediment control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
10. Adequate physical or vegetation erosion control BMPs must be installed and established for all graded areas prior to the start of the rainy season. These BMPs must be maintained throughout the rainy season. If a selected BMP fails, it must be repaired and improved, or replaced with an acceptable alternate as soon as it is safe to do so. The failure of a BMP shows that the BMP, as installed, was not adequate for the circumstances in which it was used and shall be corrected or modified as necessary. Repairs or replacements must therefore put a more effective BMP in place.
11. All vegetation erosion control must be established prior to the rainy season to be considered as a BMP.

V. IMPLEMENTATION & MAINTENANCE OF REQUIREMENTS

After all project BMPs have been approved by the City Engineer, applicants and City project managers must ensure implementation and maintenance of the BMPs according to the processes outlined in the applicable sections for projects requesting discretionary actions, construction permits, or for public projects. In addition, any project that will require a "General NPDES Permit for Storm Water Discharges Associated with Industrial Activities," shall include the following note on the plans and condition in the permit/approval:

Industrial NPDES Permit Requirement

"The Permittee or designee (or contractor for public projects) shall provide evidence of coverage under the General Industrial National Pollutant Discharge Elimination System Permit, in the form of a Notice of Intent (NOI) filed with the State Water Resources Control Board, prior to the issuance of any construction permits."

1. Discretionary Actions

A. *Permanent BMP Requirements.* Applicants proposing projects that include permanent BMPs shall enter into a maintenance agreement, satisfactory to the City, following the program outlined in the "Permanent Storm Water BMP Maintenance Agreement Requirements" below, prior to the issuance of any permits or approvals. The permanent BMPs shall be graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed below) shall also be noted on the plans and made a condition of the project's permit/approval.

B. *Construction BMP Requirements.* Projects seeking discretionary approvals are not required to graphically demonstrate any construction BMP requirements on the project plans. Instead, the discretionary action shall be conditioned to provide BMP's in accordance with the City's Storm Water Standards.

2. Construction Permits

A. *Construction Permits for Projects Under 1 Acre.* Projects proposing to disturb less than 1 acre during construction shall include construction requirements, where possible, on the plans. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted on, or stapled to, the plans (Water Pollution Control Plan) and made a condition of the permit. The project's construction priority ranking (see Appendix E) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program outlined below prior to the issuance of any construction permits. The permanent BMPs shall be graphically shown on the plans, where

possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed below) shall also be noted on the plans and made a condition of the project's permit/approval.

B. *Construction Permits for Projects Over 1 Acre.* Projects proposing to disturb more than 1 acre during construction shall include all construction BMPs in a Storm Water Pollution Prevention Plan, prepared in accordance with Appendix E, "Storm Water Pollution Prevention Plan Guidelines." The construction BMPs shall also be shown on the plans, where possible. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted or stapled to the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program outlined below prior to the issuance of any construction permits. The permanent BMPs shall be graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed below) shall also be noted on the plans and made a condition of the project's permit/approval.

3. Public Projects

Construction and Permanent storm water requirements must be incorporated into the project design and described in the contract documents (plans and specifications) prior to bidding for construction contracts, or equivalent. In addition, the permanent BMP's maintenance requirements shall also be noted on the plans and/or specifications and made a condition of the project's permit/approval. Project Managers should utilize the standard boiler specification and expound upon any project specific requirements.

For projects disturbing over 1 acre, City project managers must include the requirement for the preparation of a Storm Water Pollution Prevention Plan in the contract documents to be sent out to bid. The contract documents must also include the requirement for the contractor to periodically update the Storm Water Pollution Prevention Plan throughout the construction phase of the project.

For projects disturbing less than 1 acre, City projects shall have a specific Water Pollution Control Plan developed to identify construction BMP requirements prior to sending the public project contracts out to bid. The contract documents shall include a requirement for the contractor to update the Water Pollution Control Plan throughout the construction phase of the project.

4. Permanent BMP Maintenance Agreement Requirements

Applicants shall propose a maintenance agreement assuring all permanent BMPs will be maintained throughout the "use" of a project site, satisfactory to the City Engineer (see Appendix H for a list of potential mechanisms). The City-approved method of permanent BMP maintenance shall be incorporated into the project's construction permit, and shall be consistent with permits issued by resource agencies, before City approval of the permit.

City project managers carrying out public projects that are not required to obtain permits shall be responsible for ensuring that a client department-approved method of storm water BMP maintenance, repair and replacement is executed prior to the commencement of construction.

For all properties, the verification mechanism will include the project proponent's signed statement, as part of the project application, accepting responsibility for all permanent BMP maintenance, repair and replacement.

The maintenance agreement shall include the following:

1. *Operation & Maintenance (O&M) Plan*: The applicant shall include an Operation & Maintenance (O&M) plan, prepared satisfactory to the City, with the approved maintenance agreement, which describes the designated responsible party to manage the storm water BMP(s), employee's training program and duties, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities (including maintenance of storm water conveyance system stamps), copies of resource agency permits, and any other necessary activities. At a minimum, maintenance agreements shall require the applicant to provide inspection and servicing of all permanent treatment BMPs on an annual basis. The project proponent or City-approved maintenance entity shall complete and maintain O&M forms to document all maintenance requirements. Parties responsible for the O&M plan shall retain records for at least 5 years. These documents shall be made available to the City for inspection upon request at any time.

2. *Access Easement/Agreement:* If a permanent BMP requires access for maintenance, as part of the O&M plan , the applicant shall execute and record an access easement or agreement that shall be binding on the under lying land throughout the life of the project in favor of the party responsible for maintenance, until such time that the permanent treatment BMP requiring access for maintenance is removed or replaced. The City shall approve any changes to permanent BMP's, O&M Plans or access agreements. The agreement shall include a provision that gives the City the right, but not the obligation to perform the maintenance. The party responsible for BMP maintenance will pay the City for any and all costs incurred by the City for maintaining any BMP's. The agreement will provide a cost recovery provision in favor of the City satisfactory to the City Attorney.

VI. RESOURCES & REFERENCES

APPENDIX A

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the following checklist to determine your project's permanent and construction storm water best management practices requirements. This form must be completed and submitted with your permit application.

Section 1. Permanent Storm Water BMP Requirements:
If any answers to Part A are answered "Yes," your project is subject to the "Priority Project Permanent Storm Water BMP Requirements," and "Standard Permanent Storm Water BMP Requirements" in Section III, "Permanent Storm Water BMP Selection Procedure" in the *Storm Water Standards* manual.

If all answers to Part A are "No," and any answers to Part B are "Yes," your project is only subject to the "Standard Permanent Storm Water BMP Requirements". If every question in Part A and B is answered "No," your project is exempt from permanent storm water requirements.

Part A: Determine Priority Project Permanent Storm Water BMP Requirements.

Does the project meet the definition of one or more of the priority project categories?*	**Yes**	**No**
1. Detached residential development of 10 or more units		
2. Attached residential development of 10 or more units		
3. Commercial development greater than 100,000 square feet		
4. Automotive repair shop		
5. Restaurant		
6. Steep hillside development greater than 5,000 square feet		
7. Project discharging to receiving waters within Environmentally Sensitive Areas		
8. Parking lots greater than or equal to 5,000 ft^2 or with at least 15 parking spaces, and potentially exposed to urban runoff		
9. Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater		
* Refer to the definitions section in the *Storm Water Standards* for expanded definitions of the priority project categories.		
Limited Exclusion: Trenching and resurfacing work associated with utility projects are not considered priority projects. Parking lots, buildings and other structures associated with utility projects are priority projects if one or more of the criteria in Part A is met. If all answers to Part A are "No", continue to Part B.		

Part B: Determine Standard Permanent Storm Water Requirements.

Does the project propose:	Yes	No
1. New impervious areas, such as rooftops, roads, parking lots, driveways, paths and sidewalks?		
2. New pervious landscape areas and irrigation systems?		
3. Permanent structures within 100 feet of any natural water body?		
4. Trash storage areas?		
5. Liquid or solid material loading and unloading areas?		
6. Vehicle or equipment fueling, washing, or maintenance areas?		
7. Require a General NPDES Permit for Storm Water Discharges Associated with Industrial Activities (Except construction)?*		
8. Commercial or industrial waste handling or storage, excluding typical office or household waste?		
9. Any grading or ground disturbance during construction?		
10. Any new storm drains, or alteration to existing storm drains?		
*To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/stormwtr/industrial.html		

Section 2. Construction Storm Water BMP Requirements:

If the answer to question 1 of Part C is answered "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Storm Water Pollution Prevention Plan (SWPPP). If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Water Pollution Control Plan (WPCP). If every question in Part C is answered "No," your project is exempt from any construction storm water BMP requirements. If any of the answers to the questions in Part C are "Yes," complete the construction site prioritization in Part D, below.

Part C: Determine Construction Phase Storm Water Requirements.

Would the project meet any of these criteria during construction?	Yes	No
1. Is the project subject to California's statewide General NPDES Permit for Storm Water Discharges Associated With Construction Activities?		
2. Does the project propose grading or soil disturbance?		
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?		
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as, paints, solvents, concrete, and stucco)?		

Part D: Determine Construction Site Priority

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans, and included in the SWPPP or WPCP. Indicate the project's priority in one of the check boxes using the criteria below, and existing and surrounding conditions of the project, the type of activities necessary to complete the construction and any other extenuating circumstances that may pose a threat to water quality. The City reserves the right to adjust the priority of the projects both before and during construction. [Note: The construction priority does NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority does affect the frequency of inspections that will be conducted by City staff. See Section IV.1 for more details on construction BMP requirements.]

☐ *A) High Priority*

1) Projects where the site is 50 acres or more and grading will occur during the rainy season
2) Projects 5 acres or more. 3) Projects 5 acres or more within or directly adjacent to or discharging directly to a coastal lagoon or other receiving water within an environmentally sensitive area

   Projects, active or inactive, adjacent or tributary to sensitive water bodies

☐ *B) Medium Priority*

1) Capital Improvement Projects where grading occurs, however a Storm Water Pollution Prevention Plan (SWPPP) is not required under the State General Construction Permit (i.e., water and sewer replacement projects, intersection and street re-alignments, widening, comfort stations, etc.)
2) Permit projects in the public right-of-way where grading occurs, such as installation of sidewalk, substantial retaining walls, curb and gutter for an entire street frontage, etc. , however SWPPPs are not required.
3) Permit projects on private property where grading permits are required, however, Notice Of Intents (NOIs) and SWPPPs are not required.

☐ *C) Low Priority*

1) Capital Projects where minimal to no grading occurs, such as signal light and loop installations, street light installations, etc.
2) Permit projects in the public right-of-way where minimal to no grading occurs, such as pedestrian ramps, driveway additions, small retaining walls, etc.
3) Permit projects on private property where grading permits are not required, such as small retaining walls, single-family homes, small tenant improvements, etc.

APPENDIX B

DRAFT
ENVIRONMENTALLY SENSITIVE AREAS WITHIN THE CITY OF CARLSBAD

APPENDIX C

EXAMPLE PERMANENT STORM WATER BEST MANAGEMENT PRACTICES

The following are a list of BMPs that may be used to minimize the introduction of pollutants of concern that may result in significant impacts to receiving waters. Other BMPs approved by the Development Services Division as being equal or more effective in pollutant reduction than comparable BMPs identified below are acceptable. All BMPs must comply with local zoning and building codes and other applicable regulations.

Site Design BMPs

Minimizing Impervious Areas Consistent With City Standards, Ordinances and Policies

- Incorporate landscaped buffer areas between sidewalks and streets.
- Design residential streets for the required pavement widths
- Minimize the number of residential street cul-de-sacs and incorporate landscaped areas to reduce their impervious cover.
- Use open space development that incorporates smaller lot sizes
- Increase building density while decreasing the building footprint
- Reduce overall lot imperviousness by promoting alternative driveway surfaces and shared driveways that connect two or more homes together
- Reduce overall imperviousness associated with parking lots by providing compact car spaces, minimizing stall dimensions, incorporating efficient parking lanes, and using pervious materials in spillover parking areas

Increase Rainfall Infiltration

- Use permeable materials for private sidewalks, driveways, parking lots, and interior roadway surfaces (examples: hybrid lots, parking groves, permeable overflow parking, etc.) to the extent practicable consistent with City standards.
- Direct rooftop runoff to pervious areas such as yards, open channels, or vegetated areas, and avoid routing rooftop runoff to the roadway or the urban runoff conveyance system to the extent practicable consistent with City standards.

Maximize Rainfall Interception

- Maximizing canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs. to the extent practicable consistent with City Landscape Manual.

Storm Water Standards
4/03/03

Minimize Directly Connected Impervious Areas (DCIAs)

- Draining rooftops into adjacent landscaping prior to discharging to the storm water conveyance system to the extent practicable consistent with City standards
- Draining parking lots into landscape areas co-designed as biofiltration areas to the extent practicable consistent with City standards
- Draining roads, sidewalks, and impervious trails into adjacent landscaping to the extent practicable consistent with City standards

Use of natural drainage systems to the maximum extent practicable

- Stabilized permanent channel crossings
- Planting native or drought tolerant vegetation on slopes to the extent practicable consistent with City Landscape Manual.

Maximize Rainfall Interception

- Cisterns
- Foundation planting

Increase Rainfall Infiltration

- Dry wells

Source Control BMPs

- Storm water conveyance system stenciling and signage
- Outdoor material and trash storage area designed to reduce or control rainfall runoff
- Efficient irrigation system

Treatment Control BMPs

Biofilters
- Grass swale
- Grass strip
- Wetland vegetation swale
- Bioretention

Detention Basins

- Extended/dry detention basin with vegetated lining
- Extended/dry detention basin with impervious lining

Storm Water Standards
4/03/03

Infiltration

- Infiltration basin
- Infiltration trench

Pervious Paving

- Porous asphalt
- Porous concrete
- Porous modular concrete block

Wet Ponds and Wetlands

- Wet pond (permanent pool)
- Constructed wetland

Drainage Inserts

- Catch basin/storm drain inserts
- Catch basin screens

Filtration Systems

- Media filtration
- Sand filtration

Hydrodynamic Separation Systems

- Swirl concentrator
- Cyclone separator
- Baffle boxes

APPENDIX D

WATER QUALITY TECHNICAL REPORT GUIDELINES

Purpose

To describe the permanent storm water Best Management Practices (BMPs) that will be incorporated in the project to mitigate the impacts of urban runoff due to the development.

Minimum Requirements

- Prepared by Registered Civil Engineer

Organization & Content

Table of Contents
Vicinity Map
Project Description
- Narrative of project activities

Site Map
- Entire property included on one map (use key map if multi-sheets)
- Drainage areas and direction of flow
- Private storm drain system(s)
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing and proposed storm water controls
- Location of "impervious" areas- paved areas, buildings, covered areas
- Locations where materials would be directly exposed to storm water
- Location of building and activity areas (e.g. fueling islands, garages, waste container area, wash racks, hazardous material storage areas, etc.)
- Areas of potential soil erosion (including areas downstream of project)

Pollutants and Conditions of Concern
- Name and number of Carlsbad Watershed Hydrological UnitImpaired water bodies downstream of the project and impairment
- Impacts to hydrologic regime
- Pollutants based upon land use

Types of BMPs:

Site Design BMPs
- Reduce impervious surfaces
- Conserve natural areas
- Minimize directly connected impervious areas
- Protect slopes and channels

Source Control BMPs

- Inlet stenciling and signage
- Materials Storage
- Trash storage
- Efficient irrigation
- Other controls (as applicable)

Structural Treatment BMPs

- Basis for selection (include targeted pollutants, justification, and alternative analysis)
- Design criteria (include calculations)
- Pollutant removal information (other than vendor specifications)
- Literature References

Maintenance (i.e. identify the responsible parties who will implement the Best Management Practices)

- Maintenance schedule
- Maintenance Costs
- Qualifications of maintenance personnel

Drainage Study

APPENDIX E

STORM WATER POLLUTION PREVENTION PLAN/WATER POLLUTION CONTROL PLAN GUIDELINES

At a minimum, the Storm Water Pollution Prevention Plan (SWPPP) or Water Pollution Control Plan (WPCP), whichever is required, must cover the areas listed below. The SWPPP must be kept on site and made available upon request of a representative of the City of Carlsbad. Projects that are also required to obtain a general construction National Pollutant Discharge Elimination System (NPDES) Permit are encouraged to visit the State Water Resource Control Board's website for permit application instructions, NOI and NOT forms and guidance in preparing a Storm Water Pollution Prevention Plan (go to: www.swrcb.ca.gov/stormwtr/docs/constpermit).

Planning and Organization

- Identify the pollution prevention team members who will maintain and implement the SWPPP.
- If applicable, incorporate or reference the appropriate elements of other regulatory requirements.

Site Map

Features displayed on the map must include:

- An outline of the entire property
- Drainage areas on the property and direction of flow
- Areas of soil erosion
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing storm water controls (oil/ water separators, sumps, etc.)
- Location of "impervious" areas- paved areas, buildings, covered areas
- Locations where materials are directly exposed to storm water
- Locations where toxic or hazardous materials have spilled in the past
- Location of building and activity areas (e.g. fueling islands, garages, waste container area, wash racks, hazardous material storage areas, etc.)

List of Significant Materials

List materials stored and handled at the site. Include the location and typical quantities.

Description of Potential Pollutant Sources

- Provide a narrative description of the site's activities and list the potential pollutant sources and the potential pollutants that could be discharged in storm water discharges from each activity.
- List non-storm water discharges including the source, quantity, frequency, and characteristics of the discharges and drainage area.

Assessment of Potential Sources

Describe which activities are likely to be sources of pollution in storm water and which pollutants are likely to be present in storm water discharges.

Best Management Practices

Describe the BMPs that will be implemented at the site for each potential pollutant and its source.

APPENDIX F

EXAMPLE CONSTRUCTION BEST MANAGEMENT PRACTICES

A. Erosion Control

Physical stabilization BMPs, vegetation stabilization BMPs, or both, will be required to prevent erosion and sediment runoff from exposed graded areas. BMPs for physical and vegetation stabilization include:

1) Physical Stabilization
    a) Geotextiles
    b) Mats
    c) Fiber rolls
    d) Sprayed on binders
    e) Mulch on flat areas
    f) Other material approved by the City for use in specific circumstances

If physical stabilization is selected, materials must be appropriate to the circumstances in which they are deployed, and sufficient material must be deployed.

2) Vegetation Stabilization
    a) Preservation of existing vegetation
    b) Established interim vegetation (via Hydroseed, seeded mats, etc.)
    c) Established permanent landscaping

If vegetation stabilization is selected, the stabilizing vegetation must be installed, irrigated and established (uniform vegetative coverage with 70% coverage established) prior to October 1. In the event stabilizing vegetation has not been established by October 1, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.

B. Sediment Control

2) Perimeter protection. Protect the perimeter of the site or exposed area from sediment ingress/discharge in sheet flows using:
    a) Silt fencing
    b) Gravel bag barriers
    c) Fiber rolls

3) Resource protection. Protect environmentally sensitive areas, and watercourses from sediment in sheet flows by using:
    a) Silt fencing
    b) Gravel bag barriers
    c) Fiber rolls

4) Sediment Capture. Capture sediments in channeled storm water by using:
    a) Storm-drain inlet protection measures
    b) De-silting basins (Designed in accordance with an industry standard such as Caltrans, California Storm water BMP manual etc. If the project is 5 acres or greater the desilting basin(s) must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.)

5) Velocity Reduction. Reduce the velocity of storm water by using:
    a) Outlet protection (energy dissipater)
    b) Equalization basins
    c) Check dams

6) Off-site Sediment Tracking. Prevent sediment from being tracked off-site by using:
    a) Stabilized construction entrances/exits
    b) Construction road stabilization
    c) Tracking control (i.e., corrugated steel panels, wheel washes)
    d) Dust control

C. Materials Management

7) Prevent the contamination of storm water by wastes through proper management of the following types of wastes:
    a) Solid
    b) Sanitary
    c) Concrete
    d) Hazardous
    e) Equipment – related wastes
    f) Stock piles (protection from wind and rain)

8) Prevent the contamination of storm water by construction materials by:
    a) Covering and/or providing secondary containment of storage areas
    b) Taking adequate precautions when handling materials.

APPENDIX H

POTENTIAL PERMANENT TREATMENT BMP MAINTENANCE MECHANISMS

1. Project proponent agreement to maintain storm water BMPs: The City may enter into a contract with the project proponent obliging the project proponent to maintain, repair and replace the storm water BMP as necessary into perpetuity. Security may be required.
2. Assessment districts: The City may approve an Assessment District or other funding mechanism created by the project proponent to provide funds for storm water BMP maintenance, repair and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.
3. Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City may assure storm water BMP maintenance, repair and replacement through conditions in the lease.
4. Public entity maintenance: The City may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the permanent treatment BMP. Unless acceptable to the City, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City may seek protection from liability by appropriate releases and indemnities. The City shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The City must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

The City may accept alternative maintenance mechanisms if such mechanisms are as protective as those listed above.

APPENDIX I

DEFINITIONS

"Attached Residential Development" means any development that provides 10 or more residential units that share an interior/exterior wall. This category includes, but is not limited to: dormitories, condominiums and apartments.

"Automotive Repair Shop" means a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

"Best Management Practices" see: "storm water best management practices".

"Commercial Development" means any development on private land that is not exclusively heavy industrial or residential uses. The category includes, but is not limited to: automotive dealerships, commercial airfields, mini-malls and other business complexes, shopping malls, hotels, office buildings, public warehouses, hospitals, laboratories and other medical facilities, educational institutions, recreational facilities, plant nurseries, car wash facilities, and other light industrial complexes.

"Commercial Development greater than 100,000 square feet" means any commercial development that with a project footprint of at least 100,000 square feet.

"Construction Permits" means any ministerial, building, demolition/removal, grading and public right-of-way permits

"Detached Residential Development" means any development that provides 10 or more freestanding residential units. This category includes, but is not limited to: detached homes, such as single-family homes and detached condominiums.

"Directly Connected Impervious Area (DCIA)" means the area covered by a building, impermeable pavement, and/ or other impervious surfaces, which drains directly into the storm water conveyance system without first flowing across permeable vegetated land area (e.g., lawns).

"Discretionary Actions" means any adoption or amendment of a land use plan, zoning or rezoning action, development agreement, subdivision of land in accordance with the Subdivision Map Act, or development permits

"Environmentally Sensitive Areas" (ESA) means areas that include, but are not limited to, all Clean Water Act 303(d) impaired water bodies ("303[d] water bodies"); areas designated as an "Area of Special Biological Significance" (ASBS) by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); water bodies designated as having a RARE beneficial use by the State Water Resources Control Board (Water Quality Control Plan for the San Diego

Basin (1994) and amendments), or areas designated as preserves or their equivalent under the Multiple Species Conservation Program (MSCP) within the Cities and County of San Diego. The limits of Areas of Special Biological Significance are those defined in the Water Quality Control Plan for the San Diego Basin (1994 and amendments).

Environmentally sensitive area is defined for the purposes of implementing SUSMP requirements, and does not replace or supplement other environmental resource-based terms, such as "Environmentally Sensitive Lands," employed by the City in their land development review processes.

"Hillside" means lands that have a natural gradient of 25 percent (4 feet of horizontal distance for every 1 foot of vertical distance) or greater and a minimum elevation differential of 50 feet, or a natural gradient of 200 percent (1 foot of horizontal distance for every 2 feet of vertical distance) or greater and a minimum elevation differential of 10 feet.

"Hillside development greater than 5,000 square feet" means any development that would create more than 5,000 square feet of impervious surfaces in hillsides with known erosive soil conditions.

"Infiltration" means the downward entry of water into the surface of the soil.

"Maximum Extent Practicable (MEP)" means the technology-based standard established by Congress in the Clean Water Act 402(p)(3)(B)(iii) that municipal dischargers of urban runoff must meet. MEP generally emphasizes pollution prevention and source control BMPs primarily (as the first line of defense) in combination with treatment methods serving as a backup (additional lines of defense).

"New Development" means land disturbing activities; structural development, including construction or installation of a building or structure, the creation of impervious surfaces; and land subdivision.

"Parking Lot" means land area or facility for the temporary parking or storage of motor vehicles used personally, or for business or commerce.

"Projects Discharging to Receiving Waters within Environmentally Sensitive Areas" means all development and significant redevelopment that would create 2,500 square feet of impervious surfaces or increase the area of imperviousness of a project site to 10% or more of its naturally occurring condition, and either discharge urban runoff to a receiving water within an environmentally sensitive area (where any portion of the project footprint is located within 200 feet of the environmentally sensitive area), or discharge to a receiving water within an environmentally sensitive area without mixing with flows from adjacent lands (where the project footprint is located more than 200 feet from the environmentally sensitive area).

"Project Footprint" means the limits of all grading and ground disturbance, including landscaping, associated with a project.

"Receiving Waters" means surface bodies of water, which directly or indirectly receive discharges from urban runoff conveyance systems, including naturally occurring wetlands, streams (perennial, intermittent, and ephemeral (exhibiting bed, bank, and ordinary high water mark)), creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays and the Pacific Ocean. The City shall determine the definition for wetlands and the limits thereof for the purposes of this definition, provided the City definition is as protective as the Federal definition utilized by the United States Army Corps of Engineers and the United States Environmental Protection Agency. Constructed wetlands are not considered wetlands under this definition, unless the wetlands were constructed as mitigation for habitat loss. Other constructed BMP's are not considered receiving waters under this definition, unless the BMP was originally constructed in receiving waters.

"Residential Development" means any development on private land that provides living accommodations for one or more persons. This category includes, but is not limited to: single-family homes, multi-family homes, condominiums, and apartments.

"Restaurant" means a stand-alone facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812).

"Significant Redevelopment" means development that would create or add at least 5,000 square feet of impervious surfaces on an already developed site. Significant redevelopment includes, but is not limited to: the expansion of a building footprint; addition to or replacement of a structure; replacement of an impervious surface that is not part of a routine maintenance activity; and land disturbing activities related with structural or impervious surfaces. Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Significant redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots; new sidewalk construction, pedestrian ramps, or bikelane on existing roads; and replacement of damaged pavement.

"Site Design BMP" means any project design feature that reduces the creation or severity of potential pollutant sources or reduces the alteration of the project site's natural flow regime. Redevelopment projects that are undertaken to remove pollutant sources (such as existing surface parking lots and other impervious surfaces) or to reduce the need for new roads and other impervious surfaces (as compared to conventional or low-density new development) by incorporating higher densities and/or mixed land uses into the project design, are also considered site design BMPs.

"Source Control BMP (both structural and non-structural)" means land use or site planning practices, or structures that aim to prevent urban runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and urban runoff. Examples include roof structures over trash or material storage areas, and berms around fuel dispensing areas.

"Storm Water Best Management Practice (BMP)" means any schedules of activities, prohibitions of practices, general good house keeping practices, pollution prevention and educational practices, maintenance procedures, structural treatment BMPs, and other management practices to prevent or reduce to the maximum extent practicable the discharge of pollutants directly or indirectly to receiving waters. Storm Water BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. This manual groups development-related storm water BMPs into two categories: (1) *construction BMPs*, which are practices, procedures, devices or materials used to prevent the transport and introduction of pollutants both on and from a project site during construction; and (2) *permanent BMPs*, which are the site design features, source control features, and treatment control BMPs that become a permanent part of a project's design and remain functioning throughout the "use" phase of a project site. (See the definitions for site design, source control and treatment control BMPs in this appendix).

"Storm Water Conveyance System" means private and public drainage facilities by which storm water may be conveyed to Receiving Waters, such as: ditches, natural drainages, roads, streets, constructed channels, aqueducts, storm drains, pipes, street gutters, or catch basins.

"Streets, Roads, Highways, and Freeways" means any project that is not part of a routine maintenance activity, and would create a new paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles and other vehicles. For the purposes of SUSMP requirements, Streets, Roads, Highways and Freeways do not include trenching and resurfacing associated with utility work; applying asphalt overlay to existing pavement; new sidewalk, pedestrian ramps, or bikelane construction on existing roads; and replacement of damaged pavement.

"Treatment Control (Structural) BMP" means any engineered system designed and constructed to remove pollutants from urban runoff. Pollutant removal is achieved by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption or any other physical, biological, or chemical process.

3.1 Construction SWPPP Standards Introduction

3.1.1 Background Information

The Construction Storm Water Pollution Prevention Plan (SWPPP) standards and requirements described herein were established to ensure construction compliance with the City of Carlsbad Storm Water Ordinance and the Municipal Permit, as issued by the Regional Water Quality Control Board for the San Diego Region (see below for Municipal Permit reference details). This chapter must be used in conjunction with other chapters of this manual to ensure full compliance with both construction and post construction storm water requirements. This chapter addresses the need for temporary Best Management Practices (BMPs) during construction activities to minimize the mobilization of pollutants such as sediment and to minimize the exposure of storm water to pollutants.

Pursuant to Titles 11, 15 and 18 of the Carlsbad Municipal Code, all construction activities within the City, whether the City issues a construction permit or not, are subject to the provisions of the standards and requirements of this manual.

The water quality protection measures and construction procedures described in this chapter of the manual are intended to ensure construction activity compliance with the following State and Regional water quality permits:

Municipal Permit -more particularly described as San Diego California Regional Water Quality Control Board San Diego Region Order No. R9-2007-01, NPDES No. CAS0108758 Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the County of San Diego County, the San Diego Unified Port District, and the San Diego County Regional Airport Authority and any amendment, revision or re-issuance thereof; and,

General Construction Permit - more particularly described as NPDES General Permit for Storm Water Discharges Associated with Construction Activity, Water Quality Order No. 99-08-DWQ, NPDES No. CAS000002, issued by the State Water Resources Control Board (Construction General Permit), and any amendment, revision or re-issuance thereof; and,

General Linear Utility Permit - more particularly described as NPDES General Permit for Storm Water Discharges Associated with Construction Activity from Small Linear Underground/Overhead Projects, Water Quality Order 2003-0007 DWQ issued by the State Water Resources Control Board, and any amendment, revision or re-issuance thereof.

3.1.2 Standards Applicability to Construction Projects

All construction activities in the City of Carlsbad are subject to the requirements of the Municipal Permit. Construction activities that meet one or more of the following criteria are additionally subject to the requirements of the General Construction Permit. Construction activities that:

1) Disturb one or more acres of land area;
2) Form part of a larger common plan of development that encompasses one or more acres of soil disturbance; or
3) Have the potential for significant water quality impairment.

The General Construction Permit does not apply to routine maintenance to maintain original line and grade, hydraulic capacity, or original purpose of an existing facility, nor does it include emergency construction activities required to protect public health and safety. Developers/owners/contractors should confirm with the San Diego Regional Water Quality Control Board (SDRWQCB) staff whether or not a particular routine maintenance activity is subject to the General Construction Permit.

Construction of small linear utility facility projects that are not subject to the General Construction Permit are subject to the requirements of the General Linear Utility Permit. This includes but is not limited to construction of any conveyance pipe for transportation of gaseous, liquid, liquescent or slurry material; any cable line or wire for the transmission of electrical energy; any cable line or wire for communications; and, associated ancillary facilities. Developers/owners/contractors should confirm with the SDRWQCB staff whether or not a particular underground or overhead utility construction project is subject to the General Linear Utility Permit.

3.2 Construction SWPPP Requirements and Approval Process

3.2.1 Construction SWPPP Tier Levels

Every construction activity within the City that has the potential to negatively affect water quality must prepare a construction storm water pollution prevention plan (Construction SWPPP) whether or not the City issues a construction permit for the activity. To ensure compliance with all the various State and Regional permitting regulations, the City established a three-tiered system for the preparation of Construction SWPPPs. The tiers range from Tier 3 representing the highest threat to water quality to Tier 1 representing the lowest threat to water quality. The threshold triggers for each of the three tier levels are generally described below together with a reference to the applicable Construction SWPPP standards.

Tier 3 - Construction activities that impact one or more acres (individually or cumulatively through phased construction) or that, regardless of size, pose a significant potential for storm water quality impairment must prepare a Tier 3 Construction SWPPP in conformance with the standards and requirements of the Construction General Permit and City Standards.

Tier 2 - Construction activities that impact less than one acre and that pose a moderate threat to storm water quality must prepare a Tier 2 Construction SWPPP in conformance with City Standards. In the case of small linear underground/overhead utility projects, the project must also demonstrate compliance with the General Linear Utility Permit.

Tier 1 - Construction activities that impact less than one acre and pose a low threat to storm water quality must prepare a Tier 1 Construction SWPPP in conformance with City Standards. In the case of small linear underground/overhead utility projects, the project must also demonstrate compliance with the General Linear Utility Permit.

Exempt - Construction activities that pose no threat to storm water quality are exempt from the preparation of a Construction SWPPP; however, the construction activities must still comply with all construction BMPs required pursuant to Title 15 of the CMC and these standards.

3.2.2 Determination of Construction SWPPP Tier Level

The worksheet entitled "Project Threat Assessment Worksheet for Determination of Construction SWPPP Tier Level", attached as Appendix A, shall be used to determine the appropriate tier level of Construction SWPPP for a proposed construction project. The worksheet is also used to determine whether the project is exempt from Construction SWPPP requirements. The completed worksheet shall be submitted with applications for each construction permit submitted to the City including building permits, grading permits and right-of-way permits.

To make a determination, the project reviewer starts with the assessment criteria located at the top of the worksheet along the left hand column and works downward through the various threat categories and assessment criteria. At the first point where the proposed project makes a match with the assessment criteria, a check is made in the box next to the criteria. The tier level listed in the right hand column in the same row as the selected assessment criteria is the required Construction SWPPP Tier Level for the project.

If none of the boxes in the Significant, Moderate or Low Threat Project Assessment Criteria categories are checked, then the project is exempt from the Construction SWPPP requirements. Proposed construction projects may be considered categorically exempt from the Construction SWPPP requirements when, and if, the project only requires issuance of one or more of the construction permit types shown on Table1 below.

Exempt projects must still comply with all storm water best management practices pursuant to Title 15 of the Carlsbad Municipal Code and City Standards. If in the opinion of the City Engineer, an otherwise exempt project is, or potentially could pose, a threat to storm water quality, the City Engineer may require preparation and implementation of a Construction SWPPP at a tier level commensurate with the storm water threat

Table 1	
City Construction Permit Types Exempt from Construction SWPPP Requirements	
Electrical Permit Fire Additional Permit Fire Alarm Permit Fixed Systems Permit Mechanical Permit Mobile Home Permit Re-Roofing Permit	Patio Deck Plumbing Permit Sign Permit Spa □ Factory Made Sprinkler Permit Water Discharge Permit

Cautionary Note - The Project Threat Assessment Worksheet represents the project proponent's assessment of the threat posed by a proposed construction project. City staff has responsibility for making the final assessment regarding the need for and tier level of Construction SWPPP required The City staff decision is made after submission of the plan review application. A staff determination that the construction plan review application is subject to the preparation of a Construction SWPPP, or is subject to more stringent Construction SWPPP requirement than initially assessed by the applicant (project proponent), will result in the return of the plan review application as incomplete.

If applicants are unsure about the meaning of any of the assessment criteria described in the worksheet or need help in determining how to respond to one or more of the assessment criteria, they are strongly encouraged to seek assistance from Engineering Department Development Services staff prior to preparation of the Construction SWPPP and submission for construction plan review.

3.2.3 Qualified Persons to Prepare a Construction SWPPP

The project proponent is responsible for preparing the appropriate tier level Construction SWPPP. Tier 2 and Tier 3 Construction SWPPPs shall be prepared in accordance with the requirements of this manual. All Tier 2 and Tier 3 Construction SWPPPs shall be written, amended and certified by a Qualified SWPPP Preparer.

A Qualified SWPPP Preparer shall have one of the following registrations or certifications:

1. A California registered civil engineer,
2. A California registered geologist,
3. A California registered landscape architect,
4. A professional hydrologist registered through the American Institute of Hydrology,
5. A certified professional soil scientist registered through the Soil Science Society of America,
6. A certified professional in erosion and sediment control registered through Certified Professional in Erosion and Sediment Control, Inc.,
7. A certified professional in storm water quality registered through Certified Professional in Erosion and Sediment Control, Inc., or
8. A certified professional in erosion and sediment control registered through the National Institute for Certification in Engineering Technologies.

Any hydrology or hydraulic calculations, soils reports or geotechnical reports prepared in support of a Tier 2 or Tier 3 Construction SWPPP must be prepared by a professional engineer with appropriate registration qualifications issued by the State of California.

The City Engineer may approve alternative means for establishing the certification of a Qualified SWPPP Preparer for Tier 2 or Tier 3 Construction SWPPPs upon submittal of a letter by the project proponent requesting approval of an alternative certification and presenting due cause why such alternative certification should be considered.

Projects requiring a Tier 1 Construction SWPPP shall use the City s Tier 1 Construction SWPPP Standard Template attached as Appendix H. No special qualification is required to prepare a Tier 1 Construction SWPPP.

3.2.4 Storm Water Certification Forms

For non-exempt projects, the project proponent must submit a certified Construction SWPPP (of the appropriate tier level) concurrent with any application for construction plan review including submittals for building plans, public and private improvement plans, grading plans, blasting plans, demolition plans, landscape plans and plans for right-of-way construction activities.

In addition to any other required construction plan review application submittal requirements, the project proponent must submit a completed and signed Storm Water Compliance Certification statement on the form prescribed in this Manual. A separate certification form is used corresponding to each of the three Construction SWPPP tier levels and for exempt projects. Copies of the required Storm Water Compliance Forms for Tier 2 and 3 Construction SWPPPs and for exempt projects are attached as Appendix B. The Storm Water Compliance statement for a Tier 1 Construction SWPPP is incorporated into the City's standard form Tier 1 Construction SWPPP attached as Appendix H.

After submittal of the application, City staff will review the Storm Water Compliance statement and either note concurrence with the proponents threat assessment at the bottom right hand corner of the Storm Water Compliance Form or reject the application as incomplete and return the application submittal package with a written explanation why the project threat assessment should be changed. See Cautionary Note in Chapter 3.2.1 above.

3.2.5 Project Threat to Storm Water Quality

Before a project construction permit can be issued for any project not found exempt from the Construction SWPPP requirements, a project's perceived threat to storm water quality must be determined. The Municipal Permit mandates that the City provide inspection commensurate with a project's perceived threat to storm water quality. The assessment criteria used to determine a project's perceived threat to storm water quality is not the same as the assessment criteria used to determine the tier level of Construction SWPPP for a project.

The worksheet entitled "Construction Threat Assessment Worksheet for Determination of Project's Perceived Threat to Storm Water Quality", attached as Appendix C, is used to determine the appropriate perceived threat to storm water compliance for a particular project. The projects perceived threat to storm water quality relates to the frequency of storm water compliance inspections required under the Municipal Permit and is one of the factors used to determine the City Construction SWPPP inspection fee. For more detailed information on storm water compliance inspections please refer to Chapter 3.4 of this manual.

3.2.6 Tier 3 Construction SWPPP Requirements

For projects that result in the disturbance of one acre or more of soil (individually or cumulatively through phased construction) and/or are determined to have a significant potential for water quality impairment, a Tier 3 Construction SWPPP shall be prepared in accordance with the requirements of the General Construction Permit and these standards.

3.2.6.1 Required Elements for Tier 3 Construction SWPPP

A Tier 3 Construction SWPPP must contain all of the elements required by the General Construction Permit, the Municipal Permit and these standards. The *TIER 3 CONSTRUCTION SWPPP REQUIRED ELEMENTS CHECKLIST*, attached as Appendix B, provides a complete listing of the required elements for a Tier 3 Construction SWPPP together with the regulatory source for each listed element. The checklist utilizes the same formatting as the checklist prepared by the State Water Resources Control Board entitled *STORM WATER POLLUTION PREVENTION PLAN AND MONITORING PROGRAM CHECKLIST,* modified to include elements required by the Municipal Permit and these standards.

The checklist is provided as an aid to those unfamiliar in the preparation of a Tier 3 Construction SWPPP. It is a comprehensive list of issues a SWPPP preparer must consider during the development of the document. Many sites, especially small construction sites, will not need to address some of the listed elements because they are not relevant to the site, the construction activities planned, or the construction materials used. The list allows the preparer to consider the applicability of the element to the specific circumstances of the site, and then determine to what extent the element should be addressed in the SWPPP.

The elements in the checklist are derived from Sections A, B, and C of the General Construction Permit, Section D.2. of the Municipal Permit, and these standards. The specific regulatory permit or City Standard chapter is listed in the second column. The third column indicates the page number(s) in the SWPPP document where the line item element is addressed. If the required element is not applicable to the specific project, then N/A should be noted in the fourth column. The fifth column is a space to note the scheduled date where any specified BMP elements will be implemented.

The use of this checklist does not guarantee compliance with the General Construction Storm Water Permit or these standards. Additionally, using the checklist to generate a Tier 3 Construction SWPPP is not a substitute for knowledge of the permit requirement. The checklist serves as a guidance document only. A site specific Tier 3 Construction SWPPP must be combined with proper and timely installation of the BMPs, thorough and frequent inspections, maintenance, and documentation.

3.2.6.2 Required Format for a Tier 3 Construction SWPPP

A Tier 3 Construction SWPPP shall be formatted in accordance with the SWPPP template included in the latest version of the *California Stormwater BMP Handbook Construction"* prepared by the California Storm Water Quality Association (CASQA). As an alternative, the developer may use the Construction SWPPP format presented in the latest edition of the *Stormwater Pollution Prevention Plan (SWPPP) and Water Pollution Control Program (WPCP) Preparation Manual* prepared by Caltrans. The developer/owner/applicant must request approval for the use of the Caltrans format prior to submittal.

As an aide to the preparation of a Tier 3 Construction SWPPP document, the preparer may utilize the *Tier 3 CONSTRUCTION SWPPP CASQA FORMAT CHECKLIST (CASQA SWPPP Checklist)* included in Appendix C. The Tier 3 CASQA SWPPP Checklist is used by the City during its review of the Tier 3 Construction SWPPP documents.

The use of the checklist does not guarantee compliance with the General Construction Storm Water Permit or these standards. Additionally, using the checklist to generate a Tier 3 Construction SWPPP is not a substitute for knowledge of the permit requirement. The checklist serves as a guidance document only. A site specific Tier 3 Construction SWPPP must be combined with proper and timely installation of the BMPs, thorough and frequent inspections, maintenance, and documentation.

3.2.6.3 General Construction Permit Compliance Procedures

The General Construction Permit requires certain standard notifications to be made to the San Diego Regional Water Quality Control Board (SDRWQCB) prior to initiation of construction and after completion of construction as follows:

Notice of Intent (NOI) - It is the responsibility of the owner/developer/applicant to obtain coverage under the General Construction Permit through the filing of a Notice of Intent (NOI) with the SDRWQCB prior to commencement of construction activities. After City approval of the Tier 3 Construction SWPPP and prior to signature of the grading plans and/or issuance of grading permit for the project, the owner/developer/applicant shall submit the City approved Tier 3 Construction Permit, a filing fee and other required documentation to the SDRWQCB. Upon filing of the NOI, the project will be assigned a Waste Discharger's Identification (WDID) number by the SDRWQCB. The WDID number must be added into the Tier 3 Construction SWPPP and affixed onto the respective construction plans.

Notice of Termination (NOT) - Upon completion of the construction activity or transfer of ownership, the landowner shall file a NOT with the SDRWQCB certifying that all State and local requirements have been met in accordance with Special Provisions for Construction Activity, C.7, of the General Construction Permit.

Landowners who fail to obtain coverage of the General Construction Permit for storm water discharges to surface waters will be in violation of the CWA and the California Water Code.

To obtain a copy of the General Construction Permit, general information about the permit, fact sheets and copies of the various forms described below, visit the following website:

http://www.swrcb.ca.gov/stormwtr/construction.html

Once at the site click on the highlighted link titled "Construction General Permit, 99-08-DWQ".

3.2.7 Tier 2 Construction SWPPP Requirements

Construction activities that impact less than one acre and pose a moderate threat to water quality (as determined by the moderate threat assessment criteria contained in the Project Threat Assessment Worksheet attached as Appendix A) must prepare a Tier 2 Construction SWPPP in conformance with City Standards. Small linear underground or overhead utility projects must also comply with the requirements of the General Linear Utility Permit.

3.2.7.1 Required Elements for Tier 2 Construction SWPPP

A Tier 2 Construction SWPPP shall contain all of the elements as described on the TIER 2 CONSTRUCTION SWPPP CHECKLIST attached as Appendix G.

The use of the checklist does not guarantee compliance with these standards. The checklist serves as a guidance document only. A site specific Tier 2 Construction SWPPP must be combined with proper and timely installation of the BMPs, thorough and frequent inspections, maintenance, and documentation.

3.2.7.2 Required Format for Tier 2 Construction SWPPP

A Tier 2 Construction SWPPP shall be formatted in accordance with the template attached as Appendix F.

For small linear utility construction project subject to the General Linear Utility Permit, the project proponent shall follow the requirements of the General Linear Utility Permit for preparation of a Tier 2 Construction SWPPP. The Tier 2 SWPPP specified in the General Linear Utility Permit shall be submitted to the City in lieu of the City standard form Tier 2 Construction SWPPP.

3.2.8 Tier 1 Construction SWPPP Requirements

Construction activities that impact less than one acre and pose a low threat to water quality (as determined by the low threat assessment criteria contained in the Project Threat Assessment Worksheet attached as Appendix A) must prepare a standard format Tier 1 Construction SWPPP in conformance with City Standards. Small linear underground or overhead utility projects must also comply with the requirements of the General Linear Utility Permit.

3.2.8.1 Required Standard Format for Tier 1 Construction SWPPP

A Tier 1 Construction SWPPP shall utilize the standard form Tier 1 Construction SWPPP template attached as Appendix H. The standard form template includes the two sheets containing standard storm water prevention construction notes, a project information block, a Storm Water Compliance Statement, City approval block and a Best Management Practice (BMP) Checklist Table.

A Tier 1 level project that receives a low perceived threat to storm water quality rating as determined by the Construction Threat Assessment Worksheet, attached as Appendix C, need only complete and sign the first two sheets of the template. A Tier 1 level project that receives a medium perceived threat to storm water quality rating as determined by the Construction Threat Assessment Worksheet must additionally, attach

a site plan map sheet(s) showing the proposed construction site and depicting the areas of proposed construction and proposed location of structural BMPs. For a more detail description regarding the site plan requirements, see the site plan instruction sheet included with the template in Appendix H.

For all Tier 1 Construction SWPPPs, the property owner or owner's agent must complete the information in the Project Information block, check the appropriate boxes in the BMP Checklist Table and fill out and sign the Storm Water Compliance Statement. The form is intended to be completed as an "over the counter" type document for processing of construction permits for projects with a "low perceived threat to storm water quality". Projects with a "medium perceived threat to storm water quality", may require additional staff time to review the site plan included with the Tier 1 Construction SWPPP.

The BMP Checklist Table on page two of the standard form template is intended to be completed by the project proponent. The project proponent begins by checking the box to the left of each construction activity that will be performed during construction of the proposed project. Then, for each checked activity, the project proponent will pick one or more of the BMPs described along the top of the table that will be used to prevent storm water pollution resulting from that specific activity. The project proponent will then make a check in the box along the particular construction activity row that corresponds with the column for each BMP selected to help mitigate the potential storm water pollution effects of the activity. This process is repeated until all appropriate BMP boxes have been checked corresponding to each of the checked construction activities. Blank columns are included on the form to allow the applicant to add additional proposed BMPs not included on the standard table.

The owner/developer/contractor performing the construction work is responsible for ensuring that each of the selected BMPs is appropriately incorporated into the project during construction. The use of the BMP Checklist Table does not guarantee compliance with these standards. The BMP Checklist Table serves as a guidance document only. Additional BMPs may be required if the selected BMP(s) are shown to be ineffective or not relevant to a particular construction activity.

For small linear utility construction project subject to the General Linear Utility Permit, the project proponent shall follow the requirements of the General Linear Utility Permit for preparation of a Tier 1 Construction SWPPP. The Tier 1 SWPPP specified in the General Linear Utility Permit shall be submitted to the City in lieu of the City standard form Tier 1 Construction SWPPP.

3.2.9 General Linear Utility Permit Compliance Procedures

The General Linear Utility Permit requires certain standard notifications to be made to the San Diego Regional Water Quality Control Board (SDRWQCB) prior to initiation of construction and after completion of construction as described below. To obtain a copy of the General Linear Utility Permit, general information about the permit, fact sheets and copies of the various forms described below, visit the following website:

http://www.swrcb.ca.gov/stormwtr/construction.html

Once at the site click on the highlighted link titled "Small LUP General Permit".

3.2.9.1 Notice of Intent (NOI)

It is the responsibility of the owner/developer/applicant to obtain coverage under the General Linear Permit through the filing of a Notice of Intent (NOI) with the SDRWQCB prior to commencement of construction activities. After City approval of the Tier 2 or Tier 1Construction SWPPP and prior to issuance of grading and/or right-of-way permit for the project, the project proponent shall submit the City approved Construction Permit, a filing fee and other required documentation to the SDRWQCB. Upon filing of the NOI, the project will be assigned a Waste Discharger's Identification (WDID) number by the SDRWQCB. The WDID number must be added into the Construction SWPPP and affixed onto the respective construction plans

3.2.9.2 General Linear Utility Permit - Tier 1 SWPPP

A single Tier 1 SWPPP prepared in accordance with the General Linear Utility Permit may authorize construction of any number of small utility projects. The Notice of Intent (NOI) and corresponding WDID number remains in effect until the discharger requests termination and such termination request is approved by the SDRWQCB.

3.2.9.2.1 Linear Construction Activity Notification (LCAN)

Prior to initiation of construction for each small utility project covered by the Tier 1 SWPPP, the discharger must submit a LCAN to the SDRWQCB prior to start of construction on the form provided for such purpose by the SDRWQCB. Alternatively, the discharger may submit a LCAN at least quarterly listing multiple small utility projects that will be constructed during the next quarter.

3.2.9.2.2 Linear Construction Termination Notification (LCTN)

At the conclusion of construction of small utility project covered by a Tier 1 SWPPP, the discharger must file a LCTN with the SDRWQCB certifying that the site was in full compliance with the requirements of the General Linear Utility Permit. The discharger may submit a single LCTN for multiple projects completed over a specified period of time. The LCTN submittal must include all required documentation requested by the SDRWQCB.

3.2.9.3 Notice of Termination (NOT)

Upon completion of the construction activity the discharger shall file a NOT with the SDRWQCB certifying that all construction activities were completed in full compliance with the requirements of the General Linear Utility Permit. For Tier 1 SWPPPs, filing of the NOT, and approval of the NOT by the SDRWQCB, will terminate permit coverage and work on additional small utility projects will no longer be permitted without obtaining an new Tier 1 or Tier 2 SWPPP. A NOT for a Tier 2 SWPPP indicates that the specified small utility project is complete and all work was done in compliance with the General Linear Utility Permit. When filing the NOT dischargers must use the NOT forms provided by the SDRWQCB.

3.2.9.4 City General Operating Permit (GOP)

The City's GOP procedures are intended to provide a mechanism for utility operators to conduct routine maintenance operations under a single permit. To avoid the need for

preparing and processing separate Construction SWPPPs for each routine maintenance operation, the City will allow preparation of a single Tier 1 Construction SWPPP to cover multiple small utility projects. The process will follow the same procedures as for a Tier 1 SWPPP prepared and processed in accordance with City Standards and the requirements of the General Linear Utility Permit.

The notification procedures described above shall apply with the following addition:

1. A copy of each LCAN shall be faxed to the City Construction Management and Inspection Division a minimum of 24 hours prior to start of construction. A copy of the fax notification shall be kept at the construction site. The copy shall be presented and shown upon demand to any City Official for verification of authority to work. A lack of 24-hour notification to the City for intended work may subject the operator to a stop-work notice.
2. A copy of the LCTN shall be submitted to the City Construction Management and Inspection Division concurrent with its submittal to the RWQCB.
3. A copy of the NOT shall be submitted to the City Construction Management and Inspection Division concurrent with its submittal to the RWQCB.

Any Small Utility Project that meets the requirements of a Tier 2 SWPPP pursuant to the General Linear Utility Permit requirements shall process a Tier 2 SWPPP consistent with Tier 2 Construction SWPPP procedures described above.

3.3 Construction BMP Standards

3.3.1 Background Information

Construction Best Management Practices (BMPs) are the schedules of activities, prohibitions of practices, maintenance procedures and other management practices employed during construction activities to prevent or reduce pollution of the ocean, lagoons, lakes, streams and other sensitive water bodies and water courses. Construction BMPs also include the physical devices and structural construction control measures designed to prevent soil erosion from occurring or to contain sediment before it leaves the construction site. The BMPs required pursuant this manual are also intended to protect the health, safety and welfare of the public and to prevent damage to adjoining public and private property resulting from construction activities.

The City of Carlsbad has adopted the California Stormwater Quality Association Construction Stormwater Best Management Practice Handbook (CASQA Construction Handbook) latest edition as its preferred source for construction BMPs. All BMP reference numbers used in this manual correspond to the BMP Fact Sheets included within the CASQA Construction Handbook unless specifically noted otherwise. With the approval of the City Engineer, or his/her designee, the City may accept comparable BMPs from reputable alternative sources such as Caltrans.

This manual is not intended as a comprehensive engineering or design manual on BMPs. The engineer or other qualified person, who prepares the Construction SWPPP, must utilize their individual knowledge and experience of BMPs together with the tools and reference materials described in this manual, or found elsewhere, to prepare an appropriate and adequate Construction SWPPP document.

The BMP categories below coincide with the BMP categories described in the CASQA Construction Handbook and provide a kind of checklist of the BMPs that are to be included in a Construction SWPPP. The combination or suite of BMPs that are included in a Construction SWPPP must reflect the specific conditions at the proposed construction site. An effective SWPPP includes a suite of BMPs that are designed to work together.

3.3.2 Minimum BMP Requirements

In accordance with the Municipal Permit, minimum BMPs must be installed for all projects to be implemented year-round. Because all sites, regardless of the priority, must be protected to prevent discharges to the maximum extent practicable, the minimum BMP requirements are the same for all projects requiring a Construction SWPPP. Each site must be protected by an effective combination of erosion and sediment controls, non-storm water management, materials and waste management controls, and general site management controls. The chapters following this chapter describe the minimum BMPs for each of the above listed BMP types that must be

incorporated into each Construction SWPPP prepared in accordance with these standards.

If particular BMPs are infeasible at any specific site, the owner/developer/contractor must install other equivalent BMPs. At any time of the year, an inactive site must be fully protected from erosion and discharges of sediment. A site will be considered inactive if construction activities have ceased for a period of ten or more consecutive days. It is also the owner/developer/contractors responsibility at both active and inactive sites to implement a plan to address all potential storm water and non-storm water discharges.

3.3.3 Erosion and Sediment Control BMPs

Erosion and sediment control BMPs are the structural and non-structural practices used during the construction process to keep sediment in place (erosion control) and to capture any sediment that is moved by stormwater before it leaves the site (sediment control). Erosion controls, keeping soil where it is, are the heart of any effective Construction SWPPP. The Construction SWPPP should rely on erosion controls as the primary means of preventing stormwater pollution. Sediment controls provide a necessary second line of defense to properly designed and installed erosion controls.

3.3.3.1 Erosion Control BMPs

Erosion control is any source control practice that protects the soil surface and prevents soil particles from being detached by rainfall, flowing water or wind. Erosion control is referred to as soil stabilization. Erosion control consists of preparing the soil surface and implementing one or more of the BMPs shown in Table 2.

Table 2
Erosion Control BMPs

CASQA BMP	BMP Name
EC-1	Scheduling
EC-2	Preservation of Existing Vegetation
EC-3	Hydraulic Mulch
EC-4	Hydroseeding
EC-5	Soil Binders
EC-6	Straw Mulch
EC-7	Geotextiles & Mats
EC-8	Wood Mulching
EC-9	Earth Dikes and Drainage Swales
EC-10	Velocity Dissipation
EC-11	Slope Drains
EC-12	Streambank Stabilization
EC-13	Polyacrylamide

All inactive soil-disturbed areas on the project site, and most active areas prior to the onset of rain, must be protected from erosion. Soil disturbed areas may include relatively flat areas as well as slopes. Typically, steep slopes and large exposed areas require the most robust erosion controls; flatter slopes and smaller areas still require protection, but less costly materials may be appropriate for these areas, allowing savings to be directed to the more robust BMPs for steep slopes and large exposed areas. To be effective, erosion control BMPs must be implemented at slopes and disturbed areas to protect them from concentrated flows.

Some erosion control BMPs can be used effectively to temporarily prevent erosion by concentrated flows. These BMPs, used alone or in combination, prevent erosion by intercepting, diverting, conveying, and discharging concentrated flows in a manner that prevents soil detachment and transport. Temporary concentrated flow conveyance

controls may be required to direct run-on around or through the project in a non-erodible fashion. Temporary concentrated flow conveyance controls include EC-9 (Earth Dikes and Drainage Swales), EC-10 (Velocity Dissipation Devices) and EC-11 (Slope Drains).

3.3.3.2 Sediment Control BMPs

Sediment control is any practice that traps soil particles after they have been detached and moved by rain, flowing water, or wind. Sediment control measures are usually passive systems that rely on filtering or settling the particles out of the water or wind that is transporting them. Sediment control practices include the BMPs listed in Table 3.

Table 3
Sediment Control BMPs

CASQA BMP	BMP Name
SE-1	Silt Fence
SE-2	Sediment Basin
SE-3	Sediment Trap
SE-4	Check Dam
SE-5	Fiber Rolls
SE-6	Gravel Bag Berm
SE-7	Street Sweeping and Vacuuming
SE-8	Sandbag Barrier
SE-9	Straw Bale Barrier
SE-10	Storm Drain Inlet Protection
SE-11	Chemical Treatment

Sediment control BMPs include those practices that intercept and slow or detain the flow of stormwater to allow sediment to settle and be trapped. Sediment control practices can consist of installing linear sediment barriers (such as silt fence, sandbag barrier, and straw bale barrier); providing fiber rolls, gravel bag berms, or check dams to break up slope length or flow; or constructing a sediment trap or sediment basin. Linear sediment barriers are typically placed below the toe of exposed and erodible slopes, down-slope of exposed soil areas, around soil stockpiles, and at other appropriate locations along the site perimeter.

A few BMPs may control both sediment and erosion, for example, fiber rolls and sand bag barriers. The CASQA Construction Handbook classifies these BMPs as either erosion control (EC) or sediment control (SC) based on the BMPs most common and effective use. Sediment control BMPs are most effective when used in conjunction with erosion control BMPs. The combination of erosion control and sediment control is usually the most effective means to prevent sediment from leaving the project site and potentially entering storm drains or receiving waters. The City of Carlsbad requires that the discharger implement an effective combination of erosion and sediment controls.

Under limited circumstances, sediment control, alone may be appropriate. For example, applying erosion control BMPs to an area where excavation, filling, compaction, or grading is currently under way may not be feasible when storms come unexpectedly. Use of sediment controls by establishing perimeter control on these areas may be appropriate and allowable provided the following conditions are met:

- Weather monitoring is under way.
- Inactive soil-disturbed areas have been protected with an effective combination of erosion and sediment controls.
- An adequate supply of sediment control materials is stored on-site and there are sufficient forces of labor and equipment available to implement sediment controls on the active area prior to the onset of rain.
- The SWPPP adequately describes the methods to protect active areas.

3.3.3.3 Wind Erosion Control BMPs

Wind erosion control consists of applying water or other dust palliatives to prevent or alleviate dust nuisance. Wind erosion control best management practices BMPs are shown in Table 4.

Table 4
Wind Erosion Control BMPs

CASQA BMP	BMP Name
WE-1	Wind Erosion Control

Other BMPs that are sometimes applied to disturbed soil areas in order to control wind erosion are BMPs EC-2 through EC-7, shown in Chapter 3.3.2.1 above. Be advised that many of the dust palliatives may contain compounds that have an unknown effect on stormwater. A sampling and analysis protocol to test for stormwater contamination from exposure to such compounds is required in the SWPPP.

3.3.3.4 Tracking Control BMPs

Tracking control consists of preventing or reducing the tracking of sediment off-site by vehicles leaving the construction area. Tracking control best management practices (BMPs) are shown in Table 5.

Table 5
Tracking Control BMPs

CASQA BMP	BMP Name
TR-1	Stabilized Construction Ingress/Egress
TR-2	Stabilized Construction Roadway
TR-3	Ingress/Egress Tire Wash

Attention to control of tracking sediment off site is highly recommended, as dirty streets and roads near a construction site create a nuisance to the public and generate constituent complaints to elected officials and regulators. These complaints often result in immediate inspections and regulatory actions.

3.3.4 Non-Storm Water Management BMPs

Carlsbad Standards prohibit the discharge of materials other than stormwater and authorized non-stormwater discharges. It is recognized that certain non-stormwater discharges may be necessary for the completion of construction projects. Such discharges include but are not limited to irrigation of vegetative erosion control measures, pipe flushing and testing, and street cleaning.

Non-stormwater management BMPs are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source or eliminating off-site discharge. These practices involve day-to-day operations of the construction site and are usually under the control of the contractor. These BMPs are also referred to as good housekeeping practices which involve keeping a clean, orderly construction site.

Non-stormwater management BMPs also include procedures and practices designed to minimize or eliminate the discharge of pollutants from vehicle and equipment cleaning, fueling, and maintenance operations to stormwater drainage systems or to watercourses.

Table 6 lists standard non-stormwater management BMPs. All these BMPs must be implemented depending on the conditions and applicability of deployment described as part of the BMP.

Table 6
Non-Storm Water Management BMPs

CASQA BMP	BMP Name
NS-1	Water Conservation Practices
NS-2	Dewatering Operations
NS-3	Paving and Grinding Operations
NS-4	Temporary Stream Crossing
NS-5	Clear Water Diversion
NS-6	Illicit Connection/Discharge
NS-7	Potable Water/Irrigation
NS-8	Vehicle and Equipment Cleaning
NS-9	Vehicle and Equipment Fueling
NS-10	Vehicle and Equipment Maintenance
NS-11	Pile Driving Operations
NS-12	Concrete Curing
NS-13	Concrete Finishing
NS-14	Material and Equipment Use
NS-15	Demolition Adjacent to Water
NS-16	Temporary Batch Plants

It is recommended that owners and contractors be vigilant regarding implementation of these BMPs, including making their implementation a condition of continued employment, and part of all prime and subcontract agreements. By doing so, the chance of inadvertent violation by an uncaring individual can be prevented, potentially saving thousands of dollars in fines and project delays. Also, if procedures are not properly implemented and/or if BMPs are compromised then the discharge is subject to sampling and analysis requirements contained in the General Construction Permit.

3.3.5 Waste Management and Materials Pollution Control BMPs

Waste management and materials pollution control BMPs, like non-stormwater management BMPs, are source control BMPs that prevent pollution by limiting or reducing potential pollutants at their source before they come in contact with stormwater. These BMPs also involve day-to-day operations of the construction site, are under the control of the contractor, and are additional good housekeeping practices which involve keeping a clean, orderly construction site.

Table 7 Waste Management and Materials Pollution Control BMPs	
CASQA BMP	**BMP Name**
WM-1	Material Delivery and Storage
WM-2	Material Use
WM-3	Stockpile Management
WM-4	Spill Prevention and Control
WM-5	Solid Waste Management
WM-6	Hazardous Waste Management
WM-7	Contaminated Soil Management
WM-8	Concrete Waste Management
WM-9	Sanitary/ Septic Waste Management
WM-10	Liquid Waste Management

Waste management consists of implementing procedural and structural BMPs for handling, storing, and disposing of wastes generated by a construction project. The objective is to prevent the release of waste materials into stormwater runoff or discharges through proper management of the following types of wastes:

- Solid
- Sanitary
- Hazardous
- Equipment-related wastes

Materials pollution control (also called materials handling) consists of implementing procedural and structural BMPs in the handling, storing, and the use of construction materials. The BMPs are intended to prevent the release of pollutants during stormwater and non-stormwater discharges. The objective is to prevent or reduce the opportunity for contamination of stormwater runoff from construction materials by covering and/or providing secondary containment of storage areas, and by taking adequate precautions when handling materials. These controls must be implemented for all applicable activities, material usage, and site conditions.

Table 7 lists the waste management and materials pollution control BMPs. It is important to note that these BMPs should be implemented depending on the conditions/applicability of deployment described as part of the BMP.

3.3.6 General Site Management Requirements

Every construction site shall implement the following minimum general site management requirements:

1. Emphasize pollution prevention where appropriate; and,
2. Implement all the requirements of the site approved Construction SWPPP to manage storm water and non-storm water discharges from the site at all times; and,

3. Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction; and,
4. Minimize exposure time of disturbed soil areas; and,
5. Minimize grading during the wet season and coincide grading with seasonal dry weather periods to the extent feasible. If grading does occur during the wet season, then implement additional BMPs for any rain events that may occur; and,
6. Limit he amount of exposed soil allowed at one time to the amount that which can be adequately protected by deploying standby erosion control and sediment control BMPs prior to a predicted rainstorm; and,
7. Temporarily stabilize and/or re-seed disturbed soil areas as rapidly as possible; and,
8. Preserve the natural hydrologic features of the site where feasible; and,
9. Preserve riparian buffers and corridors where feasible; and,
10. Maintain all BMPs until removed; and,
11. Retain, reduce and properly manage all pollutant discharges on-site to the MEP standard.

3.3.6.1 Dry Season Site Management Requirements

The following minimum BMPs must be in place at all construction sites throughout the year during both the wet and dry seasons:

1. All graded areas must have erosion protection BMPs properly installed
2. Adequate perimeter protection BMPs must be installed and maintained.
3. Adequate sediment control BMPs must be installed and maintained.
4. Adequate BMPs to control offsite sediment tracking must be installed and maintained.
5. A minimum of 125 of the material needed to install standby BMPs to protect the exposed areas from erosion and prevent sediment discharges, must be stored onsite. Areas already protected from erosion using physical stabilization or established vegetation stabilization BMPs are not considered to be exposed for purposes of this requirement.
6. The owner/developer/contractor must have an approved weather triggered action plan and be able to deploy standby BMPs to completely protect the exposed portions of the site within 48 hours of a predicted storm event (a predicted storm event is defined as a forecasted, 40 chance of rain by 5-day National Weather Service). On request, the owner/developer/contractor must provide proof of this capability that is acceptable to the City.
7. Deployment of physical or vegetation erosion control BMPs must commence as soon as slopes are completed. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of slopes that have been completed.
8. The area that can be cleared, graded, and left exposed at one time is limited to the amount of acreage that the contractor can adequately protect prior to a predicted rainstorm. For larger sites, grading should be phased (See Chapter 3.3.8). It may be necessary to deploy erosion and sediment control BMPs in areas that are not completed, but are not actively being worked before additional grading is done.

3.3.6.2 Rainy Season Site Management Requirements

In addition to the dry season requirements described above, the following additional minimum BMPs must be in place at all sites during the rainy season, which is defined as October 1st through April 30th:

1) Erosion control, perimeter protection and sediment control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
2) Adequate physical or vegetation erosion control BMPs must be installed and established for all completed slopes prior to the start of the rainy season. These BMPs must be maintained throughout the rainy season. If a selected BMP fails, it must be repaired and improved, or replaced with an acceptable alternate as soon as it is safe to do so. The failure of a BMP indicates it was not adequate for the circumstances in which it was used. Repairs or replacements must therefore put a more robust BMP in place.
3) The amount of exposed soil allowed at one time shall not exceed that which can be adequately protected by deploying standby erosion control and sediment control BMPs prior to a predicted rainstorm.
4) A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for 10 or more days. The ability to deploy standby BMP materials is not sufficient for these areas. BMPs must actually be deployed.
5) All vegetation erosion control must be established prior to the rainy season to be considered as an effective BMP.

3.3.7 Additional Controls for Construction Sites

For project sites that are tributary to 303(d) water body segments that are impaired for sediment, the following BMPs must be implemented at all times to the maximum extent possible:

- Maintain vegetative cover as much as possible by developing the project in a phased approach to reduce the amount of exposed soil at any one time.
- Limit the areas of active construction to five acres at any one time.
- Provide 100 percent soil cover for all areas of inactive construction throughout the entire time of construction, on a year-round basis.
- Provide appropriate perimeter control at all appropriate locations along the site perimeter and at all inlets to the storm drain system at all times during the rainy season.
- Provide vegetated buffer strips between the active construction area and any water bodies.
- Provide stabilized construction entrances and limit all vehicle and foot traffic to those entrances.

Where the provisions described above can not be accommodated, additional or supplemental controls shall be recommended. The City Engineer or designee shall have the authority to approve supplemental or alternative control methods based upon an evaluation of the proposed control and the sites potential threat to storm water quality impairment.

3.3.8 Maximum Disturbed Area for Erosion Control

The active disturbed soil area of any project site shall be not more than 50 acres for an individual grading permit or a combination of grading permits under an associated Tentative or Final Map. The City may approve, on a case-by-case basis, expansions of the active disturbed soil area limit if adequate site protection is demonstrated. At all times, sufficient soil stabilization and sediment control materials shall be maintained on site to provide adequate site protection.

3.3.9 Advanced Treatment Methods

Advanced Treatment is defined in the Municipal Permit as the use of mechanical or chemical means to flocculate and remove suspended sediment from runoff from construction sites prior to discharge.

If a project meets all of the following criteria, advanced treatment will be required:

1. All or part of the site is within 200 feet of waters named on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation and/or turbidity;
2. The disturbance area is greater than five acres, including all phases of the development;
3. The disturbed slopes are steeper than 4:1 with at least 10 feet of relief, and drain toward a Section 303(d) listed receiving water for sedimentation or turbidity;
4. The site contains a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4.

Advanced treatment may be required on sites that do not meet all four of the criteria for exceptional threat to water quality listed above at the discretion of the City Engineer based on a record on non-compliance.

Treatment effluent water quality shall meet or exceed the water quality objectives for sediment, turbidity, pH, and toxicity as listed in the Water Quality Control Plan for the San Diego Basin (9) for inland surface waters and lagoons and estuaries for the appropriate hydrologic unit.

Prior to obtaining a grading permit, the applicant shall submit, to the satisfaction of the City Engineer, the following:

1. An operations and maintenance schedule for all advanced treatment methods.
2. A monitoring plan for all required BMPs and water quality for all proposed work deemed necessary to achieve project water quality goals.
3. A written training plan for certification and documentation of necessary training and refreshers of staff.

The discharger shall either deploy Advanced Treatment Methods or comply with source control procedures described below.

- Maintain vegetative cover as much as possible by developing the project in a phased approach to reduce the amount of exposed soil at any one time.

- Limit the areas of active construction to five acres at any one time.
- Provide 100 percent soil cover for all areas of inactive construction throughout the entire time of construction, on a year-round basis.
- Provide appropriate perimeter control at all appropriate locations along the site perimeter and at all inlets to the storm drain system at all times during the rainy season.
- Provide vegetated buffer strips between the active construction area and any water bodies.
- Provide stabilized construction entrances and limit all vehicle and foot traffic to those entrances.

3.3.10 City Standard Water Pollution Prevention Notes

All Tier 2 and Tier 3 Construction SWPPPs shall include the City Standard Storm Water Pollution Prevention notes as specified in Appendix I. The notes shall be placed upon the Construction SWPPP drawing or, in the case of a Tier 3 Construction SWPPP, on the grading plan. The Qualified Plan Preparer may include supplemental Storm Water Pollution Prevention notes to address specific requirements of the proposed project and/or construction site. The City Engineer or designee may also request inclusion of supplemental Storm Water Pollution Prevention notes to address specific construction activities or site issues.

3.4 Storm Water BMP Inspection and Maintenance

3.4.1 General information

Construction is a dynamic operation where changes are expected. Storm water BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation, revision and re-installation, particularly as project grading progresses. Therefore, in addition to City inspections, owner/developer/contractor self- inspections are required.

3.4.2 Inspection of Construction Sites

All construction sites are subject to site inspection by City staff in accordance with the Carlsbad Municipal Code, the Municipal Permit, City's policies and procedures and these standards. Additionally, owner/developer/contractors are required to perform self-inspection of construction sites, for projects requiring a Tier 2 or Tier 3 Construction SWPPP, in accordance with these standards.

The City of Carlsbad will evaluate the adequacy of the owner's/contractor's site management for storm water pollution prevention, inclusive of BMP implementation, on construction sites based on performance standards for storm water BMPs. Poor BMP practices shall be challenged. Performance standards shall include:

1. Prevent increase in pollution to the maximum extent practicable.
2. Minimize slope erosion.
3. Control discharge velocities moving offsite to limit down stream erosion potential to the pre-construction levels.

3.4.3 City Storm Water BMP Inspection Frequency

Each construction site must be inspected by City staff for compliance with storm water standards at the minimum frequency as shown in Table 8. Site-specific inspection frequencies are reevaluated periodically, particularly when grading activities are being conducted during the rainy season. The need for additional inspections may vary depending upon several factors including:

- Site conditions;
- Previous violations;
- History of developer or contractor past performance;
- Grading during rainy season; and,
- Weather patterns.

Table 8		
	Inspection Frequency	
Site Threat to Water Quality	**Rainy Season Oct 1st – April 30th**	**Dry Season May 1st – September 30th**
High	Bi-weekly	As-needed
Medium	Monthly	As-needed
Low	As-needed	As-needed

The minimum inspection frequency is based upon a project's perceived Threat to Water Quality (TTWQ) and whether or not the construction occurs during the wet or dry season. Each project site is assigned one of three priorities to describe its TTWQ - low, medium or high. The worksheet entitled "Construction Threat Assessment Worksheet for Determination of Project's Perceived Threat to Water Quality", attached as Appendix A, is used to determine a construction site's TTWQ priority.

3.4.4 City Storm Water BMP Inspection Requirements

City inspection of construction sites for storm water compliance shall include, but not be limited to the following:

1. Assessment of BMP effectiveness including implementation of an effective combination of erosion, sediment and non-stormwater BMPs to meet the City's minimum water quality protection requirements and prevent the discharge of pollutants into storm water and receiving waters, and
2. Check for coverage under the General Construction Permit (Regional Board Notice of Intent (NOI) and/or Waste Discharge Identification No. (WDID No.)) during initial inspection;
3. Ensure compliance with the City's applicable ordinances, permits and other site-specific requirements;
4. Visual observations for non-stormwater discharges, potential illicit connections and potential discharge of pollutants in stormwater runoff;
5. Ensure proper implementation of plans and specifications,
6. Education and outreach on stormwater pollution prevention as needed;
7. Ensure that the project proponents implement their stormwater management on a year-round basis, and;
8. Creation of a written or electronic inspection report

City inspection staff will utilize the following framework when conducting an inspection:

1. Review the site erosion control and BMP implementation plans and determine whether they are being properly implemented;
2. Determine if BMPs are being used in accordance with the intent of all laws and approved plans;
3. Determine whether BMPs are effectively being implemented and maintained properly; and

4. Determine whether the owner/developer/contractor is making appropriate adjustments when ineffective BMPs are found.

For projects subject to the State General Construction Permit, the RWQCB is responsible for verifying and enforcing requirements of the General Construction Permit. The City inspection staff will continue to work with RWQCB staff in assuring compliance at these sites. City staff will document observations of potential violations and will notify the RWQCB of the noncompliance in accordance with Order R9-2007-0001 if the noncompliance poses a threat to human or environmental health.

Regardless of any inspections conducted by the City, property owners or contractors are required to prevent any construction-related materials, trash, wastes, spills or residues from entering a storm water conveyance system.

3.4.5 Qualified Person Required

All construction sites requiring a Tier 2 or Tier 3 Construction SWPPP are required to employ a Qualified Person to ensure proper installation and maintenance of the project BMPs. The Qualified Person shall:

1. Be trained and competent in the use of BMPs, shall be on site daily, although not necessarily full time, to evaluate the conditions of the site with respect to storm water pollution prevention. This qualified contact person shall represent the contractor/owner on storm water issues.

2. Shall implement the conditions of the Storm Water Pollution Prevention Plan, contract documents and/or local ordinances with respect to erosion and sediment control and other waste management regulations.

3. Be responsible for monitoring the weather and implementation of any emergency plans as needed. The weather shall be monitored on a 5-day forecast plan and a full BMP protection plan shall be activated when there is a 40 chance of rain.

4. Be responsible for overseeing any site grading and operations and evaluating the effectiveness of the BMPs. This person shall modify the BMPs as necessary to keep the dynamics of the site in compliance. This person or other qualified persons are responsible for checking the BMPs routinely for maintenance and documenting the BMPs being implemented.

Appendix A

Project Threat Assessment Worksheet for Determination of Construction SWPPP Tier Level

Project Threat Assessment Worksheet for Determination of Construction SWPPP Tier Level

Project Storm Water Threat Assessment Criteria*	Construction SWPPP Tier Level
Significant Threat Assessment Criteria ❑ My project includes clearing, grading or other disturbances to the ground resulting in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, stockpiling, pavement removal, refueling and maintenance areas; or, ❑ My project is part of a phased development plan that will cumulatively result in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, refueling and maintenance areas; or, ❑ My project is located inside or within 200 feet of an environmentally sensitive area (see City ESA Proximity map) and has a significant potential for contributing pollutants to nearby receiving waters by way of storm water runoff or non-storm water discharge(s).	Tier 3
Moderate Threat Assessment Criteria My project does not meet any of the Significant Threat Assessment Criteria described above and meets one or more of the following criteria: ❑ Project requires a grading plan pursuant to the Carlsbad Grading Ordinance (Chapter 15.16 of the Carlsbad Municipal Code); or, ❑ Project will result in 2,500 square feet or more of soils disturbance including any associated construction staging, stockpiling, pavement removal, equipment storage, refueling and maintenance areas and project meets one or more of the additional following criteria: • located within 200 feet of an environmentally sensitive area or the Pacific Ocean; and/or, • disturbed area is located on a slope with a grade at or exceeding 5 horizontal to 1 vertical; and/or • disturbed area is located along or within 30 feet of a storm drain inlet, an open drainage channel or watercourse; and/or • construction will be initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30).	Tier 2
Low Threat Assessment Criteria ❑ My project does not meet any of the Significant or Moderate Threat criteria, is not an exempt permit type (see City's list of Permit Types Exempt from Construction SWPPP requirements) and the project meets one or more of the following criteria: • results in some soil disturbance; and/or • includes outdoor construction activities (such as roofing, saw cutting, equipment washing, material stockpiling, vehicle fueling, waste stockpiling)	Tier 1
No Threat Project Assessment Criteria ❑ My project is in a category of permit types exempt from City Construction SWPPP requirements (see City's list of Permit Types Exempt from Construction SWPPP requirements) and/or does not meet any of the High, Moderate or Low Threat criteria described above.	Exempt

The City Engineer may authorize minor variances from the Storm Water Threat Assessment Criteria in special circumstances where it can be shown that a lesser or higher Construction SWPPP Tier Level is warranted in the opinion of the City Engineer

Appendix B

Storm Water Compliance Forms

Storm Water Compliance Form For a Tier 3 Construction SWPPP

I am applying to the City of Carlsbad for the following type of construction permit(s):

☐ Grading Permit ☐ Building Permit ☐ Right-of-Way Permit

My project requires preparation and approval of a Tier 3 Construction Storm Water Pollution Prevention Plan (SWPPP) because my project meets one or more of the following criteria demonstrating that the project potentially poses a significant threat to storm water quality:

- ❑ My project includes clearing, grading or other disturbances to the ground resulting in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, stockpiling, pavement removal, refueling and maintenance areas; or,
- ❑ My project is part of a phased development plan that will cumulatively result in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, stockpiling, pavement removal, refueling and maintenance areas; or,
- ❑ My project is located inside or within 200 feet of an environmentally sensitive area and has a significant potential for contributing pollutants to nearby receiving waters by way of storm water runoff or non-storm water discharge(s).

I CERTIFY TO THE BEST OF MY KNOWLEDGE THAT THE ABOVE CHECKED STATEMENTS ARE TRUE AND CORRECT.

I AM SUBMITTING FOR CITY APPROVAL A TIER 3 CONSTRUCTION SWPPP PREPARED IN ACCORDANCE WITH CITY STANDARDS AND THE REQUIREMENTS OF THE STATE WATER RESOURCES CONTROL BOARD GENERAL PERMIT FOR CONSTRUCTION ACTIVITIES - WATER QUALITY ORDER NO 99-08-DWQ (GENERAL CONSTRUCTION PERMIT) AND ANY AMENDMENT, REVISION OR RE-ISSUANCE THEREOF.

I UNDERSTAND AND ACKNOWLEDGE THAT I MUST SUBMIT THE CITY APPROVED TIER 3 CONSTRUCTION SWPPP TO THE SAN DIEGO REGIONAL WATER QUALITY CONTROL BOARD TOGETHER WITH A NOTICE OF INTENTION (NOI), AN APPROPRIATE FILING FEE AND OTHER REQUIRED DOCUMENTATION AND RECEIVE A STATE WASTE DISCHARGER'S IDENTIFICATION (WDID) NUMBER PRIOR TO CITY ISSUANCE OF THE ABOVE REQUESTED CONSTRUCTION PERMIT(S).

I ALSO UNDERSTAND AND ACKNOWLEDGE THAT I MUST ADHERE TO, AND AT ALL TIMES, COMPLY WITH THE CITY APPROVED TIER 3 CONSTRUCTION SWPPP THROUGHTOUT THE DURATION OF THE CONSTRUCTION ACTIVITIES UNTIL THE CONSTRUCTION WORK IS COMPLETE AND APPROVED BY THE CITY OF CARLSBAD.

Storm Water Compliance Form For a Tier 2 Construction SWPPP

I am applying to the City of Carlsbad for one or more the following type of construction permit(s):

☐ Grading Permit ☐ Building Permit ☐ Right-of-Way Permit

My project does not meet any of the following criteria for a project that poses a significant threat to storm water quality:

- ✓ My project does not include clearing, grading or other ground disturbances resulting in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, stockpiling, pavement removal, refueling and maintenance areas; and,
- ✓ My project is not part of a phased development plan that will cumulatively result in soil disturbance totaling one or more acres including any associated construction staging, equipment storage, stockpiling, pavement removal, refueling and maintenance areas; and,
- ✓ My project is not located inside or within 200 feet of an environmentally sensitive area and will not have a significant potential for contributing pollutants to nearby receiving waters by way of storm water runoff or non-storm water discharge(s).

My project requires preparation and approval of a Tier 2 Construction Storm Water Pollution Prevention Plan (SWPPP) because my project meets one or more of the following criteria demonstrating that the project potentially poses a moderate threat to storm water quality:

- ❑ My project requires a grading plan pursuant to the Carlsbad Grading Ordinance (Chapter 15.16 of the Carlsbad Municipal Code); and/or,
- ❑ My Project will result in 2,500 square feet or more of soils disturbance including any associated construction staging, stockpiling, pavement removal, equipment storage, refueling and maintenance areas and, my project meets one or more of the following additional criteria:
  - Project is located within 200 feet of an environmentally sensitive area or the Pacific Ocean;
  - Project's disturbed area is located on a slope with a grade at or exceeding 5 horizontal to 1 vertical;
  - Project's disturbed area is located along or within 30 feet of a storm drain inlet, an open drainage channel or watercourse; and/or
  - Project will be initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30).

I CERTIFY TO THE BEST OF MY KNOWLEDGE THAT THE ABOVE CHECKED STATEMENTS ARE TRUE AND CORRECT. I AM SUBMITTING FOR CITY APPROVAL A TIER 2 CONSTRUCTION SWPPP PREPARED IN ACCORDANCE WITH THE REQUIREMENTS OF CITY STANDARDS.

I UNDERSTAND AND ACKNOWLEDGE THAT I MUST ADHERE TO, AND AT ALL TIMES, COMPLY WITH THE CITY APPROVED TIER 2 CONSTRUCTION SWPPP THROUGHTOUT THE DURATION OF THE CONSTRUCTION ACTIVITIES UNTIL THE CONSTRUCTION WORK IS COMPLETE AND APPROVED BY THE CITY OF CARLSBAD.

Storm Water Compliance Exemption Form

I am applying to the City of Carlsbad for the following type(s) of construction permit:

☐ Building Permit ☐ Right-of-Way Permit

☐ My project is categorically exempt from the requirement to prepare a storm water pollution prevention plan (SWPPP) because it only requires issuance of one or more of the following permit types:

Electrical Permit Fire Additional Permit Fire Alarm Permit Fixed Systems Permit Mechanical Permit Mobile Home Permit Re-Roofing Permit	Patio Deck Plumbing Permit Sign Permit Spa ☐ Factory Made Sprinkler Permit Water Discharge Permit

☐ My project is exempt from the requirement to prepare a storm water pollution prevention plan (SWPPP) because it meets the ☐no threat☐ assessment criteria on the City☐s Project Threat Assessment Worksheet for Determination of Construction SWPPP Tier Level.

I CERTIFY TO THE BEST OF MY KNOWLEDGE THAT THE ABOVE CHECKED STATEMENTS ARE TRUE AND CORRECT.

I UNDERSTAND AND ACKNOWLEDGE THAT EVEN THOUGH THIS PROJECT DOES NOT REQUIRE PREPARATION OF A CONSTRUCTION SWPPP, I MUST STILL ADHERE TO, AND AT ALL TIMES DURING CONSTRUCTION ACTIVITES FOR THE PERMIT TYPE(S) CHECKED ABOVE, COMPLY WITH THE STORM WATER BEST MANAGEMENT PRACTICES PURSUANT TO TITLE 15 OF THE CARLSBAD MUNICIPAL CODE AND TO CITY STANDARDS.

Appendix C

Construction Threat Assessment Worksheet
for
Determination of Threat to Storm Water Quality

Construction Threat Assessment Worksheet for Determination of a Project's Perceived Threat to Storm Water Quality

Construction SWPPP Tier Level	Construction Threat Assessment Criteria*	Perceived Threat to Storm Water Quality
Tier 3	Tier 3 – High Construction Threat Assessment Criteria ❑ Project site is 50 acres or more and grading will occur during the rainy season ❑ Project site is 1 acre or more in size and is located within the Buena Vista or Agua Hedionda Lagoon watershed, inside or within 200 feet of an environmentally sensitive area (ESA) or discharges directly to an ESA ❑ Soil at site is moderately to highly erosive (defined as having a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4) ❑ Site slope is 5 to 1 or steeper ❑ Construction is initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30). ❑ Owner/contractor received a Storm Water Notice of Violation within past two years	High
	Tier 3 – Medium Construction Threat Assessment Criteria □ All projects not meeting Tier 3 High Construction Threat Assessment Criteria	Medium
Tier 2	Tier 2 High Construction Threat Assessment Criteria ❑ Project is located within the Buena Vista or Agua Hedionda Lagoon watershed, inside or within 200 feet of an environmentally sensitive area (ESA) or discharges directly to an ESA ❑ Soil at site is moderately to highly erosive (defined as having a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4) ❑ Site slope is 5 to 1 or steeper ❑ Construction is initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30). ❑ Owner/contractor received a Storm Water Notice of Violation within past two years ❑ Site results in one half acre or more of soil disturbance	High
	Tier 2 – Medium Construction Threat Assessment Criteria ❑ All projects not meeting Tier 2 High Construction Threat Assessment Criteria	Medium
Tier 1	Tier 1 - Medium Inspection Threat Assessment Criteria ❑ Project is located within the Buena Vista or Agua Hedionda Lagoon watershed, within or directly adjacent to an environmentally sensitive area (ESA) or discharges directly to an ESA ❑ Soil at site is moderately to highly erosive (defined as having a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4) ❑ Site slope is 5 to 1 or steeper ❑ Construction is initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30). ❑ Owner/contractor received a Storm Water Notice of Violation within past two years ❑ Site results in one half acre or more of soil disturbance	Medium
	Tier 1 - Low Inspection Threat Assessment Criteria ❑ All projects not meeting Tier 1 Medium Construction Threat Assessment Criteria	Low
Exempt	- Not Applicable -	Exempt

□ The City Engineer may authorize minor variances from the Construction Threat Assessment Criteria in special circumstances where it can be shown that a lesser or higher amount of storm water compliance inspection is warranted in the opinion of the City Engineer

Appendix D

Tier 3 Construction SWPPP Required Elements Checklist

TIER 3 CONSTRUCTION SWPPP REQUIRED ELEMENTS CHECKLIST

Project Name_____ Project ID _____ SWPPP Preparer _____ Date _____

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
GCP Section A. Storm Water Pollution Prevention Plan (SWPPP)				
Vicinity Map (graphic)	***GCP A.5.a.1***			
Major roadways, geographic features or landmarks	*GCP* A.5.a.1			
Site perimeter	*GCP* A.5.a.1			
Geographic features	GCP A.5.a.1			
General topography	*GCP* A.5.a.1			
Site Map (graphic)(can modify Parcel Map)	***GCP A.5.a.2***			
Site perimeter	*GCP* A.5.a.2			
Existing and proposed buildings, lots, and roadways	*GCP* A.5.a.2			
Storm water collection and discharge points	*GCP* A.5.a.2			
General topography before and after construction	*GCP* A.5.a.2			
Anticipated discharge location(s)	*GCP* A.5.a.2			
Drainage patterns	*GCP* A.5.a.2			
Relevant drainage areas 2	*GCP* A.5.a.			
Temporary on-site drainage	*GCP* A.5.a.2			
Drainage (graphic)	*GCP A.5.b.1*			
Drainage patterns	*GCP* A.5.b.1			
Slopes after major grading	*GCP* A.5.b.1			
Calculations for storm water run-on	*GCP* A.5.b.1			
BMPs that divert off-site drainage from going through site	*GCP* A.5.b.1			
Storm Water Inlets (graphic)	***GCP A.5.b.2***			
Drainage patterns to storm water inlets or receiving water	*GCP* A.5.b.2			
BMPs that protect storm water inlets or receiving water	*GCP* A.5.b.2			
Site History/Past Site Usage (Real Estate Broker Disclosure may be sufficient)	***GCP A.5.b.3***			
Description of toxic materials treated, stored, or spilled on site	*GCP* A.5.b.3			
BMPs that minimize contact of contaminants with storm water	*GCP* A.5.b.3			
Location of Areas Designated for: (graphic)	***GCP A.5.b.4***			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
Soil or waste storage	*GCP* A.5.b.4			
Vehicle storage & service	*GCP* A.5.b.4			
Construction material loading, unloading, and access	*GCP* A.5.b.4			
Equipment storage, cleaning, maintenance	*GCP* A.5.b.4			
BMP Descriptions for: (graphic or narrative)	***GCP A.5.b.5***			
Waste handling and disposal areas	*GCP* A.5.b.5			
On-site storage and disposal of construction materials and waste	*GCP* A.5.b.5			
BMPs to minimize exposure of storm water to construction materials, equipment, vehicles, waste	*GCP* A.5.b.5			
Post Construction BMPs	***GCP A.5.b.6 See A. 10***			
Additional Information	***GCP A.5. c***			
Description of other pollutant sources and BMPs that cannot be shown graphically	*GCP* A.5.c.1			
Pre-construction control practices	*GCP* A.5.c.1			
Inventory of materials and activities that may pollute storm water	*GCP* A.5.c.2			
BMPs to reduce/eliminate potential pollutants listed in the inventory	*GCP* A.5.c.2			
Runoff coefficient (before & after)	*GCP* A.5.c.3			
Percent impervious (before & after)	*GCP* A.5.c.3			
Copy of the NOI and WDID #	*GCP* A.5.c.4			
Construction activity schedule	*GCP* A.5.c.5			
Contact information	*GCP* A.5.c.6			
EROSION CONTROL	***GCP* A.6**			
The SWPPP shall include: (graphic)	***GCP A.6.a-c***			
Areas of vegetation on site	*GCP* A.6.a.1			
Areas of soil disturbance that will be stabilized during rainy season	*GCP* A.6.a.2			
Areas of soil disturbance which will be exposed during any part of the rainy season	*GCP* A.6.a.3			
Construction phase / BMP sequencing schedule including supplemental pre-rain action plan for erosion control measures	*GCP* A.6.a.4			
BMPs for erosion control	*GCP* A.6.b			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
BMPs to control wind erosion	*GCP* A.6.c			
SEDIMENT CONTROL	*GCP* A.8			
Description/Illustration of BMPs to prevent increase of sediment load in discharge	*GCP* A.8			
Construction phase / BMP sequencing schedule including supplemental pre-rain action plan for sediment control measures	*GCP* A.8			
NON-STORM WATER	***GCP* A.9**			
Description of non-storm water discharges to receiving waters	*GCP* A.9			
Locations of discharges	*GCP* A.9			
Description of BMPs	*GCP* A.9			
Name and phone number of qualified person responsible for non-storm water management	*GCP* A.9			
POST-CONSTRUCTION	***GCP* A.10**			
Description and location of BMPs	*GCP* A.10			
Operation/Maintenance of BMPs after project completion (including funding)	*GCP* A.10			
MAINTENANCE, INSPECTIONS, AND REPAIR	*GCP* A.11			
Name and phone number of qualified person responsible for inspections	*GCP* A.11			
Inspection checklist: date, weather, inadequate BMPs, visual observations of BMPs, corrective action, inspector's name, title, signature	*GCP* A.11.a-f			
OTHER REQUIREMENTS	*GCP* A.12-16			
Documentation of all training	*GCP* A.12			
List of Contractors/Subcontractors	*GCP* A.13			
GCP Section B. Monitoring and Reporting Requirements				
Description of site inspection plans	*GCP* B.3			
Compliance certification (annually 7/1) if project is under active construction	*GCP* B.4			
Noncompliance reporting	*GCP* B.5			
Records of all inspections; compliance certifications; noncompliance reports, etc.	*GCP* B.6			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
Monitoring program for sediment contribution from direct discharges to impaired water bodies	*GCP* B.7			
Monitoring program for pollutants not visually detectable in storm water (nonvisible pollutants)	*GCP* B.8			
GCP Section C. Standard Provisions for Construction Activities				
Signed Certification for SWPPP, reports, amendments, etc. Who is authorized to sign and by what authority has the duly authorized representative been assigned?	*GCP* C.9,10			
Location of General Permit and SWPPP on site during construction activities	*GCP* C. 17			
MP Section D.2 Construction Component				
GENERAL SITE MANAGEMENT	**MP D.2.c.(1)(a)**			
Pollution prevention, where appropriate	MP D.2.c.(1)(a)i. and CSWSM 3.3.2			
Development and implementation of a storm water site management plan	MP D.2.c.(1)(a)ii. and CSWSM 3.3.6			
Minimization of areas that are cleared and graded to only the portion of the site that is necessary for construction	MP D.2.c.(1)(a)iii. and CSWSM 3.3.6.1			
Minimization of exposure time of disturbed soil areas	MP D.2.c (1)(a)iv. and CSWSM 3.3.6.1			
Minimization of grading during the wet season and correlation of grading with seasonal dry weather periods to the extent feasible	MP D.2.c.(1)(a)v. and CSWSM 3.3.6.1			
Limitation of grading to a maximum disturbed area of 50 acres	MP D.2.c.(1)(a)vi. and CSWSM 3.3.8			
Temporary stabilization and reseeding of disturbed soil areas as rapidly as feasible	MP D.2.c.(1)(a)vii. and CSWSM 3.3.6.1			
Preservation of natural hydrologic features where feasible;	MP D.2.c. (1)(a)viii. and CSWSM 3.3.6			
Preservation of riparian buffers and corridors where feasible	MP D.2.c.(1)(a)ix. and CSWSM 3.3.6			
Maintenance of all BMPs, until removed	MP D.2.c.(1)(a)x. and CSWSM 3.3.6			
Retention, reduction, and proper management of all pollutant discharges on site to	MP D.2.c.(1)(a)xi. and			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
the MEP standard	CSWSM 3.3.6			
EROSION AND SEDIMENT CONTROLS	**MP D.2.c.(1)(b)** and CSWSM 3.3.3			
Erosion prevention, to be used as the most important measure for keeping sediment on site during construction, but never as the single method	MP D.2.c.(1)(b)i. and CSWSM 3.3.3			
Sediment controls, to be used as a supplement to erosion prevention for keeping sediment on-site during construction	MP D.2.c.(1)(b)ii. and CSWSM 3.3.3			
Slope stabilization on all inactive slopes during the rainy season and during rain events in the dry season	MP D.2.c (1)(b)iii. and CSWSM 3.3.6.1&2			
Slope stabilization on all active slopes during rain events regardless of the season	MP D.2.c (1)(b)iv. and CSWSM 3.3.6.1			
Permanent re-vegetation or landscaping as early as feasible.	MP D.2.c.(1)(b)v. and CSWSM 3.3.6			
ADVANCED TREATMENT CONTROLS Addition of advanced treatment controls for projects that are determined to be an exceptional threat to water quality	**MP D.2.c.(2) and CSWSM 3.3.9**			
Operations and Maintenance Schedule	CSWSM 3.3.9			
Advanced treatment Monitoring Plan	CSWSM 3.3.9			
Advanced Treatment Training Plan	CSWSM 3.3.9			
Alternative Source Control Procedures in Lieu of Advanced Treatment Control Noted on Plans	CSWSM 3.3.9			
YEAR ROUND BMP IMPLEMENTATION	**MP D.2.c.(3) and CSWSM 3.3.6**			
Plan for year round implementation of minimum BMPs that can vary based upon wet and dry seasons	MP D.2.c.(3) and CSWSM 3.3.6			
ADDITIONAL CONTROLS FOR SITES TRIBUTARY TO CWA SECTION 303(d) IMPAIRED WATERS	**MP D.2.c.(4) and CSWSM 3.3.7**			
Maintain vegetative cover as much as possible by developing the project in a phased approach to reduce the amount of exposed soil at any one time.	CSWSM 3.3.7			
Limit the areas of active construction to five acres at any one time.	CSWSM 3.3.7			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

Construction SWPPP Required Element	Reference Document and Section (1)	Page Number (2)	Not Applicable N/A	Implementation Date (3)
Provide 100 percent soil cover for all areas of inactive construction throughout the entire time of construction, on a year-round basis.	CSWSM 3.3.7			
Provide appropriate perimeter control at all appropriate locations along the site perimeter and at all inlets to the storm drain system at all times during the rainy season	CSWSM 3.3.7			
Provide vegetated buffer strips between the active construction area and any water bodies.	CSWSM 3.3.7			
Provide stabilized construction entrances and limit all vehicle and foot traffic to those entrances.	CSWSM 3.3.7			
INSPECTION OF CONSTRUCTION SITE	**MP D.2.d and CSWSM 3.4.3**			
Inspection priority determined for site and frequency noted in SWPPP	MP D.2.d and CSWSM 3.4.3			
STANDARD STORM WATER POLLUTION PREVENTION NOTES	**CSWSM 3.3.10**			
Standard Storm Water Pollution Prevention Notes included on Grading Plans	CSWSM 3.3.10			

(1) Reference Document Legend: GCP = General Construction Permit; MP = Municipal Permit; CSWSM = City Storm Water Standards Manual

(2) Indicate the page number where the information is located in your SWPPP. If the information is not applicable to your site, construction activities, or construction materials, check the N/A box. Your SWPPP does not have to address items which are not applicable to your situation.

(3) Date that the BMP will be installed on the site

TIER 3 Construction SWPPP Checklist
(CASQA Format)

TIER 3 CONSTRUCTION SWPPP CASQA FORMAT CHECKLIST

Project Name_____ Planchecker _____
Project ID _____ Date _____

CASQA Section Number and Potential Required Elements	Required for Project	Planchecker Verification
General Formatting		
Tabbed separators included between Sections		
Section - 100 SWPPP Certifications and Approval		
100.1 - SWPPP Certification by Preparer		
Project name, grading permit, building permit, discretionary permit number(s), APN at top of form		
Certification signed and dated by person responsible for preparation of the SWPPP		
Name, title and telephone number of the person signing the form		
SWPPP and Monitoring Program Checklist in Attachment L completed		
Notice of Intent (NOI) attached, completed and signed by Owner or Owner's agent		
100.2 - Owner Approval and Certification of SWPPP		
Project name, grading permit, building permit, discretionary permit number(s), APN at top of form		
Certification signed and dated by owners staff; specifically, the person responsible for preparation of the SWPPP and/or the person responsible for overall management of the site		
Name, title and telephone number of the person signing the form		
100.3 - Annual Compliance Certification		
Blank copy of the Annual Compliance of Compliance included as Attachment M		
Section 200 – SWPPP Amendments		
200.1 - SWPPP Amendment Certification and Approval		
Instructions and Blank Amendment Certification and Approval forms included		
200.2 - Amendment Log		
Instructions and Blank Amendment Log included		
Section 300 - Introduction and Project Description		
300.1 – Introduction and Project Description		
Projects legal description including County, City and address, proximity to receiving waters to which project will discharge including surface waters, drainage channels, and drainage systems; ownership of all drainage systems to which the project discharges		
300.2 – Unique Site Features		
Description of unique site features (water bodies, wetlands, environmentally sensitive areas, endangered or protected species, etc) and significant or high risk construction activities that may impact storm water quality. Include any		

unique features or activities within or adjacent to water bodies		
300.3 - Construction Site Estimates		
Construction site area in acres		
Runoff coefficient and percentage impervious area before and after construction		
Calculations for Coefficient change included in Attachment D		
Anticipated storm water run-on to the construction site		
Calculations for storm water run-on included in Attachment E		
300.4 - Project Schedule/Water Pollution Control Schedule		
Written and geographical project schedule including:		
Project start and finish dates		
Rainy season dates		
Annual certifications		
Mobilization dates		
Mass clearing and grubbing/roadside clearing dates		
Major grading/excavation dates		
Special dates named in other permits such as Fish and Game and Army Corps of Engineers Permits		
Dates for submittal of SWPPP Amendments required by the contract documents		
Annual submittal of rainy season implementation schedule if required by the Owner or Permittee		
Dates for implementation of pre-rainy season temporary soil stabilization and temporary sediment control BMPs, if required		
Rainy season implementation schedule including:		
Deployment of temporary soil stabilization BMPs		
Deployment of temporary sediment control BMPs		
Deployment of wind erosion control Bmps		
Deployment of tracking control BMPs		
Deployment of non-storm water BMPs		
Deployment of waste management and materials pollution control BMPs		
Non-rainy season implementation schedule		
Deployment of temporary soil stabilization BMPs		
Deployment of temporary sediment control BMPs		
Deployment of wind erosion control Bmps		
Deployment of tracking control BMPs		
Deployment of non-storm water BMPs		
Deployment of waste management and materials pollution control BMPs		
Paving, saw-cutting and any other pavement related operations		
Major planned stockpiling operations		

Dates for other significant long-term operations or activities that may plan non-storm water discharges such as dewatering, grinding, etc		
Final stabilization activities staged over time for each area of the project		
300.5 - Contact Information/List of Responsible Parties		
Name and telephone number(s) of the Contractor's Storm Water Pollution Prevention Manager (SWPPM) and required text		
Section 400 - References		
List of documents referenced in the SWPPP		
All Federal, State and City permits		
On-site project information including plans and specifications, geotechnical report(s), hydrology/hydraulic report(s), and other reports and regulatory guidance documents		
Each referenced document includes title, number (if applicable), author, date published and revision date		
Section 500 – Body of SWPPP		
500.1 - Objectives		
Required text included		
500.2 – Vicinity Map		
8 ½' x 11" color copy of USGS map or equal included as Attachment A displaying site perimeter, major roadways, geographic features and landmarks, adjacent water bodies, known wells, an outline of the off-site drainage area, anticipated discharge locations and general topography		
Brief narrative description of the vicinity map		
500.3 – Pollutant Source Identification and BMP Selection		
Required text included for each subsection		
500.3.1 – Inventory of Materials and Activities that May Pollute Storm Water		
List of all construction materials that have the potential to contribute to the discharge of pollutants to storm water and required text		
List of all construction activities that have the potential to contribute sediment to storm water discharges		
500.3.2 – Existing Pre-construction Control Measures		
List of any existing BMPs in place prior to construction used to reduce erosion, sediment or other pollutants in storm water discharges		
500.3.3 Nature of Fill Material and Existing Data Describing the Soil		
Description of the conditions of the fill materials and soils at the construction site including soil types, groundwater location and condition, dewatering operations, presence of existing toxic materials and contaminants and other relevant information		
500.3.4 Erosion Control (EC) (Soil Stabilization)		
Attachment C included. BMP Consideration Checklist filled out. Appropriate EC BMPs selected		
Introductory paragraphs the define EC and give general approach on how temporary EC BMPs will be implemented		

List all temporary EC BMPs to be used on the project		
Show temporary EC BMPs on the Water Pollution Control Drawings (WPCDs)		
Provide narrative description of temporary EC BMPs that cannot be adequately identified on the WPCDs		
Discussion of on-site availability of temporary EC materials and proposed mobilization and implementation of temporary EC BMPs in event of predicted rain. Explanation of how and when BMPs will be implemented when rain is forecasted		
Additional City Required Erosion Control Requirements		
Erosion prevention, to be used as the most important measure for keeping sediment on site during construction, but never as the single method		
Sediment controls, to be used as a supplement to erosion prevention for keeping sediment on-site during construction		
Slope stabilization on all inactive slopes during the rainy season and during rain events in the dry season		
Slope stabilization on all active slopes during rain events regardless of the season		
Permanent revegetation or landscaping as early as feasible.		
500.3.5 – Sediment Control (SC)		
Attachment C included. BMP Consideration Checklist filled out. Appropriate SC BMPs selected		
List all temporary SC BMPs to be used on the project		
Show temporary SC BMPs on the Water Pollution Control Drawings (WPCDs)		
Provide narrative description of temporary SC BMPs that cannot be adequately identified on the WPCDs		
BMPs used to divert off-site drainage around and/or through the construction site shown on WPCDs		
Discussion of on-site availability of temporary EC materials and proposed mobilization and implementation of temporary EC BMPs in event of predicted rain		
500.3.6 Tracking Control (TC)		
Attachment C included. BMP Consideration Checklist filled out. Appropriate TC BMPs selected		
List all temporary TC BMPs to be used on the project		
Show all ingress/egress points to project site on WPCDs and show or describe TC BMPs		
Provide narrative description of temporary TC BMPs that cannot be adequately identified on the WPCDs		
Discussion of road cleaning BMPs		
500.3.7 Wind Erosion Control (WEC)		
Attachment C included. BMP Consideration Checklist filled out. Appropriate WEC BMPs selected		
Narrative description of WEC BMPs to be used on project		
500.3.8 – Non-Storm Water Control (NSWC)		
All potential non-storm water discharges listed		
Attachment C included. BMP Consideration Checklist filled out. Appropriate NSWC BMPs selected		
Discuss how mobile operations, such as equipment maintenance and fueling, will be addressed		
Describe each planned NSW discharge from project including flow/quantity. If flow/quantity cannot be determined,		

then describe nature and extent of activity so quantity can be inferred		
Show NSWC BMPs on WPCDs and/or provide narrative description including path of discharge to storm inlet, drainage facilities or receiving waters		
Describe time period and frequency of each NSW activity that generates or may generate a discharge		
Describe mandatory NSWC BMPs and practices required by City , State or Federal agencies and provide details and schedules as appropriate. Include maintenance, inspection, testing and reporting procedures, if applicable. Include permit info for discharges covered by separate NPDES permit		
Describe selected NSWC BMPs and practices to minimize, contain and dispose of prohibited discharges. Include maintenance, inspection, testing and reporting procedures, if applicable		
Describe sediment controls for landscape irrigation run-off prior to establishment of vegetation		
Indicate how illicit connections and illegal discharges will be handled.		
Develop new owner notification pamphlet to make new owner aware of potential for unauthorized discharges and practices, if needed		
500.3.9 – Waste Management and Material Pollution Control (WMMPC)		
All potential WMMP activities listed		
Attachment C included. BMP Consideration Checklist filled out. Appropriate WMMPC BMPs selected		
Substitute safer, less polluting products where possible		
List selected WMMPC BMPs and describe proposed facilities for materials storage and waste management. Include schedules, inspection and maintenance requirements. Show on WPCDs as appropriate		
Describe proposed waste collection and removal schedule		
500.3.10 – Cost Breakdown for Water Pollution Control		
Water pollution control cost estimate sheet included		
Additional City Requirements		
Advanced Treatment Controls (If required. See Storm Water Standards Manual Section 3.3.9)		
Operations and Maintenance Schedule		
Advanced treatment Monitoring Plan		
Advanced Treatment Training Plan		
Alternative Source Control Procedures in Lieu of Advanced Treatment Control Noted on Plans		
Year Round BMP Implementation		
Plan for year round implementation of minimum BMPs that can vary based upon wet and dry seasons		
Additional Controls for Sites tributary to CWA Section 303(d) Impaired Waters RS		
Maintain vegetative cover as much as possible by developing the project in a phased approach to reduce the amount of exposed soil at any one time.		
Limit the areas of active construction to five acres at any one time.		
Provide 100 percent soil cover for all areas of inactive construction throughout the entire time of construction, on a year-round basis.		

Provide appropriate perimeter control at all appropriate locations along the site perimeter and at all inlets to the storm drain system at all times during the rainy season		
Provide vegetated buffer strips between the active construction area and any water bodies.		
Provide stabilized construction entrances and limit all vehicle and foot traffic to those entrances.		
Inspection of Construction Site		
Inspection priority determined for site and frequency noted in SWPPP		
City Standard Storm Water Pollution Prevention Notes		
Standard Storm Water Pollution Prevention Notes included on Grading Plans		
500.4 – Water Pollution Control Drawings (WPCDs)		
WPCDs included as Attachment B		
Cover sheet listing BMPs that will be used and any selected options shown on fact sheets, along with construction notes and a legend		
All BMPs that can be shown are shown where appropriate on WPCDs		
BMP details included with WPCDs and appropriate CASQA and other standard references included		
Additional details shown as necessary to describe site specific BMP applications		
Grading sheets, drainage sheets or erosion control sheets used as base sheets for WPCDs.		
Base sheet details required:		
site perimeter		
Existing and proposed buildings, lots and roadways		
Permanent post construction BMPs		
Storm water collection and discharge points		
General topography before and after construction; anticipated discharge location(s)		
Tributary areas and drainage patterns to each on-site storm water inlet		
Receiving water or discharge point; off-site tributary drainage areas; temporary on-site drainage(s) to carry concentrated flows		
Outline of areas of existing vegetation; soil cover or native vegetation that will remain undisturbed		
Areas of cut and fill		
Outlines of areas of soil disturbance		
Locations of known toxic spills and discharges or contaminated soils		
Locations of potential non-storm water discharges such as dewatering operations, concrete saw cutting or coring, pressure washing, waterline flushing, diversions, cofferdams and vehicle equipment cleaning		
Locations of direct discharge into a Section 303(d) listed water body		
Sampling locations		
Ingress and egress points		
Temporary stockpiles		

Vehicle and equipment storage, fueling, maintenance and cleaning; and, phasing and/or construction staging		
BMPs for waste management and materials pollution control		
Show all storage, staging, borrow sites, stockpile sites, access roads, lay down areas and other non-development construction areas where construction activity will occur including contractors yard if in vicinity		
All contractor phasing and/or construction staging reflected on WPCDs for full scope of project		
500.5 – Construction BMP Maintenance, Inspection and Repair		
Description of program to maintain all construction BMPs		
Complete maintenance, inspection and repair program included as Attachment G		
500.6 – Post-Construction Storm Water Management		
500.6.1 Post-Construction Control Practices		
Describe the construction BMPs employed after all construction phases have been completed including their operation and maintenance after project completion		
For projects that require a Storm Water Management Plan (SWMP), the City SWMP identification number shall be referenced		
500.6.2 – Operation/Maintenance after Project Completion		
Description of any operations and maintenance requirements of post-construction control practices		
List parties responsible for long term operation and maintenance of permanent BMPs		
500.7 - Training		
Description of storm water pollution prevention training that contractor's inspection, maintenance and repair personnel have received		
Storm Water Pollution Prevention Manger (SWPPM) has a minimum of 24 hours training		
Document formal and informal storm water training on Trained Contractor Personnel Log Sheet included as Attachment I		
List of classes and copies of class completion documents may be submitted		
500.8 – List of Subcontractors		
List of subcontractors and individuals responsible for implementation of the SWPPP including telephone numbers and addresses included as Attachment J		
Section 600 – Monitoring Program and Reports		
600.1 – Site Inspections		
Required text included		
600.2 – Non-Compliance Reporting		
Required text included		
Sample Notice of Compliance form included as Attachment K		
Sample logging discharges form included as Attachment T		
600.3 – Record Keeping and Reports		
Required text included		

600.4 – Sampling and Analysis Plan for Sediment (for projects discharging to 303(d) waters)		
Required text included		
Describe if project discharges to 303(d) waters		
600.4.1 – Scope of Monitoring Activities		
List the impaired 303(d) water body and reason for impairment		
Describe the location(s) of direct discharge to each 303(d) listed water body		
Required text included		
600.4.2 – Monitoring Strategy		
Required text included		
Description of sampling schedule for monitoring impacts of direct discharges		
Description of sampling locations		
Description of rationale for selection of sampling location		
Identification of upstream location for sampling including GPS coordinates		
Identification of downstream location for sampling including GPS coordinates		
Include sampling location for run-on location if one exists		
Describe surrounding areas that may contribute to run-on sediment to site		
Sampling locations not located near point sources or confluences		
Sampling locations not located directly downstream from bridge or road surface run-off		
600.4.3 – Monitoring Preparation		
Identify sampling personnel including company name		
Describe training and qualifications of sampling personnel		
Identify contractors health and safety procedures for sampling personnel		
Identify alternate sampling personnel		
Identify state certified laboratory to analyze samples		
Describe strategy for ensuring adequate sample supplies are available prior to sampling		
Describe strategy for ensuring appropriate field testing equipment is available prior to sampling		
600.4.4 – Sample Collection and Handling		
Description of sample collection procedures		
Sample procedure in accordance with test procedure under 40 CFR Part 136		
Description of sample handling procedures		
Description of decontamination waste disposal requirements		
Description of sample collection documentation procedures		
Description of procedures for recording and correcting sampling data		
Chain of custody form required to be submitted to laboratory with samples		
Sampling activity log to be kept to document details of all sampling events		
Each sample bottle required to have proper and complete identification label		

600.4.5 – Sample Analysis		
Describe tests to be used on project samples using "Sample Collection, Preservation and Analysis for Monitoring Sedimentation/Siltation and/or Turbidity" form		
Appropriate answers included on form for discharges to 303(d) listed waters		
All appropriate blank fields on form filled in		
600.4.6 – Quality Assurance/Quality Control		
Required text included		
600.4.7 – Data Management and Reporting		
Required text included		
600.4.8 – Data Evaluation		
Required text included		
600.4.9 – Change of Conditions		
Required text included		
600.5 – Sampling and Analysis Plan for Non-Visible Pollutants		
Required text included		
600.5.1 – Scope of Monitoring Activities		
Required text included		
Identify general sources and locations of potential non-visible pollutants on project site for:		
Materials or wastes identified in Section 500.3.1		
Materials or wastes that are stored under watertight conditions		
Construction activities such as application of fertilizers, pesticides, herbicides etc that have occurred during a rain event of with 24 hours preceding a rain event		
Existing site features contaminated with non-visible pollutants		
Application of soil amendments and other chemicals with the potential to alter PH levels or contribute toxic pollutants to storm water runoff		
Storm water runoff from an area contaminated by historical usage of the site		
Storm water run-on to the project site with potential to contribute pollutants		
Breaches, malfunctions, leakages or spills from a BMP		
600.5.2 - Monitoring Strategy		
Required text included		
Description of sampling schedule		
Describe locations for sampling locations		
Description for rationale for selection sampling locations		
Sampling locations selected from each source of non-visible pollutants identified in Section 600.5.1		
Description of location for collecting uncontaminated background sample		
Description of location for sampling storm water run-on form each location identified in Section 600.5.1		

Description of sampling locationat off-site activities related to the project		
Sampling locations in areas that are safe, out of the path of heavy traffic and have attainable access		
List and describe surrounding sites and uses that may contribute run-on or airborne constituents to the site		
600.5.3 – Monitoring Preparation		
Identify party responsible for sample collection		
Describe training and qualifications of sampling personnel		
Identify contractors health and safety procedures for sampling personnel		
Identify alternate sampling personnel		
Identify state certified laboratory to analyze samples		
Describe strategy for ensuring adequate sample supplies are available prior to sampling		
Describe strategy for ensuring appropriate field testing equipment is available prior to sampling		
600.5.4 – Analytical Constituents		
Table 600-2 to be completed and attached		
List of non-visible pollutant source, non-visible pollutant name and water quality indicator		
Construction Material and Pollutant Testing Guidance Table – Non-Visible Pollutants table completed and attached		
Visible pollutants not added to table		
Table 600-3 completed and attached		
600.5.5 – Sample Collection and Handling		
Laboratory analysis, sampling, sample preservation and analyses conducted according to test procedures under 40 CFR Part 136		
Chain of custody form required to be submitted to laboratory with samples		
Sampling activity log to be kept to document details of all sampling events		
Each sample bottle required to have proper and complete identification label		
Description of sample collection procedures		
Description of sample handling procedures		
Description of decontamination waste disposal requirements		
Description of sample collection documentation procedures		
Description of procedures for recording and correcting sampling data		
Table 600-3 to be completed		
600.5.6 – Sample analysis		
Table 600-2 to be completed and attached		
Table 600-3 to be completed and attached		
Test method included for each non-visible pollutant identified in Table 600-2		
Procedure to contact laboratory for appropriate test method(s)/specification to be used for each constituent		
Field test instruments to be used for sampling identified		
600.5.7 – Quality Assurance/Quality Control		

Required text included		
6**00.5.8 – Data Management and Reporting**		
Required text included		
600.5.9 Data Evaluation		
Required text included		
600.5.10 – Change of Conditions		
Required text included		

Appendix F

Tier 2 Construction SWPPP Template

Tier 2 Construction SWPPP Preparation Template

This document has been prepared to identify the various components that make up a Tier 2 Construction Storm Water Pollution Prevention Plan (SWPPP). A complete Tier 2 Construction SWPPP is composed of the following components:

1. A set of storm water pollution plan drawings meeting all the requirements of the Construction SWPPP Checklist items as contained in the Tier 2 Construction SWPPP Review Checklist attached as Appendix G to Section 3 (Construction SWPPP Standards and Requirements) in the City Storm Water Standards Manual.

2. A completed and signed Storm Water Compliance Form for a Tier 2 Construction SWPPP as contained in Appendix B to Section 3 (Construction SWPPP Standards and Requirements) in the City Storm Water Standards Manual.

3. A completed and signed Tier 2 Construction SWPPP Site Assessment Form (attached)

4. All supporting documentation, studies and reports as required to comply with the Municipal Permit and City Standards including any needed hydrology and hydraulic calculations, soils and geotechnical reports, spill prevention plan and manufacturers information and other data needed to clarify and support of the proposed storm water pollution prevention plan.

Included with this template is a Tier 2 Construction SWPPP Required Elements Checklist that should be used by the qualified Construction SWPPP preparer during the preparation of the plan to ensure that all required elements are included into the plan.

Tier 2 Construction SWPPP Site Assessment Form

Project ID: _____

Project Information:

Project Name: _____

Project Address/Location; _____

_____

Responsible Parties/Contact Information:

Name of Preparer: _____

Qualification of Preparer (Registration/Certification): _____

_____

Address: _____

City/State/Zip Code: _____

Phone Number: _____

Name of Owner/Owner's Agent: _____

Address: _____

City/State/Zip Code: _____

Phone Number: _____

Name of Emergency Contact: _____
(during construction)

Address: _____

City/State/Zip Code: _____

Phone Number: _____

Site and Construction Activity Description:

Construction Start Date: _____ End Date: _____

If work begins in rainy season or extends into rainy season, explain how project work can be scheduled can be altered to avoid rainy season impacts or to lessen exposure of site during rainy season: _____

_____

_____

_____

Grading Quantities: Cut: _____CY; Fill: _____CY; Import: _____CY;

Export: _____CY

Any Stockpile Proposed? _____ If yes, then estimate quantity: _____CY

Estimated duration of stockpile: _____Months

Soils types: _____

Does site contain a preponderance of soils with USDA-NRCS erosion factor kf greater than or equal to 0.4? _____

Is a staging area proposed (yes/no)? _____

If yes, then where is it located? _____

_____

Is concrete washout required (yes/no)? _____

Where is it located? _____

Any existing site contamination (yes/no)? _____

Where is it located? _____

Any vehicle storage, maintenance or fueling area proposed (yes/no)? _____

Where is it located? _____

Any de-watering operation proposed (yes/no)? _____

Where is it located? _____

Any other special operations proposed that may impair water quality (yes/no)? _____

What and where? _____

Watershed Basin project drains to: ☐ Buena Vista Lagoon ☐ Agua Hedionda Lagoon
☐ Encinas Creek ☐ Batiquitos Lagoon ☐ Pacific Ocean

Is project drainage tributary to a CWA section 303(d) listed water body impaired for sediment (includes Buena Vista and Agua Hedionda Lagoons) (yes/no): _____

If yes, describe additional controls that will be used on project site to mitigate for sediment impairments (if any): _____

_____

_____

_____

Is project inside or within 200 feet of an Environmentally Sensitive Area (yes/no): _____

If yes, describe additional controls that will be used on project site to mitigate for potential storm water impacts (if any): _____

_____

_____

Are any agency permits required (yes/no)? _____

Check off permit types required: ☐ Army Corps 404 permit
☐ Regional Board Water Quality 401 Certification ☐ Coastal Commission Certification
☐ U.S. Fish and Wildlife Section 7 ☐ Fish and Game Stream Alteration Agreement
☐ Other list: _____

List materials that will be used on construction site and their handling and storage requirements		
Material	Characteristics/Toxicity	Handling requirements

If any toxic or hazardous materials are proposed, then a spill prevention plan is required. Is a spill prevention plan required (yes/no)? _____.

If yes, attach spill prevention plan.

Perceived Threat to Storm Water Quality rating:

Using the Construction Threat Assessment Worksheet (attached as Appendix C to Section 3 (Construction SWPPP Standards and Requirements) of the City Storm Water Standards Manual, determine the projects Perceived Threat to Storm Water Quality rating.

The Construction Threat to Storm Water Quality rating for this project is: ☐ High ☐ Medium

Signature of Plan Preparer:

Signature: _____ Date: _____

Print Name: _____ Title: _____

Attachments:

- ❑ Storm Water Compliance Form – Tier 2
- ❑ Spill Prevention Plan
- ❑ Hydrology and/or hydraulic study
- ❑ Solis and/or geotechnical report(s)
- ❑ Other. List: _____

_____

BMP Selection:

The following tables are provided to help identify and select appropriate site specific BMPs for the proposed project. Review the list of potential site construction activities and site conditions described along the left hand column of each sheet. Then, for each activity or site condition that is included in the proposed project, pick one or more of the BMPs described at the top of the form and place an X(s) in the box(es) that form(s) an intersection between the activity/site condition row and BMP column(s).

All structural (physical facility) BMP's should be shown on the site plan in the Construction SWPPP drawing set. Any proposed no-structural BMP should be noted in the Special Notes on the Construction SWPPP drawing set.

	Erosion Control BMPs													Wind Erosion BMPs
BMP Description →	Scheduling	Preservation of Existing Vegetation	Hydraulic Mulch	Hydroseeding	Soil Binders	Straw Mulch	Geotextiles & Mats	Wood Mulching	Earth Dikes and Drainage Swales	Velocity Dissipation	Slope Drains	Streambank Stabilization	Polyacrylamide	Wind Erosion Control
CASQA Designation → **Construction Activity or Site Condition**	EC-1	EC-2	EC-3	EC-4	EC-5	EC-6	EC-7	EC-8	EC-9	EC-10	EC-11	EC-12	EC-13	WE-1
Cleared Areas														
Flat pad graded areas														
Graded slope areas														
Trenching/Excavation														
Stockpiling														
Drilling/Boring														
Conduit/Pipe Installation														
Substructure/Pad Installation														
Staging Area														
Existing onsite vegetated areas														
Drainage flow onto site														
Drainage flows off of site														
Drainage at top of slope														
Other (list):														

	Sediment Control BMPs										
BMP Description →	Silt Fence	Sediment Basin	Sediment Trap	Check Dam	Fiber Rolls	Gravel Bag Berm	Street Sweeping and Vacuuming	Sandbag Barrier	Straw Bale Barrier	Storm Drain Inlet Protection	Chemical Treatment
CASQA Designation →	SE-1	SE-2	SE-3	SE-4	SE-5	SE-6	SE-7	SE-8	SE-9	SE-10	SE-11
Construction Activity Or Site Condition											
Cleared Areas											
Flat pad graded areas											
Graded slope areas											
Trenching/Excavation											
Stockpiling											
Drilling/Boring											
Conduit/Pipe Installation											
Substructure/Pad Installation											
Paving											
Staging Area											
Existing onsite vegetated areas											
Drainage flow onto site											
Drainage flows off of site											
Drainage at top of slope											
Other (list):											

	Tracking Control BMPs		
BMP Description →	Stabilized Construction Ingress/Egress	Stabilized Construcion Roadway	Ingress/Egress Tire Wash
CASQA Designation → **Construction Activity v**	TR-1	TR-2	TR-3
Site Access point(s)			
Staging area access point(s)			
Maintenance access roads to BMPs			
Other (list):			

	Non-Storm Water Management BMPs															
BMP Description →	Water Conservation Practices	Dewatering Operations	Paving and Grinding Operations	Temporary Stream Crossing	Clear Water Diversion	Illicit Connection/Discharge	Potable Water/Irrigation	Vehicle and Equipment Cleaning	Vehicle and Equipment Fueling	Vehicle and Equipment Maintenance	Pile Driving Operations	Concrete Curing	Concrete Finishing	Material and Equipment Use	Demolition Adjacent to Water	Temporary Batch Plants
CASQA Designation → **Construction Activity Site Conditions**	NS-1	NS-2	NS-3	NS-4	NS-5	NS-6	NS-7	NS-8	NS-9	NS-10	NS-11	NS-12	NS-13	NS-14	NS-15	NS-16
Landscaping & Irrigation																
Drilling/Boring																
Concrete/Asphalt Sawcutting																
Concrete flatwork																
Paving																
Wire, Cable & Connector Installation																
Site Housekeeping

Tier 2 Construction SWPPP Required Elements Checklist

Required Elements	Required for Project	Preparer Verification
Construction SWPPP Drawing Set		
1. Standard Storm Water Pollution Prevention Notes		
A. General Site Management Requirements Notes		
B. Rainy Season Site Management Requirements Notes		
C. Erosion Control Hydroseeding, Planting and Irrigation Notes		
D. Special site specific notes		
2. City SWMP identification number affixed for high priority projects		
3. Construction Threat to Storm Water Quality rating (high or medium inspection frequency required?)		
4. Regional Water Board WDID Number shall be affixed for small linear utility projects as appropriate		
5. Project Location		
6. Legend		
7. Description of work		
A. Quantities (cut, fill, import, export)		
B. Area of disturbance		
C. Site conditions description		
1) Soils type		
8. Benchmark Information		
9. Preparer's signature and seal as appropriate		
10. City title block		
11. Emergency contact name, company and phone number		
12. Water shed project drains to listed		
13. Site Plan		
A. Existing topographic and cultural features of site and immediate vicinity as appropriate		
B. Scale and north arrow		
C. Project boundary and property lines		
D. Proposed grading contours and slopes clearly shown		

E. Staging areas, equipment storage, refueling, stockpiling and maintenance areas identified		
F. Storm drain inlets, open channels and natural drainages and watercourses that flow onto or drain off of the project site clearly delineated		
G. Potential source points of pollutants (fueling locations, waste container areas, wash racks, hazardous materials storage, etc)		
H. Site access locations		
I. Proposed BMPs – location and description		
1) Perimeter controls		
2) Erosion controls		
3) Sediment controls		
4) Tracking controls		
5) Non-storm water management controls		
6) Waste management and materials pollution controls		
7) Additional controls (as needed)		
8) Advanced treatment methods (as needed)		
J. Toxic or hazardous material contamination or spill areas		
K. Existing site BMP installations		
14. BMP detail drawings as needed		
Construction SWPPP Supplemental Documentation		
1. Storm Water Compliance Form for a Tier 2 Construction SWPPP completed and signed		
2. Tier 2 Site Assessment Form completed and signed		
3. Hydrology and hydraulic calculations (as needed for sediment basins and sizing of drainage swales to handle drainage during construction		
4. Soils report (as needed when proposed BMP installation may affect ground water, slope stability or other geotechnical site condition)		

Appendix G

Tier 2 Construction SWPPP Plan Review Checklist

Tier 2 Construction SWPPP Review Checklist

PROJECT ID NO._____PROJECT NAME_____
PLANCHECKER_____DRAWING NO._____DATE_____

	1st Chk	2nd Chk	3rd Chk	Mylar	Comments
I. CONSTRUCTION SWPPP DRAWING					
1. ALL SHEETS					
A. Medium (to be reviewed at time of submission of final plan check)					
1) 24"x36" mylar film with title block (Alternative medium may be approved by Deputy City Engineer or designee)					
2) No "sticky-back", glued or taped on or together sections					
3) Drawing with waterproof ink or photographically reproduced					
B. Drafting					
1) Signed by the Qualified SWPPP Preparer					
2) Marked with the name, address & telephone number of the Qualified SWPPP Preparer preparing the plan & date of preparation					
3) Consecutively numbered & the total number of sheets shown					
4) Lettered in a neat & legible style no lettering smaller than 1/8"					
5) Title with the name & discretionary permit number of the City approval					
6) Prepared to appropriate Scale(s)					
7) Drawn as separate plans from Grading Plans, Building Plans or Improvement Plans					
8) Use standard plans & details to maximum extent					
9) Clearly designate between existing conditions & work proposed					
10) Scale noted, north arrow & bar scale provided					
11) No duplication of any section or detail letter designation.					
2. TITLE SHEET					
A. Erosion Control Notes Provided					
1) Standard Notes					
2) Supplemental special notes					
B. Project Location					
1) Legal description					
2) Assessor's parcel number					
3) Vicinity map (may be waived by Deputy City Engineer or designee)					
C. Legend					
1) Symbols per County Standards					

√ Acceptable ? Unclear, Provide More Data N/A Not Applicable X Not Acceptable (provide reason for unacceptability in comment section)

	1st Chk	2nd Chk	3rd Chk	Mylar	Comments
2) Every symbol used on the plans is shown in the legend					
3) Every symbol description clear & unequivocal					
D. Description & Quantities of Work					
1) Quantities for each item constructed or installed per these plans					
2) Erosion control Structural BMPs					
3) Standard references listed					
E. Site Plan - (certain site plan requirements may be waived for projects not requiring a grading plan per the approval of the Deputy City Engineer or designee)					
1) Full project site area shown (on one sheet if possible)					
2) Adequate adjacent site area shown to clearly indicate drainage courses that flow onto or off of the site					
3) Topography extends minimum 15' beyond limits of work & over entire property					
4) Existing contours and cultural features (screened back 60 matte)					
5) Proposed contours and cultural features					
6) Existing & proposed contours clearly differentiated					
7) Slope symbols used only on slopes 2:1 or steeper					
8) Degree of slope shown for all slopes					
9) Fill slopes shaded					
10) Proposed lot lines shown					
11) Existing lot lines shown & dimensioned					
12) Street name or designations					
F. Drainage Facilities and Water Courses					
1) Storm drains and inlets existing and proposed					
2) Water courses and natural drainages shown with arrows indicating direction of flow					
3) Down drains					
4) Paved swales & terrace drains shown with arrows indicating direction of flow					
5) Existing and proposed basins					
G. Detail Drawings (Only when necessary. Generally refer to CASQA reference drawings)					
1) Modifications to standard drawings (CASQA or others) should be detailed					
H. Proposed Storm Water BMPs					
1) BMPs shown in bold ink and clearly visible					
2) BMP notes and identifiers bolded and clearly shown					

√ Acceptable ? Unclear, Provide More Data N/A Not Applicable X Not Acceptable (provide reason for unacceptability in comment section)

	1st Chk	2nd Chk	3rd Chk	Mylar	Comments
3) Proper CASQA (or other standard) designations used					
4) Perimeter control shown					
a. Flows onto site contained or diverted around construction area					
b. Flows off-site mitigated through retention, dissipation or other means					
c. Perimeter silt fencing, fiber rolls or other sediment control BMP for sloped areas or areas of sheet flow					
5) Erosion control shown					
a. Existing vegetation preserved where possible					
b. BMP specified for all sloped areas 3:1 or steeper					
c. Minimize area and duration of exposed soils					
6) Sediment control shown					
a. Basin or other appropriate BMP shown for flat areas less than 3:1					
b. Onsite and offsite inlets protected with storm drain inlet protection, gravel bags or other appropriate BMP					
c. Onsite earth swales and water courses protected with check dams, gravel bags, fiber rolls or other appropriate BMP					
d. Additional controls proposed for sites draining directly to receiving waters					
7) Tracking control shown					
a. Limit vehicle and equipment access points onto site					
b. Stabilized construction entrance called out on plan					
8) Non-Storm Water Management BMP indicated on plan					
a. Vehicle and equipment fueling and maintenance areas identified and protected					
b. Concrete Finishing and curing protections					
9) Waste Management and Materials Control BMPs					
a. Material Delivery and Storage BMPs indicated					
b. Stockpile management BMPs indicated					
c. Concrete mixer wash out BMP indicated					
I. General Site Management					
1) All weather access provide to basins and other BMPs that require cleaning or maintenance during rainy season					

√ Acceptable ? Unclear, Provide More Data N/A Not Applicable X Not Acceptable (provide reason for unacceptability in comment section)

	1st Chk	2nd Chk	3rd Chk	Mylar	Comments
2) 24 hour telephone number for emergency erosion control person and name of specific individual with authority and responsibility for erosion control					
3) Schedule for completion of installation of erosion control facilities					
4) Erosion control planting & method of starting & maintaining growth (irrigation)					
5) Weather triggered action plan for deploying BMPs with 48 hours of a predicted rain					
6) Description of standby BMP materials plan					
J. Project Conditions of Approval (list if applicable.)					
1)					
2)					
3. ADDITIONAL PLAN SHEETS (Additional plan sheets as required to adequately depict required BMP details or depict the site plan with an appropriate scale to clearly show all existing and proposed features)					
II. SUPPLEMENTAL DOCUMENTATION					
1. STORM WATER COMPLIANCE FORM (properly filled out and signed by Owner or Owner's Agent including appropriate City approval initial)					
2. COMPLETED SITE ASSESSMENT FORM					
3. SPILL PREVENTION PLAN (as required)					
5. SOILS/GEOTECHNICAL INVESTIGATION REPORT (As needed for geotechnical safety. Follow format indicated on Grading Plan Checklist when required)					
6. CALCULATIONS (As needed for projects with sedimentation basins or significant on-site/off-site drainage flows to determine sizing of swales and potential for erosive velocities)					
A. All					
1) All pages numbered					
2) Total number of pages on each page					
3) Each page labeled with the name address & telephone number of the preparing firm					
4) Neat & legible					
5) Indexed					
6) In logical order					
7) Cross-referenced to plans					
8) Bound					
9) Sturdy cover					
10) Signed, sealed & dates of preparation and expiration of registration applied on report cover or on bound-in cover letter					
11) Cover prominently labeled with subject, name & number of the discretionary permit for the project.					

√ Acceptable ? Unclear, Provide More Data N/A Not Applicable X Not Acceptable (provide reason for unacceptability in comment section)

	1st Chk	2nd Chk	3rd Chk	Mylar	Comments
B. Hydrology Per San Diego County Standards					
1) 1984 rainfall intensity curves					
2) Appropriate value of C					
3) Appropriate design method					
a. U.S. Army Corps of Engineers HEC series					
b. Soil Conservation Service Unit Hydrography					
c. Rational Method (Q□CIA) (0.5 sq. mile max)					
4) TI correctly completed					
5) If correctly completed					
6) Tc correct					
7) Six hour/24 intensities correctly balanced					
8) Documentation provided or "plain english" output for computer generated reports					
C. Hydraulic					
1) Documentation provided or "plain english" output for computer generated reports					
2) Clear copies provided or all charts, maps, nomogrpahs or other graphic used					
3) Cite general formula before inserting specific values (i.e. Q□AV; Q□ 2.5 x 18 □ 4.75 cfs)					
7. ENGINEER'S ESTIMATE (Needed only for projects with grading plans. Follow grading plan checklist requirements)

Tier 1 Construction SWPPP Standard Template

CITY OF CARLSBAD
STANDARD FORM - TIER 1 STORM WATER POLLUTION PREVENTION PLAN

STORM WATER COMPLIANCE CERTIFICATE

- ✓ My project is not in a category of permit types exempt from the Construction SWPPP requirements
- ✓ My project is not located inside or within 200 feet of an environmentally sensitive area with a significant potential for contributing pollutants to nearby receiving waters by way of storm water runoff or non-storm water discharge(s).
- ✓ My project does not requires a grading plan pursuant to the Carlsbad Grading Ordinance (Chapter 15.16 of the Carlsbad Municipal Code)
- ✓ My project will not result in 2,500 square feet or more of soils disturbance including any associated construction staging, stockpiling, pavement removal, equipment storage, refueling and maintenance areas that meets one or more of the additional following criteria:
  - located within 200 feet of an environmentally sensitive area or the Pacific Ocean; and/or,
  - disturbed area is located on a slope with a grade at or exceeding 5 horizontal to 1 vertical; and/or
  - disturbed area is located along or within 30 feet of a storm drain inlet, an open drainage channel or watercourse; and/or
  - construction will be initiated during the rainy season or will extend into the rainy season (Oct. 1 through April 30).

I CERTIFY TO THE BEST OF MY KNOWLEDGE THAT ALL OF THE ABOVE CHECKED STATEMENTS ARE TRUE AND CORRECT. I AM SUBMITTING FOR CITY APPROVAL A TIER 1 CONSTRUCTION SWPPP PREPARED IN ACCORDANCE WITH THE REQUIREMENTS OF CITY STANDARDS.

I UNDERSTAND AND ACKNOWLEDGE THAT I MUST: (1) IMPLEMENT BEST MANAGEMENT PRACTICES (BMPS) DURING CONSTRUCTION ACTIVITIES TO THE MAXIMUM EXTENT PRACTICABLE TO MINIMIZE THE MOBILIZATION OF POLLUTANTS SUCH AS SEDIMENT AND TO MINIMIZE THE EXPOSURE OF STORM WATER TO CONSTRUCTION RELATED POLLUTANTS; AND, (2) ADHERE TO, AND AT ALL TIMES, COMPLY WITH THIS CITY APPROVED TIER 1 CONSTRUCTION SWPPP THROUGHTOUT THE DURATION OF THE CONSTRUCTION ACTIVITIES UNTIL THE CONSTRUCTION WORK IS COMPLETE AND APPROVED BY THE CITY OF CARLSBAD.

STORM WATER POLLUTION PREVENTION NOTES

1. ALL NECESSARY EQUIPMENT AND MATERIALS SHALL BE AVAILABLE ON SITE TO FACILITATE RAPID INSTALLATION OF EROSION AND SEDIMENT CONTROL BMPS WHEN RAIN IS EMINENT.
2. THE OWNER/CONTRACTOR SHALL RESTORE ALL EROSION CONTROL DEVICES TO WORKING ORDER TO THE SATISFACTION OF THE CITY ENGINEER AFTER EACH RUN-OFF PRODUCING RAINFALL.
3. THE OWNER/CONTRACTOR SHALL INSTALL ADDITIONAL EROSION CONTROL MEASURES AS MAY BE REQUIRED BY THE CITY ENGINEERING OR BUILDING INSPECTOR DUE TO UNCOMPLETED GRADING OPERATIONS OR UNFORESEEN CIRCUMSTANCES WHICH MAY ARISE.
4. ALL REMOVABLE PROTECTIVE DEVICES SHALL BE IN PLACE AT THE END OF EACH WORKING DAY WHEN THE FIVE (5) DAY RAIN PROBABILITY FORECAST EXCEEDS FORTY PERCENT (40%). SILT AND OTHER DEBRIS SHALL BE REMOVED AFTER EACH RAINFALL.
5. ALL GRAVEL BAGS SHALL BE BURLAP TYPE WITH 3/4 INCH MINIMUM AGGREGATE.
6. ADEQUATE EROSION AND SEDIMENT CONTROL AND PERIMETER PROTECTION BEST MANAGEMENT PRACTICE MEASURES MUST BE INSTALLED AND MAINTAINED.

Instructions: Begin by reviewing the list of construction activities and checking the box to the left of any activity that will occur during the proposed construction. Add any other activity descriptions in the blank activity description boxes provided for that purpose and place a check in the box immediately to the left of the added activity description. For each activity descrribed, pick one or more best management practices (BMPs) from the list located alon the top of the form. Then place an X in the box at the place where the activity row intersects with the BMP column. Do this for each activity that was checked off and for each of the selected BMPs selected from the list. For Example – If the project includes site access across dirt, then check the box to the left of "Site Access Across Dirt". Then review the list for something that applies such as "Stabilized Construcion Ingress/Egress" under Tracking Control. Follow along the "Site Access Across Dirt" row until you get to the "Stabilized Construction Ingress/Egress" column and place an X in the box where the two meet. As another example say the project included a stockpile that you intend to cover with a plastic sheet. Since plastic sheeting is not on the list of BMPs, then write in "Cover with Plastic" in the blank column under the heading Erosion Control BMPs. Then place an X in the box where "Stockpiling" row intersects the new "Cover with Plastic" column.

To learn more about what each BMP description means, you may wish to review the BMP Reference Handout prepared to assist applicants in the selection of appropriate Best Management Practice measures. The reference also explains the California Stormwater Quality Association (CASQA) designation and how to apply the various selected BMPs to a project.

Scale of map

Legend

Site Map

Features displayed on the map must include:

- An outline of the entire property
- Location and brief description of construction activity areas (e.g. grading, building, trenching, fueling areas, waste container area, wash racks, hazardous material storage areas, etc.)
- Location and flow direction arrows for existing drainage facilities (ditches, channels, inlets, storm drains, etc.)
- Location of existing storm water BMP controls (sediment basins, oil/ water separators, sumps, etc.)
- Location of proposed storm water BMP controls with brief description or legend reference

City Standard
Storm Water Pollution Prevention Notes

STORM WATER POLLUTION PREVENTION

GENERAL SITE MANAGEMENT REQUIREMENTS

THE FOLLOWING GENERAL SITE MANAGEMENT REQUIREMENTS SHALL BE ADHERED TO THROUGHOUT THE DURATION OF THE CONSTRUCTION WORK (YEAR ROUND):

1. IN CASE EMERGENCY WORK IS REQUIRED, CONTACT _____ FROM _____ AT _____.

2. DEVICES SHOWN ON CITY APPROVED PLANS SHALL NOT BE MOVED OR MODIFIED WITHOUT THE APPROVAL OF THE ENGINEERING INSPECTOR.

3. THE CONTRACTOR SHALL RESTORE ALL EROSION CONTROL DEVICES TO WORKING ORDER TO THE SATISFACTION OF THE CITY ENGINEER AFTER EACH RUN-OFF PRODUCING RAINFALL.

4. THE CONTRACTOR SHALL INSTALL ADDITIONAL EROSION CONTROL MEASURES AS MAY BE REQUIRED BY THE CITY ENGINEER DUE TO UNCOMPLETED GRADING OPERATIONS OR UNFORESEEN CIRCUMSTANCES WHICH MAY ARISE.

5. THE CONTRACTOR SHALL BE RESPONSIBLE AND SHALL TAKE NECESSARY PRECAUTIONS TO PREVENT PUBLIC TRESPASS ONTO AREAS WHERE IMPOUNDED WATERS CREATE A HAZARDOUS CONDITION.

6. GRADED AREAS AROUND THE PROJECT PERIMETER MUST DRAIN AWAY FROM THE FACE OF SLOPE AT THE CONCLUSION OF EACH WORKING DAY.

7. ALL REMOVABLE PROTECTIVE DEVICES SHALL BE IN PLACE AT THE END OF EACH WORKING DAY WHEN THE FIVE (5) DAY RAIN PROBABILITY FORECAST EXCEEDS FORTY PERCENT (40□). SILT AND OTHER DEBRIS SHALL BE REMOVED AFTER EACH RAINFALL.

8. ALL GRAVEL BAGS SHALL BE BURLAP TYPE WITH 3/4 INCH MINIMUM AGGREGATE.

9. ALL GRADED AREAS MUST HAVE EROSION CONTROL PROTECTION BEST MANAGEMENT PRACTICE MEASURES PROPERLY INSTALLED.

10. ADEQUATE PERIMETER PROTECTION BEST MANAGEMENT PRACTICE MEASURES MUST BE INSTALLED AND MAINTAINED.

11. ADEQUATE SEDIMENT CONTROL BEST MANAGEMENT PRACTICE MEASURES MUST BE INSTALLED AND MAINTAINED.

12. ADEQUATE MEASURES TO CONTROL OFFSITE SEDIMENT TRACKING MUST BE INSTALLED AND MAINTAINED.

13. A MINIMUM OF 125□ OF THE MATERIAL NEEDED TO INSTALL STANDBY BEST MANAGEMENT PRACTIVE MEASURES TO PROTECT THE EXPOSED AREAS FROM EROSION AND PREVENT SEDIMENT DISCHARGES, MUST BE STORED ONSITE. AREAS ALREADY PROTECTED FROM EROSION USING PHYSICAL STABILIZATION OR ESTABLISHED VEGETATION STABILIZATION MEASURES ARE NOT CONSIDERED TO BE □EXPOSED□FOR PURPOSES OF THIS REQUIREMENT.

14. THE OWNER/DEVELOPER/CONTRACTOR MUST HAVE AN APPROVED WEATHER TRIGGERED ACTION PLAN AND BE ABLE TO DEPLOY STANDBY BEST MANAGEMENT PRACTICE MEASURES TO COMPLETELY PROTECT THE EXPOSED PORTIONS OF THE SITE WITHIN 48 HOURS OF A PREDICTED STORM EVENT (A PREDICTED STORM EVENT IS DEFINED AS A FORECASTED, 40 CHANCE OF RAIN BY THE NATIONAL WEATHER SERVICE). ON REQUEST, THE OWNER/CONTRACTOR MUST PROVIDE PROOF OF THIS CAPABILITY THAT IS ACCEPTABLE TO THE CITY.

15. DEPLOYMENT OF PHYSICAL OR VEGETATION EROSION CONTROL MEASURES MUST COMMENCE AS SOON AS SLOPES ARE COMPLETED. THE OWNER/CONTRACTOR MAY NOT CONTINUE TO RELY ON THE ABILITY TO DEPLOY STANDBY BEST MANAGEMENT PRACTICE MATERIALS TO PREVENT EROSION OF SLOPES THAT HAVE BEEN COMPLETED.

16. UNLESS OTHERWISE SPECIFIED ON THE GRADING PLANS OR THE CONSTRUCTION STORM WATER POLLUTION PREVENTION PLAN DOCUMENTS, THE AREA THAT CAN BE CLEARED, GRADED, AND LEFT EXPOSED AT ONE TIME IS LIMITED TO THE AMOUNT OF ACREAGE THAT THE CONTRACTOR CAN ADEQUATELY PROTECT PRIOR TO A PREDICTED RAINSTORM. IT MAY BE NECESSARY TO DEPLOY EROSION AND SEDIMENT CONTROL BEST MANAGEMENT PRACTICE MEASURES IN AREAS THAT ARE NOT COMPLETED AND ARE NOT ACTIVELY BEING WORKED BEFORE ADDITIONAL GRADING IS ALLOWED TO PROCEED, AT THE DISCRETION OF THE PUBLIC WORKS INSPECTOR.

RAINY SEASON SITE MANAGEMENT REQUIREMENTS (OCTOBER 1 APRIL 30)

THE FOLLOWING RAINY SEASON SITE MANAGEMENT REQUIREMENTS SHALL BE ADHERED TO THROUGHOUT THE RAINY SEASON DEFINED AS BEGINNING ON OCTOBER 1 OF ANY YEAR AND EXTENDING THROUGH APRIL 30TH OF THE FOLLOWING YEAR:

1. EROSION CONTROL, PERIMETER PROTECTION AND SEDIMENT CONTROL BEST MANAGEMETN PRACTICE MEASURES MUST BE UPGRADED IF NECESSARY TO PROVIDE SUFFICIENT PROTECTION FOR STORMS LIKELY TO OCCUR DURING THE RAINY SEASON.

2. EQUIPMENT AND WORKERS FOR EMERGENCY WORK SHALL BE MADE AVAILABLE AT ALL TIMES DURING THE RAINY SEASON. ALL NECESSARY MATERIALS SHALL BE STOCKPILED ON SITE AT CONVENIENT LOCATIONS TO FACILITATE RAPID CONSTRUCTION OF TEMPORARY DEVICES WHEN RAIN IS EMINENT.

3. ADEQUATE PHYSICAL OR VEGETATION EROSION CONTROL BEST MANAGEMENT PRACTICE MEASURES MUST BE INSTALLED AND ESTABLISHED FOR ALL COMPLETED SLOPES PRIOR TO THE START OF THE RAINY SEASON. THESE BEST MANAGEMENT PRACTICE MEASURES MUST BE MAINTAINED THROUGHOUT THE RAINY SEASON. IF A SELECTED BEST MANAGEMENT PRACTICE MEASURE FAILS, IT MUST BE REPAIRED AND IMPROVED, OR REPLACED WITH AN ACCEPTABLE ALTERNATE AS SOON AS IT IS SAFE TO DO SO. THE FAILURE OF A BEST MANAGEMENT PRACTICE MEASURE INDICATES IT WAS NOT ADEQUATE FOR THE CIRCUMSTANCES IN WHICH IT WAS USED. REPAIRS OR REPLACEMENTS MUST THEREFORE PUT A MORE ROBUST BEST MANAGEMENT PRACTICE MEASURE IN PLACE.

4. ALL VEGETATION EROSION CONTROL MUST BE ESTABLISHED PRIOR TO THE RAINY SEASON TO BE CONSIDERED AS A BEST MANAGEMENT PRACTICE MEASURE.

5. THE AMOUNT OF EXPOSED SOIL ALLOWED AT ONE TIME SHALL NOT EXCEED THAT WHICH CAN BE ADEQUATELY PROTECTED BY DEPLOYING STANDBY EROSION CONTROL AND SEDIMENT CONTROL BEST MANAGEMENT PRACTICE MEASURES PRIOR TO A PREDICTED RAINSTORM.

6. A DISTURBED AREA THAT IS NOT COMPLETED BUT THAT IS NOT BEING ACTIVELY GRADED MUST BE FULLY PROTECTED FROM EROSION IF LEFT FOR 10 OR MORE DAYS. THE ABILITY TO DEPLOY STANDBY BEST MANAGEMENT PRACTICE MEASURE MATERIALS IS NOT SUFFICIENT FOR THESE AREAS. BEST MANAGEMENT PRACTICE MEASURES MUST ACTUALLY BE DEPLOYED.

<u>EROSION CONTROL HYDROSEEDING, PLANTING AND IRRIGATION</u>

1. ALL PERMANENT AND TEMPORARY EROSION CONTROL PLANTING AND IRRIGATION SHALL BE INSTALLED AND MAINTAINED AS REQUIRED IN SECTION 212 OF THE STANDARD SPECIFICATIONS AND THE FOLLOWING:

   A HYDROSEEDING SHALL BE APPLIED TO:
      1 ALL SLOPES THAT ARE GRADED 6:1 (HORIZONTAL TO VERTICAL) OR STEEPER WHEN THEY ARE:
         a. THREE FEET OR MORE IN HEIGHT AND ADJACENT TO A PUBLIC WALL OR STREET.
         b. ALL SLOPES 4 FEET OR MORE IN HEIGHT.
      2 AREAS GRADED FLATTER THAN 6:1 WHEN ANY OF THE FOLLOWING CONDITIONS EXIST:
         a. NOT SCHEDULED FOR IMPROVEMENTS (CONSTRUCTION OR GENERAL LANDSCAPING) WITHIN 60 DAYS OF ROUGH GRADING.
         b. IDENTIFIED BY THE PARKS AND RECREATION DIRECTOR AS HIGHLY VISIBLE TO THE PUBLIC.
         c. HAVE ANY SPECIAL CONDITION IDENTIFIED BY THE CITY ENGINEER THAT WARRANTS IMMEDIATE TREATMENT.

   B HYDROSEEDED AREAS SHALL BE IRRIGATED IN ACCORDANCE WITH THE FOLLOWING CRITERIA:
      1 ALL SLOPES THAT ARE GRADED 6:1 OR STEEPER AND THAT ARE:
         a. THREE TO EIGHT FEET IN HEIGHT SHALL BE IRRIGATED BY HAND WATERING FROM QUICK COUPLERS/HOSE BIBS OR A CONVENTIONAL SYSTEM OF LOW PRECIPITATION SPRINKLER HEADS PROVIDING 100 COVERAGE.
         b. GREATER THAN 8 FEET IN HEIGHT SHALL BE WATERED BY A CONVENTIONAL SYSTEM OF LOW PRECIPITATION SPRINKLER HEADS PROVIDING 100 COVERAGE.
      2 AREAS SLOPED LESS THAN 6:1 SHALL BE IRRIGATED AS APPROVED BY THE CITY ENGINEER, PRIOR TO HYDROSEEDING. THE DEVELOPER SHALL SUBMIT A PROPOSED SCHEME TO PROVIDE IRRIGATION TO THE CITY ENGINEER. THE PROPOSAL SHALL BE SPECIFIC REGARDING THE NUMBERS, TYPES, AND COSTS OF THE ELEMENTS OF THE PROPOSED SYSTEM.
      3 IRRIGATION SHALL MAINTAIN THE MOISTURE LEVEL OF THE SOIL AT THE OPTIMUM LEVEL FOR THE GROWN OF THE HYDROSEEDED GROWTH.

C HYDROSEEDING MIX SHALL CONSIST OF ALL OF THE FOLLOWING:

1 SEED MIX SHALL CONSIST OF NO LESS THAN:

a. 20 lbs. PER ACRE OF ROSE CLOVER
b. 20 lbs. PER ACRE OF ZORRO FESCUE
c. 3 lbs. PER ACRE OF E SCHOOL CIA CALIFORNICA
d. 4 lbs. PER ACRE OF ACHILLEA MILLEFOLIA
e. 3 lbs. PER ACRE OF ALYSSUM (CARPET OF SNOW)
f. 1/2 lb. PER ACRE OF DIMORPHOLECA
g. ITEMS c,d,e, AND f OF THIS SUBSECTION MAY BE OMITTED ON LOCATIONS WHERE THE AREA BEING HYDROSEEDED IS NOT VISIBLE FROM EITHER A PUBLIC STREET OR RESIDENTIAL STRUCTURES.
h. ITEM a OF THIS SUBSECTION MUST BE INOCULATED WITH A NITROGEN FIXING BACTERIA AND APPLIED DRY EITHER BY DRILLING OR BROADCASING BEFORE HYDROSEEDING.
i. ALL SEED MATERIALS SHALL BE TRANSPORTED TO THE JOBSITE IN UNOPENED CONTAINERS WITH THE CALIFORNIA DEPARTMENT OF FOOD AND AGRICULTURE CERTIFICATION TAG ATTACHED TO, OR PRINTED ON SAID CONTAINERS.
j. NON-PHYTO-TOXIC WETTING AGENTS MAY BE ADDED TO THE HYDROSEED SLURRY AT THE DISCRETION OF THE CONTRACTOR.

2 TYPE 1 MULCH APPLIED AT THE RATE OF NO LESS THAN 2000 lbs PER ACRE. TYPE 6 MULCH (STRAW) MAY BE SUBSTITUTED, ALL OR PART, FOR HYDRAULICALLY APPLIED FIBER MATERIAL. WHEN STRAW IS USED, IT MUST BE ANCHORED TO THE SLOPE BY MECHANICALLY PUNCHING NO LESS THAN 50 OF THE STRAW INTO THE SOIL.

3 FERTILIZER CONSISTING OF AMMONIUM PHOSPHATE SULFATE, 16-20-0, WITH 15 SULPHUR APPLIED AT THE RATE OF 500 lbs. PER ACRE.

D AREAS TO BE HYDROSEEDED SHALL BE PREPARED PRIOR TO HYDROSEEDING BY:

1 ROUGHENING THE SURFACE TO BE PLANTED BY ANY OR A COMBINATION OF:

a. TRACK WALKING SLOPES STEEPER THAN 6:1
b. HARROWING AREAS 6:1 OR FLATTER THAT ARE SUFFICIENTLY FRIABLE.
c. RIPPING AREAS THAT WILL NOT BREAK UP USING ITEMS a OR b ABOVE.

2 CONDITIONING THE SOILS SO THAT IT IS SUITABLE FOR PLANTING BY:

a. ADJUSTING THE SURFACE SOIL MOISTURE TO PROVIDE A DAMP BUT NOT SATURATED SEED BED.
b. THE ADDITION OF SOIL AMENDMENTS, PH ADJUSTMENT, LEACHING COVERING SALINE SOILS TO PROVIDED VIABLE CONDITIONS FOR GROWTH.

E HYDROSEEDED AREAS SHALL BE MAINTAINED TO PROVIDE A VIGOROUS GROWTH UNTIL THE PROJECT IS PERMANENTLY LANDCAPED OR, FOR AREAS WHERE HYDROSEEDING IS THE PERMANENT LANDSCAPING, UNTIL THE PROJECT IS COMPLETED AND ALL BONDS RELEASED.

2. ALL SLOPES SHALL HAVE IRRIGATION INSTALLED AND BE STABILIZED, PLANTED AND/OR HYDROSEEDED WITHIN TEN (10) DAYS OF THE TIME WHEN EACH SLOPE IS BROUGHT TO GRADE AS SHOWN ON THE APPROVED GRADING PLANS.

3. SHOULD GERMINATION OF HYDROSEEDED SLOPES FAIL TO PROVIDE EFFICIENT COVERAGE OF GRADED SLOPES (90 COVERAGE) PRIOR TO OCTOBER 1, THE SLOPES SHALL BE STABILIZED BY AN APPROPRIATE EROSION CONTROL MATTING MATERIAL APPROVED BY THE PUBLIC WORKS INSPECTOR.

4. LANDSCAPING SHALL BE ACCOMPLISHED ON ALL SLOPES AND PADS AS REQUIRED BY THE CITY OF CARLSBAD LANDSCAPE MANUAL, THE LANDSCAPING PLANS FOR THIS PROJECT, DRAWING NO. _____, AND/OR AS DIRECTED BY THE CITY ENGINEER OR PLANNING DIRECTOR.

5. THE OWNER/APPLICANT SHALL ENSURE THAT ALL CONTRACTORS SHALL COORDINATE THE WORK OF THIS CONSTRUCTION SWPPP WITH THAT SHOWN ON ANY GRADING PLANS, LANDSCAPE AND IRRIGATION PLANS AND IMPROVEMENT PLANS AS REQUIRED FOR THIS PROJECT WORK.

Appendix J

Excerpts from EPA Guidelines for Selecting Construction BMPs

Chapter 4: **SWPPP Development—Selecting Erosion and Sediment Control BMPs**

▶ **This chapter presents a brief discussion of erosion and sediment control principles and a discussion of some commonly used BMPs.**

This document is not intended as an engineering or design manual on BMPs. The engineer or other qualified person that develops the details of your sediment and erosion control plan should be using the appropriate state or local specifications. The descriptions below provide a kind of checklist of the things to look for and some helpful installation and maintenance hints.

Erosion and sediment controls are the structural and non-structural practices used during the construction process to keep sediment in place (erosion control) and to capture any sediment that is moved by stormwater before it leaves the site (sediment control). Erosion controls—keeping soil where it is—are the heart of any effective SWPPP. Your SWPPP should rely on erosion controls as the primary means of preventing stormwater pollution. Sediment controls provide a necessary second line of defense to properly designed and installed erosion controls.

The suite of BMPs that you include in your SWPPP should reflect the specific conditions at the site. The information that you collected in the previous steps should help you select the appropriate BMPs for your site. An effective SWPPP includes a combination or suite of BMPs that are designed to work together.

Ten Keys to Effective Erosion and Sediment Control (ESC)

The ultimate goal of any SWPPP is to protect rivers, lakes, wetlands, and coastal waters that could be affected by your construction project. The following principles and tips should help you build an effective SWPPP. **Keep in mind that there are many BMP options available to you. We have selected a few common BMPs to help illustrate the principles discussed in this chapter.**

Erosion Control (keeping the dirt in place) and Minimizing the Impact of Construction

1. **Minimize disturbed area and protect natural features and soil**
2. **Phase construction activity**
3. **Control stormwater flowing onto and through the project**
4. **Stabilize soils promptly**
5. **Protect slopes**

Sediment Controls (the second line of defense)

6. **Protect storm drain inlets**
7. **Establish perimeter controls**
8. **Retain sediment on-site and control dewatering practices**
9. **Establish stabilized construction exits**
10. **Inspect and maintain controls**

Take a Closer Look…

BMPs in Combination

BMPs work much better when they are used in combination. For instance, a silt fence should not be used alone to address a bare slope. An erosion control BMP should be used to stabilize the slope, and the silt fence should serve as the backup BMP.

What does this mean to me?

Wherever possible, rely on erosion controls to keep sediment in place. Back up those erosion controls with sediment controls to ensure that sediment doesn't leave your site. Continually evaluate your BMPs. Are they performing well? Could the addition of a supplemental BMP improve performance? Should you replace a BMP with another one that might work better? Using BMPs in series also gives you some protection in case one BMP should fail.

Erosion Control and Minimizing the Impact of Construction

ESC Principle 1: Minimize disturbed area and protect natural features and soil. As you put together your SWPPP, carefully consider the natural features of the site that you assessed in Chapter 3. By carefully delineating and controlling the area that will be disturbed by grading or construction activities, you can greatly reduce the potential for soil erosion and stormwater pollution problems. Limit disturbed areas to only those necessary for the construction of your project. Natural vegetation is your best and cheapest erosion control BMP.

Figure 7. Protect vegetated buffers by using silt fence or other sediment controls.

Protecting and preserving topsoil is also a good BMP. Removing topsoil exposes underlying layers that are often more prone to erosion and have less infiltration capacity. Keeping topsoil in place preserves the natural structure of the soils and aids the infiltration of stormwater.

ESC Principle 2: Phase construction activity. Another technique for minimizing the duration of exposed soil is phasing. By scheduling or sequencing your construction work and concentrating it in certain areas, you can minimize the amount of soil that is exposed to the elements at any given time. Limiting the area of disturbance to places where construction activities are underway and stabilizing them as quickly as possible can be one of your most effective BMPs.

ESC Principle 3: Control stormwater flowing onto and through your project. Plan for any potential stormwater flows coming onto the project area from upstream locations, and divert (and slow) flows to prevent erosion. Likewise, the volume and velocity of on-site stormwater runoff should be controlled to minimize soil erosion.

Example BMP: Diversion Ditches or Berms

Description: Diversion ditches or berms direct runoff away from unprotected slopes and may also direct sediment-laden runoff to a sediment-trapping structure. A diversion ditch can be located at the upslope side of a construction site to prevent surface runoff from entering the disturbed area. Ditches or berms on slopes need to be designed for erosive velocities. Also, ensure that the diverted water is released through a stable outlet and does not cause downslope or downstream erosion or flooding.

Installation Tips:

- Divert run-on and runoff away from disturbed areas
- Ensure that the diversion is protected from erosion, using vegetation, geotextiles, or other appropriate BMPs
- Divert sediment-laden water to a sediment-trapping structure
- Use practices that encourage infiltration of stormwater runoff wherever possible

Maintenance:

- Inspect diversions and berms, including any outlets, regularly and after each rainfall
- Remove any accumulated sediment

Figure 8. Illustration of a construction berm to divert stormwater away from the disturbed construction area.

ESC Principle 4: Stabilize soils promptly. Where construction activities have temporarily or permanently ceased, you should stabilize exposed soils to minimize erosion. You should have stabilization measures in place after grading activities have ceased (many permits require stabilization within a specified time frame). You can provide either temporary or permanent cover to protect exposed soils. Temporary measures are necessary when an area of a site is disturbed but where activities in that area are not completed or until permanent BMPs are established. Topsoil stockpiles should also be protected to minimize any erosion from these areas. Temporary-cover BMPs include temporary seeding, mulches, matrices, blankets and mats, and the use of soil binders (there may be additional state and local requirements for the use of chemical-based soil binders). Permanent-cover BMPs include permanent seeding and planting, sodding, channel stabilization, and vegetative buffer strips. Silt fence and other sediment control measures are not stabilization measures.

SWPPP Tip!

Final Stabilization

Once construction activity in an area is completed and the area is stabilized (typically by achieving 70 percent permanent vegetative cover), you can mark this area on your SWPPP and discontinue inspections in that area. By bringing areas of your site to final stabilization, you can reduce your workload associated with maintaining and inspecting BMPs. For more information on final stabilization, see Chapter 9.

Example BMP: Temporary Seeding

Description: Temporarily seeding an area to establish vegetative cover is one of the most effective, and least expensive, methods of reducing erosion. This approach, as a single BMP, might not be appropriate on steep slopes, when vegetation cannot be established quickly enough to control erosion during a storm event, or when additional activities might occur soon in the area.

Installation Tips:

- Seed and mulch area (the mulch provides temporary erosion protection by protecting the soil surface, moderating temperature, and retaining moisture while seeds germinate and grow)
- Water regularly, if needed, to ensure quick growth
- Maintain backup BMPs, such as silt fence or settling ponds

SWPPP Tip!

Wind Control BMPs

In areas where dust control is an issue, your SWPPP should include BMPs for wind-erosion control. These consist of mulching, wet suppression (watering), and other practices.

ESC Principle 5: Protect slopes. Protect all slopes with appropriate erosion controls. Steeper slopes, slopes with highly erodible soils, or long slopes require a more complex combination of controls. Erosion control blankets, bonded fiber matrices, or turf reinforcement mats are very effective options. Silt fence or fiber rolls may also be used to help control erosion on moderate slopes and should be installed on level contours spaced at 10- to 20-foot intervals. You can also use diversion channels and berms to keep stormwater off slopes.

Example BMP: Rolled erosion control products

Description: Erosion control products include mats, geotextiles, and erosion control blankets and products that provide temporary stabilization and help to establish vegetation on disturbed soils. Such products help control erosion and help establish vegetation and are often used on slopes, channels, or stream banks.

Figure 9. Illustration of erosion control blankets installed on slope.

Installation Tips:

- Use rolled erosion-control products on slopes steeper than 3 to 1 (horizontal to vertical) and in swales or long channels

Figure 10. Illustration of a fiber roll installation along a slope.

- Trench the top of the blanket into the ground to prevent runoff from flowing under the blanket
- Overlap the lower end of the top mat over the top of the downslope mat to ensure that runoff stays on top of the blankets and mats
- Staple blankets and mats according to specifications

Maintenance:

- Periodically inspect for signs of erosion or failure
- Repair the blanket or mat if necessary
- Continue inspections until vegetation is established at the level required to qualify as final *stabilization*

ESC Principle 6: Protect storm drain inlets. Protect all inlets that could receive stormwater from the project until final stabilization of the site has been achieved. Install inlet protection before soil-disturbing activities begin. Maintenance throughout the construction process is important. Upon completion of the project, storm drain inlet protection is one of the temporary BMPs that should be removed. Storm drain inlet protection should be used not only for storm drains within the active construction project, but also for storm drains outside the project area that might receive stormwater discharges from the project. If there are storm drains on private property that could receive stormwater runoff from your project, coordinate with the owners of that property to ensure proper inlet protection.

Example BMP: Storm Drain Inlet Protection

Description: Storm drain inlet protection prevents sediment from entering a storm drain by surrounding or covering the inlet with a filtering material. Several types of filters are commonly used for inlet protection: silt fence, rock-filled bags, or block and gravel. The type of filter used depends on the inlet type (for example, curb inlet, drop inlet), slope, and volume of flow. Many different commercial inlet filters are also available. Some commercial inlet filters are placed in front of or on top of an inlet, while others are placed inside the inlet under the grate.

Figure 11. Illustration of a storm drain inlet with rock-filled bags filtering stormwater.

Installation Tips:

- Install inlet protection as soon as storm drain inlets are installed and before land-disturbance activities begin in areas with existing storm drain systems
- Protect all inlets that could receive stormwater from your construction project
- Use in conjunction with other erosion prevention and sediment control BMPs—remember, inlet protection is a secondary BMP!
- Design your inlet protection to handle the volume of water from the area being drained. Ensure that the design is sized appropriately.

Maintenance:

- Inspect inlets frequently and after each rainfall

- Remove accumulated sediment from around the device and check and remove any sediment that might have entered the inlet
- Replace or repair the inlet protection if it becomes damaged
- Sweep streets, sidewalks, and other paved areas regularly

SWPPP Tip!

Storm drain inlet protection should never be used as a primary BMP! Use erosion control techniques such as hydromulching or erosion-control blankets to prevent erosion. Use inlet protection and other sediment control BMPs as a *backup* or last line of defense.

ESC Principle 7: Establish perimeter controls. Maintain natural areas and supplement them with silt fence and fiber rolls around the perimeter of your site to help prevent soil erosion and stop sediment from leaving the site. Install controls on the downslope perimeter of your project (it is often unnecessary to surround the entire site with silt fence). Sediment barriers can be used to protect stream buffers, riparian areas, wetlands, or other waterways. They are effective only in small areas and should not be used in areas of concentrated flow.

Figure 12. Illustration of proper techniques to use in installing silt fence.

Example BMP: Silt Fence and Fiber Rolls

Description: A silt fence is a temporary sediment barrier consisting of a geotextile attached to supporting posts and trenched into the ground. Silt fencing is intended to retain sediment that has been dislodged by stormwater. It is designed only for runoff from small areas and is not intended to handle flows from large slopes or in areas of concentrated flow. Fiber rolls serve the same purpose and consist of an open mesh tubular sleeve filled with a fibrous material which traps sediment. Fiber rolls are generally staked to the ground.

Installation Tips:

DO:

- Use silt fence or fiber rolls as perimeter controls, particularly at the lower or down slope edge of a disturbed area
- Leave space for maintenance between toe of slope and silt fence or roll
- Trench in the silt fence on the uphill side (6 inches deep by 6 inches wide)
- Install stakes on the downhill side of the fence or roll
- Curve the end of the silt fence or fiber roll up-gradient to help it contain runoff

DON'T:

- Install a silt fence or fiber rolls in ditches, channels, or areas of concentrated flow
- Install it running up and down a slope or hill
- Use silt fencing or fiber rolls alone in areas that drain more than a quarter-acre per 100 feet of fence

Maintenance:

- Remove sediment when it reaches one-third of the height of the fence or one-half the height of the fiber roll
- Replace the silt fence or roll where it is worn, torn, or otherwise damaged
- Retrench or replace any silt fence or roll that is not properly anchored to the ground

ESC Principle 8: Retain sediment on-site and control dewatering practices. Sediment barriers described in ESC Principle 7 can trap sediment from small areas, but when sediment retention from a larger area is required, consider using a temporary sediment trap or sediment basin. These practices detain sediment-laden runoff for a period of time, allowing sediment to settle before the runoff is discharged. Proper design and maintenance are essential to ensure that these practices are effective.

Figure 13. Illustration of a sediment basin.

You should use a sediment basin for common drainage locations that serve an area with 10 or more acres disturbed at any one time. The basin should be designed to provide storage for the volume of runoff from the drainage area for at least a 2-year, 24-hour storm (or 3,600 cubic feet of storage per acre drained, which is enough to contain 1 inch of runoff, if the 2-year, 24-hour calculation has not been performed). Check your permit for exact basin sizing requirements. Sediment basins should be located at low-lying areas of the site and on the down-gradient side of bare soil areas where flows converge. Do not put sediment traps or basins in or immediately adjacent to flowing streams or other waterways.

Where a large sediment basin is not practical, use smaller sediment basins or sediment traps (or both) where feasible. At a minimum, use silt fences, vegetative buffer strips, or equivalent sediment controls for all down-gradient boundaries (and for those side-slope boundaries deemed appropriate for individual site conditions).

Dewatering practices are used to remove ground water or accumulated rain water from excavated areas. Pump muddy water from these areas to a temporary or permanent sedimentation basin or to an area completely enclosed by silt fence in a flat vegetated area where discharges can infiltrate into the ground. Never discharge muddy water into storm drains, streams, lakes, or wetlands unless the sediment has been removed before discharge.

Keep in mind that some states and local jurisdictions require a separate permit for dewatering activities at a site.

ESC Principle 9: Establish stabilized construction exits. Vehicles entering and leaving the site have the potential to track significant amounts of sediment onto streets. Identify and clearly mark one or two locations where vehicles will enter and exit the site and focus stabilizing measures at those locations. Construction entrances are commonly made from large crushed rock. They can be further stabilized using stone pads or concrete. Also, steel wash racks and a hose-down system will remove even more mud and debris from vehicle tires. Divert runoff from wash areas to a sediment trap or basin. No system is perfect, so sweeping the street regularly completes this BMP.

Example BMP: Stabilized Construction Exit

Description: A rock construction exit can reduce the amount of mud transported onto paved roads by vehicles. The construction exit does this by removing mud from vehicle tires before the vehicle enters a public road.

Figure 14. Illustration of a stabilized construction exit.

You might also want to install a wheel wash when mud is especially difficult to remove or space doesn't allow sufficient tire revolutions (four or five are needed) before exiting the site. Direct wash water to a suitable settling area—do not discharge wash water to a stream or storm drain!

Installation tips:

- Ensure that the exit is at least 50 feet long (generally, the length of two dump trucks) and graded so runoff does not enter the adjacent street
- Place a geotextile fabric under a layer of aggregate at least 6–12 inches thick. The stones or aggregate should be 3–6 inches in diameter
- Train employees and subcontractors to use the designated construction exits. Empower your employees to provide directions to subcontractors and others that are not on the site every day

Maintenance:

- Replenish or replace aggregate if it becomes clogged with sediment
- Sweep the street regularly

ESC Principle 10: Inspect and maintain controls. Inspection and maintenance is just as important as proper planning, design, and installation of controls. Without adequate maintenance, erosion and sediment controls will quickly fail, sometimes after just one rainfall, and cause significant water quality problems and potential violations of the NPDES construction general permit. Your permit likely requires you to maintain your BMPs at all times. To do this effectively, you should establish an inspection and maintenance approach or strategy that includes both regular and spot inspections. Inspecting both prior to predicted storm events and after will help ensure that controls are working effectively. Perform maintenance or corrective action as soon as problems are noted. **Inspection and maintenance of BMPs are addressed in more detail in Chapter 6.**

Other Sediment and Erosion Control Techniques

As mentioned at the beginning of this chapter, there are many other erosion and sediment control techniques that can be used effectively. The BMPs highlighted in this chapter are among those more commonly used and highlight many general erosion and sediment control principles for which other BMPs may be used effectively. Check to see if your state or local government has developed a BMP design manual for detailed information on any BMP you are considering. Appendix D lists several good BMP design manuals. You can also find out more about various BMPs by visiting EPA's Menu of BMPs at **www.epa.gov/npdes/menuofbmps**

The following BMPs are also commonly used at construction sites.

Erosion control measures:

- Surface roughening, trackwalking, scarifying, sheepsfoot rolling, imprinting
- Soil bioengineering techniques (e.g., live staking, fascines, brush wattles)
- Composting
- Sodding

Sediment control and runoff management measures:

- Gravel bag barrier
- Compost berm
- Rock or brush filters
- Baffles or skimmers in sediment basins to increase effectiveness
- Lowering soil levels near streets and sidewalks to prevent runoff
- Level spreaders
- Energy dissipaters
- Check dams

Chapter 5: **SWPPP Development—Selecting Good Housekeeping BMPs**

▶ **This chapter presents a brief discussion of good housekeeping principles to consider to ensure your construction site does not contaminate stormwater runoff.**

As noted in Chapter 3, sediment is the principal pollutant of concern in stormwater discharges from construction sites. But, EPA's CGP and many state construction general permits require that the SWPPP describe good housekeeping measures for other pollutants that might be found on construction sites. This chapter discusses these measures.

Six Key Pollution Prevention Principles for Good Housekeeping

Construction projects generate large amounts of building-related waste, which can end up polluting stormwater runoff if not properly managed. The suite of BMPs that are described in your SWPPP must include pollution prevention (P2) or good housekeeping practices that are designed to prevent contamination of stormwater from a wide range of materials and wastes at your site. The six principles described below are designed to help you identify the pollution prevention practices that should be described in your SWPPP and implemented at your site.

1. Provide for waste management
2. Establish proper building material staging areas
3. Designate paint and concrete washout areas
4. Establish proper equipment/vehicle fueling and maintenance practices
5. Control equipment/vehicle washing and allowable non-stormwater discharges
6. Develop a spill prevention and response plan

P2 Principle 1: Provide for waste management. Design proper management procedures and practices to prevent or reduce the discharge of pollutants to stormwater from solid or liquid wastes that will be generated at your site. Practices such as trash disposal, recycling, proper material handling, and cleanup measures can reduce the potential for stormwater runoff to pick up construction site wastes and discharge them to surface waters.

Figure 15. Illustration showing construction materials with secondary containment and overhead cover to prevent stormwater contamination.

Provide convenient, well-maintained, and properly located toilet facilities. Provide for regular inspections, service, and disposal. Locate toilet facilities away from storm drain inlets and waterways to prevent accidental spills and contamination of stormwater. Treat or dispose of sanitary and septic waste in accordance with state or local regulations.

Proper material use, storage, waste disposal, and training of employees and subcontractors can prevent or reduce the discharge of hazardous and toxic wastes to stormwater. Implement a comprehensive set of waste-management practices for hazardous or toxic materials, such as paints, solvents, petroleum products, pesticides, wood preservatives, acids, roofing tar, and other materials. Practices should include storage, handling, inventory, and cleanup procedures, in case of spills (see the following P2 principles).

Waste Management Checklist

Solid or Construction Waste

- ✓ Designate trash and bulk waste-collection areas on-site
- ✓ Recycle materials whenever possible (e.g., paper, wood, concrete, oil)
- ✓ Segregate and provide proper disposal options for hazardous material wastes
- ✓ Clean up litter and debris from the construction site daily
- ✓ Locate waste-collection areas away from streets, gutters, watercourses, and storm drains. Waste-collection areas (dumpsters, and such) are often best located near construction site entrances to minimize traffic on disturbed soils. Consider secondary containment around waste collection areas to further minimize the likelihood of contaminated discharges.

Sanitary and Septic Waste

- ✓ Provide restroom facilities on-site
- ✓ Maintain clean restroom facilities and empty porta-johns regularly
- ✓ Provide secondary containment pans under porta-johns, where possible
- ✓ Provide tie-downs or stake downs for porta-johns in areas of high winds
- ✓ Educate employees, subcontractors, and suppliers on locations of facilities
- ✓ Do not discharge or bury wastewater at the construction site
- ✓ Inspect facilities for leaks, repair or replace immediately

Hazardous Materials and Wastes

- ✓ Develop and implement employee and subcontractor education, as needed, on hazardous and toxic waste handling, storage, disposal, and cleanup
- ✓ Designate hazardous waste-collection areas on-site
- ✓ Place all hazardous and toxic material wastes in secondary containment
- ✓ Hazardous waste containers should be inspected to ensure that all containers are labeled properly and that no leaks are present

P2 Principle 2: Establish proper building material handling and staging areas.
Your SWPPP should include comprehensive handling and management procedures for building materials, especially those that are hazardous or toxic. Paints, solvents, pesticides, fuels and oils, other hazardous materials or any building materials that have the potential to contaminate stormwater should be stored indoors or under cover whenever possible or in areas with secondary containment. Secondary containment prevents a spill from spreading across the site and include dikes, berms, curbing, or other containment methods. Secondary containment techniques should also ensure the protection of ground water. Designate staging areas for activities such as fueling vehicles, mixing paints, plaster, mortar, and so on. Designated staging areas will help you to monitor the use of materials and to clean up any spills. Training employees and subcontractors is essential to the success of this pollution prevention principle.

SWPPP Tip!

Material Staging Area Measures

Your SWPPP should include procedures for storing materials that can contribute pollutants to stormwater. Consider the following:

- Train employees and subcontractors in proper handling and storage practices
- Designate site areas for storage. Provide storage in accordance with secondary containment regulations and provide cover for hazardous materials when necessary. Ensure that storage containers are regularly inspected for leaks, corrosion, support or foundation failure, or any other signs of deterioration and tested for soundness
- Reuse and recycle construction materials when possible

P2 Principle 3: Designate washout areas.
Concrete contractors should be encouraged, where possible, to use the washout facilities at their own plants or dispatch facilities. If it is necessary to provide for concrete washout areas on-site, designate specific washout areas and design facilities to handle anticipated washout water. Washout areas should also be provided for paint and stucco operations. Because washout areas can be a source of pollutants from leaks or spills,

EPA recommends that you locate them at least 50 yards away from storm drains and watercourses whenever possible.

Several companies rent or sell prefabricated washout containers, and some provide disposal of waste solids and liquids along with the containers. These prefabricated containers are sturdy and provide a more reliable option for preventing leaks and spills of wash water than self-constructed washouts. Alternatively, you can construct your own washout area, either by digging a pit and lining it with 10 mil plastic sheeting or creating an aboveground structure from straw bales or sandbags with a plastic liner. If you create your own structure, you should inspect it daily for leaks or tears in the plastic because these structures are prone to failure.

Regular inspection and maintenance are important for the success of this BMP. Both self-constructed and prefabricated washout containers can fill up quickly when concrete, paint, and stucco work are occurring on large portions of the site. You should also inspect for evidence that contractors are using the washout areas and not dumping materials onto the ground or into drainage facilities. If the washout areas are not being used regularly, consider posting additional signage, relocating the facilities to more convenient locations, or providing training to workers and contractors.

SWPPP Tip!

Washout Area Measures

When concrete, paint, or stucco is part of the construction process, consider these practices which will help prevent contamination of stormwater. Include the locations of these areas and your maintenance and inspection procedures in your SWPPP.

- Do not washout concrete trucks or equipment into storm drains, streets, gutters, uncontained areas, or streams
- Establish washout areas and advertise their locations with signs
- Provide adequate containment for the amount of wash water that will be used
- Inspect washout structures daily to detect leaks or tears and to identify when materials need to be removed
- Dispose of materials properly. The preferred method is to allow the water to evaporate and to recycle the hardened concrete. Full service companies may provide dewatering services and should dispose of wastewater properly. Concrete wash water can be highly polluted. It should not be discharged to any surface water, storm sewer system, or allowed to infiltrate into the ground. It should not be discharged to a sanitary sewer system without first receiving written permission from the system operator

P2 Principle 4: Establish proper equipment/vehicle fueling and maintenance practices. Performing equipment/vehicle fueling and maintenance at an off-site facility is preferred over performing these activities on the site, particularly for road vehicles (e.g., trucks, vans). For grading and excavating equipment, this is usually not possible or desirable. Create an on-site fueling and maintenance area that is clean and dry. The on-site fueling area should have a spill kit, and staff should know how to use it. If possible, conduct vehicle fueling and maintenance activities in a covered area; outdoor vehicle fueling and maintenance is a potentially significant source of stormwater pollution. Significant maintenance on vehicles and equipment should be conducted off-site.

SWPPP Tip!

Equipment/Vehicle Fueling and Maintenance Measures

Consider the following practices to help prevent the discharge of pollutants to stormwater from equipment/vehicle fueling and maintenance. Include the locations of these areas and your inspection and maintenance procedures in your SWPPP.

- Train employees and subcontractors in proper fueling procedures (stay with vehicles during fueling, proper use of pumps, emergency shut-off valves, and such)
- Inspect on-site vehicles and equipment daily for leaks, equipment damage, and other service problems
- Clearly designate vehicle/equipment service areas away from drainage facilities and water-courses to prevent stormwater run-on and runoff
- Use drip pans, drip cloths, or absorbent pads when replacing spent fluids
- Collect all spent fluids, store in appropriate labeled containers in the proper storage areas, and recycle fluids whenever possible

P2 Principle 5: Control equipment/vehicle washing and allowable non-stormwater discharges. Environmentally friendly washing practices can be practiced at every construction site to prevent contamination of surface and ground water from wash water. Procedures and practices include using off-site facilities; washing in designated, contained areas only; eliminating discharges to the storm drain by infiltrating the wash water or routing to the sanitary sewer; and training employees and subcontractors in proper cleaning procedures.

Take a Closer Look…

Non-Stormwater Runoff

A construction site might have sources of runoff that are not generated by stormwater. These non-stormwater discharges include fire hydrant flushing, vehicle or equipment wash water (no detergents!), water used to control dust, and landscape irrigation.

What does this mean to me?

Take steps to infiltrate these sources of uncontaminated water into the ground. You can also route these sources of water to sediment ponds or detention basins or otherwise treat them with appropriate BMPs.

SWPPP Tip!

Equipment/Vehicle Washing Measures

The following equipment/vehicle washing measures will help prevent stormwater pollution. Include the location of your washing facilities and your inspection and maintenance procedures in your SWPPP.

- Educate employees and subcontractors on proper washing procedures
- Clearly mark the washing areas and inform workers that all washing must occur in this area
- Contain wash water and treat and infiltrate it whenever possible
- Use high-pressure water spray at vehicle washing facilities without any detergents because water can remove most dirt adequately
- Do not conduct any other activities, such as vehicle repairs, in the wash area

P2 Principle 6: Develop a spill prevention and response plan. Most state and EPA construction general permits require the preparation of spill prevention and response plans. Generally, these plans can be included or incorporated into your SWPPP. The plan should clearly identify ways to reduce the chance of spills, stop the source of spills, contain and clean up spills, dispose of materials contaminated by spills, and train personnel responsible for spill prevention and response. The plan should also specify material handling procedures and storage requirements and ensure that clear and concise spill cleanup procedures are provided and posted for areas in which spills may potentially occur. When developing a spill prevention plan, include, at a minimum, the following:

- Note the locations of chemical storage areas, storm drains, tributary drainage areas, surface waterbodies on or near the site, and measures to stop spills from leaving the site
- Specify how to notify appropriate authorities, such as police and fire departments, hospitals, or municipal sewage treatment facilities to request assistance
- Describe the procedures for immediate cleanup of spills and proper disposal
- Identify personnel responsible for implementing the plan in the event of a spill

SWPPP Tip!

Spill Prevention Measures

Additional spill prevention measures that will help prevent spills and leaks include the following:

- Describe and list all types of equipment to be used to adequately clean up the spill
- Provide proper handling and safety procedures for each type of waste
- Establish an education program for employees and subcontractors on the potential hazards to humans and the environment from spills and leaks
- Update the spill prevention plan and clean up materials as changes occur to the types of chemicals stored and used at the facility

Take a Closer Look…

Spill Prevention, Control and Countermeasure (SPCC) Plan

Construction sites may be subject to 40 CFR Part 112 regulations that require the preparation and implementation of a SPCC Plan to prevent oil spills from aboveground and underground storage tanks. Your facility is subject to this rule if you are a nontransportation-related facility that:

- Has a total storage capacity greater than 1,320 gallons or a completely buried storage capacity greater than 42,000 gallons and
- Could reasonably be expected to discharge oil in quantities that may be harmful to navigable waters of the United States and adjoining shorelines

Furthermore, if your facility is subject to 40 CFR Part 112, your SWPPP should reference the SPCC Plan. To find out more about SPCC Plans, see EPA's website on SPPC at **www.epa.gov/oilspill/spcc.htm**

What does this mean to me?

Reporting Oil Spills

In the event of an oil spill, you should contact the National Response Center toll free at 1-800-424-8802 for assistance, or for more details, visit their website: ***www.nrc.uscg.mil/nrchp.html***

Construction Site NPDES Compliance Inspection Checklist

Construction Management & Inspection Division

Permit #: Date:

Inspection Type: Weather:

Inspected By: Project #/Name:

Mark (√) box "Yes", "No", or "N/A"; if there are comments, mark (√) box "Comment".

Yes	No	N/A	Comment	Inspection Description
☐	☐	☐	☐	1. Are slopes steeper than 3:1 properly covered?
☐	☐	☐	☐	2. Are areas flatter than 3:1 covered or protected by desilting basins?
☐	☐	☐	☐	3. Is the SWPPP wall map up to date and accurate?
☐	☐	☐	☐	4. Are all gravel bags, straw waddles, silt fences, and other linear sediment barriers in place in accordance with the SWPPP, and are they functioning properly?
☐	☐	☐	☐	5. Are basins designed and maintained to provide the required retention/detention?
☐	☐	☐	☐	6. Is the stabilized construction entrance preventing tracking (i.e. working properly)?
☐	☐	☐	☐	7. Are all downstream storm drain inlets protected with devices that are in working order and being properly maintained?
☐	☐	☐	☐	8. Are non-storm-water BMP's being used? (e.g. concrete washouts)
☐	☐	☐	☐	9. Are all material and equipment handling, storage, and maintenance areas clean, and free of spills, leaks, or other deleterious materials?
☐	☐	☐	☐	10. Is the site free from litter and the litter collected and placed in covered containers?
☐	☐	☐	☐	11. Are temporary stockpiles and/or construction materials in approved areas and protected/covered?
☐	☐	☐	☐	12. Are all areas designated to be seeded or landscaped properly maintained (i.e. irrigation functioning properly, 90-100% coverage)? NO BMP's REQUIRED
☐	☐	☐	☐	13. Are all natural drainage courses and open spaces in proximity to this project protected?
☐	☐	☐	☐	14. Are all BMP's maintained in functional order? (e.g. sediment removed, basins pumped down, repairs made, etc.)

Carlsbad Conserves

Environmental Programs Newsletter • Summer 2007

Making the Grade

Annual Public Opinion Survey

EACH YEAR THE CITY OF CARLSBAD asks for a report card from its residents. This feedback is collected and analyzed in the annual Public Opinion Survey and used to plan programs within Carlsbad. City officials and staff take the Public Opinion Survey results very seriously.

The most recent Public Opinion Survey was published in early 2007, reflecting data gathered in 2006. Residents were asked questions about how they regularly receive information about City programs and about their knowledge of environmental practices.

Carlsbad Environmental Programs includes storm water protection, solid waste management and water conservation. Each City work area sets benchmarks – a goal to work toward – and measures achievement.

Residents report a high level of satisfaction with the City's Environmental Programs.

Residents are happy with their trash and recycling service

BASED UPON FEEDBACK from the Public Opinion Survey, residents are happy with their trash and recycling service and generally satisfied with the options offered for Household Hazardous Waste (HHW). The rating in the latest survey indicated an 87% satisfaction with trash and an 85% satisfaction with recycling service. HHW disposal service was rated at 66%.

Do you know what to do?

INTERESTING RESULTS gathered from the Public Opinion Survey included City education efforts on storm water protection and water conservation are reaching residents. The disheartening thing is that residents report not changing their behaviors despite knowing how to reduce water pollution.

Results of the survey indicated that 65% of those residents interviewed had seen or heard of how to prevent pollution in our creeks, lagoons and the ocean (up from 58% last year).

Despite almost two-thirds of residents knowing what to do, the survey indicated that the most common answer to the follow-up question of "what have you done to reduce water pollution" was *nothing*!

Storm Drains Are Not Filtered

STORM DRAINS ARE NOT FILTERED or connected to the sewer system; items entering the storm drains will eventually enter the area's waterways. Storm drains are there to prevent flooding and convey rainwater – not other liquids or trash.

What does this mean? Soaps, trash, car fluids, fertilizers and pet waste will eventually pollute our water. You could be swimming in waste!

Steps YOU can take to prevent storm water pollution:

- Wash your car at a professional carwash or on your lawn, not on the streets
- Properly dispose of materials. Storm drains are meant to carry rainwater, not trash
- Spread the word that storm drains are not filtered before delivering water to creeks, lagoons and the ocean
- Ask anyone working for you – landscapers or car detailers – to practice proper waste disposal

Storm Water Protection maintains a hotline to report illegal discharges into the storm drains – when you see it happening please call (706) 602-2799.

If you simply want more information about the storm drain system please call the Environmental Programs hotline at (760) 602-4646.

Water Conservation

Call Carlsbad Environmental Programs for information on ways you can reduce your water usage.

CARLSBAD MUNICIPAL WATER DISTRICT (CMWD) services most of Carlsbad's residents. CMWD is committed to implementing conservation programs that will reduce water demand and lessen our dependency on imported water supplies. These programs can assist you to more efficiently manage your water consumption and are offered free of charge in conjunction with the District's water wholesale suppliers, the Metropolitan Water District.

Vouchers are like coupons that are redeemed at the time of purchase. Items like high-efficiency clothes washers and landscaping controllers are eligible for vouchers. By getting a voucher before you make your purchase, you are guaranteed an immediate discount when you purchase from a participating supplier. Voucher supplies are limited, and are distributed on a first come, first served basis by calling 1-800-986-4538. You must be a Carlsbad Municipal Water District customer to receive vouchers; Olivenhain Water District does not offer the vouchers to its customers (not all Carlsbad residents qualify).

If you are interested in ways you can reduce your water usage, please call Carlsbad Environmental Programs for information. Our Water Conservation Specialist will come to your home or business and perform a thorough indoor/outdoor water survey, including recommendations on water usage improvements for your property. Call (760) 602-4646 to make an appointment for a water use audit.

Household Hazardous Waste Event Results

THE CITY OF CARLSBAD recently held its second annual Special Household Hazardous Waste (HHW) Drop-off Event. The event was free to residents of Carlsbad and offered a disposal method within the City for hazardous items within the typical home. The event, held April 21st, was a huge success. 514 residents came to the event and together those residents disposed of approximately 33 tons of hazardous materials. The total cars more than doubles the total from the previous year (232 to 514) and the material collected more than triples the 2006 total (9 tons to 33 tons). Great job everyone!

The items disposed at the event consisted of paint, used motor oil and filters, electronic waste (TVs and computers), and many other items.

For residents who either missed the event or who have HHW to dispose of throughout the year there are options. First, Carlsbad residents can dispose of HHW for free at either Vista or Oceanside permanent HHW facilities (addresses listed below). Another option is to pay $10 to have Clean Harbors (a City contractor) come to your home and collect your materials. Our next Special HHW Drop Off Event will be in April 2008.

HHW materials cannot be placed in the curbside trash – they require special handling. When transporting HHW the federal government has mandate that no one may transport more than 15 gallons or 125 lbs without a special permit. Please be careful when transporting HHW materials as they have been designated hazardous for a reason!

Oceanside HHW Facility
Free Drop-Off

Bulky Item Appointments Online!

BEGINNING IMMEDIATELY Waste Management and the City of Carlsbad are happy to offer bulky item collection appointments online through the Waste Management website. There will still be an appointment window available to residents to schedule appointments but the online service will add greater convenience – allowing residents to make their own appointment. Simply go to *http://northcounty.wm.com* or *http://www.carlsbadca.gov/waste*. **The next bulky item collection events are September 22nd and November 10th.**

Carlsbad Conserves

Environmental Programs Newsletter • Fall 2007

Water Conservation Begins At Home

WATER CONSERVATION is an environmental goal at the City of Carlsbad. Conserving water has always been important but never more so than right now. Although we enjoy seven miles of some of California's most beautiful beaches and from many vantage points throughout the City we can look out our windows and see water, we are on the verge of experiencing a water shortage. With the combination of historic dry conditions, limited local water sources and a court order that will reduce water deliveries to our area, we face the very real potential of mandated water restrictions in 2008.

The City's Environmental Programs Division is committed to working together with the citizens of Carlsbad to effectively reduce our water consumption and conserve this precious resource. We encourage you to get involved:

- Take part in the San Diego County Water Authority's 20-Gallon Challenge (*www.20gallonchallenge.com*); see the illustration below for some of the water-saving tips suggested in the Challenge.
- Take advantage of the various vouchers for water-saving products offered to Carlsbad Municipal Water District customers by calling (800) 986-4536.
- Make an appointment for a water use audit offered to District customers to help improve water usage and reduce water waste by calling (760) 602-4646.

YOU are an integral part of the water conservation process and the cost of your participation is nominal. By instituting a few or all of the following daily household conservation actions, see how the potential estimated water savings add up!

Conserving Water Helps Protect Our Storm Drains

This view brought to you by you.

Carlsbad is a great place to live, thanks to people like you, who show they care about the Earth by taking care of the neighborhood. Please call or visit our website to learn additional ways to keep Carlsbad – and the planet – beautiful.

Neighborly Tips:

- Check for oil leaks frequently and repair immediately to avoid oil spots on driveways and in streets.
- When you change your motor oil, recycle. Used motor oil is the largest source of pollution in our ocean. Carlsbad has three locations for recycling.
- Clean up pet waste from yard, patios, driveways and other hard surfaces frequently and dispose of properly. Never hose pet waste into streets or gutters.
- During pool construction and home remodeling, contain ALL materials and dispose of properly. Materials such as cement, paint, stucco, Gunite, mortar and sediment must not be discharged into storm drains.

MANY WATER CONSERVING ACTIONS also help protect our storm drains which in turn help to keep our creeks, lagoons, and ocean pollution-free. Water traveling through our storm drains does not end up in water treatment plants but goes straight into our bodies of water. Did you know that the majority of water pollution comes from common materials such as oil, fuel, and fluids leaked from cars, soaps from washing our cars, lawn and garden fertilizers, and sediments from a lack of erosion control?

YOU have the power not only to keep our water free from pollution but to reduce water waste by adopting the following procedures and practices:

- Avoid over-irrigating lawns and gardens. Excessive watering washes fertilizers and pesticides into gutters and storm drains AND wastes water.
- Use a broom, not a hose. Rather than hosing off sidewalks, parking areas and garages which forces pollutants into our storm drains AND wastes water, sweep up yard waste and debris and dispose of them in appropriate trash receptacles.
- Rather than washing your car at home take it to a commercial car wash that recycles water. Washing vehicles at home results in soap in our storm drains AND wastes water.

By practicing proper waste disposal you protect and conserve our water – now that's multi-tasking!

Use a broom, not a hose.

Important Dates in 2008

CONSERVING WATER IS VERY IMPORTANT but it's not enough. To keep our environment beautiful and viable for generations to come, we must also dispose of solid waste, bulky items and household hazardous waste properly and recycle when appropriate. Bulky items, such as furniture and appliances, and household hazardous waste, such as paint, oil, fertilizers and other common household items, can NOT be placed in your trash receptacles. Please make note of the following events scheduled in 2008 to help accommodate Carlsbad residents with the proper disposal of these items.

Call Waste Management at (760) 929-9400 or visit their website at *http://northcounty.wm.com* to schedule; limit of 2 bulky items per Carlsbad resident per quarter at no charge.

Bulky Item Dates for 2008

Saturday, January 26th
Appointments accepted January 7-14th

Saturday March 22nd
Appointments accepted March 3-10th

Saturday June 21st
Appointments accepted June 2-9th

Saturday September 20th
Appointments accepted September 1-8th

Saturday, November 8th
Appointments accepted October 20-27th

Contact Waste Management to learn about other options for disposing of bulky items throughout the year or if you are unsure if your household item(s) qualifies.

Winter 2007 - Spring 2008

NEWS • EVENTS • PROGRAMS • CLASSES

think globally. act neighborly.

Neighborly Tip #4 : Prevent

- Storm drains in the streets lead to creeks, lagoons, and oceans. Don't dump anything into them.
- Use a broom instead of a hose to clean paved surfaces so dirt and other contaminents don't go into drains, including ash from the recent fires.
- Use a drip pan beneath your vehicle if you have leaks or are doing engine work. Recycle used oil.

Recycle Christmas Trees*

Don't let your tree become a fire hazard; recycle your tree – it's easy!

- Remove decorations, lights and tinsel
- Cut tree into four-foot pieces
- Dispose of tree curbside on your scheduled trash day

Trees may also be disposed of at several locations throughout North County. Call Waste Management at 929-9400 or visit *northcountywm.com* for locations.

*Flocked trees are not recyclable

Start Your Spring Cleaning Early: Sign Up for Bulky Item Collection

Has spring cleaning left you with an old bookshelf, refrigerator or mattress that you don't know what to do with? Then Bulky Item Collection is just for you! Call Waste Management at 929-9400 from Jan. 7 to 14 to schedule an appointment for Saturday, Jan. 26. Call from March 3 to 10 to schedule an appointment for Saturday, March 22. Other collection dates will be available later this year and are listed at *www.carlsbadca.gov/waste/bulky.html*.

On your scheduled pick-up date, leave your items curbside by 7 am. There will be no charge for the first two items picked up during these special collection events.

Residents may schedule other pick-up appointments throughout the year for a cost of $35 for the first item and $5 for each additional item.

Keep Hazardous Waste In Its Place

Household hazardous waste (HHW), better known as gasoline, TVs, computers, fertilizers and many other everyday items, cannot be thrown away with your normal trash and recycling. These items contain various substances that are dangerous to humans and the environment. Keep your family and City safe, and use one of these three options to dispose of hazardous waste:

Drop-off HHW at a disposal site:
2880 Industry Street, Oceanside
By appointment only, call 929-9400

1145 East Taylor Street, Vista
Every Saturday (except holiday weekends), call (800) 444-4244

Schedule a door-to-door pick up
Contact Clean Harbors, Inc. (800) 444-4244
$10 co-payment

Attend an annual HHW Collection Event

Visit *www.carlsbadca.gov* and search for "Household Hazardous Waste" to schedule an appointment.

For a complete list of HHW items, visit *www.carlsbadca.gov* and search for "Household Hazardous Waste."

Green Scene: A New Year, A Greener You

Water Conservation: Challenge Yourself

Did YOU take the 20-Gallon Challenge offered by the San Diego County Water Authority? If you registered, congratulations! By adopting lifetime water conservation habits, you benefit not only yourself but also the community and the environment.

Here are some simple steps you can take to meet the 20-Gallon Challenge.

- Run the dishwasher only when it is full – 2 gallons
- Fix a leaky faucet – 15 gallons
- Fix a leaky toilet – 30 gallons
- Water your yard only before 6 am or after 8 pm – 20 gallons
- Install a water-efficient drip irrigation system – 20 gallons
- Install a pool cover to reduce evaporation – 30 gallons

For a complete listing, visit the San Diego County Water Authority Web site at *www.sdcwa.org*.

Storm Water Drains, Only For Rain

Storm drains primarily carry rain water away from developed areas to prevent flooding, and they are not connected to sanitary sewer systems and treatment plants.

Untreated storm water and the pollutants it carries flow directly to creeks, lagoons and the ocean. The majority of water pollution now comes from common, everyday activities performed by all of us.

You can help significantly reduce the amount of harmful substances that travel through our storm drains by adhering to the following:

Pools/Spas

- Clean filters onto dirt areas and not in streets or near storm drains.
- Drain de-chlorinated water only where it will not flow into storm drains; discharge onto a landscaped area or when applicable, to a sanitary sewer clean out.
- Call the Encinas Water Authority at 438-3941 to locate your nearest clean out. For additional guidelines on proper pool/spa draining, check out the California Stormwater Quality Association's Construction Handbook at *www.cabmphandbooks.com/Construction.asp*.

Landscape Maintenance

- Use fertilizers and pesticides sparingly, and dispose of all unused portions at a Household Hazardous Waste collection site.
- Avoid over-irrigation to reduce run-off which washes fertilizers, pesticides and sediment into streets and storm drains.

Car Washes

- When washing your car at home, use soap sparingly. When finished, pour the bucket of soapy water down the sink rather than in the street.
- Better yet, instead of washing your vehicles at home take them to a commercial car wash that re-uses wash water.

Used Motor Oil (the single largest source of oil pollution in water)

- Check frequently for leaks and repair immediately when found to avoid oil drips on driveways and in streets.
- Do not hose off oil spills or leaky spots, which washes these pollutants into our storm drains. Instead, absorb the sites with sand or kitty litter then sweep up and dispose of properly.
- Recycle used motor oil and only purchase recycled ("refined") motor oil. Call 434-2980 for locations and hours of operation of facilities that accept used motor oil.

Pet Waste

- Bring a bag on walks with your pet to collect waste.
- Flush waste down a toilet or place it into a sealed bag and dispose of in a trash receptacle.

Always remember – THINK then ACT when caring for our environment!

Welcome to the City of Carlsbad

This brochure provides guidelines and helpful hints on the environmental services available to Carlsbad residents.

Solid Waste Collection

The Solid Waste section will assist residents in understanding the services provided for refuse, recycling and yard waste collection in the City of Carlsbad. The Additional Waste Services section of this flyer instructs residents how and where to properly dispose of household hazardous waste, electronic waste and used oil.

Water Conservation

This section provides residents with cost saving options that will aid them in their efforts to conserve water. Resources such as toilet and clothes washer voucher programs and free on-site water audits are available.

Storm Water Protection

Storm water pollution affects everyone who lives, works and plays in the City of Carlsbad. Litter, fertilizers, pet waste, oil and soap can be washed from our yards, driveways and streets into the storm drain system and directly into our creeks, lagoons, and onto our beaches. This pollutes our water and endangers wildlife. The Storm Water section of this flyer identifies some preventative measures residents can take to minimize the source of these pollutants and the number to call to report illegal discharges in the storm drain system.

Brought to you in partnership by the City of Carlsbad and Waste Management, the City's refuse and recycling provider.

Storm Water Protection

Did you know that storm drains are NOT connected to sanitary sewer systems and treatment plants? The primary purpose of storm drains is to prevent flooding by carring rainwater away from developed areas . Untreated storm water flows directly into our creeks, lagoons and the ocean, carrying any pollutants from the roads.

Storm water pollution comes from a variety of sources, including:

- Oil from vehicles
- Excess pesticides and fertilizer from landscaping
- Bacteria from pet waste
- Sediment from construction and landscaping projects
- Soap from car washing
- Litter
- Lawn and garden debris
- Improperly disposed home improvement products (paint, stucco, grout, cement, solvent)
- Washing driveways and sidewalks

Pollution prevention is up to YOU!

Please help us protect OUR environment. Here are some tips to help keep creeks, lagoons and the ocean clean:

- Bag and dispose of pet waste in a trash can, not a yard waste container
- Use fertilizers and pesticides sparingly
- Adjust sprinklers to prevent over-watering
- When possible, take your car to a commercial car wash

- Keep automobiles properly maintained to prevent fluid leaks
- Properly dispose of trash and cigarette butts
- Volunteer at cleanup events in Carlsbad

"Only rain in the storm drain"

To report an illegal discharge or for more information, call our hotline at (760) 602-4646.

www.carlsbadconserves.org

Water Conservation

The Carlsbad Water Ethic promotes responsible and efficient water use in our arid city. Our residents should follow this Water Ethic even when we are not in a drought situation. We encourage residents to adopt these behaviors as a way of life.

- Incorporate drought-tolerant plant materials and micro-irrigation (drip) systems wherever possible into new landscaping
- Water should not leave the user´s property due to over-irrigation of landscape
- Water during the early morning or evening hours to minimize evaporation
- Investigate and repair all leaks
- Water cannot be used to clean paved surfaces, such as sidewalks, driveways, parking areas, etc., except to alleviate immediate safety or sanitation hazards
- Recycled water shall be used wherever and whenever possible.

Residential Voucher Programs

Carlsbad participates in a voucher/rebate program with other San Diego County Water Agencies. The goal of this program is to reduce the amount of water residents use - thus increasing the available supply to all residents. Vouchers are available for money off of the purchase and installation of water saving devices like ultra low flow toilets, high-efficiency clothes washers, landscaping and Weather-Based Irrigation Controllers.
Interested residents and Home Owners Associations can contact the Voucher Processing Center at (800) 986-4538. The center is open Monday through Friday from 8:00 a.m. to 5:00 p.m., and Saturday from 8:00 a.m. to 3:00 p.m.

Residential Survey

Carlsbad residents can receive a free, on-site water conservation survey. This will include a review of indoor and outdoor water saving opportunities, a leak check, and an irrigation system and water schedule review. Customers are also shown how to read their water meter and are given literature promoting other conservation programs.
For ideas on water conservation at home refer to www.h2ouse.org

Holiday Schedule

Waste Management does not offer service on the following holidays:

- New Year's Day
- Memorial Day
- Independence Day
- Labor Day
- Thanksgiving Day
- Christmas Day

When a holiday falls on a weekday, collection will be delayed one day for the remainder of the week.

Holiday announcements will be published in your local newspaper.

www.carlsbadconserves.org

Buyback Center

Redeemable items

- Newspaper
- CRV aluminum cans
- CRV glass bottles
- CRV plastic bottles
- CRV bi-metal cans

CRV = California Redemption Value. Ready-to-drink beverage containers which are packaged in aluminum, glass, plastic, bi-metal or any combination of these materials.

Also accepted:

- Electronic devices
- Household batteries

(For more information see Household Hazardous Waste)

Donation items

- Non CRV aluminum
- Non CRV glass
- Non CRV plastic
- Tin cans
- White ledger paper
- Computer paper
- Mixed paper
- Corrugated cardboard

Hours: Tuesday - Saturday
8:00 a.m. - 4:00 p.m.
Closed:
1:00 p.m. - 1:40 p.m.
(760) 929-9400

Bulky Item Pickup

Need to dispose of such items as furniture (couch, chair, dresser, cabinet, bookshelf, mattress) or appliances (toilet, washer, stove, sink)? FREE bulky item collection days are scheduled periodically in your community. Residents may dispose of two items per event. Special pickups are available for a fee. Call Waste Management at (760) 929-9400 to schedule an appointment or for additional information.

Electronic Waste

What is E-Waste?

The rapid advances in new technology and demand for new electronic equipment have increased the disposal of outdated electronic equipment known as "E-Waste."

Proper disposal of "E-Waste" through recycling and reuse prevents them from reaching landfills. This also helps to minimize waste, and provide usable items to organizations that need them as well as recapture valuable resources.

- Cell phones
- Computers
- Televisions
- VCRs/DVDs
- Stereos
- Printers
- Fax machines
- Monitors
- Microwaves ovens

Universal Waste

(Including household batteries)

As of February 9, 2006, it is now illegal in the State of California to dispose of common household items such as alkaline batteries*, mercury thermometers and thermostats, and fluorescent light bulbs into the trash. These items are now classified as Universal Waste, and must be disposed of properly through the Household Hazardous Waste (HHW) program. However, in an effort to make the disposal of common household batteries including re-chargeable ones, more efficient, the City has partnered with Waste Management to allow residents to drop off the batteries at the Waste Management Recycling Center located at 1145 East Taylor St., Vista, free of charge. The City recommends storing your used fluorescent light bulbs in a safe place until they can be brought to the HHW facilities or scheduled for a home pick-up.

**Note - rechargeable batteries can also be brought to a participating retail store that provides free drop-off bins for proper disposal.*

Where to recycle Electronic and Universal waste

Door-to-door: Call (800) 444-4244

Waste Management
5960 El Camino Real, Carlsbad
Hours: Tuesday - Saturday 8:00 a.m. - 4:00 p.m.
Closed: 1:00 p.m. - 1:40 p.m.
For additional information please call (760) 929-9400
COST: CRTs (television, laptops, monitors): no charge
All others electronic devices fee at drop-off.

Household Hazardous Waste Collection Facility
1145 East Taylor Street, Vista
Hours: Saturdays 9:00 a.m. - 3:00 p.m.
For additional information please call (800) 714-1195
COST: Currently there is no cost to Carlsbad residents.

www.carlsbadconserves.org

Household Hazardous Waste

MATERIALS ACCEPTED:

- Used motor oil and filters
- Pool cleaners
- Automobile fluids (antifreeze, gasoline, brake, transmission)
- Household cleaners
- Landscaping chemicals
- Automotive batteries
- Mercury thermostats
- Mercury thermometers
- Non-empty aerosol cans
- Lamps with fluorescent tubes, sodium vapor lamps
- Household batteries
- Paint
- Mercury switches(automotive or non-automotive light switches)
- Novelties such as some singing greeting cards or flashing athletic shoes

Drop-off

Residents may bring up to 15 gallons or 125 pounds per visit.

A proof of residency required (California driver license, utility bill or other).

No charge to residents at either location.

Door-to-door collection

The City has implemented a door-to-door program that allows residents to make an appointment to have their HHW picked up at their residence for a small co-pay of $10. This door-to-door program is available to all residents. For more information on this program, or to set up an appointment, call (800) 444-4244.

2880 Industry St., Oceanside

PUT TOXIC WASTE IN ITS PLACE

Funded by a grant from the California Integrated Waste Management Board.

Overflow Trash

5960 El Camino Real, Carlsbad

PALOMAR TRANSFER STATION
(760) 603-0153

Residents can dispose of overflow trash at the Palomar Transfer Station. A fee will be charged at the time of disposal. For additional information please call the Palomar Transfer Station at (760) 603-0153.

No hazardous or regulated waste is accepted at this facility including batteries, paint, tires, liquids and electronic waste.

Open to residents
Saturday & Sunday
7:30 a.m. to 4:00 p.m

Holiday Trees

The City, in partnership with Waste Management, has a holiday tree recycling and collection program that allows residents to drop off their trees for recycling or be picked up at the curb for collection. This service is free to all Carlsbad residents and it operates the day after Christmas through the first two weeks in January. For locations where residents may drop-off the trees for recycling check the City's website or the Community Services Guide.

For curbside pick-up remove stands, tinsel and ornaments from trees, cut in sections no longer than 4 feet and place out on the curb for collection. Flocked trees are not recyclable and will be collected by the trash drivers.

Holiday schedule announcements will be published.

Sanitary Sewer Overflows
July 1, 2007 - March 23, 2008

Date	Source	Substance	Volume	Enter MS4?	Enter RW?	Response
03/22/2008	Private Interceptor	FOG	600	Yes	Yes	Costco notified to clear and clean interceptor and lateral, and to clean storm darins affected.
03/04/2008	Private Lateral	Sewage	10	No	No	Replaced C/O cap, had resident cal plumber.
03/03/2008	Private Lateral	Sewage	75	No	No	Illegal storm drain to sewer connection to be disconnected. Call plumber for stoppage.
03/01/2008	Private Lateral	Sewage	25	No	No	Debris in lateral.
01/31/2008	Private Lateral	Sewage	30	No	No	Plumber cleared grease blockage.
01/17/2008	Private Lateral	Sewage	45	No	No	Plumber cleared grease blockage.
12-31-07	Sewer MH	Sewage	350	No	Yes	Clear root stoppage, TV to ID cause.
12/23/2007	Private Lateral	Sewage	5	No	No	Plumber cleared root blockage.
12/21/2007	Private Lateral	Sewage	20	No	No	Plumber cleared blockage.
11-13-07	Sewer Main C/O	Sewage	60	No	No	Clear stoppage, capture all spill.
11-04-07	Sewer MH	Sewage	2000	No	No	Contained, cleared grease blockage, and captured all.
10-28-07	Sewer MH	Sewage	3625	No	No	Vandalism, construction debris,
10/17/2007	Private Lateral	Sewage	40	No	No	Plumber cleared tampons and sanitary napkins in cleanout.
10/11/2007	Private Lateral	Sewage	40	Yes	Yes	Plumber cleared root blockage.
09/10/2007	Private Lateral	Sewage	30	No	No	Plumber cleared lateral stoppage.
09/07/2007	Private Lateral	Sewage	15	Yes	Yes	Root blockage.
09-04-07	Sewer MH	Sewage	1	No	No	Clear root stoppage.

These spills were from the City of Carlsbad maintained sewer main.

Date	Address	Volume (gallons)	Recovered (gallons)	lat - deg.min.sec	long - deg.min.sec	CIWQS

1.0 INTRODUCTION

This section of the City of Carlsbad s (City) Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report addresses the implementation of the Regional Water Quality Control Board (Regional Board) Order No. 2007-0001 (NPDES No. CAS0108758) commonly known as the Municipal Storm Water Permit (Permit). The recent Permit was issued January 24, 2007, and replaced the prior municipal storm water permit issued in 2001 (Order 2001-01). The permit went into effect on March 24, 2008 and this report covers the reporting period from March 24, 2008 through June 30, 2008.

The Regional Board issued this Permit to prevent and control polluted urban runoff from Municipal Separate Storm Sewer Systems (MS4s) to downstream water bodies. As runoff flows through urban areas, it can carry harmful pollutants such as pathogens, sediments, fertilizers, pesticides, heavy metals, and petroleum products. Pollutants entering a receiving water body through the MS4 may harm aquatic life through toxicity and habitat degradation.

Each of the Copermittees listed in the Permit was required to develop a JURMP outlining their approach to protecting water quality and preventing harmful impacts from polluted urban runoff. The Permit requires the submittal of an Annual Report to the Regional Board to document the progress and implementation of the JURMP.

The Permit also requires each Copermittee to protect water quality during the three major phases of urban development: (1) land use planning for new development; (2) construction; and (3) the use or existing development phase.

The City is a municipal corporation, following the Council-Manager form of government. City Departments fall under one of five major service areas (MSA s): Public Safety, Administrative Services, Public Works, Community Development, and Community Services. While the City created the Storm Water Protection Program to help implement the Permit, program implementation is carried out by several departments within different MSA s. This allows for program implementation and new requirements to be incorporated into daily activities of City employees, instead of being viewed as completely new requirements without a connection to on-going services.

The City encompasses just over 42 square miles and borders 6 miles of coastline. Carlsbad also contains or borders three coastal lagoons (Buena Vista, Agua Hedionda and Batiquitos lagoons). The City is part of the Carlsbad Hydrologic Unit (Watershed), which includes four separate sub-watersheds that run through Carlsbad. These include each of the three lagoons and their respective drainage areas, in addition to a fourth watershed commonly known as Encinas Creek. Portions of Agua Hedionda Lagoon and Buena Vista Lagoon are listed as impaired for bacterial indicators and sedimentation/siltation on the Federal Clean Water Act Section 303(d) Impaired Water Bodies list. Buena Vista Lagoon is also impaired for nutrients. While this report focuses on the City s implementation of the JURMP and not the Watershed program, the two are becoming more intertwined as waterbodies and implementation strategies cross programmatic and jurisdictional boundaries.

1.1 Report Organization

This Annual Report was prepared in accordance with the requirements of the Permit. It contains a comprehensive description of the activities conducted by the City of Carlsbad to meet the requirements of section F of the Permit; an accounting of all illicit discharges reported, all inspections conducted, all enforcement actions taken, all education efforts conducted; a description of the public participation mechanisms utilized during the JURMP implementation process; a summary of all urban runoff related data not included in the annual monitoring report; identification of management measures proven to be effective in reducing urban runoff pollutants and flow; identification of water quality improvements or degradation; and a budget for the upcoming year. A list of acronyms is provided in Appendix 1-1.

The organization of this report follows the table of contents agreed to and submitted by the Copermittees to the Regional Board. The Annual Report is divided into sections matching major sections in the Permit and the JURMP. As with the JURMP, many of the activities described in separate JURMP sections overlap with one another, so an activity may be referenced in more than one report section. The Annual Report is organized as follows:

Section 1 - Introduction
Section 2 Development Planning Component
Section 3 Construction Component
Section 4 - Municipal Component
Section 5 Industrial/Commercial Component
Section 6 - Residential Component
Section 7 Illicit Discharge Detection and Elimination Component
Section 8 Outreach and Education Component
Section 9 Public Participation Component
Section 10 Fiscal Analysis Component
Section 11 - Assessment of JURMP Effectiveness Component
Section 12 Special Investigations Component
Section 13 Non Emergency Fire Fighting Flows
Section 14 JURMP Revisions
Section 15 - Conclusions and Recommendations

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

This section outlines the Development Planning actions implemented by the City under San Diego Municipal Permit Order No. 2007-001 (the 2007 Municipal Permit) and covers the portion of the annual reporting period from March 24, 2008 through and including June 30, 2008. During this reporting period, the City maintained compliance with all land-use planning requirements of the 2007 Municipal Permit.

The City submitted an updated Jurisdictional Urban Runoff Management Plan to the Regional Board March 24, 2008 (hereinafter referred to as the 2008 Carlsbad JURMP). The 2008 JURMP incorporated numerous project processing changes to improve development related storm water pollution prevention activities and to ensure complete conformance with the Development Planning Component of the 2007 Municipal Permit.

During preparation of the 2008 Carlsbad JURMP, the City performed an in-depth review of its development planning and review processes. In summary, the review found that the City s existing land-use planning policies and processes met requirements and that numerous changes and modifications to the development project approval process were needed to ensure compliance with the 2007 Municipal Permit. In response to the findings, numerous revisions to the City s development review process were initiated to improve existing storm water pollution prevention activities and ensure compliance with the 2007 Municipal Permit. The changes included updates to the City s Best Management Practices (BMPs) standards, Storm Water Codes, development project approval process, project tracking and record keeping and BMP installation verification procedures. The changes which became effective after March 24, 2008 are discussed and explained in greater detail in the following sections.

2.2 Land Use Planning

2.2.1 Background

In July 1986, the City adopted a *Growth Management Plan* into its General Plan to guide development and anticipate the types and numbers of facilities needed to accommodate the Carlsbad community at build out. Those facilities include sewer plant capacity, sewage pipelines, reclaimed water system, and storm drain system with flood and pollution control basins.

In September, 1994 the City adopted a Comprehensive Update of its General Plan. The General Plan includes goals that balance environmental protection with smart, long-term economic growth. By laying out a clear vision for environmentally sensitive development within this coastal community, development projects are required to be consistent with various City ordinances (i.e.; Grading and Erosion Control, Storm Water Management, Hillside Development, Coastal Resource Protection) and other regulatory requirements.

The General Plan is reviewed annually and revised as necessary to ensure that the public facilities are considered and City goals are met. On February 19, 2002, the City Council adopted General Plan Amendment GPA 01-15. This General Plan Amendment revised and supplemented various policies regarding storm water quality protection in the Open Space and Conservation Element of the General Plan. The revised and supplemented policies reflect all

storm water quality and watershed protection principles found in both the 2001 and 2007 Municipal Permits pertaining to storm water pollution.

City staff again reviewed the storm water protection policies of the General Plan in FY 07-08 and no revisions were found necessary. The existing General Plan storm water protection policies are listed below:

a.) Develop and implement a JURMP consistent with the Permit and any amendments thereof.

b). Adopt and implement a Master Drainage Plan and Standard Urban Storm Water Mitigation Plan (SUSMP) consistent with the Permit and any amendments thereof.

c.) Prior to making land use decisions, utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City requires developments to incorporate structural and non-structural BMPs to mitigate any increases in pollutant loads.

d.) Implement storm water pollution prevention methods to the maximum extent practicable, supplemented by pollutant source controls and treatment. Use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into the municipal separate storm sewer system (MS4).

e.) Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

f.) Developments shall implement appropriate recommendations to protect water quality found in the San Diego Association of Government s (SANDAG s) Water Quality Element of its Regional Growth Management Strategy.

g.) Development projects should be designed to comply with the following site design principles:

- Protect slopes and channels to decrease the potential for slopes and/or channels from eroding and impacting storm water runoff.
- To the extent practicable, cluster development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands and buffer zones. Encourage land acquisition of such areas.
- Provide buffer zones for natural water bodies.
- Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment.
- Where feasible implement site design/landscape features to slow runoff and maximize on-site infiltration of runoff.
- Properly design outdoor material storage areas (including the use of roof or awning covers) to minimize the opportunity for toxic compounds, oil and grease,

heavy metals, nutrients, suspended solids and other pollutants from entering the storm water conveyance system.

- Incorporate roof or awning covers over trash storage areas to prevent off-site transport of trash and other pollutants from entering the storm water conveyance system.
- Limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways and bridges.
- Design streets and circulation systems to reduce pollutants associated with vehicles and traffic resulting from development.

In addition to the General Plan, the City has adopted various storm water protection policies in other land use planning documents including the City s Local Coastal Program and Habitat Management Plan.

The Carlsbad Local Coastal Program covers that part of the City lying within the Coastal Zone. The Carlsbad City Council adopted a Zone Code Amendment (ZCA 01-08), Local Coastal Program Amendment (LCPA 01-15) and Municipal Code Amendments (MCA 01-05, 01-06, and 02-01) to revise/add new policies, standards, procedures and requirements regarding water quality and watershed protection to the Local Coastal Program Land Use Plans, Chapters 21.203 (Coastal Resource Protection Overlay Zone) and 21.205 (Coastal Resource Overlay Zone Mello I LCP Segment Local Coastal Program) of the Zoning Ordinance of Carlsbad's Municipal Code. One of the notable storm water requirements of the Carlsbad Local Coastal Program (LCP) is the inclusion of an additional criterion for determining a priority development project. Per the amended LCP, any project located within 200 feet of the Pacific Ocean that creates more than 2500 square feet of impervious surface or increases the project impervious area more than 10 over the existing impervious area is to be considered a priority development project.

Under the California Natural Community Conservation Program (NCCP), the City and six other cities in north San Diego County participated in the preparation of the Multiple Habitat Conservation Program (MHCP). The MHCP is a comprehensive planning program designed to develop an extensive ecological preserve in northwestern San Diego County. The City has prepared a subarea plan, called the Carlsbad Habitat Management Plan that was adopted in November 2004. The Carlsbad HMP contains the specific conservation, management, facility planning, land use, and other actions the City will take to implement the goals, guidelines, and standards of the MHCP plan. This Habitat Management Plan prohibits development in or near natural habitat areas including creeks and lagoons. Those areas act as a buffer between urban development pollutants and receiving waters. They also protect a significant percentage of natural area that are pervious leading to natural groundwater recharge and reduction in peak run off rates.

On November 1, 2002, the revised Zoning Ordinance, Municipal Code, and Local Coastal Plan Amendments were submitted to the California Coastal Commission. In August, 2006, the California Coastal Commission approved these municipal code amendments. All requirements of these documents were implemented in FY 07-08 and previous years including the years the City waited for Coastal Commission approval. The Local Coastal Program and Habitat Management Plan were evaluated during FY 07-08 and no revisions were found necessary.

2.2.2 Source Characterization

Land Use Planning is the process whereby the City determines appropriate land use designations for a property consistent with the City's General Plan requirements. As such, source characterization of pollutants is addressed generically in association with the type of land use proposed (i.e. low density residential, high density residential, commercial, and industrial, etc). Each land use decision made during the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008) was found consistent with the storm water protection policies as contained in the City's General Plan, Local Coastal Program (if applicable) and Habitat Management Plan.

In many cases, land use planning applications are accompanied by specific project development applications. In such cases, the project was required to identify specific project pollutant sources consistent with the City's Standard Urban Storm Water Mitigation Plan dated March 2008 (the "2008 Carlsbad SUSMP") and to identify project specific Best Management Practices (BMPs) to eliminate or minimize any negative impacts to storm water quality. For more specifics on source characterization applied to development projects during the project approval and verification process reference Section 2.4.2 below.

2.2.3 Best Management Practice Requirements

The City reviewed the existing storm water quality and watershed protection goals and policies within the City General Plan and found them to be adequate to meet the requirements of the 2007 Municipal Permit. No modification was made to BMP requirements of the General Plan during FY 07-08.

2.2.4 Program Implementation

Every General Plan Amendment and land use planning application approved by the City during FY 07-08 was found in conformance with all storm water protection policies of the Carlsbad General Plan, Local Coastal Program (as appropriate), Habitat Management Plan and the Carlsbad Municipal Code (CMC). This includes compliance findings for all the storm water quality goals and objectives of the City's Grading and Drainage Ordinances (Title 15 of the CMC).

For the period covered by this component of the annual report (March 24, 2008 to June 30, 2008) the land use planning review process began with the submittal of a planning application at the City's development services counter. Concurrent with the land use application the city requires submittal of the Storm Water Standards Questionnaire which determines if the project is a priority or non-priority development project. Each project was then reviewed for conformance with the storm water protection policies and requirements of the 2008 Carlsbad SUSMP, the General Plan, any applicable Local Coastal Plan, the Habitat Management Plan and all City Codes. Concurrent with each project approval in FY 07-08, the City made specific written findings in the project approval document that the project complied with all appropriate General Plan, Local Coastal Plan (as appropriate), Habitat Management Plan and City Codes including all relevant storm water protections policies and requirements. A copy of written findings for an actual project approval is included within the examples of priority project approvals included in Appendix 2.5.

2.3 Environmental Review Process

The City's Environmental Review Process begins with the Initial Study Checklist (CEQA Guidelines). Based on the results of the checklist, the City requires the project applicant to provide additional studies to elaborate on the environmental impacts or recommend denial of the permit that the project applicant is seeking. The Initial Study Checklist includes specific hydrology and water quality analysis as follows:

HYDROLOGY AND WATER QUALITY. *Could the project:*
a. Violate any water quality standards or waste discharge requirements, including but not limited to increasing pollutant discharges to receiving waters (consider temperature, dissolved oxygen, turbidity, and other typical storm water pollutants)?
b. Have potentially significant adverse impacts on ground water quality, including but not limited to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in substantial/increased erosion or siltation on- or offsite?
d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site and/or significant adverse environmental impacts?
e. Cause significant alteration of receiving water quality during or following construction?
f. Cause an increase in impervious surfaces and associated runoff?
g. Cause potentially significant adverse impact on ground water quality?
h. Cause or contribute to an exceedance of applicable surface or ground water receiving water quality objectives or degradation of beneficial uses?
i. Is the project tributary to an already impaired water body, as listed on the Clean Water Act Section 303(d) list of impaired waterbodies. If so, can it result in an increase in any pollutant for which the water body is already impaired?
j. Create or exacerbate already existing environmentally sensitive areas (ESAs)?
k. Create potentially significant environmental impact on surface water quality, to either marine, fresh, or wetland waters?
l. Impact aquatic, wetland, or riparian habitat?

The City reviewed the existing Environmental Review Process Initial Study Checklist during FY 07-08 and found that it adequately addresses the Environmental Review requirements of the 2007 Municipal Permit; therefore, no revisions were made to the storm water quality compliance requirements of the Initial Study Checklist.

2.4 Development Project Approval and Verification Process

2.4.1 Background

The City requires new development and redevelopment projects to implement measures to ensure urban runoff from proposed project sites will be treated to reduce pollutant loads to the maximum extent practicable (MEP), and will not cause or contribute to an exceedance of receiving water quality objectives.

The City is dedicated to putting into place all the administrative and regulatory tools required to implement the Land-Use Planning requirements of the 2007 Municipal Permit. During the reporting period (March 24, 2008 to June 30, 2008), the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements and, to address the requirements of the 2007 Municipal permit (see Section 3.3 for a more detailed explanation of the ordinance updates). The City also completely rewrote and updated its Storm Water Standards Manual which includes an updated City SUSMP dated March 2008 (the 2008 Carlsbad SUSMP) and updated Construction SWPPP Standards and Requirements.

The City updated the Storm Water Requirements Applicability Checklist (now titled the Storm Water Standards Questionnaire) to make it more understandable (for City applicant benefit) and to address redevelopment projects. Changes were also made to the City's application submittal checklists, standard project conditions of approval and project plan review checklists to improve clarity, address the requirements of the new 2007 Municipal Permit and ensure greater compliance with the storm water standards and requirements.

All of the process improvement, code and standards changes became effective after March 24, 2008, with the exception of the standard project conditions of approval. The changes to the standard project conditions of approval were implemented prior to October 2007 to provide developers advance notice of 2007 Municipal Permit requirements since it generally takes a minimum of six months for a project to proceed from discretionary approval to construction permit stage. The City's early implementation of the updated standard project conditions of approval facilitated developer compliance with the new BMP requirements, interim LID and hydromodification requirements which became effective on March 24, 2008, and helped to avoid costly and timely delays for developers.

2.4.2 Source Characterization

Development project approval is the stage of the development process where storm water quality impacts are assessed and the project is designed to eliminate or minimize potential sources of storm water pollutants. Each priority development project submitted between March 24, 2008 to June 30, 2008, was required to prepare and submit a Storm Water Management Plan (SWMP) consistent with the 2008 City SUSMP concurrent with any discretionary or ministerial permit application. An important component of the SWMP is source identification.

After March 24, 2008, project proponents were required to identify potential pollutant sources generated by their particular land use and development design in accordance with the procedures outlined in the 2008 City SUSMP. Table 2 on page 8 of the 2008 Carlsbad SUSMP was used to assist the developer in identifying potential pollutant sources for various project categories. Additionally, project proponents were required to identify the pollutants of concern or impairment for the receiving waters into which the project runoff discharges. The project proponent was then required to determine if the proposed project included any land use activity or development design that generated or potentially added to any water quality impairment within the receiving waters. The 2006 303(d) list of water quality impairments for receiving waters in Carlsbad is shown in Table 2.4.2 below:

Table 2.4.2

2006 303(d) Listings within the City of Carlsbad		
Carlsbad Waterbody	**Drains to**	**Pollutant**
Agua Hedionda Creek	Agua Hedionda Lagoon	Manganese
		Selenium
		Sulfates
		Total Dissolved Solids (TDS)
Agua Hedionda Lagoon	Pacific Ocean	Indicator Bacteria
		Sedimentation/Siltation
Buena Vista Creek	Buena Vista Lagoon	Sediment Toxicity
Buena Vista Lagoon	Pacific Ocean	Indicator Bacteria
		Nutrients
		Sedimentation/Siltation
Pacific Ocean at Buena Vista Creek	Pacific Ocean	Indicator Bacteria
Buena Vista Creek		
Carlsbad Village Drive		
Pine Avenue		
Encinitas Creek	Batiquitos Lagoon	Phosphorus
San Marcos Creek	Batiquitos Lagoon	DDE
		Phosphorus
		Sediment Toxicity

Projects draining into one of these receiving waters were required to analyze their potential for contributing one or more of the identified pollutants to the receiving water. If a potential source was identified, then an appropriate source control, site design or treatment control BMP measure was identified to eliminate or reduce the pollutant of concern to the MEP and to not cause or contribute to an exceedance of receiving water quality objectives.

2.4.3 Best Management Practice Requirements

During the reporting period covered in this component of the annual report (March 24, 2008 to June 30, 2008), each land development project in the City met the minimum BMP requirements of the 2007 Municipal Permit. The City's minimum requirements are contained within the 2008 Carlsbad SUSMP and the City's Storm Water Standards Manual as specified in the 2008 Carlsbad JURMP. All approved projects were required to incorporate both site design and source control BMPs into project design. Priority projects per the 2007 Municipal Permit were required to incorporate additional treatment control BMPs into the project design.

The 2007 Municipal Permit required the City in conjunction with the other co-permittees, under the San Diego Municipal Permit, to update the regional Model SUSMP. During the reporting period covered by the first component of the annual report (July 1, 2007 to March 23, 2008) the City worked in cooperation with the other co-permittees to develop a revised Model SUSMP which was collectively adopted by the co-permittees on November 6, 2007. The City was requested under the 2007 Municipal Permit to modify its local SUSMP to comply with the interim Low Impact Development (LID) and hydromodification requirements. The interim LID and hydromodification requirements were incorporated into the 2008 Carlsbad SUSMP which

became effective March 24, 2008. Throughout the reporting period (March 24, 2008 to June 30, 2008), the City compelled all priority development/redevelopment projects, including City Capital Improvement Program (CIP) projects to comply with the 2008 Carlsbad SUSMP.

Beginning in October 2007, the City began requesting new priority development and redevelopment projects to comply with the interim LID and hydro-modification BMP requirements pursuant to the 2007 Municipal Permit. The City's early implementation of the interim BMP requirements into new project design in October 2007 facilitated developer compliance with the new interim LID and hydro-modification requirements which became effective on March 24, 2008, and helped to avoid costly and timely delays for developers and the City.

The City's local SUSMP implementation document is incorporated into the City of Carlsbad Storm Water Standards Manual hereinafter referred to as "Storm Water Standards Manual", which addresses specific post-construction site design, source control and treatment control storm water BMPs that must be incorporated into Priority Development Projects. The City updated its Storm Water Standards Manual to incorporate appropriate requirements of the 2007 Municipal Permit. The updated Storm water Standards Manual became effective on March 24, 2008. The Storm Water Standards Manual provides information on selection and implementation of the construction, site design, source control and treatment control BMPs. A copy of the updated 2008 Storm Water Standards Manual is included as Appendix 2.10.

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydromodification Management Plan (HMP). The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

Each development project was assessed for its potential to generate urban pollutants using the Storm Water Standards Questionnaire (a copy of the Questionnaire is included a Appendix A to the 2008 Carlsbad SUSMP included as Appendix 2.10. Those specific types of projects (or project components) identified as having a high potential to generate pollutants in accordance with the 2007 Municipal Permit and Local Coastal Program requirements were classified as a "priority development projects". Each priority development project was associated with one or more of the general pollutants categories as described in Table 2 of the 2008 SUSMP. Additional pollutant categories were then determined based upon their potential of being generated by the specific proposed priority project.

Each priority project was then required to incorporate site design, source control and treatment control BMPs into the project design as specified in the 2008 Carlsbad SUSMP including the new interim LID and hydromodification requirements, as appropriate. Non-priority projects were required to incorporate site design and source control BMPs into their project design. The following is a brief listing and description of the types of BMPs incorporated into project designs during the reporting period:

Site design BMP features incorporated into Carlsbad developments during the reporting period include the following:

- Minimization of building footprints and incorporation of impervious pavements

- Conservation of natural area by clustering of development and preservation of natural drainage systems
- Directing flows from impervious surfaces across pervious pavements or landscape areas
- Preservation of existing trees and planting of new trees to maintain and increase canopy coverage
- Conveying of drainage away from slopes or provision of appropriate slope down drains
- Vegetating slopes and open space areas with drought tolerant plants
- Stabilization of permanent channel crossings and installation of energy dissipaters at drainage outlets

Source Control BMP features incorporated into Carlsbad developments during the reporting period include the following:

- Enclosure of outdoor storage areas
- Trash enclosures that have impervious surfaces and do not allow drainage to flow through the enclosure and use of trash bins with lids that exclude rain
- Use of efficient irrigation systems with moisture sensors and properly designed flow control systems
- Stenciling and/or placement of tiles at every storm drain inlet

For projects that included one or more of the individual project categories, an appropriate BMP was utilized that include BMPs such as:

- Directing drainage from private streets across vegetated swales or into bioretention areas
- Directing drainage from dock and loading areas into bioretention areas or through filters/clarifiers prior to discharge into storm drains
- Keeping maintenance bays indoors and directing floor drainage into the sewer system
- Installation of special bacterial filter systems for outdoor eating areas
- Incorporation of landscape areas into surface parking lots
- Landscaping of hillside areas with deep rooted and drought tolerant plants

During the reporting period (March 24, 2008 to June 30, 2008), hydrodynamic separator systems and filter inserts were no longer permitted to be used as a primary treatment control method (the 2008 Carlsbad SUSMP was updated to show them only effective at removing trash, debris and coarse sediment).

Due to the economic slow down, the City processed fewer development approvals than in previous years. The development approvals processed during the reporting period (March 24, 2008 to June 30, 2008), encompassed many project categories including residential, commercial and industrial projects. Each high priority development project included appropriate treatment control BMPs from the list of allowable treatment controls included in Table 4 of the 2008 Carlsbad SUSMP. The types of treatment control systems approved for new developments during the reporting period included bioretention areas, vegetated swales, detention basins and filtration systems.

2.4.4 Program Implementation

Description of notable activities conducted to manage urban runoff from development projects

The City has a comprehensive set of storm water pollution prevention activities which are incorporated into its project development approval and BMP installation verification process. The measures include everything from the development of urban runoff land use planning policies, development processing procedures, project submittal and review checklist, educational pamphlets, engineering standards, City Codes, database inventory control, monitoring requirements, staff and developer training and project tracking and reporting. Each activity has been carefully designed to help eliminate or reduce storm water pollution to the maximum extent practicable (MEP) and to not cause or contribute to an exceedance of receiving water quality objectives.

The development process has many stages from concept review on through to construction completion and project operation and maintenance. The City conducts many notable activities meant to ensure development project compliance with the City s urban runoff management policies and requirements. Table 2.4.4 presents a brief description of the notable storm water pollution prevention activities undertaken at each stage of the development process. Also included in the table are a listing of the City reference materials and implementation documents available to developers and City staff which are applicable to each stage in the process.

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Conceptual Project Design	Developer uses the 2008 Carlsbad SUSMP and Storm Water Standards Questionnaire to determine project priority and begins project layout and design. For priority projects the City recommends to developers that a preliminary SWMP should be prepared	• Storm Water Standards Questionnaire • Storm Water Standards Manual which includes the 2008 Carlsbad SUSMP • 303(d) List
Pre-application Review	Developer submits the preliminary project proposal to staff to obtain input on conceptual project layout including storm water compliance issues.	• Preliminary site plan checklist • SWMP Fact Sheet
Application for Discretionary Review	City staff review application package at front Counter for completeness of submittal including storm water compliance documents. Project is logged into the City database for tracking. A completed Environmental Initial Assessment (EIA) form is submitted with the application package.	• Project Application Submittal Checklist • City review letter
Application Review	City staff reviews application, site plans and accompanying reports and documents including any SWMP, geotechnical and hydrology/hydraulic reports. Project is reviewed for consistency with General Plan, Local Coastal Plan (LCP), Habitat Management Plan (HMP1), 2008 Carlsbad SUSMP and City Codes and other Standards including all storm water protection policies and requirements including new interim LID and hydromodification requirements. Project location is reviewed for proximity to environmentally sensitive areas and to determine if project drains to a water body on the 303(d) list. Project EIA is reviewed and appropriate environmental review documents are requested and reviewed in compliance with California Environmental Quality Act (CEQA) requirements.	• Site plan review checklist • SWMP checklist • 303(d) List • General Plan • Local Coastal Plan • Habitat Management Plan • City Codes • Environmental Assessment Form • CEQA Guidelines • City review letter (if any)
Discretionary Approval	City denies project or approves with conditions including storm water compliance conditions. Applicable standard conditions of approval are applied to the project together with any special conditions of approval as City staff determines necessary to reduce or eliminate the projects storm water pollution impacts to the MEP. Approving authority makes required findings that project complies with the General Plan, LCP, HMP1, City Codes and any other appropriate land use planning documents. Environmental documents are certified and any mitigation monitoring requirements. are noted in the project approval.	• City s standard conditions of approval • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)
Final Project Design	Developer prepares project construction plans including grading, improvement, landscape and building detailing required BMPs. Construction SWPPP is prepared and SWMP is finalized. A single sheet BMP site plan is prepared.	• Storm Water Standards Manual • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Construction Plan Check Application Submittal	City staff review application package for completeness of submittal including storm water compliance documents. Applicant completes and submits Project Storm Water Threat Assessment Worksheet included as part of the Storm Water Requirements Applicability Checklist.	• Plan Check Application Submittal Checklist • Project Threat Assessment Worksheet • Project Conditions of Approval
Construction Plan Check Review	City staff reviews construction plans and accompanying reports and documents including any SWMP, single sheet BMP site plan, Construction SWPPP, geotechnical and hydrology/hydraulic reports. All storm water pollution prevention requirements are checked against construction plan checklist, SWMP checklist, Construction SWPPP checklist and project conditions of approval. Construction cost estimates are approved for bonding costs including costs for structural BMPs. For priority projects a BMP Maintenance Agreement is prepared.	• Construction Plan Checklist • SWMP Checklist • Construction SWPPP Checklist • Project conditions of approval • Project Threat Assessment • City Engineering plan review procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates
Construction Plan Approval	City approves construction plans and accompanying Construction SWPPP and SWMP including single sheet BMP site plan. The executed BMP Maintenance Agreement is recorded and entered into the City's document management system database. All treatment control BMPs are noted on the construction plans and forwarded to the GIS group for entry into the BMP inventory. Any project design changes that differ from the approved site plan or project conditions of approval are reviewed in compliance with the City's Substantial Conformance Procedures to ensure that the project remains in compliance with all land use planning findings. Secured agreements to construct project improvements are obtained backed up with cash and/or other securities. Developer is required to note the WDID number on the project plans	• Plan check completion letter • BMP Maintenance Agreement • BMP Inventory update procedures • Substantial Conformance Procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates • Secured Agreements • Single sheet BMP site plan
Ministerial (Construction) Permit Issuance	City issues permit(s) for construction activities including grading, improvement, building, demolition and blasting. Any special storm water compliance requirements are noted on permit. City staff review plan check completion letter for any special storm water compliance requirements. Copies of the permit, construction plans, Construction SWPPP, single sheet BMP site plan and SWMP are forwarded to the Construction Management and Inspection Division. A construction inspection level (low, medium or high) is assigned in accordance with the project's threat assessment form. The project tracking database is updated with the project threat assessment construction level and permit issuance status.	• Plan check completion letter • Project SWMP • Project Construction SWPPP • Construction Threat Assessment Worksheet • Pollution Prevention Guide for the Construction Industry • Construction SWPPP Fact Sheet • Single sheet BMP site plan

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Preconstruction Meeting	City staff meets with contractor and other parties to review project construction issues, schedule, and storm water BMP implementation, monitoring and testing requirements. Contractor is informed of storm water inspection and enforcement procedures and reminded to maintain compliance with the City's storm water pollution prevention requirements. City inspector verifies the NOI has been filed with the Regional Board and a WDID number has been assigned to the project.	• Preconstruction checklist • Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry • Single sheet BMP site plan
Construction and Inspection	Developer constructs project including temporary and permanent BMPs. City inspectors enforce compliance with SWPPP, SWMP and Municipal Permit. During construction City project inspector reviews construction for compliance with all plans, the Construction SWPPP, SWMP and City Standards. Regular storm water compliance inspections are scheduled and tracked per City procedures and the requirements of the 2008 JURMP. Enforcement actions are taken as necessary in accordance with City inspection and enforcement procedures. City inspector reviews and approves any minor construction revisions. Major construction revisions are referred to the Engineering Development Services Division for review and approval.	• Construction SWPPP • SWMP • Construction plans • City inspection and enforcement procedures • Pollution Prevention Guide for the Construction Industry • Inspection reports • Enforcement action reports • Secured Agreements • Single sheet BMP site plan
Project Completion	Construction plans are "as-built", securities released, and BMP construction verified. As-Built plans prepared and forwarded to the GIS Group to update the BMP inventory. City inspector reviews project site to verify installation of permanent BMPs prior to occupancy permit and/or project acceptance using the single sheet BMP site plan. Public Improvements are accepted for maintenance including any public structural control BMPs.	• Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry • Punch list • Secured Agreements • Project Acceptance Forms • Single sheet BMP site plan
Post Construction Annual Treatment Control BMP Inspections	BMP owners maintain BMPs in accordance with recommended and regulatory maintenance schedules. Treatment Control BMP owners submit annual verification of effective operation and maintenance of installed treatment control BMPs. City staff inspects project sites with installed treatment control BMPs to verify compliance with storm water requirements. (New requirement to be implemented in FY 08-09).	• SWMP • BMP Inventory List • Site BMP Inspection Report • BMP Maintenance Agreement

Confirmation that all development projects were required to undergo the City's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), all new development projects and redevelopment projects including City Capital Improvement Program (CIP) projects were required to undergo the City s urban runoff approval process in accordance with the requirements of the 2007 Municipal Permit and 2008 Carlsbad JURMP.

Project compliance was tracked through a variety of paper and computer tracking systems. During the reporting period (March 24, 2008 to June 30, 2008), tracking of projects through the discretionary project approval process consisted of paper records kept in individual files. As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specify whether the project must comply with the priority or non-priority project requirements of the 2008 Carlsbad SUSMP. For priority development projects, a written Storm Water Management Plan (SWMP) is prepared detailing all proposed site design, source control and treatment control BMPs, including interim LID and hydromodification requirements. Structural site design, source control and treatment control BMPs are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority status (Priority, Non-Priority or Exempt). A list of the project discretionary approvals for the reporting period is included as Appendix 2.2. Additionally, the City initiated a new single plan BMP sheet that includes a project site plan and calls out the location of each required LID site design, source control and treatment control BMP. The plan contains a matrix cross referencing the required BMP with the appropriate construction plan (grading, improvement, building or landscape) where the specified BMP construction is detailed. A copy of the plan is attached to each construction drawing for reference by the contractor and inspector. At the conclusion of the project and prior to issuance of an occupancy permit or acceptance of the improvements, the inspector will use the single sheet BMP plan to help ensure all required BMPs are installed as required. After verification, the inspector will initial the plan and place a copy in the project inspection file.

During the construction plan review stage, a final design SWMP is submitted and approved. In addition, each project s required structural BMPs are incorporated into the project plans. For priority projects, a table is placed on the title sheet identifying each treatment control facility including manufacturer s information and maintenance schedules and specifying which page of the plans contain the details of each required BMP. A separate table is included on the detail sheet providing additional information including the number of BMP units located on the specified plan sheet. The tables are used to highlight BMP requirements to the contractor and project inspector. The table also makes it easier for City GIS staff to locate treatment control BMPs for entry into the City s GIS database.

At the project permitting stage, the applicant is required to submit a completed Construction Threat Assessment Worksheet for Determination of a Project's Perceived Threat to Storm Water Quality (Construction Threat Assessment Worksheet). The Construction Threat Assessment Worksheet is used to determine the inspection frequency level pursuant to the 2007 Municipal Permit requirements (low, medium or high). The required inspection level is entered into the City's Permits Plus software program for automated tracking. The Permit Plus program links the various ministerial construction permits (building, right-of-way, blasting and grading) to the "master" development project. The Permits Plus program is used to automatically generate storm water inspection requests for development projects with active permits. The program is also used to track inspection results and follow-up enforcement inspections. A copy of the Construction Threat Assessment Worksheet is included as Appendix C to the Construction SWPPP Standards and Requirements Chapter of the Storm Water Standards Manual attached as Appendix 2.10.

A listing of the development projects to which SUSMP requirements were applied

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), the 2008 Carlsbad SUSMP requirements were applied to 20 private development/redevelopment projects and 4 City Capital Improvement Program (CIP) projects. Of the 20 private development/redevelopment projects, 12 were priority development projects subject to site design, source control and treatment control requirements and 8 were standard projects subject only to site design and source control BMP requirements. Of the 4 City CIP projects, there were no priority development projects and all 4 were standard projects subject only to site design and source control BMP requirements. Copies of the development and CIP project approval list showing project priority are included in Appexdices 2.2 and 2.3, respectively.

Confirmation that all applicable 2008 Carlsbad SUSMP BMP requirements were applied to all priority development projects, including a description of how the information was tracked

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), all applicable requirements of the 2008 Carlsbad SUSMP were applied to all priority development projects. The City required submittal of a completed Storm Water Standards Questionnaire for every discretionary application made to the City during the reporting period. Projects determined to be priority development projects per the Storm Water Standards Questionnaire were additionally required to submit a preliminary Storm Water Management Plan (SWMP).

As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specify whether the project must comply with the priority project or standard project requirements of the 2008 Carlsbad SUSMP. For priority projects, a written Storm Water Management Plan (SWMP) is prepared detailing all proposed site design, source control and treatment control BMPs. Structural site design, source control and treatment control BMPs, including the new interim LID and hydromodification requirements are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority

status (Priority, Non-Priority or Exempt). A of the project discretionary approval list is included as Appendix 2.2. Additionally, the City initiated a new single plan BMP sheet that includes a project site plan and calls out the location of each required LID site design, source control and treatment control BMP. The plan contains a matrix cross referencing the required BMP with the appropriate construction plan (grading, improvement, building or landscape) where the specified BMP construction is detailed. A copy of the plan is attached to each construction drawing for reference by the contractor and inspector. At the conclusion of the project and prior to issuance of an occupancy permit or acceptance of the improvements, the inspector will use the single sheet to help ensure all required BMPs were installed as required. After verification, the inspector will initial the plan and place a copy in the project inspection file.

At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs

Appendix 2.5 of the annual report includes a sample project which received discretionary approval during the review period (March 24, 2008 to June 30, 2008). The sample project was a 22,500 square foot corporate office located on a 3.85 acre industrial lot known as the Kisco Home Office (PIP 08-01). The site drains to the Encinas Creek. The anticipated and potential pollutants generated by the project, as determined by Table 2 of the 2008 Carlsbad SUSMP, include sediments, nutrients, heavy metals, trash and debris, oxygen demanding substances, oil and grease, bacteria and viruses and pesticides. The Encinas Creek is not on the 303(d) list of impaired water bodies. The required project BMPs included:

1. Site Design
    a. Minimized Impervious Footprint
        i. Building designed to maximum height allowed by Code
        ii. Used permeable surface for a portion of fire access driveway
        iii. Conserved natural and existing onsite vegetation
    b. Minimized Directly Connected Impervious Areas
        i. Roof drains and parking lot drainage directed to bioswales
        ii. Drain sidewalks to landscape areas
        iii. Maximized canopy using native or drought tolerant trees and large shrubs
    c. Maximized Canopy by retaining existing oak trees and planting new trees around building and parking areas
2. Source Control
    a. Trash receptacles to be stored under cover and designed not to allow run-on water to enter enclosure
    b. Efficient irrigation with rain and water loss shut-off devices for landscaped areas
    c. All storm drain inlets in the project area to be stenciled and signed with porcelain tiles
    d. Property owners to be provided with storm water pollution prevention informational package
    e. Integrated pest management practices to be used
3. Individual Project Category
    a. The runoff from private driveway to be directed to bioswale
    b. Hillside are or project to be landscaped with deep-rooted drought tolerant plants
4. Treatment Control
    a. Bioswales
    b. Sand filter/detention basin

A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible

No priority projects were allowed to develop using treatment control BMPs with low removal efficiency rankings as the sole method of treatment control during the reporting period (March 24, 2008 to June 30, 2008).

An updated treatment control BMP inventory

The City has a watershed-based inventory of publicly and privately owned treatment control BMPs. The inventory has been used to track and document information about each of these structures, including, BMP type, inspection dates and findings, maintenance frequencies and requirements, verifications, and other Permit requirements. Development of the inventory is an ongoing process as new structures are researched, verified, and added to the database on a continual basis.

During this reporting period, the City updated the watershed based inventory and prioritized all verified structures into high, medium, and low categories as required by the Permit according to BMP type, location, and proximity to the nearest ESA. During the last quarter of FY 07-08, the City was able to confirm 232 privately owned treatment control BMPs, which includes 85 high priority, 82 medium priority, and 65 low priority structures. In addition, there were 57 publicly owned treatment control BMPs on the inventory, which included 11 high priority, 46, medium priority, and no low priority structures. A copy of the updated treatment control BMP inventory for both publicly and privately owned facilities is included as Appendix 2.4.

The number of treatment control BMPs inspected, including a summary of inspection results and findings

During FY 07-08, the City did not conduct any inspections of privately owned treatment control BMPs. However, staff worked to confirm the accuracy of information on the inventory, research certifications and maintenance requirements, verify ownership and responsible parties, and develop inspection procedures, forms, and outreach materials for this new program. A new treatment control BMP inspection form for privately owned structures was developed and a copy can be found in Appendix 2.6. Inspection of privately owned treatment control BMPs identified on the updated inventory will be conducted as required by the Permit by October 1, 2008 and the results will be reported in the FY 08-09 annual report.

A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings

During FY 07-08, the City developed a new treatment control verification form. The form will be mailed to all private property owners and other responsible parties identified on the updated inventory prior to the rainy season. The mailers will include an information letter, treatment control BMP brochure, and the verification form. Private property owners will also be able to download information about treatment control BMPs from the City's webpage at www.carlsbadca.gov/cmi. It is anticipated that there will be a learning curve for responsible parties because they have not been required to provide verification of the maintenance and operation of the treatment control BMPs in the past. The City will work with the responsible parties for the first year of the verification program implementation. In the event that a responsible party does not respond the City may use its enforcement authority to escalate efforts. A copy of the new treatment control verification form can be found in Appendix 2.7.

Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), the installation of all structural BMPs required of priority projects were verified prior to occupancy. The process is initiated when a request for occupancy is made to the City by the building contractor or developer. Both the building inspector and public works inspector are notified of the request for occupancy and final inspections are schedule. The building inspector and public works inspectors review the project site for compliance with all City requirements including verification of BMP installation. If all the requirements are satisfactory the building inspector and public works inspector sign off on the occupancy permit and occupancy is granted. The City maintains a copy of the signed occupancy permit in the building permit file. The City Building Department staff then updates the status of the permit in the building permit database.

A listing of any projects which received a SUSMP waiver

No projects received a SUSMP waiver during the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008).

A description of any SUSMP waiver mitigation program

The City did not incorporate a SUSMP waiver program within the 2008 Carlsbad SUSMP. No SUSMP waivers were requested or granted during the reporting period. If a SUSMP waiver is requested in the future, the City will follow the waiver provisions as provided in the 2007 Municipal Permit.

A description of Hydro-modification Management Plan development collaboration and participation

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydro-modification Management Plan (HMP). City staff attended the copermittee meetings held on the HMP during FY 07-08 and provided input into the discussion process. The City of Carlsbad participated in the cost sharing for the consultant firms retained to prepare the San Diego regional HMP. The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

A listing of priority development projects required to meet Hydromodification Management Plan (HMP) requirements, including a description of hydrologic control measures implemented

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), no projects were approved that met the 50 acre minimum requirement for implementation of the interim hydromodification requirements.

A listing of priority development projects not required to meet Hydromodification Management Plan (HMP) requirements, including a description of why the projects were found to be exempt from the requirements

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), no projects were found to be exempt from the interim hydromodification requirements. Several permitted projects that met the 50 acre criteria were under construction

when the interim hydromodification requirement became effective. However, the 2007 Municipal Permit stated that projects under construction when the requirements became effective were not required to meet interim HMP requirements and therefore, no projects were exempted from the HMP requirements during the reporting period.

A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project

During the reporting period covered by this component of the annual report (March 24, 2008 to June 30, 2008), no projects were found to meet the interim HMP criteria except those which were under construction when the requirements became effective. Per the requirements of the 2007 Municipal Permit, projects under construction or which were lawfully approved prior to March 24, 2008, were not required to meet the interim hydromodification criteria.

The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance

There were no violations that occurred or enforcement actions taken during the reporting period (March 24, 2008 to June 30, 2008) regarding installation of permanent BMPs. The City achieved compliance with the 2008 SUSMP through the permitting process. Development approvals are not granted until the project shows complete compliance with the City s storm water pollution prevention requirements. The City will not issue a construction permit until all applicable BMP requirements are incorporated into the project plans. For projects involving grading and/or street and utility improvements, the City requires that the developer enter into secured agreements to guarantee developer performance on the grading or improvement work including associated structural BMPs. City inspectors review the project sites during construction to ensure that all work is being done in compliance with the construction plans and City Standards and procedures. Prior to issuance of a certificate of occupancy or release of any security, the City inspector reviews the project site to ensure that all applicable structural BMPs have been installed per the approved plans and specifications. Only when the BMP installations have been verified will the certificate of occupancy be issued or any security be released.

2.5 Development Planning Component Effectiveness Assessment

During the reporting period, the City has experienced measurable changes in outcome levels 1, 2 and 3 regarding compliance with the Land-Use Planning Component. Outcome Level 1 improvements included the many changes and improvements made to the City s storm water standards, procedures, and ordinances. The changes which became effective March 24, 2008, were primarily made to ensure compliance with the 2007 Municipal Permit. However, additional changes were made to clarify and simplify storm water compliance requirements and to enhance the City s storm water protection standards.

The Outcome Level 2 improvements included the raising of awareness of existing and new storm water compliance requirements among City development review staff, developers and the City s Planning Commission. Through a combination of training during weekly staff meetings, webinars and outside training courses, City staff significantly increased their knowledge and understanding of the new Municipal Permit requirements, LID designs, hydromodification principles and City storm water compliance processes. Developers were seen to increase their

knowledge of the new Municipal Permit requirements, LID designs, and City storm water compliance requirements through revised plan review checklists, City plan review comments, the City's updated Storm Water Standards Manual and outside training courses. The City Planning Commission increased their knowledge on LID design principles and general storm water regulatory requirements thorough a staff presentation made at a regularly scheduled Planning Commission meeting.

Outcome Level 3 improvements were seen in the development community. With the adoption of the interim LID and hydromodification criteria on March 23, 2008, the City no longer accepted the use of hydrodynamic separator systems and filter inserts as a primary treatment control BMP. To facilitate compliance to the new LID standards, the City began requesting new development/redevelopment compliance with the new interim criteria in October 2007. By March 24, 2008 when the new interim criteria became effective, the development community was already showing a marked increase in compliance with the interim criteria at the initial project submittal stage.

2.6 Program Review and Modification

The greatest strength of Carlsbad's Land-Use Planning Component is its motivated and well informed project review staff. The project review staff holds weekly meetings where issues of storm water pollution prevention are discussed including issues of new regulatory requirements, new and evolving BMP standards, inventory collection and reporting, LID application in new development design and BMP effectiveness (a list of the Engineering Development Services training meetings is included in Appendix 2.8). The weekly meetings, combined with internal and external training sessions, help to keep the staff knowledgeable on the evolving standards of storm water quality and ensure consistent application of storm water quality requirements for development projects within the City including the City's own Capital Improvement Program (CIP) projects.

The City is dedicated to putting into place all the administrative and regulatory tools required to implement the Land-Use Planning requirements of the 2007 Municipal Permit. During the reporting period (March 24, 2008 to June 30, 2008), the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements and, to address the requirements of the 2007 Municipal permit. The City also completely rewrote and updated its Storm Water Standards Manual which includes the updated 2008 Carlsbad SUSMP and updated Construction SWPPP standards and requirements.

With the exception of the standard project conditions of approval, all of the process improvement, code and standards changes became effective on March 24, 2008. The changes to the standard project conditions of approval were implemented prior to October 2007 to provide developers advance notice of 2007 Municipal Permit requirements since it generally takes a minimum of six months for a project to proceed from discretionary approval to construction permit. Early implementation of the updated standard conditions of approval ensured compliance with the new interim LID and hydro-modification requirements while avoiding costly and timely delays to the developer once the requirements became effective on March 24, 2008. A copy of the revised and updated standard project conditions of approval is included in Appendix 2.1.

The City will continue to evaluate the storm water quality policies, procedures, codes, standards and other requirements of its Land-Use Planning processes to ensure complete compliance with the 2007 Municipal Permit in FY 08-09. A primary area of focus for next year will be the development of effectiveness review and evaluation procedures for the Land-Use planning process. Another area of focus will be the improvement of the BMP inventory tracking and reporting metrics. Strengthening of these two areas will help to promote more reliable and effective storm water prevention measures and to communicate effectiveness results using measurable parameters.

3.0 CONSTRUCTION COMPONENT

3.1 Introduction

The City of Carlsbad has continued to stress the importance of storm water pollution prevention throughout the implementation of construction component. This section of the annual report for construction sites identifies those activities which occurred from January 1, 2008 through June 30, 2008 and will cover the requirements of the Permit R9-2007-0001 (Permit).

The City has implemented activities that address and minimize impacts to receiving water quality from construction sites. Performance goals were used to assess the completeness of this component and the effectiveness of action plans. These performance goals included construction site inspections, BMP implementation reviews, corrective actions, enforcement, and reporting requirements. During January 1, 2008 through June 30, 2008 of FY 07-08, the City updated the construction inventory, inspected all construction sites, responded to construction related inquiries and complaints, provided outreach and education to developers, engineers, contractors and City staff, and when necessary used enforcement actions to obtain compliance.

3.2 Source Characterization

The City uses the Permits Plus database to update a watershed based inventory of all construction sites that require (grading and/or construction) permits regardless of site size or ownership. Construction sites with grading permits may include sites where activities such as grading, excavation, clearing, road construction, structure construction, or demolition results in the disturbance of soil. Construction permits that do not require a grading permit may include sites where activities such as single family residence, remodels, or additions, home demolitions, tenant improvements, or commercial/industrial buildings that are constructed resulting in the need for water quality protection. An inventory of all active construction sites can be found in Appendix 3.1.

The Development Services Division updates the Permits Plus database until the project is ready to begin construction. The Construction Management and Inspection Division (CMI) then issue the permit and updates the database during the active construction phase of the project. The CMI inspectors are primarily responsible for conducting storm water compliance inspections during the active construction phase.

3.3 Updates to Ordinances and Approval Processes

Extensive ordinance and project approval process revisions were implemented during the reporting period to meet the new 2007 Municipal Permit requirements, to clarify and improve upon the existing storm water pollution prevention measures. The updates and revisions became effective after March 24, 2008. The ordinance updates included changes to the Public Property, Grading/Drainage, and Building Codes/Regulations ordinances in the Carlsbad Municipal Code. The following presents a brief summary of the changes made to the various ordinances:

Public Property Ordinance

Various sections in Chapter 11.16 (Permits for Work or Encroachment in Public Places) were revised to require all work in the public right-of-way to comply with the provisions of the 2007 Municipal Permit. Included with the revisions are requirements for right-of-way applicants to: 1) install permanent storm water protection measures for qualifying projects; 2) enter into storm water pollutant protection facility maintenance agreements; and, 3) implement Construction Storm Water Pollution Prevention Plans (SWPPPs) as necessary. Also included with the revision to this ordinance is a provision giving the City Engineer authority to deny issuance of right-of-way permits for any project not in compliance with requirements of the 2007 Municipal Permit.

Grading and Drainage Ordinances

Chapter 15.04 (General Regulations) was revised to include new and updated storm water compliance definitions for various words, terms and phrases used throughout the Grading and Drainage Ordinances. The changes were needed to clarify definitions, eliminate redundancy and reference the updated 2007 Municipal Permit.

Chapter 15.12 (Storm Water Management and Discharge Control) was revised to bring this ordinance into compliance with the new 2007 Municipal Permit, clarify requirements and provide the City enforcement official with improved inspection and enforcement authority. Additional revisions were made to clarify that all ministerial and discretionary permits are subject to the City s storm water standards and must install permanent storm water pollution prevention measures as required. This ordinance change included new language requiring that property owners must enter into storm water pollution prevention facility maintenance agreements before receiving construction permits.

A new Section 15.12.095 (Structural treatment control BMP maintenance requirement) was added to require property owners to maintain permanent storm water pollution prevention facilities on a continuing basis after construction work is completed. This ordinance revision also provides authority for the City enforcement official to conduct inspections of any site that includes a permanent storm water pollution prevention facility constructed in accordance with the requirements of the 2007 Municipal Permit. Also included in this ordinance update is a provision requiring the owners of privately owned and maintained storm water pollution prevention facilities, to submit an annual statement to the City verifying the effective operation and maintenance of each installed treatment control facility prior to the rainy season. The inspection and maintenance provisions of this ordinance update are necessary to accommodate new storm water facility maintenance and inspection requirements of the 2007 Municipal Permit.

Various sections of Chapter 15.16 (Grading and Erosion Control) were revised to incorporate use of the revised storm water compliance words, terms or phrases as proposed in the revised definitions included within Chapter 15.04. Section 15.16.070 (Application for a grading permit) was revised to clarify that a Construction Storm Water Pollution Prevention Plan (SWPPP), submitted with a grading permit, must pay a separate plan review and inspection fee. This revision was needed to clarify existing processing fee payment requirements.

A new Section 15.16.085 (Construction SWPPP) was added mandating preparation of a Construction SWPPP, in accordance with City Standards, for every grading permit and for any non-permitted construction activity which has the potential for contamination of storm water

and/or the discharge of non-storm water pollutants to the City's storm water conveyance system. The new section also provides an exemption from the preparation of a Construction SWPPP when the project has no potential to impair water quality. Additional provisions provide authority for the implementation of the City's existing Construction SWPPP review and inspection fees.

Other miscellaneous revisions were made to various sections of Chapter 15.16 to clarify compliance with various storm water provisions or make the code consistent with existing grading permit processing procedures including requirements to: 1) require grading plans to conform to the Grading and Drainage Ordinances; 2) require grading plans to include provisions for implementation and maintenance of all storm water pollution prevention measures identified in the accompanying Construction SWPPP; 3) clarify grading permit application withdrawal procedures; 4) require City approval of a Construction SWPPP prior to issuance of a grading permit; 5) require that grading and erosion control securities to include coverage for Construction SWPPP costs; and, 6) ensure that the enforcement provisions of this chapter specifically address failures to install storm water protection measures.

Title 18 Building Codes and Regulations

A new Chapter 18.48 was added to require that all building construction comply with the provisions of the 2007 Municipal Permit. Included with this ordinance revision are requirements to: 1) install permanent storm water protection measures for qualifying projects; 2) enter into storm water pollutant protection facility maintenance agreements; 3) implement Construction SWPPPs as necessary; and, 4) provide authority for the community development director to deny issuance of building permits for any project not in compliance with requirements of the Municipal Permit.

In addition to the ordinance changes, numerous changes were made to the City's project approval processes and BMP standards to comply with new 2007 Municipal Permit requirements and to update and improve upon the existing processes and standards. The City's Storm Water Standards Manual as revised on March 24, 2008 and again on June 4, 2008 describes the updated standards and processes. The Storm Water Standards Manual includes the City's updated Standard Urban Storm Water Mitigation Plan (referred to as the 2008 Carlsbad SUSMP) and the updated Construction Storm Water Pollution Prevention Plan (Construction SWPPP) Standards and Requirements. An additional change was made to Chapter 7 of the City's General Design Standards to incorporate new Low Impact Development (LID) design requirements. A brief description of the changes made in the 2007 Carlsbad SUSMP, Construction SWPPP Standards and Requirements and General Design Standards are as follows:

<u>2008 Carlsbad SUSMP</u>

The format of the City SUSMP document was completely revised to make it easier to read and understand. The prior 2003 Carlsbad SUSMP intermixed permanent post construction and temporary construction BMP requirements. The revised 2008 Carlsbad SUSMP removes the temporary construction BMP requirements (as they were moved to the Construction SWPPP section), and deals only with the post construction permanent BMP requirements. A simplified discretionary review process flowchart was crafted to replace the more complex flowchart found in the previous SUSMP document. The process description chapters were simplified and placed in an order more closely corresponding to the manner in which a development Storm Water Management Plan (SWMP) is prepared. The updated SUSMP includes the new interim

hydromodification criteria of the 2007 Municipal Permit.

Additional improvements include the revision of the Storm Water Requirements Checklist (now titled the Storm Water Standards Questionnaire) to make it easier to read and to address redevelopment project submittals. A new Storm Water Management Plan (SWMP) review checklist was created assist developers with the preparation of SWMPs and to assist City staff during the review process. To help ensure verification of BMP installation during the plan review and construction process, the City developed a new single sheet BMP plan requirement. For each priority project a single sheet BMP plan will be prepared by the develop calling out the location of each required LID site design, source control and treatment control BMP. The plan will include a matrix listing the required BMP cross referenced with a list of the specific construction plan drawing where the specified BMP is detailed (grading, improvement, building or landscape plan). The singe sheet BMP plan will be attached to each appropriate construction drawing. At the conclusion of the project and/or prior to occupancy, the City inspector will use the single sheet BMP plan to help ensure verification of all site BMP requirements. When verified, the inspector will initial the plan and have it placed in the project file.

Construction SWPPP Standards and Requirements

The City s existing Construction SWPPP Standards and Requirements document was updated to clarify and improve the City s Construction SWPPP processes and requirements. The temporary construction BMP standards and requirements removed from the 2003 Carlsbad SUSMP were updated and added to the City s Construction SWPPP Standards and Requirements document together with additional process and BMP standard improvements. The updated Construction SWPPP Standards and Requirements include discussion on compliance with the Municipal Permit, General Construction Permit and General Utility Permit. To accommodate these and other permit requirements, the City established a new three tiered construction SWPPP process. The three tiers allow for preparation of Construction SWPPPs tailored to match the threat to water quality posed by a specific project.

The updated Construction SWPPP Standards and Requirements incorporate detailed references to specific construction BMPs and detail general construction site management requirements during both the rainy and non-rainy seasons. Also included are updated controls for construction sites, maximum disturbed area requirements and advanced treatment control requirements. The updated standards also include new inspection frequency other inspection requirements.
As part of the update, the City prepared new Storm Water Threat Assessment forms to help determine which Tier level Construction SWPPP applies and what inspection frequency is required. New storm water compliance forms that notify and commit the developer to storm water compliance requirements were prepared and instituted.

A new Tier 3 Construction SWPPP checklist was prepared that better follows the CASQA Construction SWPPP preparation manual. A new Tier 2 Construction SWPPP Site Assessment Form, SWPPP Template and Checklist were prepared to help assist developers with the preparation of a Tier 2 Construction SWPPP. A standard format Tier 1 Construction SWPPP was created that can easily be completed over the counter for projects posing a minor threat to storm water quality. The City also adopted updated Storm Water Pollution Prevention standard notes to eliminate redundancy and clarify and improve the standard construction requirements for developers.

General Design Standards

Chapter 7 of the City's General Design Standards was modified to establish new Low Impact Development (LID) standards. The Chapter title was changed from "Grading and Erosion Control Standards" to "Grading Site Design and Low Impact Development (LID) Standards". The changes included adoption of the County of San Diego *Low Impact Development Handbook, Stormwater Management Strategies* and *Low Impact Development Appendices, San Diego Considerations and LID Fact Sheets. Also included in the update was* a description of the purpose and intent of LID, *a requirement that LID plans should be reviewed by geotechnical engineers (as appropriate), requirements for the new single sheet BMP plan and references to additional LID reference materials..*

The full text of the revised and updated ordinances (in strikeout format) can be found in Appendix 2.12. The 2008 SUSMP and Construction SWPPP Standards and Requirements are included in the Storm Water Standards Manual attached as Appendix 2.10, and the previous and revised General Deign Standards are attached as Appendix 2.11.

3.4 Best Management Practice Requirements

SWPPPs and Erosion Control Plans are reviewed prior to commencement of construction activities by the Development Services Department to ensure that the required minimum BMPs will be implemented for all construction sites. Please refer to section 2 for more information. The City has established required minimum BMPs, as identified in the 2008 JURMP and Carlsbad Municipal Code, for all construction sites. The seven required minimum BMPs include components that address the following:

1. Erosion control methods for graded slopes;
2. Erosion control method for graded flat areas (slope 5);
3. Sediment control for perimeter boundaries;
4. Offsite tracking control of sediment;
5. Materials management control;
6. Waste management control; and
7. Non-storm water management control.

The City continues to utilize the pollution prevention measures contained in the Storm Water Best Management Practice Handbooks, published by the California Storm Water Quality Association (CASQA), Caltrans Storm Water Quality Handbooks, and Standards for Design & Construction of Public Works Improvements in the City of Carlsbad. All CMI staff are trained on construction site BMPs and their appropriate application.

Pollution prevention consists of procedures and practices that eliminate or reduce the pollutants at the source. The City has identified and required implementation of the following pollution prevention controls for all applicable construction sites:

- SWPPPs and Erosion Control Plans are required for grading permits and appropriate construction projects. These plans are checked by the City to ensure they adequately address the provisions of the General Construction Permit.
- CMI inspectors enforce the implementation and effectiveness of BMPs described in approved erosion control plans and SWPPPs.

To address each of the required BMPs, the City ensures the SWPPPs and/or erosion control plans include implementation of several types of BMPs as applicable, depending on site-specific requirements. The list of BMPs can be referenced in the 2008 JURMP.

3.5 Program Implementation

During the second half of FY 07-08 the City continued to monitor and enforce storm water regulations by distinguishing the construction components into two areas-Building Construction Permits and Grading Construction Permits. CMI oversees the inspections of grading permitted sites while contracted storm water inspectors ensure building permitted sites (construction sites without a grading permit) are compliant, with two inspectors designated with full responsibility for storm water compliance related to building permitted sites.

The CMI division utilized the Permits Plus database to merge the project information onto the construction site inspection forms. This change provided more accurate information and reduced the time needed to complete forms manually. The CMI division also added a full time storm water compliance position to its staff. The new position was added to focus on storm water compliance in construction and treatment control BMP inspection and management.

The City continued to prioritize all construction sites with active grading permits as High Priority. These sites were at a minimum inspected on a bi-weekly basis during the wet season and once a month during the dry season, at a minimum, to ensure proper installation and maintenance of pollution prevention BMPs. CMI inspectors are responsible for inspections on all active grading and CIP sites. Storm water compliance remained their main focus during this reporting period, especially during the rainy season. All required inspections were documented and placed in the project files. Grading sites in the City were held to the maximum allowable disturbed areas on all applicable sites. There were no projects that triggered Advanced Treatment requirements.

Grading Permit Site Inspections:

All active grading sites were prioritized as high during this reporting period. CMI inspectors verified and documented proper BMP implementation on a weekly basis, sometimes daily. A copy of the construction site storm water checklist can be found in Appendix 3.2. Table 3.1 demonstrates the grading permit inspections conducted during this reporting period of January 1, 2008 to June 30, 2008:

Table 3.1 Grading Permit Site Compliance Inspections

Required Inspections	Inspections Conducted
1,608	1,608

Appendix 3.1 contains a listing of all of the projects active during the period of January 1, 2008, through June 30, 2008. The listing demonstrates that the projects were inspected the required number of times to meet the City's JURMP requirements.

Building Construction Permit Site Inspections:

CMI inspectors were onsite inspecting all locations as required by the priority of the site. During the wet season (Jan. 1 through April 30) high priority sites were inspected bi-weekly. All medium and low priority sites were inspected at least once monthly. All required and follow up inspections were documented. Table 3.2 describes the construction permit inspections conducted this reporting period:

Table 3.2 Building Permit Site Compliance Inspections

Required Inspections	Inspections Conducted
1,212	1,212

Capital Improvement Projects Site Inspections:

Appendix 3.3 shows the current Capital Improvement Projects (CIP) sites. Daily inspections were conducted for CIP projects. These inspections cover a number of storm water issues. It is important to note that not all sites on the inventory were active during the entire rainy season. Table 3.3 describes the CIP project inspections conducted during this reporting period:

Table 3.3 CIP Site Compliance Inspections

Required Inspections	Inspections Conducted
224	224

During required inspections, staff generally found sites to be compliant with SWPPPs, Erosion Control Plans, and BMP implementation. Most observed deficiencies were found with BMP maintenance (i.e. broken gravel bags). These deficiencies were immediately brought to the attention of the responsible site superintendent who was given specific and corrective action requirements by the project inspector. This interaction has proven to be productive in correcting minor deficiencies.

The City meets the standard procedures of inspection to obtain full compliance by conducting required field inspections of all active construction sites followed by the completion of a written construction site storm water checklist. The construction site storm water checklist is used by the inspectors and it covers all phases of the construction process. The documented inspections cover all administrative requirements including SWPPPs, updated wall maps, desiltation basins, materials and waste management, temporary BMPs, slope protection, and site conditions and interactions.

In addition, the City continued verifying the Notice of Intent (NOI) validity prior to issuance of a grading permit or Notice to Proceed for CIP projects. Prior to having a pre-construction meeting and issuing a grading permit, CMI verified a valid NOI was in place for projects subject to the State requirements. The Construction Manager reviewed the State's online database to ensure a NOI had been issued prior to assigning the project to an inspector for grading permit issuance.

There were no changes in the City's enforcement escalation procedures as described in the

2008 JURMP during this reporting period. Table 3.4 is a summary of enforcement actions taken by the City during this reporting period fro January 1, 2008 to June 30, 2008.

Table 3.4 Summary of Enforcement Actions at Construction Sites

Actions Taken	Number of Actions
Written Warning	30
Stop Work Notice	0
Total Actions	30

If a site was found to have minor deficiencies, in terms of storm water compliance, it was generally corrected at the time of the inspection. If a written warning was issued, a specific deadline for correction was noted. Follow up inspections were conducted to ensure construction sites fully complied with the required corrective actions. All sites were found to have completed corrective actions and were in compliance at the time of the follow up inspection.

There were no Stop Work Notices issued during this reporting period, January 1, 2008 to June 30, 2008.

3.6 Construction Activities Effectiveness Assessment

The City of Carlsbad has continued their strong stance on storm water pollution prevention. The field inspectors have realized a higher awareness among field personnel (superintendents, field labor, etc.) regarding the importance and application of best management practices for storm water pollution prevention on construction sites. The City will also be assessing current procedures in order to identify possible improvements in the implementation of the construction component and program in FY 08-09 based on the violations and corrective actions identified in NOV No. R9-2008-0099. A few of the possible improvements are:

- Creating a new checklist that identifies and certifies that all treatment control BMPs have been installed.
- Creating a new database to better track and record the installation, inspection, and certification of all new treatment control BMPs.
- Assessing a more efficient method of updating the current databases at the time of project approvals.

4.0 MUNICIPAL COMPONENT

4.1 Introduction

Municipal facilities are required to implement the minimum BMPs identified and described in the 2008 JURMP (good housekeeping, preventive maintenance, material handling and storage, employee training, solid waste handling, record keeping, self inspection, and spill response), as applicable. Specific BMPs are identified in SWPPPs and/or inspection reports. Specific pollution prevention measures may vary from one site to another and are evaluated separately at each facility. The City implements and assesses the effectiveness of BMPs through regular staff training, self-inspections, third party inspections by a contractor, and SWPPP implementation. The following includes a description of specific pollution prevention activities and storm water BMPs implemented from March 24 through June 30, 2008 per Order R-9-2007-0001 by various City departments. All BMPs were implemented as required by the 2008 JURMP.

Municipal areas and activities are subdivided by categories in the sections below. Prioritization of these municipal areas is presented in the High Priority column of the Municipal Inventory for Order R9-2007-0001, located in Appendix 4.1.

4.2 Minimum BMP Requirements

The following minimum BMPs were implemented at all of the facilities in the Municipal Inventory provided in Appendix 4.1.

4.2.1 Employee Training

Municipal departments provided training at least annually to all employees with responsibility for actions that have a potential to cause storm water pollution. A list of all Municipal storm water training is included in Appendix 8.2. Training generally addresses among other topics:

- Storm water awareness
- Applicable regulations
- Discharge prohibitions
- Importance of pollution prevention practices (good housekeeping, recycling, waste management, source control, etc.)
- Applicable best management practices (including those called out in the facility storm water pollution prevention plan [SWPPP]), where applicable
- Integrated pest management
- Self-inspections
- Record keeping

Documentation of training is maintained on-site at the location(s) where operations or activities are conducted. Where the operations are covered in a SWPPP, training records are filed with the SWPPP.

4.2.2 Pollution Prevention

The City implements urban runoff pollution prevention practices that are generally recognized for that facility s activity as being effective.

Pollution prevention is defined in Orders 2001-01 and 2007-0001 *as practices and processes that reduce or eliminate the generation of pollutants. Recycling, use of different types of products or chemicals, and altering operational procedures are all types of pollution prevention practices that reduce the amounts of pollutants generated by a facility."*

The City's approach is to promote pollution prevention as an activity for all municipal employees and locations. Since 1991, the City has implemented a procurement policy that directs the purchase and use of recycled products. Purchasing staff are encouraged to use *Green Purchasing* principles. This refers to buying products and services with reduced effects on human health and the environment (also called *Environmental Purchasing*). While some of these products are office and janitorial supplies, the policy also applies to construction supplies, landscape materials and equipment, automotive, road and highway supplies.

Specific pollution prevention measures may vary from one site to another, so they are evaluated separately at each facility. Where appropriate, High Priority municipal facilities implemented site specific Storm Water Pollution Prevention Plans (SWPPP) and associated training programs. Furthermore, the pollution prevention BMPs identified in the JURMP were implemented at all municipal facilities. These pollution prevention BMPs include:

- Affirmative Procurement Use alternative, safer, or recycled products.
- Reduce the amount of hazardous materials used by implementing natural controls.
- Redirect storm water flows away from areas of concern.
- Reduce use of water.
- Reduce storm water flow across facility site.
- Recycle and reuse waste products and waste flows.
- Move or cover potential pollution from storm water contact.

In addition, the City required the following minimum pollution prevention practices (detailed in SWPPPs or inspection reports) at all municipal facilities where appropriate:

- <u>Reduce use of water or use dry cleanup methods:</u> Employees used dry cleanup methods when possible (sweeping, etc.). Any washing activities required containment and recovery, with no discharge to the storm drain system. These BMPs are also required for City contractors.
- <u>Conduct storm drain maintenance:</u> Employees performed regular visual inspections of the storm drains to identify unauthorized discharges and clean as needed.
- <u>Recycle:</u> City departments recycled appropriate items and implemented the City procurement policy to purchase and use recycled products.
- <u>Move or cover potential pollution sources from storm water contact:</u> Corporate yards protected materials and products that could potentially contribute to storm water pollution by storing them indoors, or covering them, and providing them with secondary containment as needed.

4.2.3 Good Housekeeping

Good housekeeping practices employed simple common sense in creating and maintaining a clean, orderly environment that reduced the risk of accidents and urban runoff contamination.

- **Routine Housekeeping Inspections.** Locations with higher risk of impacting storm water quality (e.g., storm water outfalls, loading and unloading areas, materials, products and wastes storage areas, equipment and vehicle maintenance and cleaning areas) were inspected regularly. Inspections focused on leaks or conditions that may have led to discharges of pollutants to the Storm Water Conveyance or Receiving Waters.

- **Maintenance of Clean Grounds Surfaces.** Sweeping of all paved areas exposed to precipitation or storm water was conducted on a regular basis. Litter controls of all exposed surface were conducted on a regular basis. The frequency of sweeping and litter control is based on site conditions.

- **Waste Management.** Each facility conducted regular pickup and disposal of garbage and waste materials/products to prevent overfill of waste storage containers.

- **Equipment Inspection.** Each facility conducted routine inspection of equipment to ensure proper functioning. Where problems were identified during inspection, proper and prompt maintenance or repair is conducted.

- **Storage.** Raw materials, intermediate products, finished products, byproducts and waste products were stored in covered areas or sealed containers unless the materials or products were not a threat to urban runoff quality. To prevent accidental spills, materials or products are stored away from direct traffic routes. All containers were stacked according to applicable federal, state, and city regulations as well as manufacturers' instructions to avoid damage from improper weight distribution. Pallets or similar devices were used to prevent corrosion of the containers that can result when containers come in contact with moisture on the ground.

- **Limitations on Handling Hazardous Materials.** Each facility limited the handling of hazardous materials to those personnel specially trained to handle these materials.

- **Employee Training.** All good housekeeping practices were incorporated into a facility's employee-training program.

In addition to the BMPs listed above, good housekeeping was addressed as a site specific BMP for each category of facilities listed below. See BMP SC-60 for site specific information on implementation.

4.2.4 Spill Response and Prevention

Municipal staff implemented BMPs at all fixed facilities and field programs to prevent, control and cleanup spills. The following are general BMPs that were implemented:

- BMPs listed in SC-11, Spill Prevention, Control and Cleanup (City of Carlsbad JURMP 2008).

- Spill cleanup materials are readily available and in known locations.

- Spills are cleaned up immediately and dry methods are used where possible.

- Spill cleanup material is properly disposed of.

Spill response and prevention was also addressed as a site specific BMP for each category of facilities listed in Sections 4.3 4.14. See SC-11 for site specific information on implementation.

4.3 Roads, Streets, Highways, Parking Facilities

4.3.1 Background

This section includes BMPs and an inventory of roads, streets, highways, and parking facilities which are deemed High Priority according to Order 2007-0001, Section D.3.a.(7)(a) and the City s 2008 JURMP. This section also includes information on the City s street sweeping program and BMPs for the City s street maintenance program.

4.3.2 Source Characterization

The table below lists the 12 High Priority roads, streets, highways, and parking facilities on the City s municipal inventory, updated in the 2008 JURMP.

Table 4.1 Roads, Streets, Highways, and Parking Facilities

1	ADULT LEARNING PROGRAM PARKING LOT	1207 CARLSBAD VILLAGE DR STE O
2	CARLSBAD SENIOR CENTER PARKING LOT	799 PINE AVE
3	CITY HALL FACILITY PARKING LOT	1200 CARLSBAD VILLAGE DR
4	CITY STREETS	CITY WIDE
5	COLE LIBRARY PARKING LOT	1250 CARLSBAD VILLAGE DR
6	DOVE LIBRARY PARKING LOT	1775 DOVE LN
7	FARADAY CENTER PARKING LOT	1635 FARADAY AV
8	FARMERS BUILDING PARKING LOT	FARADAY & EL CAMINO RL
9	HARDING COMMUNITY CENTER PARKING LOT	3096 HARDING ST
10	HELEN ALLMAN GIRLS CLUB PARKING LOT	3368 EUREKA PL
11	HOUSING/REDEVELOPMENT OFFICE PARKING LOT	2965 ROOSEVELT ST B
12	RAILROAD DEPOT VISITORS CENTER PARKING LOT	400 CARLSBAD VILLAGE DR

4.3.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.2 were implemented at the 12 High Priority facilities listed above.

Table 4.2 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-70 Road and Street Maintenance
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.3.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.2 were implemented at the facilities listed in Table 4.1 and are described below:

- SC-11 Spill Prevention, Control, and Cleanup: Spill kits are located in all vehicles.
- SC-33 Outdoor Storage of Raw Materials: Plastic tarps cover raw materials in the yard, equipment is covered by canopies, and the material is covered by a permanent overhead structure or stored indoors. Materials associated with street maintenance activities are stored at the Maintenance and Operations Facility.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a contained area in case of any accidental spillage. These containers are clearly marked and stored until arrangements were made for a certified waste management company to remove them and transfer them to an approved facility. Four cigarette butt collectors have been placed along the sea wall, providing a place for proper disposal.
- SC-41 Building and Grounds Maintenance: In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking and Storage Area Maintenance: Parking lots and storage areas were swept biweekly.
- SC-60 Housekeeping Practices: Work sites were swept and all debris was removed upon completion of any asphalt or concrete repair. Water was used when sweeping to keep dust down.
- SC-70 Road and Street Maintenance: Storm drain inlets were protected using rock bags prior to the start of any maintenance activities. Concrete wash out was performed on a plastic tarp and contained to prevent any discharge to the storm drain. Street sweeping was performed for all curbed streets and municipal parking lots in the City. Table 4.3 below indicates the distance swept in curb miles, frequency, and amount of materials removed as a result of the street sweeping activities. In total, there were approximately 8,050 curb miles of streets swept from March 23 to June 30, 2008.

Table 4.3 Street Sweeping Data

Priority[1]	Description	Distance	Frequency	Material Removed
High[2]	Arterials/seawall	100 curb miles	Weekly	90 tons/month
Medium	Residential	900 curb miles	Biweekly	
Low	Alleys	50 curb miles	Biweekly	
Parking Lots	54 lots	53 acres	Biweekly	

[1]Priority is based on the volume of trash and debris generated at these types of streets; streets which generate high volumes of trash are High Priority; streets which generate moderate and low volumes of trash are medium and low priority respectively.
[2]Downtown streets were swept twice weekly

- SC-71 Plaza and Sidewalk Cleaning: A self-contained wet sweeper was used on all tile sidewalks in the downtown area on a scheduled basis.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements

on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.

- SC-75 Waste Handling and Disposal: All materials were hauled directly to transfer station and were covered.

4.4 Flood Management Projects Flood Control Devices

4.4.1 Background

This section includes BMPs and an inventory of the City s Flood Management Projects and Flood Control Devices which are deemed High Priority areas according to Order 2007-0001, Section D.3.a.(7)(a) and the City s 2008 JURMP. This section also includes a description of the Storm Drain Maintenance Program activities.

4.4.2 Source Characterization

The municipal separate storm sewer system is the only High Priority Flood Management Projects and Flood Control Devices on the City s municipal inventory, as updated for the 2008 JURMP. The municipal separate storm sewer system is inclusive of the City s flood management projects and flood control devices.

4.4.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.4 were implemented throughout the City s MS4.

Table 4.4 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal

4.4.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.4 were implemented where applicable pertaining to the municipal separate storm sewer system and are described below.

- SC-11 Spill prevention, Control, and Cleanup: All vehicles have spill kits and key vehicles carry hydrocarbon booms. All trash was placed in 55 gallon trash bags. The maintenance sweeper truck was called out to assist in spill cleanup when necessary.
- SC-21 Vehicle and Equipment Cleaning: All vehicles used in flood control device cleaning were washed at fleet maintenance using an enclosed pressure wash system. The system has a secondary water and oil separator plumbed into the sanitary sewer system.
- SC-34 Waste Handling and Disposal: Trash was hauled to transfer station. Debris and other organic material were transferred and deposited at 2400 Tamarack Avenue in three

concrete covered bins. The material was then tested for contaminants and hauled to a landfill or appropriate facility upon receipt of permissible test results.

- SC-60 □ Housekeeping Practices: Trash was removed from these areas of the MS4 on a routine basis.
- SC-74 □ Drainage System Maintenance: A small self-contained vacuum with pressure washer was used to clean the drainage system. All material in the drain box was removed by the vacuum. Disposal of the water and material occurred using a filter sock, allowing water to be decanted into the sanitary sewer system. The solid material was taken to the Tamarack site described above. All trash was removed from the MS4, placed in 55 gallon trash bags, and placed in a 40 cubic yard roll off dumpster that is covered. The material was then transported to Palomar Transfer Station for disposal. Data pertaining to maintenance activities of the MS4 is in Table 4.5 below.

Table 4.5 MS4 Maintenance

Structure	Inspected	Exceeding Cleaning Criteria	Cleaned	Amount of Material Removed (tons)
Catch Basin/Inlet	1300 units[1]	53[2]	Anthropogenic trash removed 100□	12.5[2]
MS4 miles	□15,000 linear feet	N/A	15,000 linear feet	0.5
Open Channel miles	32,000 linear feet	N/A	800 linear feet	0.5

[1] Number represents inspections for quarter four only, balance inspected during quarters one through three and described in JURMP Annual Report for Order 2001-01, July 1, 2007 - March 23, 2008.
[2] Estimation based on inlets exceeding criteria for Fiscal Year □211 and material removed for Fiscal Year □50 tons. Values are □ of the totals for the Fiscal Year.

- SC-75 □ Waste Handling and Disposal: Described under SC-34 and SC-74 above.
- BMPs to limit infiltration from sanitary sewer to storm drain system: a preventive maintenance schedule was implemented that includes jet rodding, and vactoring the sanitary lines throughout the city of Carlsbad. Closed circuit television was used for investigations in sewer lines. In addition, engineering standards described below prevent infiltration of sewage to the MS4.

  The City of Carlsbad□s Engineering Standards employed several measures to prevent sewage intrusion into municipal separate storm sewer systems (MS4).

  1. All gravity sewer pipes and laterals are required to have gasketed joints, which create water tight joints (Volume 1, Chapter 6, Item 3.A, 3.C, and 3.F). The water tight joints are tested using the methods indicated in Standard Specifications for Public Works Construction (SSPWC) section 306-1.4. The water tight test methods include a post-installation closed circuit television (CCTV) inspection and an air pressure test where the sewer line must sustain 2.5 to 3.5 psi gage pressure for at least 2 minutes after being pressurized to 3.0 psi.

  2. All gravity sewer lines are required to follow engineering standard for the amount of flow they can carry. During peak hour dry weather season the pipe shall be designed to carry a flow depth of 0.5 (or 0.75 depending on the pipe size) the diameter of the pipe (Volume 1, Chapter 6, Item 4.C). This design requirement prevents the pipe from becoming full, which would pressurize the pipe and potentially cause a leak.

3. Per Carlsbad's Engineering Standard GS-6 and GS-6A, the sewer lines are typically located at an elevation deeper than the storm drain line, which further prevents sewage intrusion into MS4. In the event of a sewage pipe leak, the leakage flow will naturally gravitate below the sewer line rather than up to the storm drain line.

4. The standard horizontal separation between sewer and storm drain is 13 feet, which further prevents sewage intrusion into MS4.

5. In special cases where storm drain lines are installed at a depth greater than that of sewer lines, additional design standards are required such as water tight joints or encasements (Volume 1, Chapter 5, Item 1.G).

- Treatment Control BMPs: Storm Drain Inserts including fossil filters, rapid flow BMPs, and debris catchers with zinc filters are in place at various storm drain locations throughout the City. Fossil filters removed trash and hydrocarbons, while debris catchers were installed to prohibit anthropogenic trash and debris from entering the storm drain system. Table 4.6 lists the type of insert, location, quantity, and minimum frequency of maintenance.

Table 4.6 Storm Drain Insert-Type BMPs

Type	Location	Number	Frequency
Debris Catcher	Carlsbad Boulevard	9	Annual
	State Street	4	Annual
	Grand Avenue	3	Annual
	Carlsbad Village Drive	4	Annual
	Ocean Street	4	Annual
	Rancho Santa Fe	1	Annual
	Celinda Drive	1	Annual
Fossil Filter	Oak Avenue	4	Annual
	Chesnut Avenue	6	Annual
	Jefferson Street	5	Annual
	Fleet Maintenance	4	Annual
	Ocean Street	2	Annual
	Paseo del Norte	3	Annual
	Cannon Road	5	Annual
	Faraday Avenue	3	Annual
	Recycled Water Plant	4	Annual
	M&O Yard	2	Annual
Gravel Filter	M&O Yard	1	Annual

The City also inspected and maintained three desiltation basins. Table 4.7 below lists the City owned and maintained basins. The basins were inspected annually prior to the rainy season and maintained as necessary.

Table 4.7. City Owned/Maintained Desiltation Basins

Site	Location	Description	Inspection Frequency
DESILTATION BASIN 13	SW END FARADAY AV SO OF LOT 102 OF CRC	Desiltation Basin	Annual
DESILTATION BASIN 30	SW CORNER MARRON AND MONROE	Desiltation Basin	Annual
DESILTATION BASIN 43	CAMINO HILLS AND FARADAY NE CORNER	Desiltation Basin	Annual

4.5 Fire Stations

4.5.1 Background

There are six fire stations in the City, which are high priority areas according to the City s JURMP. The inventory and BMPs for these facilities are described below.

4.5.2 Source Characterization

Table 4.8 below lists the High Priority Fire Stations on the City s 2008 JURMP inventory.

Table 4.8 Fire Stations

1	FIRE STATION 1	1275 CARLSBAD VILLAGE DR
2	FIRE STATION 2	1906 ARENAL RD
3	FIRE STATION 3	3701 CATALINA DR
4	FIRE STATION 4	6885 BATAQUITOS DR
5	FIRE STATION 5	2540 ORION WY
6	FIRE STATION 6	3131 LEVANTE ST

4.5.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.9 were implemented at the High Priority facilities listed above.

Table 4.9 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.5.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.9 were implemented at the facilities listed in Table 4.8 and are described below. In addition, training and pollution prevention BMPs specific to the Fire Department are described below.

Training

- The City s Reclaimed Water Facility continued to be utilized for fire engineer training and testing. A training trailer facilitated engineer operations, pump testing, and other wet training opportunities. The Facility allowed for wet training and testing opportunities while ensuring that no water is discharged to the MS4.
- Suitable locations were selected to provide wet training opportunities for personnel, while ensuring that appropriate BMPs were in place to protect the storm drains and eliminate discharges to the MS4. These sites were generally located on pervious surfaces with no potential for discharge to the storm drain system.
- A representative from the Fire Department attended and participated in the City s Storm Water Committee meetings on a regular basis.

Pollution Prevention

- Dry cleanup methods were used to reduce water use. The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations. Awareness was heightened at fire scenes to minimize the potential for excessive water flow.
- Materials were recycled where possible.
- Storm Water Manuals were developed for each station which include SWPPPs with site maps, inspection reports, facility specific spill response procedures, training records, and department policies.
- SC-11 Spill Prevention, Control, and Cleanup: Spill response equipment and materials are clearly identified and staged in accessible locations at each station. Awareness was heightened at incident scenes to contain potential discharges (once the scene had been stabilized) to prevent pollutants from entering the MS4. The Department continued implementation of the City s spill response procedure for incidents that occur on City streets. Absorbent materials are kept on all engines. The spill response plan is to apply absorbent, sweep material, place in bags, and remove from site for proper disposal. A large spill kit is also kept at Station 5.
- SC-21 Vehicle and Equipment Cleaning: The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Vacuum equipment was purchased to recover and contain all wash water from vehicle washing activities occurring at the Fire Stations.
- SC-34 Waste Handling and Disposal: Waste containers were inspected regularly for leaks and to ensure that lids remained closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter.
- SC-41 Building and Grounds Maintenance: In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented

any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.

- SC-43 Parking/Storage Area Maintenance: Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations.
- SC-60 Housekeeping Practices: Fire stations are kept clean and orderly. Wash water was disposed of properly. Sweeping material was disposed of properly. Training on storm water and spill response was provided regularly.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping are used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: Solid waste was collected and disposed of properly at appropriate disposal facilities (Palomar Transfer Station, Waste Management) in accordance with all applicable laws and regulations. Waste containers were inspected regularly for leaks and to ensure that lids remained closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter. Liquids were not disposed of in waste containers. Recycling was implemented where possible; bins were provided.

4.6 Recreation Facilities

4.6.1 Background

The Swim Complex is the only recreation facility on the City s municipal inventory listed as a High Priority area. This is primarily due to the chemicals stored on-site. BMPs implemented at this facility are described below.

4.6.2 Source Characterization

The only High Priority Recreation Facility on the City s 2008 JURMP inventory was the Swim Complex.

4.6.3 Site Specific BMP Requirements

The site specific BMPs listed below in Table 4.10 were implemented at the Swim and Recreation Complex.

Table 4.10 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-31 Outdoor Container Storage
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-60 Housekeeping Practices
SC-72 Fountains & Pools Maintenance
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.6.4 Program Implementation

BMPs listed in Table 4.10 above were implemented at the Swim and Recreation Complex. BMPs implemented specific to this facility and its activities are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Commercial spill kits are kept onsite. A facility specific SWPPP was developed and is kept onsite. The SWPPP includes a spill response plan.
- SC-31 Outdoor Container Storage: The caustic soda is stored under cover. The majority of materials stored on-site are kept inside sheds. These areas were cleaned up and maintained regularly.
- SC-34 Waste Handling and Disposal: Trash bins and containers are enclosed and covered. Lids remained closed at all times.
- SC-41 Building and Grounds Maintenance: (parks/facilities) Staff performed daily parking lot inspections looking for litter, debris, and leaking vehicles. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-60 Housekeeping Practices: Cleaning of pool decks was performed by sweeping in most cases. Occasionally wash down was necessary and all wash water was directed to a pervious area for percolation (football field).
- SC-72 Fountains and Pools Maintenance: Water was de-chlorinated if discharge to storm drain was necessary; however, this was a rare occurrence. All filter back wash was discharged to sewer; overflow from pool decks was directed to earthen swale and percolates.
- SC-73 Landscape Maintenance: Irrigation systems checked regularly to avoid run-off; soil testing utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were not stored onsite and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: The dumpster remained closed and locked at all times and was serviced weekly.

4.7 Publicly Owned Treatment Works

4.7.1 Background

The City of Carlsbad is a part owner of the Encina Wastewater Authority which treats raw sewage to the secondary treatment level.

The Carlsbad Water Recycling Facility intakes secondary treated water and treats it again to the tertiary level of treatment which is used as recycled water throughout the City of Carlsbad. This facility was determined to be High Priority as required in Order 2007-0001, Section D.3.a.(7)(a). The BMPs listed below were implemented at the Carlsbad Recycled Water Facility.

4.7.2 Source Characterization

The Carlsbad Recycled Water Facility is the only High Priority Publicly Owned Treatment Works on the City's 2008 JURMP inventory.

4.7.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.11 were implemented at the Recycled Water Facility.

4.11 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

4.7.4 Program Implementation

Each of the applicable BMPs listed above were implemented at the Carlsbad Recycled Water Facility and are described below.

- Employee Training: Employees were informed of activities that could potentially cause contamination of storm water and the importance of carefully conducting these activities in areas that do not discharge/drain to storm drains. Storm water pollution prevention and BMP brochures were available to everyone who works at the materials storage area. Subcontractors were informed about the storm water requirements and their responsibilities. Training consisted of informal tailgate meetings, formal classroom training, or self-guided training activities. Employees in targeted positions were trained annually on the requirements of the SWPPP. Employee training, at a minimum, included: SWPPP requirements; spill response and reporting; good housekeeping; BMP updates and implementation; and materials and waste handling and storage procedures.
- SC-11 Spill Prevention, Control, and Clean-up: A current spill response plan was provided in the SWPPP. The spill response plan addressed measures to clean, abate, and prevent spills and leaks from entering the storm drain. Employees were trained on the elements of the plan. Rags and absorbents were readily accessible. Waste was disposed of properly. Dry cleanup methods were used whenever possible. Spills on dirt areas were cleaned up by digging up and properly disposing of contaminated soil. Spills over 10 gallons were reported to the Storm Water Protection Program and/or the appropriate spill response agencies immediately. Employees were trained to routinely check for leaks and spills.
- SC-20 Vehicle and Equipment Fueling: All vehicles were fueled off-site. Equipment continued to be run with electricity and no equipment fueling was necessary.
- SC-22 Vehicle and Equipment Repair: All vehicle repairs were performed off-site. When equipment repair was necessary, work was performed in covered, contained areas that were not susceptible to storm water runoff.

- SC-31 Outdoor Container Storage: There were several chemical storage tanks stored outside under cover and in full secondary containment structures. See SC-33 below for more information.
- SC-33 Outdoor Storage of Raw Materials: Secondary containment was implemented where materials are stored outside. Examples of temporary BMPs utilized are: a dike, berm, or filter on the down slope sides of any stockpiles. All containment devices used around stockpiles were maintained to work effectively and were replaced when necessary. The chemical storage tanks were contained within a concrete parapet wall enclosure. Spills within the chemical storage areas were contained within the concrete walls and drain to a sump. Where chemical deliveries occurred, a concrete pad conveyed flow to a curb inlet. From the curb inlet, flow was controlled by plug valves, directing the flow to the sump.
- SC-34 Waste Handling and Disposal: Dumpsters were covered and maintained and checked frequently for leaks. Lids were kept closed at all times. Dumpsters were never cleaned out using water. When cleaning the containers, all rinse water from cleaning was routed to the sanitary sewer system. All wastes and construction debris were disposed of properly. Many materials and wastes were recycled including broken asphalt and concrete, cleared vegetation, scrap metals, aluminum cans, and plastic bottles. Materials and debris that could not be recycled were taken to an appropriate landfill or disposed of as hazardous waste. The waste storage area was swept or otherwise cleaned frequently using dry methods to collect all loose solids for proper disposal. If the amount of waste accumulated appeared to frequently exceed the capacity of the dumpster, then another container should have been obtained and utilized or collection frequency was increased. Green waste consisting of clippings, cuttings and droppings of leafy and woody materials was disposed of properly at an approved composting location or permitted landfill.
- SC-60 Housekeeping Practices: Site was kept free of litter and debris. Trash cans and recycling receptacles were located around the site to minimize litter. Material moving and transfer activities were scheduled during dry weather periods, where possible. Heavy equipment was maintained in good working condition. Areas were inspected frequently for leaks and repaired as needed. Major equipment repairs were performed away from the storage area. Paved surfaces were swept that drain to storm drains, creeks, or channels. Cleanup materials such as brooms, shovels, dustpans, and sweepers are stocked near the storage area. Paved storage areas were swept weekly for collection and disposal of loose solid materials, and were not hosed into a storm drain or conveyance ditch. Information was distributed on good housekeeping practices during employee training sessions and discussed at employee meetings. Good housekeeping tips and reminders were posted on employee bulletin boards.
- SC-75 Waste Handling and Disposal: See SC-34 above.
- SC-76 Sewer Utility Maintenance: Sewer utility maintenance was not performed at this facility.
- Source Control BMPs (specific to the Recycled Water Facility):
  - Flo-Guard inlet baskets at all curb inlets on site to collect oil and grease and debris from site.
  - Vegetated swale (approximately 400 feet) collects and treats runoff from a portion of the site.
  - Roof over chemical storage area.
  - Permanent secondary containment is in place around all chemical storage areas.
  - By-pass valves are installed at containment areas to divert rain water.

4.8 Sanitary Sewer Facilities

4.8.1 Background

The facilities listed in Table 4.12 are sewer lift stations owned and operated by the City. The table also includes the City's collection system. These have been determined to be High Priority areas according to Order 2007-0001 and the City's 2008 JURMP, primarily due to the presence of sewage and potential for contamination of surface waters resulting from sewer overflows. BMPs implemented at these facilities and BMPs applicable to maintenance of the collection system are described below.

4.8.2 Source Characterization

Table 4.12 below lists the High Priority Sanitary Sewer Facilities on the City's JURMP inventory.

Table 4.12 Sanitary Sewer Facilities

1	BATIQUITOS SEWER LIFT STATION	7382 GABBIANO LN
2	BUENA VISTA SEWER LIFT STATION	JEFFERSON
3	CALAVERA PUMP STATION	3600 BLOCK COLLEGE DR
4	CANNON SEWER LIFT STATION	2301 CANNON RD
5	CHINQUAPIN SEWER LIFT STATION	4010 CARLSBAD BL
6	FOXES LANDING LIFT STATION	4155 HARRISON ST
7	GATESHEAD SEWER LIFT STATION	4779 GATESHEAD RD
8	HOME PLANT SEWER LIFT STATION	2359 CARLSBAD BL
9	KNOTS SEWER LIFT STATION	501 KNOTS LN
10	LA GOLONDRINA SEWER LIFT STATION	2516 LA GOLONDRINA ST
11	POINSETTIA SEWER LIFT STATION	2425 POINSETTIA LN
12	SAND SHELL SEWER LIFT STATION	613 SAND SHELL
13	SANITARY SEWAGE COLLECTION SYSTEM	CITY SERVICE AREA
14	SIMSBURY SEWER LIFT STATION	3086 TAMARACK AV
15	TERRAMAR SEWER LIFT STATION	300 CANNON RD
16	VANCOUVER SEWER LIFT STATION	2690 VANCOUVER ST
17	VILLAS SEWER LIFT STATION	2860 WINTHROP AV

4.8.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.13 were implemented at all Sanitary Sewer Facilities.

Table 4.13 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

4.8.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.12 and are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Hazmat plans were drawn up and located in the SWPPP at each location; spill kits are kept inside at all facilities; secondary containment structures were implemented around generator fuel cells and around all chemicals stored on-site; overflow response included immediate Vactor response, containment, and cleanup. For more details see City of Carlsbad SSORP spill mitigation and clean-up; all vehicles have spill kits.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was performed in secondary containment areas or over pervious surfaces. Fuel deliveries were performed by an outside contractor. Documentation is kept onsite.
- SC-22 Vehicle and Equipment Repair: Pump repair occurred indoors on site and was generally performed in the wet well; all material went back to the head works was transferred to the Encinas treatment plant; wet wells were cleaned every 6 weeks with Vactor equipment and staff ensured that there were no leaks or spills at the facilities.
- SC-31 Outdoor Container Storage: The 55-gallon trash can was covered with a liner.
- SC-34 Waste Handling and Disposal: Trash and debris were removed on a regular basis.
- SC-60 - Good Housekeeping: Sweep and vacuuming instead of washing down; blowers were used to clean off concrete and asphalt.
- SC-75 Waste Handling and Disposal: Trash and debris were removed on a regular basis.
- SC-76 Sewer Utility Maintenance: All stations were inspected and cleaned daily; Vactors were checked for leaks during pre-trip inspections; all materials were discharged at Encina Wastewater Authority: solids into grit bin, liquids at headworks; recently the City began to implement FOG requirements as per Order 2006-003 including revision of ordinances, public outreach, and inspections of FOG generating facilities.

4.9 Water Facilities

4.9.1 Background

There are six High Priority water facilities on the City's JURMP inventory. The sites are High Priority facilities due to chemical storage on-site or due to their location in the watershed. BMPs implemented at the sites according to the JURMP are described below.

4.9.2 Source Characterization

The table below lists the High Priority Water Facilities on the City's JURMP inventory.

Table 4.14 Water Facilities

1	MAERKLE DAM RESERVOIR/PUMP/CHLORINATION STAT	5203 SUNNY CREEK RD
2	RESERVOIR C	CALAVERA DR
3	RESERVOIR ELM	CARLSBAD VILLAGE DR & DONNA DR
4	RESERVOIR LA COSTA HI	ALGA RD
5	RESERVOIR LA COSTA LO	ALGA RD
6	TAP PUMP STATION	6400 BLOCK OF EL CAMINO REAL

4.9.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.15 were implemented at the water facilities listed above.

Table 4.15 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-60 Housekeeping Practices
Water Operations and Maintenance

4.9.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.14 and are described below.

- Pollution Prevention: Automatic shut-off valves have been installed.
- SC-11 Spill Prevention, Control, and Cleanup: Specialized training was implemented to mitigate a chlorine release. In addition to the training all chemicals are stored in containment structures designed to contain stored amount. All chemicals were inspected prior to off loading for containment defects and returned if noted. Operations Staff was trained in Hazardous Material Emergency Response, technician level (HAZWOPER), specialized in chlorine mitigation. A site specific SWPPP was developed for Maerkle Reservoir.
- SC-20 Vehicle and Equipment Fueling: Diesel deliveries were performed by outside contractors.
- SC-22 Vehicle and Equipment Repair: All storm drain collectors were regularly inspected and cleaned accordingly. All building floor drains were inspected and verified to be isolated from discharge system.
- SC-31 Outdoor Container Storage: The 55-gallon trash cans with liners were utilized and trash was removed on a regular basis.
- SC-33 Outdoor Storage of Raw Materials: No raw materials are stored outdoors.
- SC-60 - Good Housekeeping Increased sweeping schedule of asphalted areas was implemented. Chemicals supplies are kept at a minimum to reduce potential releases.

- Water Operations and Maintenance:
    - Repairs and New Line Installation: All flushing requirements follow established BMP's regarding de-chlorination and related sediment recovery concerns.
    - Reservoir Cleaning and Dewatering: All reservoir de-watering follows pre-established BMP's addressing daily water volume discharge amounts, de-chlorination, monitoring of chlorine residuals and sediment removal and disposal

4.10 Municipal Yards

4.10.1 Background

Table 4.16 below lists the City's municipal yards that were determined to be High Priority areas as required per Order 2007-0001, Section D.3.a.(7)(a) and the City's JURMP. Site specific BMPs implemented at each facility are listed and described below.

4.10.2 Source Characterization

The table below lists the High Priority Municipal Yards on the City's JURMP inventory.

Table 4.16 MUNICIPAL YARDS

1	FLEET MAINTENANCE FACILITY AND PARKING LOT	2480 IMPALA DR
2	M&O OPERATIONS YARD AND PARKING LOT	5950 EL CAMINO REAL
3	OAK OPERATIONS YARD AND PARKING LOT	405 OAK AV
4	PARKS MAINTENANCE/STORAGE/PARKING LOT	1166 CARLSBAD VILLAGE DR

4.10.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.17 were implemented at Municipal Yards, where applicable. For example, vehicle and equipment repair is not performed at all facilities; therefore SC-22 does not apply to all yards.

Table 4.17 Best Management Practices

Storm Water Pollution Control Plan
SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-61 Safer Alternative Products
SC-70 Road and Street Maintenance
SC-71 Plaza and Sidewalk Cleaning
SC-72 Fountains & Pools Maintenance
SC-73 Landscape Maintenance
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal

4.10.4 Program Implementation

BMPs listed in Table 4.17 were implemented specific to each facility and are described below.

FLEET MAINTENANCE YARD

- Employee Training Storm water protection was covered as part of safety meetings.
- Pollution Prevention Recycling containers were provided at the ends of the fuel pump inlands.
- Storm Water Pollution Control Plan: A site specific SWPPP was developed and is maintained on-site.
- SC-11 Spill Prevention: Spill kits containing absorbents and booms are located at the fuel island and south west of the fuel island within the yard, including the shop area.
- SC-20 Vehicle and Equipment Fueling: Spill kits are located adjacent to the vehicle fueling area.
- SC-21 Vehicle and Equipment Cleaning: All vehicle washing was performed on the wash rack, inside the wash bay. This included pressure washing and hand washing of vehicles and equipment. Wash waste water is treated prior to release to the sewer system.
- SC-22 Vehicle and Equipment Repair: All maintenance and repairs to Fleet vehicles were performed inside the shop bays. Any vehicle on the dead line that had a leak had a drip pan put under it until it is brought into the shop. Any leaks or spills were handled immediately, with either the drip pans or an absorbent. The absorbent was picked up immediately and stored in the drums labeled for waste absorbent. Damaged equipment and wrecked vehicles with a potential for discharge were covered with tarps.
- SC-31 Outdoor Container Storage: Outdoor containers that include full coverage and containment of materials are utilized for storage of tires and motorcycles (two 40 yard containers) and for storage of fire extinguisher service items, used batteries, and oil filters for recycling (sheds).

- SC-33 Outdoor Storage of Materials: All materials stored outside are kept under one of the provided canopies or in the shed. City-generated hazardous waste is stored in the hazardous waste shed (covered) in an appropriate container and on a pallet. This includes batteries and waste metals. A chain link fence was installed to prevent unauthorized dumping at the Facility. Signage was also in place to inform citizens that materials were not to be left at the Facility and provided information on proper disposal facilities.
- SC-34 Waste Handling and Disposal: Waste oil was drained into the waste oil containers or into a drip pan and then into a waste oil container. The containers were emptied as needed into the waste oil in ground tank as needed. Used batteries were stored in the provided container inside the shed. Used antifreeze was drained into one of the large drip pans, then transferred to the poly drums inside the shed. Scrap metal is stored in the provided container and covered. Used tires are stored in the covered tire storage bunker.
- SC-41 Building and Grounds Maintenance: Language was included in contracts requiring storm water compliance and allowing the City to implement BMPs as needed with all associated costs recovered from the contractor. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The Fleet Yard was swept via Sweeper-truck on a monthly schedule, clean ups of spills were done with dry absorbent and picked up directly, all leaks were captured with drip pans and brought into the shop for service.
- SC-60 Housekeeping Practices: The shop was either swept or mopped. All debris was either picked up and put into appropriate containers or, in the case of wet mopping, all water was directed to the drains inside the shop that flow to our separator. All contaminated floor sweep was stored in labeled containers and removed by our hazardous waste contractor. The Fleet yard was inspected regularly as well as before and after storm events. Areas inspected were the shed and tire storage area at the north end of the shop, the waste tire and hazardous waste bunker along the north fence line, the two large dumpsters, the two trash and two recyclables cans at the fuel pumps, the spill kits for the fuel island, the storm drains on-site and the paved lot and dirt area at the east end (which is now fenced). Inspection criteria: all waste drums/containers are to have secondary containment, all materials are to be stored in covered areas. Appropriate areas included a shed and two canopies plus the hazardous waste container and waste metal containers. The dumpsters, trash cans, recyclables cans and metal storage were kept closed and no trash fell out of them. The filters at the storm drains were inspected for cleaning or replacement. The lot was inspected for spills and cleaned up as needed. Vehicles in the lot were inspected for leaks; action was taken to contain leaks as needed. The wash rack area, trash containers area, and drains were inspected for clogging from debris. All employees always took immediate action to correct any issues found during inspections of the Fleet yard directly.
- SC-61 Safer Alternative Products: Not applicable.
- SC-70 Road and Street Maintenance: Not applicable.
- SC-71 Sidewalk Cleaning: Where power washing was necessary, wash water was not allowed to drain to the storm drain system and was directed to sanitary sewer or to pervious surfaces where possible.
- SC-72 Fountain and Pools Maintenance: Not applicable.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping are used wherever

possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.

- SC-74 Drainage System Maintenance: Fossil filters have been installed at storm drain inlets in yard and were inspected and maintained regularly.
- SC-75 Waste Handling and Disposal: Updated signage was installed for Household Hazardous Waste disposal.

MAINTENANCE AND OPERATIONS YARD

- Pollution Prevention Native soils were used whenever possible to backfill trenches: the amount of dirt and soil stockpiled on site was minimized; filtration socks were used to dewater trenches.
- Storm Water Pollution Control Plan: A site specific SWPPP is kept on-site and maintained regularly.
- SC-11 Spill Prevention, Control, and Cleanup: Secondary containment where fuel and oil are stored, also yard has spill kits in each vehicle. A hazmat plan has been implemented and is located in the SWPPP.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was performed in the secondary containment area or over pervious surfaces.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks, otherwise no cleaning or washing was allowed at M&O yard.
- SC-22 Vehicle and Equipment Repair: No repairs were performed at yard.
- SC-31 Outdoor Container Storage: Container storage areas are covered using overhead canopies.
- SC-33 Outdoor Storage of Materials: Where necessary, plastic tarps cover raw materials in the yard; equipment is covered by canopies; material is covered by a permanent overhead structure or stored indoors.
- SC-34 Waste Handling and Disposal: All material was put into a covered roll-off container.
- SC-41 Building and Grounds Maintenance: The grounds and parking lot were swept twice a month by street sweeper and weekly by hand when necessary. Trash was removed daily. Erosive areas and slopes were protected by hydroseed, coconut mats, sand bags, and fiber rolls. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Where feasible, work was performed under cover and over pervious areas. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The parking lot was swept twice a month by a street sweeper; ingress/egress to unpaved area of yard was protected by rocks and shaker plates.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans were covered and kept closed.
- SC-61 Safer Alternative Products: Used less hazardous cleaning materials and water-soluble paints for mark outs.
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Sweep and/or vacuum sidewalks.
- SC-72 Fountain and Pools Maintenance: Contractor maintained fountain at facility. No water was discharged during maintenance activities; all filter material was retained on-site for proper disposal.
- SC-73 Landscape Maintenance: All material was cut and carried off by hand in burlap bags; no residue remains on site. Irrigation systems were checked regularly to avoid run-off;

timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.

- SC-74 Drainage System Maintenance: Rapid Flow filters and storm drain structures were cleaned annually. A pilot program was implemented using the innovative Drivable Grass which drains the parking lot through subsurface drainage system to reduce storm water flowing directly into MS4.
- SC-75 Waste Handling and Disposal: All material was handled properly and covered in yard roll-off dumpsters, or other appropriate containers.

OAK YARD

- Storm Water Pollution Control Plan (SWPPP description): A site specific SWPPP was developed and implemented at the Oak Yard.
- SC-11 Spill Prevention, Control, and Cleanup: All liquids and hazardous materials are stored in locked containment lockers. These are located within secondary containment areas. Large spill containment kits are strategically located within the yard. MSDS binders are strategically placed throughout the yard.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was done only in the secondary containment area.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks. No cleaning or washing was allowed in the Oak yard
- SC-22 Vehicle and Equipment Repairs: No repairs were done at the Oak yard.
- SC-31 Outdoor Container Storage: Oak yard has storage areas covered with overhead canopies.
- SC-33 Outdoor Storage of Raw Materials: No raw materials are stored at the Oak yard.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a proper containment area in case of any accidental spillage. These containers are clearly marked and stored until arrangements were made for a certified waste management company to remove them and transfer them to an approved facility. Any other debris was placed in a canopy covered 40 yd roll-off. Dumpsters were covered and all other trash receptacles had lids.
- SC-41 Building and Grounds Maintenance: The Oak yard was swept twice a month by a self-contained street sweeper and weekly by hand. Trash was removed daily. In the event that any pressure washing was necessary, all washwater was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control and lot was swept regularly.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans are covered. Yard clean-up was performed by-weekly with monthly site inspections.
- SC-61 Safer Alternative Products: Not Applicable
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Not Applicable
- SC-72 Fountain and Pools Maintenance: Not Applicable
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements

on downtown irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.

- SC-74 Drainage System Maintenance: Debris was captured prior to entry into the vegetated swale.

PARKS MAINTENANCE YARD

- Storm Water Pollution Control Plan (SWPPP description): Site specific SWPPPs were developed and implemented at each of these sites, with the exception of Aviara. Aviara is a new site and the SWPPP is currently under development.
- SC-11 Spill Prevention, Control, and Clean-up; Spill kits are located on-site; drip pans were placed under all equipment kept on-site; spill kits are located in all vehicles; spill response plan is updated and kept on-site.
- SC-20 Vehicle and Equipment Fueling: No vehicle or equipment fueling was performed on-site.
- SC-21 Vehicle and Equipment Cleaning: Most equipment was dry-cleaned in designated areas located away from storm drains; where wet cleaning was necessary, it was performed over pervious surfaces in a manner that allowed all water to percolate, generating no runoff to the storm drain system.
- SC-22 Vehicle and Equipment Repair: All equipment was repaired in designated areas away from storm drains; no vehicle repair was performed on-site.
- SC-31 Outdoor Container Storage: All chemical products are kept in locked storage bins with overhead coverage and containment.
- SC-33 Outdoor Storage of Raw Materials: All bagged materials are stored on skids (pallets) and covered with canopies; canopies are also used to cover scrap metals and equipment.
- SC-34 Waste Handling and Disposal: All waste containers are covered.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Weekly yard clean-up and litter removal and monthly site inspections were conducted.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use; artificial turf and permeable surfaces were implemented where feasible; organics from tree trimming were mulched or composted and used for landscaping.
- SC-70 Road and Street Maintenance: Not applicable at yard sites.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system; any storm drains in proximity were protected from discharges.
- SC-72 Fountains and Pools Maintenance: Not applicable at park sites.

- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on downtown irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: Storm drain inlets were maintained by City s Storm Drain Maintenance Division on an annual basis.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of properly.
- Site Design - Stagecoach Facility drains to grassy field for percolation prior to discharge from site; the Parks Maintenance/Storage Yard also drains to a pervious area allowing low flows to infiltrate into the soils instead of running into the storm drain.

4.11 Parks Facilities

4.11.1 Background

The table below lists City parks facilities that were determined to be High Priority areas based on the criteria established in Order 2007-0001, Section D.3.a.(7)(a) and the City s JURMP. High Priority parks facilities were defined as developed park sites containing landscaping, building(s), and parking lot(s) and developed park sites within an Environmentally Sensitive Area.

Site specific BMPs implemented at each facility are listed and described below.

4.11.2 Source Characterization

The table below lists facilities on the inventory that are medium priority and includes 14 parks and recreation facilities.

Table 4.18 Parks

1	AVIARA COMMUNITY PARK, MAINTENANCE STATION, AND PARKING LOTS	6425 AMBROSIA LN
2	CADENCIA PARK	3310 CADENCIA ST
3	CALAVERA HILLS PARK, COMMUNITY CENTER, AND PARKING LOT	2997 GLASGOW DR
4	CARRILLO RANCH AND PARKING LOT	5200 FLYING LC LANE
5	HIDDEN CANYON PARK (LARWIN) AND PARKING LOT	2685 VANCOUVER STREET
6	HOLIDAY PARK AND PARKING LOTS	3200 PIO PICO DR
7	HOSP GROVE PARK AND PARKING LOT	JEFFERSON & MONROE
8	LA COSTA CANYON PARK AND PARKING LOT	3020 PUEBLA ST
9	LAGUNA RIVIERA PARK	4900 KELLY DR
10	MAGEE PARK AND PARKING LOT	258 BEECH AVE
11	MAXTON BROWN PARK	500 LAGUNA DR
12	PINE PARK AND PARKING LOT	3333 HARDING ST
13	POINSETTIA COMMUNITY PARK, MAINTENANCE STATION AND PARKING LOT	6600 HIDDEN VALLEY RD
14	STAGECOACH COMMUNITY PARK, MAINTENANCE STATION, AND PARKING LOT	3420 CAMINO DE LOS COCHES

4.11.3 Site Specific BMP Requirements

Site specific BMPs listed below were implemented at Parks Facilities.

Table 4.19 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-61 Safer Alternative Products
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.11.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.18 and are described below.

- SWPPP: Aviara, Poinsettia, and Stagecoach Parks also house small maintenance yards. Because of the added potential to contribute to storm water pollution, SWPPPs were required by the City for these facilities. Poinsettia and Stagecoach have developed and fully implemented SWPPPs. Aviara is a new site and the SWPPP is currently under development.
- SC-11 Spill Prevention, Control, and Cleanup; Spills kits are located on-site; spill response plan was updated and kept on-site
- SC-20 Vehicle and Equipment Fueling: Minor equipment fueling was performed over pervious surfaces when necessary.
- SC-21 Vehicle and Equipment Cleaning: Most equipment was dry-cleaned in designated areas located away from storm drains; where wet cleaning was necessary, it was performed over pervious surfaces in a manner that allowed all water to percolate, generating no runoff to the storm drain system.
- SC-22 Vehicle and Equipment Repair: Equipment was repaired in designated areas away from storm drains; no vehicle repair was performed on-site.
- SC-31 Outdoor Container Storage: Chemical products are kept in locked storage bins with overhead coverage and containment.
- SC-33 Outdoor Storage of Raw Materials: All bagged materials are stored on skids (pallets) and covered with canopies; canopies were also used to cover scrap metals and equipment.
- SC-34 Waste Handling and Disposal: All waste containers are covered; pet waste bag dispensers and containers were provided at all parks where dogs are allowed.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Park sites are kept clean and orderly; all debris was removed in a timely fashion and hard-scape areas were swept or blown routinely; wash water, sweepings, and sediments were disposed of properly; recyclable materials were recycled; spill response plans were reviewed as part of routine training with staff.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use and are described below.

  In conjunction with the Integrated Pest Management (IPM) program, the Parks Maintenance Division continued to utilize slow release fertilizers in an effort to reduce the frequency of applications while minimizing the potential of fertilizer runoff. In some cases, staff reduced the recommended amount of fertilizer per 1,000 square feet by 50 to minimize flush of growth on turf which in turn reduced the amount of clippings. To help monitor fertilizer applications, the Parks Maintenance Division instituted a soil testing program which defined soil properties, allowing the correct monitoring of fertilization applications for proper use and desired outcome. In accordance with the new IPM practices, pesticide and herbicide applications were performed sparingly. Staff continued to search for alternative methods to pest control that are proven to be safe and effective.

As required by the Department of Pesticide Regulation, all chemical applications were reported to the County Agriculture Department on a monthly basis. As identified in the JURMP, all applicable BMPs were implemented to address pesticide, herbicide, and fertilizers sources of pollution. Specific, BMPs implemented during FY 07-08 include:

- **Education:** A training program for identifying and defining chemicals, proper handling, applying, storage, disposal, irrigating, and using non-synthetic alternatives was implemented. At many of the training seminars, new IPM methods were often presented for consideration by the department. All training information including BMPs were provided to personnel to keep in personalized folders for individual use. In addition, a master application manual that includes all Storm Water BMPs, training, and inspections was also prepared.

- **Non-chemical applications:** Some pest problems can be eliminated or controlled by handpicking, pruning, or high pressure spraying with water. Many pest problems can be reduced or eliminated by removing affected leaves or plant parts. During FY 07-08, efforts were made to improve upon our IPM system in the City s Parks and Downtown Village areas. The release of lady-bird beetles at Pine Park and the Downtown Fountain areas to combat infestations of aphids have proven successful in eradicating the bugs. Other methods used to decrease the department s dependency on chemical sprays during FY 07-08 include:

    - Increased mulching of planter beds to smother weed germination
    - Increased tilling of planter beds to kill young weed sprouts
    - The use of organic plant derivative pesticide sprays such as Safer brand Products
    - The use of water to spray plants infested with giant whitefly
    - The removal of dying or diseased plant material to decrease the presence of harmful organisms.

- Pesticide application was performed on an as needed basis and was performed internally or by an outside pest control contractor after diagnosis.

- **Native Vegetation:** The Parks Maintenance Division continued to explore opportunities to use native vegetation to control pests, reduce chemical application, and maintain the aesthetic values of the Parks and Downtown Village areas.

- **Schedules for Irrigation and Application** Irrigation systems were monitored and inspected on a weekly basis in an effort to minimize water loss. In addition, the use of evapo-transpiration (ET) gauges for controlling the irrigation system helped to reduce watering times based on evaporation and transpiration of moisture from plants and turf. ET gauges were installed at Poinsettia, Stagecoach, Pine, Aviara and Calavera Park. These gauges also helped staff to adjust watering times at other locations that were not connected to the gauge. During FY 07-08, all irrigation systems were inspected weekly and repaired as necessary to prevent excess runoff. At Poinsettia, Aviara, Stagecoach and Pine Parks, synthetic turf has been installed on the soccer and sports fields, which requires no fertilization, weeding, or watering. The synthetic turf has proven to be particularly successful in eliminating the use of water for irrigation.

- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices. Refer to description of IPM practices in SC-61 above.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of at appropriate landfill or transfer station.
- Site Design Desiltation basin was retrofitted at La Costa Canyon Park; pervious concrete was installed at Pine Park.

4.12 Administrative Areas

4.12.1 Background

One administrative building was determined to be a high priority facility based on its proximity to an environmentally sensitive area (ESA). This facility is the Safety Center, which includes a parking lot, police and fire department headquarters, and a skatepark.

4.12.2 Source Characterization

The only administrative building on the inventory that is a High Priority is the Safety Center.

4.12.3 Site Specific BMP Requirements

Site specific BMPs listed below were implemented at the Safety Center.

Table 4.20 Best Management Practices

SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.12.4 Program Implementation

Each of the BMPs listed above were implemented at the Safety Center and are described below.

- SC-34 Waste Handling and Disposal: Dumpsters were covered and maintained and checked frequently for leaks. Lids were kept closed at all times.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper

disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.

- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Site is kept clean and orderly; all debris was removed in a timely fashion and hardscape areas were swept or blown routinely; wash water, sweepings, and sediments were disposed of properly; recyclable materials were recycled.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system ; any storm drains in proximity were protected from discharges.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of properly.

4.13 Activities

4.13.1 Background

Four municipal activities were determined to be High Priority activities based on their potential to generate pollutants. These operations occur throughout the City and are required to implement BMPs as described in the JURMP.

4.13.2 Source Characterization

The table below lists the activities on the inventory that are considered High Priority.

Table 4.21 ACTIVITIES

1	LANDSCAPE MAINTENANCE AND REPAIR	CITYWIDE
2	MS4 MAINTENANCE	CITYWIDE
3	POWER WASHING	CITYWIDE
4	SANITARY SEWER MAINTENANCE AND OPERATIONS	CITY SERVICE AREA

4.13.3 Site Specific BMP Requirements

4.13.4 Program Implementation

Each of the BMPs listed were implemented for the activities listed in Table 4.21 and are described below.

Table 4.22 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-61 Safer Alternative Products
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

- SC-11 Spill Prevention, Control & Cleanup: Spill kits are kept in all vehicles. Employees were trained in spill response as applicable to their activities. Absorbents were used for spill cleanup where possible and disposed of properly.
- SC-20 Vehicle and Equipment Fueling: Minor equipment fueling was performed over pervious surfaces when necessary; larger equipment was fueled at the fleet maintenance facility (BMPs are described above for Fleet Yard).
- SC-34 Waste Handling and Disposal:
    - Landscape Maintenance: All non-recyclable waste was disposed of properly.
    - MS4 Maintenance: Trash was hauled to transfer station. Debris and other organic material were transferred and deposited at 2400 Tamarack Avenue in three concrete covered bins. The material was then tested for contaminants and disposed of properly upon receipt of permissible test results.
    - Powerwashing: All wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system ; any storm drains in proximity were protected from discharges.
    - Sewer Utility Maintenance: Waste was contained in Vactor truck tanks and disposed of properly to sanitary sewer.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use. These practices are described in detail above.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system; any storm drains in proximity were protected from discharges.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: A small self-contained vacuum with pressure washer was used to clean the drainage system. All material in the drain box was removed by the vacuum. Disposal of the water and material occurred using a filter sock, allowing water to be decanted into the sanitary sewer system through a permit from Encina Wastewater Authority. The solid material was taken to the Tamarack site described above.

All trash was removed from the MS4, placed in 55 gallon trash bags, and placed in a 40 cubic yard roll off dumpster that is covered. The material was then transported to Palomar Transfer Station for disposal.

- SC-75 Waste Handling and Disposal: See SC-34 above.
- SC-76 Sewer Utility Maintenance: All lift stations were inspected and cleaned as needed; Vactors were checked for leaks during pre-trip inspections; all materials were discharged at Encina Wastewater Authority: solids into grit bin, liquids at headworks; recently the City has begun to implement FOG requirements as per Order 2006-003 including revision of ordinances, public outreach, and inspections of FOG generating facilities.

The collections system maintenance schedule is designed to provide more frequent cleaning for identified trouble areas, with siphons being cleaned annually, low flow and flat lines cleaned semi-annually, and grease problem areas cleaned quarterly.

4.14 Areas and Activities Categorized as Not High Priority

4.14.1 Background

Table 4.23 lists City owned areas and activities that were determined NOT to be High Priority based on the criteria established in Order 2007-0001, Section D.3.a.(7)(a). Basic minimum BMPs were implemented at each facility listed below as per the City s JURMP.

4.14.2 Source Characterization

The table below lists facilities on the inventory that are NOT High Priority and includes 50 facilities that are administrative, small parks, medians, and water/wastewater stations that are small or out of service. These facilities are located outside of ESAs and do not generate significant pollutant loads.

Table 4.23 FACILITIES THAT ARE NOT HIGH PRIORITY

1	NON-EMERGENCY FIRE FIGHTING FLOWS	CITYWIDE
2	SPECIAL EVENTS	CITYWIDE
3	STREET MAINTENANCE (CLEANING/REPAIR)	CITYWIDE
4	TRAIL MAINTENANCE	CITYWIDE
5	WATER OPERATIONS AND MAINTENANCE	CITY SERVICE AREA
6	ADULT LEARNING PROGRAM	1207 CARLSBAD VILLAGE DR STE O
7	ARTS OFFICE	2955 ELMWOOD ST
8	CENTRO DE INFORMACION	3330 HARDING ST
9	CITY HALL FACILITY	1200 CARLSBAD VILLAGE DR
10	COLE LIBRARY	1250 CARLSBAD VILLAGE DR
11	DOVE LIBRARY MAIN BRANCH & ADMINISTRATION	1775 DOVE LN
12	FARADAY CENTER	1635 FARADAY AV
13	FARMERS BUILDING	FARADAY & EL CAMINO RL
14	HIRING CENTER	5958 EL CAMINO REAL
15	HOUSING/REDEVELOPMENT OFFICE	2965 ROOSEVELT ST B
16	LAS PALMAS OFFICES	2075 LAS PALMAS DR
17	LIBRARY STORAGE	2075 Q CORTE DEL NOGAL 9
18	RAILROAD DEPOT VISITORS CENTER	400 CARLSBAD VILLAGE DR
19	ANN D. L'HEUREUX MEMORIAL DOG PARK	2700 BLOCK OF CARLSBAD VILLAGE DR

20	BEACH ACCESSES	NORTH OF TAMARACK
21	BEACH BLUFF TRIANGLE/PARK	CARLSBAD BLVD AT PINE
22	CANNON PARK	300 BLOCK OF CANNON
23	CAR COUNTRY PARK	PASEO DEL NORTE
24	CHASE FIELD	3349 HARDING ST
25	EL FUERTE PARK	600 BLOCK OF EL FUERTE ST
26	HOSP GROVE-HI NOON ROTARY/PICNIC TABLE/TRAIL	2630 MONROE ST
27	LEVANTE FIELD/PARK	3031 LEVANTE ST
28	OAK PARK	PIO PICO DRIVE
29	PIO PICO PARK	2600 PIO PICO
30	SPINNAKER HILL BANK	1700 BATIQUITOS DR
31	ZONE 5 PARK	CAMINO HILLS AND FARADAY
32	BRESSI RANCH RECLAIMED PUMP STATION	BRESSI RANCH
33	RESERVOIR D-1, D-2	6700 BLACK RAIL RD
34	CARLSBAD SENIOR CENTER	799 PINE AVE
35	HARDING COMMUNITY CENTER	3096 HARDING ST
36	HELEN ALLMAN GIRLS CLUB	3368 EUREKA PL
37	SEA WALL	CARLSBAD BLVD
38	CALAVERA TREATMENT PLANT	2400 TAMARACK AV
39	LOWER FARADAY SEWER LIFT STATION	1507 FARADAY AV
40	UPPER FARADAY SEWER LIFT STATION	1711 FARADAY AV
41	BRESSI RANCH WATER PUMP STATION	BRESSI RANCH
42	BUENA VISTA WATER PUMP STATION AND RESERVOIR	1400 BLOCK BUENA VISTA DRIVE
43	ELLERY WATER PUMP STATION AND RESERVOIR	2300 BLOCK OF JANIS WY
44	RESERVOIR B	END OF BLUFF DR
45	RESERVOIR D-3	6580 BLACK RAIL ROAD
46	RESERVOIR E	HIDDEN VALLEY
47	RESERVOIR PAJAMA	PAJAMA DR
48	RESERVOIR SANTA FE I	PYRENEES
49	RESERVOIR SANTA FE II	PAR & BUSINESS PARK
50	RESERVOIR SKYLINE	SKYLINE DR

4.14.3 Site Specific BMP Requirements

a. Employee Training
b. Pollution Prevention
c. Good Housekeeping
d. Spill Response and Prevention

4.14.4 Program Implementation

The BMPs listed above in Section 4.2 were implemented City wide at all facilities, including the facilities listed in Table 4.23. A description of these BMPs and how each were implemented is provided in Section 4.2 above.

4.15 Special Events

4.15.1 Background

The City of Carlsbad hosts a multitude of events each year from major invitational sporting events to community based festivals. A Special Event Permit and BMP Implementation Plan is required for any organized event involving 50 or more people on public property that travel or assemble together, cause a change in normal traffic flow or controls, and is not within the scope of a Facility Use Permit, other land use approval, or a private property permit. The City has organized a Special Events Committee to assure events are held in a manner that is safe and does not adversely impact the Carlsbad community or the environment.

4.15.2 Source Characterization

The City developed an inventory of special events. These special events have been prioritized according to type of event, number in attendance, proximity to the nearest water body, and potential threat to water quality. During FY 07-08, there were 10 special events on the inventory, which included 6 High Priority, 3 medium priority, and 1 low priority event. Based on this prioritization, the City conducted storm water compliance inspections at all of the High Priority events and two inspections of medium priority events. Events that required inspections, were inspected at least twice a Pre-Event and Post-Event inspection. However, in some cases inspectors were onsite for the duration of the event. A copy of the special events inventory can be found in Appendix 4.2.

4.15.3 BMP Requirements

All special events were required to implement the designated special event BMPs and comply with all applicable regulations outlined in the Carlsbad Municipal Code. Event organizers were notified of the designated BMPs during the event planning process, in outreach materials, and at pre-event meetings. In addition, if site specific BMPs were needed event organizers were required to develop a Special Event SWPPP. The SWPPP is intended to help demonstrate that appropriate measures and BMPs are being implemented before, during, and after the event to reduce and/or prevent pollution. The SWPPP was approved by the City prior to Special Event Permit issuance in FY 07-08. During compliance inspections, the City confirmed that the designated and specific BMPs were implemented as required. A copy of the City's designated BMPs for all special events can be found in Appendix 4.3.

4.15.4 Program Implementation

Generally, the City found that event organizers implemented BMPs as required. Event venues were well managed, BMPs were installed, and the impacted areas were cleaned as required. As with any new program, it is anticipated that there will be a learning curve for event organizers as they have not been required to implement storm water BMPs, develop SWPPPs, and understand pollution prevention practices in the past. The City will work closely with event organizers for the first year of the program implementation to ensure compliance.

Storm water compliance inspections include a Pre-Event inspection where storm water BMPs were evaluated, a During-Event inspection to determine the effectiveness of BMPs, and a Post-Event inspection to ensure the site is properly cleaned. Compliance inspections may also include recommendations for additional measures that may be required to comply with the storm water regulations. A new Special Events Inspection Form was created to ensure that all

inspection steps were implemented consistently. A copy of the new Special Events Inspection Form can be found in Appendix 4.4.

Compliance with special event requirements was ensured throughout the planning and implementation process. During the Pre-Event inspection, the City ensured that BMPs are implemented as required. During the Post-Event inspection, the City also ensured the site was cleaned properly and returned to pre-existing state in an expeditious manner. During FY 07-08, there were only a few minor violations noted at the eight inspected events, all of which were immediately corrected. There were no enforcement actions for special events issued during FY 07-08.

4.16 Inspection of Municipal Facilities

Order 2007-0001 requires that all High Priority municipal facilities are inspected annually. Due to the timing of Order R9-2007-0001 adoption and reprioritization of the High Priority municipal inventory for the 2008 JURMP, the City s High Priority inventory changed mid-year. All High Priority municipal annual inspections under Order 2001-01 were completed this Fiscal Year, and totaled 63 of 63.

In addition, the majority of new High Priority municipal inspections from the 2008 JURMP was completed prior to the end of the Fiscal Year, and totaled 66 of 67. The last inspection occurred in the first quarter of FY 08-09. All 67, plus any new facilities, will be inspected again in FY 08-09.

4.16.1 Background

Inspections of these facilities addressed all required inspection steps according to the Section D.3.b.(3)(a) including:

- Review of BMP implementation plans, if the site uses or is required to use such a plan;
- Review of facility monitoring data, if the site monitors its runoff;
- Coverage under the General Industrial Permit and NOI filing is checked;
- Compliance with the City of Carlsbad ordinances related to urban runoff is assessed;
- BMP implementation, maintenance, and effectiveness is assessed;
- Visual observations for non-storm water discharges, potential illicit connections, and potential discharges of pollutants in storm water are made;
- And education and training on storm water pollution prevention is performed as warranted.

Each of these facilities is formally inspected annually, although responsible departments often perform inspections of their facilities more frequently, as described above in Section XX.

4.16.2 Source Characterization

In total, there were 67 High Priority municipal areas and activities identified in the 2008 JURMP. These areas and activities included:

- Roads, Streets, Highways, and Parking facilities (12);
- Flood Management Projects and Flood Control Devices (1);
- Fire Stations (6);

- Recreation Facilities (1);
- Publicly Owned Treatment Works (1);
- Sanitary Sewer Faciliites (16);
- Water Facilities (6);
- Municipal Yards (4);
- Parks Facilities (14);
- Administrative Facilities (1); and
- Activities (4).

the activities include: landscape maintenance and repair, power washing, MS4 maintenance, and sanitary sewer maintenance.

Refer to Appendix XX, the City's Municipal Inventory, for a list of the City's High Priority municipal areas and activities.

4.16.3 BMP Requirements

All areas and activities implement site specific BMP requirements as per the City's JURMP, Appendix 6-A. The preceeding sections include table of site specific BMPs required to be implemented for each area and activity listed above. For facilities that are not High Priority, minimum BMPs are required that are tailored specifically to those sites and activities occurring there. Required BMPs have been implemented at all City areas and activities as described it the City's JURMP.

4.16.4 Program Implementation

Most inspections were performed by a contractor, as in years past, while some were performed in house. Those facilities that are not High Priority are inspected on an as needed basis.

Sites inspected were found to be in compliance with permit requirements and City ordinances. In general, there were very few corrective actions required. Deficiencies were minor and most often involved over-irrigation, accumulation of organic debris and general housekeeping.

All four High Priority activities were inspected and were found to be in compliance with permit requirements and City ordinances. There were no corrective actions identified for the High Priority activities.

For a listing of all corrective actions identified during inspections and their implementation, refer to Appendix 4.5. There were no violations of the Carlsbad Municipal Code observed during municipal inspections; therefore there were no necessary enforcement actions.

5.0 INDUSTRIAL AND COMMERCIAL COMPONENT

5.1 Introduction

The City of Carlsbad s Industrial and Commercial program is intended to reduce industrial and commercial discharges of pollutants from the MS4 to the maximum extent practicable, and prevent municipal discharges from the MS4 from causing or contributing to a violation of water quality standards. This section covers activities occurring from March 24, 2008 to June 30, 2008 under the new Permit Order No. R9-2007-0001.

5.2 Stationary Industrial and Commercial Sites Sources Element

5.2.1 Background

Storm water inspectors identify pollution sources, assess the potential threat to water quality, and require BMP implementation to eliminate pollution sources from industrial and commercial businesses. Major industrial types in Carlsbad include high technology, multimedia and biomedical businesses, electronics, golf apparel and equipment manufacturers and several light industry parks. Stationary commercial types in Carlsbad are restaurants, automobile maintenance, gas stations, golf courses, and resorts. These industrial and commercial sites and their activities have the potential to generate significant amounts of pollutants, if proper BMPs are not implemented.

5.2.2 Source Characterization

Each year hundreds of new businesses are established in Carlsbad. During this reporting period, the Storm Water Protection Program worked closely with the Finance Department to obtain information about new businesses, including activities, SIC codes and descriptions, business types, and contact names and numbers. Each quarter the Storm Water Protection Program downloaded, sorted, mapped, and prioritized new businesses by SIC, business type and other criteria per the new permit.

These new businesses were screened, evaluated, prioritized, and then added to the inventory list and scheduled for inspection. In some cases information provided on business license applications was not correct and a pre-inspection evaluation was necessary. Pre-inspection evaluations helped determine if a business activities were subject to storm water requirements. Two types of pre-inspection source evaluations were used:

1. Reviews: During the review process, the inspector evaluated the source and activity using relevant information from other City departments, databases, or licensing programs to determine whether the site/source should be inspected and tracked by the Storm Water Protection Program. A business could be excluded during the review process if it was found that their activities are not regulated by the City or General Permit. The most common reason businesses were excluded was because of an incorrect SIC code designation or low threat to water quality.
2. Telephone Contacts: If the review failed to provide enough information, the inspector will contacted the business by phone to determine their status and scheduled an inspection if necessary.

After physical inspections, reviews, or telephone contacts, any changes to a business priority or status was recorded on the Storm Water Inventory List and/or in the Permits Plus database.

New businesses were also found by referral from other agencies, field discovery, or business directories.

The City s Commercial/Industrial inventory is located in Appendix 5-1.

As required by the permit, the following applicable stationary sites/sources are included in the inventory:

1. Commercial Sites/Sources:
    - Automobile repair, maintenance, fueling, or cleaning;
    - Airplane repair, maintenance, fueling, or cleaning;
    - Boat repair, maintenance, fueling, or cleaning;
    - Equipment repair, maintenance, fueling, or cleaning;
    - Automobile and other vehicle body repair or painting;
    - Automobile (or other vehicle) parking lots and storage facilities;
    - Retail or wholesale fueling;
    - Pest control services;
    - Eating or drinking establishments, including food markets;
    - Cement mixing or cutting;
    - Masonry;
    - Painting and coating;
    - Botanical or zoological gardens and exhibits;
    - Landscaping;
    - Nurseries and greenhouses;
    - Golf courses, parks and other recreational areas/facilities;
    - Cemeteries;
    - Marinas;
    - Portable sanitary services;
    - Building material retailers and storage;
    - Animal facilities

2. Industrial Sites/Sources:
    - Industrial Facilities, as defined at 40 CFR 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit;
    - Operating and closed landfills;
    - Facilities subject to SARA Title III; and
    - Hazardous waste treatment, disposal, storage and recovery facilities.

3. All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired water body segment, where the site/source generates pollutants for which the water body segment is impaired.

4. All other commercial or industrial sites/sources within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

5. All other commercial or industrial sites/sources that the Copermittee determines may contribute a significant pollutant load to the MS4.

Potential threats to water quality at each commercial and industrial site/source were determined by evaluating a variety of site-specific factors including the criteria outlined in the Permit.

Commercial and industrial facilities will continue to be reviewed during the first year of implementation and prioritizations will be reviewed and updated annually in conjunction with the watershed-based inventory to reflect any changes in industrial and commercial uses. Individual prioritization criteria are described below in further detail:

Prioritization Criteria: Prioritization involved two steps: (1) initially classifying a facility as being a high threat to water quality based on site information; and (2) subsequently confirming or reclassifying the facility based on field observations and additional information. Initial classification of sites/sources was accomplished administratively using the data provided in the existing industrial and commercial inventory. The confirmation and/or reclassification, when necessary, was and will be completed following the initial inspection of each site/source. In addition to the minimum criteria listed above, the City also considered the following site/source attributes to evaluate the potential threat to water quality:

i. Type of activity (SIC code): Standard Industrial Classification (SIC) codes were used primarily to prioritize and identify specific commercial and industrial activities/sites that have the potential to contribute to storm water pollution. In addition, the NPDES General Industrial Permit (General Permit) defines specific SIC codes such that (1) coverage under the General Permit is mandatory (as defined in Categories ii, iii, vi, and viii of the General Industrial Permit) or (2) coverage under the General Permit is conditional, required only if material, machinery, or products are exposed to storm water (as defined in Category 10 of the General Permit). Industries not listed with an SIC code were directly contacted and assigned an appropriate code based on a description of business activities.

ii. Materials used at the facility: Materials, including hazardous materials, used at industrial and commercial sites have the potential to contribute significant pollutant loads to receiving waters if transported by storm water. These materials and associated activities were considered during the prioritization process.

iii. Wastes generated: If not properly disposed of, industrial and commercial wastes have the potential to degrade receiving waters when transported by storm water. Types of wastes generated or stored onsite were considered during the prioritization process. Industrial Waste Permits issued by Encina Wastewater Authority may also be examined.

iv. Pollutant discharge potential: When evaluating a commercial or industrial site/source s potential to discharge pollutants, the inspector took into account all material handling equipment or activities, raw materials, intermediate products, final products, waste material, by-products, or industrial machinery exposed to storm water. Discharge potential was assessed during site inspections at each facility.

v. Non-storm water discharges: Authorized non-storm water discharges can contribute to water quality degradation by transporting pollutants into receiving waters. Non-storm water discharges were evaluated to determine whether they were a significant source of pollutants and whether the discharges may continue to be exempted from the prohibitions of Section B.1 of the Permit.

vi. Size of facility: Size of the facility affects the amount of runoff and pollutant loads generated from the industry. The size of a facility was taken into consideration during the threat evaluation process.

vii. Proximity to receiving water bodies: The potential for pollutant transport to sensitive receiving water bodies was evaluated by determining the proximity and sensitivity of receiving water bodies using the ESA definitions from the Permit.

viii. Sensitivity of receiving water bodies: All facilities directly discharging to or within 200 feet of the ESA s listed above were considered high priority.

ix. Whether the facility is subject to the General Industrial Permit or an individual NPDES permit: A listing of facilities located in Carlsbad that have filed a Notice of Intent (NOI) and are covered under the General Permit were classified as high priority threats to water quality.

x. Whether the facility has filed a No Exposure Certification/Notice of Non-Applicability: Those facilities that were identified as Conditional (NONA and NEC filers) were evaluated using the prioritization flowchart and prioritized accordingly.

xi. Facility design: The design of a facility, including whether structural BMPs has been installed and maintained, or there are outdoor activities, was considered during the threat to water quality evaluation process.

xii. Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff was considered during the Threat to Water Quality evaluation process.

xiii. The facility s compliance history: Inspectors reviewed the compliance history of each commercial and industrial site and considered any relevant enforcement actions in determining the threat potential on activities conducted onsite.

xiv. Any other relevant factors: The City reserved the authority to consider any other relevant factors specific to the facility to utilize in the prioritization process.

5.2.3 Best Management Practice Requirements

5.2.3.1 Pollution Prevention

Pollution prevention eliminates or reduces the management of polluted storm water runoff. Specific pollution prevention procedures may vary from one industrial or commercial facility to another, and the City informed these facilities of pollution prevention opportunities during site inspections. However, the following pollution prevention principles applied to most industrial and commercial facilities:

- Affirmative Procurement Use alternative, safer, or recycled products.
- Redirect storm water flows away from areas of concern.
- Reduce use of water or use dry methods.
- Reduce storm water flow across facility site.
- Recycle and reuse waste products and waste flows.
- Move or cover potential pollution from storm water contact.
- Provide on-going employee training in pollution prevention.

5.2.3.2 Minimum BMPs

Described below are minimum BMPs required to be implemented, during this reporting period, by stationary commercial and industrial facilities, as applicable:

1. Good housekeeping

   Specifically stationary facilities are required to:

   - Protect materials and products that could potentially pollute storm water from rain, run-on, runoff, and wind dispersal by storing them indoors or covering them, and providing them with secondary containment as needed. For industries with conditional SIC codes, moving stored materials indoors may allow an exemption from the General Permit requirements.

- Use dry clean up methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible) instead of using water hose or pressure washing system to conduct washing or cleaning activities.
- Sweep up around dumpsters and other areas to prevent trash and debris from accumulating. Dumpsters must be kept closed when not in use. All trash must be kept in appropriate sized containers until it can be hauled away. When inspecting solid waste collection areas, inspectors will note if recyclable materials (cardboard, green waste, etc.) are placed in dumpsters.

2. Preventive maintenance

   Preventive maintenance includes the regular inspection and maintenance of storm water structures (drains, catch basins, etc.) as well as other facility equipment and systems. Structures should be maintained in good working order and cleaned as needed to prevent discharge of pollutants into the storm water system. Facility equipment or systems should be properly maintained to prevent leaks or discharges of pollutants into the storm water system.

3. Material Storage and Handling

   This includes all procedures to minimize exposure of significant materials to storm water and to minimize the potential for spills and leaks from storage, loading, unloading and transfer of materials.

4. Employee training

   Appropriate personnel should be trained in good housekeeping, preventive maintenance, materials storage and handling, solid waste handling and recycling, and spill response as applicable to the facility. Records should be retained of employees attending storm water training sessions and the topics covered.

5. Solid waste (non-hazardous) handling and recycling

   This includes the procedures or processes to handle, store, or dispose of waste or recyclable materials. Waste disposal areas should be kept free of litter and debris and waste and recyclable receptacles must have a cover or lid to prevent the contents from being dispersed by the wind or coming in contact with storm water.

6. Spill response

   Spills and leaks can be a major contributor to storm water pollution. Facilities should identify potential locations and quantities of significant materials that may spill or leak, and should write and implement a response plan addressing spill containment, clean up and notification procedures. Appropriate spill clean-up equipment should be readily accessible to trained spill response personnel.

7. Record keeping

   This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary, to the appropriate facility personnel. Record keeping and internal reporting represent good operating practices as they increase the efficiency of the facility and the effectiveness of BMPs.

8. Self inspection/quality assurance
   This includes, in addition to the preventative maintenance inspections identified above, an inspection schedule of all potential pollutant sources. Tracking and follow-up procedures should be described to ensure adequate corrective actions are taken. Quality assurance includes the procedures to ensure that all elements of any required SWPPPs or monitoring plans are adequately conducted.

BMP information was made available during inspections, in printed materials and direct mailings, on the storm water website and hotline, during presentations and at outreach events. A listing of education and outreach events held during this reporting period can be found in Section 8 of this report.

5.2.3.3 BMP and Knowledge Assessment Tools

During this reporting period, the Storm Water Protection Program continued to use the *BMP and Knowledge Assessment* to measure knowledge of storm water issues and assess the implementation of BMPs onsite. The assessment tool rated a commercial operator and site using the following criteria:

Overall Knowledge Assessment:
Inspectors ranked personnel from 1-5 per the following *Knowledge Assessment* scale:

Level 1: Individual has never heard of the storm water program, requirements, or BMPs. This individual does not know what BMPs are or understand how to implement them.

Level 2: Individual has a general awareness of water quality issues, but does not understand the requirements of the storm water program, BMPs, or pollution prevention.

Level 3: Individual has a general understanding of storm water issues (*I've heard something about that*), but not specific storm water requirements or BMPs required for the facility.

Level 4: Individual has a clear understanding of BMPs but may not have a clear awareness of the connection between pollution prevention and water quality.

Level 5: Individual demonstrated an in-depth knowledge of the storm water program and BMPs consistent with the facility's activities and operations.

Overall BMP Assessment
Inspectors ranked the facility per the following 1-5 *BMP Assessment* scale:

Level 1: An illegal discharge was noted during the inspection. Enforcement actions such as a NOV and/or citation are required.

Level 2: BMPs have not been implemented. Several violations were noted during the inspection, however an illegal discharge was not observed. A detailed inspection report and/or written warning was issued.

Level 3: BMPs have been implemented throughout the site, but not properly or adequately maintained. Violations were noted during the inspection and a verbal warning was issued. A detailed inspection report or written Warning Notice may follow.

Level 4: BMPs implemented effectively, however minor violations associated with communal areas or good housekeeping practices (i.e., dumpsters open, leaves in the parking lot, etc.) were noted during the inspection.

Level 5: All BMPs implemented effectively. No violations noted during the inspection.

Table 5.1: HTTWQ Facilities Rated for Each Score □ March 24, 2008 to June 30, 2008.

Rating	Knowledge Assessment (raw score)	Knowledge Assessment (□)	BMP Implementation (raw score)	BMP Implementation (□)
1	0	0□	1	2□
2	2	4□	4	7□
3	11	22□	10	18□
4	20	39□	17	31□
5	18	35□	23	42□
TOTAL	51	100□	55	100□

Table 5.1 shows the number of instances in raw score and percentage that HTTWQ businesses rated for each score, with 5 being the highest score possible. The number of *BMP Assessments* collected is usually higher than the number of *Knowledge Assessments* collected, because at some facilities, a company representative is not available to complete the *Knowledge Assessment*. BMP implementation results show that the City has been successful in ensuring that businesses implement BMPs throughout the sites at least 91□ of the time during this reporting period. The City will continue to work with businesses to not only educate them about storm water issues, but also ensure BMPs are implemented and maintained.

5.2.4 Program Implementation

5.2.4.1 Inspections

The City conducted inspections to verify BMP implementation, Permit compliance, and municipal code compliance. From March 24 to June 30, 2008, a total of 72 inspections were performed on high threat to water quality facilities from an inventory of 558. A goal of 70 inspections was set for this time period using 12.5□ of all HTTWQ facilities (one fourth of the 50□ required by the permit for the first year of the permit cycle).

The City conducted scheduled, unscheduled, follow-up, and compliance inspections at commercial and industrial sites/sources at the frequencies as required by the Permit. During site visits, the inspector:

a. Reviewed the SWPPP or BMP implementation plans, if the site used or was required to use such a plan;
b. Reviewed facility monitoring data, if the site monitored its runoff
c. Checked for coverage under the General Industrial Permit (Notice of Intent (NOI) and/or Waste Discharge Identification No.), if applicable;
d. Assessed compliance with ordinances and permits related to urban runoff;
e. Assessed BMP implementation, maintenance and effectiveness;

f. Conducted visual observations for non-storm water discharges, potential illicit connections, and potential discharge of pollutants in storm water runoff; and
g. Evaluated education and training on storm water pollution prevention, as conditions warrant.

Copies of inspection reports and correspondence are maintained by the Storm Water Protection Program.

5.2.4.2 Enforcement

The City conducted follow-up inspections to determine compliance with corrective actions outlined in the inspection report or enforcement notices. When a storm water complaint was received about an industrial or commercial site/source or an illegal discharge was observed or suspected, the City conducted a storm water compliance inspection or investigation. If a significant and/or immediate threat to water quality was observed, appropriate actions were taken to require the responsible party to immediately cease the discharge and/or correct the situation. In judging the degree of severity, City inspectors also took into account any history of similar incidents or discharges. Table 5.2 includes a summary of businesses that received NOVs from March 24 to June 30, 2008.

Table 5.2: Summary of NOVs Issued from March 24 to June 30, 2008

Business Name	SIC	Date of NOV	CMC Violations		Findings	Compliance Achieved
			Storm Water	Trash		
Ocean House	5812	4/15/08	15.12.050 15.12.080	6.08.045	Improperly stored materials. No BMPs in place.	Yes
Express Auto Center	7538	4/30/08	15.12.080	6.08.050	Improperly stored materials. No BMPs in place.	Yes
Firestone Tire and Service	7538	5/22/08	15.12.080	6.08.045 6.08.050 6.08.090	Oil spills not properly cleaned. No BMPs in place.	Yes
Bob Baker Mazda	5511	6/19/08	15.12.080 15.12.090	6.08.045	Improperly stored materials. Vehicle fluid spills not cleaned. Trash and debris throughout site. No BMPs in place.	Yes
Bob Baker Chrysler Jeep	5511	6/19/08	15.12.080 15.12.090	6.08.045	Improperly stored materials. Vehicle fluid spills not cleaned. Trash and debris throughout site. No BMPs in place.	Yes

The Enforcement Response Plan continued to be used by inspectors to identify, document, and respond to storm water violations.

For this reporting period, the Storm Water Protection Program had three full-time Environmental Specialists. Environmental Specialists are continually trained on code enforcement, inspection procedures, laws and regulations, and investigation techniques.

These training courses, in addition to the Enforcement Response Plan, helped the Storm Water Protection Program appropriately identify and respond to storm water violations. The City took a total of 6 enforcement actions against industrial and commercial businesses from March 24 to June 30, 2008. The types and numbers of enforcement actions are listed in Table 5.3.

Table 5.3. Enforcement Actions from March 24 to June 30, 2008

Action	Total
Verbal Warning	0
Written Warning	1
Notice of Violation	5
Notice to Clean	0
Cease and Desist Order	0
Administrative Citation	0
TOTAL	6

During inspections and investigations completed during this reporting period, there were no illegal discharges found. Mobile service providers were added to the inventory and required to apply for business licenses. More detailed information on complaint response and illegal discharge investigations is found in Section 7 of this report. Escalated enforcement actions were taken when necessary to achieve compliance.

5.3 Mobile Sources Element

5.3.1 Background

The City has participated in the development of a Regional Mobile Outreach and Education Strategy. The City will work with the Copermittees to ensure the implementation and success of this strategy. A copy of the *Regional Mobile Outreach and Education Strategy*, which includes a discussion of Carlsbad s jurisdictional efforts, can be found in the City s JURMP.

5.3.2 Source Characterization

A large percentage of businesses on the inventory list are mobile businesses, which include carpet cleaning, power washing, etc. These mobile businesses were identified, contacted and mailed appropriate BMP information. Because site inspections are not required for mobile businesses, many were reviewed by City inspectors. During the review process the inspector evaluated a commercial business using any relevant information available in other City departments, databases, or licensing programs. A business could be excluded during a review if it was found that their activities were not regulated by the City or Permit. The most common reason businesses were excluded during the review process was because of an incorrect SIC code designation.

Telephone surveys continued to be used to determine the status of certain types of mobile businesses on the inventory. In most cases, this screening procedure determined that the wrong SIC code had been applied during the business license application process. The Carlsbad Municipal Code prohibits mobile businesses from storing materials outdoors. Once confirmed, mobile businesses were mailed specific BMP information.

5.3.3 Best Management Practice Requirements

Implementing BMPs are a priority for all mobile businesses. Dry cleanup methods, diverting wash water, covering or blocking drains are all required.

5.3.4 Program Implementation

Upon arrival onsite to investigate a complaint of non-compliance, City staff conducted the following activities:

Requested stop work if discharge was entering or had potential to enter the MS4 system.
Requested to speak to the manager of the responsible party or property owner as necessary.
Took photos and made observations.
Educated the responsible party or person onsite as necessary regarding the City s NPDES permit, Federal and State requirements, Carlsbad Municipal Code (CMC), and required BMPs in order to continue work.
Enforced the CMC as necessary.
Followed up with documentation in RFA system and with written correspondence to the responsible party with a CC to the property owner.

6.0 RESIDENTIAL COMPONENT

6.1 Introduction

This section describes the activities of the City for the reporting period from March 24, 2008 to June 30, 2008 with respect to implementation of the Residential Component of the JURMP. The program is intended to: (1) reduce residential discharges of pollutants from the MS4 to the MEP, and; (2) prevent residential discharges from the MS4 from causing or contributing to a violation of water quality standards.

6.2 Source Characterization

In accordance with Order R9-2007-0001 and the City's JURMP, the City focused on all the high priority activities and areas outlined in the JURMP (March 2008). Since writing the JURMP, no amendments were made to source characterization or areas of focus.

6.3 Best Management Practice Requirements

In accordance with the City's JURMP required BMPs were implemented in residential areas. City inspectors required the following minimum BMPs (detailed in fact sheets and brochures) for all residential sources or pollution:

- Move or cover potential pollution sources from storm water contact. Protect materials that could potentially contribute to storm water pollution by storing them indoors or covering them.
- Use dry cleanup methods. Washing or cleaning activities that involve the use of a water hose or pressure washing system were required to use dry clean up methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible).
- Residential car washing. Use soap sparingly, divert wash water to landscaped areas and pour buckets of soapy water down the sink. Never wash cars in the street or public right of way.
- Pet Waste. Clean up after pets. Use a bag to pick up waste when walking pets. Flush pet waste down the toilet or dispose of in a sealed plastic bag and deposit in the trash.
- Trash Management. All trash must be kept in appropriate sized containers until it can be hauled away. Frequently dispose of grass, debris, leaves, and other waste materials.
- Recycle, Reduce and Reuse. Recycle cans, bottles, paper and cardboard whenever possible.
- Reduce the Use of Landscape Chemicals: Decrease the use of lawn and garden care products such as pesticides, weed killers and chemical fertilizers. Consider using non-toxic pest control methods. Avoid over irrigation which washes these chemicals into the storm drain system.

6.4 Program Implementation

The following provides a discussion of the steps that were taken to require, encourage, and verify the implementation of the prescribed BMPs, and the notable activities conducted to manage urban runoff for high priority residential areas.

6.4.1 Regional Residential Education Program

The San Diego Regional Storm Water Copermittees sponsored the San Diego County Fair (Fair) in 2008 as an education and outreach activity. The sponsorship was a joint effort between the City of San Diego s Think Blue program and the regional Copermittees with each entity contributing approximately half towards the overall cost. The Fair was selected as a regional event due to its unique ability to potentially reach more than one million San Diegans and convey a strong environmental message. The Residential Sources and Outreach Workgroup (Outreach Workgroup) was responsible for overseeing sponsorship activities with the City of San Diego leading the coordination and implementation efforts.

The 2008 Fair was held June 14, 2008 through July 6, 2008, spanning two fiscal years and will be included in the FY 07/08 and FY 08/09 annual reports. The attendance for the fair was estimated at 1,235,698 persons for the 21 days the event occurred. Sponsorship for the Fair included staffing an outreach booth for 11 days, in which the majority of jurisdictions provided staffing support. The City of Carlsbad provided staffing on June 21, 2008. The outreach booth served as the primary method for educating the public about watershed protection and pollution prevention. The Outreach Workgroup elected to promote Integrated Pest Management (IPM) as the primary theme and collaborated on the distribution of IPM materials in both English and Spanish. Individual jurisdictions were invited to distribute their own materials in addition to the IPM materials. The Copermittees received billing as both a Flower & Garden Show sponsor and an Enviro-Fair sponsor.

Think Blue was designated as the brand for the Copemittees during the event and signage demarking the symbol included banners, planter box displays and recycle bid stickers, which were visible at over 500 locations at the Fair. Media exposure included TV, radio, and press releases. The sponsorship was printed in both the Fair program and included on the Fair map. Other promotions included newspaper advertisements, electronic messaging over the Jumbo Tron, website logos and links, and PA system announcements in both English and Spanish.

Think Blue, City of San Diego developed an event survey for the purposes of assessment. Over 1,200 survey cards were completed during the 11 days the booth was staffed. The questions focused on general storm water knowledge and awareness. The results are being tabulated and will be reported in FY 08/09.

6.4.2 BMP Implementation

During this reporting period the City continued to implement a program to reduce contaminants in urban runoff originating from existing residential areas. BMP information was made available to residents via the storm water website and hotline, at outreach events, through direct mailings, and during investigations of suspected storm water violations. Written materials (brochures, fact sheets, etc.), promotional items, and verbal explanation of BMPs were used to convey BMP information. In addition, various levels of enforcement actions were used as necessary to ensure the use of required BMPs. A listing of all education and outreach events and activities for residential audiences is addressed in Section 8 of this report. Discussion of investigations and enforcement actions for residential areas and activities are discussed in Section 6.4.7 and Section 7 of this report.

Website and Hotline

Information about water conservation, trash management, and storm water was located on one centralized web page accessed at www.carlsbadconserves.org. The Environmental Programs hotline provided information about storm water, trash, and water conservation for the public. The hotline was answered by the Storm Water Protection Program during business hours and provided a detailed voice message after hours. In addition, outreach materials continued to be revised to include the Environmental Program s web page address and hotline number. From March 24, 2008 to June 30, 2008, there were a total 8,350 visits, or average of over 84 hits per day to the Environmental Programs website. The website was updated to include the City s current JURMP and WURMP documents.

Outreach Events

The City hosted or participated in several public events, which provided opportunities for residents to learn about pollution prevention and storm water BMPs. During these events residents had the opportunity to pick up printed materials, and to speak directly to storm water representatives. Table 6.1 is a summary of these events that took place from March 24, 2008 to June 30, 2008.

Table 6.1: Outreach Events for Residential Community (March 24, 2008 to June 30, 2008)

Event	Date	Type	Audience	Attendance
Beach Cleanup	4/19/08	Booth	General Public	100
Public Works Fair	5/21/08	Booth	General Public School Children	1,300
Health & Safety Fair	6/5/08	Booth	Beckman/Coulter Employees	250
San Diego County Fair	6/21/08- 07/06/08	Booth	General Public	1.2 million

Direct Mailings

Carlsbad Conserves, the Environmental Programs newsletter was mailed in the spring of 2008. The newsletter informs residents of: environmental issues facing Carlsbad, services provided by the City, tips of how to protect the environment, storm water BMPs, and a calendar of important dates. A copy of the spring edition of Carlsbad Conserves can be found in Appendix 6.1

The Environmental Programs Guide was sent to all new customers requesting trash service during the period from March 24, 2008 to June 30, 2008. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution. A copy of the brochure can be found in Appendix 6.2.

On April 24, 2008 a letter was mailed to 95 residents in response to illegal dumping of used motor oil into a Storm Drain. Included with the letter was a copy of the Motor Oil brochure and the Only Rain in the Storm Drain brochure. A copy of the letter can be found in Appendix 6.3.

Written Materials

Written materials including various brochures and fact sheets detailing storm water BMPs were distributed as necessary to residents through the avenues listed above.

Promotional Items

The Storm Water Protection Program continued to distribute pollution prevention message pens to municipal employees and the Carlsbad community. Other items such as water bottles, notepads, mouse pads, and cups with the storm water hotline and other pollution prevention messages were distributed to residents.

The City distributed a HHW magnet that gives details about HHW disposal location for Carlsbad residents. The magnets will continually be distributed during presentations and other outreach events.

6.4.3 HHW and Used Oil

The City continued to operate the Household Hazardous Waste (HHW) and used oil recycling program outlined in the JURMP. From July 1, 2007 to June 30, 2008 the City collected and disposed of approximately 148 tons of HHW (including recycled or diverted).

On April 19, 2008, the City sponsored a free HHW disposal day where Carlsbad residents could dispose of up to 15 gallons or 125 pounds of HHW materials. The event attracted 513 households, and everyone was offered the Environmental Programs brochure as well as the Door-to-Door HHW brochure. The City collected and disposed of 60,566 pounds of HHW during this event. Table 6.2 shows the types and quantities of HHW collected at the event.

Table 6.2: Items Collected During April 19, 2008 HHW Event

Type of Material	Weight In Pounds
1. Flammable & Poison	33,620
2. Acid	400
3. Base	350
4. Oxidizer	75
5. PCB-containing	0
6. Aerosol	1,500
7. Reclaimable	6,890
a. Antifreeze	400
b. Car Batteries	2,700
c. HH Batteries	650
d. Rechargeable Batteries	65
e. Fluorescent bulbs	425
f. Motor Oil/products	2,500
g. Oil Filters	150
8. Other	17,731
a. Compressed Gas	294
b. CRT	10,161
c. E-Waste	7,276
9. Asbestos	0
10. Grand Total	**60,566**

Residents used the Environmental Programs hotline and e-mail address to request information about the HHW program, trash, and recycling. The City's RFA system was used to track calls about Environmental Programs comments and questions from residents. From March 24, 2008

to June 30, 2008 the Environmental Programs Division responded to 23 complaints/questions related to HHW, recycling, and solid waste. Table 6.3 includes a summary of these complaints.

Table 6.3: Summary of Environmental Programs Division Complaints

Issue Type/SubType	Total
HHW Complaint	2
Recycling: Complaint	3
Recycling: General Information	2
Solid Waste: Complaint	6
Solid Waste: General Information	5
Solid Waste: Missed Collection	5
TOTAL	**23**

Carlsbad residents may dispose of two large bulky household items at no charge five times per year. The City worked with Waste Management to schedule days for the bulky item pickup schedule. One bulky item pickup day was organized on Saturday June 21, 2008.

6.4.4 Oversight of Residential Areas

The Water Conservation Specialist conducted regularly scheduled patrols of different residential areas within the City. The City was divided into 4 hydrologic areas. Patrols were conducted for a specified period for each area. Evidence of excess runoff from irrigation were investigated and on a case-by-case basis. Door hangers were left and a follow-up phone call or a site visit conducted to evaluate irrigation.. When there were large areas or neighborhoods with extensive irrigation runoff mailings were conducted to educate residents of the problem.

6.4.5 Enforcement in Residential Areas

Storm water staff handled all residential complaints and subsequent enforcement actions in accordance with the City s existing procedures and Carlsbad Municipal Code. Each observed violation was documented using the RFA system.

From March 24, 2008 to June 30, 2008, the Storm Water Protection Program received 66 complaints of potential illegal discharges. Of those complaints, 41 were residential in nature. Many of the complaints that occurred in residential areas involved commercial contractors or mobile businesses. When complaints were tracked to a specific business, they were counted and documented as commercial complaints. Seven complaints were referred for action, meaning, that the investigation or resolution of the issue did not fall under the jurisdiction of the Storm Water Protection Program. Examples include wastewater discharge or construction. There were 9 residential complaints in which no violation was found, due to either the source not being found or the reported pollutant discharge not being found. There were 25 enforcement actions for residential complaints. Table 6.4, and Figure 6.1 show a summary of those actions. A summary of all complaints responded to can be found in Appendix 7.4

Table 6.4: Summary of Residential Enforcement Actions
March 24, 2008 to June 30, 2008.

Action	Total
Verbal Warning	11
Informational letter	12
Written Warning	1
Notice of Violation	1
Notice to Clean	0
Cease and Desist Order	0
Administrative Citation	0
TOTAL	25

Figure 6.1: Residential Enforcement Actions March 24, 2008-June 30, 2008 (Order 2007-0001)

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION (IDDE)

The City s Illicit Discharge Detection and Elimination (IDDE) will be submitted in December 2008 as approved by the Regional Board in Addendum 2, Order 2007-0001.

8.0 OUTREACH AND EDUCATION COMPONENT

8.1 Introduction

The City of Carlsbad Storm Water Protection Program continued to conduct outreach and education according to our 2008 JURMP from March 24, 2008 to June 30, 2008.

8.2 Staff Training Element

General information for FY 07-08 has been submitted under permit 2001-01.

Other Training
In addition to the general information for FY 07-08 submitted under Order No. 2001-01, in May 2008 all City employees were sent storm water BMP information as a paycheck stuffer. The training fact sheet includes information about the NPDES requirements, pollutants of concern, BMPs, and how to report illegal discharges to the storm drain system. A copy of the training fact sheet can be found in Appendix 8.1.

Job Specific Training
Several job positions were identified that require activity or job specific storm water training. A summary of municipal employee training is in Appendix 8.2 The City also participated in EPA sponsored webcasts this fiscal year where possible. Storm Water Protection Program staff received job specific training during this reporting period as provided in Appendix 8.-2.

Storm Water Committee
The Storm Water Committee continued to meet monthly to discuss and develop a calendar of storm water training activities for staff, coordinate compliance activities and documentation, create and distribute job specific storm water training information, and standardize documentation of training activities. A summary of Storm Water Committee meeting topics during FY 07-08 can be found in Appendix 8.3.

8.3 Educational Outreach Element

Underserved Target Audiences, High Risk Behaviors, and Allowable Behaviors and Discharges

Classroom Education
During the FY 07-08, the Solana Center for Environmental Innovation continued to conduct the Classroom Watershed Program for the City. The EnviroScape interactive model was used to teach students about watershed stewardship and pollution prevention. Outreach materials and workbooks were provided to the students and teachers. Each classroom was given a watershed poster, handouts for ten simple ways to help protect the ocean, guides to HHW alternatives and disposal in English and Spanish, and a recycling guide for students to take home. Please see Table 8.1 for the list of Carlsbad Elementary Schools participating in the Watershed Awareness Program. The educational material presented reaches out to the Spanish-speaking communities and Low-Socio-Economic Status families increasing knowledge and awareness with less complicated and/or confusing messages.

Printed Material and Website
During this reporting period, the City of Carlsbad offered brochures in the Spanish language, providing important information on Automotive Service and Repair Shops, Lawn and Garden Care and Restaurants. These brochures were developed to raise awareness in the Spanish-speaking community about the difference between storm water conveyance systems and sanitary sewer systems, the connection of storm drains to local waterways, and common residential sources of urban run-off. The brochures include BMPs, the City s logo, website address and the City s storm water phone number. These materials are available at various City facilities, through public events and the City s storm water web page, accessed at www.carlsbadconserves.org.

New Development and Construction Communities - The City continued to educate these communities during this reporting period through the distribution of print materials in person and through the mail, as well as through website postings.

Construction Site Owners and Developers The City continued to educate these communities during this reporting period through the distribution of print materials in person and through the mail, as well as through website postings.

Commercial and Industrial Owners and Operators
The City continued to educate commercial and industrial owners and operators through various methods. This included the distribution of printed materials, participation at workshops, presentations to business community groups, direct mailings, inspections and site visits. In addition to the general information submitted under permit 2001-01 annual report section, all brochures were available through the City website. During permit cycle from March 24, 2008 through June 30, 2008, there were 8,350 visits to the Environmental Programs web page.

Quasi-Government Agencies/Districts (i.e. Educational Institutions, Water Districts, Sanitation Districts, etc.). The City continued to educate these communities during this reporting period through the distribution of print materials in person and through the mail, as well as through website postings.

Residential Community, General Public, and School Children
In addition to the general information submitted under permit 2001-01, accomplishments are described below:

Direct Mailings
Carlsbad Conserves, the Environmental Programs newsletter was mailed in the spring of 2008. The newsletter informs residents of environmental issues facing Carlsbad; services provided by the City; tips of how to protect the environment; storm water BMPs; and a calendar of important dates. A copy of the spring edition of Carlsbad Conserves can be found in Appendix 6.1

The Environmental Programs Guide was sent to all new customers requesting trash service during the period from March 24, 2008 to June 30, 2008. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution. A copy brochure can be found in Appendix 6.2.

On April 24, 2008 a letter was mailed to 95 residents in response to illegal dumping of used

motor oil into a Storm Drain. Included with the letter was a copy of the Motor Oil brochure and the Only Rain in the Storm Drain brochure. A copy of the letter can be found in Appendix 6.4.

Classroom Education

During FY 07-08, the Solana Center for Environmental Innovation (Solana Center) continued to conduct the *Classroom Watershed Program* for the City.

Table 8.1 lists all of the schools and the number of classrooms and students that attended the watershed classroom presentation for permit cycle R9-2007-0001 from March 24, 2008 to June 30, 2008.

Table 8.1. Carlsbad Elementary Schools Watershed Awareness Programs

Date	Elementary School	of students
03/27/2008	Girl Scouts of Carlsbad	10
04/02/2008	Magnolia Elementary	85
04/02/2008	Calevara Hills Elementary	20
04/09/2008	ASPIRE Day Program	60
04/16/2008	Hope Elementary	79
05/21/2008	Dove Library Public Works Fair	350
Total		**604**

Advertisements

During FY 07-08, advertisements were published in the Carlsbad Magazine and the Community Services Guide. Table 8.2 lists the published ad and the estimated circulation.

Table 8.2. Dates of Publication of the Environmental Programs Advertisements

Ad	Month	Publication	Circulation
Environmental Programs Ad	June 2008	Carlsbad Magazine	80,000
Environmental Programs Ad	June 2008	Jazz in the Parks Magazine	9,000

Website and Hotline

Most of the printed materials were available for download from the City s website and Environmental Programs website. There were 8,350 hits to the Environmental Programs web pages from March 24, 2008 to June 30, 2008.

Neighborhood Outreach Campaign

The 2008 Calendar and Community Guide, a 122-page bound calendar, was mailed during the year to all Carlsbad residents. Several articles related to water quality were included during FY07-08. Approximately 47,000 were printed for distribution.

Direct Interactions

Additional information on direct interaction with the residential community through complaint investigations is provided in Section 6.4.5.

Public Events

Table 8.3. R9-2007-001 Outreach Events for Residents, General Public, and School Children

Event	Date	Type	Audience	Attendance
Employee Appreciation Day	4/17/08	Booth	City Employees	500
Beach Cleanup	4/19/08	Booth	General Public	100
Public Works Fair	5/21/08	Booth	General Public School Children	1,300
Health & Safety Fair	6/5/08	Booth	Beckman/Coulter Employees	250

8.4 Outreach Component Effectiveness Assessment

Assessment can be found under permit 2001-01 annual report section. In addition to the program strengths listed under Order No. 2001-01 annual report section, the City s waste reduction pilot program continued to increase the amount recycled.

8.5 Program Review and Modification

Review and modification can be found under the Annual Report section for Order No. 2001-01.

9.0 PUBLIC PARTICIPATION

9.1 Introduction

This section describes the activities of the City for the reporting period of March 24, 2008 to June 30, 2008 with respect to the implementation of the Public Participation Component of the 2008 JURMP.

9.2 Public Meetings and Hearings

The public had numerous opportunities to attend meetings at the local, watershed and regional levels, in order to learn about the City s implementation of the Permit and to have their concerns addressed.

City Council Meetings were held in the Council Chambers at Carlsbad City Hall and were open to the public. The City of Carlsbad also offers residents and visitors the opportunity to view City Council meetings via the Internet. Regularly scheduled Carlsbad Council meetings air live on Tuesday evenings at 6 pm. Local viewers could also view Council Meetings live on Time Warner Cable channel 19. Each meeting and agenda was posted online approximately two hours after the conclusion of each meeting. Past meetings will be available for up to a year on the City's own archive video portal. Users can conveniently "keyword search" through the audio/video content and "jump to" meeting discussion items in real-time by using a drop down menu. Agendas from previous meetings can be accessed through the City's Document Management System.

The Planning Commission is comprised of seven members appointed by the City Council. This commission makes recommendations to the City Council regarding implementation and updating of the General Plan. When needed, they also provide recommendations to the Council regarding policy issues that affect long-range planning. They review development projects, provide recommendations to the City Council, provide reports to the City Council on the Local Facilities Management Plans, review the annual CIP for consistency with Growth Management Program, identify potential problems and opportunities facing the City, and suggest special studies when appropriate. During this reporting period the City also provided live streaming of Planning Meetings that are typically held on the first and third Wednesday of each month at 6 pm. Table 9.1 contains a list of Regularly Scheduled City Council and Planning Commission Meetings from March 2, 2008 to June 30, 2008.

Table 9.1: Carlsbad Public Meetings
(March 24, 2008-June 30, 2008)

Regular Council Meetings		Planning Commission	
03/25/08	05/13/08	04/02/08	05/21/08
04/01/08	05/20/08	04/16/08	06/04/08
04/08/08	06/10/08	05/07/08	06/18/08
04/15/08	06/17/08		
04/22/08	06/24/08		
04/06/08			

Residents could also become representatives on various City committees. The City Clerk's office maintained a current list of City Boards, Commissions, and Committees, current vacancies, meeting dates and times, and coordinated all appointments to these positions.

The public could also attend the Copermittee Management Committee Meetings and other Copermittee meetings. Notices of these meetings were available from the Project Clean Water website at www.projectcleanwater.org. Table 9.2 lists the dates of these meetings.

Table 9.2 Coopermittee Public Meetings (March 24, 2008 June 30, 2008)

Municipal Storm Water Copermittees				
Management Committee	Outreach Workgroup	Regional Monitoring Workgroup	Coastal Storm Drain Monitoring Sub-Workgroup	Dry Weather Monitoring Sub-Workgroup
	05/21/08	04/22/08 05/20/08	04/23/08 06/18/08	04/08/08 04/23/08

9.3 Feedback Mechanisms

In addition to the feedback opportunities available through public meetings and hearings, there were a number of other mechanisms available for the public to provide feedback.

9.3.1 Hotline and E-mail Address

The public was encouraged to provide input and feedback on the Storm Water Protection Program implementation. In addition to the public meeting opportunities detailed above, the public could call the storm water hotline to request information, provide comments, or make illegal discharge reports. The public could also send e-mails directly to the Storm Water Protection Program at stormwater ci.carlsbad.ca.us. There were several other public contact phone numbers and City e-mail addresses available for public use. Other City departments forwarded comments and questions to the Storm Water Protection Program as needed. The public accessed the Storm Water Protection Program web page through the City s website, which provided information about the storm water requirements and BMPs.

The public used the Environmental Programs hotline and e-mail address to obtain information about HHW, trash, and recycling programs. The City s Request for Action (RFA) system was used to track calls about Environmental Programs comments and questions from residents. From March 24, 2008 to June 30, 2008 the Environmental Programs Division responded to 23 complaints/questions related to HHW, recycling, and solid waste.

9.3.2 Direct interaction

The City relied on interactions between City staff and the public to convey messages about storm water and pollution prevention. City staff received targeted training to increase their understanding of urban runoff issues. Staff interaction with the public also provided additional opportunities for the City to obtain direct feedback about BMPs, ordinances, and pollution prevention efforts.

9.3.3 General Outreach

Efforts through printed ads, newspapers, press releases, media interviews, PSA s, the Community Calendar, City guides, brochures, water bill stuffers, and other publications were used to keep the public informed of storm water requirements, updates, and public participation opportunities. Specific outreach efforts are discussed in section 8 of this report.

9.3.4 Storm Drain Stenciling

Stenciling storm drain inlets with *No Dumping – Drains to Ocean* messages reminds citizens and businesses not to pollute waterways. Stencils were available upon request to businesses and residents who were interested in stenciling private storm drains. Public inlets are marked by the Streets Department.

9.4 Community Events and Volunteer Efforts

The City s Community Volunteer Coordinator administered outreach and involvement programs for Carlsbad residents. This position continued to find volunteers to assist the Storm Water Protection Program with various activities, including cleanup events. The City participated in several community events held in Carlsbad and other locations across the county. These events are summarized in Table 9.3.

Table 9.3: Community Events FY (March 24, 2008-June 30, 2008)

DATE	Event	Location	Number of Participants
03/28/2008	CHS Career Day	Carlsbad	1000
03/29/2008	Kid's Day at the Flower Fields	Carlsbad	4740
04/17/2008	Employee Appreciation Day	Carlsbad	500
04/19/2008	Beach Cleanup	Carlsbad	100
05/21/2008	Public Works Fair	Carlsbad	1,300
06/05/2008	Health & Safety Fair Beckman Coulter	Carlsbad	250
06/14/2008-07/06/2008	SD County Fair	Del Mar	1.2 million

9.5 Other Public Participation Opportunities

The City continued to recruit interns from local universities to work with storm water staff. During this reporting period the Storm Water Protection Program had one intern working on various projects, including commercial and industrial inspections, data management, outreach and education, and coastal storm drain monitoring. Their participation in inspections, water quality studies and monitoring, data entry, and investigations added valuable input to overall programs.

9.5 Effectiveness Assessment.

The City has many opportunities for the public to get involved is storm water issues. Mechanisms are considered effective by the high usage rate of the methods of public involvement.

10.0 Fiscal Analysis Component

The Permit requires the City to secure the resources necessary to meet the requirements of the Permit and the JURMP, and to conduct an annual fiscal analysis. The analysis must evaluate the expenditures necessary to accomplish the activities identified in the JURMP and describe the sources of the funds used to meet the expenditures. The Storm Water Protection Program is comprised of numerous program activities funded from a variety of sources. Table 10.1 summarizes the storm water protection program activities and identifies the current funding source:

Table 10.1. Summary of Program Activities and Current Funding Sources

Program Activity	**Funding Source(s)**
Storm Water Facility Capital Improvement Program	Developer Impact Fees, Developer Exactions, General Fund, Gas Tax, TransNet Sales Tax, Federal and State Grants
Storm Water Facility Maintenance and Operation Program including Street Sweeping, Litter Removal and Storm Event Readiness and Patrolling	Solid Waste Service Fees, General Fund
Storm Water Program Administration	Solid Waste Service Fees
Illicit Detection and Illegal Discharge Enforcement Program	Solid Waste Service Fees
Commercial/Industrial SWPPP Inspection Program	Solid Waste Service Fees (charged to commercial service customers only)
Construction Related SWPPP Review and Inspection Program	Developer Fees

In FY 02-03 and 03-04, the City conducted a fee study to evaluate possible financing mechanisms for the Storm Water Protection Program. The new financing mechanism was detailed in the *City of Carlsbad Storm Water Pollution Protection Program Regulatory Fee Study Report*, dated September 12, 2003. The report recommended funding the storm water program through an increase in the City s Solid Waste Service fees and new development processing fees. Nearly all of the pollutants discharged into the MS4 are classified as solid waste under state and local codes. Based on this information and other findings, the City implemented a *Solid Waste Service* fee increase for residential and commercial service users to fund certain Storm Water Protection Program activities. The amount of the fee increase is calculated based upon the apportioned costs to the business and residential service users and their contribution to the pollutant loading. This fee was reviewed in June 2007, and updated to reflect current workloads. The current fee is 3.46 per month for residential customers, and 23.09 of the base trash rate for commercial customers.

The total operating costs to fund the storm water program activities related to existing development for FY 07-08 were budgeted at 3,083,049. This does not include the *Storm Water Capital Improvement Program* costs discussed in Section 10.1. It does, however, include budgeted expenditures for personnel, operating costs and capital outlay from the Storm Water Protection and Storm Drain Maintenance Program budgets, including costs for street sweeping. Since the 2003 fee study and new storm water fee increase, most of the activities related to Storm Water Protection Program and storm drain maintenance have been funded out of the Storm Water account. A few other items, such as a portion of street sweeping not directly involving the City s right-of-ways are paid for from other sources. A spreadsheet detailing the FY 07-08 expenditures for storm water activities along with the planned FY 08-09 budget is in Appendix 10.1.

The September 2003 study and proposal also recommended the establishment of development processing fees to pay for costs to review and inspect construction related SWPPPs. For FY 07-08, the SWPPP review and inspection fees generated over □149,000 in revenues.

10.1 Storm Water Facility Capital Improvement Program

Capital expenditures for new or upgraded storm water facilities are generally funded from developer revenues generated by the City□s adopted Local Drainage Area Fee program, developer exactions, or the General Fund. Occasionally, new drainage facilities or repairs and/or rehabilitation of existing drainage facilities are funded from other road-related funding resources such as the Gas Tax, TransNet Sales Tax, or Federal and State Grants. The adopted CIP budget includes funding for nearly □29 million dollars in storm water facility costs to build-out of the City. Funding for additional drainage facilities are included within the funding for various other City road improvement and civic projects. The exact amount of funding for drainage improvements included within the funding of other projects is not identified in the CIP budget.

Through the end of FY 06-07, the City had active drainage facility projects totaling □7.6 million in the adopted CIP budget. New projects initiated in FY 07-08 appropriated an additional □1.6 million. To date, approximately □4.2 million has been spent on active drainage projects. The City is committed to funding the construction of new and upgraded storm water facilities from its *Development Impact Fee Program*, the General Fund, and/or other revenue sources. The City will continue to investigate formation of a □*Storm Water Utility*□as a possible alternative source of funding to replace General Fund contributions.

10.2 Storm Water Facility Maintenance and Operation Program

For the purpose of this financial analysis, the formal *Storm Drain Maintenance Program* includes cleaning and minor repairs to the MS4, street sweeping, litter removal, storm event preparations, and patrolling. Historically, the cost to provide these services was funded by the General Fund. However, the adoption of the solid waste funding mechanism has provided a funding source for many of the *Storm Drain Maintenance Program* costs that had previously been funded in the General Fund. To better track expenses for Storm Drain Maintenance, a separate billing code was established for this program during FY07-08. This new code captures costs for salaries, benefits, equipment and services related to Storm Drain Maintenance. Street sweeping expenses totaled □203,632 during FY07-08, additionally □106,659 was spent for litter removal. When all Storm Water Protection Program expenditures were combined, it was estimated that the total costs for storm drain maintenance activities was approximately □1,087,000.

10.3 Storm Water Protection Program Administration

The administrative cost of the Storm Water Protection Program includes expenditures for annual JURMP reporting, GIS updates, records maintenance, wet weather monitoring, NPDES fee payments, education and outreach, and general program administration. The total annual cost for administration for FY 07-08 was estimated at □780,000. Prior to approval of the new storm water funding mechanisms, the full cost for administration of the program was funded from the General Fund. With the approval of the new funding mechanisms, the full cost for administration of the Storm Water Protection Program is paid from the revenues generated from the *Solid Waste Service* fee increase.

10.4 Illicit Discharges Detection and Elimination

The *Illicit Discharge Detection and Elimination Program* includes activities to detect and investigate the discharge of non-permitted pollutants into the MS4. This also includes any activities required to eliminate discharges and/or otherwise enforce compliance with the storm water regulations. The primary expenditures for the *Illicit Detection and Illegal Discharge Enforcement Program* for FY 07-08 are included in the administrative costs listed above in Section 10.3. This figure does not include any cost for legal actions taken to enforce compliance with the *Illicit Detection and Illegal Discharge Enforcement Program* when enforcement is elevated beyond an administrative citation. The cost for any legal action taken against an illegal/illicit discharger above an administrative citation will be paid from the General Fund or fines levied against the respective illegal/illicit discharger.

10.5 Commercial Industrial SWPPP Inspection Program

The City s *Commercial/Industrial SWPPP Inspection Program* includes the review of business related SWPPPs together with periodic site inspections to ensure compliance with requirements of the JURMP and the Carlsbad Municipal Code. The total budget allocated for the *Commercial/Industrial SWPPP Inspection Program* for FY 07-08 was estimated at 100,000. These costs were partially paid for out of the Storm Water Protection Program and the General Fund. Prior to approval of the new storm water funding mechanisms, the full cost for administration of the program was funded from the General Fund.

10.6 Construction Related SWPPP Review and Inspection Program

The *Construction Related SWPPP Review and Inspection Program* also includes regular site inspections during project construction to ensure project proponents comply with the requirements of the Permit, JURMP, and Carlsbad Municipal Code. The annual cost for the *Construction Related SWPPP Review and Inspection Program* varies from year to year depending upon the level of development within the City. The developer processing fees will ensure that adequate revenues are generated to fund all construction related SWPPP reviews and inspections.

Based upon current development activity levels, the City anticipates the annual program costs in the range of 46,000. Prior to the approval of the new storm water funding mechanisms, the full cost for the *Construction Related SWPPP Review and Inspection Program* was funded from the General Fund. With the approval of the new funding mechanisms, the full cost for the program will be paid from the revenues generated from the collection of development processing fees.

10.7 Self-Assessment

Program Strengths

The City has had a steady revenue source to fund the Storm Water Protection Program over the past year. Adjustments to the Solid Waste Fee funding mechanism for Storm Water-related programs have been made to ensure adequate funding for anticipated programs over the next fiscal year.

Program Improvements

The City has worked over this Fiscal Year to ensure that that Storm Drain Maintenance Activities are following the funding conventions outlined in the 2003 Fee Study, and 2007 update to same.

To better track Storm Drain Maintenance expenditures, versus Storm Water Protection Program Expenses, a new account was established for Storm Drain Maintenance. This will allow City Staff to better track expenses for storm drain maintenance activities which are funded by both the General Fund and Storm Water Fee.

For FY 08-09 we are reviewing our developer fee structure to recover costs incurred to comply with the NPDES permit.

11.0 EFFECTIVENESS ASSESSMENT

The effectiveness assessment is based on data for the full Fiscal Year 2007-08 and focuses on the assessment of three areas, as required in Section I.1.a.(1) of Order 2007-0001: significant activities, components, and an integrated assessment.

- Section 11.1 assesses the significant activities as listed in the City's JURMP. Each significant activity has an associated measure and targeted outcome. These measures relate to various levels in the range of Levels 1-4 outcome levels, assessing permit compliance, changes in knowledge and awareness, changes in behavior/BMP implementation, and load reductions.

- Section 11.2 assesses each component identified in Section I.1.a.(1)(b). The components include Development Planning, Construction, Municipal, Industrial/Commercial, Residential, Illicit Discharge Detection and Elimination, and Education. Each component assessment uses various levels in the range of Levels 1-4 outcome levels where measures have been developed applicable to the component.

- Section 11.3 provides an integrated assessment, combining conclusions from the individual component assessments and water quality data. At this time, it is not always feasible to link jurisdictional activities and components to changes in discharge and receiving water quality. This assessment draws conclusions where possible and will be further developed as more water quality data is collected in future years.

11.1 Significant Activity Assessment

The identification of significant activities was performed during the development of the JURMP. These significant activities, targeted measurable outcomes, and results for FY 07-08 are listed in Table 11.1. Some of the measurable goals are related to Levels 1-4 of the Effectiveness Assessment Outcomes as defined in Attachment C of Order R9-2007-0001. As more information about water quality problems, sources and activities are gathered, the City may revise its significant activities and targeted measurable outcomes.

The discussion below is related to Table 11.1 which follows.

Level 1: Compliance with Activity Based Permit Requirements

Where required during this fiscal year, all compliance based permit activities were completed successfully at or above 100 compliance. These measures are effective at determining the City's compliance with the permit.

The compliance measure for the Land Development Category crosses the FY reporting boundary because the measure is a new permit requirement that must be completed prior to the onset of the rainy season, October 1. All required inspections will be performed prior to October 1, 2008 and reported in the next Annual Report. Other measures appear to be appropriate for assessing compliance this year and the City was in compliance on all counts.

Level 2: Changes in Knowledge/Awareness

Changes in knowledge and awareness of storm water requirements were assessed using two significant activities or measures as described in Table 11.1.

As a part of the business inspection program, the City implemented a rating system to assess the general knowledge of storm water requirements at the establishments during inspections. This measure has been used for several years in the industrial and commercial inspections programs. For this measure, data collected during FY 07-08 was compared to data collected during FY 06-07. As shown in the table, the average knowledge/awareness at these businesses was down this year as compared to last. This may be a result of the difference in businesses inspected from year to year or reflect the difference in assessments by the various inspectors.

The second method to assess changes in knowledge and awareness compares quiz scores that are administered before and after class room presentations to school aged children. In general, the knowledge base before the presentation is low. Quizzes administered this year showed only 2 of the children had an awareness of storm water prior to the presentation. After the presentation, the number of children aware of storm water issues rose to 69 of the children. This demonstrates an increase in storm water awareness in 67 of the students that were present during the presentations. By measuring this change, it appears that the presentations are effective at increasing the children s knowledge of storm water issues.

Level 3: Behavioral Change/BMP Implementation

The mechanism the City used to assess behavior change is the BMP inspection ratings for industrial and commercial businesses, assessed during site inspections.

As a part of the business inspection program, the City used the one to five rating system to assess BMP implementation (i.e. behavior change) at the establishments during industrial and commercial inspections. Because this measure has been used for several years data collected during FY 07-08 was compared to data collected during FY 06-07. As shown in Table 11.1, the average measured BMP implementation at these businesses was down this year as compared to last. While a slight decline is evident, in general, BMP implementation remained relatively high this fiscal year. A comparison of the changes from year to year over the past four are discussed below in Section 11.2.

Level 4: Load Reductions

There are two significant activities that provide direct load reductions of various pollutants. These include storm drain cleaning and street sweeping activities, providing estimations of the removal of trash, sediments, and debris from these facilities. Combined, these activities account for the removal of nearly 1300 tons of trash, sediment, and debris from the storm drain system and streets.

Additionally, the City uses two estimations of load reductions related to residential outreach and education activities in an attempt to quantify the amount of nutrients and bacteria prevented from entering the MS4. These estimations are dependent on the types of education and outreach utilized and relate this education to reductions in fertilizer usage (i.e. nitrogen and phosphorous reductions) and reductions in pet waste (i.e. bacteria) entering the MS4.

Table 11.1 contains relevant information pertaining to the significant activities defined in the City's JURMP. This data is used to determine if these activities are considered effective.

Table 11.1 Significant Activity Assessment Table

Component	Significant Activity	Method	Measure	Level	Targeted Outcome	Data	Result	Program Effective? YES/NO			
								Compliance	Knowledge Change	Behavior Change	Load Reduction
								Level 1	Level 2	Level 3	Level 4
Land Development	1. Post construction BMP inspection: inspections performed/inspections required.[1]	Confirmation	Performed /Required	Compliance (1)	100% prior to October 1	Refer to JURMP Annual Report for Fiscal Year 2008-09.					
Construction	1. Were all required inspections performed during the wet season?	Confirmation	Performed /Required	Compliance (1)	100%	6192 /6192	100%	Yes	N/A	N/A	N/A
Municipal	1a. Were all required inspections performed under Order 2001-01?	Confirmation	Performed/ Required	Compliance (1)	100%	63/63	100%	Yes	N/A	N/A	Yes
	1b. Were all required inspections performed under Order 2007-0001, Permit Year 1, March 24, 2008 – March 23, 2009?	Confirmation	Performed /Required	Compliance (1)	100%	67/67	100%				
	2. Were all required catch basin inspections performed?	Confirmation	Performed /Required	Compliance (1)	100%	3680 /3680	100%				
	3. How much debris was removed from the MS4?	Direct Measure	Tons	Load Reduction (4)	N/A	204	N/A				
	4. How much debris was removed from street sweeping activities?	Direct Measure	Tons	Load Reduction (4)	N/A	1080	N/A				
	5. Were all special events applications reviewed for potential coverage under City requirements?	Confirmation	# Reviewed /Total	Compliance (1)	100%	10/10	100%				

Commercial-Industrial	1. Were all inspections performed as required?	Confirmation	Performed /Required	Compliance (1)	100%	112/112	100%	Yes	No[2]	No[2]	N/A
	2. Were knowledge scores, on average, for current fiscal year higher than previous fiscal year?	Analysis	Average Score	Knowledge Change (2)	Upward Average	4.05 FY06-07, 3.23 FY 07-08	-20%[2]				
	3. Were behavioral change/BMP implementation scores, on average, for current fiscal year higher than previous fiscal year?	Analysis	Average Score	Behavior Change (3)	Upward Average	4.00 FY06-07, 3.73 FY 07-08	-6.8%[2]				
IDDE	1. Were all urban runoff related complaints responded to and resolved?	Confirmation	# Responses /Total Complaints	Compliance (1)	100%	226 responses, 226 total	100%	Yes	N/A	N/A	N/A
Education	1. Were changes in knowledge demonstrated or verified (i.e. quizzes?)[3]	Analysis	Average Score Before/After	Knowledge Change (2)	%Change	2% aware in pre-test, 69% aware in post test	67%	N/A	Yes	N/A	Yes
	2. How much nutrient load reduction occurred as a result of the "Lawn Care Education" Program?	WTM	Tons	Load Reduction (4)	N/A	N=3.0, P=0.06	N/A				
	3. How much bacteria load reduction occurred as a result of the "Pet Waste Education" Program?	WTM	billion/year	Load Reduction (4)	N/A	26,600	N/A				

[1]During FY 07-08, City staff worked to confirm information on the BMP inventory, ensure ownership and responsible parties, and revise procedures. A new treatment control inspection form was created and a copy can be found in Appendix 2.6, and a new Treatment Control BMP Verification Form was created and can be found in Appendix 2.7. Inspection of treatment control BMPs will be conducted as required by the Permit by October 1, 2008 and reported in the FY 08-09 annual report.

[2]During Fiscal Year 2007-08, new inspectors may have been implementing a higher rating standard as compared to previous years, accounting for the decrease in knowledge/awareness and BMP implementation ratings.
[3]Quiz results based on acquisition of knowledge or not, as opposed to based on a raw score.

11.2 Component Assessment

11.2.1 Development Planning

During FY 07-08, the City has experienced changes in outcome levels 1, 2, and 3 regarding compliance with the Development Planning Component.

Level 1: Compliance with Activity Based Permit Requirements

Outcome Level 1 improvements included the many changes and improvements made to the City's storm water standards, procedures, and ordinances. The changes which became effective March 24, 2008, were primarily made to ensure compliance with the 2007 Municipal Permit. However, additional changes were made to clarify and simplify storm water compliance requirements and to enhance the City's storm water protection standards.

Level 2: Changes in Knowledge/Awareness

The Outcome Level 2 improvements included the raising of awareness of existing and new storm water compliance requirements among City development review staff, developers and the City's Planning Commission. Through a combination of training during weekly staff meetings, webinars and outside training courses, City staff significantly increased their knowledge and understanding of the new Municipal Permit requirements, LID designs, hydromodification principles and City storm water compliance processes. Developers were seen to increase their knowledge of the new Municipal Permit requirements, LID designs, and City storm water compliance requirements through revised plan review checklists, City plan review comments, the City's updated Storm Water Standards Manual and outside training courses. The City Planning Commission increased their knowledge on LID design principles and general storm water regulatory requirements through a staff presentation made at a regularly scheduled Planning Commission meeting.

Level 3: Behavioral Change/BMP Implementation

Outcome Level 3 improvements were seen in the development community. With the adoption of the interim LID and hydromodification criteria on March 23, 2008, the City no longer accepted the use of hydrodynamic separator systems and filter inserts as a primary treatment control BMP. To facilitate compliance to the new LID standards, the City began requesting new development/redevelopment compliance with the new interim criteria in October 2007. By March 24, 2008 when the new interim criteria became effective, the development community was already showing a marked increase in compliance with the interim criteria at the initial project submittal stage.

11.2.2 Construction

Outcome levels one, three, and four are used to the assess the effectiveness of the City's Construction Component.

Level 1: Compliance with Activity Based Permit Requirements

Overall, the Construction, Management, and Inspections Division (CM&I) was successful at maintaining full compliance with the permit requirements during FY 07-08. Table 11.2 contains examples of permit requirements and confirmation that these requirements were met.

Table 11.2 Examples of Construction Related Permit Requirements and Compliance

Permit Requirements	Requirement	Performed
Ordinance updates to comply with order	As Necessary	Yes
Designate a set of minimum BMPs	In JURMP	Yes
Require implementation of designated minimum BMPs	All sites	Yes
Maintain and update a watershed based inventory	Monthly	Yes
Require advanced treatment	Sites determined to be an exceptional threat to water quality	Yes, none identified.
Inspections of sites meeting criteria in D.2.d.(1)	Every 2 weeks during wet season	Yes
Implement follow-up actions	As needed based on inspection results	Yes
Inspect according to requirements in Section D.2.d.(6)	Each inspection	Yes
Track number of inspections for the inventoried sites	Continuous	Yes
Develop escalating enforcement process	JURMP	Yes
Implement escalating enforcement process	As needed based on inspections	Yes
Report non-compliant sites to Regional Board	Stop Work order or higher level of enforcement	Yes

In the next fiscal year, the CM&I division will continue to explore new methods for tracking inspections and compliance activities in order to facilitate better reporting.

Level 3: Behavioral Change/BMP Implementation

Changes in behavior and implementation of BMPs on construction sites are evident throughout the City. In general, contractors are more aware of the BMP requirements and are more willing to cooperate with inspectors, resulting in timely and proper implementation of the required BMPs. This may be due to increased presence and knowledge from the inspectors, allowing the inspectors to better understand and convey the necessary information to the contractors, and increased enforcement actions in previous years pertaining to erosion and sediment controls.

One method used to draw comparison of BMP implemention from year to year is to track the number and types of enforcement actions, normalized by the number of inspections each year. This may allow for a comparison of overall changes in compliance levels over time. Table 11.3 contains data for FY 06-07 and FY 07-08 and shows that the number of necessary enforcement actions has decreased. This may indicate better implementation of BMPs on construction sites; however it is difficult to draw conclusions from this small amount of data.

Table 11.3 Comparison of Enforcement Actions on Construction Sites

Enforcement Actions	FY 06-07			FY 07-08		
	Number	Total Inspections	Percentage	Number	Total Inspections	Percentage
Written Warning/Correction Notice	116	6294	1.8	74	6192	1.2
Stop Work	15	6294	0.24	4	6192	0.06

Staff will continue to develop ideas and implement those deemed appropriate in the future to assist in assessing the changes in knowledge and awareness in the construction community.

Level 4: Load Reductions

Load reductions are estimated for the construction program using a Watershed Treatment Model (WTM) developed by USEPA. The efficiency of the erosion and sediment control program is based on a best case scenario: a sediment control program that emphasizes erosion control measures, including practices that limit clearing and grading or use of phased construction methods (Brown and Caraco, 1997), and requires advanced sediment control measures to reduce sediment runoff from leaving the site. The WTM default efficiency for erosion and sediment control is 80 .

The user assigns the discount factors related to the fraction of the erosion practices installed and the fraction installed/maintained properly. There is a range of discount factors based on the level of program implementation and oversight. For example, if there were few inspectors, with no pre-construction meetings and poor practices allowed by codes and regulations, the input value would be 0.4. If inspectors visit sites weekly and if there are education programs for inspectors and contractors, the input value is 0.9 (the highest discount value in the WTM). City inspectors treat each grading site as high priority and perform inspections and enforcement actions as required in the permit. This allows for high discount input values. Due to continued improvements made to the program in FY 07-08, as described in detail in Section 3 of this report, a discount value of 0.8 was used.

A discount factor is also calculated based on the fraction of practices installed and maintained properly. Based on input from CMI with regular inspections, education programs, and guidance on BMP selection, a high discount value of 0.8 was used. Based on the estimated acres under construction and the discount factors applied, this results in an annual loading reduction of 16,571 pounds of nitrogen, 49,713 pounds of phosphorus, and 16,570,884 pounds of Total Suspended Solids per year (Table 11.4).

Table 11.4: Loading Reduction from Existing Erosion and Sediment Control Programs

	N (lbs/year)	P (lbs/year)	TSS (lbs/year)
Erosion and Sediment Control	16,571	49,713	16,570,884

11.2.3 Municipal

Level 1: Compliance with Activity-Based Permit Requirements

This level of effectiveness assessment is based on compliance with Activity Based Permit Requirements. The City was in compliance with all municipal requirements of Orders 2001-01 and 2007-0001 for the applicable time periods during the past fiscal year. Table 11.5 tracks some of the City's Municipal Program activity measures, which are discussed in detail in the previous report sections. Tracking of many of these activities was useful in assessing compliance with the program, but is not yet tied to long-term assessment or improved water quality.

Table 11.5: FY 07-08 Program Activity Measures

	Permit Requirements	Requirement	Performed
	Develop Inventory of Areas and Activities	Update with JURMP	Yes
	Develop and Implement Minimum BMPs	Update with JURMP	Yes
Special Events	Require Minimum BMPs	Establish and Require Implementation	Yes
	Inspections	Inspection all Special Event venues following events	Yes
MS4 Maintenance	Catch Basins	Inspect all, clean those exceeding 33% criteria	3680 inspections, cleaned all trash and 211 exceeding 33% criteria
	Pipelines (miles)	As needed	3 miles cleaned
	Open Channels (miles)	Inspect all and clean in a timely manner	Inspected 6 miles and removed all trash from 6.
	Desilting Basins	Inspect all, clean as needed	Inspected 3, removed all trash from 3
	Treatment Controls	Inspection and Maintenance	annually
	High Volumes of Trash	Inspection between May 1 and September 30	Yes
	Tracking of Quantities of Waste Removed	Track Quantities	Yes
Integrated Pest Management	Implement Program	Develop and Implement	Yes
Street Sweeping	High Volume Streets (miles)	2 times/month	weekly
	Moderate Volume Streets (miles)	monthly	biweekly
	Low Volume Streets (miles)	annual	biweekly

	Permit Requirements	Requirement	Performed
	Parking Lots (acres)	Depends on volume, see above	biweekly
Infiltration from Sanitary Sewer to MS4	Preventative Maintenance of Sanitary Sewer	Perform	Yes
	Preventative Maintenance of MS4	Perform	Yes
	High Priority Facilities	Inspect all in Permit Year 1	67 inspected

Based on the permit requirements presented above in Table 11.5, the municipal program remains in compliance with the requirements of Order 2007-0001. Several of the measures will be further developed in the upcoming year, with better tracking mechanisms and improved coordination between departments.

Level 2: Changes in Knowledge / Awareness

Changes in knowledge and awareness of storm water requirements are evident across City staff. Although not specifically measured, all staff is trained regularly on storm water compliance, as required in Section D.5 of Order 2007-0001. Appendix 8.1 (2001-01) and Appendix 8.2 (2007-01) contains all municipal training performed for FY 07-08.

An assessment of the numbers of complaints reported by City staff is one measurement that may lead to a better understanding of the effects of the training on municipal staff. Over the last four years, the number of complaints related to storm water has shown an increasing trend. The numbers of complaints reported by City staff has also shown an increasing trend. See Figure 11.1 below for an illustration of these data.

Figure 11.1 Storm Water Complaints Reported by City Staff FY 04-05 through FY 07-08

Each year for the past three, a significant portion of the increase in complaints reported has been attributable to City staff. It is possible that the increase in complaints in general has caused the increase in staff reporting; however, assuming the number of actual storm water related incidents within the community is the same or decreasing, it is likely that more complaints are being reported by staff due to an increased awareness of storm water issues corresponding to better and more frequent training as the Storm Water Program has continued to develop.

Level 3: Behavioral Change / BMP Implementation

One way to assess the amount of behavioral change and the actual implementation of BMPs for storm water is to look at the results of the municipal inspections. In general, all facilities have improved over the years. In past years, corrective actions have been more complicated and numerous. This year the most common corrective actions found during municipal inspections were minor and less numerous and pertained to organic debris (i.e. leaves) in the parking and storage areas, stenciling storm drains, and updating of SWPPP documents.

In addition, several departments and facilities have invested in new structural BMPs at their sites which are effective at mitigating potential pollutants at the sites. Three examples of new BMPs implemented this year include:

- Vacuum equipment was used to recover and contain all wash water from vehicle washing activities occurring at the Fire Stations.
- A pilot BMP was implemented using the innovative Drivable Grass which drains the parking lot through subsurface drainage system to reduce storm water flowing directly into MS4.
- Site specific SWPPPs were developed and updated for many of the high priority municipal facilities including: six fire stations, all maintenance yards, pump stations, and the Carlsbad Recycled Water Facility.

Level 4: Load Reductions

As described in Table 11.1, there are several methods of calculating load reductions available from data collected in the municipal program. Refer to Section 11.1 and Table 11.1 for more detail on estimated load reductions resulting from activities performed in the municipal program.

11.2.4 Industrial and Commercial

Level 1: Compliance with Activity Based Permit Requirements

As seen in Table 11.6, all inspections, as required by both permits, were completed during FY 07-08.

Table 11.6 Inspections of sites/sources FY 07-08

Order 2001-01 (July 1, 2007 to March 23, 2008)				
Industrial	**Inventory**	**Inspected**	**Permit Requirement**	**Percent Completed**
High Priority	42	42	100□	100□
Medium Priority	158	54	As needed	34□
Low Priority	99	37	As needed	37□
Commercial	**Inventory**	**Inspected**	**Target Percentage**	**Percent Completed**
High Priority	701	385	As needed	55□
Order 2007-0001 (March 24 to June 30, 2008)				
High Threat to WQ	**Inventory**	**Inspected**	**Target Percentage**	**Percent Completed**
Ind/Comm Sites/Sources	558	72	12.5□ [1]	13□

[1] Calculated based on requirement in Order 2007-01 to inspect 50□ of high priority businesses during Permit Year 1. Because there was approximately □ of the fiscal year left, the 50□ was multiplied by 25□ require a total of 12.5□ of the total high priority business inventory.

Level 2: Changes in Knowledge / Awareness

For Knowledge Assessment, inspectors rank personnel from one to five. Refer to Section 5 of this report for details on the rating scale.

Since the implementation of the rating system, the majority of businesses have ranked at three or better for storm water knowledge and awareness. Figure 11.2 illustrates that on average the majority of the sites inspected had a relatively high knowledge of storm water and ranked greater than or equal to 3.

Figure 11.2 Average Scores for Storm Water Knowledge and Awareness at Businesses Inspected

11.2.5 Residential

Level 1: Compliance with Activity-Based Requirements

Residential activities outlined in the March 2008 JURMP were completed as described in Section 6 of this report. Activities include various outreach events and activities; used oil and waste collection services, and complaint response followed by enforcement action.

Level 2: Changes in Knowledge/ Awareness

City of Carlsbad Public Opinion Survey

An annual public telephone survey was conducted this year by a new firm, the BW Research Partnership, as part of the *Performance Measurement Program* and *State-of-Effectiveness Report.* Carlsbad households were selected using *Random-Digit-Dial* methodology with a minimum sample size of 1,000. This survey had a margin of error of /- 3 at the 95 confidence level. Storm water pollution was addressed briefly in this survey. The City survey asked, *Have you seen or heard any information about how residents can prevent the pollution of creeks, lagoons, and the ocean?* This question was used to guage the public s perception of ocean water pollution and was asked previously in 2003. The results are presented in Table 11.7 below.

Table 11.7: Results of Environmental Question 1

Answer:	2003 ( )	2006 ( )	2007 ( )
1. Yes	58.1	64.6	61.1
2. No	41.9	35.4	38.9

This question illustrates a steady awareness of storm water and urban runoff pollution from 2003 to 2007 among residents.

An additional question was added to the surveys this year to assess the most affective educational methods by asking, Where do you recall seeing or hearing about ways to prevent pollution? The top two responses were newspaper and radio, respectively comprising over 50 of the total responses. Newsletters and brochures were the next highest, making up nearly 30 of the responses. Other responses included posters, website, curb signs, word of mouth, and public events.

Level 3: Behavioral Change/BMP Implementation

The City asked a behavioral question during the survey to those who answered affirmatively to the question, *Have you seen or heard any information about how residents can prevent the pollution of creeks, lagoons, and the ocean?* The 61.1 who answered question one affirmatively were asked the follow-up question, *What things are you doing to reduce water pollution?* Results for this question are presented in Table 11.8.

Table 11.8: Top Responses to *What things are you doing to reduce water pollution*?

Answer:	**Percent**
1. Properly disposing of hazardous waste.	24.0
2. Cleaned up trash at Beach, Roadside, Etc.	14.0
3. Using environmentally friendly soaps, pesticides, etc.	12.6
4. Used a commercial carwash.	14.9
5. Cleaned up animal waste.	6.6
6. Did nothing.	21.4
7. Other (recycling, reduced runoff.	42.8
8. Don't know.	3.6

Continued survey data should help to show if long-term behavior change has occurred. Over seventy percent of residents who answered question one affirmatively, consciously chose an environmentally friendly method over others in certain instances.

Level 4: Load Reduction

The primary goal of BMP implementation is to reduce pollutant loads in storm water discharges. An important emphasis of annual program assessments is to estimate the load reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important intermediate endpoint for assessments. The Regional Board wrote the following in October 2004:

> *Program effectiveness can be assessed by quantifying the pollutant load reductions attributable to various program activities. An effective program will compare pollutant load reductions of various program activities and implement those activities which result in the largest pollutant load reductions. It is expected that by implementing program activities which maximize pollutant load reductions, Copermittees will be implementing effective programs which will improve receiving water quality.*

The City used the Watershed Treatment Model (WTM) as a simple tool for rapid assessment of effectiveness of the storm water programs. The WTM (version 3.1) was prepared by Deb Caraco of the Center for Watershed Protection for the U.S. EPA Region V - Office of Wetlands, Oceans and Watersheds. Last year's report identified bacteria, sediment, and nutrients as constituents of concern. In response, specific program activities were undertaken to address these constituents. The WTM estimates the pollutant loading reductions for sediment, bacteria and nutrients for various program activities, such as residential education, erosion and sediment control programs, and street sweeping, among others. The results of some of these storm water management programs are discussed below. Complete explanations and assumptions are found in the WTM book.

<u>Public Education</u>
A variety of public education programs may help to reduce the concentration of nutrients, sediment and bacteria in urban streams. The model currently focuses only on a few of these, including programs to address lawn care, septic system maintenance, and pet waste. Several other residential pollution prevention programs improve water quality, but have little effect on nutrients, suspended solids, and bacteria. For example, HHW programs are effective at

reducing toxics but do not have a quantifiable impact on pollutants such as suspended solids, nutrients, or bacteria.

Lawn Care: The ideal pollutant removal associated with lawn care would be achieved if all of the additional fertilizer applied to turf were eliminated. The model uses equations to estimate optimal nutrient load reduction from a lawn care program combined with a calculation of the residential lawn area. The model calculates the residential lawn area based on the City's input of residential acres taken from GIS. The user inputs the information on how the education campaign was conducted. Default values were given for the fraction of the audience willing to change behavior based on nationwide data. The City conducted lawn care education through brochure distribution, workshops and newspaper ads.

The model allows the user to input the media type, which determines the portion of the population that *remember* the message ("Awareness of Message"). This number is largest with television (0.4), followed by newspaper (0.3), radio (0.25), billboard (0.13), brochures (0.08) and workshops (0.07). Because residents have been exposed to five of these mechanisms in FY 07-08, the input value entered was an average for brochures, workshops and newspaper, radio, and television (0.22). This results in an annual nutrient load reduction of 6,031 pounds of nitrogen and 121 pounds of phosphorus (Table 11.9).

Table 11.9: Loading Reduction from Existing Lawn Care Education

	N (lbs/year)	P (lbs/year)
Lawn Care Education	6,048	121

Pet Waste: The Storm Water Protection Program also conducted a *Pet Waste Education Program* during FY 07-08. In the urban watershed, dogs are a significant contributor of bacteria and nutrients. Ideally, a *Pet Waste Education Program* would reduce this source to zero, with all homeowners properly disposing of waste. The model provides estimated values for the fraction of households with a dog, the fraction of owners who walk their dog, the fraction of owners who cleanup after their dog, and the fraction willing to change their behavior. As with the lawn care education, the portion of the population that remembers the message is based on the media used for the education. This past year, the City delivered this message through brochures and the newspaper. Residents were also exposed to regional education efforts on television and radio. In addition, the City distributed free pet waste bag dispensers at local events and provided animal care facilities with these dispensers. These activities were considered similar to a workshop, so an averaged value of 0.22 was used for this calculation.

This results in an annual pollutant loading removal of 3,059 pounds of nitrogen, 399 pounds of phosphorus, and 26,600 billion bacteria per year (Table 11.10).

Table 11.10: Loading Reduction from Existing Pet Waste Education Program

	N (lbs/year)	P (lbs/year)	Bacteria (billion/year)
Pet Waste Education	3,059	399	26,600

The overall assessments of these education programs show that the media significantly affected the associated pollutant removal due to the increased audience that *remembers* the message. For instance, if the City had the ability to use mass media (television and radio), the estimated pollutant reduction would be increased significantly. The City's annual phone survey confirms that most people recall hearing these messages through mass media. However, mass media is <u>significantly</u> more expensive than brochures and workshops. The City has a storm water

performance measure that calculates the cost per capita for education activities. With these loading reduction estimations, costs can also be calculated on a per pound basis in order to justify the use of one option over another. Such calculations may show that it is not cost efficient to conduct a mass media campaign due to these costs and the associated reductions achieved. Large campaigns for mass media may be best conducted on a regional basis with Copermittees sharing the expense or pursuing grant funds for these expensive activities. Due to an increase in mass media educational tools used at the Regional level this year, it is expected that many of the residents in Carlsbad were affected by these campaigns, accounting for the increase in load reductions associated with lawn care and pet waste. Specifically the Think Blue campaign is described in Section 6.

11.2.6 Illicit Discharge Detection and Elimination

Effectiveness assessment for the IDDE Program will be submitted with Section 7 of this year's Annual Report to be submitted to the Regional Board by December 15, 2008.

11.2.7 Outreach and Education

Level 1: Compliance with Activity Based Permit Requirements

Table 11.11 below illustrates examples of the permit requirements in the outreach and education section and what activities the City implemented to comply with each.

Table 11.11 Outreach and Education Permit Requirements

Requirement	Compliance Activity
Municipal Training	
• Development Planning	Staff training specific to development planning activities 9/20/08
• Construction	Various staff training events (14) specific to construction activities
• Inspection Staff (industrial/commercial)	Various training events specific to inspections of businesses
• Other Activities	Various activity specific training events for fire, water and waste water, parks departments
New Development and Construction	Various outreach activities as described in Section 8.3
Residential	
General Public	
School Children	

Level 2: Changes in Knowledge/Awareness

Measurably increase the knowledge/awareness of target communities:

- Municipal Departments and Personnel

  During FY 07-08, a detailed municipal training program was developed to ensure compliance with Order 2007-0001. This training program assesses each position within the City to determine the applicable (i.e. required) training and groups the positions into separate modules to make training easier for the various departments. Staff will continue to determine ways to assess the changes in knowledge and awareness of municipal personnel throughout the permit cycle.

- Construction Site Owners and Developers

  The City conducts outreach activities specific to construction site owners and developers as described in Section 8.3. The activities occur throughout the development process.

- Industrial and Commercial Owners and Operators

  The City uses a program to assess changes in knowledge at industrial and commercial facilities based on a numeric ranking from one to five, with one representing a lack of knowledge and five representing adequate knowledge of storm water BMPs and requirements as applicable to their facility. The results are compiled each year and reported in the industrial/commercial section of the Annual Reports. Over time, these site assessments can be compiled and compared.

- Residential Community, General Public, and School Children

  There are various outreach efforts in place to increase storm water knowledge and awareness for residents, the general public, and for school children. Changes in the knowledge and awareness of the residents and general public are assessed and tracked via an annual telephone survey of the citizens of Carlsbad. The survey includes several questions used to assess these changes in awareness. Survey results, tracked over the past three surveys are described above in Section 11.6.

Level 3: Changes in Behavior/BMP Implementation

Measurably change the behavior of target communities:

- Municipal Departments and Personnel

  Behavior changes are evident throughout municipal departments and personnel and can be attributed to targeted outreach and training for municipal staff. As illustrated above, the awareness continues to increase, as evidenced by the continually increasing numbers of calls to the storm water hotline by City staff. All levels of staff are continually seeking advice from the Storm Water Program on how to implement BMPs allowing them to continue to perform their necessary activities. There have also been programmatic changes in the Development Services Division, ensuring that required BMPs and submittals are provided on all projects, and are tracked and approved.

- Construction Site Owners and Developers

  Changes in behavior on construction sites and by developers are also evident throughout the development community. These changes are manifested throughout the development process, from submitting appropriate BMPs on plans and better Storm Water Management Plans, to installation and maintenance of proper BMPs during construction, to the development, installation, and maintenance of BMPs on projects after construction is complete. The City is

developing better tracking mechanism for these various changes in behavior and will be able to better assess these changes in future years.

- Industrial/Commercial Owners and Operators

  Industrial and commercial owners and operators are continually educated on storm water issues via direct interaction during inspections, mailers, and interactions during outreach events. In general, the BMP implementation on industrial sites remains the highest, as evidenced by the fewer number of enforcement actions at these sites (refer to Section 5). In contrast, while the BMP implementation is consistently high, more enforcement actions are required at the commercial sites, likely due to the larger number of commercial sites in the City, and therefore less frequent inspections at these locations. Commercial sites also tend to have more turn over in staff, hindering the continuity desired to implement and maintain BMPs year to year. The Carlsbad Watershed Group is currently piloting an outreach project specifically targeting the commercial community. Results of this pilot will be discussed in the upcoming WURMP Annual Report and may be implemented within the City in the future, pending positive results.

- Residential Community, General Public, and School Children

  Outreach to the residential community, general public, and school children continues to be effective in conveying storm water information. At this time, it is difficult to measure the changes in BMP implementation in these target audience. Several methods have been discussed previously and will continue to be utilized. One of the best feedback mechanisms that the City has in place is its annual citizen survey. Answers to the question, What things are you doing to reduce water pollution? helps the Storm Water Program track BMP implementation over time and changes in the community, as discussed previously in the report.

11.3 Integrated Assessment

11.3.1 Changes in Discharge Water Quality

Dry Weather Field Screening and Analytical Monitoring Program

The City has conducted an annual *Dry Weather Field Screeing and Analytical Monitoring Program* since 1995. The purpose of the monitoring program is to detect and eliminate illicit connections and illegal discharges to the storm drain system. The Dry Weather Monitoring Program report for FY 07-08 and follow-up activities will be provided under separate cover, due to the Regional Board by December 15, 2008. The following discussions summarize current and past dry weather results in order to assess changes in MS4 water quality, through the 2007 dry weather season, as data is not yet available for the 2008 season.

Fecal coliform concentrations are generally lower over the past four years than in 2003, while enterococcus concentrations are slightly higher in recent years. In comparison to dry weather action levels, fecal coliform and enterococcus mean values are well below the established action levels across all years of data. With many variable factors unaccounted for, it is unclear if the recent results are due to improvements and BMP implementation or to the variable nature of bacteria concentrations.

The City has conducted field testing of detergents since 1995. Data appear to show a downward trend in detergent levels found in the MS4 with results less than established action levels for MBAS. Currently, detergents are rarely detected in the dry weather program.

The average pH levels have also shown a downward trend since 1995. This may be a result of the decreased detergents in the MS4, which are typically basic having pH values 7.

Ammonia concentrations show that concentrations have been decreasing in past years. With the exception of 2002, all recent years have averaged well below the established action level for ammonia-nitrogen.

Nitrate concentrations appear to be decreasing at dry weather sites over the past three years, with the lowest average in the past six occurring in 2007.

Lower in recent years, all ortho-phosphate averages are well below established dry weather action levels.

Over the course of the past six years of dry weather programs, water quality parameters have been repeatedly analyzed at the same sites allowing for a comparison of data. In general, water quality within the MS4 is good, with evidence of decreasing concentrations of bacteria, nutrients, pH, and surfactants. Efforts continue to focus on bacteria concentrations in the MS4 and their sources. In the future, increased efforts to understand bacteria concentrations and sources will be made through various TMDL activities. With an enhanced understanding of bacteria, the City will be better prepared to address and abate sources within the watershed.

Coastal Outfall Monitoring Program

The City continued to collect samples from various storm drain outfalls as part of the *Coastal Outfall Monitoring Program*. If water was flowing from a storm drain outfall, samples were collected and analyzed for total coliform, fecal coliform and enterococci. Storm drain sample results were compared to the 95th percentile criteria established in the *Adaptive Monitoring Plan*. Where possible, a paired receiving water sample was collected to assess the impacts of the storm drains on the receiving waters. The receiving water samples were compared to Rec-1 standards to determine exceedances. Where storm drain bacteria concentrations exceeded 95th percentile criteria or receiving water samples exceeded Rec-1 objectives, follow-up sampling and/or investigations were performed.

Recent years indicate a decrease in storm drain exceedances for all three bacterial indicators, showing improvements in water quality. In all cases, the flow from outfalls was intermittent and low volume. In many cases, the flow did not actually reach the receiving waters, but dissipated into the sand or sediment. The City will continue to conduct the Coastal Outfall Monitoring Program and to conduct follow-up investigations as detailed in the Adaptive Plan.

11.3.2 Level 6: Changes in Receiving Water Quality

It is important to note that receiving water quality reflects considerably more than the quality of the City's MS4 discharges. In addition, receiving water quality can be adversely impacted by other events that are not under the control of the City, such as other permitted NPDES discharges, wildlife (impacting bacteria levels), atmospheric deposition, and other events and activities.

Watershed Receiving Water Samples

This year the City continued to have four receiving water samples collected in order to provide additional baseline data of surface water quality. These samples are collected at the same time as the Dry Weather Program samples. This is the sixth year of data collected under the this program, however at the time of this report, data for the sixth year is not available for inclusion. The program includes monitoring sites on Buena Vista Creek, Agua Hedionda Creek (at the Mass Loading Station site), Encinas Creek, and San Marcos Creek. Each of these tributaries is representative of the four separate Carlsbad sub-watersheds.

This special study was initiated in support of the Carlsbad Watershed Copermittees efforts to learn more about the quality of receiving waters in the Carlsbad Hydrologic Unit. The high priority pollutants in the Carlsbad Watershed are sediment and bacteria. Data collected in this study is insufficient in quality to provide information on nutrients due to the methodology used in analyzing nutrient concentrations. The prioritization of sediment as a high priority pollutant does not appear to be supported by data collected in this study. This is likely because all samples were collected during dry weather and sediment is potentially more prevalent during wet weather.

Bacteria is also listed as a high priority pollutant in the Carlsbad Watershed and data has been shown to exceed REC-1 water quality objectives during wet and dry weather. This special study appears to support the Watershed's prioritization of bacteria during dry weather.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this special study. These data support the findings of previous monitoring in the Carlsbad Watershed indicating that bacterial indicators are a constituent of concern in the Carlsbad Hydrologic Unit. Other water chemistry constituents in the creeks appear to be within standards. Because this is a limited set of data, the watershed is in need of additional data to validate these findings. With the onset of the requirements of Order 2007-0001, Temporary Watershed Assessment Stations were located on Buena Vista Creek and on Agua Hedionda Creek during FY 07-08, collecting samples for analysis during wet and dry weather. These results were not available at the time of this report, but will be available for inclusion in future years.

Coastal Outfall Monitoring Program Receiving Waters

Of samples collected in the receiving waters during FY 07-08, there was only one exceedance for enterococcus across all three indicators. This exceedance occurred in Agua Hedionda Lagoon. There were no exceedances of the REC-1 standards in the Ocean for total coliform, fecal coliform or enterococci during the last six reporting periods. A general decline in receiving water exceedances in the lagoons is evident across all bacterial indicators, showing improvements in water quality.

It should be noted that lagoon samples were only collected during July, August, and September of 2007, as the Coastal Monitoring Program implemented permit requirements under Order 2007-0001 on October 1, 2007 monitoring only ocean outfalls. The City will continue to implement this program and to conduct follow-up investigations in accordance with the *Adaptive Plan*.

11.3.3 Overall Assessment

Program implementation in areas of construction, residential, MS4 maintenance, and street sweeping are properly targeted for protection of and improvement of water quality, as evidenced by direct load reductions in these programs.

Other program implementation in areas of industrial and commercial inspections, municipal, residential, construction, and outreach and education appear to be properly targeted for the protection of and improvement of water quality, as evidenced by changes in knowledge and awareness and in behavior.

12.0 SPECIAL INVESTIGATIONS

12.1 Introduction

This section describes any special investigations that the City of Carlsbad has knowledge of occurring during FY 07-08 within its jurisdiction.

12.2 Special Investigations

Lagoon TMDL Investigative Order

The City of Carlsbad participated in the San Diego Coastal Lagoon TMDL Monitoring Program that is described in San Diego Coastal Lagoons Monitoring Workplan (Mclauglin et al, June 2008). Samples were taken on February 7-8, 2008 and on April 8, 2008. Two storm drain outfalls in Carlsbad were sampled during each index period. Flow rates were measured and samples were analyzed for pH, Specific Conductivity, Temperature, Dissolved Oxygen, Turbidity, Totals Suspended Solids (TSS), Total Coliform, Fecal Coliform, and Enterococcus. Results and conclusions of the monitoring program will be in the final report, written by Southern California Coastal Research Project, expected to be completed in the third quarter of 2010.

Agua Hedionda Creek Datasonde

At the end of FY 04-05, the City purchased a continuous water quality monitoring probe (Datasonde) to be installed in Agua Hedionda Creek near the Mass Loading Station. The Datasonde was installed during FY 05-06. The probe is tied into a continuous stream flow gauge that was installed during the year as part of a State Proposition 13 Grant for the removal of invasive plant species in the Carlsbad Watershed. Stream flow gauges were installed on Buena Vista Creek, San Marcos Creek, and Agua Hedionda Creek. Although the probe is gathering some data, it has been removed and re-installed a few times, and the data has not been compiled, quality controlled, or assessed at this time.

Watershed Receiving Water Samples

This year the City continued to have four receiving water samples collected in order to provide additional baseline data of surface water quality. These samples are collected at the same time as the Dry Weather Program samples. This is the sixth year of data collected under the this program, however at the time of this report, data for the sixth year is not available for inclusion. The program includes monitoring sites on Buena Vista Creek, Agua Hedionda Creek (at the Mass Loading Station site), Encinas Creek, and San Marcos Creek. Each of these tributaries is representative of the four separate Carlsbad sub-watersheds.

This special study was initiated in support of the Carlsbad Watershed Copermittees efforts to learn more about the quality of receiving waters in the Carlsbad Hydrologic Unit. The high priority pollutants in the Carlsbad Watershed are sediment and bacteria. Data collected in this study is insufficient in quality to provide information on nutrients due to the methodology used in analyzing nutrient concentrations. The prioritization of sediment as a high priority pollutant does not appear to be supported by data collected in this study. This is likely because all samples were collected during dry weather and sediment is potentially more prevalent during wet weather.

Bacteria is also listed as a high priority pollutant in the Carlsbad Watershed and data has been shown to exceed REC-1 water quality objectives during wet and dry weather. This special study appears to support the Watershed s prioritization of bacteria during dry weather.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this special study. These data support the findings of previous monitoring in the Carlsbad Watershed indicating that bacterial indicators are a constituent of concern in the Carlsbad Hydrologic Unit. Other water chemistry constituents in the creeks appear to be within standards. Because this is a limited set of data, the watershed is in need of additional data to validate these findings. With the onset of the requirements of Order 2007-0001, Temporary Watershed Assessment Stations were located on Buena Vista Creek and on Agua Hedionda Creek during FY 07-08, collecting samples for analysis during wet and dry weather. These results were not available at the time of this report, but will be available for inclusion in future years.

13.0 NON-EMERGENCY FIRE-FIGHTING

13.1 Introduction

The Carlsbad Fire Department (CFD) has developed the Non-Emergency Fire Fighting Program to meet the requirements of Order R9-2007-0001, as written in the City's 2008 JURMP. This section describes the City's program to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) conducted in FY 07-08 from March 24, 2008 to June 30, 2008.

13.2 Overall Program Definition

The CFD is a dedicated team of professionals whose mission is to enhance the quality of life in our community by delivering exceptional services in safeguarding lives, property and the environment. By default, the definition of non-emergency fire-fighting flows are flows generated by the Fire Department other than emergency situations. The duration of an emergency exists from alarm notification until, in the opinion of the Incident Commander, the emergency has concluded and equipment is returned to service. Outside of this duration of time, Fire Department flows are considered non-emergency.

13.3 BMP Implementation

In order to reduce pollutant discharges from non-emergency fire-fighting flows, the City of Carlsbad's Fire Department has implemented several BMPs. During this reporting period, the CFD maintained a Storm Water Manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water. The BMPs incorporated at Fire Stations are listed below:

- The manuals included facility specific site maps, storm water inspection reports, facility specific spill response procedures, training records, department policies, and other related storm water compliance information.
- A written department policy on outside water use was followed and covers vehicle, hose, and equipment washing.
- Spill response equipment and materials were clearly identified and staged in accessible locations.
- Sweeping and removal of organic material from parking lots and walkways was completed on a weekly or as needed basis at all fire stations.
- Awareness was heightened at fire scenes to minimize the potential for excessive water flow.
- Awareness was heightened at incident scenes to contain potential discharges (once the scene had been stabilized) to prevent pollutants from entering the storm drain system.
- The Fire Department continued to implement the City's Spill Response Procedure for incidents that occur on City streets.

13.4 Training and Education

The CFD continued to communicate with other City departments to improve coordination and education with regards to storm water. The CFD's Storm Water Committee met quarterly to address new and ongoing storm water topics and how they relate to the responsibilities of the

Fire Department, and included personnel from each Fire Department rank. Other activities CFD participated in are as follows:

- Attended the City's Storm Water Committee meetings on a regular basis;
- Worked closely with the Storm Water Protection Program to conduct a series of meetings to review BMP implementation and perform one-on-one training;
- Conducted Fire Engineer training and testing at the City's reclaimed water facility at 6220 Avenida Encinas. A training trailer was used to facilitate engineer operations, pump testing, and other wet training opportunities;
- The Fire Department continued to provide acceptable wet training opportunities for personnel, while ensuring that appropriate BMPs were in place to protect storm drains and eliminate discharges to the MS4;
- Explored CIP opportunities for potential funding for permanent structural BMPs at the fire stations to serve wash areas;
- Worked extensively with the design and construction committee for new fire stations to ensure that storm water requirements were 1) addressed early in the process and 2) met during and after construction.
- Continued current annual training levels to ensure that all CFD personnel were versed in storm water as it relates to fire stations and fire fighting activities.

13.5 Fire Prevention Program

Fire prevention is itself a Best Management Practice (BMP). During this reporting period, Fire Prevention activities included those activities not directly associated with emergency scene operations, post fire scene or mop-up operations.

Perhaps the most effective way to eliminate water runoff from fires is to eliminate or reduce the magnitude of fires. The CFD has shown that an aggressive Fire Prevention Program has a significant impact on the number and magnitude of fires. Procedures or actions that lead to early fire detection/notification, automatic suppression, confinement, or enhanced suppression capabilities can reduce or control fires and ultimately reduce water runoff. The installation and maintenance of these procedures, devices, or features can significantly reduce potential flows in the event of an emergency.

An example of this type of prevention was weed abatement which included the encouragement of mowing. When mowing was not practical for perimeter breaks, and after considering topography, roughing the slope in a manner that would not increase soil or sediment releases was utilized, such as disking.

The City of Carlsbad continued its Fire Prevention Program during this reporting period.

14.0 JURMP REVISIONS

The City s JURMP was re-written during the previous reporting period in response to the issuance of Order 2007-0001. The new JURMP was initially implemented beginning March 24, 2008 as required under the new permit. At this time, no revisions to the new JURMP have been required. Any necessary changes to the new JURMP that are made during the upcoming reporting period will be detailed in the Annual Report for FY 08-09.

15.0 CONCLUSIONS AND RECOMMENDATIONS

15.1 Overview

During this reporting period, from March 24, 2008 to June 30, 2008, the City started implementing the new Permit Order No. R9-2007-0001. This section of the JURMP Annual Report described activities that the City undertook to reduce discharges of pollutants and urban runoff flow to the MS4 to the maximum extent practicable. It also provided an overall account of the activities conducted and the programs implemented to address the new Permit requirements for major components: Development Planning, Construction, Municipal, Industrial/Commercial, Residential, Illicit Discharge Detection and Elimination, and Education.

Several highlights are listed below, including specific discussion of activities conducted related to meeting Permit requirements as well as those that exceeded requirements. Note that these are highlights only and do not represent all activities conducted by the City to maintain compliance. Comprehensive details are reported in the applicable preceding sections.

15.2 Highlighted Activities Performed to Meet Permit Requirements

The City continued activities that were consistent between the two permits, as well as started new programs specific to the new Permit, Order No. R9-2007-0001. For comprehensive details, please refer to the applicable preceding sections of the report. Highlights for March 24, 2008 to June 30, 2008 are listed below.

The City:

- Updated the Carlsbad Municipal Code to reflect new requirements of the Permit related to Development Planning, Construction, and Existing Development.
- Continued updating and revising the Treatment Control BMP (TCBMP) database of private and public TCBMPs.
- Created a new TCBMP Inspection Form
- Created a new TCBMP Verification Form
- Created a new TCBMP outreach brochure.
- Distributed a copy of the Pollution Prevention Guide to the Construction Industry brochure with each construction related permit application
- Inspected all high priority construction sites at required frequencies, conducted outreach to project proponents and City staff, and issued 30 enforcement actions to obtain compliance, during 3044 inspections.
- Updated and mapped the municipal inventory and inspected all high priority municipal facilities in year 1 of the Permit, prior to the start of the rainy season October 1, 2008.
- Conducted cleaning and maintenance activities to reduce pollutant discharges from the MS4.
- Inspected 100 of catch basins.
- Developed a new program to evaluate and inspect Special Events.
- Updated and revised the Special Events inventory, developed a Special Events BMP brochure, and created a Special Events Inspection Form.
- Updated and mapped the High Threat to Water Quality Industrial/Commercial inventory, and conducted 72 inspections. The total revised inventory per the new Permit and JURMP prioritization criteria totaled 558 for this reporting period. Since the Permit requirement is 50 inspected within the first year of implementation and there were 3 months in FY 07-08 to start implementing the new Permit, 12.5 (one fourth of 50) of

the inventory was set as the goal for this reporting period, or 70 inspections. The City conducted 72 inspections during this reporting period. The City issued 6 enforcement actions to obtain compliance from March 24, 2008 to June 30, 2008.

- Continued using the *Knowledge and BMP Assessment*s at commercial and industrial facilities.
- Continued distributing the new brochure for mobile service providers, including carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, and any other mobile businesses that provide services at various off-site locations. This brochure was designed for mobile service providers, their employees, and anyone that hires a mobile service provider.
- Distributed educational information for residential activities, continued an advertising campaign, hosted or participated in 5 community outreach events, collaborated in offering five oil recycling and two HHW drop-off sites for residential use, responded to 66 reports of illegal discharges, and issued 25 enforcement actions to obtain compliance.
- Collaborated with other internal departments to assist with investigations and remediation during field incidents. The Storm Drain Maintenance Division was key to prompt, effective responses to complaints involving clean ups of incidents on public streets. Regular meetings and discussions about compliance issues and consistent contacts facilitates this inter-departmental coordination.
- Conducted a proactive program to detect and eliminate illegal discharges to the MS4. The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. The Storm Water Protection Program responded to 66 reports of illegal discharges to the storm drain system.
- Continued implementation of the *Dry Weather Field Screening and Analytical Program*, analyzing conditions and samples from 60 sites in the MS4.
- Continued implementation of the *Coastal Outfall Program* by routinely monitoring 8 active outfall sites on a regular basis, and inactive sites semi-annually.
- Created monitoring plans and located sites for the new MS4 Discharge Program
- Created monitoring plans and located sites for the new Trash Monitoring Program to be conducted concurrently with the Dry Weather Field Screening and Analytical Program.
- Continued involvement in outreach and education at the local level, the watershed level, and the regional level with the Project Clean Water Outreach Workgroup, and the Think Blue campaign.
- Continued distributing storm water educational brochures and continued the Environmental Programs advertising campaign.
- Distributed information through direct mail, during inspections and investigations, on the website, at workshops, during presentations, training seminars, and other public outreach events.
- Conducted a Public Opinion Survey of 1,000 residents and included questions on storm water.
- Distributed promotional items such as notepads, pens, Bags on Board, and key chains with pollution prevention messages.
- Improved the Carlsbad Municipal Code by working with the City Attorney s office to revise the ordinance to reflect current enforcement levels and mechanisms.
- Continued to review inventory management, prioritization practices, inspection and enforcement procedures, training programs, record-keeping, and reporting procedures related to construction activities.

15.3 Highlighted Activities in Addition to Permit Requirements

The City implemented several initiatives in addition to the requirements of the new Permit. Some of these highlights are internal program goals and should not be viewed as enforceable under the Permit. These internal program goals will be continued and enhanced as resources allow. For comprehensive details, please refer to the applicable preceding sections of this report. Highlights for March July 1, 2007 to March 23, 2008 are as follows:

The City:

- Started educating Developers and applicants about the new Development Planning Permit requirements early to ensure compliance would be achieved.
- Implemented Permit requirements related to Construction Inspection activities earlier than required, starting January 1, 2008.
- Adopted new storm water BMP maintenance agreements and incorporated into standard operating procedures. The new BMP maintenance agreements provide increased control over property owner compliance with storm water BMP requirements. These new agreements will also provide the City with legal authority to access, inspect and if necessary maintain onsite BMPs. In addition, the agreements will allow the City to place a lien on a property if BMPs are not maintained as required.
- Continued to maintain regular communications with the Industrial Compliance Unit of the Regional Board. In addition to copies of inspection reports and other correspondence with high and medium industries covered under the Permit, the City regularly coordinated compliance issues with Regional Board representatives over the phone and through emails. On several occasions, the Regional Board expressed their appreciation of the City s professionalism, responsiveness, and implementation of the storm water program
- Continued using the streamlined Industrial/Commercial inspection report revised in FY 05-06 so that businesses could promptly implement corrective actions. The revised streamlined inspection form now includes spaces to report previous enforcement actions, new storm water contacts, and a detailed list of necessary corrective actions. The revised form has proven to be successful in attaining compliance from regulated facilities.
- Posted minimum BMPs on the City s website for access by the public, permit applicants, developers, and property owners.
- Continued Storm Water Committee meetings which included members from Public Works, the Fire Department, Recreation, Planning, and the Building Department.
- Continued to implement a computerized asset management/work order system that will allow the Storm Drain Maintenance Division to manage of the MS4 inventory, inspections, and maintenance activities conducted.
- Continued the Environmental Resources Management Team (ERMT) initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles.
- Supported the ERMT s work creating Environmental Guiding Principles for City decision-making, obtaining approval from City Council on the formal principles.
- Continued Storm Water Leadership Team (SWLT) meetings. Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City s major service areas and Directors. Agenda items covered all areas of the City s compliance with Order No. 2001-001, as well as new programs under Order No. R9-2007-0001.

- Continued to collect data for Performance Measures and the *Maintenance Assessment Program* to analyze improved work methods to balance scheduled versus unscheduled maintenance.

15.4 Recommendations for Improvements

As the City started to implement the new 2008 JURMP in this reporting period, some areas for improvement were noted for the future:
The City will:

- Continue to research, observe, and evaluate the performance of various types of BMPs.
- Continue working on a *Best Management Practices Manual* that includes the minimum and required BMPs for activities and pollutant types. The manual should be completed in FY 08-09.
- Continue to develop effectiveness assessment mechanisms for each significant activity, for each major component, as well as an integrated assessment of the overall program.
- Continue to work at the watershed level and help focus activities on high priority pollutants.

15.5 Water Quality Improvements or Degradation

The complete 2008 Dry Weather report and the full IDDE Section of the Annual Report will be submitted in December of 2008. Please refer to the *Carlsbad Watershed 2008 WURMP* for data trends supporting the focus on *High Priority Pollutants* on a watershed basis. The following text highlights some of the observations on water quality.

<u>MS4 Water Quality</u>
With five years of data from the Dry Weather Program, ranging from nutrient and physical measurements to bio-available metals and pesticides, collected at 60 sites covering the entire MS4, a picture of water quality within the system is starting to appear. While data is only collected once annually, improvements can be seen for nutrient concentrations, pH, fecal coliform, ammonia, and surfactants within the MS4.

Exceedances of bacteria 95th percentile criteria in the *Coastal Storm Drain Monitoring Program* have declined in recent years.

<u>Receiving Water Quality</u>
The City is continuing to conduct additional receiving water monitoring to assess receiving water quality in Carlsbad. Current programs include the *Coastal and Lagoon Outfall Monitoring Program*, the Watershed Receiving Waters samples, and mass loading station monitoring.

Coastal Monitoring Program data indicate no water quality exceedances for bacteria in the ocean and only a few in the enclosed lagoons. The exceedances in the lagoons have declined in recent monitoring seasons and water quality appears to be improving.

In the Watershed Receiving Waters samples during dry weather nearly all constituents were undetected in the four additional creek sites water samples including: MBAS, oil and grease, dissolved cadmium, dissolved copper, dissolved lead, diazinon, and chlorpyrifos. Water quality at the four locations was relatively good.

Data related to the Mass Loading Station will be submitted with the Copermittees Regional Monitoring Annual Report.

15.6 Conclusion

The Storm Water Protection Program continues to evolve over time in response to the iterative process of implementing BMPs, assessing effectiveness, and evaluating results. As more procedures, programs and activities are implemented, there is a clear need for better databases to track and report activities and BMPs being implemented. Tying these activities to changes in water quality still presents a considerable challenge. This is part of the long-term assessment strategy that will take time to develop trends and to determine cause and effect relationships between pollution prevention and water quality management. The City will continue to work individually and with the Copermittees to further develop existing compliance programs and create new opportunities for improvement.

This section of the Annual Report demonstrated the City s compliance with Permit 2007-0001 and initial implementation of the 2008 JURMP. Because the new Permit was only implemented for 3 months of the reporting FY, it does not represent a full year of implementation.

Other sections of this report show that knowledge has increased in target communities, improved BMP implementation and behavior changes are occurring, pollutant loadings are being reduced from storm water management programs, the MS4 quality is improving, and some pollutants in receiving waters are improving. These are encouraging signs that are worth noting. The City recognizes that changes are likely to happen slowly and that continued program improvements and effectiveness measures are needed for long-term success.

FOR

SECOND COMPONENT TO ANNUAL REPORT

COVERING PERIOD FROM

MARCH 24, 2008 THROUGH JUNE 30, 2008

KISCO HOME OFFICE (PIP 08-01)

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Project Address	Assessors Parcel Number(s):	Project # (city use only):
1901 Wright Place	212-091-13	

Complete Sections 1 and 2 of the following checklist to determine your project's permanent and construction storm water best management practices requirements. This form must be completed and submitted with your permit application.

Section 1. Permanent Storm Water BMP Requirements:
If any answers to Part A are answered "Yes," your project is subject to the "Priority Project Permanent Storm Water BMP Requirements," and "Standard Permanent Storm Water BMP Requirements" in Section III, "Permanent Storm Water BMP Selection Procedure" in the Storm Water Standards manual.

If all answers to Part A are "No," and any answers to Part B are "Yes," your project is only subject to the "Standard Permanent Storm Water BMP Requirements". If every question in Part A and B is answered "No," your project is exempt from permanent storm water requirements.

Part A: Determine Priority Project Permanent Storm Water BMP Requirements.

Does the project meet the definition of one or more of the priority project categories?*	Yes	No
1. Detached residential development of 10 or more units.		X
2. Attached residential development of 10 or more units.		X
3. Commercial development greater than 100,000 square feet.	X	
4. Automotive repair shop.		X
5. Restaurant.		X
6. Steep hillside development greater than 5,000 square feet.		X
7. Project discharging to receiving waters within Environmentally Sensitive Areas.		X
8. Parking lots greater than or equal to 5,000 ft^2 or with at least 15 parking spaces, and potentially exposed to urban runoff.	X	
9. Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater		X
* Refer to the definitions section in the Storm Water Standards for expanded definitions of the priority project categories.		
Limited Exclusion: Trenching and resurfacing work associated with utility projects are not considered priority projects. Parking lots, buildings and other structures associated with utility projects are priority projects if one or more of the criteria in Part A is met. If all answers to Part A are "No", continue to Part B.		

Part B: Determine Standard Permanent Storm Water Requirements.

Does the project propose:	Yes	No
1. New impervious areas, such as rooftops, roads, parking lots, driveways, paths and sidewalks?	X	
2. New pervious landscape areas and irrigation systems?	X	
3. Permanent structures within 100 feet of any natural water body?		X
4. Trash storage areas?	X	
5. Liquid or solid material loading and unloading areas?		X
6. Vehicle or equipment fueling, washing, or maintenance areas?		X
7. Require a General NPDES Permit for Storm Water Discharges Associated with Industrial Activities (Except construction)?*	X	
8. Commercial or industrial waste handling or storage, excluding typical office or household waste?		X
9. Any grading or ground disturbance during construction?	X	
10. Any new storm drains, or alteration to existing storm drains?	X	
*To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/stormwtr/industrial.html		

Section 2. Construction Storm Water BMP Requirements:

If the answer to question 1 of Part C is answered "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Storm Water Pollution Prevention Plan (SWPPP). If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Water Pollution Control Plan (WPCP). If every question in Part C is answered "No," your project is exempt from any construction storm water BMP requirements. If any of the answers to the questions in Part C are "Yes," complete the construction site prioritization in Part D, below.

Part C: Determine Construction Phase Storm Water Requirements.

Would the project meet any of these criteria during construction?	Yes	No
1. Is the project subject to California's statewide General NPDES Permit for Storm Water Discharges Associated With Construction Activities?	X	
2. Does the project propose grading or soil disturbance?	X	
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	X	
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as, paints, solvents, concrete, and stucco)?	X	

Part D: Determine Construction Site Priority

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans, and included in the SWPPP or WPCP. Indicate the project's priority in one of the check boxes using the criteria below, and existing and surrounding conditions of the project, the type of activities necessary to complete the construction and any other extenuating circumstances that may pose a threat to water quality. The City reserves the right to adjust the priority of the projects both before and during construction. [Note: The construction priority does NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority does affect the frequency of inspections that will be conducted by City staff. See Section IV.1 for more details on construction BMP requirements.]

☑ ***A) High Priority***

1) Projects where the site is 50 acres or more and grading will occur during the rainy season
2) Projects 1 acre or more.
3) Projects 1 acre or more within or directly adjacent to or discharging directly to a coastal lagoon or other receiving water within an environmentally sensitive area
4) Projects, active or inactive, adjacent or tributary to sensitive water bodies

☐ ***B) Medium Priority***

5) Capital Improvement Projects where grading occurs, however a Storm Water Pollution Prevention Plan (SWPPP) is not required under the State General Construction Permit (i.e., water and sewer replacement projects, intersection and street re-alignments, widening, comfort stations, etc.)
6) Permit projects in the public right-of-way where grading occurs, such as installation of sidewalk, substantial retaining walls, curb and gutter for an entire street frontage. etc. , however SWPPPs are not required.
7) Permit projects on private property where grading permits are required, however, Notice Of Intents (NOIs) and SWPPPs are not required.

☐ ***C) Low Priority***

8) Capital Projects where minimal to no grading occurs, such as signal light and loop installations, street light installations, etc.
9) Permit projects in the public right-of-way where minimal to no grading occurs, such as pedestrian ramps, driveway additions, small retaining walls, etc.
10) Permit projects on private property where grading permits are not required, such as small retaining walls, single-family homes, small tenant improvements, etc.

City of Carlsbad
Planning Department

PLANNED INDUSTRIAL PERMIT

July 10, 2008

Robert Haskins
KSL Wright Place Office, LLC
5790 Fleet Street, Ste. 300
Carlsbad, CA 92008

SUBJECT: PIP 08-01 - KISCO HOME OFFICE

The City has completed a review of the application for a Planned Industrial Permit for development proposed on Lot 12 of the Carlsbad Airport Centre Specific Plan (SP 181F). The site is addressed as 1901 Wright Place (APN 212-091-13) and is located on the corner of Palomar Airport Road, Palomar Oaks Way, and Wright Place. The proposed project entails a 22,500 square foot, two-story corporate office/industrial building with 90 surface parking spaces, site landscaping, and all of the necessary improvements to provide utilities for the site. Vehicular access is proposed off of Wright Place, along the northern boundary of the lot.

It is the Assistant Planning Director's determination that the project **IS** consistent with the City's Planned Industrial Zone regulations (Chapter 21.34), the Carlsbad Airport Centre Specific Plan (SP 181F), and with all other applicable City ordinances and policies. The Planning Director, therefore, **APPROVES** this request based on the following:

Findings:

1. That the site indicated by the Planned Industrial Permit **PIP 08-01** is adequate in size and shape to accommodate the proposed use, and all yards, spaces, walls, fences, parking, loading, landscaping and other features required by SP 181(F) and Chapter 21.34 in that **the proposed two-story corporate office/industrial building, surface parking, landscaping, employee eating areas, and all other associated improvements fit within the developable footprint of the lot and all applicable development standards are met**.

2. That the improvements indicated on the Planned Industrial Permit **PIP 08-01** are located in such a manner to be related to existing and proposed streets and highways in that **the proposed building's access is provided off of Wright Place, which was previously-approved by the Carlsbad Airport Centre Specific Plan (SP 181F), in accordance with City Engineering standards.**

3. That the improvements as shown on the Planned Industrial Permit **PIP 08-01** are consistent with the intent and purpose of the Planned Industrial zone and SP 181(F) and all adopted development, design and performance standards as set forth in Chapter 21.34 and SP 181(F) in that **the proposed two-story office building conforms to the building height, setbacks, parking, lot coverage, employee eating areas, and design criteria of the P-M zone (Carlsbad Municipal Code, Chapter 21.34) and all applicable development standards in the Carlsbad Airport Centre Specific Plan (SP 181F) and the Zoning Ordinance.**

CEQA Finding

4. That the Planning Director has determined that the project belongs to a class of projects that the State Secretary for Resources has found do not have a significant impact on the environment, and it is therefore categorically exempt from the requirement for the preparation of environmental documents pursuant to Section **15332, Class 32 – In-Fill Development Projects**, of the state

CEQA Guidelines. In making this determination, the Planning Director has found that the exceptions listed in Section 15300.2 of the state CEQA Guidelines do not apply to this project.

General Plan Conformance Finding

5. That the **Planning Director** finds that the project, as conditioned herein, is in conformance with the Elements of the City's General Plan, in that **the project consists of a two-story corporate office/industrial building which is consistent with the Carlsbad Airport Centre Specific Plan (SP 181F) which implements the intent and purpose of the Planned Industrial (P-I) General Plan Land Use Designation.**

6. That the project is consistent with the City-Wide Facilities and Improvements Plan, the Local Facilities Management Plan for Zone **5** and all City public facility policies and ordinances. The project includes elements or has been conditioned to construct or provide funding to ensure that all facilities and improvements regarding: sewer collection and treatment; water; drainage; circulation; fire; schools; parks and other recreational facilities; libraries; government administrative facilities; and open space, related to the project will be installed to serve new development prior to or concurrent with need. Specifically,

   a. The project has been conditioned to provide proof from the **Carlsbad Unified** School District that the project has satisfied its obligation for school facilities;

   b. The Public Facility fee is required to be paid by Council Policy No. 17 and will be collected prior to the issuance of building permit;

   c. The Local Facilities Management fee for Zone **5** is required by Carlsbad Municipal Code Section 21.90.050 and will be collected prior to issuance of building permit; and

   d. **A growth management park fee of 40 cents per square foot of non-residential development will be collected at the time of building permit issuance. This fee will be used to construct recreational facilities to offset the demand created by employees within Local Facilities Management Zone 5.**

7. That the project is consistent with the Airport Land Use Comprehensive Plan (ALUCP) for the McClellan-Palomar Airport, dated April 1994, in that as conditioned, the applicant shall record a notice concerning aircraft noise. The project is compatible with the projected noise levels of the ALUCP; and, based on the noise/land use compatibility matrix of the ALUCP, the proposed land use is compatible with the airport, **in that the project is not located within any noise contours greater than 65 CNEL as created by airport operations.**

Landscape Manual Compliance

8. That the project is consistent with the City's Landscape Manual (Carlsbad Municipal Code Section 14.I28.020 and Landscape Manual Section 1B) **as well as the Carlsbad Airport Centre Specific Plan (SP 181F) landscape guidelines and requirements.**

9. That the Assistant Planning Director has reviewed each of the exactions imposed on the Developer contained in this letter, and hereby finds, in this case, that the exactions are imposed to mitigate impacts caused by or reasonably related to the project, and the extent and the degree of the exaction is in rough proportionality to the impact caused by the project.

Conditions:

Note: Unless otherwise specified herein, all conditions shall be satisfied prior to issuance of a grading permit or building permit, whichever occurs first.

1. Approval is granted for **PIP 08-01** as shown on Exhibits **"A – U"**, dated **July 10, 2008**, on file in the Planning Department and incorporated herein by reference. Development shall occur substantially as shown unless otherwise noted in these conditions.

2. All uses established in this structure shall be consistent with Section III of SP 181F (Permitted Uses).

3. If any of the following conditions fail to occur; or if they are, by their terms, to be implemented and maintained over time, if any of such conditions fail to be so implemented and maintained according to their terms, the City shall have the right to revoke or modify all approvals herein granted; record a notice of violation on the property title; deny or further condition issuance of all future building permits; deny, revoke or further condition all certificates of occupancy issued under the authority of approvals herein granted; record a notice of violation on the property title; institute and prosecute litigation to compel their compliance with said conditions or seek damages for their violation. No vested rights are gained by Developer or a successor in interest by the City's approval of this **Planned Industrial Permit (PIP 08-01)**.

4. Staff is authorized and directed to make, or require the Developer to make, all corrections and modifications to the **Planned Industrial Permit (PIP 08-01)** documents, as necessary to make them internally consistent and in conformity with the final action on the project. Development shall occur substantially as shown on the approved Exhibits. Any proposed development different from this approval, shall require an amendment to this approval.

5. Developer shall comply with all applicable provisions of federal, state, and local laws and regulations in effect at the time of building permit issuance.

6. If any conditions for construction of any public improvements or facilities, or the payment of any fees in-lieu thereof, imposed by this approval or imposed by law on this Project are challenged, this approval shall be suspended as provided in Government Code Section 66020. If any such condition is determined to be invalid this approval shall be invalid unless the City Council determines that the project without the condition complies with all requirements of law.

7. Developer/Operator shall and does hereby agree to indemnify, protect, defend and hold harmless the City of Carlsbad, its Council members, officers, employees, agents, and representatives, from and against any and all liabilities, losses, damages, demands, claims and costs, including court costs and attorney's fees incurred by the City arising, directly or indirectly, from (a) City's approval and issuance of this **Planned Industrial Permit,** (b) City's approval or issuance of any permit or action, whether discretionary or non-discretionary, in connection with the use contemplated herein, and (c) Developer/Operator's installation and operation of the facility permitted hereby, including without limitation, any and all liabilities arising from the emission by the facility of electromagnetic fields or other energy waves or emissions. This obligation survives until all legal proceedings have been concluded and continues even if the City's approval is not validated.

8. Developer shall submit to **Planning Department** a reproducible 24" x 36," mylar copy of the **Site Plan** reflecting the conditions approved by the final decision making body.

9. Prior to the issuance of a building permit, the Developer shall provide proof to the Director from the **Carlsbad Unified** School District that this project has satisfied its obligation to provide school facilities.

10. This project shall comply with all conditions and mitigation measures which are required as part of the Zone **5** Local Facilities Management Plan and any amendments made to that Plan prior to the issuance of building permits, including, but not limited to the following:

    a. **A growth management park fee of 40 cents per square foot of non-residential development will be collected at the time of building permit issuance. This fee will be used to construct recreational facilities to offset the demand created by employees within Local Facilities Management Zone 5.**

11. This approval shall become null and void if building permits are not issued for this project within 24 months from the date of project approval.

12. Building permits will not be issued for this project unless the local agency providing water and sewer services to the project provides written certification to the City that adequate water service and sewer facilities, respectively, are available to the project at the time of the application for the building permit, and that water and sewer capacity and facilities will continue to be available until the time of occupancy.

13. Developer shall pay the citywide Public Facilities Fee imposed by City Council Policy #17, the License Tax on new construction imposed by Carlsbad Municipal Code Section 5.09.030, and CFD #1 special tax (if applicable), subject to any credits authorized by Carlsbad Municipal Code Section 5.09.040. Developer shall also pay any applicable Local Facilities Management Plan fee for Zone **5,** pursuant to Chapter 21.90. All such taxes/fees shall be paid at issuance of building permit. If the taxes/fees are not paid, this approval will not be consistent with the General Plan and shall become void.

Landscape Plan Conditions

14. Developer shall submit and obtain Planning Director approval of a Final Landscape and Irrigation Plan showing conformance with the approved Preliminary Landscape Plan and the City's Landscape Manual. Developer shall construct and install all landscaping as shown on the approved Final Plans, and maintain all landscaping in a healthy and thriving condition, free from weeds, trash, and debris.

15. The first submittal of Final Landscape and Irrigation Plans shall be pursuant to the landscape plan check process on file in the Planning Department and accompanied by the project's building, improvement, and grading plans.

16. Prior to the issuance of the **grading permit**, Developer shall submit to the City a Notice of Restriction executed by the owner of the real property to be developed. Said notice is to be filed in the office of the County Recorder, subject to the satisfaction of the Planning Director, notifying all interested parties and successors in interest that the City of Carlsbad has issued a **Planned Industrial Permit** on the property. Said Notice of Restriction shall note the property description, location of the file containing complete project details and all conditions of approval as well as any conditions or restrictions specified for inclusion in the Notice of Restriction. The Planning Director has the authority to execute and record an amendment to the notice which modifies or terminates said notice upon a showing of good cause by the Developer or successor in interest.

Trash receptacle Conditions

17. Developer shall construct trash receptacle and recycling areas enclosed by a six-foot high masonry wall with gates pursuant to City Engineering Standards and Carlsbad Municipal Code Chapter 21.105. Location of said receptacles shall be approved by the Planning Director. Enclosure shall be of similar colors and/or materials to the project to the satisfaction of the Planning Director.

Outdoor Storage of materials prohibited

18. No outdoor storage of materials shall occur onsite unless required by the Fire Chief. When so required, the Developer shall submit and obtain approval of the Fire Chief and the Planning Director of an Outdoor Storage Plan, and thereafter comply with the approved plan.

19. Developer shall submit and obtain Planning Director approval of an exterior lighting plan including parking areas. All lighting shall be designed to reflect downward and avoid any impacts on adjacent property.

20. All roof appurtenances, including air conditioners, shall be architecturally integrated and concealed from view and the sound buffered from adjacent properties and streets, in substance as provided in Building Department Policy No. 80-6, to the satisfaction of the Directors of Community Development and Planning.

21. The Developer shall construct, install, and stripe not less than **90** parking spaces, as depicted on Exhibits **"A - U."**

22. **The location and size of all employee eating areas, surface parking, and landscaped areas within the project as shown on Exhibits "A – U" shall not be altered, reduced, fenced, or divided so as to preclude the equal use by all employees of the office building.**

23. Prior to the issuance of building or grading permits, whichever occurs first, the Developer shall prepare and record a Notice that this property may be subject to noise impacts from the Palomar Airport Road Transportation Corridor,, in a form meeting the approval of the Planning Director and the City Attorney (see Noise Form #1 on file in the Planning Department).

24. **Pursuant to the Carlsbad Airport Centre Specific Plan (SP 181F), any signs proposed for this development shall be designed to comply with the City's Sign Ordinance, CMC Chapter 21.41, and shall require review and approval of the Planning Director prior to installation of any such signs.**

25. Prior to the issuance of building or grading permits, whichever occurs first, the Developer shall prepare and record a Notice that this property is subject to overflight, sight and sound of aircraft operating from McClellan-Palomar Airport, in a form meeting the approval of the Planning Director and the City Attorney (see Noise Form #2 on file in the Planning Department).

26. **Prior to issuance of building permits, a revised acoustical analysis shall be submitted to demonstrate how the proposed building will meet the City's interior noise standard of 55 dBA CNEL.**

27. **The proposed sound wall defining the western perimeter of the employee eating area shall be designed to meet the minimum specifications as recommended in the acoustical analysis. In addition, the height of the combination sound/retaining wall shall not exceed six (6) feet.**

28. **All retaining walls shall utilize a decorative material consistent with the architectural materials of the main building and shall incorporate a decorative architectural cap, to the satisfaction of the Planning Director.**

29. **All development, including retaining walls, shall be located outside of the drip line (i.e. exterior edge of canopy) of all existing, mature oak trees on the site.**

Removed trees to be replaced at 2:1 ratio

30. **A total of two (2) sapling oak trees (identified as an "oak bush" with 3-inch caliper on landscape plan) are approved to be removed. Said trees shall be replaced at a minimum 2:1 ratio with 36-inch box size oak trees (Quercus Agrifolia). Said trees proposed to be removed shall be clearly noted on all final grading and landscape plans, to the satisfaction of the Planning Director.**

Engineering:

General

31. Prior to hauling dirt or construction materials to or from any proposed construction site within this project, the Developer shall apply for and obtain approval from, the City Engineer for the proposed haul route.

32. The Developer shall install sight distance corridors at all street intersections and driveways in accordance with City Engineering Standards.

Fees/Agreements

33. The Developer shall cause property owner to execute and submit to the City Engineer for recordation the City's standard form Drainage Hold Harmless Agreement.

34. Prior to approval of any grading or building permits for this project, the Developer shall cause Owner to give written consent to the City Engineer for the annexation of the area shown within the boundaries of the site plan into the existing City of Carlsbad Street Lighting and Landscaping District No. 1 and/or to the formation or annexation into an additional Street Lighting and Landscaping District. Said written consent shall be on a form provided by the City Engineer.

Grading

35. Based upon a review of the proposed grading and the grading quantities shown on the site plan, a grading permit for this project is required. Developer shall apply for and obtain a grading permit from the City Engineer prior to issuance of a building permit.

Storm water BMP Compliance Condition

36. The Developer shall comply with the City's requirements of the National Pollutant Discharge Elimination System (NPDES) permit and the City's current Standard Urban Storm Water Mitigation Plan (SUSMP). Developer shall provide improvements constructed pursuant to best management practices as referenced in the "California Storm Water Best Management Practices Handbook" to reduce surface pollutants to an acceptable level prior to discharge to sensitive areas. Plans for such improvements shall be submitted to and subject to the approval of the City Engineer. Said plans shall include but not be limited to notifying prospective owners and tenants of the following:

A. All owners and tenants shall coordinate efforts to establish or work with established disposal programs to remove and properly dispose of toxic and hazardous waste products.

B. Toxic chemicals or hydrocarbon compounds such as gasoline, motor oil, antifreeze, solvents, paints, paint thinners, wood preservatives, and other such fluids shall not be discharged into any street, public or private, or into storm drain or storm water conveyance systems. Use and disposal of pesticides, fungicides, herbicides, insecticides, fertilizers and other such chemical treatments shall meet Federal, State, County and City requirements as prescribed in their respective containers.

C. Best Management Practices shall be used to eliminate or reduce surface pollutants when planning any changes to the landscaping and surface improvements.

Project Threat Assessment condition

37. **With the application for grading plan check, the Developer shall complete and submit to the City Engineer a Project Threat Assessment Form (PTAF) pursuant to City Engineering Standards. Concurrent with the PTAF, Developer shall also submit the appropriate Tier level Storm Water Compliance form and Tier level Storm Water Pollution Prevention Plan (SWPPP) as determined by the completed PTAF, all to the satisfaction of the City Engineer.**

Priority project required to submit storm water management plan (SWMP)

38. **Prior to the issuance of grading permit or building permit, whichever occurs first, Developer shall submit for City approval a "Storm Water Management Plan (SWMP)." The SWMP shall demonstrate compliance with the City of Carlsbad Standard Urban Stormwater Mitigation Plan (SUSMP), Order R9-2007-0001 issued by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Municipal Code, all to the satisfaction of the City Engineer. The SWMP shall address measures to avoid contact or filter said pollutants from storm water, to the maximum extent practicable, for the post-construction stage of the project.**

LID Condition

39. **The Developer shall incorporate Low Impact Development (LID) standards into the design of this project per City Standard Urban Storm Water Mitigation Plan (SUSMP), latest version, including applicable Regional Water Quality Control Board Orders, all to the satisfaction of the City Engineer.**

Permanent BMP maintenance condition

40. The Developer shall cause property owner to process, execute and submit an executed copy to the City Engineer for recordation a City standard Permanent Stormwater Quality Best

Management Practice Maintenance Agreement for the perpetual maintenance of all treatment control, applicable site design and source control, post-construction permanent Best Management Practices prior to the issuance of a grading permit or building permit, whichever occurs first for this Project.

Dedications/Improvements

41. The Developer shall cause Owner to dedicate to the City and/or other appropriate entities for the **waterline easement** shown on the site plan. The offer shall be made by a separate recorded document. All land so offered shall be free and clear of all liens and encumbrances and without cost to the City. Streets that are already public are not required to be rededicated.

42. Additional drainage easements may be required. The Developer shall dedicate and provide or install drainage structures, as may be required by the City Engineer, prior to or concurrent with any grading or building permit.

43. **Owner shall execute and record a Grant of Easement across the southeasterly corner of the subject property for private storm drain purposes, as shown in the site plan, for the benefit of the property easterly of the project site, all to the satisfaction of the City Engineer.**

44. The Developer shall provide the design of the drainage system to the satisfaction of the City Engineer. The private drainage system shall be inspected by the City. The Developer shall pay the standard improvement plan check and inspection fees.

45. The Developer shall execute a City standard Development Improvement Agreement to install and secure with appropriate security as provided by law, public improvements shown on the site plan. Said improvements shall be installed to City Standards to the satisfaction of the City Engineer. More specifically, these improvements include:

Water main, fire hydrants and appurtenances

Improvements listed above shall be constructed within 18 months of approval of the subdivision or development improvement agreement or such other time as provided in said agreement.

46. Prior to issuance of building permits, the Developer shall install or secure with appropriate security as provided by law street lights along all public and private street frontages abutting and/or within the project site in conformance with City of Carlsbad Standards.

47. Prior to issuance of building permits, the Developer shall install or secure with appropriate security as provided by law, sidewalks along all public streets abutting the project site in conformance with City of Carlsbad Standards.

48. Prior to the issuance of building permits, the Developer shall install or secure with appropriate security as provided by law wheelchair ramps at the public street corners abutting the project site in conformance with City of Carlsbad Standards.

Utilities

49. Prior to approval of improvement plans or final map, the Developer shall meet with the Fire Marshal to determine if fire protection measures (fire flows, fire hydrant locations, building sprinklers) are required to serve the project. Fire hydrants, if proposed, shall be considered public improvements and shall be served by public water mains to the satisfaction of the District Engineer.

50. The Developer shall design and construct public facilities within public right-of-way or within minimum 20-foot wide easements granted to the District or the City of Carlsbad. At the discretion of the District Engineer, wider easements may be required for adequate maintenance, access and/or joint utility purposes.

51. Prior to the issuance of building permits, the Developer shall pay all fees, deposits, and charges for connection to public facilities.

52. The Developer shall design landscape and irrigation plans utilizing recycled water as a source and prepare and submit a colored recycled water use map to the Planning Department for processing and approval by the District Engineer.

53. The Developer shall install potable water and/or recycled water services and meters at locations approved by the District Engineer. The locations of said services shall be reflected on public improvement plans.

54. The Developer shall install sewer laterals and clean-outs at locations approved by the District Engineer. The locations of sewer laterals shall be reflected on public improvement plans.

55. The Developer shall design and construct public water, sewer, and recycled water facilities substantially as shown on the site plan to the satisfaction of the District Engineer.

Fire:

56. The alternative surface for the Fire Department turn-around shall be designed by an Engineer and shall be able to support a minimum axle weight of 75,000 pounds.

Code Reminders:

The project is subject to all applicable provisions of local ordinances, including but not limited to the following:

57. The Average Daily Trips (ADT) and floor area shown on the site plan are for planning purposes only. Developer shall pay traffic impact and sewer impact fees based on Section 18.42 and Section 13.10 of the City of Carlsbad Municipal Code, respectively.

58. Developer shall pay a landscape plan check and inspection fee as required by Section 20.08.050 of the Carlsbad Municipal Code.

59. Approval of this request shall not excuse compliance with all applicable sections of the Zoning Ordinance and all other applicable City ordinances in effect at time of building permit issuance, except as otherwise specifically provided herein.

60. The project shall comply with the latest nonresidential disabled access requirements pursuant to Title 24 of the California Building Code.

61. Premise identification (addresses) shall be provided consistent with Carlsbad Municipal Code Section 18.04.320.

NOTICE

Please take **NOTICE** that approval of your project includes the "imposition" of fees, dedications, reservations, or other exactions hereafter collectively referred to for convenience as "fees/exactions."

You have 90 days from date of final approval to protest imposition of these fees/exactions. If you protest them, you must follow the protest procedure set forth in Government Code Section 66020(a) and file the protest and any other required information with the City Manager for processing in accordance with

Carlsbad Municipal Code Section 3.32.030. Failure to timely follow that procedure will bar any subsequent legal action to attack, review, set aside, void, or annul their imposition.

You are hereby FURTHER NOTIFIED that your right to protest the specified fees/exactions DOES NOT APPLY to water and sewer connection fees and capacity charges, nor planning, zoning, grading, or other similar application processing or service fees in connection with this project; NOR DOES IT APPLY to any fees/exactions of which you have previously been given a NOTICE similar to this, or as to which the statute of limitations has previously otherwise expired.

If you have any questions, please contact Shannon Werneke at (760) 602-4621 or swern@ci.carlsbad.ca.us.

Sincerely,

GARY T. BARBERIO
Assistant Planning Director

1.0 INTRODUCTION

The purpose of this Storm Water Management Plan (SWMP) is to develop and implement practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from the project site and considers urban runoff flow rates and velocities. The SWMP intends to ensure the effectiveness of the Best Management Practices (BMP's) through proper maintenance, based on long-term operational and fiscal planning. The purpose of this SWMP is to address the possible water quality impacts from the proposed site improvements for this project and the best methods to mitigate them.

1.1 PROJECT DESCRIPTION

The 3.85 acre project site is located at 1901 Wright Place in the City of Carlsbad, California (See Vicinity Map). The site is currently a vacant and graded building pad. The proposed project includes the development of one commercial office building, site parking, and a graded pad area (See attached Site Map).

The current general plan designation is PI. The existing site zone for the project is PM

The project is planned to be developed in and include the construction of a 22,500 square foot building onsite parking areas. The stormwater treatment system planned for this project will consist of a network of bioswales, and the utilization of an sand infiltration basin which will function as a detention basin during large storm events.

An on-site stormdrain system will be constructed within the project in order to convey drainage from the subject site and will be designed as a comprehensive system that will direct low flows through bioswales and the sand filter basin. The larger flows will also be directed through the onsite stormdrain system to the detention basin..

The onsite system will be connected to an existing stormdrain system that crosses the site, at the northeast corner of the subject property. This stormdrain system connects to a public stormdrain located in Palomar Airport Road. There will not be any on site material storage and the trash enclosures have been covered according to current City of Carlsbad Standards.

1.2 HYDROLOGIC UNIT CONTRIBUTION

The subject project is located in the Carlsbad Hydrologic Unit, Encinas basin, and hydrologic unit (904.40). The project is a small portion of this larger watershed. Project improvements will require that approximately 2.69 acres of area will be graded in order to finish grade the existing building pad, driveways and parking. The drainage for this project will flow into a proposed on-site stormdrain system that will be connected to an existing on-site private stormdrain system.

This drainage will flow towards the south and confluence into a public stormdrain located within Palomar Airport Road. This combined drainage will travel approximately 4.0 miles, in a westerly direction, and ultimately empty into the Pacific Ocean near Ponto State Beach.

1.3 BENEFICIAL USE

The beneficial uses of Coastal Water(Pacific Ocean) for this hydrologic unit are included in Table 2-3 Beneficial Use of Coastal Waters

Table 2-3. BENEFICIAL USES OF COASTAL WATERS

Coastal Waters	Hydrologic Unit Basin Number	BENEFICIAL USE														
		IND	NAV	REC1	REC2	COMM	BIOL	EST	WILD	RARE	MAR	AQUA	MIGR	SPWN	WARM	SHELL

1 Includes the tidal prisms of the Otay and Sweetwater Rivers.

2 Fishing from shore or boat permitted, but other water contact recreational (REC-1) uses are prohibited.

● Existing Beneficial Use

2.0 CHARACTERIZATION OF PROJECT RUNOFF

Discharge from the project site outlet point, should have minimal influence on water quality in nearby coastal areas south of the Carlsbad state beach and waters further south.

The project area is located approximately 4 miles upstream from the Pacific Ocean. The development is planned so surface water generated from the site will be physically clarified through the use of selected BMP practices before it is directed to the public storm drain system.

2.1 POLLUTANTS OF CONCERN

The runoff generated from the project site during and after construction may consist of the following constituents, potential pollutants and conditions of concern:

Pollutants of concern from the Project Area Pollutants from the Project Area

General Pollutant Categories									
Project Categories	Sediments	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Commercial Development >1000,000 ft	P	P	P		x	P	x	P	p
Parking Lots	p	p	X		x	P	x		p

Legend: X = Anticipated, P = Potential

Receiving waters (Pacific Ocean) in the Hydrologic Area Basin Number 904.40 (As shown in table CWA 2006 are not affected by any pollutants.

There are no primary pollutants of concern. Secondary pollutants of concern are listed and described in section 2.2 thru 2.10.

2.2 CONDITIONS OF CONCERN

The project drainage study is supplied with this report in addition to the project precise grading plans. We have observed downstream conditions and found minimal potential for this project to contribute significantly to increased soil erosion, slope stability factors, vegetative stress and will not alter existing habitat in the nearby areas.

2.3 SEDIMENTS

Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

2.4 NUTRIENTS

Nutrients are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

2.6 TRASH & DEBRIS

Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Additionally, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

2.7 OXYGEN – DEMANDING SUBSTANCES

This category includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-demanding compounds.

The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

2.8 HEAVY METALS

Metals are raw material components in non-metal products such as fuels, adhesives, paints and other coatings. Primary source of metal pollution in stormwater are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Environmental concerns, regarding the potential for release of metals into the environment, have already led to restricted metal usage in certain applications.

2.9 BACTERIA AND VIRUSES

Bacteria and viruses are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. In addition, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

2.10 PESTICIDES

Pesticides (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

3.0 SOIL CHARACTERISTICS

The project area consists of Soil Group D.

3.1 MITIGATIVE MEASURES TO PROTECT WATER QUALITY

Best management practices (BMP's) will be implemented during construction(see project SWPPP) and post construction (permanent) phases in order to address water quality issues for the subject site.

3.2 CONSTRUCTION BMP'S

A detailed description of the construction BMP's will be developed and shown on the final Grading Plans and in the Project SWPPP.

3.3 SITE DESIGN

The site has been designed to maintain the predevelopment rainfall runoff characteristics as much as possible by incorporating the measures in order to reduce post construction storm water runoff discharges.

The site will incorporate a system of bioswales and an sand filter/detention basin as a treatment train approach in order to effectively treat the stormwater from the project site. Drainage from the buildings, impervious parking areas and all exposed impervious surfaces will first be directed into a network of bioswales as primary treatment and then to a secondary treatment facility which will be a sand filter/detention basin.

The basin will be designed to treat the low flow stormwater volumes which will be directed after treatment directly to the stomdrain system. This basin will also act as an onsite detention facility designed to detain the 100 year drainage flows from the site and release flows at current existing drainage flow rates

We have chosen the sand filter/detention basin as the treatment method for the project because of its treatment specifications which show that it will effectively treat the potential pollutants from the parking lot and the drainage directed from the separate building and landscape areas. With proper maintenance and attention to the filtering media the basin will work effectively to treat the stormwater from the site.

The maintenance and inspection requirement for this system can be easily incorporated into the scheduled maintenance and management of the developments landscaping and ground keeping work.

The planned grassy swale locations, infiltration basin/media filter, on-site stormdrain systems, and drainage patterns can be found and are shown on the project conceptual grading plans for this site which will accompany this report as part of the submittal documents.

This stormwater management plan has been prepared upon the current City of Carlsbad SUSMP. This SWMP will be part of the documents submitted for a planned industrial permit (PIP)submittal.

A brief description of the site design principles utilized for this project are described below:

Maintain Pre Development rainfall Runoff Characteristics

Minimize Impervious footprint:

1. The buildings are designed to maximum height to minimize the impervious footprint. Sidewalks are sloped towards landscaping where possible and are designed to minimum widths allowed by code. All additional secondary concrete

paths proposed within the landscaping areas will be sloped into the adjacent landscaping. A portion of the planned fire access driveway near building A portion of the fire access lane will be constructed using plantable "ritter rings" which will allow drainage in this area to pass through grassy vegetation before it is directed to the drainage outlet point.

2. Conserve natural areas and provide buffer zones natural water bodies and the project footprint:

   The project is planned to conserve the existing on-site landscaping and trees to the maximum extent possible. New landscaping is planned for the project development and is shown on the project conceptual landscaping plans. There are no know environmentally sensitive areas on the project site. This project maintains the existing runoff drainage patterns and will not discharge directly into natural drainage systems. Grassy swales are used to direct drainage into landscaping around the planned buildings and from the parking areas.

Minimize Directly Connected Impervious Areas:

3. In order to minimize directly connected impervious areas we have directed roof drainage and exposed parking garage drainage into downspouts which will discharge directly into bioswales that ring the planned building site. It is planned to collect and reuse this stormwater runoff as site irrigation water. The water reuse system will be shown and incorporated into the site landscaping plans. The design, layout and connection to the irrigation system will be performed by others.

   Separating the building roof areas, sidewalks, patio and landscaping from directly discharging onto the impervious parking areas allows better treatment of stromwater flows and minimizes stormwater contact with parking lot areas.

   Pervious pavements may be used for secondary sidewalks and access paths; However, the pervious pavement will have to be underlain by a pervious gravel or sand layers with drainage pipes and a protective liner since the underlying soils have a very high clay content and have a low permeability. In addition, the site requires extensive removal and recompaction of on-site alluvial soils. The recompacted soil will have almost no permeability once it is processed and placed according to geotechnical specifications.

Maximize canopy interception and water conversation Consistent with the Carlsbad Landscape Manual

4. Existing native oak trees, shrubs and onsite landscaping areas will be preserved to the maximum extent practicle. In addition, new landscaping has been placed in and around the buildings with trees and shrubs in order to maximize the canopy rainfall interception. A preliminary landscaping plan has been prepared which shows the planned project landscaping areas and types of plant species to be utilized. This landscaping plan will be submitted with the project conceptual grading plans and other project documents. This plan will be developed based upon the City of Carlsbad standard list of approved planting species. The

landscaping will consist of ornamental plantings and ground covers including turfed areas to provide bio-filtration of storm and non-storm runoff. The goal is to achieve plant establishment expeditiously to reduce erosion. A water efficient irrigation system for these landscape areas will be installed and monitored to reduce over-irrigation and minimize erosion and over watering.

Protect slopes and Channels:

5. Runoff will be directed away from the top of any slopes. Runoff has been conveyed safely from the top of slopes by utilizing brow ditches as shown on the project grading plans
6. Slopes that will be generated as part of this project would be vegetated with native or drought tolerant vegetation as required. All proposed slopes will be vegetated with native or drought tolerant vegetation where practicable consistent with the current City of Carlsbad landscape manual other City requirements
7. No permanent channel crossings are proposed.
8. No energy dissipaters are planned for this project.

3.4 SOURCE CONTROL BMP'S

Design Outdoor Material Storage Areas to Reduce Pollution Introduction:

9. No Outside material storage is planned for the project. The project is designed for commercial office use and will not have fueling islands, wash racks or hazardous material storage on-site.

Design Trash Storage Areas to Reduce Pollution:

10. The enclosure will be paved and designed to not allow run-on from adjoining areas. It will be walled and constructed with roof or awning to minimize direct precipitation from falling on the area for Phase 1. Phase 2 will require that the trash enclosure be relocated amd incorporated into the parking garage. It will be covered and designed as required to minimize stormwater contact.

Use Efficient Irrigation Systems & Landscape Design

11. Rain shutoff devices to prevent over irrigation will be employed to minimize watering during precipitation events. consistent with the current City of Carlsbad Landscape Manual.

12. . A water efficient irrigation system for these landscape areas will be installed and monitored to reduce over-irrigation and minimize erosion and over watering, A landscape plan must be prepared by a licensed landscape architect and incorporate irrigations systems to each landscape area's specific water requirements consistent with the current City of Carlsbad Landscape Manual.The use of flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines will be incorporated into the landscaping design. The landscape plans shall also address herbicide and pesticide management for the project.

Provide Storm water conveyance System Stenciling and Signage:

13. Provide concrete stamping, percelien tile, inset permanaent marking or equivalent as approved by the City of Carlsbad. of all storm water conveyance system inlets and catch basins within the project are with prohibitive language("No Dumping – I live Downstream, satifactroy to the City engineer
14. No public access near channels or creeks is proposed within the project area.

BMP's Applicable to Individual Priority Project Categories

15. No private roads are planned for this project
16. The new driveway planned for the project site will be paved. Drainage from this driveway will be directed to the proposed bioswales and other stromwater treatment devices.
17. No permanent temporary or guest parking is proposed for the site. Phase one parking will be directed to bioswales.
18. No loading docks are planned for the sites.
19. No maintenance bays are planned for the sites
20. No maintenance bays are planned for the sites
21. No Vehicle & equipment Wash areas are planned for the site.
22. No outdoor processing is planned for the site.
23. No outdoor processing is planned for the site
24. No equipment repair is planned for the site
25. Landscaping has been incorporated into the drainage design
26. No overflow parking is planned for the project sites.
27. No retail fueling is planned for the project sites.
28. No retail fueling is planned for the project sites.
29. Any portion of the project site that disturbs any steep hillsides shall be landscaped with deep rooted, drought tolerant plant species selected for erosion control, in accordance with the current landscape technical manual.

Employ Integrated Pest Management Principles:

30. Pesticide reduction will be accomplished by planting pest resistant or well adapted plant varieties, native plants and incorporating a comprehensive landscaping design and plan. A landscape management plan, developed by the landscape architect, will be incorporated into the project. The elements of the plan should consist of public awareness signs, and management of herbicide/pesticide usage.

31. IPM educational materials will be distributed to current owners. We have provided a sample of the handout "Stormwater Pollution Prevention Yard Work (Landscaping, Gardening, Pest) Control" with this report.

Other Controls

An educational component, of source control, directed towards future building owners, and tenants will be and supplied with a set of brochures developed by the County's Environmental Health Department that will be distributed to all building owners and tenants. A copy of the County handouts and CASQUA Fact sheets are supplied in Section 15.

These brochures and handouts will include the following:

1. Stormwater Runoff Pollution Fact Sheet;
2. Stormwater Runoff Pollution Prevention Tips for property owners and tenants;
3. Stormwater Pollution Prevention Yard Work (Landscaping, Gardening, Pest Control);

3.5 TREATMENT CONTROL BMP'S

Treatment Control BMP's include, but are not limited to the following:

1. Bioswales
2. Sand filter/Detention Basin

The treatment control system is designed to meet flow based sizing standards outlined in the latest City of Carlsbad Storm Water Management Manual. Calculations for the proposed structural treatment controls are provided within this report. Operations and Maintenance procedures are also provided within this report.

BIOSWALE

The bioswale swale best management practice (BMP) functions as a soil and plant-based filtration devise that removes pollutants through a variety of physical, biological, and chemical treatment processes. These facilities normally consist of a grass buffer strip, organic layer or mulch layer, water passing over or through the grass buffer strip is subsequently distributed evenly along and within the grass strip. Exfiltration of the stormwater in the grassy swale area is usually through the planting soil into the underlying soils and occurs over a period of days. The bioswale is an effective way to minimize siltation and sediment transport within the stormwater before the water is directed into the primary stormwater treatment system.

Bioswales requires frequent landscaping maintenance, including measures to ensure that the area is functioning properly, as well as maintenance of the landscaping on the practice. In many cases, grassy swale areas initially require intense maintenance, but less maintenance is needed over time. In many cases, maintenance tasks can be completed by a landscaping contractor, who may already be hired at the site. In cold climates the soil may freeze, preventing runoff from infiltrating into the planting soil.

Sand Filter/Detention Basin

We have chosen the sand filter/ detention basin as the primary stromwater treatment control system for this project because of its treatment specifications which show that it will effectively treat the potential pollutants from the parking lot and the drainage directed from the separate building and landscape areas. The stormwater will undergo pretreatment to remove physical and chemical contaminants prior to being directed to the sand filter via the onsite bioswales and the utilization of a settling basin. The basin will be lined with a water proof fabric in order to avoid infiltrating the high clay content subsurface soils. The treatment layer will be designed based upon 0.2 inch of rainfall per hour for each hour of a storm event flow based design method. The basin will be lined with grass to minimize erosion and sedimentation clogging of the filter medium.

Notes

(1) Periodic performance assessment and updating of the guidance provided by this table may be necessary.

(2) Includes grass swales, grass strips, wetland vegetation swales, and bioretention.

(3) Includes extended/dry detention basins with grass lining and extended/dry detention basins with impervious lining. Effectiveness based upon minimum 36-48-hour drawdown time.

(4) Includes infiltration basins, infiltration trenches, and porous pavements.

(5) Includes permanent pool wet ponds and constructed wetlands.

(6) Includes sand filters and media filters.

(7) Also known as hydrodynamic devices, baffle boxes, swirl concentrators, or cyclone separators.

(8) Includes proprietary stormwater treatment devices as listed in the CASQA Stormwater Best Management Practices Handbooks, other stormwater treatment BMPs not specifically listed in this WQMP, or newly developed/emerging stormwater treatment technologies.

(9) Project proponents should base BMP designs on the Riverside County Stormwater Quality Best Management Practice Design Handbook. However, project proponents may also wish to reference the California Stormwater BMP Handbook for New Development and Redevelopment (www.cabmphandbooks.com). The Handbook contains additional information on BMP operation and maintenance.

(10) Note: Projects that will utilize infiltration-based Treatment Control BMPs (e.g., Infiltration Basins, Infiltration Trenches, Porous Pavement) must include a copy of the property/project soils report as Appendix E to the project-specific WQMP. The report must at a Treatment Control BMP (or BMPs) for the project must specifically consider the effectiveness of the Treatment Control BMP for pollutants identified as causing an impairment of Receiving Waters to which the project will discharge. 3.7 OPERATION MAINTANCE PROCEDURES AND MAINTENANCE SCHEDULE TREATMENT CONTROL BMP'S – BIOSWALES, SAND FILTER BASIN

BIOSWALES

Regular Inspections

Inspection soil and repair eroded areas. Inspect for erosion or damage to vegetation, preferably at the end of the wet season to schedule summer maintenance and before major fall runoff to be sure the strips are ready for winter. However, additional inspection after periods of heavy runoff is desirable. Inspect to ensure grass is well established. If not, either prepare soil and reseed or replace with alternative species. Install erosion control blanket. Check for debris and litter, and areas of sediment accumulation. Inspect health of trees and shrubs.

Maintenance

Water plants regularly. Remove litter and debris bi weekly. Remove sediment after rain events. Remulch void areas as required. Treat and replace diseased areas. Mow turf areas as required to maintain proper grass length. Repair erosion at inflow points. Repair outflow points. Repair outflow structures. Unclog underdrains if required. Regulate soil pH to maintain the correct plant growth. Remove and replace dead and diseased vegetation. Mulch should be replaced every 2 to 3 years or when bare spots appear. Remulch prior to the wet season. Maintain a bi weekly maintenance schedule, incorporated into ongoing landscape maintenance procedures to ensure proper condition of grassy swale is always maintained.

SAND FILTER/DETENTION BASIN

Regular Inspections

Inspection soil and repair eroded areas. Inspect for erosion or damage to vegetation, preferably at the end of the wet season to schedule summer maintenance and before major fall runoff to be sure the strips are ready for winter. However, additional inspection after periods of heavy runoff is desirable. Inspect to ensure grass is well established. If not, either prepare soil and reseed or replace with alternative species. Install erosion control blanket. Check for debris and litter, and areas of sediment accumulation. Inspect health of trees and shrubs.

Inspections and maintenance to ensure that water infiltrates into the subsurface completely (We recommend a 48 hour draw down time) and that vegetation is carefully managed to prevent creating mosquito and other vector habitats.

Observe drain time for the design storm after completion or modification to the facility to confirm that the desired drain time has been obtained

Schedule semiannual inspections for beginning and the end of the wet season to identify potential problems such as erosion of the basin side slopes and invert, standing water, trash and debris and sediment accumulation.

Remove accumulated trash and debris in the basin at the strat and end of the wet season

Inspect for standing water at the end of the wet season

Trim vegetation at the beginning and the end of the wet season to prevent establishment of woody vegetation and for asthetic and vector control reasons

Remove accumulated sediment and regrade when the accumulated sediment volume exceeds 10 % of the basin volume

If erosion is occurring within the basin, revegetate immediately and stabilize with and erosion control much or mat until vegetation cover is established

Maintenance

Water plants regularly. Remove litter and debris bi weekly. Remove sediment after rain events. Remulch void areas as required. Treat and replace diseased areas. Mow turf areas as required to maintain proper grass length. Repair erosion at inflow points. Repair outflow points. Repair outflow structures. Unclog underdrains if required. Regulate soil pH to maintain the correct plant growth. Remove and replace dead and diseased vegetation. Mulch should be replaced every 2 to 3 years or when bare spots appear. Remulch prior to the wet season. Maintain a bi weekly maintenance schedule, incorporated into ongoing landscape maintenance procedures to ensure proper condition of grassy swale is always maintained.

SWMP TREATMENT CONTROL MAINTENANCE SCHEDULE - TABLE B

TREATMENT CONTROL BMP DESCRIPTION	OPERATION AND MAINTENANCE SCHEDULE FOR TREATMENT CONTROL BMP'S				
	O&M RESPONSIBLE PARTY DESIGNEE: PROPERTY OWNER/CC & R'S				
	INSPECTION FREQUENCY	MAINTENANCE FREQUENCY	MAINTENANCE METHOD	SERVICE FREQUENCY	SERVICE METHOD
SAND FILTER	WEEKLY	AS REQUIRED	INSPECTION/TRASH REMOVAL	YEARLY	REPLACE MEDIA IF NECESSARY

3.8 MAINTENANCE COSTS

Bioswales

The estimated annual costs to inspect, maintain, monitor the bioswales approximately $1,000 per year.

Sand Filter Basin

The estimated annual costs to inspect, maintain, monitor, clean the sand filter basin is approximately $2,000 per year.

4.0 MAINTENANCE RESPONSIBILTY

The perpetual maintenance upkeep and monitoring of the proposed BMP will be the responsibility of the property owners and tenants and will be outlined in a permanent Stormwater Quality Best Management Practice Maintenance Agreement(See Section 16.0).

5.O EDUCATION AND OUTREACH

Potential BMP's that could be used by any one performing daily activities on the site that could impact run-off will be provided by the property owners on an as needed basis to thereby reduce pollutant releases to the environment. The property owners will provide information to increase the knowledge of building owners regarding impacts of urban runoff on receiving waters, on-site BMP's incorporated into the project for the planned commercial land use and how to mitigate and minimize these impacts on local receiving waters. County of San Diego brochures and handouts are made part of this report and can be found in Section 13.

The property owners will be notified of their responsibilities pertaining to the BMP's set-forth in Sections 67.807 and 67.808 of the County of San Diego Watershed Protection Stormwater Management, and Discharge Control Ordinance, Ordinance No. 9424 N.S.

Additionally building owners will be advised, by the property owner, of the reporting of illicit discharge responsibilities and provided with the reporting hotlines: (888) 846-0800 and (888) 844-6525.

6.0 FISCAL RESOURCES

Construction, installation and maintenance of the post- development BMP's will be the responsibility of the project developer under a BMP Maintenance Agreement with the City of Carlsbad. The permanent responsibility of the post--development BMP's will be outlined in the final covenants, conditions and restrictions (CC&R's) for the development. Individual property owners and tenants will be responsible for their respective properties. The responsibility to perform landscape maintenance to permanently stabilize graded areas will lie with the same entities.

Most of the post--construction BMP's accrue minimal maintenance costs. Mulching, slope seeding and plantings are maintained as part of continuing landscape maintenance through the project owners and tenants. Landscape Maintenance to permanently stabilize graded areas will be the responsibility of the individual property owners.

7.0 CONCLUSIONS

This SWMP has been prepared to define potential Best Management Practices (BMP's) that satisfy the requirements identified in the following documents:

1. Standard Specifications for Public Works Construction.
2. City of Carlsbad Stormwater Standards Manual for Construction & Permanent Storm Water Best Management Practices Requirements April, 2003.
3. NPDES General Permit for Storm Water Discharges Associated with Construction Activity issued by the State Water Resources Control Board.
4. San Diego Regional Water Quality Control Board Municipal Storm Water Permit (Order Number 2001-01).
5. County of San Diego Low Impact Development Handbook, July 20th, 2007

It has been shown, within this report, that this project can meet the water quality objectives as required in the City of Carlsbad Public Works Department Standard Urban Stormwater Mitigation Plan Storm Water Standards Dated April 2003.

REVISIONS TO CHAPTER 7 (GRADING, SITE DESIGN AND LOW IMPACT DEVELOPMENT STANDARDS)

OF

CITY OF CARLSBAD

GENERAL DESIGN STANDARDS

CHAPTER 7 - GRADING AND EROSION CONTROL STANDARDS

1. SOILS REPORTS

A preliminary soils report is required with the submittal of all grading plans. The City Engineer may waive the requirement for the preliminary report for grading projects which have cut or fill with a height of five feet or less or where it can be shown that the preliminary report is not needed to ensure the protection of the health, safety or welfare of the public. All soil reports shall be bound within sturdy covers and signed and sealed by a registered engineer competent in the field of soils engineering. The report shall be neat and logically ordered and include an index, the City project ID, name and location of the project, the name, address and telephone number of the firm which prepared the report and the date of the report. Each page of the report shall be numbered..

The preliminary soils report must be current and must reference the specific project proposed for development. Reports over one year old at time of grading plan submittal and/or reports which reference a different grading proposal must be made current by submittal of an amended report or by submittal of a signed and sealed letter from the soils engineer stating that the findings and conclusions of the previous report are current and valid for the present proposed project.

The preliminary soils report shall at a minimum include the following:

A. A written description of the proposed project or grading work to be done and a preliminary site plan;

B. A location map and geologic history of the site and surrounding region including a synopsis of the existing soils condition, description of the type and extent of the existing vegetation, description of the seismic setting and proximity of nearby faults, and presence of water on the site;

C. A description of the testing done onsite including number and location of the test holes, a map showing the location of the test sites, type and depth of the holes, depth of any found water table, evidence of seismic or landslide activity, reason for performing the test and explanation of the test results;

D. Soil profiles;

E. A description of the laboratory testing done on soil samples including a description of where the samples came from, reason for performing the test, test results and explanation of the test results;

F. Calculations, if any, needed to determine the stability of any slopes which exceed twenty feet in height or which are steeper than two horizontal to one vertical;

G. A summary of the conclusions and recommendations as to the suitability of the site for the proposed project, any building restrictions, any proposed mitigation measures, footing or building foundation recommendations, type and placement of any subsurface drains or any other recommendations as may be determined by the soils engineer;

H. A set of recommended specifications for the grading work to be done on the site.

2. SLOPES

A. No cut or fill slope shall be steeper than two horizontal to one vertical unless specifically approved by the City Engineer. The City Engineer may approve a slope steeper than two to one under the following conditions:

1) The cut or fill at a steeper slope will be stable and not create a hazard to public or private property;

2) The steeper slope is determined by the City Engineer to be necessary to reduce the overall environmental or aesthetic impacts of the grading project;

3) The overall project grading is consistent with the provisions of the Hillside Grading Ordinance;

4) A soils report prepared by a registered engineer qualified in the field of soils engineering is submitted which report shall provide calculations indicating that the proposed slope will have a factor of safety of 1.5 or better for both deep seated and surficial failures under saturated soil conditions.

B. Cut and fill slopes shall be set back from site boundaries in accordance with City of Carlsbad Standard Drawing GS-14.

C. Buildings shall be set back from cut or fill slopes in accordance with City of Carlsbad Standard Drawing GS-15, or as specifically approved by the City Engineer.

D. Terrace drains shall be installed on all manufactured slopes exceeding thirty feet in height. The City Engineer may waive this requirement for slopes with a longitudinal length of one hundred feet or less, or upon the recommendation of a registered soils engineer or geologist that such terrace drain is not necessary for stability or erosion protection. Terrace drains shall be designed to prevent deposition of sand and/or other soil materials within the concrete drain. The minimum longitudinal slope shall be two percent and maximum slope shall be twelve percent. Drainage terraces exceeding eight feet in width need only be paved for a width of eight feet, provided such pavement provides for a minimum channel depth of one foot. Down drains or drainage outlets shall be provided at approximately three hundred foot intervals along the drainage terrace. All such down drains or outlets shall be designed to safely convey the intercepted waters to the point of disposal.

3. SITE DRAINAGE

A. All drainage facilities shall be designed to carry surface waters to the nearest practical street, storm drain, or natural water course approved by the City Engineer. When discharging concentrated flows onto natural ground, the engineer-of-work shall provide appropriate calculations to determine the erosive effects at the point of discharge and immediately downstream from the discharge point. If erosive velocities will occur at the discharge point or immediately downstream, then an appropriately designed rip-rap field or other energy dissipating device shall be installed to mitigate the erosive effects.

B. Graded building pads shall have a minimum slope of one percent towards an adjoining street or an approved drainage course. A lessor slope may be approved by the City Engineer for sites graded in relatively flat terrain, or where special drainage provisions are made. In such cases, the City Engineer may require a supporting recommendation by a registered soils engineer.

C. Berms, swales or other methods and devices shall be provided at the top of cut and fill slopes to prevent surface waters from overflowing onto and damaging the slope face. Special drainage provisions shall be made where a building or structure exists within five feet of the top of a slope.

4. EROSION CONTROL

A. An erosion control plan shall be included as an integral part of all grading plans. The erosion control plan shall be designed to minimize the loss of soil materials from the project site to the maximum extent practicable. Onsite erosion control measures are required for all grading projects regardless of whether or not a proposed or existing sedimentation basin is located downstream from the project site. Engineers are encouraged to use the standard erosion control detail and note sheet available at minimal cost from the Engineering Counter. The erosion control sheet is also available in digital format.

B. All temporary onsite erosion control measures shall be designed to mitigate the erosion impacts of a two year 24-hour storm unless otherwise directed by the City Engineer.

C. Erosion control measures employed on a project site shall include but not be limited to the use of gravel bags, straw and other matting materials, hay bales, siltation fences, sedimentation basins, grassy swales, hydroseeding, straw mulching, check dams or any other measure as may be approved by the City Engineer.

D. For project sites with a graded area of one acre or more, the erosion control plan must also be made to comply with the General Construction Permit requirements of the Regional Water Quality Control Board.

E. All landscaping and irrigation shall be done in accordance with the latest version of the City Landscape Manual.

F. Permanent sedimentation basins shall be designed to capture soils with a particle size of 0.02 mm or greater during a ten year 24-hour storm. The City Engineer may allow the use of 0.074 mm particle size in areas where the discharge of finer soil materials will not adversely affect downstream habitats or land uses. Sedimentation basins shall be adequately designed to retain a minimum five years worth of sediment generated from the contributing hydrologic basin in its fully developed state.

G. Check dams or other erosion control measures shall be installed along all unprotected swales, roads or other drainage courses where the velocity of the drainage runoff exceeds the erosive velocity of the underlying soil material. In the absence of specific soil testing and soil transport calculations which may dictate another design, the distance between check dams shall be as follows:

Slope Gradient	Interval
0 - 4%	100 feet
4 - 10%	50 feet
Over 10%	25 feet

5. STANDARD NOTES

All Grading and Erosion Control Plans shall include the standard grading and erosion control notes and erosion control details as shown on City of Carlsbad Standard Drawing GS22 and GS23.

CHAPTER 7 - GRADING, SITE DRAINAGE AND LOW IMPACT DEVELOPMENT (LID) STANDARDS

1. SOILS REPORTS

A preliminary soils report is required with the submittal of all grading plans. The City Engineer may waive the requirement for the preliminary report for grading projects which have cut or fill with a height of five feet or less or where it can be shown that the preliminary report is not needed to ensure the protection of the health, safety or welfare of the public. All soil reports shall be bound within sturdy covers and signed and sealed by a registered engineer competent in the field of soils engineering. The report shall be neat and logically ordered and include an index, the City project ID, name and location of the project, the name, address and telephone number of the firm which prepared the report and the date of the report. Each page of the report shall be numbered.

The preliminary soils report must be current and must reference the specific project proposed for development. Reports over one year old at time of grading plan submittal and/or reports which reference a different grading proposal must be made current by submittal of an amended report or by submittal of a signed and sealed letter from the soils engineer stating that the findings and conclusions of the previous report are current and valid for the present proposed project.

The preliminary soils report shall at a minimum include the following:

A. A written description of the proposed project or grading work to be done and a preliminary site plan;

B. A location map and geologic history of the site and surrounding region including a synopsis of the existing soils condition, description of the type and extent of the existing vegetation, description of the seismic setting and proximity of nearby faults, and presence of water on the site;

C. A description of the testing done onsite including number and location of the test holes, a map showing the location of the test sites, type and depth of the holes, depth of any found water table, evidence of seismic or landslide activity, reason for performing the test and explanation of the test results;

D. Soil profiles;

E. A description of the laboratory testing done on soil samples including a description of where the samples came from, reason for performing the test, test results and explanation of the test results;

F. Calculations, if any, needed to determine the stability of any slopes which exceed twenty feet in height or which are steeper than two horizontal to one vertical;

G. A summary of the conclusions and recommendations as to the suitability of the site for the proposed project, any building restrictions, any proposed mitigation measures, footing or building foundation recommendations, type and placement of any subsurface drains or any other recommendations as may be determined by the soils engineer;

H. A set of recommended specifications for the grading work to be done on the site.

2. SLOPES

A. No cut or fill slope shall be steeper than two horizontal to one vertical unless specifically approved by the City Engineer. The City Engineer may approve a slope steeper than two to one under the following conditions:

1) The cut or fill at a steeper slope will be stable and not create a hazard to public or private property;

2) The steeper slope is determined by the City Engineer to be necessary to reduce the overall environmental or aesthetic impacts of the grading project;

3) The overall project grading is consistent with the provisions of the Hillside Grading Ordinance;

4) A soils report prepared by a registered engineer qualified in the field of soils engineering is submitted which report shall provide calculations indicating that the proposed slope will have a factor of safety of 1.5 or better for both deep seated and surficial failures under saturated soil conditions.

B. Cut and fill slopes shall be set back from site boundaries in accordance with City of Carlsbad Standard Drawing GS-14.

C. Buildings shall be set back from cut or fill slopes in accordance with City of Carlsbad Standard Drawing GS-15, or as specifically approved by the City Engineer.

D. Terrace drains shall be installed on all manufactured slopes exceeding thirty feet in height. The City Engineer may waive this requirement for slopes with a longitudinal length of one hundred feet or less, or upon the recommendation of a registered soils engineer or geologist that such terrace drain is not necessary for stability or erosion protection. Terrace drains shall be designed to prevent deposition of sand and/or other soil materials within the concrete drain. The minimum longitudinal slope shall be two percent and maximum slope shall be twelve percent. Drainage terraces exceeding eight feet in width need only be paved for a width of eight feet, provided such pavement provides for a minimum channel depth of one foot. Down drains or drainage outlets shall be provided at approximately three hundred foot intervals along the drainage terrace. All such down drains or outlets shall be designed to safely convey the intercepted waters to the point of disposal.

3. SITE DRAINAGE

A. All drainage facilities shall be designed to carry surface waters to the nearest practical street, storm drain, or natural water course approved by the City Engineer. When discharging concentrated flows onto natural ground, the engineer-of-work shall provide appropriate calculations to determine the erosive effects at the point of discharge and immediately downstream from the discharge point. If erosive velocities will occur at the discharge point or immediately downstream, then an appropriately designed rip-rap field or other energy dissipating device shall be installed to mitigate the erosive effects.

B. Graded building pads shall have a minimum slope of one percent towards an adjoining street or an approved drainage course. A lesser slope may be approved by the City Engineer for sites graded in relatively flat terrain, or where special drainage provisions are made. In such cases, the City Engineer may require a supporting recommendation by a registered soils engineer.

C. Berms, swales or other methods and devices shall be provided at the top of cut and fill slopes to prevent surface waters from overflowing onto and damaging the slope face. Special drainage provisions shall be made where a building or structure exists within five feet of the top of a slope.

4. LOW IMPACT DEVELOPMENT (LID)

A. All development projects shall be developed with LID Integrated Management Practices (IMPs) to mimic the site's natural hydrological function. LID uses decentralized, site-based planning and design strategies to manage the quantity and quality of storm water runoff. LID attempts to reduce the amount of runoff by mimicking the natural hydrologic function of the site. Lid focuses on minimizing impervious surfaces and promoting infiltration and evaporation of runoff before it can leave the location of origination. Using small, economical landscape features, LID techniques work as a system to filter, slow, evaporate, and infiltrate surface runoff at the source (reference Mull, K.K., (2005, December) *Selling Low Impact Development: Audiences, Messages, and Media).*

B. LID Design shall generally be in accordance with the latest edition of the County of San Diego *Low Impact Development Handbook, Stormwater Management Strategies* and *Low Impact Development Appendices, San Diego Considerations and LID Fact Sheets.* For additional literature on LID and best management practices consult the reference materials listed in the latest edition of the County of San Diego *Low Impact Development Literature Index.*

C. Stormwater infiltration plans, including permeable pavement, should be reviewed by a qualified, licensed professional to provide a professional opinion regarding the potential adverse geological conditions created by implementation of the plans. Geotechnical conditions such as: slope stability, expansive soils, compressible soils, seepage, groundwater level, and loss of foundation or pavement subgrade strength should be addressed, and where appropriate, mitigation recommendations should be provided. The impact on existing, proposed, and future improvements including buildings, roads and manufactured

slopes must be included in the review.

D. A Storm Water Management Plan (SWMP) prepared in accordance with Title 15 of the Carlsbad Municipal Code and the City s Standard Urban Storm Water Mitigation Plan (SUSMP) shall be submitted concurrent with all development permits for projects determined to meet priority development project criteria, as such term is defined in the Municipal Permit. The SWMP shall describe in detail all proposed LID IMPs to be incorporated into the site design for the proposed development.

E. The post construction BMP site plan prepared in accordance with the SWMP shall be attached to each construction plan (grading, improvement, erosion control, landscape or building) highlighting the BMPs incorporated within the respective plan. The developer/owner/applicant shall be responsible for the construction and/or implementation of all BMPs as shown on the post construction BMP site plan whether or not such BMPs are reflected on the respective construction plans. No changes are to be made to the post construction BMP site plan without the express approval of the City Engineer or his/her designated representative.

Draft Chapter 11.16 Strikeout Version

Chapter 11.16 Permits for Work or Encroachments in Public Property

11.16.010 Title.

The ordinance codified in this chapter may be cited as the Right-of-Way Permit Ordinance.(Ord. NS-386 2 (part), 1996)

11.16.020 Definitions.

For the purpose of this chapter, the following words, terms and phrases shall have the following meanings as set out in this section:

A. City engineer means the city engineer of the city of Carlsbad or his designated representative.

B. Encroachment means and includes any tower, pole, pole line, pipe, pipeline, fence, billboard, stand or building, or any structure or object of any kind or character not particularly mentioned in this subsection, which is placed in, under or over any portion of a public place.

C. Facility means any street, highway, curb, gutter, fencing, pipe, pipeline, tube, main, service, trap, vent, vault, manhole, meter, gauge, regulator, valve, conduit, wire, tower, pole, pole line, anchor, cable, junction box, transformer or any other material structure or object of any kind or character, whether enumerated in this subsection or not which is constructed, left, placed or maintained in, upon, along, across, under or over any public place.

D. Improvement plans means the construction plans, prepared by a civil engineer, in accordance with City Standards for the purpose of describing a public improvement to be constructed, repaired, rehabilitated and/or otherwise installed in a public place. The term may also be used to mean the construction plans, prepared by a civil engineer, in accordance with City Standards for the purpose of describing a private improvement to be constructed, repaired, rehabilitated and/or otherwise installed on private property or in a public easement or right-of-way.

E. Plans means the document developed and approved by the city engineer describing the nature and extent of works proposed to be constructed or carried out on a public place.

F. Public place means any public street, highway, way, place, alley, sidewalk, easement, right-of-way, park, square, plaza or other similar public property owned or controlled by the city and dedicated to public use.

G. Redevelopment director means the redevelopment director of the City of Carlsbad or his designated representative.

H. Specification means the Standard Specifications for Public Works Construction (current edition including supplements) written and promulgated by Southern California Chapter American Public Works Association and Southern California District Associated General Contractors or California Joint Cooperative Committee and published by Building News Incorporated, or such other specifications noted on approved plans.

I. Standard drawings means the standard drawings of the City of Carlsbad, adopted and revised by the city engineer and the most recently adopted San Diego Area Regional Standard Drawings.

In addition to the above defined words, terms and phrases, the definition of words, terms and phrases, as described in Chapter 15.04, shall apply to this chapter.

(Ord. NS-386 2 (part), 1996)

11.16.030 City engineer's authority and responsibilities.
This chapter shall be administered by the city engineer who shall have the responsibility and authority to:

A. Establish the form and procedures for application for right-of-way permits required pursuant to this chapter including the certification of completed applications, the approval of plans, the establishment of files, collection of fees and security deposits;
B. Interpret the provisions of this chapter and advise the public regarding requirements for plans, specifications and special provisions for facilities or encroachments subject to the provisions of this chapter;
C. Establish format and content of plans and standards governing work on facilities or encroachments pursuant to the provisions of this chapter;
D. Issue right-of-way permits upon such conditions as determined are reasonable and necessary to protect the public health, safety and welfare;
E. Consider and approve amendments, including extensions, of any right-of-way permit issued when such amendment is necessary to provide for the safe and efficient movement of traffic or to protect public places, persons or property;
F. The city engineer shall, subject to the authority of the community development director pursuant to Section 1.08.020, administer and enforce the provisions of this chapter. (Ord. NS-386 2 (part), 1996)

11.16.040 Redevelopment director's authority and responsibilities.
In cases where a sign or table is proposed to be placed in the right-of-way within the village redevelopment zone, the redevelopment director shall be the city engineer's designated representative and shall have all of the authority and responsibilities of the city engineer as stated in this chapter. (Ord. NS-386 2 (part), 1996)

11.16.050 Permits--Required.
No person shall do any of the following acts without first obtaining a valid right-of-way permit:

A. Make or cause to be made any excavation or opening, fill or obstruction in, over, along, on, across or through any public place for any purpose whatsoever;
B. Construct or repair or cause to be constructed or repaired any curb, sidewalk, gutter, curb with integral gutter, drive approach, driveway, alley approach, spandrel and cross gutter, wheelchair ramp, A.C. dike, or any other work of any nature covered by the city standard drawings or city policy within a public place; or place, change, renew an encroachment in, over, along or across or through any street right-of-way or public place excepting, however, for or in connection with the installation of poles, guys and anchors constructed for use under franchise for public utility purposes where such poles, guys and anchors do not interfere with or lie within ten feet of existing improvements;
C. Place any banner over, across, on, or along any public place;
D. Plant, remove, cut, cut down, injure or destroy any tree, plant, shrub, or flower growing within any public place excepting necessary pruning or trimming to protect persons or property;
E. Construct or modify or cause to be constructed or modified, any storm drain or conveyor of drainage waters and appurtenant items within a public place;
F. Modify, alter or deface any block wall on or adjacent to public places;
G. Engage in any traffic-control operations in such a fashion as to affect any public place while constructing, demolishing or maintaining any facility;
H. Enter onto or exit from any public place at any location not approved and constructed as a driveway;

I. Install marquees, awnings and building mounted signs which obtrude into a public place. (Ord. NS-386 □2 (part), 1996)

11.16.060 Permits--Application.

A. Any person proposing to do any of the acts described in Section 11.16.050 of this chapter shall make an application for a right-of-way permit to the city engineer.
B. The following information shall be included on the application:
   1. The location, nature and extent of work to be performed;
   2. The proposed date when such work shall be commenced;
   3. The proposed date when work shall be completed;
   4. Such other information as may be required by the city engineer.
C. The city engineer may require the application to contain an encroachment agreement if deemed necessary due to the size, duration, and/or nature of the encroachment. The encroachment agreement shall require removal of the encroachment by the permittee upon reasonable demand by the city engineer, adequate security for performance of such promise, and be in a form acceptable to the city attorney. It may be executed on behalf of the city by the city engineer.
D. If the work proposed to be done requires the making of plans or the setting of stakes, or both, the city engineer may require the application to be accompanied by the necessary plans, which plans shall be prepared by a competent engineer licensed by the State Department of Consumer Affairs.
E. Upon right-of-way permit issuance the application shall become part of the right-of-way permit. (Ord. NS-386 □2 (part), 1996)

11.16.070 Relocation of structures--Removal of encroachment.

The city engineer may require any person who, pursuant to a duly issued right-of-way permit under this chapter, has performed construction work or placed and maintained any encroachment, to move the same at his own cost and expense to such different location as is specified in a written demand of the city engineer, whenever such move is necessary to ensure the safety and convenience of the public or facilitate construction within the right-of-way. The city engineer shall specify in the demand a reasonable time within which the work of relocation must be commenced, and the permittee must commence such relocation within the time specified in the demand and thereafter diligently prosecute the same to completion. Any encroachment agreement required by the city engineer shall specify these requirements and require adequate security to enforce these provisions if the permittee fails to do so. (Ord. NS-386 □2 (part), 1996)

11.16.080 Permits--Commencement and completion of work.

Every permittee shall commence work as stipulated in the right-of-way permit and diligently pursue the work to completion without interruption within the time period required by the right-of-way permit. Right-of-way permits issued under this chapter shall be valid for the period of time specified in the right-of-way permits, unless the city engineer grants a time extension. (Ord. NS-386 □2 (part), 1996)

11.16.090 Permits--Requirements for performance of work.

A. The permittee shall perform the work in a timely manner, in accordance with approved plans, specifications and City Standards and, to the satisfaction of the city engineer.
B. No person shall cause any public improvement or appurtenant work to be performed upon any public place within the city by any person other than a licensed contractor or a public utility.

Deleted: c
Deleted: s
Deleted: ;

C. Any works conducted requiring the temporary, partial or full closure of the traveled or pedestrian right-of-way shall not be commenced until the permittee has obtained a permit therefor pursuant to Title 8 or Title 10 of this code and has been issued a traffic-control permit stipulating the date, time and provisions under which closure may be carried out.

D. As the work progresses, all streets shall be thoroughly cleaned of all rubbish, excess earth, rock and other debris resulting from such work. All cleanup operations at the location of such work shall be accomplished at the expense of the permittee. From time to time, as may be ordered by the city engineer, and in any event immediately after completion of the work, the permittee shall, at its own expense, clean up and remove all refuse and unused materials of any kind resulting from the work. Upon failure to do so, within twenty-four hours after having been notified, the work may be done by the city and the cost thereof charged to the permittee. Whenever it may be necessary for the permittee to excavate through any landscaped area, the area shall be reestablished in a like manner after the excavation has been backfilled as required. All construction and maintenance work shall be done in a manner designed to leave the area clean of earth and debris and in a condition as nearly as possible to that which existed before such work began. The permittee shall not remove, even temporarily, any existing trees or shrubs without first obtaining the consent of the city engineer.

E. All work affecting public improvements or public safety shall be inspected by the city engineer as follows:
   1. No person shall prevent or obstruct the city engineer in making any inspection authorized by this chapter or in taking any sample or in making any test;
   2. Twenty-four-hour notice to the city engineer is required for all inspections;
   3. All work not in conformance with approved plans and specifications is subject to rejection by the city engineer;

   Request for final inspections shall be made in writing. (Ord. NS-386 □2 (part), 1996)

F. Prior to the issuance of a right-of-way permit for a project, the project owner or authorized agent shall:
   1. Provide the city engineer with a completed storm water requirements applicability questionnaire in accordance with SUSMP requirements;
   2. If the project is determined to be a priority development project, then the project owner or authorized agent shall:
      (a) Prepare and submit a storm water management plan in conformance with the requirements of City Standards and Title 15 of this code;

(b) Enter into a Permanent Storm Water Quality Best Management Practices Maintenance Agreement or provide an alternate maintenance mechanism as approved by the city engineer.G. A city approved Construction SWPPP is required to be submitted prior to right-of-way permit issuance in accordance with City Standards and Chapter 15.16.085 of this code for any project which has the potential for adding pollutants to storm water or non-storm water runoff during construction activities, unless an exemption from such requirement is provided pursuant to Chapter 15.16.085 and the Municipal Permit.

11.16.100 Permits--Acceptance of work.

The city engineer, upon determination by survey or by inspection or by both, that the work has been completed according to the requirements of this chapter and the right-of-way permit, shall issue a certificate of acceptance which shall contain a statement of the location, nature and extent of the work performed under the right-of-way permit. (Ord. NS-386 □2 (part), 1996)

11.16.110 Permits - Denial and revocation.

Deleted: --

A. The city engineer may deny the issuance of a right-of-way permit to any person who refuses or fails to comply with the provisions of this chapter, who is indebted to the city for past permit violations or who in the judgment of the city engineer has repeatedly violated permit procedures or failed to comply with conditions requiring protection of the public health and safety.
B. The city engineer may deny the issuance of a right-of-way permit to any person who refuses to execute an encroachment agreement as required pursuant to Section 11.16.060.
C. Any permittee found in violation of the conditions of a right-of-way permit or the provisions of this chapter shall be given a written notice to comply stipulating the code violation. Upon receipt of a notice to comply, the permittee shall take action to correct the condition of violation within the period stipulated in the notice. If within that period appropriate measures have not been implemented, the city engineer may revoke the right-of-way permit and take any measures required to secure the work site or return the work site to its original condition. The cost of such work may be collected from the permittee. (Ord. NS-386 □2 (part), 1996)
D. The city engineer shall deny the issuance of a right-of-way permit to any person who refuses to comply with all storm water protection provisions of this chapter or Title 15 of this code.

11.16.120 Appeal procedure.

A. An individual may appeal the decision of the city engineer made in regard to administration of this chapter to the city council within ten calendar days following the decision. Appeals shall be in writing, filed with the city clerk and shall state the basis for the appeal. Fees for filing an appeal shall be in an amount as established by resolution of the city council. The decision of the city council shall be final.
B. The city clerk shall thereupon fix a time and place for hearing such appeal. The city clerk shall give notice to the appellant and applicant/permittee of the time and place of hearing by serving the notice personally or by depositing it in the United States Post Office in the city, postage prepaid, addressed to such persons at their last known address. (Ord. NS-386 □2 (part), 1996)

11.16.130 Right-of-way permit fees.

Right-of-way permit fees shall be charged by the city for the processing of a right-of-way application and the issuance of a right-of-way permit. The fee shall be established by resolution of the city council and is for the purpose of defraying the cost of processing an application, issuing the requested right-of-way permit, inspection of works completed under the right-of-way permit and other costs of administrating this chapter. (Ord. NS-386 □2 (part), 1996)

11.16.140 Performance deposits.

(a) As a condition of issuance of a right-of-way permit, the city engineer may require posting of a cash deposit or an equivalent security in a form acceptable to the city attorney. The city engineer may require that up to one hundred percent of any deposit be submitted in the form of a cash deposit. The cash deposit may be used at the discretion of the city engineer to provide for traffic-control, restoration of public facilities or removal from the right-of-way of work, materials or equipment when permittee or the permittee□s agent fails to act in a timely manner to provide for the public health, safety or welfare. The deposit shall otherwise be for the purpose of guaranteeing performance of work contemplated under the permit including removal

of Encroachments, if required. Each deposit shall be accompanied by a right-of-way cash security agreement stipulating the uses and conditions under which the funds may be expended.

(b) The amount of the deposit shall be established by the city engineer based on the size, duration, and/or nature of the encroachment.

(c) Upon completion and acceptance of work under permit, any funds unused shall be refunded to the permittee and any other bonds or security instruments shall be released.

(d) If any deposit or security is not sufficient for the protection of the public interest in the public places, the city engineer may require an additional deposit or an increase in the security in such amount as he determines necessary. The permittee shall, upon demand, deposit the additional cash or security.
Upon failure or refusal to pay, the city engineer may revoke the permit and/or recover the deficiency by appropriate action in any court of competent jurisdiction. Until such deficiency is paid in full, no other permit shall be issued to such permittee.

(e) Where work is to be done by persons or utilities operating under a franchise issued by the city or regulated by the State Public Utilities Commission or utilities operated by governmental agencies, a permit may be granted without making a deposit. In such cases, the permittee shall be liable for the actual cost of any work to be done by the city in restoring the area covered by the permit to the satisfaction of the city engineer. (Ord. NS-386 □2 (part), 1996)

11.16.145 Improvement Plans.

A. Improvement plans shall be prepared in accordance with City Standards and this chapter for all work involving the construction repair and/or major rehabilitation of public improvements with a public place. The city engineer may waive the requirement for preparation of improvement plans if, in the opinion of the city engineer, the improvements are of a size or type that does not warrant the preparation of improvement plans.

B. A separate application for each set of improvement plans, if required, shall be made in advance of submittal for a right-of-way permit. Each application for improvement plan review shall include a completed application form, improvement plans, specifications, engineering calculations, a soils and/or geotechnical investigation, and other such calculations, documentation and information as may be necessary to demonstrate that the improvement work will be carried out in substantial compliance with all city codes, City Standards and the requirements of the Landscape Manual. Each improvement plan review application shall be accompanied by a Construction SWPPP prepared in accordance with the requirements of this chapter, Title 15 and City Standards.

C. An improvement plan review fee and inspection fee shall be charged by the city for the processing of the improvement plan review and inspecting the improvements during construction. The fees shall be established by resolution of the city council and are for the purpose of defraying the cost of processing the improvement plan review and inspecting the improvements during construction. The improvement plan review fee and inspection fee are in addition to any other plan review, inspection and permit issuance fees charged for the issuance of a right-of-way permit or processing grading plans and building plans or, the issuance of permits thereto.

D. Improvement plan applications for which city approval is not granted one year following the date of application shall be deemed withdrawn. The improvement plans and other documents submitted for review may thereafter be returned to the applicant or destroyed by the city engineer. The city engineer may extend the time

Formatted: Indent: Left: 0", Hanging: 0.25"

for action by the applicant for a period not exceeding one hundred eighty days upon request by the applicant showing that circumstances beyond the control of the applicant have prevented action from being taken. No application shall be extended more than once. In order to renew action on an application after withdrawal, the applicant shall resubmit a new application and pay new improvement plan review and inspection fees.

E. The city engineer may authorize refunding of the entire improvement plan inspection fee and not more than eighty percent of the improvement plan review fee paid when an application for a improvement plan is withdrawn in accordance with this section. The city engineer shall not authorize refunding of any fee paid except upon written application filed by the original applicant not later than sixty days after withdrawal of the improvement plan application by the applicant, when withdrawn prior to completion of the improvement plan review.

F. Any application in process on the effective date of this code amendment shall be subject to the provisions of this section. The filing date for such application shall be considered to be the effective date of the code amendment.

15.16.146 Improvement Plan Security.

A. The owner, developer or subdivider shall enter into a secured agreement with the city guaranteeing the construction of the public improvements in accordance with this chapter and the improvement security requirements of Chapters 20.16.070 and 20.16.080 of this code, prior to issuance of a right-of-way permit or at such other time as required per the conditions of approval for projects approved pursuant to Titles 20 and 21 of this code.

B. The improvement security release procedures described in Chapter 20.16.090 of this code shall be followed for release of security posted per the requirements of this section.

Formatted: Indent: Left: 0", Hanging: 0.25"

11.16.150 Placement of materials or obstruction of streets.

A. No person shall place or maintain any material or any obstruction or impediment to travel in or upon any public place without a permit to do so.

B. Persons violating provisions of this section shall be issued a notice of removal and given a specified time to remove such material, obstruction or impediment. Any failure to comply with the notice is unlawful and a public nuisance endangering the health, safety and general welfare of the public. In addition to any other remedy provided by law for the abatement of such public nuisance, the city engineer may, after giving notice, cause the work necessary to accomplish the removal. The costs thereof may be assessed against the owner or owners of the project creating the obstruction.

C. Notice of removal shall be in writing and mailed to all persons whose names appear on the last equalized assessment roll as owners of real property creating the obstruction at the address shown on the assessment roll. Notice shall also be sent to any person known to the city engineer to be responsible for the nuisance. The city engineer shall also cause at least one copy of such notice to be posted in a conspicuous place on the premises. No assessment shall be held invalid for failure to post or mail or correctly address any notice. The notice shall particularly specify the work required to be done and shall state that if the work is not commenced within twenty-four hours after receipt of such notice and diligently prosecuted (without interruption) to completion, the city shall cause such work to be done, in which case the cost and expense of such work, including incidental expenses incurred by the

city, will be assessed against the property or against each separate lot and become a lien upon such property.

D. If upon the expiration of the twenty-four hour period provided for in subsection C of this section, the work has not been done, or having commenced, is not being performed with diligence, the city engineer shall proceed to do such work or cause such work to be done. Upon completion of such work, the city engineer shall file written report with the city council setting forth the fact that the work has been completed and the cost thereof, together with a legal description of the property against which cost is to be assessed. The city council shall thereupon fix a time and place for hearing protest against the assessment of the cost of such work. The city engineer or the city clerk, if so directed by the council, shall thereafter give notice in writing to the owners of the project in the manner provided in subsection (c) of the hour and place that the city council will pass upon the city engineer s report and will hear protests against the assessments. Such notice shall also set forth the amount of the proposed assessment.

E. Upon the date and hour set for the hearing of protests, the city council shall hear and consider the city engineer s report and all protests, if there are any, and then proceed to confirm, modify or reject the assessments.

F. A list of assessments as finally confirmed by the city council shall be sent to the city treasurer for collection. If any assessment is not paid within ten days after its confirmation by the city council, the city clerk shall cause to be filed in the office of the county recorder a notice of lien, substantially in the following form:

NOTICE OF LIEN

Pursuant to Chapter 11.16, Title 11, of the Carlsbad Municipal Code (Ordinance No. ____), the City of Carlsbad did on the _____ day of _____, 20 ___, cause maintenance and report work to be done in the public right-of-way for the purpose of abating a public nuisance caused by activities related to construction at the property described below. The Council of the City of Carlsbad did on the _____ day of _____, 20 ____, by its Resolution No. _____ assess the cost or portion of the cost thereof upon the real property hereinafter described, and the same has not been paid nor any part thereof, and the City of Carlsbad does hereby claim a lien upon said real properly until the same sum with interest thereon at the maximum rate allowed by law from the date of the recordation of this instrument has been paid in full and discharged of record. The real property hereinbefore mentioned and upon which a lien is hereby claimed is that certain parcel of land in the City of Carlsbad, County of San Diego, State of California, particularly described as follows:

(Description of property)

Dated this _____ day of _____, 20 ___.

City Clerk, City of Carlsbad.

G. From and after the date of recordation of such notice of lien, the amount of the unpaid assessment shall be a lien on the property against which the assessment is made, and such assessment shall bear interest at the maximum rate allowed by law until paid in full. The lien shall continue until the amount of the assessment and all interest thereon has been paid. The lien shall be subordinate to tax liens and all fixed special assessment items previously imposed upon the same property, but shall have priority over all contractual liens and all fixed special assessment liens which may thereafter be created against the property. From and after the date of

recordation of such notice of lien, all persons shall be deemed to have notice of the contents thereof. (Ord. NS-386 □2 (part), 1996)

11.16.160 Holding city harmless--Insurance.
The applicant for a right-of-way permit, as a condition to receiving a right-of-way permit, shall sign a statement that he agrees to indemnify and hold harmless the city, and each officer and employee thereof, from any liability or responsibility for death or injury to persons and loss or damage to property happening or occurring as a result of the design or performance of any work undertaken under any right-of-way permit granted pursuant to the application. The applicant shall be required to provide proof of liability insurance in the amount of at least one million dollars and shall name the city as an additional insured under the insurance policy. The insurance shall be provided by a company satisfactory to the city. Any deductible or self-insured retention under the insurance policy shall be in an amount acceptable to the city. (Ord. NS-386 □2 (part), 1996)

11.16.170 Exemptions.
The city and its employees, acting in their official capacity, are exempt from the requirements set forth in this chapter. (Ord. NS-386 □2 (part), 1996)

Chapter 15.04 GENERAL REGULATIONS

Sections:
15.04.010 Title
15.04.020 Definitions

15.04.010 Title.

This title shall be known as the Grading and Drainage Ordinances. (Ord. NS-385 3, 1996: Ord. NS-293 2 (part), 1994)

15.04.020 Definitions.

For the purpose of this title, the following words or phrases shall be construed as defined in this section:

A. Basin Plan means the Water Quality Control Plan for the San Diego Region (July 1975) and approved by the State Water Resources Control Board, together with subsequent amendments.

B. Best management practices (BMP) means schedules of activities, prohibitions of practices, general good housekeeping practices, pollution prevention and educational practices, employee training programs, maintenance procedures, and other management practices to prevent or reduce to the maximum extent practicable the discharge of pollutants directly or indirectly to storm water conveyance system and/or receiving waters. Best management practices also include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw materials storage. Best management practices also include the use of structural treatment controls designed to remove pollutants from storm water runoff.

C. Building permit means a permit required by and issued pursuant to Chapter 18.04 of this code.

D. Building footprint means the gross floor area of a structure measured at the ground level elevation within the confines of the exterior wall surfaces.

E. Business Activity SWPPP means a storm water pollution prevention plan prepared pursuant to General Industrial Activity Permit or pursuant to Section 15.12.080 for the purpose of 1) identifying and evaluating sources of pollutants associated with business activities that may affect the quality of storm water discharges and authorized non-storm water discharges from a facility; and 2) Identifying and implementing site-specific best management practices to reduce or prevent pollutants associated with business activities in storm water discharges and authorized non-storm water discharges from a facility.

F. California Ocean Plan means the California Ocean Plan: Water Quality Control Plan for Ocean Waters of California adopted by the State Water Resources Control Board effective February 14, 2006, and any subsequent amendment, revision or re-issuance thereof.

G. City Standards means the standards used for the design and construction of public and private improvements in Carlsbad, including grading improvements and storm water best management practices, as contained in the latest edition of the City of Carlsbad City Standards as promulgated by the city engineer.

H. Construction SWPPP means a storm water pollution prevention plan prepared pursuant to the General Construction Permit, Chapters 11.16.090, 15.12.080, 15.16.085 and 18.48.040 of this code and, City Standards for the purpose of 1) identifying and evaluating sources of pollutants associated with construction activities that may affect the quality of storm water

Formatted: Numbered + Level: 1 + Numbering Style: A, B, C, … + Start at: 1 + Alignment: Left + Aligned at: 0.13" + Tab after: 0.38" + Indent at: 0.38"

Deleted: (a)

Deleted: (b)

Formatted: Numbered + Level: 1 + Numbering Style: A, B, C, … + Start at: 1 + Alignment: Left + Aligned at: 0.13" + Tab after: 0.38" + Indent at: 0.38"

discharges and authorized non-storm water discharges from a construction site; and 2) identifying and implementing site-specific best management practices to reduce or prevent pollutants associated with construction activities in storm water discharges and authorized non-storm water discharges from a construction site.

I. Development means:

1. The placement or erection of any solid material or structure on land, in water, or under water;
2. The discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste;
3. The grading, removing, dredging, mining, or extraction of any materials;
4. A change in the density or intensity of the use of land, including, but not limited to, a subdivision pursuant to the Subdivision Map Act (Government Code Section 66410, et seq.) and any other division of land, including lot splits, except where the division of land is brought about in connection with the purchase of such land by a public agency for public recreational use;
5. A change in the intensity of the use of water, or of access to water.
6. The construction, reconstruction, demolition, or alteration of the size of any structure, including any facility of any private, public, or municipal entity; and,
7. The removal or harvesting of major vegetation other than for agricultural purposes. As used in this definition, structure includes, but is not limited to, any building, road, pipe, flume, conduit, siphon, aqueduct, telephone line, and electrical power transmission and distribution line. (Source: Government Code Section 65927).

J. Development permit means any permit approval or entitlement issued pursuant to Titles 11, 15,18, 20 or 21 of this code.

K. Development project means any new development or redevelopment with land disturbing activities; structural development, including construction or installation of a building or structure; the creation of impervious surfaces; public agency projects; and, land subdivision.

L. Drainage master plan means the report entitled Master Drainage and Storm Water Quality Management Plan, dated March 1994, and any supplements, revision or modification thereto as may be approved by city council resolution.

M. General Construction Permit means NPDES General Permit for Storm Water Discharges Associated with Construction Activity (Water Quality Order No. 99-08-DWQ, NPDES No. CAS000002) issued by the State Water Resources Control Board, and any amendment, revision or re-issuance thereof. The General Construction Permit establishes a framework for regulating the discharge of storm water runoff from construction activities that encompass one of more acres of soil disturbance.

N. General Industrial Activity Permit means NPDES General Permit for Storm Water Discharges Associated with Industrial Activities (Order No. 97-03-DWQ, NPDES No. CAS 000001) issued by the State Water Resources Control Board, and any amendment, revision or re-issuance thereof. The General Industrial Activity Permit establishes a framework for regulating the discharge of storm water runoff from certain industrial activities as specified in the permit.

O. General Linear Utility Permit means NPDES General Permit for Storm Water Discharges Associated with Construction Activity from Small Linear Underground/Overhead Projects, Water Quality Order No. 2003-0007 issued by the State Water Resources Control Board, and any amendment, revision or re-issuance thereof. The General Linear Utility Permit establishes a framework for regulating the discharge of storm water runoff from small linear underground or overhead utility projects as specified in the permit.

P. Illicit connection means any physical connection (pipe, facility, or other device) to the storm water conveyance system permitted or unpermitted by the City of Carlsbad, which drains illegal discharges either directly or indirectly into a storm water conveyance system.

Formatted: Bullets and Numbering

Formatted: Numbered + Level: 2 + Numbering Style: 1, 2, 3, … + Start at: 1 + Alignment: Left + Aligned at: 0.63" + Tab after: 0.88" + Indent at: 0.88"

Formatted: Numbered + Level: 1 + Numbering Style: A, B, C, … + Start at: 1 + Alignment: Left + Aligned at: 0.13" + Tab after: 0.38" + Indent at: 0.38"

Q. Jurisdictional Urban Runoff Mitigation Plan (JURMP) means a plan, prepared pursuant to Municipal Permit, to:
   1. Ensure that discharges from municipal separate storm sewer system do not cause or contribute to degradation of water quality,
   2. Effectively prohibit urban discharges of illicit connections to the municipal separate storm sewer system, and,
   3. Reduce the discharge of pollutants from municipal separate storm sewer system to the maximum extent practicable. When used in the Carlsbad Municipal Code, this refers to the JURMP adopted by the city of Carlsbad.

R. Landscape Manual means the Landscape Manual adopted by city council resolution which contains the policies and requirements for the design, construction and maintenance of landscape and irrigation systems constructed pursuant to a city development approval.

S. Low impact Design (LID) means a storm water management and land development strategy that emphasizes conservation and the use of on-site natural features integrated with engineered small-scale hydrologic controls to more closely reflect pre-development hydrologic functions.

T. Maximum extent practicable (MEP) means, with respect to best management practices (BMPs), an individual BMP or group of BMPs which reduces or eliminates the discharge of a pollutant of concern, which have a cost of implementation reasonably related to the pollution control benefits achieved, and which are technologically feasible.

U. Municipal Permit means California Regional Water Quality Control Board San Diego Region Order No. R9-2007-01, NPDES No. CAS0108758 Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the County of San Diego County, the San Diego Unified Port District, and the San Diego County Regional Airport Authority (Municipal Permit), and any amendment, revision or re-issuance thereof.

V. National Pollution Discharge Elimination System (NPDES) Permit means a permit issued by the San Diego Regional Water Quality Control Board or the State Water Resources Control Board pursuant to Chapter 5.5, Division 7 of the California Water Code, to control discharges from point sources to waters of the United States, including, but not limited to:
   1. Municipal Permit;
   2. General Industrial Activity Permit;
   3. General Construction Permit;
   4. General Linear Utility Permit; and,
   4. California Regional Water Quality Control Board, San Diego Region, General De-Watering Permits (Order Numbers 91-10 and 90-31).

W. National Pollution Discharge Elimination System (NPDES) general permit means a permit issued by the State Water Resources Control Board which establishes a framework for regulating the discharge of storm water runoff for certain broad classes of activities, including, but not limited to:
   1. General Construction Permit;
   2. General Industrial Activity Permit; and,
   3. General Linear Utility Permit.

X. Occupancy permit means a permit required or issued pursuant to Chapter 21.60 of this code.

Y. Pollutant means and includes, but is not limited to, solid waste, sewage, garbage, medical waste, wrecked or discarded equipment, radioactive materials, dredged spoil, rock, sand, sediment, silt, industrial waste, and any organic or inorganic substance defined as a pollutant under 40 C.F.R. 122.2 whose presence degrades the quality of the receiving waters in violation of basin plan and California ocean plan standards such as fecal coliform, fecal

streptococcus, enterococcus, volatile organic carbon, surfactants, oil and grease, petroleum hydrocarbons, total organic carbon, lead, copper, chromium, cadmium, silver, nickel, zinc, cyanides, phenols, fertilizers, pesticides, herbicides and other biocides.A pollutant also includes any contaminant which degrades the quality of the receiving waters in violation of basin plan and California ocean plan standards by altering any of the following parameters: pH, total suspended and settleable solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), nutrients, temperature and other narrative standards of the basin plan.

Z. Priority development project means new development and redevelopment project categories listed in section D.1.d(2) of the Municipal Permit.

AA. Planned local drainage facility means any storm drainage facility, flood control facility or water quality enhancement facility identified in the drainage master plan including drainage easements, storm drain pipes, inlet structures, outlet structure, sedimentation and depollutant basins, drop structures, rip rap, junction structures, environmental mitigation measures, water quality monitoring and testing equipment and other improvements necessary to convey, contain or enhance the quality of storm water discharge.

BB. Planned local drainage area (PLDA) means one of four drainage areas within the city identified within the drainage master plan. Separate planned local drainage area (PLDA) fees are established for each of the four drainage areas and were calculated to be equal to or less than the cost of the planned local facility drainage improvements within each respective PLDA. (Ord. NS-293 2 (part), 1994)

CC. Receiving waters means surface bodies of water which serve as receiving points for discharges from the storm water conveyance system, including Encinas Creek, San Marcos Creek, Batiquitos Lagoon, Agua Hedionda Lagoon, San Elijo Lagoon and Buena Vista Lagoon and their tributary creeks, reservoirs, lakes, estuaries, and the Pacific Ocean.

DD. Rainy season means the period of time between October 1 of any year and April 30 of the following year during which the likelihood of rainfall is greater than at other times of the year.

EE. Standard Urban Storm Water Mitigation Plan (SUSMP) means a plan, prepared pursuant to the Municipal Permit, to reduce pollutants and runoff flows from all new development and significant redevelopment projects that fall under priority project categories. When used in the Carlsbad Municipal Code, this refers to the SUSMP prepared by the city of Carlsbad.

FF. Storm water means surface runoff and drainage associated with storm events and snow melt that flows across a surface to the storm water conveyance system or receiving waters. For the purposes of this chapter, storm water runoff and drainage from areas that are in a natural state, have not been significantly disturbed or altered, either directly or indirectly, as a result of human activity, and the character and type of pollutants naturally appearing in the runoff have not been significantly altered, either directly or indirectly, as a result of human activity, shall be considered unpolluted and shall satisfy the definition of storm water in this chapter.

GG. Storm water requirements applicability questionnaire means the questionnaire form, as specified in the SUSMP, filled out and signed by the responsible party submitting an application for a development permit, and used by the city to determine if the development project is required to comply with standard or priority project storm water requirements.

HH. Storm water conveyance system means private and public drainage facilities by which storm water may be conveyed to receiving waters, such as natural drainages, ditches, roads, streets, constructed channels, aqueducts, storm drains, pipes, culverts, street gutters or catch basins.

II. Storm water management plan (SWMP) means a storm water pollution prevention plan prepared in accordance with the SUSMP which describes best management practices to be implemented on a development site during the post construction phase of a project. A storm

Deleted: (e) Project means on any property subject to this chapter, any new building permit or any redevelopment or remodel permit wherein the building footprint is increased by fifty percent or greater over the existing building footprint. (f) Property subject to this chapter means any lot or parcel of land in the city

water management plan also includes recommended maintenance activities and schedules of maintenance for any structural treatment controls included in the plan. A SWMP is sometimes referred to as a post-construction SWPPP.

JJ. Storm water pollution prevention plan (SWPPP) means a document which describes the on-site program activities and structural treatment control measures to eliminate or reduce to the maximum extent practicable, pollutant discharges to the storm water conveyance system primarily through the application and use of best management practices. A SWPPP is prepared in accordance with the requirements of a NPDES general permit and/or City Standards. The city utilizes three types of SWPPP documents for storm water pollution prevention during different phases of land development and land use activities including the following:

1. Storm Water Management Plan (SWMP);
2. Construction SWPPP; and,
3. Business Activity SWPPP.

KK. Structural treatment control BMP means engineered facilities designed for the treatment of storm water runoff. Structural treatment controls typically use infiltration, filtration, retention/detention, biofiltering and other techniques to remove pollutants from storm water runoff.

Draft Chapter 15.12 Strikeout Version

Chapter 15.12 STORM WATER MANAGEMENT AND DISCHARGE CONTROL

Sections:

15.12.010 Purpose and intent.
15.12.020 Definitions.
15.12.030 Administration.
15.12.040 Applicability.
15.12.050 Prohibited discharges.
15.12.055 Exemptions from discharge prohibitions.
15.12.060 Discharge in violation of permit.
15.12.070 Illicit connections.
15.12.080 Reduction of pollutants contacting or entering storm water required.
15.12.090 Storm water conveyance system protection.
15.12.095 Structural treatment control BMP maintenance requirement.
15.12.100 Authority to inspect.
15.12.110 Inspection procedures--Additional requirements.
15.12.120 Containment, cleanup, and notification of spills.
15.12.130 Testing, monitoring or mitigation requirements.
15.12.140 Concealment.
15.12.150 Administrative code enforcement powers and procedures.
15.12.160 Administrative notice, hearing, and appeal procedures.
15.12.170 Judicial enforcement.
15.12.180 Violations deemed a public nuisance.
15.12.190 Remedies not exclusive.

15.12.010 Purpose and intent.

The purpose of this chapter is to ensure the environmental and public health, safety, and general welfare of the residential, commercial, and industrial sectors of the City of Carlsbad by:

A. Prohibiting non-storm water discharges to the storm water conveyance system.
B. Eliminating discharges to the storm water conveyance system from spills, dumping or disposal of materials other than storm water or permitted or exempted discharges.
C. Reducing pollutants in storm water discharges to the maximum extent practicable, including those pollutants taken up by storm water as it flows over urban areas (urban runoff).
D. Reducing pollutants in storm water discharges in order to achieve applicable water quality objectives for receiving waters within the City of Carlsbad.

The intent of this chapter is to protect and enhance the water quality of the City of Carlsbad receiving waters and wetlands in a manner pursuant to and consistent with the Clean Water Act and Municipal Permit. (Ord. NS-624 □ 1 2002: Ord. NS-394 □ 2 (part), 1997)

15.12.020 Definitions.

When used in this chapter, the following terms shall have the meanings ascribed to them in this section:

Deleted: c

Deleted: , to the maximum extent practicable

Deleted: c

Formatted: Indent: Left: 0.13", First line: 0", Tabs: 0.13", Left + Not at 0.38"

Deleted: c

Deleted: California Regional Water Quality Control Board NPDES Permit No. CAS0108758, Order No. 2001-01 and any amendment, revision or reissuance thereof

Deleted: A. □Basin plan□means the Water Quality Control Plan for the San Diego Region (July 1975) and approved by the State Water Resources Control Board, together with subsequent amendments.□
B. □Best management practices (BMP)□means schedules of activities, prohibitions of practices, general good housekeeping practices, pollution prevention and educational practices, maintenance procedures, and other management practices to prevent or reduce to the maximum extent practicable the discharge of pollutants directly or indirectly to storm water conveyance system and/or receiving waters. Best management practices also include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, and drainage from raw materials storage.□
C. □Building permit□means a permit issued pursuant to Chapter 18.04.□
D. □California ocean plan□means the California Ocean Plan: Water Quality Control Plan for Ocean Waters of California adopted by the State Water Resources Control Board effective July 23, 1997, and any subsequent amendments.□

A. "Clean Water Act" means the Federal Water Pollution Control Act enacted by Public Law 92-500, as amended by Public Laws 95-217, 95-576, 96-483, and 95-117 (33 USCA Section 1251 et seq.), and any subsequent amendments.

B. "County health officer" means the health officer of the County of San Diego Department of Public Health or designee.

C. "Employee training program" means a documented employee training program for all persons responsible for implementing a storm water pollution prevention plan. The employee training program shall include, but is not limited to, the following topics:

1. Laws, regulations, and local ordinances associated with storm water pollution prevention, and an overview of the potential impacts of polluted storm water on the receiving waters of the San Diego region;
2. Proper handling of all materials and wastes to prevent spillage;
3. Mitigation of spills including spill response, containment and cleanup procedures;
4. Visual monitoring of all effluent streams to ensure illicit discharges do not enter the storm water conveyance system;
5. Discussion of the differences between the storm water conveyance system and the sanitary sewer system;
6. Identification of all on-site connections to the storm water conveyance system;
7. Preventive maintenance and good housekeeping procedures;
8. Material management practices employed by the facility to reduce or eliminate pollutant contact with storm water discharge: and
9. Documentation of training and records detailing dates, time, subjects covered and, attendance.

D. "Enforcement agency" means the City of Carlsbad or its authorized agents charged with ensuring compliance with this chapter.

E. "Enforcement official" means the city manager of the City of Carlsbad or his or her designee.

F. "Hazardous materials" means any substance or mixture of substances which is toxic, corrosive, flammable, an irritant, a strong sensitizer, or generates pressure through decomposition, heat or other means, if such a substance or mixture of substances may cause, or contribute to, substantial injury, serious illness or harm to humans, domestic livestock, wildlife, or deterioration of receiving water quality or the environment.

G. "Illegal discharge" means any discharge to the storm water conveyance system that is not composed entirely of storm water, or is expressly prohibited by federal, state, or local regulations, laws, codes, or ordinances, or degrades the quality of receiving waters in violation of any NPDES Permit, the Basin Plan and California Ocean Plan standards.

H. "Parking lot" means an open area, other than a street or other public way, used for the parking of motorized vehicles, whether for a fee or free, to accommodate clients or customers or to accommodate residents of multi-family dwellings (i.e., apartments, condominiums, townhomes, mobile homes, dormitories, group quarters, etc.).

I. "Person" means any individual, organization, business trust, company, partnership, entity, firm, association, corporation, or public agency, including the State of California and the United States of America.

J. "Premises" means any building, lot parcel, real estate, land or portion of land whether improved or unimproved.

K. "Responsible Party" means one or more persons that control, are in possession of or own property that shall be individually or, jointly and severally held responsible for compliance with the provision of this chapter or with any illicit discharge from property controlled, possessed or owned. As defined in this chapter, "property" includes, but is not limited to, real estate, fixtures, facilities or premises of any kind located upon, under or above the real estate. This definition of responsible party does not include the city when an illicit discharge is caused by a person on a public street or on public property.

L. Wetlands means areas that are inundated or saturated by surface or ground waters at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas. (Ord. NS-624 2, 2002: Ord. NS-468 1--3, 1999; Ord. NS-394 2 (part), 1997)

15.12.030 Administration.
The enforcement official shall administer, implement, and enforce the provisions of this chapter. Any powers granted to, or duties imposed upon, the enforcement official may be delegated by the enforcement official to persons in the employ of the City of Carlsbad, or pursuant to contract. When deemed necessary by the enforcement official, the enforcement official shall prepare and present to the city council for approval regulations consistent with the general policies established herein by the city council. The enforcement official shall enforce council approved regulations necessary to the administration of this chapter, and may recommend that the council amend such regulations as conditions require. (Ord. NS-394 2 (part), 1997)

15.12.040 Applicability.
This chapter shall be interpreted to assure consistency with the requirements of the federal Clean Water Act, applicable implementing regulations, and Municipal Permit. (Ord. NS-624 2, 2002: Ord. NS-394 2 (part), 1997)

15.12.050 Prohibited discharges.
The discharge of non-storm water discharges to the storm water conveyance system or to any other conveyance system which discharges into receiving water is prohibited, including, but not limited to:

A. Sewage;
B. Discharges of wash water resulting from the hosing or cleaning of gas stations, auto repair garages, or other types of automotive services facilities;
C. Discharges resulting from the cleaning, repair, or maintenance of any type of equipment, machinery, or facility including motor vehicles, cement-related equipment, and port-apotty servicing, etc.;
D. Discharges of wash water from mobile operations such as mobile automobile washing, steam cleaning, power washing, and carpet cleaning, etc.;
E. Discharges of wash water from the cleaning or hosing of impervious surfaces in municipal, industrial, commercial, and residential areas including parking lots, streets, sidewalks, driveways, patios, plazas, work yards and outdoor eating or drinking areas, etc.;
F. Discharges of runoff from material storage areas containing chemicals, fuels, grease, oil, or other hazardous materials;
G. Discharges of pool or fountain water containing chlorine, biocides, or other chemicals; discharges of pool or fountain filter backwash water;
H. Discharges of sediment, pet waste, vegetation clippings, or other landscape or construction-related wastes; and
I. Discharges of food-related wastes (e.g., grease, fish processing, and restaurant kitchen mat and trash bin wash water, etc.).

(Ord. NS-624 4, 2002: Ord. NS-468 4, 5, 1999; Ord. NS-394 2 (part), 1997)

15.12.055 Exemptions from discharge prohibitions.
A. The prohibition on discharges shall not apply to any discharge regulated under a NPDES permit issued to the discharger and administered by the state of California pursuant to Chapter 5.5, Division 7, of the California Water Code, provided that the discharger is in compliance with all requirements of the permit and other applicable laws and regulations.

Deleted: W. Storm water means surface runoff and drainage associated with storm events and snow melt that flows across a surface to the storm water conveyance system or receiving waters. For the purposes of this chapter, storm water runoff and drainage from areas that are in a natural state, have not been significantly disturbed or altered, either directly or indirectly, as a result of human activity, and the character and type of pollutants naturally appearing in the runoff have not been significantly altered, either directly or indirectly, as a result of human activity, shall be considered unpolluted and shall satisfy the definition of storm water in this chapter.
X. Storm water conveyance system means private, natural and publicly owned facilities within the city of Carlsbad by which storm water may be conveyed to receiving waters of the United States, including any roads with drainage systems, streets, catch basins, curbs, gutters, ditches, pipes, natural and man-made channels or storm drains.
Y. Storm water pollution prevention plan means a document which describes the on-site program activities to eliminate or reduce to the maximum extent practicable, pollutant discharges to the storm water conveyance system primarily through the application and use of BMPs. A storm water pollution prevention plan prepared and implemented pursuant to any NPDES Storm Water Permit shall meet the definition of a storm water pollution prevention plan for the purposes of this chapter.
Z. System means storm water conveyance system, as defined herein. ... [8]

Proof of compliance with such permit may be required in a form acceptable to the city prior to or as a condition of a subdivision map, site plan, building permit, or development improvement plan; upon inspection of the facility; during any enforcement proceeding or action; or for any other reasonable cause.

B. Discharges from the following activities will not be considered a source of pollutants to the storm water conveyance system or receiving waters and are exempt from the definition of non-storm water discharge when properly managed as required by applicable federal, state and local laws, regulations or codes:

1. Water line flushing;
2. Landscape irrigation and lawn watering;
3. Diverted stream flows;
4. Rising ground waters or springs;
5. Uncontaminated pumped ground water not subject to any applicable NPDES permit;
6. Discharges from potable water sources not subject to any applicable NPDES permit;
7. Foundation and footing drains;
8. Air conditioning and refrigeration condensation;
9. Natural springs;
10. Water from crawl space pumps;
11. Individual residential car washing;
12. Flows from riparian habitats and wetlands;
13. Dechlorinated swimming pool discharges;
14. Emergency firefighting; and,
15. Uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)].

C. The prohibition of discharges shall not apply to any discharge which the enforcement official, the county health officer, the State or San Diego Regional Water Quality Control Board, or U.S. Environmental Protection Agency determines in writing are necessary for the protection of the environment, water quality, and public health and safety. (Ord. NS-624 □5, 2002)

15.12.060 Discharge in violation of permit.

Any discharge that would result in or contribute to a violation of Municipal Permit either separately considered or when combined with other discharges, is prohibited. Liability for any such discharge shall be the responsibility of the person(s) causing or responsible for the discharge. (Ord. NS-624 □6, 2002: Ord. NS-394 □2 (part), 1997)

Deleted: California Regional Water Quality Control Board NPDES Permit No. CAS0108758, Order 2001-01 and any amendment, revision or reissuance to it

Deleted: ,

15.12.070 Illicit connections.

It is prohibited to establish, use, maintain, conceal or continue illicit connections to the storm water conveyance system, regardless of whether such connections were made under a permit or other authorization or whether permissible under the law or practices applicable or prevailing at the time of the connection except as authorized in Section 15.12.050. (Ord. NS-394 □2 (part), 1997)

15.12.080 Reduction of pollutants contacting or entering storm water required.

A. It is unlawful for any person not to utilize best management practices to the maximum extent practicable to eliminate or reduce pollutants entering the city□s storm water conveyance system.

B. In order to reduce the risk of contamination of storm water and the discharge of non-storm water or pollutants to the city□s storm water conveyance system, the enforcement official may require the person(s) conducting the following activities to implement best management practices to the maximum extent practicable:

1. Automobile, airplane, boat, and/or vehicle repair, service, fueling, maintenance, washing, storage, and/or parking;

2. Landscape and garden care activities including application of related products, such as pesticides, herbicides, and fertilizers;
3. Building remodeling, repair and maintenance, including, but not limited to: cement mixing, repair or cutting, masonry, plumbing, painting and/or coating;
4. Impervious surface or building washing or cleaning, including pressure washing or steam cleaning;
5. Storage and disposal of household hazardous waste (e.g. paints, used motor oil, cleaning products, pesticides, herbicides);
6. Disposal of pet waste;
7. Storage and disposal of green waste;
8. Mobile carpet, drape or furniture cleaning;
9. Pool, spa, jacuzzi, or fountain cleaning, servicing, or repair;
10. Pest control;
11. Plant growing including: farmlands, fields, nurseries, greenhouses, and botanical gardens.

C. Persons conducting an activity or activities that the enforcement official determines may contribute to an illegal discharge to the storm water conveyance system, and/or a tributary to a Clean Water Act Section 303(d) impaired water body, where the site or source generates pollutants for which the water body is impaired; and/or any person within or directly adjacent to or discharging directly to a coastal lagoon or other receiving water may also be subject to subsection 15.12.080(B.).

D. Business Activity Storm Water Pollution Prevention Plan (SWPPP). When the enforcement official determines that a person in the course of conducting a business-related activity causes, has the potential to cause, or contributes to a violation of the water quality standards set forth in the San Diego Basin Plan or California Ocean Plan, or conveys pollutants to receiving waters that may cause or contribute to the deterioration of water quality, then the enforcement official may require the person to develop and implement a Business Activity SWPPP that includes the implementation and use of best management practices, and an employee training program. This section applies, but is not limited to:

1. Persons conducting maintenance, storage, manufacturing, assembly, equipment operations, vehicle loading, and/or cleanup activities partially or wholly out of doors;
2. Persons conducting automobile, airplane, boat, and/or equipment mechanical service, repair, maintenance, fueling, cleaning and/or parking; marinas; mobile automobile or other vehicle washing and/or parking; retail or wholesale fueling; mobile carpet, drape or furniture cleaning; pest control services; eating and drinking establishments; cement mixing, repair or cutting; masonry; plumbing; painting and coating; surface or building washing or cleaning services, including pressure washing or steam cleaning; botanical or zoological gardens and exhibits; landscaping and lawn and garden services; nurseries and greenhouses; golf courses, parks and other recreational areas/facilities; cemeteries; pool and fountain cleaning; or port-a-potty servicing;
3. Persons owning or operating a parking lot or an impervious surface (including, but not limited to, service station pavements, sidewalks, patios and paved private streets and roads) used for automobile-related or similar purposes shall clean those surfaces as frequently and as thoroughly as is necessary, in accordance with best management practices, to prevent the discharge of pollutants to the city's storm water conveyance system. Sweepings or cleaning residue from parking lots or impervious surfaces shall not be swept or otherwise made or allowed to enter any storm water conveyance system, gutter, or roadway, but must be disposed of in accordance with regional and local solid waste procedures and regulations.
   Persons owning or operating a parking lot or impervious surfaces used for similar purposes shall clean those surfaces thoroughly as is necessary to prevent the

accumulation and discharge of pollutants to the storm water conveyance system to the maximum extent practicable, but not less than once prior to each rainy season. Sweepings or cleaning residue from parking lots or said impervious surfaces shall not be swept or otherwise made or allowed to enter the gutter roadway or storm water conveyance system.

E. Development, Grading or Construction Activities. Any person engaged in development, grading or construction in the City of Carlsbad shall utilize best management practices to prevent pollutants from entering the storm water conveyance system by complying with City Standards, all applicable local ordinances, including the Chapter 15.16 of the Carlsbad Municipal Code, the standard specifications for public works construction, when performing public work, and, required provisions of all applicable NPDES Permits.
In order to reduce the risk of contamination of storm water and the discharge of non-storm water or pollutants to the city s storm water conveyance system, the enforcement official may require the person conducting the development, grading or construction activities to prepare and implement a Construction SWPPP in compliance with City Standards and/or to implement best management practices to the maximum extent practicable.

F. No person shall stand or park any vehicle or equipment on any street for the purpose of washing, greasing, repairing, and/or maintaining the vehicle or equipment, except for repairs necessitated by an emergency.

G. No person shall stand or park any vehicle or equipment on any public street, if such vehicle or equipment is determined by the enforcement official to be leaking fluids such as oils or other fluids that contribute or have the potential to contribute a discharge of pollutants to the storm water conveyance system and/or the receiving waters.

H. Other activities not covered by sections B, C, D, E and F of this section.
In order to reduce the risk of contamination of storm water the discharge of non-storm water or, pollutants to the city s storm water conveyance system, the enforcement official may require the person conducting any activity not listed in sections B, C and D above, to implement best management practices to the maximum extent practicable, if the enforcement official determines that the activity has the potential to discharge pollutants or is known to discharge pollutants to the storm water conveyance system or receiving waters.

I. Storm Water Management Plan (SWMP). Any project issued a development permit shall comply with all applicable best management practices and low impact development (LID) requirements of the Municipal Code, Standard Urban Storm Water Mitigation Plan (SUSMP), City Standards and this code including but not limited to the following:

1. All development permit applications for priority development projects shall be accompanied by a SWMP prepared pursuant to the SUSMP. No development permit shall be approved or issued unless the following requirements have been met:
   a. The city engineer has approved the SWMP in accordance with the SUSMP; and,
   b. The development project complies with all best management practices specified in the approved SWMP.
2. No development permit shall be issued for a priority development project without ensuring that all structural treatment control best management practices, as specified in the approved SWMP, will be maintained in compliance with the requirements of the Municipal Permit, JURMP and SUSMP. To ensure maintenance of the structural treatment control best management practices, the owner of the development site shall enter into a Permanent Storm Water Quality Best Management Practices Maintenance Agreement or provide an alternate maintenance mechanism as approved by the enforcement official.

Every person owning property through which a storm water conveyance system passes, and such person□s lessee or tenant, shall keep and maintain that part of the storm water conveyance system within the property free of trash, debris, excessive vegetation, and other obstacles which would pollute, contaminate or significantly retard the flow of water through the storm water conveyance system.

Every person shall maintain existing privately owned storm water conveyance structures within or adjacent to a storm water conveyance system, so that such structures do not become a hazard to the use, function or physical integrity of the storm water conveyance system.

Deleted: will

Every person shall not remove healthy banks of vegetation beyond that actually necessary for such maintenance which shall be accomplished in a manner that minimizes the vulnerability of the storm water conveyance system to erosion; and shall be responsible for maintaining that portion of the storm water conveyance system that is within their property lines in order to protect against erosion and degradation of the storm water conveyance system originating or contributed from their property.

No person shall commit or cause to be committed any of the following acts, unless a written permit has first been obtained from the city and the appropriate state or federal agencies, if applicable:

Deleted: enforcement official,

A. Discharge pollutants into or connect any pipe or channel to the storm water conveyance system;
B. Modify the natural flow of water in a storm water conveyance system;
C. Carry out developments within thirty feet of the center line of any storm water conveyance system or twenty feet of the edge of a storm water conveyance system, whichever is the greater distance, unless such development is approved pursuant to a development permit issued in compliance with Titles 19, 20 and 21 of this code;
D. Deposit in, plant in, or remove any material from a storm water conveyance system including its banks except as required for necessary maintenance;
E. Construct, alter, enlarge, connect to, change or remove any structure in a storm water conveyance system; or
F. Place any loose or unconsolidated material along the side of or within a storm water conveyance system or so close to the side as to cause a diversion of the flow, or to cause a probability of such material being carried away by storm waters passing through such a storm water conveyance system.
G. The above requirements do not supersede any requirements set forth by the California Department of Fish and Game Stream Alteration Permit process. (Ord. NS-624 □8, 2002: Ord. NS-468 □6, 1999: Ord. NS-394 □2 (part), 1997)

15.12.095 Structural treatment control BMP maintenance requirement.

A. Every person owning property which includes a structural treatment control best management practice (BMP), installed pursuant to a city approved Storm Water Management Plan, shall:
   1. Insure that each and every city approved structural treatment control BMP is operating effectively and has been adequately maintained; and,
   2. Provide an annual verification of the effective operation and maintenance of each and every city approved structural treatment control BMP by the party responsible for the maintenance of the structural treatment control BMP. The annual verification shall be submitted to the enforcement official in a format as approved by the city prior to the start of the rainy season.

Formatted: Indent: Left: 0.38", Tabs: 0.63", Left + Not at 0.38"

B. The enforcement official shall have the authority to conduct an inspection of any property containing a city approved structural treatment control BMP to enforce the provision of this section in accordance with the inspection provisions specified in section 15.12.100 and 15.12.110 of this chapter.

15.12.100 Authority to inspect.

A. During normal and reasonable hours of operation, the enforcement official shall have the authority to conduct an inspection to enforce the provisions of this chapter, and to ascertain whether the requirements of this chapter are being met. The enforcement official has the authority to inspect all publicly visible and accessible areas during reasonable times without the permission of the property owner or representative, as long as those areas are not specifically designated as no public access areas. If inaccessible or limited access areas are to be inspected, an inspection may be conducted after the enforcement official has presented the proper credentials and the owner, occupant, and or facility operator authorizes entry. If the enforcement official is unable to locate the owner or other persons having charge or control of the premises, or the owner, occupant, and/or facility operator refuses the request for entry, the City of Carlsbad is empowered to seek assistance from any court of competent jurisdiction in obtaining entry.

After obtaining authorized entry to a business or facility, the enforcement official may:

1. Inspect the premises at all reasonable times.
2. Carry out any sampling activities or install devices to conduct sampling or metering operations necessary to enforce this chapter, including taking samples from the property which the enforcement official reasonably believes is currently, or has in the past, caused or contributed to causing an illegal storm water discharge to the storm water conveyance system. Upon request by the property owner or his or her authorized representative, split samples shall be given to the person from whose property the samples were obtained.
3. Conduct tests, analyses and evaluations to determine whether a discharge of storm water is an illegal discharge or whether the requirements of this chapter are met.
4. Photograph any effluent stream, material or waste, material or waste container, container label, vehicle, waste treatment process, waste disposal site connection, or condition believed to contribute to storm water pollution or constitute a violation of this chapter.
5. Review and obtain a copy of the Industrial Activity Storm Water Pollution Prevention Plan, the hazardous materials release response plan and inventory, and/or any other documents, permits, manifests, logs or records that may be required of the facility from local, state or federal laws, regulations or codes in order to conduct operations or business on the premises.
6. Require the facility operator to retain evidence, as instructed by the enforcement official, for a period not to exceed thirty days.
7. Review and obtain copies of all storm water monitoring data compiled by the facility, if such monitoring is required of the facility. (Ord. NS-624 □9, 2002: Ord. NS-394 □2 (part), 1997)

15.12.110 Inspection procedures - Additional requirements.

During the inspection, the enforcement official shall comply with all reasonable security, safety, and sanitation measures. In addition, the enforcement official shall comply with reasonable precautionary measures specified by the owner and/or occupant or facility operator.

At the conclusion of the inspection, and prior to leaving the site, the enforcement official shall make every reasonable effort to review with the owner and/or occupant or the facility operator each of the violations noted by the enforcement official and any corrective actions that may be necessary. A report listing any violation found by the enforcement official during the inspection shall be kept on file by the enforcement agency. An inspection report shall be provided to the

owner and/or occupant or facility operator, or left at the premises after being signed by a designated representative of the facility. If corrective action is required, then the occupant, facility owner, and/or facility operator shall implement corrective actions based upon a written corrective action plan. The corrective action plan shall be submitted to the enforcement agency for review and approval and should state the corrective actions to be taken and the expected dates of completion. Failure to implement a corrective action plan constitutes a violation of this chapter.

All enforcement officials shall have adequate identification. Enforcement officials and other authorized personnel shall identify themselves when entering any property for inspection purposes or when inspecting the work of any contractor.

With the consent of the property owner or occupant, or pursuant to a search warrant, the enforcement official is authorized to establish on any property that discharges directly or indirectly to the municipal storm water conveyance system such devices as are necessary to conduct sampling or metering operations. During all inspections as provided herein, the enforcement official may take samples of materials, wastes, and/or effluent as deemed necessary to aid in the pursuit of the investigation or in the recordation of the activities onsite. 15.12.130 Testing, monitoring or mitigation requirements.

A. The enforcement official may require that any person engaged in any activity and/or owning or operating any facility which causes or contributes to storm water pollution or contamination, illegal discharges, prohibited discharges and/or discharge of non-storm water to the storm water conveyance system perform monitoring, including physical and chemical monitoring and/or analyses and furnish reports as the enforcement official may specify if:
   1. The person, or facility owner or operator, fails to eliminate illegal or prohibited discharges within a specified time after receiving a written notice to do so by the enforcement official;
   2. The enforcement official has documented repeated violations of this chapter by the person or facility owner or operator which has caused or contributed to storm water pollution.

      It is unlawful for such person or facility owner or operator to fail or refuse to undertake and provide the monitoring, analyses, and/or reports specified. Specific monitoring criteria shall bear a relationship to the types of pollutants which may be generated by the person□s activities or the facility□s operations. If the enforcement agency has evidence that a pollutant is originating from a specific source or premises, then the enforcement agency may require monitoring for that pollutant regardless of whether said pollutant may be generated by routine activities or operations. The person or facility owner or operator shall be responsible for all costs of these activities, analyses and reports.
B. Any persons required to monitor pursuant to subsection A of this section, shall implement a storm water monitoring program including, but not limited to, the following:
   1. Routine visual monitoring for dry weather flows;
   2. Routine visual monitoring for spills which may pollute storm water runoff;

3. A monitoring log including monitoring date, potential pollution sources, as noted in parts 1 and 2 of this section B, and a description of the mitigation measures taken to eliminate any potential pollution sources;
4. All samples must be collected using approved procedures and guidelines as set forth by federal Environmental Protection Agency (EPA) approved protocols; and,
5. The samples must be analyzed by a State of California certified laboratory qualified to undertaken such analyses.

C. The enforcement official may require a person, or facility owner or operator, to install or implement storm water pollution reduction or control measures, including, but not limited to, process modification to reduce the generation of pollutants if:
1. The person, or facility owner or operator fails to eliminate illegal or prohibited discharges after receiving a written notice from the enforcement official;
2. The person, or facility owner or operator, fails to implement a storm water pollution prevention plan, as required by the enforcement official; or,
3. The enforcement official has documented repeated violations of this chapter by any such person or facility owner or operator which has caused or contributed to storm water pollution.

D. If testing, monitoring or mitigation required pursuant to this chapter are deemed no longer necessary by the enforcement official, then any or all of the requirements contained in subsections A, B, and C of this section may be discontinued.

E. A storm water monitoring program prepared and implemented pursuant to any state-issued NPDES General Permit shall be deemed to meet the requirements of a monitoring program for the purposes of this chapter. (Ord. NS-624 □11, 2002: Ord. NS-394 □2 (part), 1997)

15.12.140 Concealment.
Causing, permitting, aiding, abetting or concealing a violation of any provision of this chapter is unlawful and shall constitute a separate violation of this chapter. (Ord. NS-394 □2 (part), 1997)

15.12.150 Administrative code enforcement powers and procedures.
The enforcement agency and enforcement official can exercise any code enforcement powers and procedures as provided in Title 1 of this code. In addition to the general enforcement powers and procedures provided in Title 1 of this code, the enforcement agency and enforcement official have the authority to utilize the following administrative remedies as may be necessary to enforce this chapter:

A. Cease and Desist Orders. When the enforcement official finds that a discharge has taken place or is likely to take place in violation of this chapter, the enforcement official may issue an order to cease and desist such discharge, practice, or operation likely to cause such discharge and direct that those persons not complying shall:
1. Comply with the applicable provisions and policies of this chapter;
2. Comply with a time schedule for compliance; and,
3. Take appropriate remedial or preventive action to prevent the violation from recurring.

B. Notice to Clean, Test and/or Abate. Whenever the enforcement official finds any oil, earth, dirt, grass, weeds, dead trees, tin cans, rubbish, refuse, waste or any other material of any kind, in or upon the sidewalk abutting or adjoining any parcel of land, or upon any parcel of land or grounds, which may result in an increase in pollutants entering the city□s storm water conveyance system or a non-storm water discharge to the city□s storm water conveyance system, the enforcement official may issue orders and give written notice to remove same in any reasonable manner. The recipient of such notice shall undertake the activities as described in the notice.

C. Stop Work Orders. Whenever any work is being done contrary to the provisions of this chapter, the enforcement official may order the work stopped by notice in writing served on

Deleted: .
Deleted: □
Deleted:
Deleted:

any person engaged in performing or causing such work to be done, and any such person shall immediately stop such work until authorized by the enforcement official to proceed with the work.

D. Permit or License Suspension, Denial or Revocation. Violations of this chapter may be grounds for permit or license suspension or revocation, including but not limited to building permits, right-of-way permits, grading permits and conditional use permits.

E. Civil Penalties. Any person who violates any of the provisions of this chapter, fails to prepare or implement a corrective action plan when requested by the enforcement official, fails to implement a storm water monitoring plan, violates any cease and desist order or notice to clean and abate, or fails to adopt or implement a storm water pollution prevention plan as directed by the enforcement official shall be liable for a civil penalty not to exceed two thousand five hundred dollars for each day such a violation exists. The responsible party shall be charged for the full costs of any investigation, inspection, or monitoring survey which led to the detection of any such violation, for abatement costs, and for the reasonable costs of preparing and bringing legal action under this subsection. In addition to any other applicable procedures, the enforcement agency may utilize the lien procedures listed in Section 15.12.150(F) to enforce the responsible party's liability. The responsible party may also be liable for compensatory damages for impairment, loss or destruction to water quality, wildlife, fish and aquatic life.

Deleted: or who

Deleted: violator

Deleted: violator's

Deleted: violator

F. The enforcement official shall take all appropriate legal steps to collect these obligations, including referral to the city attorney for commencement of a civil action to recover said funds. If collected as a lien, the enforcement official shall cause a notice of lien to be filed with the county recorder, inform the county auditor and county recorder of the amount of the obligation, a description of the real property upon which the lien is to be recovered, and the name of the agency to which the obligation is to be paid. Upon payment in full, the enforcement official shall file a release of lien with the county recorder.

Deleted:

G. Environmental Code Enforcement Civil Penalties Fund. Civil penalties collected pursuant to this chapter shall be deposited in the Environmental Code Enforcement Civil Penalties Fund as established by the city manager for the enhancement of the city's code enforcement efforts, environmental public outreach or education, environmental improvement grants, and/or to reimburse city departments for investigative costs and costs associated with the hearing process that are not paid by the responsible party. Civil penalties deposited in this fund shall be appropriated and allocated in a manner determined by the city manager. The city auditor shall establish accounting procedures to ensure proper account identification, credit and collection. (Ord. NS-624 12, 2002: Ord. NS-394 2 (part), 1997)

Deleted: person or violator

15.12.160 Administrative notice, hearing, and appeal procedures.

A. Unless otherwise provided herein, any notice required to be given by the enforcement official under this chapter shall be in writing and served in person or by registered or certified mail. If served by mail, the notice shall be sent to the last address known to the enforcement official. Where the address is unknown, service may be made upon the owner of record of the property involved. Such notice shall be deemed to have been given at the time of deposit, postage prepaid, in a facility regularly serviced by the United States Postal Service whether or not the registered or certified mail is accepted.

B. When the enforcement official determines that a violation of one or more provisions of this chapter exists or has occurred, any violator(s) or property owner(s) of record shall be served by the enforcement official with a written notice and order. The notice and order shall state the municipal code section violated, describe how violated, the location and date(s) of the violation(s), and describe the corrective action required. The notice and order shall require immediate corrective action by the violator(s) or property owner(s) and explain which method(s) of administrative enforcement are being utilized by the enforcement official: cease

and desist order, notice to clean and abate, establishment of a storm water pollution prevention plan, and/or establishment of an employee training program. The notice and order shall also explain the consequences of failure to comply, including that civil penalties shall begin to immediately accrue if compliance is not achieved within ten days from the date the notice and order is issued. The notice and order shall identify all hearing rights. The enforcement official may propose any enforcement action reasonably necessary to abate the violation.

C. If the violation(s) is not corrected within ten days from the date the notice and order is issued, the enforcement official shall request the city manager to appoint a hearing officer and fix a date, time, and place for hearing. The enforcement official shall give written notice thereof to the violator(s) or owner(s) of record, at least ten days prior to the date for hearing.

1. The hearing officer shall consider any written or oral evidence presented to determine whether the violation(s) exists, a corrective action plan should be required, a cease and desist order should be required, a notice to clean and abate should be required, a storm water pollution prevention plan should be required, an employee training program should be required, and/or civil penalties should be imposed, consistent with rules and procedures for the conduct of hearings and rendering of decisions established and promulgated by the city manager.
2. In determining whether action should be taken or the amount of a civil penalty to be imposed, the hearing officer may consider any of the following factors:
   a. Duration of the violation(s).
   b. Frequency or recurrence.
   c. Seriousness. Deleted:
   d. History. Deleted:
   e. Violator's conduct after notice and order.
   f. Good faith effort to comply.
   g. Economic impact of the penalty on the violator(s). Deleted:
   h. Impact of the violation on the community. Deleted:
   i. Any other factor which justice may require.
3. If the violator(s) or owner(s) of record fail to attend the hearing, it shall constitute a waiver of the right to a hearing and adjudication of all or any portion of the notice and order.
4. The hearing officer shall render a written decision within ten days of the close of the hearing, including findings of fact and conclusions of law, identifying the time frame involved and the factors considered in assessing civil penalties, if any. The decision shall be effective immediately unless otherwise stated in the decision. The hearing officer shall cause the decision to be served on the enforcement official and all participating violators or owners of record.
5. If the persons assessed civil penalties fail to pay them within the time specified in the hearing officer's decision, the unpaid amount constitutes either a personal obligation of the person assessed or a lien upon the real property on which the violation occurred, in the discretion of the enforcement official. If the violation(s) is not corrected as directed the civil penalty continues to accrue on a daily basis. Civil penalties may not exceed one hundred thousand dollars in the aggregate. When the violation is subsequently corrected, the enforcement official shall notify the violator(s) and/or owner(s) of record of the outstanding civil penalties and provide an opportunity for hearing if the amount(s) is disputed within ten days from such notice.
6. The enforcement official shall take all appropriate legal steps to collect these obligations, including referral to the city attorney for commencement of a civil action to recover said funds. If collected as a lien, the enforcement official shall cause a notice of lien to be filed with the county recorder, inform the county auditor and county recorder of the amount of

the obligation, a description of the real property upon which the lien is to be recovered, and the name of the agency to which the obligation is to be paid. Upon payment in full, the enforcement official shall file a release of lien with the county recorder. (Ord. NS-394 □2 (part), 1997)

15.12.170 Judicial enforcement.

A. Criminal Penalties. Any person who violates any provision of this chapter or who fails to implement a storm water monitoring plan, violates any cease and desist order or notice to clean and abate, or fails to adopt or implement storm water pollution prevention plans or employee training programs as directed by the enforcement official shall be punished, upon conviction, by a fine not to exceed one thousand dollars for each day in which such violation occurs, or imprisonment in the San Diego County jail for a period not to exceed six months, or both.

B. Injunction/Abatement of Public Nuisance. Whenever a discharge into the storm water conveyance system is in violation of the provisions of this chapter or otherwise threatens to cause a condition of contamination, pollution, or nuisance, the enforcement official may also cause the city to seek a petition to the Superior Court for the issuance of a preliminary or permanent injunction, or both, or an action to abate a public nuisance, as may be appropriate in restraining the continuance of such discharge.

C. Other Civil Action. Whenever a notice and order, notice of determination, hearing officer□s decision or city council□s decision is not complied with, the city attorney may, at the request of the enforcement official, initiate any appropriate civil action in a court of competent jurisdiction to enforce such notice and order and decision, including the recovery of any unpaid storm drain fees and/or civil penalties provided herein. (Ord. NS-624 □13, 2002: Ord. NS-394 □2 (part), 1997)

Deleted: or

15.12.180 Violations deemed a public nuisance.

In addition to the other civil and criminal penalties provided herein, any condition caused or permitted to exist in violation of any of the provisions of this chapter is a threat to the public health, safety, and welfare and is declared and deemed a public nuisance, which may be summarily abated and/or restored as directed by the enforcement official in accordance with the procedures identified in Chapter 6.16. A civil action to abate, enjoin or otherwise compel the cessation of such nuisance may also be taken by the city, if necessary.

The full cost of such abatement and restoration shall be borne by the owner of the property and shall be a lien upon and against the property in accordance with the procedures set forth in Section 15.12.150(F). (Ord. NS-624 □14, 2002: Ord. NS-394 □2 (part), 1997)

15.12.190 Remedies not exclusive.

Remedies set forth in this chapter are not exclusive but are cumulative to all other civil and criminal penalties provided by law, including, but not limited to, penalty provisions of the Federal Clean Water Act and/or the state Porter-Cologne Water Quality Control Act. The Porter-Cologne Water Quality Control Act is California Water Code Section 13000 et seq., and any future amendments. The seeking of such federal and/or state remedies shall not preclude the simultaneous commencement of proceedings pursuant to this chapter. (Ord. NS-468 □7, 1999: Ord. NS-394 □2 (part), 1997)

Page 96: [1] Deleted **02/03/2008 8:48:00 PM**

G. Development means:

1. The placement or erection of any solid material or structure on land, in water, or under water;
2. The discharge or disposal of any dredged material or of any gaseous, liquid, solid, or thermal waste;
3. The grading, removing, dredging, mining, or extraction of any materials;
4. A change in the density or intensity of the use of land, including, but not limited to, a subdivision pursuant to the Subdivision Map Act (Government Code Section 66410, et seq.) and any other division of land, including lot splits, except where the division of land is brought about in connection with the purchase of such land by a public agency for public recreational use;
5. A change in the intensity of the use of water, or of access to water.
6. The construction, reconstruction, demolition, or alteration of the size of any structure, including any facility of any private, public, or municipal entity; and
7. The removal or harvesting of major vegetation other than for agricultural purposes. As used in this definition, structure includes, but is not limited to, any building, road, pipe, flume, conduit, siphon, aqueduct, telephone line, and electrical power transmission and distribution line. (Source: Government Code Section 65927).

H

Page 96: [2] Deleted **02/03/2008 8:49:00 PM**

L. Illicit connection means any physical connection (pipe, facility, or other device) to the storm water conveyance system permitted or unpermitted by the city of Carlsbad, which drains illegal discharges either directly or indirectly into a storm water conveyance system.

N. Maximum extent practicable (MEP) means, with respect to best management practices (BMPs), an individual BMP or group of BMPs which reduces or eliminates the discharge of a pollutant of concern, which have a cost of implementation reasonably related to the pollution control benefits achieved, and which are technologically feasible.

O. National Pollution Discharge Elimination System (NPDES) Permit means a permit issued by the Regional Water Quality Control Board or the State Water Resources Control Board pursuant to Chapter 5.5, Division 7 of the California Water Code, to control discharges from point sources to waters of the United States, including, but not limited to:

1. California Regional Water Quality Control Board NPDES Permit No. CASO108758, Order 2001-01 and any amendment, revision or reissuance to it;
2. General Permit for Storm Water Discharges Associated with Industrial Activities (NPDES No. CAS 000001, Order No. 97-03-DWQ);
3. NPDES General Permit for Storm Water Discharges Associated with Construction Activity (Permit No. 99-08-DWQ, NPDES General Order No. CAS000002); and

4. California Regional Water Quality Control Board, San Diego Region, General De-Watering Permits (Order Numbers 91-10 and 90-31).

P. Non-storm water discharge means any discharge to the storm water conveyance system that is not entirely composed of storm water.

Q. NPDES General Permit means a permit issued by the State Water Resources Control Board, including, but not limited to:

1. NPDES General Permit for Storm Water Discharges Associated with Industrial Activities; and
2. NPDES General Permit for Storm Water Discharges Associated with Construction Activity (Permit No. 99-08-DWQ, NPDES General Order No. CAS000002).

R

Page 96: [6] Deleted **11/04/2007 7:33:00 PM**

T. Pollutant means and includes, but is not limited to, solid waste, sewage, garbage, medical waste, wrecked or discarded equipment, radioactive materials, dredged spoil, rock, sand, sediment, silt, industrial waste, and any organic or inorganic substance defined as a pollutant under 40 C.F.R. 122.2 whose presence degrades the quality of the receiving waters in violation of basin plan and California ocean plan standards such as fecal coliform, fecal streptococcus, enterococcus, volatile organic carbon, surfactants, oil and grease, petroleum hydrocarbons, total organic carbon, lead, copper, chromium, cadmium, silver, nickel, zinc, cyanides, phenols, fertilizers, pesticides, herbicides and other biocides.

A pollutant also includes any contaminant which degrades the quality of the receiving waters in violation of basin plan and California ocean plan standards by altering any of the following parameters: pH, total suspended and settleable solids, biochemical oxygen demand (BOD), chemical oxygen demand (COD), nutrients, temperature and other narrative standards of the basin plan.

U

Page 96: [7] Deleted **02/03/2008 8:49:00 PM**

V. Receiving waters means surface bodies of water which serve as receiving points for discharges from the storm water conveyance system, including Encinas Creek, Batiquitos Lagoon, Agua Hedionda Lagoon and Buena Vista Lagoon and their tributary creeks, reservoirs, lakes, estuaries, and the Pacific Ocean.

Page 97: [8] Deleted **11/04/2007 7:46:00 PM**

W. Storm water means surface runoff and drainage associated with storm events and snow melt that flows across a surface to the storm water conveyance system or receiving waters.

For the purposes of this chapter, storm water runoff and drainage from areas that are in a natural state, have not been significantly disturbed or altered, either directly or indirectly, as a result of human activity, and the character and type of pollutants naturally appearing in the runoff have not been significantly altered, either directly or indirectly, as a result of human activity, shall be considered unpolluted and shall satisfy the definition of storm water in this chapter.

X. Storm water conveyance system means private, natural and publicly owned facilities within the city of Carlsbad by which storm water may be conveyed to receiving waters of the United States, including any roads with drainage systems, streets, catch basins, curbs, gutters, ditches, pipes, natural and man-made channels or storm drains.

Y. Storm water pollution prevention plan means a document which describes the on-site program activities to eliminate or reduce to the maximum extent practicable,

pollutant discharges to the storm water conveyance system primarily through the application and use of BMPs.

A storm water pollution prevention plan prepared and implemented pursuant to any NPDES Storm Water Permit shall meet the definition of a storm water pollution prevention plan for the purposes of this chapter.

Z. System means storm water conveyance system, as defined herein.

AA. Wet season means the period of time between October 1 through April 30.

Deleted: 15.16.090 Information on grading plans, specifications and engineering reports.

15.16.010 Title.

A. This chapter shall be known as the Grading Ordinance.(Ord. NS-385 4 (part), 1996)

15.16.020 Purpose.

A. The purpose of this chapter is to establish minimum requirements for grading, including clearing and grubbing of vegetation, to provide for the issuance of ministerial permits and to provide for the enforcement of the requirements. These provisions are supplementary and additional to Title 20, Subdivisions, and Title 21, Zoning, of this code and shall be read and construed as an integral part of these titles and the land development patterns and controls established thereby. It is the intent of the city council to protect life and property and promote the general welfare; enhance and improve the physical environment of the community; and preserve, subject to economic feasibility, the natural scenic character of the city. The provisions of this chapter shall be administered to achieve the intent expressed above and, to the maximum extent feasible, the following goals:
   1. Facilitate the planning, design and construction of development sites to maximize safety and human enjoyment while protecting, insofar as possible, the surrounding natural environment;
   2. Ensure compatibility of graded land development sites with surrounding land forms and land uses;
   3. Prevent unnecessary and unauthorized grading, including clearing and grubbing of vegetation, on property within Carlsbad;
   4. Preserve natural plant communities and existing mature trees;
   5. Preserve significant cultural and archaeological sites;

6. Promote the rapid restoration of graded slopes with fire resistant, drought tolerant landscaping that is aesthetically pleasing and which enhances adjacent habitat values; and
7. Protect public and private property, storm water conveyance systems, downstream riparian habitats, waterways, wetlands, and lagoons by controlling soil erosion, sedimentation and other potential adverse impacts caused by grading operations or which result as a consequence of the increased rate of surface water runoff from graded sites. (Ord. NS-623 □1, 2002: Ord. NS-385 □4 (part), 1996)

15.16.030 City engineer authority.

A. This chapter shall be administered by the city engineer who shall have the authority and responsibility to:
   1. Establish the form and procedures for application for grading permits required pursuant to this chapter including the certification of completed applications, the approval of grading plans, Construction SWPPPs, the establishment of files, the processing of secured grading and erosion control agreements and the collection of fees and security deposits;
   2. Interpret the provisions of this chapter and advise the public regarding requirements for grading plans, Construction SWPPPs, specifications and special provisions;
   3. Establish the format and content of grading plans, Construction SWPPPs, specifications and special provisions pursuant to the provisions of this chapter;
   4. Establish and promulgate city standards to govern grading and storm water pollution prevention work in accordance with good engineering practice pursuant to the provisions of this chapter;
   5. Issue permits and approve amendments, including extensions, to permits found to conform with this chapter and applicable city standards and the landscape manual;
   6. Issue and maintain permanent records of determinations of exemption authorized by Section 15.16.060;
   7. Approve grading and erosion control agreements;
   8. Accept surety bonds and other forms of security in connection with grading and erosion control agreements;
   9. Monitor compliance of all grading work with city codes, city standards and any limitations of the grading permit;
   10. Record notices of grading violation and/or take other administrative actions against violators of the provisions of this chapter; and
   11. Grant authority to appropriate members of the city engineer□s staff to act on behalf of the city engineer with regard to any aspect of the administration of the provisions of this chapter. (Ord. NS-385 □4 (part), 1996)

15.16.040 Definitions.

Whenever the following words, terms or phrases are used in this chapter they shall be construed as defined in the following subsections unless from the context in which the word, term, or phrase is used a different meaning is specifically defined or intended.

A. □Civil engineer□means a professional engineer in the branch of civil engineering holding a valid certificate of registration issued by the state of California.

B. □Clearing and grubbing of vegetation□means the removal of any and all types of vegetation, roots, stumps or other plant material and the clearing or breaking up of the surface of the land by digging or other means.

C. □Default□means the condition or situation which results when an applicant fails to perform in compliance with the terms and requirements of the grading and erosion control agreement required pursuant to Section 15.16.140 of this chapter.

Deleted: and erosion control

Deleted: and erosion control

Deleted: 3

Deleted: 4

D. Engineer-of-work means the civil engineer responsible for the preparation of the grading and/or construction plans, for the certification of the completed work and preparation of the record plans.

E. Excavation means the cutting, digging, removal, displacement or any other movement of soil, sand, gravel, rock or other similar material from its natural or preexisting location upon or beneath the surface of the earth by the direct action of humans and/or human invention.

F. Fill means the depositing of soil, sand, gravel, rock, or other similar materials upon or beneath the surface of the earth by the direct action of humans and/or human invention.

G. Finished grade means the vertical location of the ground surface upon completion of any excavation or fill.

H. Geologist means a person holding a valid certificate of registration as a geologist in the specialty of engineering geology issued by the state of California under provisions of the Geologist Act of the Business and Professions Code.

I. Grading means any excavation, fill, clearing and grubbing of vegetation or any combination thereof.

J. Grading permit means the document issued by the city engineer pursuant to Section 15.16.110, after having determined that the application demonstrates compliance with this chapter, city standards, the landscape manual, and all applicable portions of Titles 15, 19, 20 and 21 of this code.

K. Landscape manual means the landscape manual adopted by city council resolution which contains the policies and requirements for the design, construction and maintenance of landscape and irrigation systems constructed pursuant to a city development approval.

L. Site is any lot or parcel of land or contiguous combination thereof, under the same ownership, where grading is proposed or performed.

M. Soils engineer means a person holding a valid certificate of registration as an engineer in the specialty of soils engineering issued by the state of California under the provisions of the Business and Professions Code.

N. Uncontrolled stockpile means any fill placed on land for which no soil testing was performed or no compaction reports or other soil reports were prepared or submitted.

In addition to the above defined words, terms and phrases, the definition of words, terms and phrases, as described in Chapter 15.04, shall apply to this chapter.

(Ord. NS-623 2, 9, 10, 2002; Ord. NS-385 4 (part), 1996)

15.16.050 Grading permit required.

A. Except as provided in Section 15.16.060, no person shall do, or cause to be done, any grading, including clearing and grubbing of vegetation, without first having obtained a grading permit. (Ord. NS-385 4 (part), 1996)

15.16.060 Work exempt from grading permit.

A. A grading permit shall not be required for the following:
   1. An excavation below finished grade for basements and footings of a building, retaining wall or other structure authorized by a valid building permit. This shall not exempt any fill made with the material from such excavation nor exempt any excavation having an unsupported height greater than five feet after the completion of such structure.
   2. Cemetery graves.
   3. Refuse disposal sites controlled by other regulations.
   4. Excavations for wells or tunnels or utilities.
   5. Exploratory excavations under the direction of soil engineers or engineering geologists.

Deleted: 15

Deleted: 16

Deleted:
17. Jurisdictional Urban Runoff Mitigation Plan (JURMP) means a plan, prepared pursuant to Regional Water Quality Control Board NPDES Order No. 2001-02, to: 1) ensure that discharges from municipal runoff conveyance systems do not cause or contribute to degradation of water quality, 2) effectively prohibit urban discharges of illicit connections to the storm water conveyance system, and 3) reduce the discharge of pollutants from urban runoff conveyance systems to the maximum extent practicable. When used in the Carlsbad Municipal Code, this refers to the JURMP adopted by the city of Carlsbad.

Deleted:
18

Deleted: Standard Urban Storm Water Mitigation Plan (SUSMP) means a plan, prepared pursuant to Regional Water Quality Control Board NPDES Order No. 2001-01, to reduce pollutants and runoff flows from all new development and significant redevelopment projects that fall under priority project categories. When used in the Carlsbad Municipal Code, this refers to the SUSMP prepared by the city of Carlsbad

6. Grading on any site or contiguous sites held under one ownership in which the city engineer finds all of the following conditions exist:
   a. No cut or fill material exceeds three and one half feet in vertical depth at its deepest point measured from the existing ground surface. The city engineer may waive this requirement for grading work which is not intended to support a building structure;
   b. No fill material is placed on an existing slope steeper than five units horizontal to one vertical;
   c. The grading work does not adversely affect the existing drainage pattern;
   d. The toe of any fill slope or top of any cut slope is no closer than one foot to an exterior property line; and
   e. The amount of soil material moved does not exceed one hundred cubic yards.
7. Grading in an isolated, self-contained area if the city engineer finds that no danger to private or public property can now or hereafter result from grading operations.
8. Grading on a site which has been previously graded to provide a relatively flat pad area, suitable for development, where the city engineer finds all of the following to exist:
   a. The proposed grading work complies with all of the environmental protection procedures described in Chapter 19.04 of this code;
   b. The proposed grading will not adversely affect existing drainage patterns or result in a condition which may cause damage to adjacent property; and
   c. The proposed grading work is performed concurrent with the site preparation work done in connection with a building permit issued pursuant to Chapter 18.04 of this code and does not require a Hillside Development Permit (HDP) or a Coastal Development Permit (CDP).
   d. Best management practices (BMPs) for erosion control construction activities have been incorporated into the construction documents and site design.
9. Clearing and grubbing of vegetation done for the purpose of routine landscape maintenance, the removal of dead or diseased trees or shrubs or the removal of vegetation done upon order of the fire marshal to eliminate a potential fire hazard or for the abatement of weeds.
10. Clearing and grubbing of vegetation done preparatory to agricultural operations on land which has been used for agricultural purposes within the previous five years.
11. Construction of pavement surfaces less than five thousand square feet on natural or existing grade for the purposes of a private road or commercial, industrial or multi-residential parking lot or travel way.

B. All grading work, including any grading work exempted from the requirement of a grading permit as determined pursuant to subsection a of this section, shall be done in compliance with city standards and Titles 15, 19, 20 and 21 of this code, and within the coastal zone, shall also be consistent with all certified local coastal program provisions. (Ord. NS-623 □□3--6, 2002; Ord. NS-385 □4 (part), 1996)

15.16.065 Application for Grading Plan.

A. A separate application for a grading plan shall be made in advance of submittal for a grading permit.

Formatted: Bullets and Numbering

B. Each application for a grading plan review shall include a complete grading plan review application form, grading plans, specifications, engineering calculations, a soils investigation, a geotechnical report and other such documentation and information as may be necessary to demonstrate that the grading work will be carried out in substantial compliance with all city codes, City Standards and the requirements of the Landscape Manual. Each grading plan review application shall be accompanied by a Construction SWPPP prepared in accordance with the requirements of this chapter and City Standards.

C. The city engineer may waive submission of a geotechnical report or other required documents if the applicant clearly demonstrates that the nature of the grading work applied for is such that reviewing of such report or other documents is not necessary to obtain compliance with this code

D. A grading plan review fee shall be charged by the city for the processing of the grading plan review. The fee shall be established by resolution of the city council and is for the purpose of defraying the cost of processing the grading plan review. The grading plan review fee is in addition to any other plan review, inspection and permit issuance fees charged for the issuance of a grading permit or processing improvement plans and building plans or the issuance of permits thereto.

E. Grading plan applications for which city approval is not granted within one year following the date of application shall be deemed withdrawn. The grading plans and other documents submitted for review may thereafter be returned to the applicant or destroyed by the city engineer. The city engineer may extend the time for action by the applicant for a period not exceeding one hundred eighty days upon request by the applicant showing that circumstances beyond the control of the applicant have prevented action from being taken. No application shall be extended more than once. In order to renew action on an application after withdrawal, the applicant shall resubmit a new application and pay a new grading plan review application fee.

F. The city engineer may authorize refunding of not more than eighty percent of the grading plan review fee paid when an application for a grading plan is withdrawn in accordance with this section. The city engineer shall not authorize refunding of any fee paid except upon written application filed by the original permittee not later than sixty days after withdrawal of the grading plan application by the applicant, when withdrawn prior to completion of the grading plan review.

G. Any application in process on the effective date of this code amendment shall be subject to the provisions of this section. The filing date for such application shall be considered to be the effective date of the code amendment.

15.16.067 Information on grading plans, specifications and engineering reports.

A. All grading plans, specifications and engineering reports required for grading permit submittal shall be prepared in accordance with the following requirements:

1. Grading plans, specifications, engineering calculations and other relevant engineering data shall be prepared by a civil engineer. The grading plans shall be drawn to scale in accordance with City Standards and be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this chapter, City Standards, the Landscape Manual and Titles 15, 19, 20 and 21 of this code. All grading plans must include provisions for implementation and maintenance of all storm water pollution prevention measures identified in the Construction SWPPP prepared for the project, pursuant to Title 15 and City Standards.
2. Geotechnical investigation report(s) shall be based upon the proposed grading plan. The geotechnical investigation report(s) shall include an adequate description of the geology of the site and conclusions and recommendations regarding the effect of geologic conditions on the proposed development. Recommendations included in the report shall be consistent with the provisions of this chapter and City Standards and shall be incorporated into the grading plans and/or specifications.
3. Preliminary soils investigations and reports shall be based upon the proposed grading plan. Such report shall include data regarding the nature, distribution and strength of existing soil types at the proposed grading site, recommendations for grading procedures and design criteria for corrective measures, if required by the soils engineer.

Formatted: Indent: Left: 0.38", Hanging: 0.25"

Recommendations included in the report and approved by the city engineer shall be incorporated into the grading plans and/or specifications.

15.16.070 Application for grading permit.

A. To obtain a grading permit, the applicant shall first file an application therefore in writing on a form furnished by the city engineer for that purpose. Every such application shall:
   1. Identify and describe the work to be covered by the grading permit for which the application is made;
   2. Describe the land on which the proposed work is to be done by legal description, street address, and/or similar description that will readily identify and definitely locate the proposed grading work;
   3. State the quantity of excavation and fill for the proposed grading work including the amount of excavation or fill to be imported to or exported from the grading site;
   4. State the name, address, telephone number and state of California certification number of the engineer-of-work, soils engineer and geotechnical engineer who prepared the grading plan, soils report and geotechnical report for the proposed grading work;
   5. State the name, address, telephone number, state contractors license number and Carlsbad business license number for the contractor who will perform the grading work;
   6. State the name, address and telephone number of the property owner upon whose property the work will be done and the applicant requesting the grading permit;
   7. Be signed by the applicant and property owner or their authorized agent(s); and
   8. Give other such information as may be required by the city engineer.

B. Each grading permit application shall be accompanied by:
   1. Grading plans, specifications, calculations, reports and other data as required in Section 15.16.080;
   2. Proof of all other applicable discretionary approvals, including a site plan approved in accordance with such prior discretionary approvals, if any, pursuant to Title 20 or 21, except where:
      a. The grading work is necessary to complete a major arterial roadway or other major public facility, will significantly reduce the need to haul fill material over public roads, or is incidental to the grading for another project which has obtained all appropriate development approvals in accordance with Titles 20 and 21 of this code, or
      b. The grading work is found by the planning director to be reasonably consistent with the future development of the site pursuant to the site's existing general plan land use classification;
   3. A completed environmental impact assessment form or submittal of other environmental documentation which demonstrates compliance with the California Environmental Quality Act (CEQA) and Title 19 of this code;
   4. All appropriate documentation evidencing the applicant's right to enter upon and grade property not within the ownership of the person signing the grading permit application form;
   5. An agreement for uncontrolled stockpile, if required, signed by the property owner with appropriate signature notarization; and
   6. A grading permit application fee in an amount as established by the city council by resolution. A separate plan review and/or inspection fee shall apply to retaining walls, Construction SWPPP or major drainage structures as provided for elsewhere in this code. There shall be no separate charge for standard terraced drains and similar facilities. If during the grading plan review the grading quantities, upon which the grading plan fee is based, are changed, the applicant shall pay any supplemental fee required or receive a credit against the payment of the grading permit fee. (Ord. NS-385 4 (part), 1996)

Deleted: , respectively,

15.16.080 Grading Permit Submittal documents.

A. Each application submittal for a grading permit shall be accompanied by city approved grading plans, city approved Construction SWPPP and other such documentation and information as may be necessary to demonstrate that the grading work will be carried out in substantial compliance with all city codes, City Standards and the requirements of the Landscape Manual.

B. The number of copies and format of the submittal documents required pursuant to this chapter shall be as prescribed by the city engineer.

C. All documents shall, upon submittal to the city engineer, become the property of the city and shall be kept on file with the city engineer. (Ord. NS-385 4 (part), 1996)

15.16.085 Construction Storm Water Pollution Prevention Plan (SWPPP).

A. Each grading permit issued shall be accompanied by a Construction SWPPP prepared in accordance with City Standards and approved by the city engineer.

B. The city engineer may also require preparation of a Construction SWPPP, in accordance with City Standards, for any person conducting development or other construction activity, including grading activities which are exempt from a grading permit, in order to reduce the risk of contamination of storm water and the discharge of non-storm water pollutants to the city s storm water conveyance system.

C. Construction activities that have no potential to add pollutants to storm water or non-storm water runoff may be exempt from the preparation of a Construction SWPPP, pursuant to the Construction SWPPP exemption requirements of City Standards and the Municipal Permit. Any construction activity exempted from the preparation of a Construction SWPPP must still comply with the storm water pollution prevention requirements of city standards at all times during construction.

D. Each Construction SWPPP shall be prepared in a form and include the content as specified in City Standards and shall be made to comply with all other applicable NPDES Permit requirements.

E. Construction SWPPP review and inspection fees shall be charged by the city for the processing of the plan review and field inspection of the construction work. The fee shall be established by resolution of the city council and is for the purpose of defraying the cost of processing the plan review and ensuring compliance with the Construction SWPPP during construction. The Construction SWPPP review and inspection fees are in addition to any other plan review, inspection and permit issuance fees charged for processing grading plans, improvement plans and building plans or the issuance of permits thereto.

F. The processing time limits, application withdrawal and refund provisions of section 15.16.082 subsections C through D shall be applicable to the processing of an application for a Construction SWPPP.

(Ord. NS-623 7, 2002; Ord. NS-385 4 (part), 1996)

15.16.100 Withdrawal of grading permit applications.

A. Applications for which no grading permit is issued within two hundred forty days following the date of application shall be deemed withdrawn. Plans and other documents submitted for review may thereafter be returned to the applicant or destroyed by the city engineer. The city engineer may extend the time for action by the applicant for a period not exceeding one hundred eighty days upon request by the applicant showing that circumstances beyond the

Deleted: 15.16.090 Information on grading plans, specifications and engineering reports.

A. All grading plans, specifications and engineering reports required for grading permit submittal shall be prepared in accordance with the following requirements:

1. Grading plans, specifications, engineering calculations and other relevant engineering data shall be prepared by a civil engineer. The grading plans shall be drawn to scale in accordance with city standards and be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this chapter, city standards, the landscape manual and Titles 19, 20 and 21 of this code. All grading plans must include provision for protective measures for the control of urban pollutants, erosion and sedimentation in accordance with the requirements of this chapter, and city standards, including but not limited to the city Standard Urban Storm Water Mitigation Plan (SUSMP).

2. Geotechnical investigation reports shall be based upon the proposed grading plan. The geotechnical investigation report shall include an adequate description of the geology of the site and conclusions and recommendations regarding the effect of geologic … [1]

control of the applicant have prevented action from being taken. No application shall be extended more than once. In order to renew action on an application after withdrawal, the applicant shall resubmit a new application and pay a new grading permit application fee.

B. The city engineer may authorize refunding of not more than eighty percent of the grading permit application fee paid when an application for a grading permit is withdrawn in accordance with this section. The city engineer shall not authorize refunding of any fee paid except upon written application filed by the original permittee not later than sixty days after withdrawal of the grading permit application by the applicant or by action of this section.

C. Any application in process on the effective date of this code amendment shall be subject to the provisions of this section. The filing date for such application shall be considered to be the effective date of the code amendment. (Ord. NS-385 4 (part), 1996)

Deleted: The city engineer may waive any or all of the grading permit application fee when a resubmitted application is accompanied by a grading plan which has been previously signed and approved by the city engineer. The amount of the waiver shall be determined by the city engineer based upon the estimated amount of work required to complete review of the grading permit.

Deleted: , when withdrawn prior to completion of the grading plan review

15.16.110 Grading permit issuance.

A. Following submittal of a completed grading permit application and completion of the following requirements, the city engineer shall issue a grading permit:
   1. Approval and signature of the grading plans by the city engineer;
   2. Payment of the grading permit application fee required pursuant to Section 15.16.070(B)(6);
   3. Submittal of a fully executed grading and erosion control agreement together with the required cash and/or other securities;
   4. Approval of a Construction SWPPP prepared in accordance with this chapter and city standards;
   Submittal of proof of valid Coastal Development Permit, Stream Alteration Permit, Army Corps Permit, National Pollutant Discharge Elimination System Permit or other permits, if any, required by other departments or agencies with competent authority; and
   Completion of all environmental documentation in accordance with Chapter 19.04 of this code.

Deleted: 3. Payment of a grading permit fee in an amount as determined by city council resolution;

Deleted: 4

Deleted: 5

Deleted: 6

B. The issuance or granting of a grading permit or approval of grading plans, specifications and computations shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this chapter or any other chapter of this code. Permits presuming to give authority to violate or cancel the provisions of this chapter or any other chapter of this code shall not be valid.

C. The issuance of a grading permit based on approved grading plans, Construction SWPPP, specifications and other data shall not prevent the city engineer from thereafter requiring correction of errors in said plans, specifications and other data, or from preventing grading operations being carried on thereunder when in violation of this chapter or any other chapter of this code. (Ord. NS-385 4 (part), 1996)

1540

15.16.120 Grading permit limitations, requirements and procedures.

A. All grading permits shall be subject to the following limitations, requirements and procedures:
   1. Scope of Work; Amendments. Issuance of a grading permit shall constitute authorization to do only that work which is described on the application for the permit and detailed on the grading plans and specifications approved by the city engineer in accordance with the provisions of this chapter. No approved grading plans or specifications may be modified without approval by the city engineer of a revised grading plan. Application for the revision of a grading plan shall be submitted to the city engineer on the prescribed form, accompanied by a grading plan revision fee in the amount set forward in the fee schedule approved by city council resolution. Modifications which substantially affect the basic tract design or land use as described on any prior discretionary approvals, issued pursuant to Titles 20 and 21 of this code, must have the approval of the appropriate approving authority.

2. Jurisdictions of Other Agencies. Permits issued under the provisions of this chapter shall not relieve the owner of the responsibility for securing permits or licenses that may be required from other departments or divisions of all governing agencies.
3. Time Limits; Extensions. The permittee shall fully perform and complete all of the work required to be done pursuant to the grading permit within the time limit specified therein or, if no time is so specified, within one hundred eighty days after the date of issuance of the permit. The specified time limit may be extended by action of the city engineer upon written request of the permittee, owner or surety showing that good and sufficient cause has prevented the permittee from completing the grading work within the allotted time limit. All such extension requests shall be accompanied by an extension fee in an amount as established by city council resolution.
4. Time of Grading Operations. Grading operations within one-half mile of a structure for human occupancy shall not be conducted between the hours of sunset and seven a.m. Grading operations may be allowed during specific hours after sunset or before seven a.m. if the city engineer determines that such operations are not detrimental to the health, safety or welfare of the inhabitants of such a structure. The permitted hours of operation may be shortened by the city engineer upon a finding of a previously unforeseen effect upon the health, safety or welfare of the public.
5. Noise Limitations. The noise limitation provisions of Chapter 8.48 of this code shall be observed.
6. Hauling Operations. All hauling operations to or from the grading site shall be conducted in accordance with city code, over the route and in accordance with the procedures prescribed by the city engineer in the grading permit.
7. Storm Damage Precautions. All grading operations shall install protective measures to prevent unnecessary erosion and sedimentation as follows:
   a. All grading permits issued during the rainy season or within thirty days of the start of the rainy season shall require the installation of erosion and sedimentation control protective measures in advance of the start of the grading work in accordance with city standards;
   b. All grading permits issued earlier than thirty days prior to the start of the rainy season shall require the installation of all erosion and sedimentation control protective measures within thirty days prior to the start of the rainy season in accordance with city standards;
   c. All erosion and sedimentation control protective measures shall be maintained in good working order throughout the duration of the grading operation unless it can be demonstrated to the city engineer that their removal at an earlier date will not result in any unnecessary erosion of or sedimentation on public or private properties; and
   d. All slopes required to be landscaped and irrigated shall be landscaped and irrigated within the time limits as specified in the landscape manual. All other erosion and sedimentation control protective measures shall be installed as quickly as practicable.
8. Inspection and Testing. The applicant shall ensure that the work is inspected and tested as follows:
   a. Inspection and testing of the grading work by a soils or civil engineer to ensure proper compaction of fill materials, stability of the cut and fill slopes and general compliance of the grading work with the recommendations of the preliminary soils report, city standards, permit conditions and the provisions of this chapter.
   b. Inspection and survey of the grading work by a civil engineer to ensure that all building pads, street grades and drainage facilities have been constructed in general conformance with the locations and elevations as shown on the approved grading plans.

c. Where unusual or hazardous geotechnical conditions exist upon or beneath the grading site, a geologist shall inspect all or any portion of the grading work to assure that all geologic and geotechnical conditions have been adequately addressed and that any recommended corrective measures are incorporated into the work.

9. Partial Releases. The city engineer may authorize the partial release of a portion of the grading work to allow construction of a structure pursuant to a building permit issued in accordance with this code and in accordance with the following requirements:
   a. Prior to the issuance of such building permit for any given lot or lots, the engineer-of-work, or another civil engineer as may be approved by the city engineer, shall provide the city engineer with a written statement certifying that, in their professional opinion, all grading for the proposed building pad was completed within the tolerances allowed pursuant to city standards and that all embankments, cut slopes and pad elevations are constructed as shown on the approved plans.
   b. The soils or civil engineer shall provide the city engineer with a written statement certifying that, in their professional opinion, all embankments beneath the proposed building pad site have been constructed in accordance with city standards and the recommendations of the preliminary soils report.
   c. The city engineer may also require compliance with any other requirement or condition as may be deemed necessary to ensure the health, safety and welfare of the public prior to release of the site for the purpose of issuing a building permit.
10. Final Reports. Upon completion of the grading work the permittee shall ensure that the following reports and documents are submitted to the city engineer:
   a. A written statement signed by the engineer-of-work, or another civil engineer as may be approved by the city engineer, which shall state that, in their professional opinion, all grading work and drainage facilities have been completed in substantial conformance with the grading permit. The approved grading plan on file with the city shall be amended by the engineer-of-work, or another civil engineer as may be approved by the city engineer, to show the as-built elevations for all pads, streets and drainage facilities together with any other field modifications or changes made to the original approved plans.
   b. A report by a soils or civil engineer which shall include recommended soil bearing capacities for the project site, a statement as to the expansive qualities of the soil, and summaries of field and laboratory tests. The locations of such tests and the limits of the compacted fill shall be shown on a final plan, prepared by the soils or civil engineer and submitted to the city engineer with the final soils report, which shall also show by plan and cross-section the location of any rock disposal areas, sub-drains and/or buttress fills if such were involved in the grading. The final soils report shall contain a written statement that all soils inspections and tests were made by, or under the supervision of, the soils or civil engineer and that in the professional opinion of the soils or civil engineer, all embankments have been constructed and compacted to city standards and in accordance with the earthwork specification of the preliminary soils report.
   c. A report and an as-graded geologic map of the site prepared by the geologist which shall include specific approval of the grading as affected by geological factors. Where necessary, such report shall include geologic cross-sections and recommendations regarding the location of buildings, sewage disposal systems or any other special requirements.
11. Notification of Noncompliance. If, in the course of fulfilling their responsibility under this chapter, the engineer-of-work, soils engineer or geologist finds that the work is not being done in conformance with the grading permit, this chapter or the approved plans and specifications or with accepted engineering practices, they shall immediately notify the

permittee and the city engineer, in writing, of the nonconformity and of the recommended corrective measures to be taken. (Ord. NS-623 □8, 2002; Ord. NS-385 □4 (part), 1996)

15.16.130 Responsibility of permittee.

A. The permittee shall be responsible for the following:
   1. Completion of all work in compliance with the approved grading permit, plans and specifications, city standards, the landscape manual and the requirements of this code;
   2. Protection of public and/or franchise facilities, utilities or services from damage caused by the grading operation;
   3. Protection of adjacent public or private properties from damage caused by the grading operation;
   4. Preservation of adjacent and on site environmental resources, which are outside of the scope of work, from the impacts of the grading operation;
   5. Installation and maintenance of drainage and erosion control measures to protect downstream properties and habitats from flooding, sedimentation and other adverse impacts caused by the grading operation or the increase in surface water runoff resulting from the grading operation; and
   6. Inspection and testing of the grading work to ensure conformance with the plans and specifications, the recommendations of the soils and geotechnical engineers, city standards, the landscape manual and the provisions of this chapter.

B. The responsibilities described in this section shall also apply to the permittee□s authorized agents, contractors or employees; however, any such application shall not in any way relieve or absolve the permittee from the responsibility to grade or to conduct the grading operation consistent with this section or this chapter. The permittee shall have ultimate responsibility over the actions and conduct of any and all authorized agents, contractors and employees with regard to the performance of the permitted work and compliance with this section. (Ord. NS-385 □4 (part), 1996)

15.16.140 Grading and erosion control agreement and securities.

A. Secured Agreement Required. Prior to issuance of a grading permit, the permittee shall enter into a secured grading and erosion control agreement with the city to guarantee performance of the grading work in compliance with the grading permit.

B. Form of Secured Agreement. The grading and erosion control agreement shall be in a form as prescribed by the city attorney which shall include, but not be limited to, the following:
   1. Incorporation of the grading permit and the approved plans and specifications, including Construction SWPPP, as part of the agreement;
   2. Agreement by the permittee to comply with all the terms and conditions of the grading permit including the grading permit time limits;
   3. Agreement by the permittee to comply with all provisions of this chapter and other applicable laws and ordinances;
   4. A cost estimate prepared by a civil engineer which provides for the construction of all earthwork, drainage facilities, retaining walls, storm water best management practices including the cost of maintenance during the period of time the permit is active, geotechnical mitigation measures, landscaping, irrigation and any other items needed to complete the grading work;
   5. Agreement to indemnify and hold the city harmless against any and all claims arising from the performance of the grading work; and
   6. Agreement by the permittee to maintain all safety and storm water best management practices until the grading work is complete and stabilized against erosion in accordance with City Standards.

Deleted: erosion control measures

Deleted: erosion control measures

Deleted: c

Deleted: s

C. Security Types. The grading and erosion control agreement shall be secured using one or more of the security types listed in Section 20.16.070.

D. Security Requirements. Security offered to guarantee performance in connection with the grading and erosion control agreement shall meet the following requirements:

1. The amount of the security shall be sufficient to guarantee performance of all grading work described on the approved grading plans, Construction SWPPP and specifications as estimated in Section 15.16.140(B)(4);
2. Surety bonds shall be valid upon the date of filing with the city and shall remain valid until the work has been completed to the satisfaction of the city engineer. Any extension of the time specified in the permit shall not be cause for release of a surety bond;
3. The surety company which issues a surety bond shall meet or exceed the minimum qualifications established by the city council by resolution;
4. The city engineer may require that up to ten percent of the engineer's estimated cost for the grading work be submitted in the form of a cash deposit, provided however, that no such cash deposit shall be less than five hundred dollars. The cash deposit may be utilized by the city to cure any default in regard to the performance of work covered by the grading and erosion control agreement including but not limited to cleaning, repair and rehabilitation of public or private facilities that are damaged by sedimentation, erosion or construction activities and to insure that adequate safeguards for the prevention of erosion and sedimentation are in place when needed;
5. The city engineer may allow a single security to cover work under multiple grading permits when the work covered is either part of a progressive construction of a single project or when several concurrent projects are being constructed by one permittee. In such cases, the grading and erosion control agreement shall include reference to the multiple permit requirements or a grading and erosion control agreement shall be submitted for each separate permit; and
6. The city engineer may permit substitution of the required security either in kind or of any other type allowed for in Section 20.16.070; provided, however, that the substitute security is adequate to insure completion of the remaining work to be performed and the security is found to be of proper form and substance. The original security may be released upon acceptance of the new security and upon determination that all conditions of the permit are being complied with and there is no default as to the performance of the work up to the date of acceptance of the new security.

E. Secured Agreement Waivers. The city engineer may waive the requirement for a secured agreement or may waive all or any portion of the security amount if the applicant clearly demonstrates to the city engineer that the proposed grading work will not adversely affect or will have minimal impact upon public or private property and upon the health, safety and welfare of the public. In no such case, shall the city engineer reduce the security amount below the amount needed to ensure public safety and to secure the site with effective storm water best management practices.

Deleted: against erosion

F. Reduction of Security. The city engineer may reduce the amount of the security commensurate with the value of the grading work which has been completed. In no case shall the security be reduced below the amount necessary to ensure public health, safety and welfare.

G. Release of Security. The city engineer shall release the security held by the city to secure the grading work upon completion of the work in substantial compliance with the terms and conditions of the permit and the provisions of this chapter.

H. Default Procedures. Whenever the permittee fails to perform in compliance with the terms and requirements of the grading and erosion control agreement, the city engineer may, in addition to any other administrative and judicial remedies allowed pursuant to this chapter, make a demand upon the cash, letter of credit, surety bond or other collateral held as

security for the grading and erosion control agreement in accordance with the following procedures:

1. Notice of Default. The city engineer shall send a written notice of default by certified mail to the permittee which specifies the permit number and identifies the location, nature and extent of the activity or condition which contributed to the default. The notice of default shall specify the work to be done to cure the default, the estimated cost of such work and the period of time deemed by the city engineer to be reasonably necessary for the completion of such work. A copy of the notice of default shall be mailed to the owner of the grading site and to the surety company, bank or institution which provided the security for the grading and erosion control agreement.
2. Emergency Corrective Actions. In the event the work needed to cure the default is not completed by the permittee, surety company or financial institution within the period of time specified on the notice of default, the city engineer may thereupon enter the property for the purpose of performing, by city forces or by other means, the necessary corrective or curative work. The cost for such corrective work shall be paid for by the permittee, surety company or financial institution as provided for in this section.
3. Surety Bond, Letter of Credit or Instrument of Credit. Upon receipt of the notice of default, the surety company or financial institution shall, within the time specified, cause or require the work needed to cure the default to be performed, or failing therein, shall pay over to the city the estimated cost of doing the work as set forth in the notice of default.
4. Cash Deposit. Upon expiration of the time period specified in the notice of default, the city engineer may withdraw all or any portion of the cash deposit to reimburse the city for completing or having a third party complete the work needed to cure the default as specified in the notice of default. Upon utilizing the cash deposit, the city engineer shall notify the applicant in writing of the amount utilized and the purpose for which the deposit was used. (Ord. NS-385 □4 (part), 1996)

15.16.150 Agreement for uncontrolled stockpile.

A. Applications for grading permits involving uncontrolled stockpiles shall be accompanied by an agreement signed by the property owner.
B. The agreement shall be in a form as prescribed by the city attorney which shall include, but not be limited to, the following:
   1. Owner acknowledgment that the grading or fill material is designated as an uncontrolled stockpile;
   2. Owner acknowledgment that the site is not eligible for a building permit unless special soils analysis and foundation design are submitted and approved by the city engineer or, the site is subsequently graded pursuant to a valid grading permit issued in accordance with the provisions of this chapter;
   3. Agreement by the owner that the grading or stockpile work will be done in accordance with grading plans and specifications as approved by the city engineer;
   4. Agreement by the owner that the stockpile will be maintained in a safe and sanitary manner at the sole cost, risk and responsibility of the owner;
   5. Agreement by the owner indemnifying and holding the city harmless against any and all claims arising from the grading or maintenance of the stockpile; and
   6. Agreement by the owner that the agreement for uncontrolled stockpile will inure and be binding upon any and all successors in interest to the property.
C. The agreement for uncontrolled stockpile shall be approved by the city engineer and recorded by the city clerk in the office of the county recorder as constructive notice upon the land involved. The notice shall remain in effect until release of the agreement is filed by the city engineer. (Ord. NS-385 □4 (part), 1996)

15.16.160 Appeals.

A. An individual may appeal the decision of the city engineer made in regard to administration of this chapter to the city council within ten calendar days following the decision. Appeals shall be in writing, filed with the city clerk and shall state the basis for the appeal. Fees for filing an appeal shall be in an amount as established by resolution of the city council. The decision of the city council shall be final.

B. The city clerk shall thereupon fix a time and place for hearing such appeal. The city clerk shall give notice to the appellant and applicant/permittee of the time and place of hearing by serving the notice personally or by depositing it in the United States Post Office in the city, postage prepaid, addressed to such persons at their last known address. (Ord. NS-385 □4 (part), 1996)

15.16.170 Unlawful acts.

A. It is unlawful to:
   1. Perform grading work without a grading permit when such permit is required pursuant to this chapter;
   2. Perform any grading work which is not in conformance with an approved grading permit;
   3. Make a false statement or furnish false data on any application, grading plan, engineering report or other document required pursuant to the provisions of this chapter; or,
   4. Delay, frustrate or otherwise hinder the efforts of the city engineer or his/her designee from carrying out the duties required pursuant to the provisions of this chapter.

B. Regardless of whether or not a grading permit has been issued or is required to be issued, it is unlawful for any person to commit or cause to be committed the following acts or, to maintain or cause to be maintained a property in such a manner as to result in the commission of the following acts:
   1. Grading in such a manner as to become a hazard to life and limb or to endanger property or to adversely affect the safe use or stability of a public property, place or way;
   2. Grading without application of appropriate storm water best management practices (BMPs) in accordance the provisions of Title 15, City Standards and Municipal Permit;
   3. Dump, move or place any soil, sand, gravel, rock or other earthen material, or leave any bank, slope or other earthen surface unprotected so as to cause any such earthen material to be deposited upon or to roll, blow or wash upon or over the premises of another without the express consent of the owner of each such premises so affected or, upon or over any public property, place or way. Such consent shall be in writing and in a form acceptable to the city engineer; or
   4. Transport, haul or otherwise move any soil, sand, gravel, rock or other earthen material over any public or private street, place or way in such a manner as to allow such materials to blow or spill over and upon such public or private street, place or way. (Ord. NS-385 □4 (part), 1996)

15.16.180 Investigation fee.

A. Whenever any work for which a permit is required by this code has been commenced without first obtaining a grading permit or an unlawful act, as defined in Section 15.16.170, has been committed, the city engineer shall conduct a special investigation into the cause, extent and potential remedial actions that must be undertaken before a new permit may be issued, the stop work notice is removed or the notice of grading violation is released. The city engineer shall collect an investigation fee from the offender whether or not a permit is then or

subsequently issued. The investigation fee shall be established by resolution of the city council and shall be in addition to any required permit fee. The investigation fee may be reduced or waived if the city engineer finds that:

1. The amount of the investigation fee is significantly out of proportion to the cost of the administrative work necessary to investigate the violation or unlawful act;
2. The violation or unlawful act was not in the control of the property owner and the property owner took immediate action to correct the violation upon notification by the city engineer; or
3. The violation or unlawful act was caused by or resulted from an unintentional action or misunderstanding of city codes or a directive issued by the city engineer or the city engineer's authorized representative.

B. The payment of an investigation fee shall not exempt any person from compliance with all other provisions of this code nor from any penalty prescribed by law. (Ord. NS-385 § 4 (part), 1996)

15.16.190 Enforcement measures--Remedies.

A. Whenever the city engineer determines that an unlawful act, as defined in Section 15.16.170, has been committed by an individual operating with or without benefit of a grading permit, the following enforcement measures and remedies may be undertaken by the city engineer, in lieu of or in addition to any remedial actions undertaken in accordance with Section 15.16.140:

1. Stop Work Notice. The city engineer may issue a stop work notice demanding that all unlawful activities, as defined in this chapter, be stopped until a valid grading permit is obtained or corrective action is authorized by the city engineer. The city engineer may allow continuance of the work to the extent necessary to install protective measures to safeguard the public or to secure the site against erosion, sedimentation and the discharge of non-storm water pollutants. Prior to resumption of any work, other than as may be permitted by the city engineer pursuant to this subsection, on a permitted grading operation, the permittee shall restore all cash deposits and/or other securities consumed by the city to the amount specified in the approved grading and erosion control agreement.

Deleted: and

2. Owner Notification. The owner of the property shall be notified in writing that a violation has occurred. The notification shall specify the location, nature and extent of the activity or condition which contributed to the violation, the corrective action needed to cure the violation and the period of time deemed necessary by the city engineer to correct the violation.
3. Record Notice of Grading Violation. In the event that the owner does not correct the violation in the manner or within the time period requested by the city engineer, the city engineer shall record a notice of grading violation against the property with the county recorder. Upon completion of any corrective action and/or issuance of a valid grading permit and upon payment of the investigation fee required pursuant to this section, the city engineer shall file a notice of release of grading violation with the county recorder releasing the property from the notice of grading violation.
4. Prohibition of Development Permits. Any property which has a notice of grading violation recorded against it shall be prohibited from obtaining or using any development permit pursuant to Titles 18, 20 and 21 of this code until after all corrective actions are taken in accordance with the requirements of the city engineer and, a notice of release of grading violation has been recorded with the county recorder.
5. Investigation Fee. An investigation fee shall be paid by the person responsible for the violation in accordance with the provisions of this chapter. The payment of such

investigation fee shall not relieve any person from the performance of the corrective work or otherwise complying with the requirements of this chapter.

6. Criminal Penalties. Each person, firm or corporation who commences or does any grading contrary to the provisions of this chapter, or otherwise violates the provisions of this chapter, is guilty of an infraction. Every day during any portion of which any violation of any provisions of this title is committed, continued or permitted by such person, firm or corporation, shall be deemed a separate violation and shall be punishable as provided in this title and in Section 1.08.010(b) of this code.
7. Abatement of Public Nuisance. Any grading commenced or done contrary to the provisions of this chapter, or other violation of this chapter, shall be, and the same is declared to be, a public nuisance. Upon order of the city council, the city attorney shall commence necessary proceedings for the abatement of any such public nuisance in the manner provided by law. Any failure, refusal, or neglect to obtain a permit as required by this chapter shall be prima facie evidence of the fact that a public nuisance has been committed in connection with any grading commenced or done contrary to the provisions of this chapter.
8. Civil Action. The city attorney may, at the request of the city engineer, initiate any appropriate civil action in a court of competent jurisdiction to enforce the stop work notice, including the required corrective actions, and/or the grading and erosion control agreement, including the recovery of any funds expended by the city to abate any public nuisance resulting from an unlawful act as defined in Section 15.16.170 and any additional civil penalties provided for by law. (Ord. NS-385 □4 (part), 1996)

15.16.090 Information on grading plans, specifications and engineering reports.

A. All grading plans, specifications and engineering reports required for grading permit submittal shall be prepared in accordance with the following requirements:

1. Grading plans, specifications, engineering calculations and other relevant engineering data shall be prepared by a civil engineer. The grading plans shall be drawn to scale in accordance with city standards and be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this chapter, city standards, the landscape manual and Titles 19, 20 and 21 of this code. All grading plans must include provision for protective measures for the control of urban pollutants, erosion and sedimentation in accordance with the requirements of this chapter, and city standards, including but not limited to the city Standard Urban Storm Water Mitigation Plan (SUSMP).
2. Geotechnical investigation reports shall be based upon the proposed grading plan. The geotechnical investigation report shall include an adequate description of the geology of the site and conclusions and recommendations regarding the effect of geologic conditions on the proposed development. Recommendations included in the report shall be consistent with the provisions of this chapter and city standards and shall be incorporated into the grading plans and/or specifications.
3. Preliminary soils investigations and reports shall be based upon the proposed grading plan. Such report shall include data regarding the nature, distribution and strength of existing soil types at the proposed grading site, recommendations for grading procedures and design criteria for corrective measures, if required by the soils engineer. Recommendations included in the report and approved by the city engineer shall be incorporated into the grading plans and/or specifications.

Code Revisions to Title 18 Building Codes and Regulations

Chapter 18.48 Storm Water Pollution Prevention

Sections:

18.48.010 Purpose and intent.
18.48.020 Definitions.
18.48.030 Prohibition on development.
18.48.040 Requirement for permit issuance.
18.48.050 Duty to deny final building permit approval.

18.48.010 Purpose and intent.

The purpose of this chapter is to ensure the environmental and public health, safety, and general welfare of the residential, commercial, and industrial sectors of the city of Carlsbad by:

A. Prohibiting non-storm water discharges to the storm water conveyance system.
B. Eliminating discharges to the storm water conveyance system from spills, dumping or disposal of materials other than storm water or permitted or exempted discharges.
C. Reducing pollutants in storm water discharges, including those pollutants taken up by storm water as it flows over urban areas (urban runoff), to the maximum extent practicable.
D. Reducing pollutants in storm water discharges in order to achieve applicable water quality objectives for receiving waters within the city of Carlsbad.

18.48.020 Definitions.

For purposes of this chapter, the definitions for the words, terms or phrases defined in chapter 15.04 of this code shall be used.

18.48.030 Prohibition on development.

For any property subject to this chapter, notwithstanding any provision of this code to the contrary, no building permit or occupancy permit for any project shall be issued and no person shall build, use or occupy any project, without first complying to the storm water protection provisions of Title 15 of this code.

18.48.040 Requirement for permit issuance.

A. Prior to the issuance of a building permit or occupancy permit for a project, the project owner or developer shall:
   1. Provide the city engineer with a completed storm water requirements applicability checklist in accordance with Standard Urban Storm Water Mitigation Plan (SUSMP) requirements;
   2. If the project is determined by the city engineer to be a priority development project, then the project owner or developer shall:

a. Prepare and submit a storm water management plan in conformance with the requirements of the SUSMP and Title 15 of this code;
b. Enter into a Permanent Storm Water Quality Best Management Practices Maintenance Agreement or provide an alternate maintenance mechanism as approved by the city engineer.

3. Agree to comply with storm water best management practices during construction of the building, structure or dwelling.

B. A city approved Construction SWPPP is required to be submitted prior to building permit issuance in accordance with city standards and Chapter 15.16.085 of this code for any project which has the potential for adding pollutants to storm water or non-storm water runoff during construction activities, unless an exemption from such requirement is provided pursuant to Chapter 15.16.085 and the Municipal Permit.

18.48.050 Duty to deny final building permit approval.

The community development director shall deny final approval and acceptance of a building permit, and shall refuse to allow final public utility connection and occupancy in any building, structure or dwelling unless the project owner or developer has complied with all storm water protection provisions of Title 15 of this code.

Construction Site NPDES Compliance Inspection Checklist

Construction Management & Inspection Division

Permit #: Date:

Inspection Type: Weather:

Inspected By: Project #/Name:

Mark (√) box "Yes", "No", or "N/A"; if there are comments, mark (√) box "Comment".

Yes	No	N/A	Comment	Inspection Description
☐	☐	☐	☐	1. Are slopes steeper than 3:1 properly covered?
☐	☐	☐	☐	2. Are areas flatter than 3:1 covered or protected by desilting basins?
☐	☐	☐	☐	3. Is the SWPPP wall map up to date and accurate?
☐	☐	☐	☐	4. Are all gravel bags, straw waddles, silt fences, and other linear sediment barriers in place in accordance with the SWPPP, and are they functioning properly?
☐	☐	☐	☐	5. Are basins designed and maintained to provide the required retention/detention?
☐	☐	☐	☐	6. Is the stabilized construction entrance preventing tracking (i.e. working properly)?
☐	☐	☐	☐	7. Are all downstream storm drain inlets protected with devices that are in working order and being properly maintained?
☐	☐	☐	☐	8. Are non-storm-water BMP's being used? (e.g. concrete washouts)
☐	☐	☐	☐	9. Are all material and equipment handling, storage, and maintenance areas clean, and free of spills, leaks, or other deleterious materials?
☐	☐	☐	☐	10. Is the site free from litter and the litter collected and placed in covered containers?
☐	☐	☐	☐	11. Are temporary stockpiles and/or construction materials in approved areas and protected/covered?
☐	☐	☐	☐	12. Are all areas designated to be seeded or landscaped properly maintained (i.e. irrigation functioning properly, 90-100% coverage)? NO BMP's REQUIRED
☐	☐	☐	☐	13. Are all natural drainage courses and open spaces in proximity to this project protected?
☐	☐	☐	☐	14. Are all BMP's maintained in functional order? (e.g. sediment removed, basins pumped down, repairs made, etc.)

Storm Water Compliance Inspections

The City of Carlsbad has developed an inventory of special events. These special events have been prioritized according to type of event, number in attendance, proximity to the nearest water body, and potential threat to water quality. Based on this prioritization, the City will be conducting storm water compliance inspections of most **special events** within the City. These compliance inspections will include a pre-event inspection where storm water BMPs are evaluated. An event inspection is required to determine the effectiveness of BMPs, and a post-event inspection to ensure the site is properly cleaned. Compliance inspections may also include recommendations for additional measures that may be required to comply with the storm water regulations. Please note that all special events in the City of Carlsbad are required to implement all of the minimum special event BMPs and comply with all applicable regulations outlined in the Carlsbad Municipal Code.

City of Carlsbad
5950 El Camino Real
Carlsbad, CA 92008

Sanitary Sewer vs. Storm Drain What's the difference?

The water that drains down a sink or toilet flows to the sanitary sewer and is treated at a wastewater treatment plant before being discharged to the ocean. The storm drain system, on the other hand, is designed to carry rainwater away from streets, parking lots, and driveways to help prevent flooding during rain events. Water entering the storm drain system does not receive any treatment and flows directly to our creeks, lagoons, and ocean.

Construction Management and Inspection
760-602-2780

Best Management Practices

SPECIAL EVENTS

City of Carlsbad Storm Water Compliance Guidelines for Special Events

Only Rain in the Storm Drain!

Preventing Pollution Is Up To US!

Did you know that storm drains are NOT connected to sanitary sewer systems or other treatment plants? As rainfall flows over the ground, it picks up a variety of pollutants that flow directly to our creeks, lagoons, and ocean.

Special Event Pollutants o

- Sediments
- Metals
- Detergents
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

Best Management Practices Work!

Best Management Practices (BMPs) are procedures and practices that all special event organizers **are required** to implement to prevent pollutants from entering our storm drains. Once sources of pollution have been identified, the next step is to select BMPs that eliminate or reduce storm water pollution. Storm Water Compliance staff can work with you to develop BMPs for your specific special event.

Protection for All Seasons

Even when rain is not expected, event organizers are required to implement the designated BMPs. Depending on the size, location, number of participants, and other relevant factors, Storm Water Pollution Prevention Plan (SWPPP) may need to be developed. The SWPPP is intended to help demonstrate that appropriate measures are being actively implemented before, during, and after the event to reduce and prevent pollutants from leaving the event venue. The SWPPP must be approved by the City prior to Special Event Permit issuance.

Good House Keeping

- **Use dry clean-up methods first!** Never use a water hose or pressure washing system to clean up spills. Use mops, brooms, or wire brushes to clean sidewalks, pavement, and other impervious surfaces. Wash water must be disposed of to the sanitary sewer and never the storm drain.
- Minimize the use of cleaning solutions and chemical agents. Dispose of waste properly.
- Keep site free of litter. Place trash and recycling receptacles around the site to minimize litter.

Preventive Maintenance

- Inspect equipment and vehicles frequently and clean up leaks and spills immediately.
- Prior to the event, locate and protect all drainage points using storm drain protection devices such as sand bags, fabric filters, berms, containment booms, etc.
- Label or place signs at, around, or adjacent to storm drains with the following wording: *"No Dumping"* or other pollution prevention message.
- Regularly inspect storm drains during the event to prevent pollutants from accumulating.

Waste Management

- Reduce, Reuse, Recycle.
- Frequently inspect trash and recycling receptacles to ensure they do not overflow. Place trash inside dumpsters or plastic bags until it can be removed.
- Dumpsters must be kept closed when not in use.
- Never place liquid waste, leaky bags, or hazardous waste in dumpsters or trash bins.

Materials Storage and Handling

- Store materials in covered areas not exposed to rain.
- Keep outdoor storage areas clean.
- Clean around stored materials so that pollutants do not accumulate.

Food Preparation

- Food vendors must have spill kits in or adjacent to their work area. Spill kits include: towels, kitty litter, and/or clean-up materials. All spilled materials must be promptly cleaned up and disposed of properly.

Temporary Relief Stations

- Relief stations must be placed away from locations that have the potential to impact the storm drain system.
- All relief stations are required to have a secondary containment or additional BMPs to contain possible overflows.

Staff and Vendor Training

- Discuss and distribute information about storm water pollution prevention during staff (including contractor) training and vendor registration.

Post Event Clean Up

- All streets, sidewalks, and public areas must be cleaned (sweeping, litter pickup, etc.) and returned to the pre-event condition.
- Remove temporary public art (chalk, paint, charcoal, clay, etc) using dry clean-up methods only.

- If a street sweeper will be used , ensure they are onsite promptly after the event.
- Assign an appropriate number of staff to promptly and adequately clean-up after the event.
- After the site has been cleaned, storm drain containment and protection devices must be removed.

For more information or assistance, please call 760-602-2780

OBSERVATIONS

❒ **No violations observed during the inspection.**	❒ **No violations observed during the inspection.**
❒ **Violations observed during the inspection**	❒ **Violations observed during the inspection**
❒ **Implement Corrective Actions As Required Below**	❒ **Implement Corrective Actions As Required Below**

CORRECTIVE ACTION REQUIRED: ☐ Photos Taken

1	2		1	2	
☐	☐	Prevent trash/recycling from overflowing.	☐	☐	Sweep up trash and debris.
☐	☐	**Immediately** clean up oil/grease spills and leaks.	☐	☐	**Immediately** discontinue outdoor washing or hosing.
☐	☐	Post-event street sweeping required.	☐	☐	Dumpsters and trash receptacles must be covered during rain events.
☐	☐	Provide immediate protection for storm drain inlets.	☐	☐	Provide spill kit(s) in required areas.
☐	☐	Clean in and around storm drains.	☐	☐	Provide secondary containment for portable restroom(s).
☐	☐	Train staff, vendors, and participants on pollution prevention.			

Other _____

Implement corrective actions by_____. A City Inspector will return to verify that corrective actions implemented as required. If you have any questions or comments, please contact the Storm Water Inspector at 760-602-2780 x7111.

Comments/Notes

2007-08 Muncipal Inspection Recommendations and Corrective Actions

Facility	Recommendation	Corrective Actions Taken
Fleet Maintenance	1. Provide a working spill kit inside the garage and train employees on its location.	Ordered and placed additional spill kits, followed with training information on use and placement
	2. Check vehicles for leaks regularly and consider draining fluids from leaky non-operational vehicles/equipment if feasible.	It is generally not feasible to drain fluids from equipment unless it has been damaged in an accident and is no longer moveable under its own power. Vehicles awaiting service or auction are regularly inspected. Any minor fluid leaks are first addressed with absorbent. Absorbent is swept up by staff and is disposed of by a Haz-mat contractor. 10 large drip trays were procured and are utilized for any vehicle with minor fluid leaks. These trays are inspected regularly and any fluids captured are emptied, recycled and the drip tray is replaced.
	3. Minimize waste inventory and ensure the shed for temporary hazardous material storage can properly store materials as needed.	Hazardous materials are regularly removed by a Haz-mat Contractor. Leak containment has been placed in the storage area to prevent spills.
	4. Update and maintain SWPPP appropriately.	Updated SWPPP with weekly inspections and info.
	5. Provide adequate cover for vehicles and equipment that pose a threat to storm water to the maximum extent practicable.	It is not practical to cover stored automobiles, equipment, or trucks. We have ordered a 40' weatherproof storage container for covered storage of used tires and motorcycles. Delivery of the storage unit is scheduled for July 16, 2008.
Maintenance and Operations	1. keep vehicle parking area free of vehicle fluids	Staff training and also purchasing 3 24" x 36" pans with hydrocarbon boom inserts. Installation undrivable pavers with sand filter to remove any hydrocarbons prior to entering conveyance system located at the lowest portion of the driveway were all drainage enters
	2. Keep site free of sediment and debris to MEP	Yard is swept by Canon Pacific services twice a month yard is also cleaned by staff once a week Sandbag storage was reconfigured with all bags placed on pallets with biweekly inspections, broken bags to be removed and swept up
Public Works Operations and Maintenance Facility (Oak Ave)	1. Keep site free of sediment and debris to maximum extent practicable, especially under storage areas.	All trees that line the Oak yard have been trimmed and put on a regular pruning schedule.
	2. Provide "no dumping" signage for storm drain inlet.	Applied "no dumping" sign at storm drain inlet.
	3. Store paint in a way that ensures leaks will be contained within the bermed storage area.	Painted yellow line 12" from containment wall along inside perimeter of containment area. Moved all paint storage pallets inside of delineated area.
Parks Maintenance Storage	1. Finish updating spill response plan with appropriate site specific information.	Spill Plan updated and on file
Carlsbad Recycled Water Facility	1. Keep dumpster lids closed when not in use.	Staff shall check during each routine visit to ensure compiance
North Batiquitos Pump Station	1. Keep paved areas of the site free of sediment and organic debris to the maximum extent practicable.	Wastewater facility
	2. Keep concrete swales free of organic debris and sediment accumulations to the maximum extent practicable.	
Reservoir Elm	1. Provide appropriate signage for the storm drain inlet.	Will label inlet and instal bmp the week of 7-21-08
	2. Keep site free of organic debris to the maximum extent practicable.	Site is maintaine bi-weekly via a landscape contract thereby not taking away resources needed to operate the potable water system
Reservoir C	1. Provide appropriate signage for the storm drain inlet.	Will label inlet the week of 7-21-08
	2. Keep site free of debris and leaves to the maximum extent practicable.	Site is maintaine bi-weekly via a landscape contract thereby not taking away resources needed to operate the potable water system
Reservoir La Costa Hi	1. Provide appropriate signage for the storm drain inlet.	Will instal bmp the week of 7-21-08

	2. Keep site free of debris and leaves to the maximum extent practicable.	Site is maintaine bi-weekly via a landscape contract thereby not taking away resources needed to operate the potable water system
Reservoir La Costa Lo	1. Keep paved areas free of sediment and organic debris to the maximum extent practicable.	Site is maintaine bi-weekly via a landscape contract thereby not taking away resources needed to operate the potable water system
	2. Ensure the soil stockpile is adequately protected to prevent runoff transport.	Pile is located on SDG&E property
Tap Pump Station	1. Implement erosion control BMPs in order to prevent sediment transport to the paved areas of the site to maximum extent practicable.	
	2. Consider implementing tracking control BMPs in order to prevent sediment tracking to El Camino Real to the maximum extent practicable.	
Aviara Community Park	1. Control sediment racking from fields to maximum extent practicable.	Installation of gravel bags around edges to minimize runoff.
	2. Minimize overwatering to the maximum extent practicable.	Irrigation controller set for cycle and soak to prevent runoff.
	3. Cover and contain stockpiles.	Tarpulins used to cover stockpiles.
	4. Replace broken gravel bags surrounding catch basin as needed.	Replaced with new bags and changed as necessary.
Calavera Hills Park	1. Keep trash areas and parking lot free of litter, debris and sediment to the maximum extent practicable.	Ongoing litter removal and sediment sweeping on scheduled basis.
	2. Inspect and maintain filter inserts as needed, particularly before the start of the rainy season.	Filters cleaned and monitored and replaced as necessary.
Carillo Ranch and Parking Lot	1. Control erosion and sediment tracking into catch basins to maximum extent practicable.	Gravel bags used for erosion control.
Holiday Park and Parking Lots	1. Keep parking lot free of debris and sediment to the maximum extent practicable.	Scheduled weekly clean-up along with daily litter removal.
Hosp Grove Park and Parking Lot	1. Remove organic debris accumulations from the two storm drain inlets located along the northern portion of the eastern	Permeable water socks, straw wattles and gravel bags installed.
	2. Implement BMPs to reduce sediment tracking from the eastern parking lot to Monroe Street.	Sediment cleaning scheduled □ 3 times per week.
La Costa Canyon Park and Parking Lot	1. Prevent erosion and control sediment tracking to maximum extent practicable.	Pedestrian foot traffic prevents tarping of slope, straw wattles installed at base of slope.
Laguna Riviera Park	1. Keep drainage channels free of trash and debris to maximum extent practicable.	Cleanouts scheduled accordingly depending on dry/wet season.
	2. Consider investigating source of water discharge.	Irrigation controller set for cycle and soak to prevent runoff.
Magee Park and Parking Lot	1. Keep trash enclosure free of organic debris and the dumpster lids closed when not in use.	Enclosures cleaned regularly.
	2. Keep all storm drain inlets free of organic debris to the maximum extent practicable.	Cleanouts scheduled on regular basis.
Pine Park and Parking Lot	1. Maintain BMPs along unpaved western portion of the park.	Replaced straw wattles along alley.
	2. Ensure gravel bags along Chestnut Avenue are properly maintained.	Gravel bags removed from original park construction.
	3. Adjust irrigation timers, or implement other effective BMPs, to minimize irrigation runoff.	Irrigation controller set for cycle and soak to prevent runoff.
Poinsettia Community Park, Maintenance Station and Parking Lot	1. Control sediment tracking to the maximum extent practicable.	Gravel bags installed.
	2. Consider adding "no dumping" signage to catch basin in center of maintenance yard.	Signs painted □ perimeter of basin.
Stagecoach Maintenance Station	1. Finish preparing the site specific SWPPP.	SWPPP revised and current.
Adult Learning Parking Lot	1. Trench drains should be kept free of sediment, debris and litter.	The lease has terminated and we are no longer occupying this site.
Carlsbad Senior Center Parking Lot	1. Sweep up organic debris in outdoor areas.	Parking lots are swept semi-monthly with a mechancial sweeper. Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	2. Provide appropriate signage for the grated storm drain in the eastern parking lot.	Will coordinate with Streets to have "No Dumping" stencil installed.

Cole Library Parking Lot	1. Keep parking lot free of organic debris to the maximum extent practicable.	Parking lots are swept semi-monthly with a mechancial sweeper. Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	2. Keep parking lot free of vehicle fluids to the maximum extent practicable.	Parking lots are swept semi-monthly with a mechancial sweeper. Facilities staff will coordinate periodically with Streets to clean vehicle fluids where excessive.
Farmers Building Parking Lot	1. Keep outdoor areas free of trash and debris.	Parking lots are swept semi-monthly with a mechancial sweeper. Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	2. Keep storm drain inlets free of debris to maximum extent practicable.	Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	3. Minimize irrigation runoff from landscape areas.	Coordinate with Parks staff to minimize irrigation runoff.
Harding Community Center Parking Lot	1. Routinely inspect the parking lot for fresh oil stains and treat stains as necessary.	Parking lots are swept semi-monthly with a mechancial sweeper. Facilities staff will coordinate periodically with Streets to clean oil stains where excessive.
Helen Allman Girls Club Parking Lot	1. Keep outdoor areas free of sediment and debris to the maximum extent practicable.	Parking lots are swept semi-monthly with a mechancial sweeper. Litter and organic material is removed on a regular basis by our landscape maintenance contractor..
	2. Keep dumpster lids closed when not in use.	Staff has been instructed to keep the dumpsters closed when not in use.
Railroad Depot Visitors Center Parking Lot	1. Keep outdoor areas free of trash and debris to maximum extent practicable.	Parking lots are swept semi-monthly with a mechancial sweeper. Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	2. Clean in and around storm drains on a regular basis.	Litter and organic material is removed on a regular basis by our landscape maintenance contractor.
	3. Ensure filter fabric is securely installed to adequately cover the curb inlet it is protecting.	There are no curb inlets at the Railroad Depot Visitors Center Parking Lot. This inspection was performed at the Amtrack Station which is not a City of Carlsbad facility.

Spring Cleaning Made Easy

...THEN ACT!

YOUR EVERYDAY ACTIONS IMPACT OUR ENVIRONMENT!

Proper disposal of household electronics, poisons and cleaning supplies is not only important for the environment but it's the law. Carlsbad offers a variety of options to do the right thing – isn't it worth going the extra mile?

ONCE AGAIN IT'S TIME to clean out our homes and garages in preparation for spring. Did you know that many common products used daily require special handling for disposal and may not be discarded in sinks, storm drains or household trash? These items are classified as "household hazardous waste" (HHW) and are typically labeled Caution, Warning, Danger, Poison, Toxic, Flammable or Corrosive.

Carlsbad residents have several options for properly disposing of HHW.

Annual HHW Collection Event

Saturday, April 19, 2008, 9 a.m. - 1 p.m.
Visit *www.carlsbadca.gov/waste/hhwsched.html*
Or call (760) 602-7559 to book an appointment
FREE to Carlsbad residents with proof of residency

Door-to-Door Collection Program

Operated by Clean Harbors
Call (800) 444-4244 to schedule an appointment
$10 Co-pay

HHW Collection Facility

Operated by Clean Harbors
1145 East Taylor Street, Vista
Hours: Saturdays 9 a.m. - 3 p.m.
No appointment necessary
Call (800) 444-4244 for additional information
FREE to Carlsbad residents with proof of residency

HHW Collection Facility

Operated by Waste Management
2880 Industry Street, Oceanside
Hours: Alternating Saturdays 9 a.m. - 1 p.m.
By Appointment Only
Call (760) 929-9400 to schedule your appointment
FREE to Carlsbad residents with proof of residency

Common HHW Items:

- Automotive products (antifreeze, fluids, motor oil)
- Batteries (home and car)
- Cathode ray tubes (TVs, computer monitors)
- Fluorescent light tubes and ballasts
- Fuels
- Herbicides
- Hobby supplies
- Household cleaners
- Medicines
- Mercury (thermometers, thermostats)
- Paint products
- Paints (latex and oil)
- Pesticides
- Polishes and waxes
- Pool and spa chemicals
- Propane tanks from barbeques
- Small household appliances with LED displays
- Unused road flares
- Wood preservatives

Bulky Items Take Up Lots of Space

GETTING RID OF BULKY ITEMS such as furniture and appliances that can not be disposed of with regular household trash? No problem! There are three Bulky Item Collection dates still to come:

Call Waste Management at (760) 929-9400 or visit their website at *http://northcounty.wm.com* to schedule an appointment for the pick-up in June, September or November; limit of two bulky items per Carlsbad resident at no charge. Contact Waste Management regarding other options for disposing of bulky items throughout the year or to determine if your household item(s) qualifies.

Saturday June 21st
Appointments accepted June 2-9th

Saturday September 20th
Appointments accepted September 1-8th

Saturday November 8th
Appointments accepted October 20-27th

City of Carlsbad Environmental Programs Outreach Events Spring 2008

EACH YEAR the City of Carlsbad's Environmental Programs Division participates in several outreach events intended to increase public awareness of current environmental issues impacting residents in Carlsbad. Events include fairs, household hazardous waste collection, and beach and creek clean-ups, among others. Please plan to join us at these upcoming events.

March 22 • 10 a.m. - 4 p.m.
World Water Day Festival
Agua Hedionda Lagoon
Discovery Center
1580 Cannon Road, Carlsbad

March 29 • 9 a.m. - 5 p.m.
Kids Day at the Flower Fields
Paseo Del Norte, Carlsbad

March 30 • 11 a.m. - 4 p.m.
Peppertree/Earth Day Event*
Mission San Luis Rey
4050 Mission Avenue, Oceanside

April 20 • 10 a.m. - 4 p.m.
Avocado Festival*
Downtown Main Street, Fallbrook

April 26 • 9 a.m. - noon
Regional Creek to Bay Clean Up
Various locations throughout San Diego
Check *www.idacsd.org* for more information

May 21 • 9 a.m. - 1 p.m.
Public Works Fair, City of Carlsbad
Dove Library
1775 Dove Lane, Carlsbad

*A Watershed sponsored event; Carlsbad City staff will be present.

April Showers Bring ...

THE NEED TO WATER OUR LAWNS LESS! Even with the perceived benefits of recent rainfall, we are on the verge of experiencing a water shortage. Limited local water sources, historic dry conditions and a recent court order that will reduce water deliveries to our area threaten our water supply and could very well lead to mandated water restrictions. Water conservation is a team sport and we are all the most valuable players! Here are a few winning conservation actions that can reduce our water consumption and help conserve this precious resource:

- Eliminate one irrigation cycle per week
- Turn off sprinklers during rain storms
- Repair leaks around pool or spa pumps
- Adjust sprinklers to reduce overspray
- Use a broom, not a hose, to clean driveways and sidewalks

We have many teammates in our quest to conserve water who can offer invaluable assistance:

- Vouchers for water-savings products offered to Carlsbad Municipal Water District customers: call (800) 986-4538
- Water use audits offered to District customers: call (760) 602-7585
- San Diego County Water Authority's 20-Gallon Challenge: log onto *http://www.20gallonchallenge.com/*
- Metropolitan Water District's "Be Waterwise" website offers water efficiency tips for outside the home: log onto *http://www.bewaterwise.com/*
- "The Water Conservation Garden" website showcases water conservation through a series of themed gardens: log onto *http://www.thegarden.org/*
- The "H2OUSE Water Saver Home" has numerous tips for reducing water consumption in and around your home: log onto *http://www.h2ouse.org/*

...THEN ACT!

YOUR EVERYDAY ACTIONS IMPACT OUR ENVIRONMENT!

Don't leave the water running ... not in the sink, in the yard or from the hose. The City can help you save money if you take advantage of vouchers offered for the use of water saving devices like efficient washing machines and weather-based irrigation systems. And if you think you might have a leak – have it fixed immediately and don't wait a week. Think about it – you will have a little money saved for a rainy day.

Welcome to the City of Carlsbad

This brochure provides guidelines and helpful hints on the environmental services available to Carlsbad residents.

Solid Waste Collection

The Solid Waste section will assist residents in understanding the services provided for refuse, recycling and yard waste collection in the City of Carlsbad. The Additional Waste Services section of this flyer instructs residents how and where to properly dispose of household hazardous waste, electronic waste and used oil.

Water Conservation

This section provides residents with cost saving options that will aid them in their efforts to conserve water. Resources such as toilet and clothes washer voucher programs and free on-site water audits are available.

Storm Water Protection

Storm water pollution affects everyone who lives, works and plays in the City of Carlsbad. Litter, fertilizers, pet waste, oil and soap can be washed from our yards, driveways and streets into the storm drain system and directly into our creeks, lagoons, and onto our beaches. This pollutes our water and endangers wildlife. The Storm Water section of this flyer identifies some preventative measures residents can take to minimize the source of these pollutants and the number to call to report illegal discharges in the storm drain system.

Brought to you in partnership by the City of Carlsbad and Waste Management, the City's refuse and recycling provider.

Storm Water Protection

Did you know that storm drains are NOT connected to sanitary sewer systems and treatment plants? The primary purpose of storm drains is to prevent flooding by carring rainwater away from developed areas . Untreated storm water flows directly into our creeks, lagoons and the ocean, carrying any pollutants from the roads.

Storm water pollution comes from a variety of sources, including:

- Oil from vehicles
- Excess pesticides and fertilizer from landscaping
- Bacteria from pet waste
- Sediment from construction and landscaping projects
- Soap from car washing
- Litter
- Lawn and garden debris
- Improperly disposed home improvement products (paint, stucco, grout, cement, solvent)
- Washing driveways and sidewalks

Pollution prevention is up to YOU!

Please help us protect OUR environment. Here are some tips to help keep creeks, lagoons and the ocean clean:

- Bag and dispose of pet waste in a trash can, not a yard waste container
- Use fertilizers and pesticides sparingly
- Adjust sprinklers to prevent over-watering
- When possible, take your car to a commercial car wash

- Keep automobiles properly maintained to prevent fluid leaks
- Properly dispose of trash and cigarette butts
- Volunteer at cleanup events in Carlsbad

"Only rain in the storm drain"

To report an illegal discharge or for more information, call our hotline at (760) 602-4646.

www.carlsbadconserves.org

Water Conservation/Storm Water Program

Water Conservation

The Carlsbad Water Ethic promotes responsible and efficient water use in our arid city. Our residents should follow this Water Ethic even when we are not in a drought situation. We encourage residents to adopt these behaviors as a way of life.

- Incorporate drought-tolerant plant materials and micro-irrigation (drip) systems wherever possible into new landscaping
- Water should not leave the user´s property due to over-irrigation of landscape
- Water during the early morning or evening hours to minimize evaporation
- Investigate and repair all leaks
- Water cannot be used to clean paved surfaces, such as sidewalks, driveways, parking areas, etc., except to alleviate immediate safety or sanitation hazards
- Recycled water shall be used wherever and whenever possible.

Residential Voucher Programs

Carlsbad participates in a voucher/rebate program with other San Diego County Water Agencies. The goal of this program is to reduce the amount of water residents use - thus increasing the available supply to all residents. Vouchers are available for money off of the purchase and installation of water saving devices like ultra low flow toilets, high-efficiency clothes washers, landscaping and Weather-Based Irrigation Controllers.
Interested residents and Home Owners Associations can contact the Voucher Processing Center at (800) 986-4538. The center is open Monday through Friday from 8:00 a.m. to 5:00 p.m., and Saturday from 8:00 a.m. to 3:00 p.m.

Residential Survey

Carlsbad residents can receive a free, on-site water conservation survey. This will include a review of indoor and outdoor water saving opportunities, a leak check, and an irrigation system and water schedule review. Customers are also shown how to read their water meter and are given literature promoting other conservation programs.
For ideas on water conservation at home refer to www.h2ouse.org

Waste Management
5960 El Camino Real
Carlsbad, California 92008
(760) 929-9400

Hours: Monday - Friday 8:00 a.m. - 5:00 p.m

http://northcounty.wm.com

Holiday Schedule

Waste Management does not offer service on the following holidays:

- New Year's Day
- Memorial Day
- Independence Day
- Labor Day
- Thanksgiving Day
- Christmas Day

When a holiday falls on a weekday, collection will be delayed one day for the remainder of the week.

Holiday announcements will be published in your local newspaper.

www.carlsbadconserves.org

Buyback Center

Redeemable items

- Newspaper
- CRV aluminum cans
- CRV glass bottles
- CRV plastic bottles
- CRV bi-metal cans

CRV = California Redemption Value. Ready-to-drink beverage containers which are packaged in aluminum, glass, plastic, bi-metal or any combination of these materials.

Also accepted:

- Electronic devices
- Household batteries

(For more information see Household Hazardous Waste)

Donation items

- Non CRV aluminum
- Non CRV glass
- Non CRV plastic
- Tin cans
- White ledger paper
- Computer paper
- Mixed paper
- Corrugated cardboard

Hours: Tuesday - Saturday
8:00 a.m. - 4:00 p.m.
Closed:
1:00 p.m. - 1:40 p.m.
(760) 929-9400

Bulky Item Pickup

Need to dispose of such items as furniture (couch, chair, dresser, cabinet, bookshelf, mattress) or appliances (toilet, washer, stove, sink)? FREE bulky item collection days are scheduled periodically in your community. Residents may dispose of two items per event. Special pickups are available for a fee. Call Waste Management at (760) 929-9400 to schedule an appointment or for additional information.

Electronic Waste

What is E-Waste?

The rapid advances in new technology and demand for new electronic equipment have increased the disposal of outdated electronic equipment known as "E-Waste."

Proper disposal of "E-Waste" through recycling and reuse prevents them from reaching landfills. This also helps to minimize waste, and provide usable items to organizations that need them as well as recapture valuable resources.

- Cell phones
- Computers
- Televisions
- VCRs/DVDs
- Stereos
- Printers
- Fax machines
- Monitors
- Microwaves ovens

Universal Waste

(Including household batteries)

As of February 9, 2006, it is now illegal in the State of California to dispose of common household items such as alkaline batteries*, mercury thermometers and thermostats, and fluorescent light bulbs into the trash. These items are now classified as Universal Waste, and must be disposed of properly through the Household Hazardous Waste (HHW) program. However, in an effort to make the disposal of common household batteries including re-chargeable ones, more efficient, the City has partnered with Waste Management to allow residents to drop off the batteries at the Waste Management Recycling Center located at 1145 East Taylor St., Vista, free of charge. The City recommends storing your used fluorescent light bulbs in a safe place until they can be brought to the HHW facilities or scheduled for a home pick-up.

**Note - rechargeable batteries can also be brought to a participating retail store that provides free drop-off bins for proper disposal.*

Where to recycle Electronic and Universal waste

Door-to-door: Call (800) 444-4244

Waste Management
5960 El Camino Real, Carlsbad
Hours: Tuesday - Saturday 8:00 a.m. - 4:00 p.m.
Closed: 1:00 p.m. - 1:40 p.m.
For additional information please call (760) 929-9400
COST: CRTs (television, laptops, monitors): no charge
All others electronic devices fee at drop-off.

Household Hazardous Waste Collection Facility
1145 East Taylor Street, Vista
Hours: Saturdays 9:00 a.m. - 3:00 p.m.
For additional information please call (800) 714-1195
COST: Currently there is no cost to Carlsbad residents.

Household Hazardous Waste

MATERIALS ACCEPTED:

- Used motor oil and filters
- Pool cleaners
- Automobile fluids (antifreeze, gasoline, brake, transmission)
- Household cleaners
- Landscaping chemicals
- Automotive batteries
- Mercury thermostats
- Mercury thermometers
- Non-empty aerosol cans
- Lamps with fluorescent tubes, sodium vapor lamps
- Household batteries
- Paint
- Mercury switches(automotive or non-automotive light switches)
- Novelties such as some singing greeting cards or flashing athletic shoes

Drop-off

Residents may bring up to 15 gallons or 125 pounds per visit.

A proof of residency required (California driver license, utility bill or other).

No charge to residents at either location.

Door-to-door collection

The City has implemented a door-to-door program that allows residents to make an appointment to have their HHW picked up at their residence for a small co-pay of $10. This door-to-door program is available to all residents. For more information on this program, or to set up an appointment, call (800) 444-4244.

Drop-off locations

VISTA
Hours: Saturdays:
9:00 a.m.- 3:00 p.m.
No appointment necessary
(800) 714-1195

1145 E Taylor St., Vista

OCEANSIDE
Hours: Alternating Saturdays:
9:00 a.m. - 1:00 p.m.
Appointment ONLY.
For additional information, please call
(760) 929-9400.

2880 Industry St., Oceanside

PUT TOXIC WASTE IN ITS PLACE

Funded by a grant from the California Integrated Waste Management Board.

Overflow Trash

5960 El Camino Real, Carlsbad

PALOMAR TRANSFER STATION
(760) 603-0153

Residents can dispose of overflow trash at the Palomar Transfer Station. A fee will be charged at the time of disposal. For additional information please call the Palomar Transfer Station at (760) 603-0153.

No hazardous or regulated waste is accepted at this facility including batteries, paint, tires, liquids and electronic waste.

Open to residents
Saturday & Sunday
7:30 a.m. to 4:00 p.m

Holiday Trees

The City, in partnership with Waste Management, has a holiday tree recycling and collection program that allows residents to drop off their trees for recycling or be picked up at the curb for collection. This service is free to all Carlsbad residents and it operates the day after Christmas through the first two weeks in January. For locations where residents may drop-off the trees for recycling check the City's website or the Community Services Guide.

For curbside pick-up remove stands, tinsel and ornaments from trees, cut in sections no longer than 4 feet and place out on the curb for collection. Flocked trees are not recyclable and will be collected by the trash drivers.

Holiday schedule announcements will be published.

City of Carlsbad

Storm Water Protection

April 23, 2008

Re: Discharge of Motor Oil into storm drain. (RFAA-7DAMC)

Dear Resident,

This letter is to inform you of a recent event that took place in your neighborhood. On Monday March 31, 2008, City staff received a report that a sheen, which appeared to be used motor oil, was exiting a storm drain into Agua Hedionda Lagoon. City staff and Contractors responded and were able to clean the oil from the Lagoon and Storm Drain. Fortunately, the discharge was caught in a timely manner and little oil actually reached the lagoon. This prevented any permanent damage to the lagoon or wildlife. On Tuesday April 1st an article covering the event appeared in the newspaper. The article led a witness to report the source or the oil to the City's Storm Water Protection Program.

Automotive fluids are hazardous and may be toxic to our environment. It is a violation of Carlsbad Municipal Code (CMC) 15.12.050 to discharge motor oil or any non-storm water to the storm drain. In addition CMC 15.12.080(F) prohibits any person from parking or standing any vehicle on any street for the purpose of washing, greasing, repairing, and/or maintaining the vehicle or equipment, except for repairs necessitated by an emergency.

The City of Carlsbad operates a Storm Water Protection Program, which is part of a statewide effort to protect our creeks, lagoons, and ocean from pollution. Storm drains are NOT connected to sanitary sewer systems and treatment plants. The untreated water and pollutants flow directly into our waterways. The Program is regulated by a State permit which requires the City to respond to complaints of illegal discharges to the City's storm drain system.

The program strives to inform residents of these requirements and how to comply with the City ordinance. CMC requires persons to properly dispose of trash and other materials and to eliminate or reduce pollutants entering the City's storm water conveyance system. Enclosed is information about the City's Storm Water Protection Program. To report suspected storm water violations or for more information please call the City's Storm Water Hotline at 760 602-2799.

Sincerely,

Tim Murphy

Storm Water-General Information/Questions				
APUXP	1/9/2008	1/9/2008	[redacted] La Costa Ave [redacted] Across the street from his residence, [redacted] he states there used to be a culvert that ran down to the street to divert the water. He said that a couple years ago the City did work out there and dammed it up and the water now collects up on top in a lake & the water no longer follows its natural flow and doesn't drain into the street. He says the water goes into the ground and underneath his house now. He states the situation should be remedied before there's a slide out there. From Tim Fennessy Immediate response provided to resident's at 10:45 a.m. Prior to meeting residents a quick review of [redacted]s was made and a small amount of water is present at the rock bags placed at the "F" box inlet. This water is being filtered by the rock bags and draining to the "F' box as designed. Reviewed both the [redacted] properties, met with [redacted]. [redacted] property; [redacted] observed standing water on his property in the back yard during the most recent rain event of Jan. 4th to the 6th. The yard is immediately adjacent to the open drainage channel at [redacted]urse. Water is no longer present. He believes water is migrating from the [redacted] repair project, across La Costa Ave. and day lighting into his [redacted]. He came to this conclusion due to the fact that sedimentation devices were holding water as designed in order to desilt storm water runoff per the SSWPP requirements. During the course of reviewing his property, It was discovered his rain gutters go underground and have since been disconnected at an unknown location and do not outfall at a lower surface elevation on the property. The line presently is disconnected somewhere under a side yard. I advised [redacted] to locate this line as soon as possible and re-establish the connection in order to alleviate a potential wash out to the slope. This gutter drain is on the west side of his house. A City drainage easement and line out falls on his properties east	1/9/2008 3:43:58PM - Kim Stankavich Status Change Previous: Open New: Closed Reason: [redacted] has been to site and address the situation with residents

Storm Water-General Information/Questions

Issue Nr.	Opened	Closed	Issue Description	Action History - Closed Action
			side. I told [redacted] I would request the City storm drain maintenance to check this storm drain line to insure it is operating correctly. I then met with [redacted] and reviewed their property. The rain gutters at this residence are also connected to an underground conduit, 3 in. PVC that out falls up slope of the William's property on an adjacent property line. It appears the water is crossing the property line and contributing to the area in question on the [redacted] property. I suggested [redacted] connect a line of suitable length to carry the roof drainage to the toe of slope thereby allowing the water to sheet flow across @ 30ft. of landscape at the northerly property line. These actions, if taken by the property owners, will probably correct the situation. Departed the [redacted] location at 12:00 p.m. Upon returning to office I met with Don Wasko and Clayton Dobbs, briefed them on situation and requested they review the storm drain outfall in order to be sure the City line is functioning as designed. This action should be taken to assure the property owners the city line is not contributing to the problem.

Storm Water Protection... It's OUR Business!

What You Need to Know…

The City of Carlsbad's storm water conveyance system consist of pipes, concrete ditches, basins, drains and inlets, as well as natural drainage areas, such as canyons, gullies and streams. The purpose of the system is to carry rainwater away from developed areas to prevent flooding.

Storm drains are **not** connected to sanitary sewer systems or treatment plants. Rainwater and the pollutants it carries flow directly to our creeks, lagoons and ocean. Pollutants of concern include:

- Sediments
- Fertilizers
- Metals
- Detergents
- Pesticides
- Organic Compounds
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

.

What is the Storm Water Protection Program?

The City's Storm Water Protection Program regulates storm water activities for existing development (residential, commercial and industrial), investigates illegal discharges to the storm water system, educates the public about pollution prevention, and oversees the water quality monitoring program.

What does the Municipal Permit require?

The Municipal Permit requires the City to prevent storm water pollution during all three phases of urban development land use planning for new development, construction, and existing development.

The Permit also requires the City - **employees, residents, and businesses** - to improve the quality of the water flowing into the storm water system to the maximum extent practical. This is accomplished through the implementation of Best Management Practices (BMPs). In addition, the Municipal Permit requires the City to investigate and eliminate illegal discharges, develop an outreach and education program, and implement BMPs at municipal facilities.

I've heard the term NPDES. What does it mean?

NPDES stands for National Pollutant Discharge Elimination System and is the name of a permit system implemented under the 1972 Federal Clean Water Act. The 1987 amendments to this Act required municipalities discharging storm water runoff into surface waters (i.e., ocean, lagoon, etc.) to obtain a permit. In California, these permits are issued by the Regional Water Quality Control Board.

Our current municipal storm water permit was issued on January 24, 2007 and applies to all 18 cities in San Diego County, the Unified Port District, the San Diego County Regional Airport Authority, and the County of San Diego. To view a copy of the Permit, please go to http://www.swrcb.ca.gov/rwqcb9/programs/sd_stormwater.html.

Who is responsible for protecting storm water?

EVERYONE! Storm water pollution prevention is a shared duty between the City of Carlsbad and the community. Storm drains on ***public*** streets, property, or easements are monitored and cleaned by the City. Everyone has a part to play in keeping our storm drains free of trash, debris, excessive vegetation, and other materials that may pollute, contaminate or block the flow of water through the storm drain system.

- **City Employees**
- **Residents**
- **Business Community**
- **Developers and construction workers**
- **YOU!!**

Storm Water Hotline: 760-602-2799

Only Rain in the Storm Drain!

Are all non-storm water discharges illegal?

The Municipal Permit prohibits **all** non-storm water discharges into the storm water system, with some exemptions:

- Landscape irrigation and lawn watering runoff
- Dechlorinated pool water
- Individual Residential car washing
- Potable water sources
- Foundation drains, crawl spaces
- Air conditioning condensate
- Emergency Fire Fighting Flows

What are Best Management Practices?

Best Management Practices or BMPs are procedures or structures that help to prevent pollutants from entering our storm drains. Once potential and existing sources of pollution have been identified, the next step is to select proper BMPs to eliminate or reduce storm water pollution.

What are some BMPs I can use in my daily work?

- Instead of using a hose or pressure washing system, **try a dry clean up method!** Use mops, brooms or wire brushes to clean dumpsters, sidewalks, buildings, equipment, pavement, driveways, or other impervious surfaces. Never dispose of wash water to the storm drain.

- When possible, store materials indoors or under covered areas not exposed to rain. If materials can not be stored under cover, place materials on pallets and cover with a tarp to avoid contact with storm water run-on and runoff.
- Dumpsters should always be kept closed to prevent rainwater from entering. Never place liquid waste, leaky garbage bags or hazardous waste in a dumpster or trash bin.
- Wash vehicles at a commercial car wash, whenever possible. City employees and/or mobile detailers can not wash vehicles on public streets or on public property, including City Hall and all public parking lots.

How do I report a storm water violation?

The Storm Water Protection Program operates a hotline and e-mail address to receive referrals about storm water pollution and illegal discharges. If you see someone dumping or washing waste or pollutants to the street or storm drain, please call the **hotline** at **760-602-2799** or send an email to stormwater ci.carlsbad.ca.us. This information is entered into the City s Request for Action system and is routed to the appropriate person for response.

Storm Water Hotline

760-602-2799

What is the City doing to comply with the Permit?

- A Jurisdictional Urban Runoff Management Plan (JURMP) that specifies how the City will implement the storm water program has been developed and implemented.
- The Carlsbad Municipal Code includes regulations for storm water protection and pollution prevention.
- Several informative brochures and fact sheets have been developed to educate the public and City employees about storm water pollution prevention.
- An extensive education and inspection program has been implemented to ensure the community is aware of and complying with the storm water requirements.
- Reports of illegal discharges are fully investigated and resolved to the maximum extent practical.
- Storm water pollution prevention measures have been incorporated into the new construction and building permit process.
- Storm water pollution prevention plans (SWPPP) have been developed and implemented at all high priority municipal facilities throughout the City.
- City employees have been trained and will continue to be trained on the requirements of the storm water program.
- The General Plan and Environmental Review process includes storm water and pollution prevention requirements.
- The City has completed a Standard Urban Storm Water Mitigation Plan (SUSMP) to address storm water requirements for new development and significant redevelopment.
- Water quality monitoring is being conducted at lagoon and ocean outlets within the City s jurisdiction.
- The storm drain conveyance system has been mapped and the information made available in a GIS format.
- A Watershed Urban Runoff Management Plan (WURMP) has been developed and implemented in association with other North County cities.

Be A Part of the Pollution Solution!!

Storm Water Training for Municipal Employees
March 24, 2008- June 30, 2008

DATE	DEPT. DIV.	EMPLOYEES ATTENDING	TRAINING TYPE	NAME OF TRAINING OR TOPICS	LOCATION	SPONSOR PRESENTER
03/27/2008	Water	34	Meeting	BMP Innovations	M&O	Don Wasko
03/27/2008	CM&I	10	Meeting	Overall Erosion Control and Reporting	M&O	Tim Fennessy
04/09/2008	CM&I	3	Workshop	EPA Webcast-Retro-fitting of BMPs	Safety Center	EPA
04/09/2008	CM&I	10	Meeting	Typical Lot Protection During Production	M&O	Tim Fennessy
04/09/2008	Storm Water, Parks, General Services, Construction, Storm Drain Maintenance	15	Webcast	EPA - Retrofitting BMPs	Carlsbad	EPA
04/18/2008	Parks	36	Meeting	Preventative Maintenance, BMPs, Federal/State Laws & Regulations, Non-storm water discharges	Parks Yard	Greg Dauss
04/24/2008	Water	45	all hands meeting	M&O Yard Inspection	PW M&O	Don Wasko
05/07/2008	Storm Water Dept	7	Meeting	WURMP 2008	Carlsbad	Storm Water
05/08/2008	Water	44	all hands meeting	Stormwater Terms and Accromyns	PW M&O	Don Wasko
06/04/2008	Storm Water Dept	5	webcast	EPA - Effectiveness Assessment	Carlsbad	Storm Water
06/17/2008	Building and CE	12	Meeting	Municipal Construction Actvities [per Sec. D.5b(1)(b)]	Faraday	Shawn Grandberry
06/17/2008	CM&I	11	Meeting	Municipal Construction Actvities [per Sec. D.5b(1)(b)]	Faraday	Shawn Grandberry
03/17-3/21/08	Storm Water Dept	1	Class	PC 832	San Diego	Miramar College
08/06-08/08/2007	Storm Water Dept	2	Class	24 Hr. HAZWOPER	San Diego	Pacific Saftey Council

Storm Water Committee Meetings Summary
March 24 - June 30, 2008

DATE	in attendance	AGENDA ITEMS
04/15/2008	10	Audit preparation and overview, JURMP questions, Municipal BMPs
05/13/2008	15	JURMP Annual Report preparation, RWQCB Audit review
06/10/2008	13	Annual Municipal Inspections recap, review JAR submitted, WURMP training

Expenditure Data
Budget, Actuals & Projections
Through 6/30/2008
5215710 - Storm Water
5216310 - Storm Drain Maintenance

Ending Date ==>> 06/30/08

Title Date

INTRODUCTION

This section of the City of Carlsbad's (City) Jurisdictional Urban Runoff Management Plan (JURMP) FY 07-08 Annual Report addresses the Illicit Discharge Detection and Elimination (IDDE) requirements of the Regional Water Quality Control Board (Regional Board) Orders No. 2001-01 and 2007-0001 (NPDES No. CAS0108758) commonly known as the Municipal Storm Water Permit (Permit).

Order No. 2007-0001 was issued January 24, 2007, and replaced Order No. 2001-01 issued in 2001. The new permit went into effect on March 24, 2008 partway through FY 07-08, therefore this report covers both reporting periods: from July 1, 2007 to March 23, 2008 under Order No. 2001-01, as well as from March 24, 2008 to June 20, 2008 under Order No. 2007-0001. The report is segregated into two main sections corresponding to the permit and time frames listed above.

The Regional Board issued these Permits to prevent and control polluted urban runoff from Municipal Separate Storm Sewer Systems (MS4s) discharging to downstream water bodies. As runoff flows through urban areas, it can carry harmful pollutants such as pathogens, sediments, fertilizers, pesticides, heavy metals, and petroleum products. Pollutants entering a receiving water body through the MS4 may harm aquatic life through toxicity and habitat degradation.

Each of the Copermittees listed in the Permit was required to develop a JURMP outlining their approach to protecting water quality and preventing harmful impacts from polluted urban runoff submitted to the Regional Board in March of 2008. The Permit requires the submittal of an Annual Report to the Regional Board to document the progress and implementation of the JURMP with Addendum No. 2 outlining submission of this IDDE section in December of each year.

The City is a municipal corporation, following the Council-Manager form of government. City Departments fall under one of five major service areas (MSA's): Public Safety, Administrative Services, Public Works, Community Development, and Community Services. While the City created the Storm Water Protection Program to help implement the Permit, program implementation is carried out by several departments within different MSA's. This allows for program implementation and new requirements to be incorporated into daily activities of City employees, instead of being viewed as completely new requirements without a connection to on-going services.

The City encompasses just over 42 square miles and borders 6 miles of coastline. Carlsbad also contains or borders three coastal lagoons (Buena Vista, Agua Hedionda and Batiquitos lagoons). The City is part of the Carlsbad Hydrologic Unit (Watershed), which includes four separate sub-watersheds that run through Carlsbad. These include each of the three lagoons and their respective drainage areas, in addition to a fourth watershed commonly known as Encinas Creek. Portions of Agua Hedionda Lagoon and Buena Vista Lagoon are listed as impaired for bacterial indicators and sedimentation/siltation on the Federal Clean Water Act Section 303(d) Impaired Water Bodies list. Buena Vista Lagoon is also impaired for nutrients. While this report focuses on the City's implementation of the JURMP and not the Watershed program, the two are becoming more intertwined as waterbodies and implementation strategies cross programmatic and jurisdictional boundaries.

Highlights

There were several highlights to be noted in FY 07-08 as follows:

- The City responded to a total of 226 complaints of illegal discharges to the MS4
- There was an increase in the percentage of complaint calls originating from City staff between the first of the year, and the last , increasing from 48 to 59
- The City s existing nine Smart Covers saved 4 wastewater spills in the first of the year, and the City added a tenth Smart Cover in the last of the year
- The City continued daily, quarterly, annual inspections of the wastewater system
- The City conducted 4106 manhole inspections and cleaned 188.24 miles of sewer lines
- The City conducted targeted outreach to 800 residents resulting from Dry Weather Program investigations
- There was a decrease in exceedances in coastal monitoring in both storm drains and receiving waters
- The City conducted 6 high level investigations resulting from either notification to or from the Regional Board, or those involving hazardous materials
- The City issued 73 enforcement actions consisting of an informational letter, verbal or written warning, or NOV
- The City conducted two Fats, Oils, and Grease workshops in the last of the year.

Notable Activities

Notable activities for FY07-08 include:

- There was an increase in complaints responded to from the hotline, with a total number of calls in FY 06-07 of 154, and a total of calls in FY 07-08 of 226
- The City conducted two Fats, Oils, and Grease workshops in the last of the year
- The City added a tenth Smart Cover in the last of the year
- The City conducted 6 high level investigations resulting from either notification to or from the Regional Board, or those involving hazardous materials.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

Under Order 2001-01, the City continued to conduct a proactive program for detecting and eliminating illegal discharges and illicit connections to the storm drain system during this reporting period. The City s program actively sought to identify and eliminate illicit discharges and connections by conducting illegal discharge investigations, responding to spills and sewage overflows, conducting monitoring, and performing routine cleaning and maintenance activities on the sewer and storm drain systems. Several notable activities occurred between July 1, 2007 and March 23, 2008 and are described below.

- Addition of staff an Environmental Specialist I in October 2007, and a new Public Works Supervisor for the Storm Drain Maintenance Division
- Continued operation of the stormwater hotline and complaint response with a summary in Section 7.2.
- Continued 24 hour spill response for wastewater and storm drain emergencies

7.1 Introduction

The Illicit Discharge Detection & Elimination (IDD&E) Program for the City encompasses all sources of solids and liquids containing pollutants and sanitary sewer system wastewater that may enter the municipal separate storm sewer system (MS4). The Program focuses on prevention while actively pursuing, investigating, and eliminating illicit discharges. The City facilitates public reporting of illicit discharges and connections as described in Section 7.2. Continued efforts are in place to facilitate reporting of spills, immediate response to spills, and continued education to prevent spills. These efforts are described in Section 7.3. In addition to complaint and spill response, the City continues to perform monitoring in support of the IDDE program. These monitoring programs are described in Section 7.4. The previously mentioned parts of the IDDE Program require routine follow-up investigations and may prompt enforcement actions by the City. These efforts are described in Section 7.5. The City strongly encourages voluntary elimination and cleanup of illicit discharges; however, enforcement is escalated to obtain compliance, where necessary.

7.2 Public Reporting of Illicit Discharges and Connections

As required under Order 2001-01, the City continued to publicize and facilitate public reporting of illicit discharges and water quality impacts. Methods to publicize and facilitate public reporting included:

- Brochures and Publications
- Outreach events
- The City s Website
- Internal training
- Operation of a Storm Water Hotline
- Operation of an Environmental Programs Hotline

All outreach methods utilized are described in detail in Sections 8.0 and 9.0, the Education and Public Participation Sections of the Annual Report submitted to the Regional Board on September 30, 2008.

During regular office hours from Monday to Friday, Storm Water Protection Program staff answered the storm water hotline, checked emails to the storm water account, and forwarded reported information to the appropriate personnel. When calls were received after office hours, the hotline provided a voice mail message (in English and Spanish) directing complainants to leave a message for follow-up or be directed to police dispatch for emergency response (i.e., dumping of hazardous materials into the storm water system).

The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. During this reporting period, the Storm Water Program received 161 reports regarding urban runoff or storm water. Figure 7.1 illustrates the breakdown of storm water complaints by reporting mechanism.

Figure 7.1 Storm Water Complaints by Reporting Mechanism
July 1, 2007 - March 23, 2008 (Order 2001-01)

Other calls ranged from information requests, to solid waste inquiries, to other City business.

Sources of illegal discharge reports to the City included approximately 44 from the public, 48 from City employees, and 8 from outside agencies. Figure 7.2 illustrates the breakdown of reporting parties for the storm water complaints received during this reporting period.

Figure 7.2 Storm Water Complaints by Reporting Party
July 1, 2007 - March 23, 2008 (Order 2001-01)

The Storm Water Protection Program responded to 161 complaints potentially related to urban runoff during this reporting period. Figure 7.3 illustrates the breakdown of storm water related complaints by type of complaint.

Figure 7.3 Storm Water Complaints
July 1, 2007 - March 23, 2008 (Order 2001-01)

The City continued to operate a Household Hazardous Waste (HHW), and used oil recycling program. During the entire FY 07-08, the City collected and disposed of approximately 148 tons of HHW (including recycled or diverted).

Residents used the Environmental Programs hotline and e-mail address to request information about the HHW program, trash, and recycling. The City's RFA system was used to track calls about Environmental Programs comments and questions from residents. From July 1, 2007 to March 23, 2008 the Environmental Programs Division responded to 60 complaints related to HHW, recycling, and solid waste. Table 6.4 in the Residential section of the City's FY 07-08 JURMP Annual Report submitted to the Regional Board on September 30, 2008 summarizes these complaints.

7.3 Spill Reporting, Response, and Prevention

Spill Response

City employees are trained to follow the City's Sewer Overflow Prevention Plan/Response Plan. Staff training was conducted semi-annually, either by tailgate or all-hands class format. All spill response incidents were tracked in the Hansen system or spill reports. Sanitary sewage overflow responses were documented as required on the Sanitary Sewer Overflow Report Form, which was sent via fax to the Regional Board, County Health Department, and the Storm Water Protection Program.

During this reporting period the City responded to 17 sewage overflows or spills. Four of these spill responses involved sewer mains, of approximately 5,686 gallons. The other 13 spill responses were due to private sewer lateral spills, of approximately 916 gallons. Of an estimated 5686 gallons spilled, 2061 gallons were recovered with approximately 3625 gallons entering the environment. The overflow reports are found in Appendix 7.1.

Public Works Maintenance and Operations staff (M&O) continued to respond and coordinate sewage spill response with the Leucadia Waste Water District (LWWD) and Vallecitos Water District for spills that occur outside the M&O jurisdiction. During normal business hours, calls were dispatched by M&O to field units for immediate response and evaluation. After working hours, phone numbers were routed through police dispatch to M&O standby personnel.

A portion of the Leucadia Wastewater District (LWWD) collection system is located within the City limits. LWWD are responsible for operating and maintaining their system, including responding to overflows and spills. However, the City's M&O Department responds or provides assistance when requested. During this reporting period, LWWD responded to four sewage overflows in Carlsbad, three of which were private lateral spills. A total of 340 gallons of sewage was spilled with 250 gallons recovered, resulting in the release of 90 gallons of sewage into the environment. Response details are found in Appendix 7.2.

A portion of the Vallecitos Water District (VWD) sewage collection system is also located within the City limits. They are responsible for operating and maintaining their system, including responding to overflows and spills. However, M&O responds or provides assistance when requested. During this reporting period, VWD reported one sewage overflow in the City of Carlsbad. Seven gallons were released and all seven gallons were recovered, with zero gallons discharged to the environment.

The City continued to actively prevent and respond to sewage spills and other spills, and to limit discharges from the sanitary sewer system to the MS4. This occurred through public education and outreach, inspections, preventive maintenance, complaint response, and spill response (containment and remediation). The City operated a total of 283.5 miles of sewer mains and City staff maintained 253 miles of 12 and under sewer mains. Large sewer trunk mains are maintained by both City staff and contract work. City staff maintains 14 sewer pump stations.

The City of Carlsbad had nine Smart Covers to monitor flow levels in problem sewer manholes during this reporting period, and plans to add one more next quarter. Smart cover alarms saved the City from four spills during the reporting period.

Table 7.1 contains a summary of information associated with miles of sewer mains and spills.

Table 7.1 Summary

Time Period	Number of Reportable Spills[1]	Reportable Gallons Spilled	Total Miles of Sewer Mains
July 1, 2007 - March 23, 2008	5	5686	283.5

[1] Includes all spills caused by a failure in the sewer system (excludes recycled water spills and/or spills from sewer laterals).

The following inspection and preventive maintenance activities were conducted during this reporting period.

Inspection

From Monday through Friday, all sewer pump stations were inspected daily. The ten largest pump stations were also inspected on Saturdays and Sundays. The operator inspected the electrical systems quarterly and the pumps and shafts were serviced annually. In addition, outside services were contracted to inspect the electrical services annually. The wet wells were cleaned every six weeks or more frequently if necessary.

Eleven pump stations are equipped with telemetry which were inspected daily. This included checking the 24-hour history records, pump gallons per minute, wet well on-off cycles and pump alternating cycles. The City conducted most pump repair work, although any needed machine work was performed by outside services. In the case of emergencies, the City has a 24-hour duty person, and cell phones were issued to each member of the Wastewater Operations staff, and Supervisor. In the case of power failures, ten of the stations have onsite generators and three stations can be powered by the City s two trailer mounted generators. The remaining station has 24 hours of storage capacity and can be maintained by a vacuum or pumper truck.

Education

Educating the public on the proper disposal of fats, oils and grease is one of the BMPs used to prevent sewage spills. The City continued to distribute the Water Environment Federation brochure entitled *Fat-Free Sewers.* These brochures were distributed at various public events and during field visits. The City planned Fats, Oils and Grease (FOG) workshops for the Food Service Establishments.

Preventive Maintenance

During this reporting period, the City performed routine preventative maintenance and inspections of the sanitary sewer system, which included video inspections, access hole inspections, semi-annual inspections of three major trunk lines, and routine cleaning of sewer mains. For the reporting period July 1, 2007 through March 23, 2008, the City crews performed

approximately 3,496 manhole inspections. Regular monitoring of the sewer system was achieved with routine cleaning and manhole inspections. Sewer system surveillance was conducted on a regular basis. Flow monitoring was performed to compare the flows in dry and wet seasons. Anything unusual was reported and followed up on.

Approximately 147.51 miles of sewer lines were cleaned during this reporting period. The maintenance schedule is designed to provide more frequent cleaning for identified trouble areas, with siphons being cleaned annually, low flow and flat lines cleaned semi-annually, and grease problem areas cleaned quarterly. The Buena Vista Force Main is inspected Monday through Friday, by walking all accessible areas from the lift station west to I-5.

Complaint Response

The Storm Water Protection Program occasionally depends on other City departments to assist with investigations and remediation during field reviews. M&O and the Storm Drain Maintenance Division were key to prompt, effective responses to investigations involving spills and clean ups. Regular meetings and discussions about compliance issues facilitated this interdepartmental coordination effort.

M&O personnel responded to 149 sewer stoppage complaints during this reporting period. These requests and the City s response were tracked electronically in the RFA and Hansen systems.

Other Spills

The City s Emergency Services (Fire/Police Departments) continued to respond to reports of hazardous materials spills and discharges in Carlsbad. Fire Department personnel were trained in hazardous material emergency response and identification of hazardous materials and other City departments relied on the Fire Department to assume command during hazardous materials incidents. Emergency services may request assistance from the Streets Department or Storm Drain Maintenance Division (SDMD) to contain discharges that have the potential to endanger life, property, and/or the City right-of-way, control traffic, and provide secondary perimeter boundaries as directed by Emergency Services staff.

During this reporting period, the City s Spill Response Procedure continued to be used to detail the roles and responsibilities of Emergency Services, Streets Department, M&O, and the Storm Water Protection Program. If Emergency Services was first on the scene of an unidentified spill, the Incident Commander suspected the substance to be of a hazardous nature, emergency response procedures were implemented. Incident Commanders retained a copy of the Department of Transportations *Emergency Response Guidebook* which lists classifications of hazardous materials and recommendations for handling materials.

The San Diego County DEH HIRT, through a Joint Powers Agreement, was involved in any significant spills of a hazardous nature. The County maintains these records, as does the State OES. Minor petroleum or other small spills on City streets were handled by the Streets Department or SDMD using absorbents, sweeping, and proper waste disposal. These cleanup requests were documented in the City s RFA or work order systems. During this reporting period, there were 9 other spills (non-sewage related) in Carlsbad as referenced in Appendix 7.3.

PREVENTION MEASURES OF SEWAGE INTRUSION INTO MS4

The City of Carlsbad's Engineering Standards have several measures to prevent sewage intrusion into municipal separate storm sewer systems (MS4).

1. All gravity sewer pipes and laterals are required to have gasketed joints, which create water tight joints (Volume 1, Chapter 6, Item 3.A, 3.C, and 3.F). The water tight joints are tested using the methods indicated in Standard Specifications for Public Works Construction (SSPWC) section 306-1.4. The water tight test methods include a post-installation closed circuit television (CCTV) inspection and an air pressure test where the sewer line must sustain 2.5 to 3.5 psi gage pressure for at least 2 minutes after being pressurized to 3.0 psi.

2. All gravity sewer lines are required to follow engineering standard for the amount of flow they can carry. During peak hour dry weather season the pipe shall be designed to carry a flow depth of 0.5 (or 0.75 depending on the pipe size) the diameter of the pipe (Volume 1, Chapter 6, Item 4.C). This design requirement prevents the pipe from becoming full, which would pressurize the pipe and potentially cause a leak.

3. Per Carlsbad's Engineering Standard GS-6 and GS-6A, the sewer lines are typically located at an elevation deeper than the storm drain line, which further prevents sewage intrusion into MS4. In the event of a sewage pipe leak, the leakage flow will naturally gravitate below the sewer line rather than up to the storm drain line.

4. The standard horizontal separation between sewer and storm drain is 13 feet, which further prevents sewage intrusion into MS4.

5. In special cases where storm drain lines are installed at a depth greater than that of sewer lines, additional design standards are required such as water tight joints or encasements (Volume 1, Chapter 5, Item 1.G).

Preventative maintenance of the sanitary sewer system, as described above is also effective at preventing infiltration from sanitary sewer lines into the MS4. Continued preventative maintenance prevents exfiltration of sewer water from the pipelines by ensuring that flow is maintained in the system and pressure does not build up causing water to leave the system.

In the storm drain system, ammonia test kits are utilized as part of the dry weather program, primarily to test for the presence of sewage. These tests are taken once per year at various points strategically placed throughout the MS4 to provide adequate coverage. Exceedances for ammonia may trigger source investigations, which may detect infiltration from sewer lines if present.

7.4 Urban Runoff Monitoring

Dry Weather Monitoring

During this reporting period, the City continued investigations related to the Dry Weather Monitoring Program that was implemented between May 1 and September 30, 2007. As in years past this program included monitoring at 60 MS4 locations throughout the City.

Several of the findings in the 2007 Dry Weather Program prompted further investigations upstream. As reported previously, several investigations resulted in extensive outreach campaigns in response to water quality exceedances, especially in residential areas, where

specific sources of pollutants were not able to be identified. The City distributed educational information to over 800 residents, focusing mainly on over irrigation, lawn care and landscaping, and pet waste.

Additionally, three sites were recommended for further inspection where low pH was detected. The low pH was suspected to be caused by groundwater intrusion into the MS4. Using closed circuit television (CCTV) camera equipment, the City inspected the portions of the MS4 where the pH was low. In two cases, groundwater intrusion was evident through seams in the pipe and no illicit connections were identified. In the third case, a connection to the MS4 was located that appears to convey groundwater from a sub-drain system. In all three cases, groundwater was confirmed as the source of the low pH.

Results and investigations from the 2007 Dry Weather Monitoring Program were reported in the City s Dry Weather Monitoring Report for 2007 submitted with the City s FY 06-07 JURMP Annual Report in January 2008.

Coastal Storm Drain Monitoring

As required under the Permit, the City continued to monitor storm drains discharging to coastal waters. In order to facilitate the transition from Order 2001-01 to Order 2007-0001, the Copermittees requested permission from the Regional Board to implement the Coastal Storm Drain Monitoring Program beginning with the new monitoring season, October 1, 2007. This request was granted and the City began to implement the program according to the Order 2007-0001 requirements at this time.

Table 7.2 summarizes the City Coastal Storm Drain Monitoring activities under each permit during this reporting period.

Table 7.2 Coastal Storm Drain Monitoring Program Summary Statistics (July 1, 2007 March 23, 2008)

Sites Monitored		Frequency	Routine Samples Collected		Sites with Exceedances		Findings
Ocean	Lagoon		Pairs	Singles	Storm Drain	Receiving Water	
Order 2001-01							
6	16	Monthly	9	9	2	1	All confirmation samples were within established criteria. No further action.
Order 2007-0001							
8	0	Monthly	1	3	1	0	No flow was observed at the sites when staff returned to collect confirmation samples. No further action.

Results of this reporting period show that the majority of sites do not have sufficient flow to sample the majority of the time during dry weather. Over the course of this reporting period, 114 site visits were made and samples were collected on 22 of the visits, or only 19 of the time. Of the 22 monitoring events where samples were collected, four of the initial samples had exceedances of water quality criteria: three for exceeding 95th percentile criteria in the storm drain and one for exceeding Rec-1 criteria in the receiving water. On follow-up visits, none of

the samples collected confirmed exceedances of water quality criteria. On one of the three follow-up visits, there was no flow at the site.

All data collected and a full analysis of the Coastal Storm Drain Monitoring Program will be submitted in the San Diego County Storm Water Monitoring Annual Report to be submitted in January 2009.

7.5 Follow-up and Enforcement

The IDDE process is an ongoing endeavor, involving a combination of education, inspections, complaint response, and enforcement. The City used one or any combination of these efforts as necessary to achieve compliance. The ultimate goal is to eliminate the discharge or connection and to prevent future occurrences.

During this reporting period, the Storm Water Protection Program received 161 complaints of potential illegal discharges. As illustrated in Figure 7.3, 64 of the complaints involved alleged washing or dumping to the storm drain, totaling 104 of the 161 complaints. These types of complaints are representative of illegal discharges reported to the program. All reports were investigated, however not all reports of washing or dumping to the storm drain were illegal discharges. Of the 104 reports of washing or dumping to the storm drain, 69 were found to be valid complaints, 11 were not illicit discharges, and 25 were not found upon investigation. Table 7.3 provides a breakdown of illicit discharges and connections by residential, commercial, industrial, and municipal land uses. There were no illicit connections identified. All illicit discharges (69) that were identified were eliminated as required.

Table 7.3 Illicit Discharges and Connections

Land Use	Number of Illicit Discharges	Number of Illicit Connections
Residential	37	0
Commercial	18	0
Industrial	1	0
Mobile Washer	6	0
Municipal	5	0
Construction	2	0

All complaints were addressed according to the City s Enforcement Procedures as described in the JURMP, Section 2.4. In utilizing this escalating enforcement process, all illicit discharges were eliminated. Table 7.4 summarizes the enforcement actions that were necessary to eliminate the discharges described above. Enforcement actions specific to land uses (i.e. residential, construction, industrial/commercial) are described in their respective sections of the annual report.

Table 7.4 Enforcement Actions to Eliminate Illicit Discharges/Connections

Enforcement Action	Number	Percentage
No Issue/No Violation	22	21
Verbal Warning	23	22
Informational Letter	15	14
Written Warning	4	4
Notice of Violation	6	6
Referred for Action	17	16
Not Found	17	16
	104	

The City conducted four high level illicit discharge investigations during this reporting period. High level illicit discharge investigations include those that involve hazardous and/or toxic substances and those investigations resulting from complaints to or from the Regional Board. Each of these high level complaints is described below.

West Buffet (RFAA-753MT9)

On July 13, 2007 the City's storm water staff was notified of grease observed at a storm drain outfall near Buena Vista Creek. The observation was a result of the City's Dry Weather Monitoring Program. Initially the source was not identified and the City hired a contractor to clean the storm drain and area adjacent to the outfall. Further upstream investigation led City inspectors to a nearby restaurant, West Buffet. It appeared that they had washed grease and other materials to the storm drain in the back of their building. They were instructed to stop the activity immediately and agreed to have the storm drain system cleaned from their restaurant to the outfall. The MS4 was hydro-jetted from the source to the discharge. The City oversaw both cleanup efforts to ensure that no further discharges occurred. A Notice of Violation was issued to West Buffet and the City charged the business for time and money spent on the cleanup of the discharge. West Buffet responded in writing that they would implement BMPs to prevent any further discharges to the MS4. A subsequent storm water inspection was performed on January 23, 2008 and no violations were observed. The incident was reported to the Regional Board verbally within 24 hours and followed up in writing within five business days.

La Costa Foam Incident (RFAA-7DTKV5)

During a rain event on November 30, 2007 the City responded to a report of foam entering the storm drain. An investigation was initiated by City staff and it appeared that the foam originated from property owned by SDG&E. SDG&E was contacted and responded to the incident with equipment to contain the remainder of the foam and to recover as much as possible. Because the discharge was observed in the storm drain and in Batiquitos Lagoon, the RWQCB was notified. SDG&E cleaned the foam and drainage path from its source. The source of the foam was not definitively identified. The incident was reported the Regional Board verbally within 24 hours and followed up in writing within five business days.

Sediment Discharge Carlsbad High School (RFAA-7BERTK)

In February the City of Carlsbad Storm Water Department received a complaint from nearby residents regarding sediment leaving the property of Carlsbad High School. Sediment had been discharged onto the City streets and into the storm drain system. City Staff worked with the Carlsbad Unified School District and the RWQCB to address a short term solution to the erosion issue. The School District cleaned up all sediment from the streets and implemented appropriate BMPs to retain sediment on-site. City crews cleaned the sediment from the storm drain system. Currently under construction, the District will address the long term erosion concerns with the new construction.

Quality Inn and Suites (RFAA-7BRN4W)

On February 13, 2008, the City responded to a report of a mobile washing operation in the parking lot of the Quality Inn and Suites. Semi-trucks were being washed on-site and excess wash water was flowing into the storm drain system. Workers stopped all washing and were required to build containment around the wash area and direct all water to the landscape prior to

resuming the activity. A follow up inspection was performed to verify compliance and a Notice of Violation was issued to the Quality Inn and Suites for violations of Carlsbad Municipal Code 15.12.050 and 15.12.080.

A complete summary of all Storm Water Protection Program investigations and responses is found in Appendix 7.4.

Sanitary Sewer Overflows
July 1, 2007 - March 23, 2008

Date	Source	Substance	Volume	Enter MS4?	Enter RW?	Response
03/22/2008	Private Interceptor	FOG	600	Yes	Yes	Costco notified to clear and clean interceptor and lateral, and to clean storm darins affected.
03/04/2008	Private Lateral	Sewage	10	No	No	Replaced C/O cap, had resident cal plumber.
03/03/2008	Private Lateral	Sewage	75	No	No	Illegal storm drain to sewer connection to be disconnected. Call plumber for stoppage.
03/01/2008	Private Lateral	Sewage	25	No	No	Debris in lateral.
01/31/2008	Private Lateral	Sewage	30	No	No	Plumber cleared grease blockage.
01/17/2008	Private Lateral	Sewage	45	No	No	Plumber cleared grease blockage.
12-31-07	Sewer MH	Sewage	350	No	Yes	Clear root stoppage, TV to ID cause.
12/23/2007	Private Lateral	Sewage	5	No	No	Plumber cleared root blockage.
12/21/2007	Private Lateral	Sewage	20	No	No	Plumber cleared blockage.
11-13-07	Sewer Main C/O	Sewage	60	No	No	Clear stoppage, capture all spill.
11-04-07	Sewer MH	Sewage	2000	No	No	Contained, cleared grease blockage, and captured all.
10-28-07	Sewer MH	Sewage	3625	No	No	Vandalism, construction debris,
10/17/2007	Private Lateral	Sewage	40	No	No	Plumber cleared tampons and sanitary napkins in cleanout.
10/11/2007	Private Lateral	Sewage	40	Yes	Yes	Plumber cleared root blockage.
09/10/2007	Private Lateral	Sewage	30	No	No	Plumber cleared lateral stoppage.
09/07/2007	Private Lateral	Sewage	15	Yes	Yes	Root blockage.
09-04-07	Sewer MH	Sewage	1	No	No	Clear root stoppage.

These spills were from the City of Carlsbad maintained sewer main.

Date	Address	Volume (gallons)	Recovered (gallons)	lat - deg.min.sec	long - deg.min.sec	CIWQS
08/31/07	Private Cleanout, 2534 Luceirnaga, Carlsbad, CA	20	0	33.06.11N	117.15.25W	656751

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

Under Order 2007-0001, the City continued to conduct a proactive program for detecting and eliminating illegal discharges and illicit connections to the storm drain system. The City's program actively seeks to identify and eliminate illicit discharges and connections by conducting illegal discharge investigations, responding to spills and sewage overflows, conducting monitoring, and performing routine cleaning and maintenance activities on the sewer and storm drain systems. Several notable activities occurred between March 24 and June 30, 2008 and are described below.

- Continued operation of a stormwater hotline and complaint response with a summary in Section 7.2.
- Continued 24 hour spill response for wastewater and storm drain emergencies
- Updated the Dry Weather Program sites
- Conducted the Dry Weather Program from May 1 September 30, 2008

7.1 Introduction

The Illicit Discharge Detection & Elimination (IDD&E) Program for the City encompasses sources of solids and liquids containing pollutants and sanitary sewer system wastewater that may enter the municipal separate storm sewer system (MS4). The Program focuses on prevention while actively pursuing, investigating, and eliminating illicit discharges. The City facilitates public reporting of illicit discharges and connections as described in Section 7.2. Continued efforts are in place to facilitate reporting of spills, immediate response to spills, and continued education to prevent spills, described in Section 7.3. In addition to complaint and spill response, the City continues to perform monitoring in support of the IDDE program, described in Section 7.4. Routine follow-up investigations and associated enforcement actions are described in Section 7.5. The City strongly encourages voluntary elimination and cleanup of illicit discharges, however, enforcement is escalated to obtain compliance when necessary.

7.2 Public Reporting of Illicit Discharges and Connections

As required under Order 2007-0001, the City continues to publicize and facilitate public reporting of illicit discharges and water quality impacts. Methods to publicize and facilitate public reporting include:

- Brochures and Publications
- Outreach events
- The City's Website
- Internal training
- Operation of a Storm Water Hotline
- Operation of an Environmental Programs Hotline

All outreach methods utilized are described in detail in Sections 8.0 and 9.0, the Education and Public Participation Sections of the City's FY 07-08 Annual Report, submitted on September 30, 2008 to the RWQCB.

During regular office hours, 8 am to 5 pm, Monday through Friday, Storm Water Protection Program staff answered the storm water hotline, checked emails to the storm water account, and forwarded reported information to the appropriate personnel. When calls were received

after office hours, the hotline provided a voice mail message (in English and Spanish) directing complainants to leave a message for follow-up or be directed to an after hours number for dumping of hazardous materials into the storm water system.

The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. During this reporting period, the Storm Water Program received 65 reports of potential illegal discharges to the MS4. Figure 7.1 illustrates the breakdown of storm water complaints by the reporting mechanism.

Figure 7.1 Storm Water Complaints by Reporting Mechanism
March 24 - June 30, 2008 (Order 2007-0001)

Other calls ranged from information requests, to solid waste inquiries, to other City business.

During the time period from March 24 through June 30, 2008 the storm water program researched software available to track the number of calls to the storm water hotline. New methods to track calls were implemented July 1, 2008 and will be reported on in the Annual Report for Fiscal Year 2008-09. There were 65 storm water related complaints received, 35 of which were via the hotline.

Sources of illegal discharge reports to the City included approximately 36 from the public, 59 from City employees, and 5 from outside agencies. Figure 7.2 illustrates the breakdown of reporting parties for the storm water complaints received during this reporting period.

Figure 7.2 Storm Water Complaints by Reporting Party
March 24 - June 30, 2008 (2007-0001)

Of the 65 storm water related complaints received during the period from March 24 to June 30, 2008, most were related to washing or dumping to the storm drain. Figure 7.3 illustrates the types of storm water related complaints received during this period.

Figure 7.3 Storm Water Complaints
March 24-June 30, 2008 (Order 2007-0001)

As compared to previous reporting periods, call volume appears to be increasing marginally. For this report period, March to June, there were 65 calls. In FY 07-08, the total number of storm water related calls were 226 compared to 154 in FY 06-07.

7.3 Spill Reporting, Response, and Prevention

Spill Response

City employees are trained to follow the City s Sewer Overflow Prevention Plan/Response Plan. Staff training was conducted semi-annually, either by tailgate or all-hands class format. All spill response incidents were tracked in the Hansen system or spill reports. Sanitary sewage overflow responses were documented as required on the Sanitary Sewer Overflow Report Form, which was sent via fax to the Regional Board, County Health Department, and the Storm Water Protection Program. During this reporting period of March 24 to June 30, 2008, the City responded to 2 sewage overflows or spills of approximately 1,145 gallons. Of the estimated 1,145 gallons spilled, all was recovered plus approximately 10,020 gallons of wash down water. The overflow reports are found in Appendix 7.1.

The City Public Works Maintenance and Operations Division (M&O) continued to respond and coordinate sewage spill response with the Leucadia Waste Water District (LWWD) and Vallecitos Water District (VWD) for spills that occurred outside the M&O jurisdiction. During normal business hours, calls were dispatched by M&O to field units for immediate response and evaluation. After working hours, phone numbers were routed through police dispatch to M&O standby personnel.

A portion of the LWWD collection system is located within the City limits. LWWD is responsible for operating and maintaining their system, including responding to overflows and spills. However, M&O responds or provides assistance when requested. During this reporting period, LWWD responded to zero sewage overflows in Carlsbad.

A portion of the VWD sewage collection system is also located within the City limits. VWD is responsible for operating and maintaining their system, including responding to overflows and spills. However, M&O responds or provides assistance when requested. During this reporting period, Vallecitos Water District reported zero sewage overflows in the City of Carlsbad.

The City continued to actively prevent and respond to sewage spills and other spills, and to limit discharges from the sanitary sewer system to the MS4. This occurred through public education and outreach, inspections, preventive maintenance, complaint response, and spill response (containment and remediation). The City operated 283.5 miles of sewer mains, and City staff maintained 253 miles of 12 and under sewer mains. Large sewer trunk mains are maintained by both City staff and contract work. City staff maintained 14 sewer pump stations.

The City also added an additional Smart Cover to the existing nine, for a total of ten, to monitor flow levels in problem sewer manholes. Smart Cover alarms saved the City from one spill during this reporting period. The City entered into a joint project with Encina Wastewater Authority and installed new ADS Intelliserve flow monitoring systems to monitor sanitation flow rates 24 hours a day at selected areas.

Table 7.1 contains a summary of information associated with miles of sewer mains and spills.

Table 7.1 Summary

Time Period	Number of Reportable Spills[1]	Reportable Gallons Spilled	Total Miles of Sewer Mains
March 24 - June 30, 2008	2	1145	283.5

[1] Includes all spills caused by a failure in the sewer system (excludes recycled water spills and/or spills from sewer laterals).

The following inspection and preventive maintenance activities were conducted during this reporting period.

Inspection

From Monday through Friday, all 14 sewer pump stations were inspected daily. The ten largest pump stations were also inspected on Saturdays and Sundays. The operator inspected the electrical systems quarterly and the pumps and shafts were serviced annually. In addition, outside services were contracted to inspect the electrical services annually. The wet wells were cleaned every six weeks or more frequently if necessary.

Eleven pump stations are equipped with telemetry which was inspected daily. This included checking the 24-hour history records, pump gallons per minute, wet well on-off cycles and pump alternating cycles. The City conducted most pump repair work; although any needed machine work was performed by outside services. In the case of emergencies, the City has a 24-hour duty person, and cell phones were issued to each member of the Wastewater Operations staff, and Supervisor. In the case of power failures, ten of the stations have onsite generators and three stations can be powered by the City s two trailer mounted generators. The remaining station has 24 hours of storage capacity and can be maintained by a vacuum or pumper truck.

Education

Educating the public on the proper disposal of fats, oils and grease is one of the BMPs used to prevent sewage spills. The City continued to distribute the Water Environment Federation brochure entitled *Fat-Free Sewers.* These brochures were distributed at various public events and during field visits. The City held two Fats, Oils, and Grease (FOG) workshops during this reporting period.

Preventive Maintenance

During this reporting period, the City performed routine preventative maintenance and inspections of the sanitary sewer system, which included video inspections, 610 manhole inspections, semi-annual inspections of three major trunk lines, and routine cleaning of sewer mains. Regular monitoring of the sewer system was achieved with routine cleaning and manhole inspections. Sewer system surveillance was conducted on a regular basis. Flow monitoring was performed to compare the flows in dry and wet seasons. Anything unusual was reported and followed up on.

Approximately 40.74 miles of sewer lines were cleaned from March 23 June 30, 2008. The maintenance schedule is designed to provide more frequent cleaning for identified trouble areas, with siphons being cleaned annually, low flow and flat lines cleaned semi-annually, and grease problem areas cleaned quarterly. City staff also performs Monday through Friday checks of the Buena Vista Force Main, walking the line from the lift station to I-5.

Complaint Response

The Storm Water Protection Program occasionally depends on other City departments to assist with investigations and remediation during field reviews. M&O and the Storm Drain Maintenance Division were key to prompt, effective responses to investigations involving spills and clean ups. Regular meetings and discussions about compliance issues facilitated this interdepartmental coordination effort.

M&O personnel responded to 36 sewer stoppage complaints during this reporting period. These requests and the City s response were tracked electronically in the Accela, Hansen systems, and the CIWQS website.

Other Spills

The City s Emergency Services (Fire/Police Departments) continued to respond to reports of hazardous materials spills and discharges in Carlsbad. Fire Department personnel were trained in hazardous material emergency response and identification of hazardous materials and other City departments relied on the Fire Department to assume command during hazardous materials incidents. Emergency services may request assistance from the Streets Department or Storm Drain Maintenance Division (SDMD) to contain discharges that have the potential to endanger life, property, and/or the City right-of-way, control traffic, and provide secondary perimeter boundaries as directed Emergency Services staff.

During this reporting period, the City s Spill Response Procedures continued to be used to detail the roles and responsibilities of Emergency Services, Streets Department, M&O, and the Storm Water Protection Program. If Emergency Services was first on the scene of an unidentified spill, and the Incident Commander suspected the substance to be of a hazardous nature, emergency response procedures were implemented. Incident Commanders retained a copy of the Department of Transportations *Emergency Response Guidebook* which lists classifications of hazardous materials and recommendations for handling materials.

The San Diego County DEH HIRT, through a Joint Powers Agreement, was involved in any significant spills of a hazardous nature. The County maintains these records, as does the State OES. Minor petroleum or other small spills on City streets were handled by the Streets Department or SDMD using absorbents, sweeping, and proper waste disposal. These cleanup requests were documented in the City s RFA or work order systems. During this reporting period, there were nine other spills (non-sewage related) in Carlsbad as reference in Appendix 7.2.

PREVENTION MEASURES OF SEWAGE INTRUSION INTO MS4

The City of Carlsbad s Engineering Standards have several measures to prevent sewage intrusion into municipal separate storm sewer systems (MS4).

1. All gravity sewer pipes and laterals are required to have gasketed joints, which create water tight joints (Volume 1, Chapter 6, Item 3.A, 3.C, and 3.F). The water tight joints are tested using the methods indicated in Standard Specifications for Public Works Construction (SSPWC) section 306-1.4. The water tight test methods include a post-installation closed circuit television (CCTV) inspection and an air pressure test where the sewer line must sustain 2.5 to 3.5 psi gage pressure for at least 2 minutes after being pressurized to 3.0 psi.

2. All gravity sewer lines are required to follow engineering standard for the amount of flow they can carry. During peak hour dry weather season the pipe shall be designed to carry a flow depth of 0.5 (or 0.75 depending on the pipe size) the diameter of the pipe (Volume 1, Chapter 6, Item 4.C). This design requirement prevents the pipe from becoming full, which would pressurize the pipe and potentially cause a leak.

3. Per Carlsbad s Engineering Standard GS-6 and GS-6A, the sewer lines are typically located at an elevation deeper than the storm drain line, which further prevents sewage intrusion into MS4. In the event of a sewage pipe leak, the leakage flow will naturally gravitate below the sewer line rather than up to the storm drain line.

4. The standard horizontal separation between sewer and storm drain is 13 feet, which further prevents sewage intrusion into MS4.

5. In special cases where storm drain lines are installed at a depth greater than that of sewer lines, additional design standards are required such as water tight joints or encasements (Volume 1, Chapter 5, Item 1.G).

Preventative maintenance of the sanitary sewer system, as described above is also effective at preventing infiltration from sanitary sewer lines into the MS4. Continued preventative maintenance prevents exfiltration of sewer water from the pipelines by ensuring that flow is maintained in the system and pressure does not build up causing water to leave the system.

In the storm drain system, ammonia test kits are utilized as part of the dry weather program, primarily to test for the presence of sewage. These tests are taken once per year at various points strategically placed throughout the MS4 to provide adequate coverage. Exceedances for ammonia may trigger source investigations, which may detect infiltration from sewer lines if present.

7.4 Urban Runoff Monitoring

Dry Weather Monitoring

The Dry Weather Monitoring Program was implemented between May 1 and September 30, 2008. The program was designed to detect and eliminate illicit connections and illegal discharges to the MS4. This was accomplished by performing field observations and field screening at all monitoring locations and performing analytical monitoring at 25 of the locations. As in years past this program included monitoring at 60 MS4 locations throughout the City. New in 2008, the program included an assessment for trash at each location, as required per Order 2007-0001. The dry weather sites were re-assessed as part of the JURMP preparation process and have changed slightly.

All results and investigations are included under separate cover in the City s Dry Weather Monitoring Report for 2008. This report includes the Dry Weather Field Screening and Analytical Monitoring Map.

In general, exceedances for field screening and analytical parameters decreased in the 2008 monitoring season as compared to previous years. Water quality at most sites had no exceedances. The most common field constituent to exceed action levels were nitrate-nitrogen. The most common analytical constituents to exceed action levels were bacteria. All follow up activities were performed as required under Order 2007-0001. Follow-up activities performed

immediately after the initial sampling efforts are described in the Dry Weather Report under separate cover. Follow-up activities performed by the City are described in Appendix 7.4. Required follow up actions were taken for all sites where water quality exceeded established action levels as described in the permit.

MS4 Outfall Monitoring

The MS4 Outfall Monitoring Program is part of the Regional Monitoring required in Order 2007-0001. This program has been developed by the Regional Copermittees and was implemented within the region during FY 07-08 as required. Sites were monitored in all watersheds throughout the County. Monitoring results will be summarized in the County of San Diego Storm Water Monitoring Annual Report, to be submitted in January 2009.

The objective of this monitoring program is to assess MS4 discharge water quality throughout the county and assess the relative contributions to receiving waters within each defined watershed management area.

The monitoring design is based on a combination of random and targeted sampling of MS4 outfalls in each watershed. Random sampling will be conducted to assess countywide conditions of MS4 outfall water quality. Targeted sampling will be conducted to assess the relative contribution of particular MS4 outfalls to receiving waters.

A detailed description of the program was submitted to the Regional Board prior to July 1, 2008 as required by the Order. The description includes monitoring locations, frequencies, analytes, sampling and analysis methods, procedures, and reporting strategies.

Random samples were collected throughout the watershed management areas by the Regional Monitoring contractor. These samples were collected during FY 07-08, as prescribed in the permit.

Targeted samples will be collected during FY 08-09 and during subsequent years by the individual jurisdictions, independent of the regional group. The targeted approach includes six locations within the City of Carlsbad. These locations were selected based on criteria developed in the Regional Monitoring Workgroup. Table 7.2 lists the targeted locations, hydrologic area, and analytes to be monitored for the program.

Table 7.2 Targeted monitoring locations.

Site ID	Hydrologic Area	Analytes
1D-21	904.2	Bacteria, TSS, Total Nitrogen-N, Total Phosphate-P
1D-20	904.2	Bacteria, TSS, Total Nitrogen-N, Total Phosphate-P
1C-21	904.2	Bacteria, TSS, Total Nitrogen-N, Total Phosphate-P
16C-61	904.3	Bacteria, TSS
21C-14	904.3	Bacteria, TSS, Total Nitrogen-N, Total Phosphate-P
19C-1	904.3	Bacteria, TDS, TSS, Manganese, Selenium, Sulfates

Results will be summarized in the Regional Monitoring Report submitted by the County of San Diego each year.

Coastal Storm Drain Monitoring

As required under the Permit, the City continued to monitor storm drains discharging to coastal waters. In order to facilitate the transition from Order 2001-01 to Order 2007-0001, the Copermittees requested permission from the Regional Board to implement the Coastal Storm Drain Monitoring Program beginning with the new monitoring season, October 1, 2007. This request was granted and the City began to implement the program according to the Order 2007-0001 requirements at that time.

Table 7.3 summarizes the City Coastal Storm Drain Monitoring activities during this reporting period, March 24 June 30, 2008.

Table 7.3 Coastal Storm Drain Monitoring

Sites Monitored		Frequency	Total Site Visits	Routine Samples Collected		Sites with Exceedances		Findings
Ocean	Lagoon			Pairs	Singles	Storm Drain	Receiving Water	
8	0	Monthly	24	0	4	1	0	No flow was observed at the site when staff returned to collect confirmation samples. No further action.

Results of this year of monitoring show that the majority of sites do not have sufficient flow to sample the majority of the time during dry weather. Over the course of this reporting period, 24 routine site visits were made and samples were collected on four of the visits, or only 17 of the time. Upstream investigations are performed at the time of sampling. During these four site visits, the storm drain flow did not reach the receiving water, therefore samples were only collected from the storm drain. Of the four monitoring events where samples were collected, one of the initial samples had exceedances of water quality criteria in the storm drain sample. On the follow-up visit there was no flow at the site.

All data collected and a full analysis of the Coastal Storm Drain Monitoring Program will be submitted in the San Diego County Storm Water Quality Monitoring Annual Report to be submitted in January 2009.

7.5 Follow-up and Enforcement

The IDDE process is an ongoing endeavor, involving a combination of education, inspections, complaint response, and enforcement. The City used one or any combination of these efforts as necessary to achieve compliance. The ultimate goal is to eliminate the discharge or connection and to prevent future occurrences.

During this reporting period, the Storm Water Protection Program received 65 complaints of potential illegal discharges. As illustrated in Figure 7.4, 70 of the complaints involved alleged washing or dumping to the storm drain, totaling 46 of the 65 complaints. These types of complaints are representative of illegal discharges reported to the program. All reports were investigated, however not all reports of washing or dumping to the storm drain were illegal discharges. Of the 65 reports of washing or dumping to the storm drain, 33 were found to be valid complaints, 9 were not illicit discharges, and 4 were not found upon investigation. Table 7.4 provides a breakdown of illicit discharges and connections by residential, commercial, industrial, and municipal land uses. All illicit discharges (33) that were identified were eliminated as required. There were no illicit connections identified during this reporting period.

Table 7.4 Illicit Discharges and Connections

Land Use	Number of Illicit Discharges	Number of Illicit Connections
Commercial	9	0
Industrial	1	0
Municipal	1	0
Mobile Washer	3	0
Residential	19	0
Total	33	0

All complaints were addressed according to the City s Enforcement Procedures as described in the 2008 JURMP, Section 2.4. In utilizing this escalating enforcement process, all illicit discharges were eliminated. Table 7.5 summarizes the enforcement actions that were necessary to eliminate the discharges described above.

Table 7.5 Enforcement Actions Related to Illicit Discharges

Enforcement Action	Number	Percentage
Verbal Warning	6	13
Informational Letter	14	30
Written Warning	1	2
Notice of Violation	4	9
Total	25	

The City conducted two high level illicit discharge investigations during this reporting period. High level illicit discharge investigations include those that involve hazardous and/or toxic substances and those investigations resulting from complaints to or from the Regional Board. Each of these high level complaints is described below.

Agua Hedionda Lagoon Middle Basin Oil Discharge (RFAA-7DAMC6)

On March 31, 2008 Storm Water staff received a call from a City employee stating there was an oily substance discharging from a storm drain into Agua Hedionda Lagoon. Upon receipt, Storm Water staff, Carlsbad Fire Department and other city divisions responded immediately. Carlsbad Fire Department and public works crews initiated containment measures, and Storm Water staff, police units and other city employees canvassed the area looking for the source. The California Office of Emergency Services was notified and San Diego County HIRT responded. It was determined by San Diego County HIRT that the substance was most likely motor oil. An environmental clean-up contractor was called in to conduct a thorough cleanup of the immediate area around the outfall and the upstream storm drain system. It was estimated that approximately five gallons of motor oil entered the lagoon. The incident was reported to Regional Board staff within 24 hours verbally and followed up in writing within five business days.

After a comprehensive search of the drainage area, City employees were unable to locate a source. The following day an article describing the event ran in the newspaper. Upon reading the article, a Carlsbad resident notified the Storm Water department of the suspected location that the motor oil entered the storm drain. After confirming the location was in fact accurate, Carlsbad Police initiated an investigation and were able to determine that the used motor oil

from a tractor trailer was emptied to the storm drain; however, they were unable to identify the responsible party. Outreach materials were distributed and placed in nearby businesses and an educational letter was sent to all residents in the surrounding neighborhood.

AT T Vault Discharge (RFAA-7DRTJZ)

On April 16, 2008, City Storm Water Staff received a report of a large flow of discolored water entering a storm drain in a local business park. Upon receipt, multiple departments including Storm Water Protection and Storm Drain Maintenance responded. Upon arrival, the discharge had ceased; a rust colored stain in the street and gutter line and rust colored water in Encinas Creek were observed. The discharge originated from an AT&T underground utility vault. Approximately 2800 gallons of discolored water were pumped from an underground utility vault by HP Communications (a contractor for AT&T). AT&T was contacted and required to clean the street and storm drain and was advised to contact appropriate agencies (RWQCB, CDFG, USFWS, and City of Vista) concerning cleanup of material in the creek. The City oversaw the cleanup of the street and storm drain and the other agencies were involved in the cleanup of the impacted area of the creek.

The City of Carlsbad Storm Water Department issued a Notice of Violation to AT&T and HP Communications, Inc. for four violations of the City of Carlsbad Municipal Code including: prohibited discharges, a discharge in violation of a separate Permit, a failure to reduce pollutants, and a failure to contain, cleanup, and notify the City of the discharge. Follow-up inspections/investigations showed no further issues or action required.

A complete summary of the storm water related complaints is provided in Appendix 7.3.

7.6 Effectiveness Assessment

Level 1: Compliance with Activity Based Permit Requirements

Overall, the City is compliant with activity based permit requirements.

- The City implemented a program to actively seek and eliminate illicit discharges and connections to the MS4: As described above in Sections 7.1-7.5.

- The City continued to verify the accuracy of its MS4 map and update it at least annually: The accuracy of the City s MS4 map is verified continually by field staff and updated with new information or as existing information is updated. The most current MS4 map is provided in Appendix 7.5.

- The City performed Dry Weather Screening and Analytical Monitoring:The City conducted a Dry Weather Monitoring Program inclusive of 60 monitoring locations throughout the drainage area in the City. The Dry Weather Report for 2008 is included as under separate cover with this submission.

- Investigations and follow-up actions were performed in accordance with the Permit: Indications of illicit discharges and/or connections to the MS4 were investigated and followed up accordingly. Follow-up investigations to dry weather field screening exceedances were usually performed immediately and always within two business days

of the field screening. Any results of analytical parameters were investigated within two business days of receipt of results from the laboratory.

- All illicit discharges and connections were investigated and eliminated: All reported illicit discharges and connections were investigated and eliminated.

- The City implemented and enforced the City's ordinances to prevent or eliminate illicit discharges and connections to the MS4:The City implemented an escalating enforcement process as described in its 2008 JURMP, Section 2. Enforcement actions related to illicit discharges are described above in Table 7.5.

- The City prevented and responded to sewage spills, including from private laterals and failing septic systems, and other spills:The City responded to all reported spills as described above in Section 7.3.

- The City facilitated public reporting of illicit discharges and connections via a public hotline:A storm water hotline was staffed year round. Complaints received via the storm water hotline are summarized above in Section 7.2.

Overall, the City's IDDE program is compliant with permit requirements.

Level 2: Changes in Knowledge/Awareness

Educational material is distributed in response to nearly all storm water related complaints, whether to residents or businesses within the City. Additionally, educational information is distributed to entire neighborhoods throughout the year, most often in response to complaints or dry weather exceedances. Often, exceedances of nutrient action levels in residential areas will trigger the need for larger scale distribution of outreach materials. These efforts are described in Section 6 of the City's JURMP Annual Report for FY 07-08, submitted in September 2008. While the City does not currently measure the changes in knowledge, educational materials provide a good source of information to citizens and businesses about the connection between their activities and water quality.

Level 3: Behavioral Change/BMP Implementation

Behavioral changes and BMP implementation are continually obtained through the IDDE program. Over the Fiscal Year 2007-08, 226 storm water related complaints were responded to by City staff. Of these, approximately 150 pertained to illegal dumping or washing. In all cases, the discharges were discontinued immediately. Some of the incidents were one time occurrences, however, many were routine activities performed by the responsible parties. In these cases, through education and enforcement actions, BMPs were implemented and behavioral changes were evident. Follow-up inspections confirmed BMP implementation and behavioral changes.

Level 4: Load Reductions

Load reductions are difficult to estimate in relation to the IDDE program. Estimates of sewage recovered during spills can provide the number of gallons of raw sewage prevented from entering the environment. If correlated with bacteria data, rough estimates of load reductions of bacteria may be generated. Of an estimated 6831 gallons (5686 from July 1, 2007 to March 23,

2008 and 1145 from March 24 to June 30, 2008) spilled during FY 07-08 due to municipal infrastructure failure, 3206 gallons were recovered. If a conservative estimate of 1,000,000 cfu/100 ml of fecal coliform is used for raw sewage, a total of 121,360,300,000 colony forming units of fecal coliform was prevented from entering the environment.

Level 5: Changes in Discharge Water Quality

Dry Weather Field Screening and Analytical Monitoring Program

The City has conducted an annual *Dry Weather Field Screeing and Analytical Monitoring Program* since 1995. The purpose of the monitoring program is to detect and eliminate illicit connections and illegal discharges to the storm drain system. The Dry Weather Monitoring Program report for FY 07-08 and follow-up activities is provided under separate cover. The following discussions summarize current and past dry weather results in order to assess changes in MS4 water quality, through the 2008 dry weather season.

Fecal coliform concentrations are generally lower over the past five years than in 2003, while enterococcus concentrations are slightly higher in recent years. In comparison to dry weather action levels, fecal coliform and enterococcus mean values are well below the established action levels across all years of data. With many variable factors unaccounted for, it is unclear if the recent results are due to improvements and BMP implementation or to the variable nature of bacteria concentrations.

The City has conducted field testing of detergents since 1995. Data appear to show a downward trend in detergent levels found in the MS4 with results less than established action levels for MBAS.

The average pH levels have also shown a downward trend since 1995, with results generally below action levels. This may be a result of the decreased detergents in the MS4, which are typically basic having pH values 7.

Ammonia and Nitrate concentrations have continued to show no significant increases from previous years. With the exception of 2002, all recent years have averaged well below the established action level for ammonia-nitrogen.

Lower in recent years, all ortho-phosphate averages are well below established dry weather action levels.

Over the course of the past seven years of dry weather programs, water quality parameters have been repeatedly analyzed at the same sites allowing for a comparison of data. In general, water quality within the MS4 is good, with concentrations of bacteria, nutrients, pH, and surfactants generally decreasing and below Action Levels. Efforts continue to focus on bacteria concentrations in the MS4 and their sources. In the future, increased efforts to understand bacteria concentrations and sources will be made through various TMDL activities. With an enhanced understanding of bacteria, the City will be better prepared to address and abate sources within the watershed.

Coastal Storm Drain Outfall Monitoring Program

The City continued to collect samples from various storm drain outfalls as part of the *Coastal Outfall Monitoring Program*. If water was flowing from a storm drain outfall, samples were collected and analyzed for total coliform, fecal coliform and enterococci. Storm drain sample results were compared to the 95th percentile criteria established in the previous year s annual

report for the CSDM Program. Where required, a paired receiving water sample was collected to assess the impacts of the storm drains on the receiving waters. However, the majority of the time, storm drain flows, when present, did not reach the receiving water and only a single storm drain sample was collected. The receiving water samples were compared to Rec-1 standards to determine exceedances. Where storm drain bacteria concentrations exceeded 95th percentile criteria or receiving water samples exceeded Rec-1 objectives, follow-up sampling and/or investigations were performed.

Recent years indicate a decrease in storm drain exceedances for all three bacterial indicators, showing improvements in outfall water quality. In all cases, the flow from outfalls was intermittent and low volume. In most cases, the flow did not actually reach the receiving waters, but dissipated into the sand or sediment. The City will continue to conduct the Coastal Outfall Monitoring Program and to conduct follow-up investigations as detailed in the Monitoring Plan per permit requirements.

Level 6: Changes in Receiving Water Quality

It is important to note that receiving water quality reflects considerably more than the quality of the City s MS4 discharges. In addition, receiving water quality can be adversely impacted by other events that are not under the control of the City, such as other permitted NPDES discharges, wildlife (impacting bacteria levels), atmospheric deposition, and other events and activities.

Watershed Receiving Water Samples

This year the City continued to have four receiving water samples collected during the Dry season in order to provide additional baseline data of surface water quality in conjunction with Carlsbad Watershed numbers. These samples are collected at the same time as the Dry Weather Program samples. This is the sixth year of data collected under the this program. The program includes monitoring sites on Buena Vista Creek, Agua Hedionda Creek (at the Mass Loading Station site), Encinas Creek, and San Marcos Creek. Each of these tributaries is representative of the four separate Carlsbad sub-watersheds.

This special study was initiated in support of the Carlsbad Watershed Copermittees efforts to learn more about the quality of receiving waters in the Carlsbad Hydrologic Unit. The high priority pollutants in the Carlsbad Watershed are sediment, nutrients, and bacteria. Data collected in this study is insufficient in quality to provide information on nutrients due to the methodology used in analyzing nutrient concentrations. The prioritization of sediment as a high priority pollutant does not appear to be supported by data collected in this study. This is likely because all samples were collected during dry weather and sediment is potentially more prevalent during wet weather.

Bacteria is also listed as a high priority pollutant in the Carlsbad Watershed and data has been shown to exceed REC-1 water quality objectives during wet and dry weather. This special study appears to support the Watershed s prioritization of bacteria during dry weather.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this special study. These data support the findings of previous monitoring in the Carlsbad Watershed indicating that bacterial indicators are a constituent of concern in the Carlsbad Hydrologic Unit. Other

water chemistry constituents in the creeks appear to be within standards. Because this is a limited set of data, the watershed is in need of additional data to validate these findings. With the onset of the requirements of Order 2007-0001, Temporary Watershed Assessment Stations were located on Buena Vista Creek and on Agua Hedionda Creek during FY 07-08, collecting samples for analysis during wet and dry weather. These results were not available at the time of this report, but will be available for inclusion in future years.

Coastal Outfall Monitoring Program Receiving Waters

Of samples collected in the receiving waters during FY 07-08, there was only one exceedance for enterococcus across all three indicators. This exceedance occurred in Agua Hedionda Lagoon prior to the change in procedure to monitor only ocean sites. There were no exceedances of the REC-1 standards in the Ocean for total coliform, fecal coliform or enterococci during the last six reporting periods. A general decline in receiving water exceedances in the lagoons is evident across all bacterial indicators, showing improvements in water quality.

It should be noted that lagoon samples were only collected during July, August, and September of 2007, as the Coastal Monitoring Program implemented permit requirements under Order 2007-0001 on October 1, 2007 monitoring only ocean outfalls. The City will continue to implement this program and to conduct follow-up investigations in accordance with the *Adaptive Plan*.

Overall, the City has remained in compliance with all permit requirements of the IDDE program. With full program implementation, evidence of knowledge and behavior changes are evident, although difficult to measure. Program implementation also results in immediate load reductions, through complaint response efforts, whether related to urban runoff, sewer overflows, or other spills. It is difficult to quantify these reductions at this time,however, the City will continue to develop assessment measures related to load reductions. Changes in discharge water quality are also evident, most often showing improvements during dry weather. While not fully attributable solely to the IDDE program, implementation of the monitoring programs provides useful data to make this assessment. As more data is collected in discharge waters and in receiving waters, assessments will show a more accurate picture of the changes in water quality and relationships to MS4 programs.

Sanitary Sewer Overflows
March 23 - June 30, 2008

Date	Source	Substance	Volume	Enter MS4?	Enter RW?	Response
06/27/2008	Private Lateral	Sewage	10	No	No	Root blockage.
06/19/08	Sewer Lateral C/O, main stoppage	Sewage	20	No	No	Clear root stoppage, capture all spill.
04/28/08	Sewer MH	Sewage	1125	Yes	No	Captured at silt pond, used bypass pump to sewer, flushed storm system with 10,000 gals fresh water.
04/14/2008	Private Lateral	Sewage	800	No	No	Plumber cleared root blockage.
04/10/2008	Private Lateral	Sewage	25	No	No	Plumber cleared root blockage.

These spills were from the City of Carlsbad maintained sewer main.

Other Spills March 24, 08 to June 30, 08

Storm Drain-Dumping to Storm Drain				
9ZVEB	12/18/2007	12/18/2007	SW21 Dumping - Hazardous Materials 50 gallon oil drum at trail head - leaking - this was Sunday. Report of Dumping to the Storm Drain Report of Dumping to the Storm Drain	1/10/2008 4:01:34PM - Greg Clavier Status Change Previous: Open New: Closed Reason: A short report on the cleanup activities of the 55 gallon oil drum deposited north of La Costa Avenue. I met with NRC Environmental Services at approximately 1 p.m. to remove and manifest the oil drum and contaminated soil illegally dumped on Paseo Tamarindo a small dirt road off La Costa Avenue. We used an" Over- Pack" to contain and quarantine the abandoned 55 gallon drum and we also removed approximately 225 gallons of saturated and contaminated soil. The oil had infiltrated the soil approximately 6 inches in depth and needed to be removed, The soil was then packed into five 55 gallon containers and removed from the site at 3:45 p.m. and hauled down to NRC's facility in Mira Mesa to be repackaged and sent to Overton in Long Beach for its final resting place. I signed as generator of the waste material on the manifest the City of Carlsbad is liable for payment for the removal of the drum and the contaminated soil witho

Issue Nr.	Opened	Closed	Issue Description	Action History - Closed Action
Storm Water-General Information/Questions				
APUXP	1/9/2008	1/9/2008	[redacted] Across the street from his residence, [redacted] he states there used to be a culvert that ran down to the street to divert the water. He said that a couple years ago the City did work out there and dammed it up and the water now collects up on top in a lake & the water no longer follows its natural flow and doesn't drain into the street. He says the water goes into the ground and underneath his house now. He states the situation should be remedied before there's a slide out there. From Tim Fennessy Immediate response provided to resident's at 10:45 a.m. Prior to meeting residents a quick review of [redacted]s was made and a small amount of water is present at the rock bags placed at the "F" box inlet. This water is being filtered by the rock bags and draining to the "F' box as designed. Reviewed both the [redacted] properties, met with [redacted]. [redacted] property; [redacted] observed standing water on his property in the back yard during the most recent rain event of Jan. 4th to the 6th. The yard is immediately adjacent to the open drainage channel at [redacted]urse. Water is no longer present. He believes water is migrating from the [redacted] repair project, across La Costa Ave. and day lighting into his [redacted]. He came to this conclusion due to the fact that sedimentation devices were holding water as designed in order to desilt storm water runoff per the SSWPP requirements. During the course of reviewing his property, It was discovered his rain gutters go underground and have since been disconnected at an unknown location and do not outfall at a lower surface elevation on the property. The line presently is disconnected somewhere under a side yard. I advised [redacted] to locate this line as soon as possible and re-establish the connection in order to alleviate a potential wash out to the slope. This gutter drain is on the west side of his house. A City drainage easement and line out falls on his properties east	1/9/2008 3:43:58PM - Kim Stankavich Status Change Previous: Open New: Closed Reason: [redacted] has been to site and address the situation with residents

Appendix 7.3 RFA Report

Storm Water-General Information/Questions

Issue Nr.	Opened	Closed	Issue Description	Action History - Closed Action
			side. I told [redacted] I would request the City storm drain maintenance to check this storm drain line to insure it is operating correctly. I then met with [redacted] and reviewed their property. The rain gutters at this residence are also connected to an underground conduit, 3 in. PVC that out falls up slope of the William's property on an adjacent property line. It appears the water is crossing the property line and contributing to the area in question on the [redacted] property. I suggested [redacted] connect a line of suitable length to carry the roof drainage to the toe of slope thereby allowing the water to sheet flow across @ 30ft. of landscape at the northerly property line. These actions, if taken by the property owners, will probably correct the situation. Departed the [redacted] location at 12:00 p.m. Upon returning to office I met with Don Wasko and Clayton Dobbs, briefed them on situation and requested they review the storm drain outfall in order to be sure the City line is functioning as designed. This action should be taken to assure the property owners the city line is not contributing to the problem.

2008 Dry Weather Exceedances and Investigations

Site ID	Initial Site Visit	Initial Findings	Date Data Received	Date Investigated	Sampled by	Confirmation Findings	Follow up	Closing Notes
Follow-up Sampling and Investigations for Water Quality Exceedances								
19C-1 (AH-46)	09/04/2008	TC 78,000 FC 39,000 Ent 31,000		09/11/08	Dmax	Confirmation sample collected on 09/11/08 (TC 46,000, FC 23,000, Ent 6,000). Results still high for Fecal Coliform.	Resample on 09/18/08 (TC 36,000, FC 34,000, Ent 7,300). Fecal Coliform result still out of compliance. Sample was taken at next accessible manhole above this outfall (24A-3) with no exceedances (TC 4,600, FC 4,000, Ent 800).	No exceedances were found in the discharge up the pipe from the outfall. There was an excessive amount of vegetation surrounding the outfall and several various animal droppings were found around the site. Suspected source of fecal coliform is wild animals in vicinity of outfall. Closed.
48D-24 (BA-13)	09/05/2008	TC 52,000 FC 8,500 Ent 38,000		09/11/08	Dmax	Confirmation sample collected on 09/11/08 (TC 15,000, FC 12,000, Ent 2,000)	09/11/08 resample results within limits for TC, FC and Entero.	Exceedance not confirmed. Closed.
45G-13 (BA-40)	09/10/2008	TC 23,000 FC 18,000 Ent 11,000		09/18/08	Dmax	Confirmation sample collected on 09/18/08 (TC 10,400, FC 10,200, Ent 4,600)	09/18/08 resample results within limits for TC, FC and Entero.	Exceedance not confirmed. Closed.
42C-92 (BA-06)	09/10/2008	TC 56,000 FC 37,600 Ent 9,000		09/18/08	Dmax	Confirmation sample collected on 09/18/08 (TC 63,000, FC 53,000, Ent 15,200) Results high for all parameters.	10/15/08 Onsite investigation performed by PH, JW, and CD. 10/22-10/23/08 Contractor brought in to clean SD lines and boxes. Resample taken on 10/27/08 within limits for TC, FC and Entero.	Samples taken following cleaning of SD lines and boxes were within limits for all paramaters. Closed.
Follow-up Actions Related to Trash Observations during Monitoring								
48D-24	09/05/2008	Sub-optimal			Dmax	Trash observed in vacant lot east of Dove Lane.	Referral to Code Enforcement for clean-up of private property, 10/9/08.	Referral to Code Enforcement for clean-up of private property, 10/9/08.
37B-19		Marginal			Dmax	Trash observed (boxes and paper) between 2225 and 2265 Camino Vida Roble.	Referred to Storm Drain Maintenance Division for clean-up of MS4, 10/9/08.	Cleaned 10/10/08.
58A-13		Sub-optimal		10/09/08	Dmax	White powdery substance in front of 2012 and 2022 Ladera Court.	Referral to Environmental Specialist for investigation, 10/9/08.	See RFAA--7K9NT7. No powdery substance found on site at time of investigation. Street sweepers had cleaned the streets.
1D-31		Sub-optimal			Dmax	Trash (food containers and aluminum cans) observed in vegetation on South Bank of Buena Vista Creek, ten yards west of El Camino Real.	Referral to Storm Drain Maintenance Division for clean-up of trash on Creek bank, 10/9/08.	Cleaned 10/10/08.
1D-20		Sub-optimal			Dmax	Trash (soda cans, drink cups, plastic bags) observed on South side of Buena Vista Creek, 50 feet west of South Vista Way bridge.	Referral to Storm Drain Maintenance Division for clean-up of trash on Creek bank, 10/9/08.	Cleaned 10/10/08.

Executive Summary

Section 1: Introduction

The City of Carlsbad's (City) Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report addresses the implementation of the Municipal Storm Water Permit Order No. R9-2007-0001, issued January 24, 2007 and effective March 24, 2008. This Annual Report is covering Order No. R9-2007-0001 from July 1, 2008 to June 30, 2009, hereby listed as Fiscal Year 2008-09.

In the Fiscal Year 2008-09 (FY 2008-09), many procedures have been streamlined to efficiently manage data, monitor sites, track inspections and investigations, and manage other storm water related activities. Planning, Construction, and Existing Development activities have implemented improved processes to further incorporate storm water pollution prevention practices into internal activities as well as activities enforced by City departments. Highlights of each major component of the JURMP are listed below, and correspond to Section headings in this JURMP Annual Report.

The City has defined Notable Activities as those that are above and beyond compliance requirements, and are highlighted in Sections 2, 3, 4, 5, 6, as well as 15 Conclusions. Section 7 Notable Activities will be included in the December submittal of that section.

New this year, the City has included a Compliance Reference Table located in Appendix 1.2 that links permit requirements with corresponding sections in the report where they are referenced.

Section 2: Development Planning

Permit Order No. R9-2007-0001 requires the City to describe amendments to the General Plan, evaluate land use planning policies and principles, revise the environmental review processes, and develop an approval process to minimize the impacts of development activities on receiving water quality. Land-use planning gives the community an opportunity to comment on and shape policies that guide community development and interests. The City has developed goals that balance environmental protection with smart, long-term economic growth. By laying out a vision for local growth and coastal development, projects are consistent with the state and federal regulatory requirements and the City's land-use planning efforts.

The City continued to implement the Standard Urban Stormwater Mitigation Plan (SUSMP), and all applicable projects were subject to a thorough discretionary and plan check review process to ensure compliance. From July 1, 2008 to June 30, 2009, there were 88 discretionary projects that were reviewed and required to submit applicable storm water pollution prevention plans (SWPPP). SUSMP requirements were applied to 74 private development/redevelopment projects and 14 City Capital Improvement Projects (CIP). Of the 74 private development/redevelopment projects, 40 were priority development projects subject to site design, source control and treatment control requirements and 24 were standard projects subject only to site design and source control BMP requirements. Of the 14 City CIPs, 3 were priority development projects and 11 were standard projects.

During FY 2008-09, the City instituted three new procedures on NPDES Treatment Control BMP (TCBMP) inspections, TCBMP inventory management, and compliance verification. In addition,

the City updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.

Section 3: Construction

Order No. R9-2007-0001 requires the City to implement activities that address and minimize short and long-term impacts on receiving water quality related to runoff from new construction sites. The City requires, prior to approval of a construction or grading permit, that project proponents implement measures to ensure that pollutants will be reduced to the maximum extent practicable and will not cause or contribute to an exceedance of water quality objectives. The City met these requirements by amending or conditioning existing permits, procedures and ordinances.

During FY 2008-09, the City updated the construction inventory, inspected all high priority sites, conducted outreach and education to developers, engineers, contractors, and City staff, and used enforcement actions to obtain compliance when necessary. All active grading permits were ranked as high priority and inspected weekly during the rainy season, with some inspected on a daily basis. The required number of inspections was exceeded this fiscal year. There were 1415 required inspections and 1858 inspections were completed in this reporting period. Inspectors issued 164 enforcement actions to achieve compliance, including issuing 116 Verbal Notices, 44 Written Warnings, 3 Stop Work Notices, and 1 Summary Abatement Notice. The City continued to distribute the *Pollution Prevention Guide to the Construction Industry* brochure.

Section 4: Municipal

The City's municipal facilities and their activities have the potential to contribute to water pollution if Best Management Practices (BMPs) are not properly implemented. City facilities include administration buildings, recreational areas, maintenance and storage yards, water reservoirs, water pump stations, sewer lift stations, a road system, parking facilities, the storm drain system, pressure regulator vaults, and fire stations. Municipal facilities maintain the City's infrastructure that supports Carlsbad's quality of life.

The Storm Water Committee comprised of various City departments including Public Works, Fire Department, Recreation, and the Building Department continued to meet and discuss municipal storm water BMPs and pollution prevention issues. The intent of the committee is to communicate problems and solutions among the group in order to share knowledge, discuss training opportunities, enhance compliance with the Permit, and to pass along any new information from the Regional Water Quality Control Board (Regional Board). SWPPPs were developed for appropriate High Priority municipal facilities.

The City of Carlsbad's City Manager continued support for the Storm Water Leadership Team (SWLT). Monthly meetings were conducted and attendees included Senior Management of the City's major service areas and Directors. Agenda items covered all areas of the City's compliance with Order No. R9-2007-001.

The City's street sweeping program exceeded both Permit requirements throughout the FY with twice weekly downtown sweeping routes.
High Priority Municipal facility inspections were conducted by both internal City staff and external consultants. The combination of annual inspections by the State Department of

Pesticide Regulations, municipal inspections by internal and external inspectors, and staff training on storm water BMPs, personnel are more aware of the required maintenance practices in preventing storm water pollution.

The City also continued the Environmental Resources Management Team (ERMT) initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles. Support for the ERMT's work implementing the Environmental Guiding Principles for City decision-making approved by Council in August of 2007 continued.

Municipal facilities and departments also continued to implement Integrated Pest Management practices to reduce the City's use of pesticides.

Section 5: Industrial/Commercial

The City currently maintains an inventory of industrial and commercial sites and sources within its jurisdiction. Major industry types include airport services, refuse and sewage management, pharmaceutical research and development, high technology and electronics, golf apparel and equipment manufacturers, and several light industry parks. Major commercial types include automobile maintenance, restaurants, pressure washing, masonry and concrete work, carpet cleaning, and landscaping activities. The City continued to implement a comprehensive program to reduce urban runoff originating from existing sites and sources since industrial and commercial activities have the potential to contribute to water pollution, if BMPs are not implemented properly.

During this reporting period, the City updated the industrial/commercial inventory, mapped all facilities, provided education and outreach on BMPs, inspected 65% of fixed high threat to water quality facilities, and conducted 46 enforcement activities to ensure compliance.

The Storm Water Protection Program continues to use *Knowledge and BMP Effectiveness Assessment* measures for inspected sites and sources.

Section 6: Residential

The residential community has a significant potential to contribute to water quality degradation. Beyond year 2010, there will be nearly 54,599 residential units, housing approximately 135,000 residents. The focus of the City's pollution prevention strategy is a proactive information and education program that utilizes public presentations, fact sheets, direct mailers, brochures, website, and other media to increase knowledge and awareness of storm water pollution prevention efforts.

Targeted activities for residential areas include vehicle washing, storage and maintenance, lawn and garden care, home improvement projects, pet waste disposal, swimming pool maintenance, household hazardous waste (HHW) disposal, and trash and debris cleanup and disposal. The Storm Water Protection Program continued to distribute educational information addressing these residential BMPs and required several minimum BMPs to be implemented.

Between July 1, 2008 to June 30, 2009 the City distributed storm water educational information for residential activities, continued an advertising campaign, hosted or participated in 10 residential outreach events, offered five oil recycling drop-off sites and two HHW collection sites for residential use, initiated a door-to-door residential HHW pick up program, hosted a HHW

drop-off disposal day for Carlsbad residents, responded to 116 reports of illegal discharge, and issued 41 enforcement actions to achieve compliance.

Four mailers were sent out to a total of 198 households regarding storm water pollution issues. Two of these mailers addressed overirrigation issues. The Storm Water Protection Program continues to work closely with the City's Water Conservation Specialist to address runoff due to overirrigation.

Section 7: Illegal Discharge Detection and Elimination

The City continued to conduct a comprehensive and proactive program for detecting and eliminating illegal discharges to the storm drain system. The City's program actively seeks to identify and eliminate illicit discharges and connections by conducting investigations, responding to spills and sewage overflows, conducting monitoring, and performing routine cleaning and maintenance activities on the sewer and MS4.

The Illegal Discharge Detection and Elimination (IDDE) report will be submitted in December 2009, as per Addendum 2, Order No. R9-2007-0001, and will include Notable Activities in that section.

Section 8: Outreach and Education

The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent, though these messages often took varied forms. During FY 2008-09, the City continued to be actively involved in outreach and education at the local level, the watershed level with the North County Storm Water Program (NCSWP), and at the regional level with the Project Clean Water Outreach Workgroup and the Think Blue campaign.

The City sent storm water educational information to all city employees distributed via paychecks in FY 2008-09, participated in EPA webcasts as training opportunities, collaborated with local non-governmental organizations, hosted or participated in 10 outreach events, presented urban runoff and watershed concepts to 1084 school-aged children, and distributed information through various media. The City also distributed promotional items such as notepads, pens, and pet waste Bags on Board with pollution prevention messages.

Section 9: Public Participation

The City led or assisted with several public participation opportunities this reporting period. During the reporting period, citizens, business owners and representatives, and other interested parties were invited to attend public meetings, outreach events, workshops, City Council meetings, and other events related to storm water pollution prevention at the local and watershed levels.

During this reporting period, the City conducted a Public Opinion Survey of 1,000 residents that included questions about storm water pollution, and held 10 community events.

The City continued to recruit students from the San Diego Region, to participate in an internship program with the Storm Water Protection Program. One intern worked on a variety of activities including complaint response, commercial and industrial inspections, data management, and

outreach and education. Due to budget reductions, this program was not funded in the Fall of FY 2008-09 but will be reconsidered as resources allow.

Section 10: Fiscal Analysis

The total operating costs to fund the Storm Water Protection Program activities for FY 2008-09 was 2,561,593. This includes actual expenditures for personnel, operating costs, and capital outlay from the Storm Water Protection Program budget, Storm Drain Maintenance budget, Storm Water Engineering budget, and income from Engineering Plan Checks related to storm water, but does not include the *Storm Water Capital Improvement Program* costs.

Section 11: Effectiveness Assessment

Information collected in surveys, public comments, inspections, investigations, monitoring and other activities during the year were assessed on a full fiscal year basis to identify any trends and determine new or modified courses of action.

The City continued to make progress with effectiveness assessment measures during FY 2008-09, using the Watershed Treatment Model to assess the effectiveness of storm water pollution prevention. Assessment of each significant activity, each component, and an integrated assessment of the overall jurisdictional program is provided in Section 11 of this report.

Section 12: Special Investigations

The City continued to participate in the San Diego Coastal Lagoon TMDL Monitoring Program that is described in San Diego Coastal Lagoons Monitoring Workplan. Results and conclusions of the monitoring program will be in the final report, written by Southern California Coastal Waters Research Project, near the end of the calendar year 2010.

A Watershed Additional Receiving Water Study is also described in Section 12 of this report.

Section 13: Non-Emergency Fire-Fighting

The Carlsbad Fire Department (CFD) developed this section to meet the requirements of Order No. R9-2007-0001. Several BMPs have been developed and incorporated at all 6 of the City s Fire Stations. Each station has a storm water manual, spill response equipment, regular cleanup and removal of organic debris from parking lots, and portable BMPs to contain and collect equipment and vehicle wash water. Training is conducted on property with no runoff or discharge potential into the MS4, or at the City s Reclaimed Water Facility where water is collected into the Reclaimed Water reservoirs. Fire Prevention activities were also continued during this reporting period.

Section 14: JURMP Revisions

The City s 2008 JURMP was developed in response to the issuance of Order No. R9-2007-0001. The City began implementing the 2008 JURMP on March 24, 2008 as required under the new permit. There were a few minor changes to the City s 2008 JURMP during FY 2008-09 and they are discussed in Section 14.

Section 15: Conclusion

The City successfully implemented the Permit requirements and the program activities described in the JURMP. Information from JURMP activities, WURMP activities, as well as the 303(d) List indicated that bacteria, sediment, and nutrients are high priority pollutants in the Carlsbad Watershed. The City proposes to continue addressing these pollutants through a number of existing or new activities, which include education, inspections, monitoring and maintenance through implementation of Order No. R9-2007-0001.

This Section also highlights Notable Activities conducted over and above permit requirements.

1.0 INTRODUCTION

1.1 Background

The San Diego Regional Water Quality Control Board issued the Municipal Storm Water Permit Order No. R9-2007-0001, NPDES No. CAS018758 on January 24, 2007 to control waste discharges in urban runoff from the Municipal Separate Storm Sewer System (MS4) draining the watersheds of the County of San Diego, the Incorporated Cities of San Diego County and the San Diego Unified Port District Copermittees.

The Order describes all requirements, including the content of the Jurisdictional Urban Runoff Management Plan (JURMP) to be prepared and submitted to the San Diego Regional Water Quality Control Board by each and all of the Copermittees.

The Regional Board issued this Permit to specify the requirements necessary to reduce the discharge of pollutants in urban runoff to the maximum extent practicable (MEP). Pollutants in urban runoff discharging to downstream water bodies can be prevented and controlled by effective implementation of best management practices (BMP s). The Permit requires the submittal of a Jurisdictional Urban Runoff Management Plan (JURMP) to the Regional Board in the first year of the permit, and an Annual Report each remaining year of the permit to document the progress and implementation of the JURMP.

The Permit also requires the City of Carlsbad (City) to protect water quality during the three major phases of urban development: (1) land use planning for new development; (2) construction; and (3) the use or existing development phase.

In 2008, the City prepared a JURMP that addresses the requirements of Water Quality Order No. R9-2007-0001. The City officially began implementing the 2008 JURMP on March 24, 2008. The following report covers the implementation of the JURMP for Fiscal Year 2008-09 (July 1, 2008 to June 30, 2009).

1.2 Overview of the City of Carlsbad

The City encompasses just over 42 square miles and borders 6 miles of coastline. The entire city is contained within the Carlsbad Hydrologic Unit (Watershed) and encompasses four smaller hydrologic areas. These include Buena Vista Creek, Agua Hedionda, Encinas, and San Marcos. Major water bodies within the city are Buena Vista Creek, Buena Vista Lagoon, Agua Hedionda Creek, Agua Hedionda Lagoon, San Marcos Creek, and Batiquitos Lagoon. Several waterbodies within the city are listed as impaired under Section 303(d) of the Federal Clean Water Act.

The City is a municipal corporation, following the Council-Manager form of government. During FY 2008-09, the City changed from a General Law City to a Charter City. City Departments fall under one of five major service areas (MSA s): Public Safety, Administrative Services, Public Works, Community Development, and Community Services. While the City created the Storm Water Protection Program to help implement the Permit, program implementation is carried out by several departments within different MSA s. This allows for program implementation and new requirements to be incorporated into daily activities of City employees, instead of being viewed as completely new requirements without a connection to on-going services.

1.3 Purpose and Objectives

The purpose of the City s JURMP Annual Report is to provide a comprehensive account of activities conducted by the City to meet the requirements of Water Quality Order No. R9-2007-0001. In addition the reporting process allows the City to evaluate the effectiveness of the program and make any changes necessary to improve the implementation and effectiveness of the JURMP.

1.4 Report Organization

This Annual Report was prepared in accordance with the requirements of the Permit. It contains a comprehensive description of the activities conducted by the City of Carlsbad to meet the requirements of the Permit; an accounting of illicit discharges reported, inspections conducted, enforcement actions taken, education efforts conducted; a description of the public participation mechanisms utilized during the JURMP implementation process; identification of management measures proven to be effective in reducing urban runoff pollutants and flow; identification of water quality improvements or degradation; and a fiscal analysis. A list of acronyms is provided in Appendix 1-1.

The organization of this report follows the Table of Contents agreed to and submitted by the Regional Copermittees to the Regional Board. The Annual Report is divided into sections matching major sections in the Permit and the JURMP. As with the JURMP, many of the activities described in separate JURMP sections overlap with one another, so an activity may be referenced in more than one report section. The Annual Report is organized as follows:

Section 1	Introduction
Section 2	Development Planning Component
Section 3	Construction Component
Section 4	Municipal Component
Section 5	Industrial/Commercial Component
Section 6	Residential Component
Section 7	Illicit Discharge Detection and Elimination Component
Section 8	Outreach and Education Component
Section 9	Public Participation Component
Section 10	Fiscal Analysis Component
Section 11	Assessment of JURMP Effectiveness Component
Section 12	Special Investigations Component
Section 13	Non Emergency Fire Fighting Flows
Section 14	JURMP Revisions
Section 15	Conclusions and Recommendations

Appendix 1.2 contains the JURMP Annual Report Requirements Checklist which shows the reporting requirements from the Permit and where each requirement can be found in the City s 2008-09 JURMP Annual Report.

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

This section outlines the Development Planning actions implemented by the City under San Diego Municipal Permit Order No. R9-2007-001 (the 2007 Municipal Permit) and covers the portion of the annual reporting period from July 1, 2008 through and including June 30, 2009. During this reporting period, the City maintained compliance with all land-use planning requirements of the 2007 Municipal Permit.

The City submitted an updated Jurisdictional Urban Runoff Management Plan to the Regional Board March 24, 2008 (hereinafter referred to as the 2008 Carlsbad JURMP). The 2008 JURMP incorporated numerous project processing changes to improve development related storm water pollution prevention activities and to ensure complete conformance with the Development Planning Component of the 2007 Municipal Permit.

During preparation of the 2008 Carlsbad JURMP, the City performed an in-depth review of its development planning and review processes. In summary, the review found that the City s existing land-use planning policies and processes met requirements and that numerous changes and modifications to the development project approval process were needed to ensure compliance with the 2007 Municipal Permit. In response to the findings, numerous revisions to the City s development review process were initiated in FY 2007-08 to improve existing storm water pollution prevention activities and ensure compliance with the 2007 Municipal Permit. The changes included updates to the City s Best Management Practices (BMPs) standards, Storm Water Codes, development project approval process, project tracking and record keeping and BMP installation verification procedures. For a complete detailed listing of the changes made during FY 2007-08 see the FY 2007-08 Carlsbad JURMP Annual Report.

During the current reporting period, from July 1, 2008 through June 30, 2009, the City proceeded with implementation of the comprehensive development planning changes put into place during FY 2007-08. Several development planning process changes were instituted to ensure compliance with the 2007 Municipal Permit as more fully discussed and detailed in the following sections.

2.2 Land Use Planning

2.2.1 Background

In July 1986, the City adopted a *Growth Management Plan* into its General Plan to guide development and anticipate the types and numbers of facilities needed to accommodate the Carlsbad community at build out. Those facilities include sewer plant capacity, sewage pipelines, reclaimed water system, and storm drain system with flood and pollution control basins.

In September, 1994 the City adopted a Comprehensive Update of its General Plan. The General Plan includes goals that balance environmental protection with smart, long-term economic growth. By laying out a clear vision for environmentally sensitive development within this coastal community, development projects are required to be consistent with various City ordinances (i.e.; Grading and Erosion Control, Storm Water Management, Hillside Development, Coastal Resource Protection) and other regulatory requirements.

The General Plan is reviewed annually and revised as necessary to ensure that the public facilities are considered and City goals are met. On February 19, 2002, the City Council adopted General Plan Amendment GPA 01-15. This General Plan Amendment revised and supplemented various policies regarding storm water quality protection in the Open Space and Conservation Element of the General Plan. The revised and supplemented policies reflect all storm water quality and watershed protection principles found in both the 2001 and 2007 Municipal Permits pertaining to storm water pollution.

City staff again reviewed the storm water protection policies of the General Plan in FY 2008-09 and no revisions were found necessary. The existing General Plan storm water protection policies are listed below:

a.) Develop and implement a JURMP consistent with the Permit and any amendments thereof.

b). Adopt and implement a Master Drainage Plan and Standard Urban Storm Water Mitigation Plan (SUSMP) consistent with the Permit and any amendments thereof.

c.) Prior to making land use decisions, utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City requires developments to incorporate structural and non-structural BMPs to mitigate any increases in pollutant loads.

d.) Implement storm water pollution prevention methods to the maximum extent practicable, supplemented by pollutant source controls and treatment. Use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into the municipal separate storm sewer system (MS4).

e.) Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

f.) Developments shall implement appropriate recommendations to protect water quality found in the San Diego Association of Government s (SANDAG s) Water Quality Element of its Regional Growth Management Strategy.

g.) Development projects should be designed to comply with the following site design principles:

- Protect slopes and channels to decrease the potential for slopes and/or channels from eroding and impacting storm water runoff.
- To the extent practicable, cluster development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands and buffer zones. Encourage land acquisition of such areas.
- Provide buffer zones for natural water bodies.
- Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment.

- Where feasible implement site design/landscape features to slow runoff and maximize on-site infiltration of runoff.
- Properly design outdoor material storage areas (including the use of roof or awning covers) to minimize the opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids and other pollutants from entering the storm water conveyance system.
- Incorporate roof or awning covers over trash storage areas to prevent off-site transport of trash and other pollutants from entering the storm water conveyance system.
- Limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways and bridges.
- Design streets and circulation systems to reduce pollutants associated with vehicles and traffic resulting from development.

In addition to the General Plan, the City has adopted various storm water protection policies in other land use planning documents including the City s Local Coastal Program and Habitat Management Plan.

The Carlsbad Local Coastal Program covers that part of the City lying within the Coastal Zone. The Carlsbad City Council adopted a Zone Code Amendment (ZCA 01-08), Local Coastal Program Amendment (LCPA 01-15) and Municipal Code Amendments (MCA 01-05, 01-06, and 02-01) to revise/add new policies, standards, procedures and requirements regarding water quality and watershed protection to the Local Coastal Program Land Use Plans, Chapters 21.203 (Coastal Resource Protection Overlay Zone) and 21.205 (Coastal Resource Overlay Zone Mello I LCP Segment Local Coastal Program) of the Zoning Ordinance of Carlsbad's Municipal Code. One of the notable storm water requirements of the Carlsbad Local Coastal Program (LCP) is the inclusion of an additional criterion for determining a priority development project. Per the amended LCP, any project located within 200 feet of the Pacific Ocean that creates more than 2500 square feet of impervious surface or increases the project impervious area more than 10 over the existing impervious area is to be considered a priority development project.

Under the California Natural Community Conservation Program (NCCP), the City and six other cities in north San Diego County participated in the preparation of the Multiple Habitat Conservation Program (MHCP). The MHCP is a comprehensive planning program designed to develop an extensive ecological preserve in northwestern San Diego County. The City has prepared a subarea plan, called the Carlsbad Habitat Management Plan that was adopted in November 2004. The Carlsbad HMP contains the specific conservation, management, facility planning, land use, and other actions the City will take to implement the goals, guidelines, and standards of the MHCP plan. This Habitat Management Plan prohibits development in or near natural habitat areas including creeks and lagoons. Those areas act as a buffer between urban development pollutants and receiving waters. They also protect a significant percentage of natural areas that are pervious, leading to natural groundwater recharge and reduction in peak run off rates.

On November 1, 2002, the revised Zoning Ordinance, Municipal Code, and Local Coastal Plan Amendments were submitted to the California Coastal Commission. In August, 2006, the California Coastal Commission approved these municipal code amendments. All requirements of these documents continued to be implemented in FY 2008-09 and previous years including

the years the City waited for Coastal Commission approval. The Local Coastal Program and Habitat Management Plan were evaluated during FY 2008-09 and no revisions were found necessary.

2.2.2 Source Characterization

Land Use Planning is the process whereby the City determines appropriate land use designations for a property consistent with the City's General Plan requirements. As such, source characterization of pollutants is addressed generically in association with the type of land use proposed (i.e. low density residential, high density residential, commercial, and industrial, etc). Each land use decision made during FY 2008-09 was found consistent with the storm water protection policies as contained in the City's General Plan, Local Coastal Program (if applicable) and Habitat Management Plan.

In many cases, land use planning applications are accompanied by specific project development applications. In such cases, the project was required to identify specific project pollutant sources consistent with the City's Standard Urban Storm Water Mitigation Plan dated March 2008 (the "2008 Carlsbad SUSMP") and to identify project specific Best Management Practices (BMPs) to eliminate or minimize any negative impacts to storm water quality. For more specifics on source characterization applied to development projects during the project approval and verification process reference Section 2.4.2 below.

2.2.3 Best Management Practice Requirements

The City reviewed the existing storm water quality and watershed protection goals and policies within the City General Plan and found them to be adequate to meet the requirements of the 2007 Municipal Permit. No modification was made to BMP requirements of the General Plan during FY 2008-09.

2.2.4 Program Implementation

Every General Plan Amendment and land use planning application approved by the City during FY 2008-09 was found in conformance with all storm water protection policies of the Carlsbad General Plan, Local Coastal Program (as appropriate), Habitat Management Plan and the Carlsbad Municipal Code (CMC). This includes compliance findings for all the storm water quality goals and objectives of the City's Grading and Drainage Ordinances (Title 15 of the CMC).

For the period covered by this annual report (July 1, 2008 to June 30, 2009), the land use planning review process began with the submittal of a planning application at the City's development services counter. Concurrent with the land use application the city requires submittal of the Storm Water Standards Questionnaire which determines if the project is a priority or non-priority development project. Each project was then reviewed for conformance with the storm water protection policies and requirements of the 2008 Carlsbad SUSMP, the General Plan, any applicable Local Coastal Plan, the Habitat Management Plan and all City Codes. Concurrent with each project approval in FY 2008-09, the City made specific written findings in the project approval document that the project complied with all appropriate General Plan, Local Coastal Plan (as appropriate), Habitat Management Plan and City Codes including all relevant storm water protections policies and requirements. A copy of written findings for an

actual project approval is included within the examples of priority project approvals included in Appendix 2.5.

2.3 Environmental Review Process

The City's Environmental Review Process begins with the Initial Study Checklist (CEQA Guidelines). Based on the results of the checklist, the City requires the project applicant to provide additional studies to elaborate on the environmental impacts or recommend denial of the permit that the project applicant is seeking. The Initial Study Checklist includes specific hydrology and water quality analysis as follows:

HYDROLOGY AND WATER QUALITY. *Could the project:*
a. Violate any water quality standards or waste discharge requirements, including but not limited to increasing pollutant discharges to receiving waters (consider temperature, dissolved oxygen, turbidity, and other typical storm water pollutants)?
b. Have potentially significant adverse impacts on ground water quality, including but not limited to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in substantial/increased erosion or siltation on- or offsite?
d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site and/or significant adverse environmental impacts?
e. Cause significant alteration of receiving water quality during or following construction?
f. Cause an increase in impervious surfaces and associated runoff?
g. Cause potentially significant adverse impact on ground water quality?
h. Cause or contribute to an exceedance of applicable surface or ground water receiving water quality objectives or degradation of beneficial uses?
i. Is the project tributary to an already impaired water body, as listed on the Clean Water Act Section 303(d) list of impaired waterbodies? If so, can it result in an increase in any pollutant for which the water body is already impaired?
j. Create or exacerbate already existing environmentally sensitive areas (ESAs)?
k. Create potentially significant environmental impact on surface water quality, to either marine, fresh, or wetland waters?
l. Impact aquatic, wetland, or riparian habitat?

The City reviewed the existing Environmental Review Process Initial Study Checklist during FY 2008-09 and found that it adequately addresses the Environmental Review requirements of the 2007 Municipal Permit; therefore, no revisions were made to the storm water quality compliance requirements of the Initial Study Checklist.

2.4 Development Project Approval and Verification Process

2.4.1 Background

The City requires new development and redevelopment projects to implement measures to ensure urban runoff from proposed project sites will be treated to reduce pollutant loads to the maximum extent practicable (MEP), and will not cause or contribute to an exceedance of receiving water quality objectives.

The City is dedicated to putting into place all the administrative and regulatory tools required to implement the Land-Use Planning requirements of the 2007 Municipal Permit. During the FY 2007-08 reporting period, the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements and, to address the requirements of the 2007 Municipal permit. During FY 2007-08, the City also rewrote and updated its Storm Water Standards Manual, City SUSMP (now referred to as the 2008 Carlsbad SUSMP) document, its Storm Water Requirements Applicability Checklist (now titled the Storm Water Standards Questionnaire) and Construction SWPPP Standards and Requirements. For a more complete and detailed description of the changes made during the FY 2007-08 reporting period, see Section 2 of the FY 2007-08 Carlsbad JURMP Annual Report.

During the current reporting period (July 1, 2008 to June 30, 2009), the City instituted new storm water program elements and/or procedures as follows:

1. Instituted a new procedure to define the process for inspecting, tracking, and enforcing compliance for structures listed on the privately owned treatment control BMP Inventory List (procedure CMI-300). A copy of this new procedure can be found in Appendix 2.8.
2. Instituted a new procedure that defines the process for managing and updating the privately owned treatment control BMP Inventory List (procedure CMI-310). A copy of this new procedure can be found in Appendix 2.9
3. Instituted a new procedure that defines the process for verifying and tracking compliance with the treatment control BMP verification of maintenance requirements (procedure CMI-320). A copy of this new procedure can be found in Appendix 2.10.
4. Developed two new outreach handouts to assist private property owners in understanding and complying with the new annual treatment control BMP verification program including the *What You Need to Know About Privately Owned Treatment Control BMPs* (Appendix 2.7) brochure and the *Frequently Asked Questions About Treatment Control BMPs* (Appendix 2.6) factsheet.
5. Updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.
6. Initiated use of standard findings of storm water compliance on administrative minor subdivision approvals. The new finding is included in Appendix 2.1.

2.4.2 Source Characterization

Development project approval is the stage of the development process where storm water quality impacts are assessed and the project is designed to eliminate or minimize potential sources of storm water pollutants. Each priority development project submitted between July 1, 2008 to June 30, 2009, was required to prepare and submit a Storm Water Management Plan

(SWMP) consistent with the 2008 City SUSMP concurrent with any discretionary or ministerial permit application. An important component of the SWMP is source identification.

During the FY 2008-09, project proponents were required to identify potential pollutant sources generated by their particular land use and development design in accordance with the procedures outlined in the 2008 City SUSMP. Table 2 on page 8 of the 2008 Carlsbad SUSMP was used to assist the developer in identifying potential pollutant sources for various project categories. Additionally, project proponents were required to identify the pollutants of concern or impairment for the receiving waters into which the project runoff discharges. The project proponent was then required to determine if the proposed project included any land use activity or development design that generated or potentially added to any water quality impairment within the receiving waters. The 2006 303(d) list of water quality impairments for receiving waters in Carlsbad is shown in Table 2.4.2 below:

Table 2.4.2: 2006 303(d) Listings within the City of Carlsbad

Carlsbad Waterbody	Drains to	Pollutant
Agua Hedionda Creek	Agua Hedionda Lagoon	Manganese
		Selenium
		Sulfates
		Total Dissolved Solids (TDS)
Agua Hedionda Lagoon	Pacific Ocean	Indicator Bacteria
		Sedimentation/Siltation
Buena Vista Creek	Buena Vista Lagoon	Sediment Toxicity
Buena Vista Lagoon	Pacific Ocean	Indicator Bacteria
		Nutrients
		Sedimentation/Siltation
Pacific Ocean at Buena Vista Creek	Pacific Ocean	Indicator Bacteria
Buena Vista Creek		
Carlsbad Village Drive		
Pine Avenue		
Encinitas Creek	Batiquitos Lagoon	Phosphorus
San Marcos Creek	Batiquitos Lagoon	DDE
		Phosphorus
		Sediment Toxicity

Projects draining into one of these receiving waters were required to analyze their potential for contributing one or more of the identified pollutants to the receiving water. If a potential source was identified, then an appropriate source control, site design or treatment control BMP measure was identified to eliminate or reduce the pollutant of concern to the MEP and to not cause or contribute to an exceedance of receiving water quality objectives.

2.4.3 Best Management Practice Requirements

During FY 2008-09, each land development project in the City met the minimum BMP requirements of the 2007 Municipal Permit. The City s minimum requirements are contained within the 2008 Carlsbad SUSMP and the City s Storm Water Standards Manual as specified in the 2008 Carlsbad JURMP. All approved projects were required to incorporate both site design

and source control BMPs into project design. Priority projects per the 2007 Municipal Permit were required to incorporate additional treatment control BMPs into the project design.

The 2007 Municipal Permit required the City in conjunction with the other Copermittees, under the San Diego Municipal Permit, to update the regional Model SUSMP. The City worked in cooperation with the other Copermittees to develop a revised Model SUSMP which was collectively adopted by the Copermittees on November 6, 2007. The City was requested under the 2007 Municipal Permit to modify its local SUSMP to comply with the interim Low Impact Development (LID) and hydromodification requirements. The interim LID and hydromodification requirements were incorporated into the 2008 Carlsbad SUSMP which became effective March 24, 2008. Throughout FY 2008-09, all priority development/redevelopment projects, including City Capital Improvement Program (CIP) projects complied with the 2008 Carlsbad SUSMP.

The City s local SUSMP implementation document is incorporated into the City of Carlsbad Storm Water Standards Manual hereinafter referred to as Storm Water Standards Manual, which addresses specific post-construction site design, source control and treatment control storm water BMPs that must be incorporated into Priority Development Projects. The City updated its Storm Water Standards Manual to incorporate appropriate requirements of the 2007 Municipal Permit. The updated Storm Water Standards Manual became effective on March 24, 2008. The Storm Water Standards Manual provides information on selection and implementation of the construction, site design, source control and treatment control BMPs. A copy of the updated 2008 Storm Water Standards Manual can be found in Appendix 2.10 of the FY 2007-08 Carlsbad JURMP Annual Report and at the following City of Carlsbad web link http://www.carlsbadca.gov/engineering/4engstd.html.

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydromodification Management Plan (HMP). The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

Each development project was assessed for its potential to generate urban pollutants using the Storm Water Standards Questionnaire (a copy of the Questionnaire is included as Appendix A to the 2008 Carlsbad SUSMP and is included as Appendix 2.11 to this annual report. Those specific types of projects (or project components) identified as having a high potential to generate pollutants in accordance with the 2007 Municipal Permit and Local Coastal Program requirements were classified as a priority development projects". Each priority development project was associated with one or more of the general pollutants categories as described in Table 2 of the 2008 SUSMP. Additional pollutant categories were then determined based upon their potential of being generated by the specific proposed priority project.

Each priority project was then required to incorporate site design, source control and treatment control BMPs into the project design as specified in the 2008 Carlsbad SUSMP including the new interim LID and hydromodification requirements, as appropriate. Non-priority projects were required to incorporate site design and source control BMPs into their project design. The following is a brief listing and description of the types of BMPs incorporated into project designs during the reporting period:

Site design BMP features incorporated into Carlsbad developments during the reporting period include the following:

- Minimization of building footprints and incorporation of impervious pavements
- Conservation of natural area by clustering of development and preservation of natural drainage systems
- Directing flows from impervious surfaces across pervious pavements or landscape areas
- Preservation of existing trees and planting of new trees to maintain and increase canopy coverage
- Conveying of drainage away from slopes or provision of appropriate slope down drains
- Vegetating slopes and open space areas with drought tolerant plants
- Stabilization of permanent channel crossings and installation of energy dissipaters at drainage outlets

Source Control BMP features incorporated into Carlsbad developments during the reporting period include the following:

- Enclosure of outdoor storage areas
- Trash enclosures that have impervious surfaces and do not allow drainage to flow through the enclosure and use of trash bins with lids that exclude rain
- Use of efficient irrigation systems with moisture sensors and properly designed flow control systems
- Stenciling and/or placement of tiles at every storm drain inlet

For projects that included one or more of the individual project categories, an appropriate BMP was utilized. This included the following:

- Directing drainage from private streets across vegetated swales or into bioretention areas
- Directing drainage from dock and loading areas into bioretention areas or through filters/clarifiers prior to discharge into storm drains
- Keeping maintenance bays indoors and directing floor drainage into the sewer system
- Installation of special bacterial filter systems for outdoor eating areas
- Incorporation of landscape areas into surface parking lots
- Landscaping of hillside areas with deep rooted and drought tolerant plants

During FY 2008-09, hydrodynamic separator systems and filter inserts were not permitted to be used as a primary treatment control method (the 2008 Carlsbad SUSMP was updated to show them only effective at removing trash, debris and coarse sediment).

Due to the economic slowdown, the City processed fewer development approvals than in previous years. The development approvals processed during FY 2008-09, encompassed many project categories including residential, commercial and industrial projects. Each high priority development project included appropriate treatment control BMPs from the list of allowable treatment controls included in Table 4 of the 2008 Carlsbad SUSMP. The types of treatment control systems approved for new developments during the reporting period included bioretention areas, vegetated swales, detention basins and filtration systems.

2.4.4 Program Implementation

Description of notable activities conducted to manage urban runoff from development projects
The City has a comprehensive set of storm water pollution prevention activities which are incorporated into its project development approval and BMP installation verification process. The measures include everything from the development of urban runoff land use planning policies, development processing procedures, project submittal and review checklist, educational pamphlets, engineering standards, City Codes, database inventory control, monitoring requirements, staff and developer training and project tracking and reporting. Each activity has been carefully designed to help eliminate or reduce storm water pollution to the maximum extent practicable (MEP) and to not cause or contribute to an exceedance of receiving water quality objectives.

The development process has many stages from concept review on through to construction completion and project operation and maintenance. The City conducts many notable activities meant to ensure development project compliance with the City s urban runoff management policies and requirements. Table 2.4.4.1 presents a brief description of the storm water pollution prevention activities undertaken at each stage of the development process. Also included in the table are a listing of the City reference materials and implementation documents available to developers and City staff which are applicable to each stage in the process.

Table 2.4.4.1 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Conceptual Project Design	Developer uses the 2008 Carlsbad SUSMP and Storm Water Standards Questionnaire to determine project priority and begins project layout and design. For priority projects the City recommends to developers that a preliminary SWMP should be prepared	• Storm Water Standards Questionnaire • Storm Water Standards Manual which includes the 2008 Carlsbad SUSMP • 303(d) List
Pre-application Review	Developer submits the preliminary project proposal to staff to obtain input on conceptual project layout including storm water compliance issues.	• Preliminary site plan checklist • SWMP Fact Sheet
Application for Discretionary Review	City staff review application package at front Counter for completeness of submittal including storm water compliance documents. Project is logged into the City database for tracking. A completed Environmental Initial Assessment (EIA) form is submitted with the application package.	• Project Application Submittal Checklist • City review letter
Application Review	City staff reviews application, site plans and accompanying reports and documents including any SWMP, geotechnical and hydrology/hydraulic reports. Project is reviewed for consistency with General Plan, Local Coastal Plan (LCP), Habitat Management Plan (HMP1), 2008 Carlsbad SUSMP and City Codes and other Standards including all storm water protection policies and requirements including new interim LID and hydromodification requirements. Project location is reviewed for proximity to environmentally sensitive areas and to determine if project drains to a water body on the 303(d) list. Project EIA is reviewed and appropriate environmental review documents are requested and reviewed in compliance with California Environmental Quality Act (CEQA) requirements.	• Site plan review checklist • SWMP checklist • 303(d) List • General Plan • Local Coastal Plan • Habitat Management Plan • City Codes • Environmental Assessment Form • CEQA Guidelines • City review letter (if any)
Discretionary Approval	City denies project or approves with conditions including storm water compliance conditions. Applicable standard conditions of approval are applied to the project together with any special conditions of approval as City staff determines necessary to reduce or eliminate the projects storm water pollution impacts to the MEP. Approving authority makes required findings that project complies with the General Plan, LCP, HMP1, City Codes and any other appropriate land use planning documents. Environmental documents are certified and any mitigation monitoring requirements. are noted in the project approval.	• City s standard conditions of approval • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)
Final Project Design	Developer prepares project construction plans including grading, improvement, landscape and building detailing required BMPs. Construction SWPPP is prepared and SWMP is finalized. A single sheet BMP site plan is prepared.	• Storm Water Standards Manual • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)

Table 2.4.4.1 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Construction Plan Check Application Submittal	City staff review application package for completeness of submittal including storm water compliance documents. Applicant completes and submits Project Storm Water Threat Assessment Worksheet included as part of the Storm Water Requirements Applicability Checklist.	• Plan Check Application Submittal Checklist • Project Threat Assessment Worksheet • Project Conditions of Approval
Construction Plan Check Review	City staff reviews construction plans and accompanying reports and documents including any SWMP, single sheet BMP site plan, Construction SWPPP, geotechnical and hydrology/hydraulic reports. All storm water pollution prevention requirements are checked against construction plan checklist, SWMP checklist, Construction SWPPP checklist and project conditions of approval. Construction cost estimates are approved for bonding costs including costs for structural BMPs. For priority projects a BMP Maintenance Agreement is prepared.	• Construction Plan Checklist • SWMP Checklist • Construction SWPPP Checklist • Project conditions of approval • Project Threat Assessment • City Engineering plan review procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates
Construction Plan Approval	City approves construction plans and accompanying Construction SWPPP and SWMP including single sheet BMP site plan. The executed BMP Maintenance Agreement is recorded and entered into the City s document management system database. All treatment control BMPs are noted on the construction plans and forwarded to the GIS group for entry into the BMP inventory. Any project design changes that differ from the approved site plan or project conditions of approval are reviewed in compliance with the City s Substantial Conformance Procedures to ensure that the project remains in compliance with all land use planning findings. Secured agreements to construct project improvements are obtained backed up with cash and/or other securities. Developer is required to note the WDID number on the project plans	• Plan check completion letter • BMP Maintenance Agreement • BMP Inventory update procedures • Substantial Conformance Procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates • Secured Agreements • Single sheet BMP site plan
Ministerial (Construction) Permit Issuance	City issues permit(s) for construction activities including grading, improvement, building, demolition and blasting. Any special storm water compliance requirements are noted on permit. City staff review plan check completion letter for any special storm water compliance requirements. Copies of the permit, construction plans, Construction SWPPP, single sheet BMP site plan and SWMP are forwarded to the Construction Management and Inspection Division. A construction inspection level (low, medium or high) is assigned in accordance with the project s threat assessment form. The project tracking database is updated with the project threat assessment construction level and permit issuance status.	• Plan check completion letter • Project SWMP • Project Construction SWPPP • Construction Threat Assessment Worksheet • Pollution Prevention Guide for the Construction Industry • Construction SWPPP Fact Sheet • Single sheet BMP site plan

Table 2.4.4.1 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Preconstruction Meeting	City staff meets with contractor and other parties to review project construction issues, schedule, and storm water BMP implementation, monitoring and testing requirements. Contractor is informed of storm water inspection and enforcement procedures and reminded to maintain compliance with the City's storm water pollution prevention requirements. City inspector verifies the NOI has been filed with the Regional Board and a WDID number has been assigned to the project.	• Preconstruction checklist • Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry • Single sheet BMP site plan
Construction and Inspection	Developer constructs project including temporary and permanent BMPs. City inspectors enforce compliance with SWPPP, SWMP and Municipal Permit. During construction City project inspector reviews construction for compliance with all plans, the Construction SWPPP, SWMP and City Standards. Regular storm water compliance inspections are scheduled and tracked per City procedures and the requirements of the 2008 JURMP. Enforcement actions are taken as necessary in accordance with City inspection and enforcement procedures. City inspector reviews and approves any minor construction revisions. Major construction revisions are referred to the Engineering Development Services Division for review and approval.	• Construction SWPPP • SWMP • Construction plans • City inspection and enforcement procedures • Pollution Prevention Guide for the Construction Industry • Inspection reports • Enforcement action reports • Secured Agreements • Single sheet BMP site plan
Project Completion	Construction plans are "as-built", securities released, and BMP construction verified. As-Built plans prepared and forwarded to the GIS Group to update the BMP inventory. City inspector reviews project site to verify installation of permanent BMPs prior to occupancy permit and/or project acceptance using the single sheet BMP site plan. Public Improvements are accepted for maintenance including any public structural control BMPs.	• Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry • Punch list • Secured Agreements • Project Acceptance Forms • Single sheet BMP site plan
Post Construction Annual Treatment Control BMP Inspections	BMP owners maintain BMPs in accordance with recommended and regulatory maintenance schedules. Treatment Control BMP owners submit annual verification of effective operation and maintenance of installed treatment control BMPs. City staff inspects project sites with installed treatment control BMPs to verify compliance with storm water requirements. (New requirement to be implemented in FY 2008-09).	• SWMP • BMP Inventory List • Site BMP Inspection Report • BMP Maintenance Agreement

Confirmation that all development projects were required to undergo the City's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked

In FY 2008-09, all new development projects and redevelopment projects including City Capital Improvement Program (CIP) projects were required to undergo the City s urban runoff approval process in accordance with the requirements of the 2007 Municipal Permit and 2008 Carlsbad JURMP.

Project compliance was tracked through a variety of paper and computer tracking systems. In FY 2008-09, tracking of projects through the discretionary project approval process consisted of paper records kept in individual files. As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specify whether the project must comply with the priority or non-priority project requirements of the 2008 Carlsbad SUSMP. For priority development projects, a written Storm Water Management Plan (SWMP) is prepared detailing all proposed site design, source control and treatment control BMPs, including interim LID and hydromodification requirements. Structural site design, source control and treatment control BMPs are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority status (Priority, Non-Priority or Exempt). A list of the project discretionary approvals for the reporting period is included as Appendix 2.2. Additionally, the City adopted a single plan BMP sheet that includes a project site plan and calls out the location of each required LID site design, source control and treatment control BMP. The plan contains a matrix cross referencing the required BMP with the appropriate construction plan (grading, improvement, building or landscape) where the specified BMP construction is detailed. A copy of the plan is attached to each construction drawing for reference by the contractor and inspector. At the conclusion of the project and prior to issuance of an occupancy permit or acceptance of the improvements, the inspector will use the single sheet BMP plan to help ensure all required BMPs are installed as required. After verification, the inspector will initial the plan and place a copy in the project inspection file.

During the construction plan review stage, a final design SWMP is submitted and approved. In addition, each project s required structural BMPs are incorporated into the project plans. For priority projects, a table is placed on the title sheet identifying each treatment control facility including manufacturer s information and maintenance schedules and specifying which page of the plans contain the details of each required BMP. A separate table is included on the detail sheet providing additional information including the number of BMP units located on the specified plan sheet. The tables are used to highlight BMP requirements to the contractor and project inspector. The table also makes it easier for City GIS staff to locate treatment control BMPs for entry into the City s GIS database.

At the project permitting stage, the applicant is required to submit a completed Construction Threat Assessment Worksheet for Determination of a Project s Perceived Threat to Storm Water Quality (Construction Threat Assessment Worksheet). The Construction Threat Assessment Worksheet is used to determine the inspection frequency level pursuant to the 2007 Municipal Permit requirements (low, medium or high). The required inspection level is

entered into the City's Permits Plus software program for automated tracking. The Permit Plus program links the various ministerial construction permits (building, right-of-way, blasting and grading) to the "master" development project. The Permits Plus program is used to automatically generate storm water inspection requests for development projects with active permits. The program is also used to track inspection results and follow-up enforcement inspections. A copy of the Construction Threat Assessment Worksheet is included as Appendix C to the Construction SWPPP Standards and Requirements Chapter of the Storm Water Standards Manual attached and is attached as Appendix 2.12.

A listing of the development projects to which SUSMP requirements were applied
During FY 2008-09, the 2008 Carlsbad SUSMP requirements were applied to 74 private development/redevelopment projects and 14 City Capital Improvement Program (CIP) projects. Of the 74 private development/redevelopment projects, 40 were priority development projects subject to site design, source control and treatment control requirements and 24 were standard projects subject only to site design and source control BMP requirements. Of the 14 City CIP projects, there were 3 priority development projects subject to site design, source control and treatment control BMP requirements and 11 standard projects subject only to site design and source control BMP requirements. Copies of the development and CIP project approval list showing project priority are included in Appendices 2.2 and 2.3, respectively.

Confirmation that all applicable 2008 Carlsbad SUSMP BMP requirements were applied to all priority development projects, including a description of how the information was tracked
In FY 2008-09, all applicable requirements of the 2008 Carlsbad SUSMP were applied to all priority development projects. The City required submittal of a completed Storm Water Standards Questionnaire for every discretionary application made to the City during the reporting period. Projects determined to be priority development projects per the Storm Water Standards Questionnaire were additionally required to submit a preliminary Storm Water Management Plan (SWMP).

As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specify whether the project must comply with the priority project or standard project requirements of the 2008 Carlsbad SUSMP. For priority projects, a written Storm Water Management Plan (SWMP) is prepared detailing all proposed site design, source control and treatment control BMPs. Structural site design, source control and treatment control BMPs, including the new interim LID and hydromodification requirements are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority status (Priority, Non-Priority or Exempt). A list of the project discretionary approval list is included as Appendix 2.2. Additionally, the City requires preparation of a single plan BMP sheet for all priority development projects that includes a project site plan and calls out the location of each required LID site design, source control and treatment control BMP. The single sheet plan contains a matrix cross referencing the required BMP with the appropriate construction plan (grading, improvement, building or landscape) where the specified BMP construction is detailed. A copy of the plan is attached to each construction drawing for reference by the contractor and inspector. At the conclusion of the project and prior to issuance of an occupancy permit or

acceptance of the improvements, the inspector uses the single sheet to help ensure all required BMPs were installed as required. After verification, the inspector initials the plan and places a copy in the project inspection file.

At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs

Appendix 2.5 of the annual report includes a sample project which received discretionary approval during the review period (July 1, 2008 to June 30, 2009). The sample project is a commercial development including two restaurant sites and a 44,391 square foot commercial center. The site drains to a concrete lined channel located within the Agua Hedionda Lagoon hydrologic area. The anticipated and potential pollutants generated by the project, as determined by Table 2 of the 2008 Carlsbad SUSMP, include sediments, nutrients, trash and debris, oxygen demanding substances, oil and grease, bacteria and viruses and pesticides. The Agua Hedionda Lagoon is impaired for sedimentation/siltation and indicator bacteria. The required project BMPs included:

1. Site Design
    a. Minimized Directly Connected Impervious Areas
        i. Roof drains and parking lot drainage directed to bioswales
        ii. Drain impervious surfaces to landscape areas
        iii. Clustered lot design.
    b. Use of smart irrigation system
    c. Re-tilling of soils compacted by construction equipment
    d. Collection and re-use of onsite organic soils material
2. Source Control
    a. Trash receptacles to be stored under cover and designed not to allow run-on water to enter enclosure
    b. Efficient irrigation with rain and water loss shut-off devices for landscaped areas
    c. All storm drain inlets in the project area to be stenciled and signed with porcelain tiles
    d. Integrated pest management practices to be used
3. Individual Project Category
    a. Loading docks to be covered or drainage designed to preclude urban run-on and run-off. No direct connects from depressed truck wells to storm drains
    b. Parking landscape areas to include tree canopies where possible.
    c. Grease interceptors to be installed for restaurants.
4. Treatment Control
    a. Extended dry detention basin
    b. High-rate media filter
    c. Pre-treatment baffle boxes with trash rack and sediment traps.
    d. Water polisher to treat offsite water draining through the project.

A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible

No priority projects were allowed to develop using treatment control BMPs with low removal efficiency rankings as the sole method of treatment control during FY 2008-09.

An updated treatment control BMP inventory

The City has a watershed-based inventory of publicly and privately owned treatment control BMPs. The inventory has been used to track and document information about each of these

structures including BMP type, inspection dates and findings, maintenance frequencies and requirements, verifications, and other Permit requirements. Development of the inventory is an ongoing process, as new structures are researched, verified, and added to the database on a continual basis.

During this reporting period, the City updated the watershed based inventory and prioritized all verified structures into high, medium, and low categories as required by the Permit according to BMP type, location, and proximity to the nearest ESA. During dry season 2008 (July 1, 2008 through September 30, 2008), the City had verified 232 privately owned treatment control BMPs on the inventory, which includes 85 high priority, 82 medium priority, and 65 low priority structures. In addition, there were 79 publicly owned treatment control BMPs on the inventory, which included 31 high priority, 48 medium priority, and zero low priority structures. A copy of the updated treatment control BMP inventory for both publicly and privately owned facilities is included as Appendix 2.4.

For privately owned treatment control BMPs, staff continued to confirm the accuracy of the inventory, research certifications and maintenance requirements, verify ownership and responsible parties, and develop inspection procedures, forms, and outreach materials for the treatment control BMP program. In addition, the City developed a new procedure that defines the process for managing and updating the privately owned treatment control BMP Inventory List (procedure CMI-310). A copy of this new procedure can be found in Appendix 2.9. Although updating this inventory was a major undertaking during FY 2008-09, the new procedures in place will help maintain a more accurate inventory.

The number of treatment control BMPs inspected, including a summary of inspection results and findings

During FY 2008-09, the City conducted two rounds of compliance inspections of privately owned treatment control BMPs. During dry season 2008 (July 1, 2008 through September 30, 2008), the City inspected 71.55 of the privately owned treatment control BMP inventory. The City also began conducting inspections of privately owned treatment control BMPs for dry season 2009 (May 1, 2009 through June 30, 2009) during this reported period. At the end of the reporting period, June 30, 2009, the City had inspected 65.64 of the privately owned treatment control BMP inventory. Inspection of privately owned treatment control BMPs identified on the updated inventory will continue to be conducted as required by the Permit through October 1, 2009 and additional results will be reported in the FY 2009-10 annual report.

Inspectors used the treatment control BMP inspection form developed in FY 2007-08 for privately owned structures. During inspections, the inspector uses their best professional judgment to determine the condition of the TCBMP using the following criteria:

- **Good:** Currently no maintenance or corrective action is required for the TCBMP. No trees, large plants, excessive trash, stagnant water, blockages, or other major sources of pollutants were observed. The TCBMP appears to be functioning as designed. Re-inspect in one year.
- **Fair:** Light to minor maintenance required within the next year. Small amounts of trash, weeds, plants, debris, and/or silt has accumulated, but the TCBMP is functioning as designed. The structure should be re-inspected within one year by the responsible party and/or the City.
- **Poor:** Maintenance and/or repairs are required on the structure. Excessive trash, weeds, vegetation, stagnant water, trees, silt, and/or other pollutants were observed during the

inspection. The TCBMP is blocked, needs repaired, and/or is not functioning as required. The responsible party should be notified and corrective actions implemented within six months of inspection. The structure should be re-inspected within six months by the responsible party and/or the City.

In addition, the City developed a new procedure to define the process for inspecting, tracking, and enforcing compliance for structures listed on the privately owned treatment control BMP Inventory List (procedure CMI-300). A copy of this new procedure can be found in Appendix 2.8.

Dry Season 2008 (July 1, 2008 September 30, 2008)

For dry season 2008, all high priority privately owned treatment control BMPs were inspected as required. In addition, all minimum inspection requirements for privately owned treatment control BMPs were met or exceeded during the 2008 dry season inspections. Table 2.4.4.2 includes a summary of the inspections and findings of the 2008 dry season inspections.

Table 2.4.4.2: Summary of July 1 - September 30, 2008 Dry Season Inspections and Findings for Privately Owned Treatment Control BMPs

Classification	Total on Inv List	Condition	Total	Total Confirmed	% to target Dry Season 2008

Dry Season 2009 (May 1, 2009 June 30, 2009)

The City began conducting inspections of privately owned treatment control BMPs for dry season 2009 (May 1, 2009 through June 30, 2009) during this reported period. Between October 1, 2008 and May 1, 2009, the treatment control inventory was updated and additional structures were added to the inventory. Inspection of privately owned treatment control BMPs identified on the updated inventory will continue to be conducted as required by the Permit through October 1, 2009 and complete inspection results for dry season 2009 will be reported in the FY 09-10 annual report. Table 2.4.4.3 includes a summary of the inspections and findings of the 2008 dry season inspections.

Table 2.4.4.3: Summary of May 1 - June 30, 2009 Dry Season Inspections and Findings for Privately Owned Treatment Control BMPs

Classification	Total on Inv List	Condition	Total	Total Confirmed	% to target 2009

A description of the annual verification of operation and maintenance of treatment control BMPs including a summary of verification results and findings

During FY 2008-09, the City finalized and mailed a new treatment control verification form to all responsible parties on the treatment control BMP inventory list. The form was mailed to all

private property owners and other responsible parties identified on the updated inventory prior to the 2008 and 2009 rainy season. In addition, the City instituted a new procedure that defines the process for verifying and tracking compliance with the treatment control BMP verification of maintenance requirements (procedure CMI-320). A copy of this new procedure can be found in Appendix 2.10.

New outreach materials were developed to be included with the verification form mailers. The *What You Need to Know About Privately Owned Treatment Control BMPs* (Appendix 2.7) brochure and the *Frequently Asked Questions About Treatment Control BMPs* (Appendix 2.6) factsheet were developed to help property owners and other responsible parties understand their maintenance responsibilities. All the new outreach materials and verification forms along with additional information about treatment control BMPs were also available for download from the City s webpage at www.carlsbadca.gov/cmi. In addition, the City created a new email address for the treatment control BMP verification program. Owners and responsible parties can send questions, verification forms, and other requests to the tcbmp carlsbadca.gov email address, which is monitored by the Senior Construction Inspector.

For dry season 2008, mailers were sent out between July 30 and September 15, 2008. In addition to the first notification, those who did not comply with the first request were sent reminder notices after the initial due date. As a result of the 2008 dry season effort, over 60 (140 of the 232 mailed) of the verification forms were returned as required. This return rate was higher than expected and seen as a success for the City considering this is a new requirement for private property owners. The City will be using the first year return rate as a benchmark to help measure the effectiveness of the verification program.

For dry season 2009, the first notifications were sent to all responsible parties listed on the updated treatment control BMP inventory on May 4, 2009, with a second reminder notice mailed on June 22, 2009. As of June 30, 2009, over 48 (249 of the 518 mailed) of the verification forms were returned, which is already twice as many as the total number returned for the entire 2008 dry season. The City will continue to work with the responsible parties to ensure verifications are returned as required. In the event that a responsible party does not respond, the City may use its enforcement authority to escalate efforts. .

Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked

During FY 2008-09, the installation of all structural BMPs required of priority projects were verified prior to occupancy. The process is initiated when a request for occupancy is made to the City by the building contractor or developer. Both the building inspector and public works inspector are notified of the request for occupancy and final inspections are schedule. The building inspector and public works inspectors review the project site for compliance with all City requirements including verification of BMP installation. If all the requirements are satisfactory the building inspector and public works inspector sign off on the occupancy permit and occupancy is granted. The City maintains a copy of the signed occupancy permit in the building permit file. The City Building Department staff then updates the status of the permit in the building permit database.

A listing of any projects which received a SUSMP waiver

No projects received a SUSMP waiver in FY 2008-09.

A description of any SUSMP waiver mitigation program

The City did not incorporate a SUSMP waiver program within the 2008 Carlsbad SUSMP. No SUSMP waivers were requested or granted during the reporting period. If a SUSMP waiver is requested in the future, the City will follow the waiver provisions as provided in the 2007 Municipal Permit.

A description of Hydromodification Management Plan development collaboration and participation

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydromodification Management Plan (HMP). City staff attended the copermittee meetings held on the HMP during FY 2008-09 and provided input into the discussion process. The City of Carlsbad participated in the cost sharing for the consultant firms retained to prepare the San Diego regional HMP. The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

A listing of priority development projects required to meet Hydromodification Management Plan (HMP) requirements, including a description of hydrologic control measures implemented

In FY 2008-09, no projects were approved that met the 50 acre minimum requirement for implementation of the interim hydromodification requirements.

A listing of priority development projects not required to meet Hydromodification Management Plan (HMP) requirements, including a description of why the projects were found to be exempt from the requirements

In FY 2008-09, no projects were found to be exempt from the interim hydromodification requirements. Several permitted projects that met the 50 acre criteria were under construction when the interim hydromodification requirement became effective. However, the 2007 Municipal Permit stated that projects under construction when the requirements became effective were not required to meet interim HMP requirements and therefore, no projects were exempted from the HMP requirements during the reporting period.

A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project

In FY 2008-09, no projects were found to meet the interim HMP criteria except those which were under construction when the requirements became effective. Per the requirements of the 2007 Municipal Permit, projects under construction or which were lawfully approved prior to March 24, 2008, were not required to meet the interim hydromodification criteria.

The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken

In FY 2008-09, CMI issued 18 Notice to Clean enforcement actions for privately owned treatment control BMPs found to be in poor condition during the 2008 dry season inspections. In addition, the City conducted follow-up inspections and found that corrective action had been implemented as required.

The City achieved compliance with the 2008 SUSMP through the permitting process. Development approvals are not granted until the project shows complete compliance with the City s storm water pollution prevention requirements. The City will not issue a construction

permit until all applicable BMP requirements are incorporated into the project plans. For projects involving grading and/or street and utility improvements, the City requires that the developer enter into secured agreements to guarantee developer performance on the grading or improvement work including associated structural BMPs. City inspectors review the project sites during construction to ensure that all work is being done in compliance with the construction plans and City Standards and procedures. Prior to issuance of a certificate of occupancy or release of any security, the City inspector reviews the project site to ensure that all applicable structural BMPs have been installed per the approved plans and specifications. Only when the BMP installations have been verified will the certificate of occupancy be issued or any security be released.

2.5 Notable Activities

As mentioned in the Executive Summary, the City considers Notable Activities to be any activity above compliance requirements.

- The greatest strength of Carlsbad s Land-Use Planning Component is its motivated and well informed project review staff. The project review staff holds weekly meetings where issues of storm water pollution prevention are discussed including issues of new regulatory requirements, new and evolving BMP standards, inventory collection and reporting, LID application in new development design and BMP effectiveness (a list of the Engineering Development Services training meetings is included in (Appendix 8.2).

- During FY 2008-09, the City hired a qualified storm water professional to prepare an in-house training program for the City s Development Services staff (planning, engineering, building and inspection). Two training sessions were conducted during the FY 2008-09 reporting period, including an introduction to storm water regulations and the City s storm water processes and requirements. This particular training program was notable because the class syllabus was specially designed to cover the City s local development storm water regulations and requirements. The training included hands on review of sample City projects and use of City storm water forms and checklist.

- During FY 2008-09, the City instituted a new procedure to define the process for inspecting, tracking, and enforcing compliance for structures listed on the privately owned treatment control BMP Inventory List (procedure CMI-300). A copy of this new procedure can be found in Appendix 2.8.

- The City also instituted a new procedure that defines the process for managing and updating the privately owned treatment control BMP Inventory List (procedure CMI-310). A copy of this new procedure can be found in Appendix 2.9.

- The City instituted a new procedure that defines the process for verifying and tracking compliance with the treatment control BMP verification of maintenance requirements (procedure CMI-320). A copy of this new procedure can be found in Appendix 2.10.

- The City developed two new outreach handouts to assist private property owners in understanding and complying with the new annual treatment control BMP verification program including the *What You Need to Know About Privately Owned Treatment*

Control BMPs brochure located in Appendix 2.7, and the *Frequently Asked Questions About Treatment Control BMPs* fact sheet found in Appendix 2.6.

- In FY 2008-09, the City updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.

- This reporting period the City also initiated use of standard findings of storm water compliance on administrative minor subdivision approvals. The new finding is included in Appendix 2.1.

3.0 CONSTRUCTION COMPONENT

3.1 Introduction

The City of Carlsbad continues to stress the importance of storm water pollution prevention throughout the implementation of the construction component. This section of the annual report identifies those activities which occurred from July 1, 2008 through June 30, 2009 and will cover the requirements of the Permit No. R9-2007-0001 (Permit).

The City has implemented activities that address and minimize impacts to receiving water quality from construction sites. Performance goals were used to assess the completeness of this component and the effectiveness of action plans. These performance goals included construction site inspections, BMP implementation reviews, corrective actions, enforcement, and reporting requirements. During this reporting period, the City updated the construction inventory on a monthly basis, inspected all construction sites at the required frequencies, responded to construction related inquiries and complaints, provided outreach and education to developers, engineers, contractors and City staff, and when necessary used enforcement actions to obtain compliance.

3.2 Source Characterization

All construction sites were required to undergo the City s construction urban runoff approval process and meet the applicable construction requirements. The City uses the Permits Plus database to update a watershed based inventory of all construction sites that required grading and/or construction permits. The Development Services Division updates the Permits Plus database until the project is ready to begin construction. The Construction Management and Inspection Department (CMI) then issues the permit and updates the database during the active construction phase of the project. The CMI inspectors are primarily responsible for conducting storm water compliance inspections during the active construction phase.

Construction sites with grading permits may include sites where activities such as grading, excavation, clearing, road construction, structure construction, or demolition results in the disturbance of soil. Construction permits that do not require a grading permit may include sites where activities such as single family residence, remodels, or additions, home demolitions, tenant improvements, or commercial/industrial buildings that are constructed resulting in the need for water quality protection. An inventory of all active construction sites requiring a grading permit can be found in Appendix 3.1. At the end of FY 2008-09, there were 173 grading permits on the construction site inventory, of which 123 were active and 50 were inactive (finaled, expired or withdrawn). Table 3.2.1 is a summary of the FY 2008-09 active construction site inventory.

Table 3.2.1: Summary of the FY 2008-09 Active Grading Permit and Construction Site Inventory

Priority	Active	Finaled	Withdrawn	Expired	Total
High	44	8	0	1	53
Medium	26	7	0	0	33
Low	53	32	1	1	87
Total	**123**	**47**	**1**	**2**	**173**

3.3 Updates to Ordinances and Approval Processes

Extensive changes to the ordinance, storm water standards and grading and construction approval process changes were implemented during the FY 2007-08 reporting period to meet the Permit requirements.

During the FY 2008-09 reporting period, the ordinances were reviewed and with the changes adopted in the FY 2007-08 reporting period, the ordinances were found to be adequate; therefore, no ordinance changes were made. In addition, the City initiated several grading and construction approval process changes to implement the various ordinance and standards changes adopted FY 2007-08. Below is a complete listing of the grading and construction approval process changes made during FY 2008-09:

1. Updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.
2. Updated the procedure for inspecting tracking and enforcing construction sites as described in procedure CMI-100 (Appendix 3.4).
3. Updated the procedure for inspecting building sites as described in procedure CMI-110 (Appendix 3.5).
4. Updated the procedure for managing and updating data on the Active Grading Permit and Construction Site Inventory List as described in procedure CMI-120 (Appendix 3.6).

3.4 Best Management Practice Requirements

SWPPPs and Erosion Control Plans are reviewed prior to commencement of construction activities to ensure that the required minimum BMPs will be implemented for all construction sites. The City has required the minimum BMPs be implemented, as identified in the 2008 JURMP and Carlsbad Municipal Code, for all construction sites. The seven required minimum BMPs include components that address the following:

1. Erosion control methods for graded slopes;
2. Erosion control method for graded flat areas (slope 5);
3. Sediment control for perimeter boundaries;
4. Offsite tracking control of sediment;
5. Materials management control;
6. Waste management control; and
7. Non-storm water management control.

The City continues to utilize the pollution prevention measures contained in the Storm Water Best Management Practice Handbooks, published by the California Storm Water Quality Association (CASQA), Caltrans Storm Water Quality Handbooks, and Standards for Design & Construction of Public Works Improvements in the City of Carlsbad. All CMI staff are trained on

construction site BMPs and their appropriate application.

Pollution prevention consists of procedures and practices that eliminate or reduce the pollutants at the source. The City has identified and required implementation of the following pollution prevention controls for all applicable construction sites:

- SWPPPs and Erosion Control Plans are required for grading permits and appropriate construction projects. These plans are checked by the City to ensure they adequately address the provisions of the General Construction Permit.
- CMI inspectors enforce the implementation and effectiveness of BMPs described in approved erosion control plans and SWPPPs.

To address each of the required BMPs, the City ensures the SWPPPs and/or erosion control plans include implementation of several types of BMPs as applicable, depending on site-specific requirements. The list of BMPs can be referenced in the 2008 JURMP.

Grading sites in the City were held to the maximum allowable disturbed areas on all applicable sites.

There were no projects that triggered the Advanced Treatment requirements.

3.5 Program Implementation

During FY 2008-09, the City continued to monitor and enforce storm water regulations by distinguishing the construction components into two areas - Building Construction Permits and Grading Construction Permits. CMI oversees the inspections of grading permitted sites while contracted storm water inspectors ensure building permitted sites (construction sites without a grading permit) are compliant. In addition, one Senior Construction Inspector has been designated with full responsibility for storm water compliance. A copy of the active grading permit inventory detailing each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the wet season, the number of inspections conducted during the wet season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all active grading sites can be found in Appendix 3.1.

In an effort to identify and implement BMPs in a more effective manner, the City revised the NPDES inspection report in January 2009, to include a duplicate tear off sheet. The revised NPDES inspection report covers all administrative requirements including inspection and evaluation of SWPPPs, wall maps, desiltation basins, materials and waste management, temporary BMPs, slope protection, and site conditions and interactions. A copy of the inspection report can be provided directly to the site representative upon completion of an inspection. This process has proven to be time saving, cost effective, and successful in attaining compliance from construction sites. If corrective actions were required, follow-up inspections were conducted to verify compliance. A copy of the revised NPDES inspection form can be found in Appendix 3.3.

For the first half of FY 2008-09, the City continued to prioritize all construction sites with active grading permits as high priority. These sites were, at a minimum, inspected on a bi-weekly

basis during the wet season and once a month during the dry season, to ensure proper installation and maintenance of pollution prevention BMPs. Beginning January 1, 2009, all active grading permits and building inspection sites were prioritized into high, medium, and low categories and inspected at the minimum frequencies required by the Permit. All inspection protocols outlined in the Permit, JUMRP, CMI procedures, and the CMC were followed and implemented as required.

CMI updated and finalized three new procedures for NPDES inspections and inventory management during FY 2008-09. Procedure CMI-100 defines the process for inspecting, tracking, and enforcing grading and construction sites (Appendix 3.4), procedure CMI-110 defines the process for inspecting, tracking, and enforcing building sites (Appendix 3.5), and procedure CMI-120 defines the process for managing and updating data on the Active Grading Permit and Construction Site Inventory List (Appendix 3.6).

CMI inspectors are responsible for inspections on all active grading and CIP sites. Storm water compliance remained their main focus during this reporting period, especially during the wet season. All required inspections were documented and placed in the project files. During required inspections, staff generally found sites to be compliant with SWPPPs, Erosion Control Plans, and BMP implementation. Most observed deficiencies were found with BMP maintenance (i.e. broken gravel bags, silt fences, etc.). These deficiencies were immediately brought to the attention of the responsible site superintendent who was given specific and corrective action requirements by the project inspector. This interaction has proven to be productive in correcting minor deficiencies.

Prior to the wet season, CMI inspectors hand delivered a memo to all site superintendents reminding them of the NPDES requirements and informing them to ensure all sites are in compliance by and throughout the wet season. A copy of the *Rainy Season Preparation and Storm Water Compliance* memorandum issued on September 3, 2008, can be found in Appendix 3.7.

In addition, the City continued to verify the validity of a project s Notice of Intent (NOI) prior to issuance of a grading permit or Notice to Proceed for CIP projects. Prior to the pre-construction meeting and issuing a grading permit, CMI verified a valid NOI was in place for projects subject to the State requirements. The Construction Manager reviewed the State s online database to ensure a NOI had been issued prior to assigning the project to an inspector for grading permit issuance.

Grading Permit Site Inspections:

All active grading sites were prioritized and inspected as required during this reporting period. CMI inspectors verified and documented proper BMP implementation on a weekly, sometimes daily basis. Table 3.5.1 is a summary the grading permit inspections conducted during this reporting period:

Table 3.5.1: Inspections Required and Conducted for Sites Requiring a Grading Permit FY 2008-09

Wet Season Inspections Required	Wet Season Inspections Conducted	Dry Season Inspections Required	Dry Season Inspections Conducted	**Total** Inspections Required	**Total** Inspections Conducted
995	**1226**	**420**	**632**	**1415**	**1858**

On October 9, 2008, the RWQCB conducted storm water compliance inspections at various construction sites within the City of Carlsbad. On November 3, 2008, the City received an inspection report from the RWQCB detailing several minor corrective actions that would need to be implemented to bring these construction sites into compliance. The City worked closely with the developers and contractors to ensure corrective actions were implemented in a timely manner. On November 12, 2008, a written response to the inspection report was sent to the RWQCB detailing the City's efforts to ensure corrective actions were implemented. In addition, follow up inspections were conducted at all the noted sites to ensure compliance was achieved.

Building Construction Permit Site Inspections:

CMI inspectors also conducted inspections at building permit sites. During the wet season high priority sites were inspected bi-weekly. All medium and low priority sites were inspected as needed. All required and follow up inspections were conducted. There were 851 inspections conducted at building sites during FY 2008-09.

Capital Improvement Projects Site Inspections:

Daily inspections were conducted for all CIP projects. These inspections cover a number of storm water compliance issues. All medium and low priority sites were inspected as needed. All required and follow up inspections were conducted. There were 100 NPDES inspections conducted at CIP sites during FY 2008-09. A copy of the CIP inventory can be found in Appendix 3.2.

Enforcement Actions at Construction Sites:

There were no changes in the City's enforcement escalation procedures as described in the 2008 JURMP during this reporting period. Table 3.5.2 is a summary of enforcement actions taken by the City during this reporting period from July 1, 2008 to June 30, 2009.

Table 3.5.2 Summary of Violations and Enforcement Actions at Construction Sites

Actions Taken	Number of Actions
Verbal Notices	116
Written Warning	44
Stop Work Notice	3
Notice of Violations	0
Summary Abatement Notice	1
Total Actions	164

If a site was found to have deficiencies in storm water compliance, it was generally corrected at the time of the inspection. If a verbal or written warning was issued, a specific deadline for correction action was noted. Follow up inspections were conducted to ensure construction sites fully complied with the required corrective actions. All sites were found to have completed corrective actions and were in compliance at the time of the follow up inspection.

If a site was found to be out of compliance to the point where major deficiencies were noted, a Stop Work Notice was issued. Stop Work Notices prevent the contractor from continuing any construction related work until the corrective actions have been implemented. Stop Work Notices were found to be an immediate and effective mechanism to ensure non-compliance was

corrected in an expeditious manner. Therefore, zero Notice of Violations (NOV) were issued during FY 2008-09.

There were three Stop Work Notices issued during this reporting period. As required by the JURMP and CMI procedures, the RWQCB was notified via telephone and email during this reporting period. Table 3.5.3 is a summary of the Stop Work Notices issued in FY 2008-09.

Table 3.5.3 Summary of Stop Work Notices Issued

Permit Number	Issue Date	RWQCB Notification	Follow Up Inspection Date
Carlsbad Golf Center	10/22/08	10/24/08	10/24/08
CB080429	12/22/08	12/22/08	12/22/08
CB081283	04/10/09	04/13/09	04/14/09

On February 5, 2009, the City responded to a report that an unidentified septic pumping company had dumped raw septage into a storm drain system located on an active construction site managed by Warmington Homes. The City responded by blocking the storm drain system and preventing additional discharge of the material through the system. The City estimates that approximately 3,000 gallons of septage was contained within an impacted storm drain clean out, vortex separator, desiltation basin, and desiltation basin clean out. A contractor retained by the City removed approximately 100,000 gallons of contaminated storm water runoff from the storm drain system. The site was monitored by the City until all contaminants were properly and adequately removed. On February 19, 2009, the City initiated Summary Abatement proceedings and issued a Notice of Determination to Warmington Homes, which required them to reimburse the City for all costs associated with remediation/abatement effort. A Notice of Violation was considered for issuance, but after careful analysis of the circumstances of the incident, it was determined that a Summary Abatement would be a more effective and consequential course of action.

3.6 Notable Activities

As mentioned in the Executive Summary, the City considers Notable Activities to be any activity above compliance requirements.

The City of Carlsbad has continued its strong stance on storm water pollution prevention. The Construction Inspectors have obtained a higher awareness among field personnel (superintendents, field labor, etc.) regarding the importance and application of Best Management Practices for storm water pollution prevention on construction sites. Notable activities for FY 2008-09 include:

- In FY 2008-09, CMI revised the NPDES inspection form for construction sites, which includes a duplicate tear off sheet. The revised NPDES inspection report covers all administrative requirements including SWPPPs, updated wall maps, desiltation basins, materials and waste management, temporary BMPs, slope protection, and site conditions and interactions. A copy of the revised inspection report can be provided directly to the site representative upon completion of an inspection. This process has proven to be time saving, cost effective, and successful in attaining compliance from construction sites.

- CMI developed three new procedures for NPDES inspections and inventory

management. Procedure CMI-100 defines the process for inspecting, tracking, and enforcing grading and construction sites, procedure CMI-110 defines the process for inspecting, tracking, and enforcing building sites, and procedure CMI-120 defines the process for managing and updating data on the Active Grading Permit and Construction Site Inventory List. All active grading permits and building inspection sites are prioritized into high, medium, and low categories and inspected at the minimum frequencies required by the Permit.

- In FY 2008-09, the required number of inspections for active construction sites was exceeded. CMI conducted 1858 inspections, which exceeds the 1415 inspections required for the wet and dry seasons.

4.0 MUNICIPAL COMPONENT

4.1 Introduction

Municipal facilities are required to implement the minimum BMPs identified and described in the 2008 JURMP (good housekeeping, preventive maintenance, material handling and storage, employee training, solid waste handling, record keeping, self inspection, and spill response), as applicable. Specific BMPs are identified in SWPPPs and/or inspection reports. Specific pollution prevention measures may vary from one site to another and are evaluated separately at each facility. The City implements and assesses the effectiveness of BMPs through regular staff training, self-inspections, third party inspections by a contractor, and SWPPP implementation. The following includes a description of specific pollution prevention activities and storm water BMPs implemented from July 1, 2008 to June 30, 2009 per Order R9-2007-0001 by various City departments. All BMPs were implemented as required by the 2008 JURMP.

Municipal areas and activities are subdivided by categories in the sections below. Prioritization of these municipal areas is presented in the High Priority column of the Municipal Inventory for Order R9-2007-0001, located in Appendix 4.1.

4.2 Minimum BMP Requirements

The following minimum BMPs were implemented at the facilities in the Municipal Inventory provided in Appendix 4.1, where appropriate.

4.2.1 Employee Training

Municipal departments provided training at least annually to all employees with responsibility for actions that have a potential to cause storm water pollution. A list of all Municipal storm water training is included in Appendix 8.2. Training generally addresses, among other topics, the following:

- Storm water awareness
- Applicable regulations
- Discharge prohibitions
- Importance of pollution prevention practices (good housekeeping, recycling, waste management, source control, etc.)
- Applicable best management practices (including those called out in the facility storm water pollution prevention plan [SWPPP]), where applicable
- Integrated pest management
- Self-inspections
- Record keeping

Documentation of training is maintained on-site at the location(s) where operations or activities are conducted. Where the operations are covered in a SWPPP, training records are filed with the SWPPP.

4.2.2 Pollution Prevention

The City implements urban runoff pollution prevention practices that are generally recognized for that facility's activity as being effective.

Pollution prevention is defined in Order No. R9-2007-0001 *as practices and processes that reduce or eliminate the generation of pollutants. Recycling, use of different types of products or chemicals, and altering operational procedures are all types of pollution prevention practices that reduce the amounts of pollutants generated by a facility."*

The City's approach is to promote pollution prevention as an activity for all municipal employees and locations. Since 1991, the City has implemented a procurement policy that directs the purchase and use of recycled products. Purchasing staff are encouraged to use *Green Purchasing* principles. This refers to buying products and services with reduced effects on human health and the environment (also called *Environmental Purchasing*). While some of these products are office and janitorial supplies, the policy also applies to construction supplies, landscape materials and equipment, automotive, road and highway supplies.

Specific pollution prevention measures may vary from one site to another, so they are evaluated separately at each facility. Where appropriate, High Priority municipal facilities implemented site specific Storm Water Pollution Prevention Plans (SWPPP) and associated training programs. Furthermore, the pollution prevention BMPs identified in the JURMP were implemented at all municipal facilities. These pollution prevention BMPs include:

- Affirmative Procurement Use alternative, safer, or recycled products.
- Reduce the amount of hazardous materials used by implementing natural controls.
- Redirect storm water flows away from areas of concern.
- Reduce use of water.
- Reduce storm water flow across facility site.
- Recycle and reuse waste products and waste flows.
- Move or cover potential pollution from storm water contact.

In addition, the City required the following minimum pollution prevention practices (detailed in SWPPPs or inspection reports) at all municipal facilities where appropriate:

- <u>Reduce use of water or use dry cleanup methods:</u> Employees used dry cleanup methods when possible (sweeping, etc.). Any washing activities required containment and recovery, with no discharge to the storm drain system. These BMPs are also required for City contractors.
- <u>Conduct storm drain maintenance:</u> Employees performed regular visual inspections of the storm drains to identify unauthorized discharges and clean as needed.
- <u>Recycle:</u> City departments recycled appropriate items and implemented the City procurement policy to purchase and use recycled products.
- <u>Move or cover potential pollution sources from storm water contact:</u> Corporate yards protected materials and products that could potentially contribute to storm water pollution by storing them indoors, or covering them, and providing them with secondary containment as needed.

4.2.3 Good Housekeeping

Good housekeeping practices employed simple common sense in creating and maintaining a clean, orderly environment that reduced the risk of accidents and urban runoff contamination.

- **Routine Housekeeping Inspections.** Locations with higher risk of impacting storm water quality (e.g., storm water outfalls, loading and unloading areas, materials, products and wastes storage areas, equipment and vehicle maintenance and cleaning areas) were inspected regularly. Inspections focused on leaks or conditions that may have led to discharges of pollutants to the Storm Water Conveyance System or Receiving Waters.

- **Maintenance of Clean Grounds Surfaces.** Sweeping of all paved areas exposed to precipitation or storm water was conducted on a regular basis. Litter controls of all exposed surface were conducted on a regular basis. The frequency of sweeping and litter control is based on site conditions.

- **Waste Management.** Each facility conducted regular pickup and disposal of garbage and waste materials/products to prevent overfill of waste storage containers.

- **Equipment Inspection.** Each facility conducted routine inspection of equipment to ensure proper functioning. Where problems were identified during inspection, proper and prompt maintenance or repair is conducted.

- **Storage.** Raw materials, intermediate products, finished products, byproducts and waste products were stored in covered areas or sealed containers unless the materials or products were not a threat to urban runoff quality. To prevent accidental spills, materials or products are stored away from direct traffic routes. All containers were stacked according to applicable federal, state, and city regulations as well as manufacturers' instructions to avoid damage from improper weight distribution. Pallets or similar devices were used to prevent corrosion of the containers that can result when containers come in contact with moisture on the ground.

- **Limitations on Handling Hazardous Materials.** Each facility limited the handling of hazardous materials to those personnel specially trained to handle these materials.

- **Employee Training.** All good housekeeping practices were incorporated into a facility's employee-training program.

In addition to the BMPs listed above, good housekeeping was addressed as a site specific BMP for each category of facilities listed below. See BMP SC-60 for site specific information on implementation.

4.2.4 Spill Response and Prevention

Municipal staff implemented BMPs at all fixed facilities and field programs to prevent, control and clean up spills. The following are general BMPs that were implemented:

- BMPs listed in SC-11, Spill Prevention, Control and Cleanup (City of Carlsbad JURMP 2008).

- Spill cleanup materials were readily available and in known locations.

- Spills were cleaned up immediately and dry methods are used where possible.
- Spill cleanup material was disposed of properly.

Spill response and prevention was also addressed as a site specific BMP for each category of facilities listed in Sections 4.3 4.14 of this report. See SC-11 for site specific information on implementation.

4.3 Roads, Streets, Highways, Parking Facilities

4.3.1 Background

This section includes BMPs and an inventory of roads, streets, highways, and parking facilities which are deemed High Priority according to Order No. R9-2007-0001, Section D.3.a.(7)(a) and the City s 2008 JURMP. This section also includes information on the City s street sweeping program and BMPs for the City s street maintenance program.

4.3.2 Source Characterization

The table below lists the 10 High Priority roads, streets, highways, and parking facilities on the City s municipal inventory as updated in the 2008 JURMP.

Table 4.1 Roads, Streets, Highways, and Parking Facilities

1	ADULT LEARNING PROGRAM PARKING LOT	3368 EUREKA PL
2	CARLSBAD SENIOR CENTER PARKING LOT	799 PINE AVE
3	CITY HALL FACILITY PARKING LOT	1200 CARLSBAD VILLAGE DR
4	CITY STREETS	CITY WIDE
5	COLE LIBRARY PARKING LOT	1250 CARLSBAD VILLAGE DR
6	DOVE LIBRARY PARKING LOT	1775 DOVE LN
7	FARADAY CENTER PARKING LOT	1635 FARADAY AV
8	FARMERS BUILDING PARKING LOT	FARADAY & EL CAMINO RL
9	HARDING COMMUNITY CENTER PARKING LOT	3096 HARDING ST
10	RAILROAD DEPOT VISITORS CENTER PARKING LOT	400 CARLSBAD VILLAGE DR

4.3.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.2 were implemented at the 10 High Priority facilities listed above.

Table 4.2 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-70 Road and Street Maintenance
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.3.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.2 were implemented at the facilities listed in Table 4.1 and are described below:

- SC-11 Spill Prevention, Control, and Cleanup: Spill kits were located in all vehicles.
- SC-33 Outdoor Storage of Raw Materials: Plastic tarps covered raw materials in the yard, equipment was covered by canopies, and the material was covered by a permanent overhead structure or stored indoors. Materials associated with street maintenance activities were stored at the Maintenance and Operations Facility.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a proper containment area in case of any accidental spillage. These containers were clearly marked and stored until arrangements were made for a certified waste management company to remove them and transfer them to an approved facility.
- SC-41 Building and Grounds Maintenance: In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting was necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking and Storage Area Maintenance: Parking lots and storage areas were swept biweekly.
- SC-60 Housekeeping Practices: All maintenance vehicles are equipped with spill kits. Work sites were swept and all debris was removed upon completion of any asphalt or concrete repair.
- SC-70 Road and Street Maintenance: Storm drain inlets were protected using rock bags prior to the start of any maintenance activities. Concrete wash out was performed on a plastic tarp and contained to prevent any discharge to the storm drain. Street sweeping was performed for all curbed streets and municipal parking lots in the City. Table 4.3 below indicates the distance swept in curb miles, frequency, and amount of materials removed as a result of the street sweeping activities. In total, there were approximately 8,050 curb miles of streets swept from July 1, 2008 to June 30, 2009.

Table 4.3 Street Sweeping Data

Priority[1]	Description	Distance	Frequency	Material Removed
High[2]	Arterials/seawall	100 curb miles	Weekly	90 tons/month
Medium	Residential	1000 curb miles	Biweekly	
Low	Alleys	50 curb miles	Biweekly	
Parking Lots	54 lots	53 acres	Biweekly	

[1]Priority is based on the volume of trash and debris generated at these types of streets - streets which generate high volumes of trash are High Priority; streets which generate moderate and low volumes of trash are medium and low priority respectively.
[2]Downtown streets were swept twice weekly

- SC-71 Plaza and Sidewalk Cleaning: A self-contained wet sweeper was used on all tile sidewalks in the downtown area on a scheduled basis.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever

possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.

- SC-75 Waste Handling and Disposal: All materials were hauled directly to the transfer station and were covered.

4.4 Flood Management Projects Flood Control Devices

4.4.1 Background

This section includes BMPs and an inventory of the City s Flood Management Projects and Flood Control Devices which are deemed High Priority areas according to Order No. R9-2007-0001, Section D.3.a.(7)(a) and the City s 2008 JURMP. This section also includes a description of the Storm Drain Maintenance Program activities.

4.4.2 Source Characterization

The municipal separate storm sewer system is the only High Priority Flood Management Projects and Flood Control Devices on the City s municipal inventory, as updated for the 2008 JURMP. The municipal separate storm sewer system is inclusive of the City s flood management projects and flood control devices.

4.4.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.4 were implemented throughout the City s MS4.

Table 4.4 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal

4.4.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.4 were implemented where applicable pertaining to the municipal separate storm sewer system and are described below.

- SC-11 Spill prevention, Control, and Cleanup: All vehicles have spill kits and key vehicles carry hydrocarbon booms. All trash was placed in 55 gallon trash bags. The maintenance sweeper truck was called out to assist in spill cleanup when necessary.
- SC-21 Vehicle and Equipment Cleaning: All vehicles used in flood control device cleaning were washed at fleet maintenance using an enclosed pressure wash system. The system has a secondary water and oil separator plumbed into the sanitary sewer system.
- SC-34 Waste Handling and Disposal: Trash was hauled to transfer station. Debris and other organic material were transferred and deposited at 2400 Tamarack Avenue in three concrete covered bins. The material was then tested for contaminants and hauled to a landfill or appropriate facility upon receipt of permissible test results.

- SC-60 Housekeeping Practices: Trash was removed from these areas of the MS4 on a routine basis.
- SC-74 Drainage System Maintenance: A small self-contained vacuum with pressure washer was used to clean the drainage system. All material in the drain box was removed by the vacuum. Disposal of the water and material occurred using a filter sock, allowing water to be decanted into the sanitary sewer system. The solid material was taken to the Tamarack site described above. All trash was removed from the MS4, placed in 55 gallon trash bags, and placed in a 40 cubic yard roll off dumpster that is covered. The material was then transported to Palomar Transfer Station for disposal. Data pertaining to maintenance activities of the MS4 is in Table 4.5 below.

Table 4.5 MS4 Maintenance

Structure	Inspected	Exceeding Cleaning Criteria	Cleaned	Amount of Material Removed (tons)
Catch Basin/Inlet	3446 units	224	Anthropogenic trash removed 100	54
MS4 miles	5,000 linear feet	N/A	5,000 linear feet	0.5
Open Channel miles	32,000 linear feet	N/A	908 linear feet	0.5

- SC-75 Waste Handling and Disposal: Described under SC-34 and SC-74 above.
- BMPs to limit infiltration from sanitary sewer to storm drain system: a preventive maintenance schedule was implemented that includes jet rodding, and vactoring the sanitary lines throughout the city of Carlsbad. Closed circuit television was used for investigations in sewer lines. In addition, engineering standards described below prevent infiltration of sewage to the MS4.

  The City of Carlsbad s Engineering Standards employed several measures to prevent sewage intrusion into municipal separate storm sewer systems (MS4).

  1. All gravity sewer pipes and laterals are required to have gasketed joints, which create water tight joints (Volume 1, Chapter 6, Item 3.A, 3.C, and 3.F). The water tight joints are tested using the methods indicated in Standard Specifications for Public Works Construction (SSPWC) section 306-1.4. The water tight test methods include a post-installation closed circuit television (CCTV) inspection and an air pressure test where the sewer line must sustain 2.5 to 3.5 psi gage pressure for at least 2 minutes after being pressurized to 3.0 psi.

  2. All gravity sewer lines are required to follow engineering standard for the amount of flow they can carry. During peak hour dry weather season the pipe shall be designed to carry a flow depth of 0.5 (or 0.75 depending on the pipe size) the diameter of the pipe (Volume 1, Chapter 6, Item 4.C). This design requirement prevents the pipe from becoming full, which would pressurize the pipe and potentially cause a leak.

  3. Per Carlsbad s Engineering Standard GS-6 and GS-6A, the sewer lines are typically located at an elevation deeper than the storm drain line, which further prevents sewage intrusion into MS4. In the event of a sewage pipe leak, the leakage flow will naturally gravitate below the sewer line rather than up to the storm drain line.

  4. The standard horizontal separation between sewer and storm drain is 13 feet, which further prevents sewage intrusion into MS4.

5. In special cases where storm drain lines are installed at a depth greater than that of sewer lines, additional design standards are required such as water tight joints or encasements (Volume 1, Chapter 5, Item 1.G).

- Treatment Control BMPs: Storm Drain Inserts including fossil filters, rapid flow BMPs, and debris catchers with zinc filters are in place at various storm drain locations throughout the City. Fossil filters removed trash and hydrocarbons, while debris catchers were installed to prohibit anthropogenic trash and debris from entering the storm drain system. Table 4.6 lists the type of insert, location, quantity, and minimum frequency of maintenance.

Table 4.6 Storm Drain Insert-Type BMPs

Type	Location	Number	Frequency
Debris Catcher	Carlsbad Boulevard	9	Annual
	State Street	4	Annual
	Grand Avenue	3	Annual
	Carlsbad Village Drive	4	Annual
	Ocean Street	4	Annual
	Rancho Santa Fe	1	Annual
	Celinda Drive	1	Annual
Fossil Filter	Oak Avenue	4	Annual
	Chesnut Avenue	6	Annual
	Jefferson Street	5	Annual
	Fleet Maintenance	4	Annual
	Ocean Street	2	Annual
	Paseo del Norte	3	Annual
	Cannon Road	5	Annual
	Faraday Avenue	3	Annual
	Recycled Water Plant	4	Annual
	M&O Yard	2	Annual
Debris Filter at	Oak Avenue	3	Bi-monthly
inlet entrance	Valencia Avenue	1	Bi-monthly
	Carlsbad Boulevard	6	Weekly
	Orion Street	3	Weekly

The City also inspected and maintained three desiltation basins. Table 4.7 below lists the City owned and maintained basins. The basins were inspected annually prior to the rainy season and maintained as necessary.

Table 4.7. City Owned Maintained Desiltation Basins

Site	Location	Description	Inspection Frequency
DESILTATION BASIN 13	SW END FARADAY AV SO OF LOT 102 OF CRC	Desiltation Basin	Annual
DESILTATION BASIN 30	SW CORNER MARRON AND MONROE	Desiltation Basin	Annual
DESILTATION BASIN 43	CAMINO HILLS AND FARADAY NE CORNER	Desiltation Basin	Annual

4.5 Fire Stations

4.5.1 Background

There are six fire stations in the City, which are high priority areas according to the City's JURMP. The inventory and BMPs for these facilities are described below.

4.5.2 Source Characterization

Table 4.8 below lists the High Priority Fire Stations on the City's 2008 JURMP inventory.

Table 4.8 Fire Stations

1	FIRE STATION 1	1275 CARLSBAD VILLAGE DR
2	FIRE STATION 2	1906 ARENAL RD
3	FIRE STATION 3	3701 CATALINA DR
4	FIRE STATION 4	6885 BATIQUITOS DR
5	FIRE STATION 5	2540 ORION WY
6	FIRE STATION 6	7201 RANCHO SANTA FE ROAD

4.5.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.9 were implemented at the High Priority facilities listed above.

Table 4.9 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.5.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.9 were implemented at the facilities listed in Table 4.8 and are described below. In addition, training and pollution prevention BMPs specific to the Fire Department are described below.

Training

- The City's Reclaimed Water Facility continued to be utilized for fire engineer training and testing. A training trailer facilitated engineer operations, pump testing, and other wet training opportunities. The Facility allowed for wet training and testing opportunities while ensuring that no water is discharged to the MS4.

- Conduct training and testing at other fire agencies Training Facilities which recycles the water that is being discharged (i.e. Rancho Santa Fe and San Marcos Fire Departments).Suitable locations were selected to provide wet training opportunities for personnel, while ensuring that appropriate BMPs were in place to protect the storm drains and eliminate discharges to the MS4. These sites were generally located on pervious surfaces with no potential for discharge to the storm drain system.
- A representative from the Fire Department attended and participated in the City s Storm Water Committee meetings when available.

Pollution Prevention

- Dry cleanup methods were used to reduce water use. The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations. Awareness was heightened at fire scenes to minimize the potential for excessive water flow.
- Materials were recycled where possible.
- Storm Water Manuals were developed for each station which include SWPPPs with site maps, inspection reports, facility specific spill response procedures, training records, and department policies.
- SC-11 Spill Prevention, Control, and Cleanup: Spill response equipment and materials are clearly identified and staged in accessible locations at each station. Awareness was heightened at incident scenes to contain potential discharges (once the scene had been stabilized) to prevent pollutants from entering the MS4. The Department continued implementation of the City s spill response procedure for incidents that occur on City streets. Absorbent materials are kept on all engines. The spill response plan is to apply absorbent, sweep material, place in bags, and remove from site for proper disposal.
- SC-21 Vehicle and Equipment Cleaning: The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Vacuum equipment was purchased to recover and contain all wash water from vehicle washing activities occurring at the Fire Stations. Fire Station 5 currently has a pressure washer for vehicle and equipment cleaning to minimize the amount of water being used. Five more pressure washers have been approved and purchased for the other five fire stations.
- SC-34 Waste Handling and Disposal: Waste containers were inspected regularly for leaks and to ensure that lids remained closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter.
- SC-43 Parking/Storage Area Maintenance: Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations.
- SC-60 Housekeeping Practices: Fire stations are kept clean and orderly. Wash water was disposed of properly. Sweeping material was disposed of properly. Training on storm water and spill response was provided regularly.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping are used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: Solid waste was collected and disposed of properly at appropriate disposal facilities (Palomar Transfer Station, Waste Management) in

accordance with all applicable laws and regulations. Waste containers were inspected regularly for leaks and to ensure that lids remained closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter. Liquids were not disposed of in waste containers. Recycling was implemented where possible; bins were provided.

4.6 Recreation Facilities

4.6.1 Background

The Monroe Street Pool is the only Recreation facility on the City s municipal inventory listed as a High Priority area. This is primarily due to the chemicals stored on-site. The pool s chemical systems were changed from gas chlorine and caustic soda to liquid chlorine (sodium hypochlorite) and muriatic (hydrochloric) acid/carbon dioxide, with 500 and 300 gallon double wall containers, respectively. BMPs implemented at this facility are described below.

4.6.2 Source Characterization

The only High Priority Recreation facility on the City s 2008 JURMP inventory was the Monroe Street Pool.

4.6.3 Site Specific BMP Requirements

The site specific BMPs, listed below in Table 4.10, were implemented at the Monroe Street Pool.

Table 4.10 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-31 Outdoor Container Storage
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-60 Housekeeping Practices
SC-72 Fountains & Pools Maintenance
SC-73 Landscape Maintenance

4.6.4 Program Implementation

BMPs listed in Table 4.10 above were implemented at the Monroe Street Pool. BMPs implemented specific to this facility and its activities are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Commercial spill kits are kept onsite. A facility specific SWPPP was developed and is kept onsite. The SWPPP includes a spill response plan.
- SC-31 Outdoor Container Storage: The majority of materials stored on-site are kept inside sheds. These areas were cleaned up and maintained regularly.
- SC-34 Waste Handling and Disposal: Trash bins and containers are enclosed and covered. Lids remain closed and locked at all times and serviced weekly.
- SC-41 Building and Grounds Maintenance: (parks/facilities) Staff performed daily parking lot inspections looking for litter, debris, and leaking vehicles. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting,

scraping, or sandblasting was necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.

- SC-60 Housekeeping Practices: Cleaning of pool decks was performed by sweeping in most cases. Occasionally, wash down was necessary and all wash water was directed to a pervious area for percolation (football field).
- SC-72 Fountains and Pools Maintenance: Water was de-chlorinated if discharging to the storm drain was necessary; however, this was a rare occurrence. All filter back wash was discharged to sewer. Overflow from pool decks was directed to earthen swale and percolates.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off. Soil testing was utilized to assess need for fertilizers and irrigation. Timing improvements on irrigation system have reduced water usage. Blowing and sweeping were used wherever possible. Pesticide, herbicide, and fertilizers were not stored onsite and used sparingly in accordance with required application practices.

4.7 Publicly Owned Treatment Works

4.7.1 Background

The City of Carlsbad is a member agency of the Encina Wastewater Authority which treats raw sewage to the secondary treatment level. The Carlsbad Water Recycling Facility intakes secondary treated water and treats it again to the tertiary level of treatment which is used as recycled water throughout the City of Carlsbad. This facility was determined to be High Priority as required in Order No. R9-2007-0001, Section D.3.a.(7)(a). The BMPs listed below were implemented at the Carlsbad Recycled Water Facility.

4.7.2 Source Characterization

The Carlsbad Recycled Water Facility is the only High Priority Publicly Owned Treatment Works on the City's 2008 JURMP inventory.

4.7.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.11 were implemented at the Recycled Water Facility.

4.11 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

4.7.4 Program Implementation

Each of the applicable BMPs listed above were implemented at the Carlsbad Recycled Water Facility and are described below.

- Employee Training: Employees were informed of activities that could potentially cause contamination of storm water and the importance of carefully conducting these activities in areas that do not discharge/drain to storm drains. Storm water pollution prevention and BMP brochures were available to everyone who works at the materials storage area. Subcontractors were informed about the storm water requirements and their responsibilities. Training consisted of informal tailgate meetings, formal classroom training, or self-guided training activities. Employees in targeted positions were trained annually on the requirements of the SWPPP. Employee training, at a minimum, included: SWPPP requirements; spill response and reporting; good housekeeping; BMP updates and implementation; and materials and waste handling and storage procedures.
- SC-11 Spill Prevention, Control, and Clean-up: A current spill response plan was provided in the SWPPP. The spill response plan addressed measures to clean, abate, and prevent spills and leaks from entering the storm drain. Employees were trained on the elements of the plan. Rags and absorbents were readily accessible. Waste was disposed of properly. Dry cleanup methods were used whenever possible. Spills on dirt areas were cleaned up by digging up and properly disposing of contaminated soil. Spills over 10 gallons were reported to the Storm Water Protection Program and/or the appropriate spill response agencies immediately. Employees were trained to routinely check for leaks and spills.
- SC-20 Vehicle and Equipment Fueling: All vehicles were fueled off-site. Equipment continued to be run with electricity and no equipment fueling was necessary.
- SC-22 Vehicle and Equipment Repair: All vehicle repairs were performed off-site. When equipment repair was necessary, work was performed in covered, contained areas that were not susceptible to storm water runoff.
- SC-31 Outdoor Container Storage: There were several chemical storage tanks stored outside under cover and in full secondary containment structures. See SC-33 below for more information.
- SC-33 Outdoor Storage of Raw Materials: Secondary containment was implemented where materials are stored outside. Examples of temporary BMPs utilized are: a dike, berm, or filter on the down slope sides of any stockpiles. All containment devices used around stockpiles were maintained to work effectively and were replaced when necessary. The chemical storage tanks were contained within a concrete parapet wall enclosure. Spills within the chemical storage areas were contained within the concrete walls and drain to a sump. Where chemical deliveries occurred, a concrete pad conveyed flow to a curb inlet. From the curb inlet, flow was controlled by plug valves, directing the flow to the sump.
- SC-34 Waste Handling and Disposal: Dumpsters were covered and maintained and checked frequently for leaks. Lids were kept closed at all times. Dumpsters were never cleaned out using water. When cleaning the containers, all rinse water from cleaning was routed to the sanitary sewer system. All wastes and construction debris were disposed of properly. Many materials and wastes were recycled including broken asphalt and concrete, cleared vegetation, scrap metals, aluminum cans, and plastic bottles. Materials and debris that could not be recycled were taken to an appropriate landfill or disposed of as hazardous waste. The waste storage area was swept or otherwise cleaned frequently using dry

methods to collect all loose solids for proper disposal. If the amount of waste accumulated appeared to frequently exceed the capacity of the dumpster, then another container should have been obtained and utilized or collection frequency was increased. Green waste consisting of clippings, cuttings and droppings of leafy and woody materials was disposed of properly at an approved composting location or permitted landfill.

- SC-60 Housekeeping Practices: Site was kept free of litter and debris. Trash cans and recycling receptacles were located around the site to minimize litter. Material moving and transfer activities were scheduled during dry weather periods, where possible. Heavy equipment was maintained in good working condition. Areas were inspected frequently for leaks and repaired as needed. Major equipment repairs were performed away from the storage area. Paved surfaces were swept that drain to storm drains, creeks, or channels. Cleanup materials such as brooms, shovels, dustpans, and sweepers are stocked near the storage area. Paved storage areas were swept weekly for collection and disposal of loose solid materials, and were not hosed into a storm drain or conveyance ditch. Information was distributed on good housekeeping practices during employee training sessions and discussed at employee meetings. Good housekeeping tips and reminders were posted on employee bulletin boards.
- SC-75 Waste Handling and Disposal: See SC-34 above.
- SC-76 Sewer Utility Maintenance: Sewer utility maintenance was not performed at this facility.
- Source Control BMPs (specific to the Recycled Water Facility):
  - Flo-Guard inlet baskets at all curb inlets on site to collect oil and grease and debris from site.
  - Vegetated swale (approximately 400 feet) collects and treats runoff from a portion of the site.
  - Roof over chemical storage area.
  - Permanent secondary containment is in place around all chemical storage areas.
  - By-pass valves are installed at containment areas to divert rain water.

4.8 Sanitary Sewer Facilities

4.8.1 Background

The facilities listed in Table 4.12 are sewer lift stations owned and operated by the City. The table also includes the City's collection system. These have been determined to be High Priority areas according to Order No. R9-2007-0001 and the City's 2008 JURMP, primarily due to the presence of sewage and potential for contamination of surface waters resulting from sewer overflows. BMPs implemented at these facilities and BMPs applicable to maintenance of the collection system are described below.

4.8.2 Source Characterization

Table 4.12 below lists the High Priority Sanitary Sewer Facilities on the City's JURMP inventory.

Table 4.12 Sanitary Sewer Facilities

1	AGUA HEDIONDA SEWER LIFT STATION	SDGE PLANT SITE
2	BATIQUITOS SEWER LIFT STATION	7382 GABBIANO LN
3	BUENA VISTA SEWER LIFT STATION	JEFFERSON
4	CANNON SEWER LIFT STATION	2301 CANNON RD
5	CHINQUAPIN SEWER LIFT STATION	4010 CARLSBAD BL

6	FOXES LANDING LIFT STATION	4155 HARRISON ST
7	GATESHEAD SEWER LIFT STATION	4779 GATESHEAD RD
8	HOME PLANT SEWER LIFT STATION	2359 CARLSBAD BL
9	KNOTS SEWER LIFT STATION	501 KNOTS LN

11	POINSETTIA SEWER LIFT STATION	2425 POINSETTIA LN
12	SAND SHELL SEWER LIFT STATION	613 SAND SHELL
13	SANITARY SEWAGE COLLECTION SYSTEM	CITY SERVICE AREA
14	SIMSBURY SEWER LIFT STATION	3086 TAMARACK AV
15	TERRAMAR SEWER LIFT STATION	300 CANNON RD
16	VANCOUVER SEWER LIFT STATION	2690 VANCOUVER ST
17	VILLAS SEWER LIFT STATION	2860 WINTHROP AV

4.8.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.13 were implemented at all Sanitary Sewer Facilities.

Table 4.13 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

4.8.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.12 and are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Hazmat plans were drawn up and located in the SWPPP at each location. Spill kits are kept inside at all facilities. Secondary containment structures were implemented around generator fuel cells and around all chemicals stored on-site. Overflow response included immediate Vactor response, containment, and cleanup. For more details see City of Carlsbad SSORP spill mitigation and clean-up. All vehicles have spill kits.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was performed in secondary containment areas or over pervious surfaces. All locations have secondary containment for fuel spills or oil leaks. Fuel deliveries were performed by an outside contractor. Documentation is kept onsite.
- SC-22 Vehicle and Equipment Repair: Pump repair occurred indoors on site and was generally performed in the wet well. All material went back to the headworks and was transferred to the Encinas treatment plant. Wet wells were cleaned every 6 weeks with Vactor equipment and staff ensured that there were no leaks or spills at the facilities.
- SC-31 Outdoor Container Storage: The 55-gallon trash cans are covered with a liner.
- SC-34 Waste Handling and Disposal: Trash and debris were removed on a regular basis.

- SC-60 - Good Housekeeping: Sweep and vacuuming were implemented instead of washing down. Blowers were used to clean off concrete and asphalt. All hoses are rolled up and stored off the ground.
- SC-75 Waste Handling and Disposal: Trash and debris were removed on a regular basis. All trash cans or other containers are covered or closed.
- SC-76 Sewer Utility Maintenance: All stations were inspected and cleaned daily. Vactors were checked for leaks during pre-trip inspections. All materials were discharged at Encina Wastewater Authority: solids into grit bin, liquids at headworks. Recently the City began to implement FOG requirements as per Order 2006-003, including revision of ordinances, public outreach, and inspections of FOG generating facilities.

4.9 Water Facilities

4.9.1 Background

There are seven High Priority water facilities on the City s JURMP inventory. The sites are High Priority facilities due to chemical storage on-site or due to their location in the watershed. BMPs implemented at the sites according to the JURMP are described below.

4.9.2 Source Characterization

The table below lists the High Priority Water Facilities on the City s JURMP inventory.

Table 4.14 Water Facilities

1	MAERKLE DAM RESERVOIR/ PUMP/ CHLORINATION STATION	5203 SUNNY CREEK RD
2	RESERVOIR C	CALAVERA DR
3	RESERVOIR ELM	CARLSBAD VILLAGE DR & DONNA DR
4	RESERVOIR LA COSTA HI	ALGA RD
5	RESERVOIR LA COSTA LO	ALGA RD
6	CALAVERA PUMP STATION	3600 BLOCK COLLEGE DR
7	TAP PUMP STATION	6400 BLOCK OF EL CAMINO REAL

4.9.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.15 were implemented at the water facilities listed above.

Table 4.15 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-60 Housekeeping Practices
Water Operations and Maintenance

4.9.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.14 and are described below.

- Pollution Prevention: Automatic shut-off valves have been installed.
- SC-11 Spill Prevention, Control, and Cleanup: At facility 1, specialized equipment has been implemented to mitigate a chlorine release; chlorine gas detectors, vacuum regulators, automatic shut-off valves, and chlorine scrubber systems. In addition to the equipment, all chemicals are stored in containment structures designed to contain stored amount. All chemicals are inspected prior to off-loading for containment defects and returned if any defects are noted. Operations Staff have the necessary hazardous materials training to be considered qualified to assess the severity of a chlorine leak. A site specific SWPPP was developed for Maerkle Reservoir.
- SC-20 Vehicle and Equipment Fueling: Diesel deliveries were performed by outside contractors.
- SC-22 Vehicle and Equipment Repair: All storm drain collectors were regularly inspected and cleaned accordingly. All building floor drains were inspected and verified to be isolated from discharge system.
- SC-31 Outdoor Container Storage: The 55-gallon trash cans with liners were utilized and trash was removed on a regular basis.
- SC-33 Outdoor Storage of Raw Materials: No raw materials are stored outdoors.
- SC-60 - Good Housekeeping Increased sweeping schedule of asphalted areas was implemented. Chemicals supplies are kept at a minimum to reduce potential releases.
- Water Operations and Maintenance:
    - Repairs and New Line Installation: All flushing requirements follow established BMPs regarding de-chlorination and related sediment recovery concerns.
    - Reservoir Cleaning and Dewatering: All reservoir de-watering follows pre-established BMPs addressing daily water volume discharge amounts, de-chlorination, monitoring of chlorine residuals and sediment removal and disposal

4.10 Municipal Yards

4.10.1 Background

Table 4.16 below lists the City's municipal yards that were determined to be High Priority areas as required per Order No. R9-2007-0001, Section D.3.a.(7)(a) and the City's JURMP. Site specific BMPs implemented at each facility are listed and described below.

4.10.2 Source Characterization

The table below lists the High Priority Municipal Yards on the City's JURMP inventory.

Table 4.16 MUNICIPAL YARDS

1	FLEET MAINTENANCE FACILITY AND PARKING LOT	2480 IMPALA DR
2	M&O OPERATIONS YARD AND PARKING LOT	5950 EL CAMINO REAL
3	OAK OPERATIONS YARD AND PARKING LOT	405 OAK AV
4	PARKS MAINTENANCE/STORAGE/PARKING LOT	1166 CARLSBAD VILLAGE DR

4.10.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.17 were implemented at Municipal Yards, where applicable. For example, vehicle and equipment repair is not performed at all facilities; therefore SC-22 does not apply to all yards.

Table 4.17 Best Management Practices

Storm Water Pollution Control Plan
SC-11 Spill Prevention, Control & Cleanup

SC-75 Waste Handling and Disposal

4.10.4 Program Implementation

BMPs listed in Table 4.17 were implemented specific to each facility and are described below.

<u>FLEET MAINTENANCE YARD</u>

- Employee Training Storm water protection was covered as part of safety meetings.
- Pollution Prevention Recycling containers were provided at the ends of the fuel pump inlands.
- Storm Water Pollution Control Plan: A site specific SWPPP was developed and is maintained on-site.
- SC-11 Spill Prevention: Spill kits containing absorbents and booms are located at the fuel island and south west of the fuel island within the yard, including the shop area.
- SC-20 Vehicle and Equipment Fueling: Spill kits are located adjacent to the vehicle fueling area.
- SC-21 Vehicle and Equipment Cleaning: All vehicle washing was performed on the wash rack, inside the wash bay. This included pressure washing and hand washing of vehicles and equipment. Wash waste water is treated prior to release to the sewer system.
- SC-22 Vehicle and Equipment Repair: All maintenance and repairs to Fleet vehicles were performed inside the shop bays whenever possible. Any vehicle on the dead line that had a leak had a drip pan put under it until it is brought into the shop. Any leaks or spills were handled immediately, with either the drip pans or an absorbent. The absorbent was picked

up immediately and stored in the drums labeled for waste absorbent. Damaged equipment and wrecked vehicles with a potential for discharge were covered with tarps.

- SC-31 Outdoor Container Storage: Outdoor containers that include full coverage and containment of materials are utilized for storage of tires and motorcycles (two 40 yard containers) and for storage of fire extinguisher service items, used batteries, and oil filters for recycling (sheds).
- SC-33 Outdoor Storage of Materials: All materials stored outside are kept under one of the provided canopies or in the shed. City-generated hazardous waste is stored in the hazardous waste shed (covered) in an appropriate container and on a pallet. This includes batteries and waste metals. A chain link fence was installed to prevent unauthorized dumping at the Facility. Signage was also in place to inform citizens that materials were not to be left at the Facility and provided information on proper disposal facilities.
- SC-34 Waste Handling and Disposal: Waste oil was drained into the waste oil containers or into a drip pan and then into a waste oil container. The containers were emptied as needed into the waste oil in-ground tank as needed. Used batteries were stored in the provided container inside the shed. Used antifreeze was drained into one of the large drip pans, then transferred to the poly drums inside the shed. Scrap metal is stored in the provided container and covered. Used tires are stored in the covered tire storage bunker.
- SC-41 Building and Grounds Maintenance: Language was included in contracts requiring storm water compliance and allowing the City to implement BMPs as needed with all associated costs recovered from the contractor. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting was necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The Fleet Yard was swept via Sweeper-truck on a monthly schedule, clean ups of spills were done with dry absorbent and picked up directly, all leaks were captured with drip pans and brought into the shop for service.
- SC-60 Housekeeping Practices: The shop was either swept or mopped. All debris was either picked up and put into appropriate containers or, in the case of wet mopping, all water was directed to the drains inside the shop that flow to our separator. All contaminated floor sweep was stored in labeled containers and removed by our hazardous waste contractor. The Fleet yard was inspected regularly as well as before and after storm events. Areas inspected were the shed and tire storage area at the north end of the shop, the waste tire and hazardous waste bunker along the north fence line, the two large dumpsters, the two trash and two recyclables cans at the fuel pumps, the spill kits for the fuel island, the storm drains on-site and the paved lot and dirt area at the east end (which is now fenced). Inspection criteria: all waste drums/containers are to have secondary containment, all materials are to be stored in covered areas. Appropriate areas included a shed and two canopies plus the hazardous waste container and waste metal containers. The dumpsters, trash cans, recyclables cans and metal storage were kept closed and no trash fell out of them. The filters at the storm drains were inspected for cleaning or replacement. The lot was inspected for spills and cleaned up as needed. Vehicles in the lot were inspected for leaks; action was taken to contain leaks as needed. The wash rack area, trash containers area, and drains were inspected for clogging from debris. All employees always took immediate action to correct any issues found during inspections of the Fleet yard directly.
- SC-71 Sidewalk Cleaning: Where power washing was necessary, wash water was not allowed to drain to the storm drain system and was directed to sanitary sewer or to pervious surfaces where possible.

- SC-72 Fountain and Pools Maintenance: Not applicable.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off. Soil testing was utilized to assess need for fertilizers and irrigation. Timing improvements on irrigation system have reduced water usage; blowing and sweeping are used wherever possible. Pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: Fossil filters have been installed at storm drain inlets in yard and were inspected and maintained regularly.
- SC-75 Waste Handling and Disposal: Updated signage was installed for Household Hazardous Waste disposal.

MAINTENANCE AND OPERATIONS YARD

- Pollution Prevention Native soils were used whenever possible to backfill trenches: the amount of dirt and soil stockpiled on site was minimized; filtration socks were used to dewater trenches.
- Storm Water Pollution Control Plan: A site specific SWPPP is kept on-site and maintained regularly.
- SC-11 Spill Prevention, Control, and Cleanup: Secondary containment where fuel and oil are stored, also yard has spill kits in each vehicle. A hazmat plan has been implemented and is located in the SWPPP.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was performed in the secondary containment area or over pervious surfaces.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks, otherwise no cleaning or washing was allowed at M&O yard.
- SC-22 Vehicle and Equipment Repair: No repairs were performed at yard.
- SC-31 Outdoor Container Storage: Container storage areas are covered using overhead canopies.
- SC-33 Outdoor Storage of Materials: Where necessary, plastic tarps cover raw materials in the yard; equipment is covered by canopies; material is covered by a permanent overhead structure or stored indoors.
- SC-34 Waste Handling and Disposal: All material was put into a covered roll-off container.
- SC-41 Building and Grounds Maintenance: The grounds and parking lot were swept twice a month by street sweeper and weekly by hand when necessary. Trash was removed daily. Erosive areas and slopes were protected by hydroseed, coconut mats, sand bags, and fiber rolls. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Where feasible, work was performed under cover and over pervious areas. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. Parking lots are spot cleaned for all spills weekly. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The parking lot was swept twice a month by a street sweeper; ingress/egress to unpaved area of yard was protected by rocks and shaker plates.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans were covered and kept closed.
- SC-61 Safer Alternative Products: Used less hazardous cleaning materials and water-soluble paints for mark outs.
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Sweep and/or vacuum sidewalks.

- SC-72 Fountain and Pools Maintenance: Contractor maintained fountain at facility. No water was discharged during maintenance activities; all filter material was retained on-site for proper disposal.
- SC-73 Landscape Maintenance: All material was cut and carried off by hand in burlap bags; no residue remains on site. Irrigation systems were checked regularly to avoid run-off; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: Rapid Flow filters and storm drain structures were cleaned annually. A pilot program was implemented using the innovative Drivable Grass which drains the parking lot through subsurface drainage system to reduce storm water flowing directly into MS4.
- SC-75 Waste Handling and Disposal: All material was handled properly and covered in yard roll-off dumpsters, or other appropriate containers.

OAK YARD

- Storm Water Pollution Control Plan (SWPPP description): A site specific SWPPP was implemented at the Oak Yard.
- SC-11 Spill Prevention, Control, and Cleanup: All liquids and hazardous materials are stored in locked containment lockers. These are located within secondary containment areas. Large spill containment kits are strategically located within the yard. MSDS binders are strategically placed throughout the yard.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was done only in the secondary containment area.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks. No cleaning or washing was allowed in the Oak yard
- SC-22 Vehicle and Equipment Repairs: No repairs were done at the Oak yard.
- SC-31 Outdoor Container Storage: Oak yard has storage areas covered with overhead canopies.
- SC-33 Outdoor Storage of Raw Materials: No raw materials are stored at the Oak yard.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a proper containment area in case of any accidental spillage. These containers are clearly marked and stored until arrangements were made for a certified waste management company to remove them and transfer them to an approved facility. Any other debris was placed in a canopy covered 40 yd roll-off. Dumpsters were covered and all other trash receptacles had lids.
- SC-41 Building and Grounds Maintenance: The Oak yard was swept twice a month by a self-contained street sweeper and weekly by hand. Trash was removed daily. SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control and lot was swept regularly.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans are covered. Yard clean-up was performed by-weekly with monthly site inspections.
- SC-61 Safer Alternative Products: Not Applicable
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Not Applicable
- SC-72 Fountain and Pools Maintenance: Not Applicable
- SC-73 Landscape Maintenance: Not Applicable

- SC-74 Drainage System Maintenance: Debris was captured prior to entry into the vegetated swale.

PARKS MAINTENANCE YARD

- Storm Water Pollution Control Plan (SWPPP description): Site specific SWPPPs were developed and implemented at each of these sites.
- SC-11 Spill Prevention, Control, and Clean-up; Spill kits are located on-site; drip pans were placed under all equipment kept on-site; spill kits are located in all vehicles; spill response plan is updated and kept on-site.
- SC-20 Vehicle and Equipment Fueling: No vehicle or equipment fueling was performed on-site.
- SC-21 Vehicle and Equipment Cleaning: Most equipment was dry-cleaned in designated areas located away from storm drains; where wet cleaning was necessary, it was performed over pervious surfaces in a manner that allowed all water to percolate, generating no runoff to the storm drain system.
- SC-22 Vehicle and Equipment Repair: All equipment was repaired in designated areas away from storm drains; no vehicle repair was performed on-site.
- SC-31 Outdoor Container Storage: All chemical products are kept in locked storage bins with overhead coverage and containment.
- SC-33 Outdoor Storage of Raw Materials: All bagged materials are stored on skids (pallets) and covered with canopies; canopies are also used to cover scrap metals and equipment.
- SC-34 Waste Handling and Disposal: All waste containers are covered.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Weekly yard clean-up and litter removal and monthly site inspections were conducted.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use; artificial turf and permeable surfaces were implemented where feasible; organics from tree trimming were mulched or composted and used for landscaping.
- SC-70 Road and Street Maintenance: Not applicable at yard sites.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system; any storm drains in proximity were protected from discharges.
- SC-72 Fountains and Pools Maintenance: Not applicable at park sites.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on downtown irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.

- SC-74 Drainage System Maintenance: Storm drain inlets were maintained by City's Storm Drain Maintenance Division on an annual basis.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of properly.
- Site Design - Parks Maintenance/Storage Yard drains to a pervious area allowing low flows to infiltrate into the soils instead of running into the storm drain.

4.11 Parks Facilities

4.11.1 Background

The table below lists City parks facilities that were determined to be High Priority areas based on the criteria established in Order No. R9-2007-0001, Section D.3.a.(7)(a) and the City's JURMP. High Priority parks facilities were defined as developed park sites containing landscaping, building(s), and parking lot(s) and developed park sites within an Environmentally Sensitive Area.

Site specific BMPs implemented at each facility are listed and described below.

4.11.2 Source Characterization

The table below lists facilities on the inventory that are medium priority and includes 14 parks and recreation facilities.

Table 4.18 Parks

1	AVIARA COMMUNITY PARK, MAINTENANCE STATION, AND PARKING LOTS	6425 AMBROSIA LN
2	CADENCIA PARK	3310 CADENCIA ST
3	CALAVERA HILLS PARK, COMMUNITY CENTER, AND PARKING LOT	2997 GLASGOW DR
4	CARRILLO RANCH AND PARKING LOT	5200 FLYING LC LANE
5	HIDDEN CANYON PARK (LARWIN) AND PARKING LOT	2685 VANCOUVER STREET
6	HOLIDAY PARK AND PARKING LOTS	3200 PIO PICO DR
7	HOSP GROVE PARK AND PARKING LOT	JEFFERSON & MONROE
8	LA COSTA CANYON PARK AND PARKING LOT	3020 PUEBLA ST
9	LAGUNA RIVIERA PARK	4900 KELLY DR
10	MAGEE PARK AND PARKING LOT	258 BEECH AVE
11	MAXTON BROWN PARK	500 LAGUNA DR
12	PINE PARK AND PARKING LOT	3333 HARDING ST
13	POINSETTIA COMMUNITY PARK, MAINTENANCE STATION AND PARKING LOT	6600 HIDDEN VALLEY RD
14	STAGECOACH COMMUNITY PARK, MAINTENANCE STATION, AND PARKING LOT	3420 CAMINO DE LOS COCHES

4.11.3 Site Specific BMP Requirements

Site specific BMPs listed below were implemented at Parks Facilities.

Table 4.19 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-61 Safer Alternative Products
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.11.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.18 and are described below.

- SWPPP: Aviara, Poinsettia, and Stagecoach Parks also house small maintenance yards. Because of the added potential to contribute to storm water pollution, SWPPPs were required by the City for these facilities. Poinsettia and Stagecoach have developed and fully implemented SWPPPs. Aviara is a new site and the SWPPP is currently under development.
- SC-11 Spill Prevention, Control, and Cleanup; Spills kits are located on-site; spill response plan was updated and kept on-site
- SC-20 Vehicle and Equipment Fueling: Minor equipment fueling was performed over pervious surfaces when necessary.
- SC-21 Vehicle and Equipment Cleaning: Most equipment was dry-cleaned in designated areas located away from storm drains; where wet cleaning was necessary, it was performed over pervious surfaces in a manner that allowed all water to percolate, generating no runoff to the storm drain system.
- SC-22 Vehicle and Equipment Repair: Equipment was repaired in designated areas away from storm drains; no vehicle repair was performed on-site.
- SC-31 Outdoor Container Storage: Chemical products are kept in locked storage bins with overhead coverage and containment.
- SC-33 Outdoor Storage of Raw Materials: All bagged materials are stored on skids (pallets) and covered with canopies; canopies were also used to cover scrap metals and equipment.
- SC-34 Waste Handling and Disposal: All waste containers are covered; pet waste bag dispensers and containers were provided at all parks where dogs are allowed.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the

storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.

- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Park sites are kept clean and orderly; all debris was removed in a timely fashion and hard-scape areas were swept or blown routinely; wash water, sweepings, and sediments were disposed of properly; recyclable materials were recycled; spill response plans were reviewed as part of routine training with staff.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use and are described below.

In conjunction with the Integrated Pest Management (IPM) program, the Parks Maintenance Division continued to utilize slow release fertilizers in an effort to reduce the frequency of applications while minimizing the potential of fertilizer runoff. In some cases, staff reduced the recommended amount of fertilizer per 1,000 square feet by 50 to minimize flush of growth on turf which in turn reduced the amount of clippings. To help monitor fertilizer applications, the Parks Maintenance Division instituted a soil testing program which defined soil properties, allowing the correct monitoring of fertilization applications for proper use and desired outcome. In accordance with the new IPM practices, pesticide and herbicide applications were performed sparingly. Staff continued to search for alternative methods to pest control that are proven to be safe and effective.

As required by the Department of Pesticide Regulation, all chemical applications were reported to the County Agriculture Department on a monthly basis. As identified in the JURMP, all applicable BMPs were implemented to address pesticide, herbicide, and fertilizers sources of pollution. Specific, BMPs implemented during FY 2008-09 include:

- **Education:** A training program for identifying and defining chemicals, proper handling, applying, storage, disposal, irrigating, and using non-synthetic alternatives was implemented. At many of the training seminars, new IPM methods were often presented for consideration by the department. All training information including BMPs were provided to personnel to keep in personalized folders for individual use. In addition, a master application manual that includes all Storm Water BMPs, training, and inspections was also prepared.

- **Non-chemical applications:** Some pest problems can be eliminated or controlled by handpicking, pruning, or high pressure spraying with water. Many pest problems can be reduced or eliminated by removing affected leaves or plant parts. During FY 2008-09, efforts were made to improve upon our IPM system in the City s Parks and Downtown Village areas. The release of lady-bird beetles at Pine Park and the Downtown Fountain areas to combat infestations of aphids have proven successful in eradicating the bugs. Other methods used to decrease the department s dependency on chemical sprays during FY 2008-09 include:

    - Increased mulching of planter beds to smother weed germination
    - Increased tilling of planter beds to kill young weed sprouts
    - The use of organic plant derivative pesticide sprays such as Safer brand Products

- The use of water to spray plants infested with giant whitefly
- The removal of dying or diseased plant material to decrease the presence of harmful organisms.

- Pesticide application was performed on an as needed basis and was performed internally or by an outside pest control contractor after diagnosis.

- **Native Vegetation:** The Parks Maintenance Division continued to explore opportunities to use native vegetation to control pests, reduce chemical application, and maintain the aesthetic values of the Parks and Downtown Village areas.

- **Schedules for Irrigation and Application** Irrigation systems were monitored and inspected on a weekly basis in an effort to minimize water loss. In addition, the use of evapo-transpiration (ET) gauges for controlling the irrigation system helped to reduce watering times based on evaporation and transpiration of moisture from plants and turf. ET gauges were installed at Poinsettia, Stagecoach, Pine, Aviara and Calavera Park. These gauges also helped staff to adjust watering times at other locations that were not connected to the gauge. During FY 2008-09, all irrigation systems were inspected weekly and repaired as necessary to prevent excess runoff. At Poinsettia, Aviara, Stagecoach and Pine Parks, synthetic turf has been installed on the soccer and sports fields, which requires no fertilization, weeding, or watering. The synthetic turf has proven to be particularly successful in eliminating the use of water for irrigation.

- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices. Refer to description of IPM practices in SC-61 above.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of at appropriate landfill or transfer station.
- Site Design Desiltation basin was retrofitted at La Costa Canyon Park; pervious concrete was installed at Pine Park.

4.12 Administrative Areas

4.12.1 Background

One administrative building was determined to be a high priority facility based on its proximity to an environmentally sensitive area (ESA). This facility is the Safety Center, which includes a parking lot, police and fire department headquarters, and a skatepark.

4.12.2 Source Characterization

The only administrative building on the inventory that is a High Priority is the Safety Center.

4.12.3 Site Specific BMP Requirements

Site specific BMPs listed below were implemented at the Safety Center.

Table 4.20 Best Management Practices

SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.12.4 Program Implementation

Each of the BMPs listed above were implemented at the Safety Center and are described below.

- SC-34 Waste Handling and Disposal: Dumpsters were covered and maintained and checked frequently for leaks. Lids were kept closed at all times.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Site was kept clean and orderly; all debris was removed in a timely fashion and hardscape areas were swept or blown routinely; wash water, sweepings, and sediments were disposed of properly; recyclable materials were recycled.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system ; any storm drains in proximity were protected from discharges.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of properly.

4.13 Activities

4.13.1 Background

Four municipal activities were determined to be High Priority activities based on their potential to generate pollutants. These operations occur throughout the City and are required to implement BMPs as described in the JURMP.

4.13.2 Source Characterization

The table below lists the activities on the inventory that are considered High Priority.

Table 4.21 ACTIVITIES

1	LANDSCAPE MAINTENANCE AND REPAIR	CITYWIDE
2	MS4 MAINTENANCE	CITYWIDE
3	POWER WASHING	CITYWIDE
4	SANITARY SEWER MAINTENANCE AND OPERATIONS	CITY SERVICE AREA

4.13.3 Site Specific BMP Requirements

Each of the BMPs listed were implemented for the activities listed in Table 4.21 and are described below.

Table 4.22 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-61 Safer Alternative Products
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal
SC-76 Sewer Utility Maintenance

4.13.4 Program Implementation

- SC-11 Spill Prevention, Control & Cleanup: Spill kits are kept in all vehicles. Employees were trained in spill response as applicable to their activities. Absorbents were used for spill cleanup where possible and disposed of properly.
- SC-20 Vehicle and Equipment Fueling: Minor equipment fueling was performed over pervious surfaces when necessary; larger equipment was fueled at the fleet maintenance facility (BMPs are described above for Fleet Yard).
- SC-34 Waste Handling and Disposal:
    - Landscape Maintenance: All non-recyclable waste was disposed of properly.
    - MS4 Maintenance: Trash was hauled to transfer station. Debris and other organic material were transferred and deposited at 2400 Tamarack Avenue in three concrete covered bins. The material was then tested for contaminants and disposed of properly upon receipt of permissible test results.

  - Powerwashing: All wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system ; any storm drains in proximity were protected from discharges.
  - Sewer Utility Maintenance: Waste was contained in Vactor truck tanks and disposed of properly to sanitary sewer.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use. These practices are described in detail above.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system; any storm drains in proximity were protected from discharges.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: A small self-contained vacuum with pressure washer was used to clean the drainage system. All material in the drain box was removed by the vacuum. Disposal of the water and material occurred using a filter sock, allowing water to be decanted into the sanitary sewer system through a permit from Encina Wastewater Authority. The solid material was taken to the Tamarack site described above. All trash was removed from the MS4, placed in 55 gallon trash bags, and placed in a 40 cubic yard roll off dumpster that is covered. The material was then transported to Palomar Transfer Station for disposal.
- SC-75 Waste Handling and Disposal: See SC-34 above.
- SC-76 Sewer Utility Maintenance: All lift stations were inspected and cleaned as needed; Vactors were checked for leaks during pre-trip inspections; all materials were discharged at Encina Wastewater Authority: solids into grit bin, liquids at head-works; recently the City has begun to implement FOG requirements as per Order 2006-003 including revision of ordinances, public outreach, and inspections of FOG generating facilities.

  The collections system maintenance schedule is designed to provide more frequent cleaning for identified trouble areas, with siphons being cleaned annually, low flow and flat lines cleaned semi-annually, and grease problem areas cleaned quarterly.

4.14 Areas and Activities Categorized as Not High Priority

4.14.1 Background

Table 4.23 lists City owned areas and activities that were determined NOT to be High Priority based on the criteria established in Order No. R9-2007-0001, Section D.3.a.(7)(a). Basic minimum BMPs were implemented at each facility listed below as per the City s JURMP.

4.14.2 Source Characterization

The Municipal Inventory found in Appendix 4.1, lists facilities that are NOT High Priority and includes 46 facilities that are administrative, small parks, medians, and water/wastewater stations that are small or out of service. These facilities are located outside of ESAs and do not generate significant pollutant loads.

4.14.3 Site Specific BMP Requirements

a. Employee Training
b. Pollution Prevention
c. Good Housekeeping
d. Spill Response and Prevention

4.14.4 Program Implementation

The BMPs listed above were implemented City wide at all facilities, including the facilities listed in Table 4.23. A description of these BMPs and how each was implemented is provided in Section 4.2.

4.15 Special Events

4.15.1 Background

The City of Carlsbad hosts a multitude of events each year from major invitational sporting events to community based festivals. A Special Event Permit and SWPPP is required for any organized event involving 50 or more people on public property that travel or assemble together, cause a change in normal traffic flow or controls, and is not within the scope of a Facility Use Permit, other land use approval, or a private property permit. The City has organized a Special Events Committee to ensure events are held in a manner that is safe and does not adversely impact the Carlsbad community or the environment.

4.15.2 Source Characterization

The City manages an updated inventory of special events. These special events have been prioritized according to type of event, number in attendance, proximity to the nearest water body, and potential threat to water quality. During FY 2008-09, there were 37 special events on the inventory, which included 19 high priority, 8 medium priority, and 10 low priority events. Based on this prioritization, the City conducted storm water compliance inspections at all of the high priority events and 3 inspections at medium priority events. During this reporting period, there were 42 inspections conducted which included 22 pre-event inspections and 20 post-event inspections. In some cases inspectors were onsite for the duration of the event. A copy of the special events inventory can be found in Appendix 4.2.

4.15.3 BMP Requirements

All special events were required to implement the designated minimum special event BMPs and comply with all applicable regulations outlined in the Carlsbad Municipal Code. Event organizers were notified of the minimum BMPs during the event planning process, in outreach materials, and at pre-event meetings. All special events, regardless of priority, submitted a SWPPP for City review and approval in FY 2008-09. The SWPPP is intended to help demonstrate that appropriate measures and BMPs are being implemented before, during, and after the event to reduce and/or prevent pollution. All SWPPPs were approved by the City prior to Special Event Permit issuance in FY 2008-09. During compliance inspections, the City confirmed that the designated and specific BMPs were implemented as required.

The City revised and updated the brochure that outlines the minimum BMPs for special events. The Best Management Practices for Special Events brochure was provided to all event promoters during the applications and planning process. A copy of the revised brochure can be found in Appendix 4.3.

4.15.4 Program Implementation

Generally, the City found that event organizers implemented BMPs as required. Event venues were well managed, BMPs were installed, and the impacted areas were cleaned as required. The City will continue to work closely with event organizers to ensure compliance.

Storm water compliance inspections include a pre-event inspection where storm water BMPs were evaluated, a during-event inspection to determine the effectiveness of BMPs, and a post-event inspection to ensure the site is properly cleaned. Compliance inspections may also include recommendations for additional measures that may be required to comply with the storm water regulations. The Special Events Inspection Form developed at the end of FY 2007-08 continued to be used throughout FY 2008-09 and is attached as Appendix 4.4.

During FY 2008-09, there were only a few minor violations noted at the 22 inspected events, all of which were immediately corrected. There were no enforcement actions for special events issued during FY 2008-09.

CMI developed two new procedures for NPDES inspections and inventory management for special events. Procedure CMI-200 defines the process for inspecting, tracking, and enforcing special events (Appendix 4.7) and procedure CMI-210 defines the process for managing and updating information on the special events inventory (Appendix 4.8). All special events are prioritized into high, medium, and low categories and inspected at the minimum frequencies required by the Permit. All inspection protocols outlined in the Permit, JURMP, CMI procedures, and the CMC were implemented as required.

4.16 Inspection of Municipal Facilities

4.16.1 Background

All High Priority municipal facilities were formally inspected during this fiscal year as required by the Permit. In addition, many departments will perform inspections of their facilities more frequently. Inspections of these facilities addressed all required inspection steps according to the Section D.3.b.(3)(a) including:

- Review of BMP implementation plans, if the site uses or is required to use such a plan;
- Review of facility monitoring data, if the site monitors its runoff;
- Coverage under the General Industrial Permit and NOI filing is checked;
- Compliance with the City of Carlsbad ordinances related to urban runoff is assessed;
- BMP implementation, maintenance, and effectiveness is assessed;
- Visual observations for non-storm water discharges, potential illicit connections, and potential discharges of pollutants in storm water are made;
- And education and training on storm water pollution prevention is performed as warranted.

4.16.2 Source Characterization

In total, there were 63 High Priority municipal areas and activities on the City s inventory list. These areas and activities included:

- Roads, Streets, Highways, and Parking facilities;
- Flood Management Projects and Flood Control Devices;
- Fire Stations;
- Recreation Facilities;
- Publicly Owned Treatment Works;
- Sanitary Sewer Faciliites;
- Water Facilities;
- Municipal Yards;
- Parks Facilities;
- Administrative Facilities; and
- Activities

the activities include: landscape maintenance and repair, power washing, MS4 maintenance, and sanitary sewer maintenance.

Refer to Appendix 4.1, the City s Municipal Inventory, for a list of the City s High Priority municipal areas and activities.

4.16.3 BMP Requirements

All areas and activities implement site specific BMP requirements as per the City s JURMP, Appendix 6-A. The preceding sections include table of site specific BMPs required to be implemented for each area and activity listed above. For facilities that are not High Priority, minimum BMPs are required that are tailored specifically to those sites and activities occurring there. Required BMPs have been implemented at all City areas and activities as described it the City s JURMP.

4.16.4 Program Implementation

A total of 63 inspections were performed at municipal facilities. Of the 63, 47 were performed by a third party contractor and 16 performed in house. Third party inspections were performed at larger, more complex facilities such as Fire Stations, Fleet Maintenance, Parks Maintenance and Operations as well as simple parks, water facilities and parking lots. Facilities that are not High Priority are inspected on an as needed basis.

All sites inspected with the exception of Maerkle Dam Reservoir, Pump, and Chlorination Station were found to be in compliance with permit requirements and City ordinances. In general, the recommendations and/or corrective actions most often involved over-irrigation, accumulation of organic debris and general housekeeping. The Maerkle Dam facility was found to be in violation of the City's Storm Water Ordinance Section 15.12.080 which requires reduction of pollutants contacting or entering storm water. At the time of the inspection, there was evidence of a prior discharge from construction related activities. All corrective actions were implemented and follow-up was conducted by City staff to ensure compliance.

All four High Priority activities were inspected during field activities and were found to be in compliance with permit requirements and City ordinances. There were no corrective actions identified for the High Priority activities.

For a listing of all corrective actions identified during inspections and their implementation, refer to Appendix 4.5. There were no violations of the Carlsbad Municipal Code observed during municipal inspections; therefore there were no necessary enforcement actions.

4.17 Notable Activities

As mentioned in the Executive Summary, the City considers a Notable Activity to be any activity above compliance requirements. Notable Activities for FY 2008-09 include:

- The continued use and addition of treatment control BMPs to prevent pollutants from reaching receiving waters.
- The completion and use of a strip drain in the driveway at the new Fire Station 6 facility which allows Fire Department employees to wash Fire vehicles onsite, with any excess wash water diverted to sewer.
- The utilization of the Reclaimed Water Facility and a training trailer which allowed the Fire Department to perform wet training and testing with no discharge to the MS4 and while conserving water.
- The Maintenance and Operations Yard and the Oak Yard parking lots were swept twice a month by a street sweeper and weekly by hand when necessary.
- The Maintenance and Operations Yard parking areas were spot cleaned for all spills weekly.
- The CMI department developed new procedures for inspecting, tracking and enforcing special events as well as managing and updating information on the special events inventory.

5.0 INDUSTRIAL AND COMMERCIAL COMPONENT

5.1 Introduction

The City of Carlsbad s Industrial and Commercial program is intended to reduce industrial and commercial discharges of pollutants from the MS4 to the maximum extent practicable, and prevent municipal discharges from the MS4 from causing or contributing to a violation of water quality standards. This section covers activities occurring from July 1, 2008 to June 30, 2009 under the Permit Order No. R9-2007-0001.

5.2 Stationary Industrial and Commercial Sites Sources Element

5.2.1 Background

Storm water inspectors identify pollution sources, assess the potential threat to water quality, and require BMP implementation to eliminate pollution sources from industrial and commercial businesses. Major industrial types in Carlsbad include high technology, multimedia and biomedical businesses, electronics, golf apparel and equipment manufacturers and several light industry parks. Stationary commercial types in Carlsbad consist of restaurants, automobile maintenance, gas stations, golf courses, and resorts, among others. Many of these industrial and commercial sites and their activities have the potential to generate significant amounts of pollutants, if proper BMPs are not implemented.

5.2.2 Source Characterization

Each year hundreds of new businesses are established in Carlsbad. During this reporting period, the Storm Water Protection Program worked closely with the Finance Department to obtain information about new businesses, including activities, SIC codes and descriptions, business types, and contact names and numbers. Each quarter the Storm Water Protection Program downloaded, sorted, mapped, and prioritized new businesses by SIC, business type and other criteria per Investigative Order No. R9-2007-0001.

These new businesses were screened, evaluated, prioritized, and then added to the inventory list and scheduled for inspection. In some cases information provided on business license applications was not correct and a pre-inspection evaluation was necessary. Pre-inspection evaluations helped determine if a business activities were subject to storm water requirements. Two types of pre-inspection source evaluations were used:

1. Reviews: During the review process, the inspector evaluated the source and activity using relevant information from other City departments, databases, or licensing programs to determine whether the site/source should be inspected and tracked by the Storm Water Protection Program. A business could be excluded during the review process if it was found that their activities are not regulated by the City or General Permit. The most common reason businesses were excluded was because of an incorrect SIC code designation or they were not a high threat to water quality.
2. Telephone Contacts: If the review failed to provide enough information, the inspector contacted the business by phone to determine its status and scheduled an inspection if necessary.

After physical inspections, reviews, or telephone contacts, any changes to a business priority or status were recorded on the Storm Water Inventory List and/or in the Permits Plus database.

New businesses were also found by referral from other agencies, field discovery, complaint investigations, or business directories.

The City s Commercial/Industrial inventory is located in Appendix 5-1.

As required by the permit, the following applicable stationary sites/sources are included in the inventory:

1. Commercial Sites/Sources:
    - Automobile repair, maintenance, fueling, or cleaning;
    - Airplane repair, maintenance, fueling, or cleaning;
    - Boat repair, maintenance, fueling, or cleaning;
    - Equipment repair, maintenance, fueling, or cleaning;
    - Automobile and other vehicle body repair or painting;
    - Automobile (or other vehicle) parking lots and storage facilities;
    - Retail or wholesale fueling;
    - Pest control services;
    - Eating or drinking establishments, including food markets;
    - Cement mixing or cutting;
    - Masonry;
    - Painting and coating;
    - Botanical or zoological gardens and exhibits;
    - Landscaping;
    - Nurseries and greenhouses;
    - Golf courses, parks and other recreational areas/facilities;
    - Cemeteries;
    - Marinas;
    - Portable sanitary services;
    - Building material retailers and storage;
    - Animal facilities

2. Industrial Sites/Sources:
    - Industrial Facilities, as defined at 40 CFR 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit;
    - Operating and closed landfills;
    - Facilities subject to SARA Title III; and
    - Hazardous waste treatment, disposal, storage and recovery facilities.

3. All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired water body segment, where the site/source generates pollutants for which the water body segment is impaired.

4. All other commercial or industrial sites/sources within or directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas. This criterion will be reviewed in FY 2009-10, to ensure that all sites/sources within an ESA are included on the current business inventory.

5. All other commercial or industrial sites/sources that the Copermittee determines may contribute a significant pollutant load to the MS4.

Potential threats to water quality at each commercial and industrial site/source were determined by evaluating a variety of site-specific factors including the criteria outlined in the Permit. Commercial and industrial facilities will continue to be reviewed annually and prioritizations will be reviewed and updated annually in conjunction with the watershed-based inventory to reflect any changes in industrial and commercial uses. Individual prioritization criteria are described below in further detail:

Prioritization Criteria: Prioritization for high threat sites and sources involved two steps: (1) initially classifying a facility as being a high threat to water quality based on site information; and (2) subsequently confirming or reclassifying the facility based on field observations and additional information. Initial classification of sites/sources was accomplished administratively using the data provided in the existing industrial and commercial inventory. The confirmation and/or reclassification, when necessary, were and will be completed following the initial inspection of each site/source. In addition to the minimum criteria listed above, the City also considered the following site/source attributes to evaluate the potential threat to water quality:

i. Type of activity (SIC code): Standard Industrial Classification (SIC) codes were used primarily to prioritize and identify specific commercial and industrial activities/sites that have the potential to contribute to storm water pollution. In addition, the NPDES General Industrial Permit (General Permit) defines specific SIC codes such that (1) coverage under the General Permit is mandatory (as defined in Categories ii, iii, vi, and viii of the General Industrial Permit) or (2) coverage under the General Permit is conditional, required only if material, machinery, or products are exposed to storm water (as defined in Category 10 of the General Permit). Industries not listed with an SIC code were directly contacted and assigned an appropriate code based on a description of business activities.
ii. Materials used at the facility: Materials, including hazardous materials, used at industrial and commercial sites have the potential to contribute significant pollutant loads to receiving waters if transported by storm water. These materials and associated activities were considered during the prioritization process.
iii. Wastes generated: If not properly disposed of, industrial and commercial wastes have the potential to degrade receiving waters when transported by storm water. Types of wastes generated or stored onsite were considered during the prioritization process. Industrial Waste Permits issued by Encina Wastewater Authority may also be examined.
iv. Pollutant discharge potential: When evaluating a commercial or industrial site/source s potential to discharge pollutants, the inspector took into account all material handling equipment or activities, raw materials, intermediate products, final products, waste material, by-products, or industrial machinery exposed to storm water. Discharge potential was assessed during site inspections at each facility.
v. Non-storm water discharges: Authorized non-storm water discharges can contribute to water quality degradation by transporting pollutants into receiving waters. Non-storm water discharges were evaluated to determine whether they were a significant source of pollutants and whether the discharges may continue to be exempted from the prohibitions of Section B.1 of the Permit.
vi. Size of facility: Size of the facility affects the amount of runoff and pollutant loads generated from the industry. The size of a facility was taken into consideration during the threat evaluation process.

vii. Proximity to receiving water bodies: The potential for pollutant transport to sensitive receiving water bodies was evaluated by determining the proximity and sensitivity of receiving water bodies using the ESA definitions from the Permit.

viii. Sensitivity of receiving water bodies: All facilities directly discharging to or within 200 feet of the ESA s listed above were considered high priority. This criterion will be reviewed in FY 2009-10, to ensure that all sites/sources within an ESA are included on the current business inventory.

ix. Whether the facility is subject to the General Industrial Permit or an individual NPDES permit: A listing of facilities located in Carlsbad that have filed a Notice of Intent (NOI) and are covered under the General Permit were classified as high priority threats to water quality.

x. Whether the facility has filed a No Exposure Certification/Notice of Non-Applicability: Those facilities that were identified as Conditional (NONA and NEC filers) were evaluated using the prioritization flowchart and prioritized accordingly.

xi. Facility design: The design of a facility, including whether structural BMPs has been installed and maintained, or there are outdoor activities, was considered during the threat to water quality evaluation process.

xii. Total area of the site, area of the site where industrial or commercial activities occur, percentage of pervious surface, and area of the site exposed to rainfall and runoff was considered during the Threat to Water Quality evaluation process.

xiii. The facility s compliance history: Inspectors reviewed the compliance history of each commercial and industrial site and considered any relevant enforcement actions in determining the threat potential on activities conducted onsite.

xiv. Any other relevant factors: The City reserved the authority to consider any other relevant factors specific to the facility to utilize in the prioritization process.

5.2.3 Best Management Practice Requirements

5.2.3.1 Pollution Prevention

Pollution prevention eliminates or reduces polluted storm water runoff. Specific pollution prevention procedures and management guidelines may vary from one industrial or commercial facility to another, and the City informed these facilities of pollution prevention opportunities during site inspections. Nevertheless, the following pollution prevention principles applied to most industrial and commercial facilities:

- Affirmative Procurement Use alternative, safer, or recycled products.
- Redirect storm water flows away from areas of concern.
- Reduce use of water or use dry methods.
- Reduce storm water flow across facility site.
- Recycle and reuse waste products and waste flows.
- Move or cover potential pollution from storm water contact.
- Provide on-going employee training in pollution prevention.

5.2.3.2 Minimum BMPs

Described below are minimum BMPs required to be implemented, during this reporting period, by stationary commercial and industrial facilities, as applicable:

1. Good housekeeping

   Specifically stationary facilities are required to:

   - Protect materials and products that could potentially pollute storm water from rain, run-on, runoff, and wind dispersal by storing them indoors or covering them, and providing them with secondary containment as needed. For industries with conditional SIC codes, moving stored materials indoors may allow an exemption from the General Permit requirements.
   - Use dry cleanup methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible) instead of using water hose or pressure washing system to conduct washing or cleaning activities.
   - Sweep up around dumpsters and other areas to prevent trash and debris from accumulating. Dumpsters must be kept closed when not in use. All trash must be kept in appropriate sized containers until it can be hauled away. When inspecting solid waste collection areas, inspectors will note if recyclable materials (cardboard, green waste, etc.) are placed in dumpsters.

2. Preventive maintenance

   Preventive maintenance includes the regular inspection and maintenance of storm water structures (drains, catch basins, etc.) as well as other facility equipment and systems. Structures should be maintained in good working order and cleaned as needed to prevent discharge of pollutants into the storm water system. Facility equipment or systems should be properly maintained to prevent leaks or discharges of pollutants into the storm water system.

3. Material Storage and Handling

   This includes all procedures to minimize exposure of significant materials to storm water and to minimize the potential for spills and leaks from storage, loading, unloading and transfer of materials.

4. Employee training

   Appropriate personnel should be trained in good housekeeping, preventive maintenance, materials storage and handling, solid waste handling and recycling, and spill response as applicable to the facility. Records should be retained of employees attending storm water training sessions and the topics covered.

5. Solid waste (non-hazardous) handling and recycling

   This includes the procedures or processes to handle, store, or dispose of waste or recyclable materials. Waste disposal areas should be kept free of litter and debris and waste and recyclable receptacles must have a cover or lid to prevent the contents from being dispersed by the wind or coming in contact with storm water.

6. Spill response

   Spills and leaks can be a major contributor to storm water pollution. Facilities should identify potential locations and quantities of significant materials that may spill or leak, and should write and implement a response plan addressing spill containment,

clean up and notification procedures. Appropriate spill clean-up equipment should be readily accessible to trained spill response personnel.

7. Record keeping
   This includes the procedures to ensure that all records of inspections, spills, maintenance activities, corrective actions, visual observations, etc., are developed, retained, and provided, as necessary, to the appropriate facility personnel. Record keeping and internal reporting represent good operating practices as they increase the efficiency of the facility and the effectiveness of BMPs.

8. Self inspection/quality assurance
   This includes, in addition to the preventative maintenance inspections identified above, an inspection schedule of all potential pollutant sources. Tracking and follow-up procedures should be described to ensure adequate corrective actions are taken. Quality assurance includes the procedures to ensure that all elements of any required SWPPPs or monitoring plans are adequately conducted.

BMP information was made available during inspections, in printed materials and direct mailings, on the storm water website and hotline, during presentations and at outreach events. A listing of education and outreach events held during this reporting period can be found in Section 8 of this report.

5.2.3.3 BMP and Knowledge Assessment Tools

During this reporting period, the Storm Water Protection Program continued to use the *BMP and Knowledge Assessment* to measure knowledge of storm water issues and assess the implementation of BMPs onsite. The assessment tool rated a commercial operator and site using the following criteria:

Overall Knowledge Assessment:
Inspectors ranked personnel from 1-5 per the following *Knowledge Assessment* scale:

Level 1: Individual has never heard of the storm water program, requirements, or BMPs. This individual does not know what BMPs are or understand how to implement them.

Level 2: Individual has a general awareness of water quality issues, but does not understand the requirements of the storm water program, BMPs, or pollution prevention.

Level 3: Individual has a general understanding of storm water issues (*I've heard something about that*), but not specific storm water requirements or BMPs required for the facility.

Level 4: Individual has a clear understanding of BMPs but may not have a clear awareness of the connection between pollution prevention and water quality.

Level 5: Individual demonstrated an in-depth knowledge of the storm water program and BMPs consistent with the facility's activities and operations.

Overall BMP Assessment
Inspectors ranked the facility per the following 1-5 *BMP Assessment* scale:

Level 1: An illegal discharge was noted during the inspection. Enforcement actions such as a NOV and/or citation are required.

Level 2: BMPs have not been implemented. Several violations were noted during the inspection, however an illegal discharge was not observed. A detailed inspection report and/or written warning were issued.

Level 3: BMPs have been implemented throughout the site, but not properly or adequately maintained. Violations were noted during the inspection and a verbal warning was issued. A detailed inspection report or written Warning Notice may follow.

Level 4: BMPs implemented effectively, however minor violations associated with communal areas or good housekeeping practices (i.e., dumpsters open, leaves in the parking lot, etc.) were noted during the inspection.

Level 5: All BMPs implemented effectively. No violations noted during the inspection.

Table 5.1: HTTWQ Facilities Rated for Each Score □ July 1, 2008 to June 30, 2009.

Rating	Knowledge Assessment (raw score)	Knowledge Assessment (□)	BMP Implementation (raw score)	BMP Implementation (□)
1	5	1.3□	19	4□
2	32	8.4□	24	5□
3	80	21□	72	14□
4	152	39.9□	157	31□
5	112	29.4□	236	46□
TOTAL	381	100□	508	100□

Table 5.1 shows the number of instances in raw score and percentage that HTTWQ businesses rated for each score, with 5 being the highest score possible. The number of *BMP Assessments* collected is usually higher than the number of *Knowledge Assessments* collected, because at some facilities, a company representative is not available to complete the *Knowledge Assessment*. BMP implementation results show that the City has been successful in ensuring that businesses implement BMPs throughout the sites at least 91□ of the time during this reporting period. The City will continue to work with businesses to not only educate them about storm water issues, but also ensure BMPs are implemented and maintained.

5.2.4 Program Implementation

5.2.4.1 Inspections

The City conducted inspections to verify BMP implementation, Permit compliance, and municipal code compliance. From July 1, 2008 to June 30, 2009, a total of 370 inspections were performed on fixed high threat to water quality facilities from a year-end inventory of 566. The inspectors performed on-site inspections at 65□ of the high threat to water quality facilities, which is greater than the permit requirement of 50□.

The City conducted scheduled, unscheduled, follow-up, and compliance inspections at commercial and industrial sites/sources at the frequencies required by the Permit. During site visits, the inspector:

a. Reviewed the SWPPP or BMP implementation plans, if the site used or was required to use such a plan;
b. Reviewed facility monitoring data, if the site monitored its runoff
c. Checked for coverage under the General Industrial Permit (Notice of Intent (NOI), Waste Discharge Identification No., or No Exposure Certification), if applicable;
d. Assessed compliance with ordinances and permits related to urban runoff;
e. Assessed BMP implementation, maintenance and effectiveness;
f. Conducted visual observations for non-storm water discharges, potential illicit connections, and potential discharge of pollutants in storm water runoff; and
g. Evaluated education and training on storm water pollution prevention, as conditions warrant.

Copies of inspection reports and correspondence are maintained by the Storm Water Protection Program. No inspections were performed by a third party.

On January 30, 2009 the City of Carlsbad also received a complaint from the RWCQB that a Bobcat machine was being used to push dirt into Cannon Lake. The report was called into the RWQCB by a nearby resident. Cannon Lake is an approximately two acre wet detention basin in the City s storm water conveyance system.

The alleged violation took place on the eastern side of Cannon Lake on an agriculture property. Upon investigation the activity was no longer taking place and no sediment was discharged into the lake. There were small piles of dirt near the edge of the lake and no immediate threat of sediment or pollutants entering the conveyance system.

The complaint was also investigated by the Engineering Department for a possible grading violation, but no violations were found because the dirt moved was part of agricultural activities. The Storm Water Department added the commercial grower to the industrial/commercial inventory. Through the inspection process the grower was required to remove the sediment piles and implement several other BMPs. The commercial grower has implemented the required BMPs and is in compliance with storm water regulations.

5.2.4.2 Enforcement

The City conducted follow-up inspections to determine compliance with corrective actions outlined in the inspection report or enforcement notices. When a storm water complaint was received about an industrial or commercial site/source or an illegal discharge was observed or suspected, the City conducted a storm water compliance inspection or investigation. If a significant and/or immediate threat to water quality was observed, appropriate actions were taken to require the responsible party to immediately cease the discharge and/or correct the situation. In judging the degree of severity, City inspectors also took into account any history of similar incidents or discharges. Table 5.2 includes a summary of businesses that received NOVs from July 1, 2008, to June 30, 2009.

Table 5.2: Summary of NOVs Issued during FY 2008-09

Business Name	SIC	Date of NOV	CMC Violations		Findings	Compliance Achieved
			Storm Water	Trash		
Lexus Carlsbad	5511	07/23/08	15.12.050 15.12.080		Prohibited discharge of wash water to MS4.	Yes
San Diego International Floral Trade Center	5193	07/23/08	15.12.080	6.08.045	Prohibited discharge of colored water to MS4. Oil leaks in parking lot. Trash and debris accumulation in receptacle area.	Yes
Ruby s Diner	5812	08/01/08	15.12.050 15.12.080 15.12.090		Prohibited discharge to MS4. Grease accumulation around bins. Debris in and around storm drains.	Yes
Plaza Camino Real	6512	09/03/08	15.12.090	6.08.040	Compactor leaking. Trash and debris in receptacle area. Grease accumulation on bin and surrounding areas. Trash and debris in and around storm drains. Improper storage of hazardous waste.	Yes
The Village Faire	6512	10/07/08	15.12.080 15.12.090	6.08.045	Evidence of outdoor washing without proper BMPs. Trash and debris in and around storm drains. Grease and trash accumulation in disposal areas.	Yes
Claim Jumper	5812	10/21/08	15.12.050 15.12.080	6.08.040	Prohibited discharge of wash water to MS4. Debris in and around storm drains.	Yes
Panda Express 393	5812	10/16/08	15.12.050 15.12.080	6.08.040	Grease and trash accumulation in disposal areas.	Yes
Lexus Carlsbad	5511	11/12/08	15.12.050 15.12.080		Prohibited discharge of wash water to MS4.	Yes
Dini s By The Sea	5812	12/09/08	15.12.050 15.12.080		Prohibited discharge from outdoor hosing discharged to MS4.	Yes
Mikko Japanese Cuisine	5812	12/18/08	15.12.080		Improper storage of cleaning chemicals and unusable equipment outdoors. Evidence of outdoor washing without BMPs.	Yes
KoKo Beach	5812	12/29/08	15.12.080	6.08.050	Improper storage of materials and equipment.	Yes
King s Fish House	5812	12/30/08	15.12.050 15.12.080		Prohibited discharge of wash water to the MS4.	Yes

Express Auto Center	7538	01/08/09	15.12.080		Improper storage of equipment and hazardous materials. Unusable materials stored on-site.	Yes
Lexus Carlsbad	5511	03/09/09	15.12.050 15.12.080		Prohibited discharge of wash water to MS4.	Yes
Vons 2142	5411	03/12/09	15.12.050 15.12.080 15.12.090		Prohibited discharge from sump pump to MS4. Trash and debris accumulation in and around loading bay.	Yes
Senor Grubby s	5812	04/08/09	15.12.080	6.08.030 6.08.090	Trash and debris accumulation not contained within receptacles. Unused equipment and materials stored outdoors. Standing water in pump vault in parking lot.	Yes

The Enforcement Response Plan continued to be used by inspectors to identify, document, and respond to storm water violations.

For this reporting period, the Storm Water Protection Program had three full-time Environmental Specialists and one part-time intern. In addition, a Senior Environmental Specialist was hired in February 2009. Environmental Specialists are continually trained on code enforcement, inspection procedures, applicable laws and regulations, and investigation techniques.

These training courses, in addition to the Enforcement Response Plan, helped the Storm Water Protection Program appropriately identify and respond to storm water violations. The City took a total of 46 enforcement actions against industrial and commercial businesses during FY 2008-09. The types and numbers of enforcement actions are listed in Table 5.3.

Table 5.3. Enforcement Actions during FY 2008-09

Action	Total
Verbal Warning	16
Written Warning	12
Notice of Violation	16
Notice to Clean	0
Cease and Desist Order	0
Administrative Citation	2
TOTAL	46

During inspections and investigations completed during this reporting period, there were no illegal discharges found. Mobile service providers were added to the inventory and required to apply for business licenses. More detailed information on complaint response and illegal discharge investigations is found in Section 7 of this report. Escalated enforcement actions were taken when necessary to achieve compliance.

5.2.4.3 Third Party Inspections

There were no third party inspections conducted on any industrial or commercial facilities during FY 2008-09.

5.3 Mobile Sources Element

5.3.1 Background

The City has participated in the development of a Regional Mobile Outreach and Education Strategy. The City will work with the Copermittees to ensure the implementation and success of this strategy. A copy of the *Regional Mobile Outreach and Education Strategy*, which includes a discussion of Carlsbad s jurisdictional efforts, can be found in the City s JURMP.

5.3.2 Source Characterization

A large percentage of businesses on the inventory list are mobile businesses, which include carpet cleaning, power washing, etc. These mobile businesses were identified, contacted and mailed appropriate BMP information. Because site inspections are not required for mobile businesses, many were reviewed by City inspectors. During the review process the inspector evaluated a commercial business using any relevant information available in other City departments, databases, or licensing programs. A business could be excluded during a review if it was found that their activities were not regulated by the City or Permit. The most common reason businesses were excluded during the review process was because of an incorrect SIC code designation.

Telephone surveys continued to be used to determine the status of certain types of mobile businesses on the inventory. In most cases, this screening procedure determined that the wrong SIC code had been applied during the business license application process. The Carlsbad Municipal Code prohibits mobile businesses from storing materials outdoors. Once confirmed, mobile businesses were mailed specific BMP information.

5.3.3 Best Management Practice Requirements

Implementing BMPs is a priority for all mobile businesses. Dry cleanup methods, diverting wash water, and covering or blocking drains are all required practices.

5.3.4 Program Implementation

Upon arrival onsite to investigate a complaint of non-compliance, City staff conducted the following activities:

- Requested stop work if discharge was entering or had potential to enter the MS4 system.
- Requested to speak to the manager of the responsible party or property owner as necessary.
- Took photos and made observations.
- Educated the responsible party or person onsite as necessary regarding the City s NPDES permit, Federal and State requirements, Carlsbad Municipal Code (CMC), and required BMPs in order to continue work.
- Enforced the CMC as necessary.
- Followed up with documentation in RFA system and with written correspondence to the responsible party with a CC to the property owner.

5.4 Notable Activities

As mentioned in the Executive Summary, the City considers a Notable Activity to be any activity above compliance requirements.

Notable Activities for the Industrial and Commercial Program during FY 2008-09 include:

- Performed 370 inspections of high threat fixed facilities from an inventory of 566. This was an inspection rate of 65 which exceeded the permit requirement of 50 .

6.0 RESIDENTIAL COMPONENT

6.1 Introduction

This section describes the activities of the City for the reporting period for FY 2008-09 with respect to implementation of the Residential Component of the JURMP. The program is intended to: (1) reduce residential discharges of pollutants from the MS4 to the MEP, and; (2) prevent residential discharges from the MS4 from causing or contributing to a violation of water quality standards.

6.2 Source Characterization

In accordance with Order R9-2007-0001 and the City s JURMP, the City focused on all the high priority activities and areas outlined in the JURMP (March 2008). Since writing the JURMP, no amendments were made to source characterization or areas of focus.

6.3 Best Management Practice Requirements

In accordance with the City s JURMP required BMPs were implemented in residential areas. City inspectors required the following minimum BMPs (detailed in fact sheets and brochures) for all residential sources or pollution:

- Move or cover potential pollution sources from storm water contact. Protect materials that could potentially contribute to storm water pollution by storing them indoors or covering them.
- Use dry cleanup methods. Washing or cleaning activities that involve the use of a water hose or pressure washing system were required to use dry cleanup methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible).
- Residential car washing. Use soap sparingly, divert wash water to landscaped areas and pour buckets of soapy water down the sink. Never wash cars in the street or public right of way.
- Pet Waste. Clean up after pets. Use a bag to pick up waste when walking pets. Flush pet waste down the toilet or dispose of in a sealed plastic bag and deposit in the trash.
- Trash Management. All trash must be kept in appropriate sized containers until it can be hauled away. Frequently dispose of grass, debris, leaves, and other waste materials.
- Recycle, Reduce and Reuse. Recycle cans, bottles, paper and cardboard whenever possible.
- Reduce the Use of Landscape Chemicals. Decrease the use of lawn and garden care products such as pesticides, weed killers and chemical fertilizers. Consider using non-toxic pest control methods. Avoid over irrigation which washes these chemicals into the storm drain system.

6.4 Program Implementation

The following provides a discussion of the steps that were taken to require, encourage, and verify the implementation of the prescribed BMPs, and the notable activities conducted to manage urban runoff for high priority residential areas.

6.4.1 Regional Residential Education Program

The San Diego Regional Storm Water Copermittees sponsored the San Diego County Fair (Fair) in 2008 as an education and outreach activity. The sponsorship was a joint effort between the City of San Diego s Think Blue program and the regional Copermittees with each entity contributing approximately half towards the overall cost. The Fair was selected as a regional event due to its unique ability to potentially reach more than one million San Diegans and convey a strong environmental message. The Residential Sources and Outreach Workgroup (Outreach Workgroup) was responsible for overseeing sponsorship activities with the City of San Diego leading the coordination and implementation efforts.

The 2008 Fair was held June 14, 2008 through July 6, 2008, spanning two fiscal years and was included in the FY 2007-08 as well as the current FY annual reports. The attendance for the fair was estimated at 1,235,698 persons for the 21 days the event occurred. Sponsorship for the Fair included staffing an outreach booth for 11 days, in which the majority of jurisdictions provided staffing support. The City of Carlsbad provided staffing on June 21, 2008. The outreach booth served as the primary method for educating the public about watershed protection and pollution prevention. The Outreach Workgroup elected to promote Integrated Pest Management (IPM) as the primary theme and collaborated on the distribution of IPM materials in both English and Spanish. Individual jurisdictions were invited to distribute their own materials in addition to the IPM materials. The Copermittees received billing as both a Flower & Garden Show sponsor and an Enviro-Fair sponsor.

Think Blue was designated as the brand for the Copermittees during the event, and signage demarking the symbol included banners, planter box displays and recycle bid stickers, which were visible at over 500 locations at the Fair. Media exposure included TV, radio, and press releases. The sponsorship was printed in both the Fair program and included on the Fair map. Other promotions included newspaper advertisements, electronic messaging over the Jumbo Tron, website logos and links, and PA system announcements in both English and Spanish.

Think Blue, City of San Diego developed an event survey for the purposes of assessment. Over 1,200 survey cards were completed during the 11 days the booth was staffed. The questions focused on general storm water knowledge and awareness. The results were tabulated by the City of San Diego and were not available to the City of Carlsbad at the time of writing this report.

6.4.2 BMP Implementation

During FY 2008-09 the City implemented a program to reduce contaminants in urban runoff originating from existing residential areas. BMP information was made available to residents via the following:

- Storm water website and hotline
- Outreach events
- Direct mailings
- During investigations of suspected storm water violations.

Written materials (brochures, fact sheets, etc.), promotional items, and verbal explanation of BMPs were used to convey BMP information. In addition, various levels of enforcement actions were used as necessary to ensure the use of required BMPs. A listing of all education and outreach events and activities for residential audiences is addressed in Section 8 of this report. Discussion of investigations and enforcement actions for residential areas and activities are discussed in Section 6.4.5 and Section 7 of this report.

Website and Hotline

Information about water conservation, trash management, and storm water was located on one centralized web page accessed at www.carlsbadconserves.org. The Environmental Programs and Storm Water hotlines provided information about storm water, trash, and water conservation for the public. The hotline was answered by the Storm Water Protection Program during business hours and provided a detailed voice message after hours. In addition, outreach materials continued to be revised to include the Environmental Programs web page address and hotline number. During FY 2008-09 there were a total 44,944 visits, or average of over 123 hits per day to the Environmental Programs website.

Outreach Events

The City hosted or participated in several public events, which provided opportunities for residents to learn about pollution prevention and storm water BMPs. During these events residents had the opportunity to pick up printed materials, and to speak directly to storm water representatives. Table 6.1 is a summary of these events that took place during FY 2008-09.

Table 6.1: Outreach Events for Residential Community (FY 2008-09)

Event	Date	Type	Audience	Attendance
San Diego County Fair	6/21/08-07/06/08	Booth	General Public	1.2 million
Health Fair	7/12/08	Booth	General Public	500
Beach Cleanup	9/20/08	Booth	General Public	130
Citizen s Academy	10/9/08	Presentation	Carlsbad Residents	30
Aqua Hedionda Water Festival	3/21/09	Booth	General Public	850
Children s Day at The Flower Fields	3/28/09	Booth	General Public	4500
Citizen s Academy	4/2/09	Presentation	Carlsbad Residents	38
Earth Day Cleanup	4/18/09	Booth	General Public	250
Beach Cleanup	5/2/09	Booth	General Public	1000
Hosp Grove Cleanup	5/2/09	Booth	General Public	200

Direct Mailings

Table 6.2 outlines several direct mailings that were sent to Carlsbad Residents during FY 2008-09. Copies of the mailings can be found in Appendix 6.1, 6.2, 6.3, and 6.4. Table 6.2 provides a summary of direct mailings to Carlsbad Residents.

Table 6.2: Direct Mailings for Residential Community (FY 2008-09)

Date	Type	Topic	Number
Once per Quarter	News Letter Carlsbad Conserves	Storm Water BMPs	All Residents
Varies	Environmental Programs Guide	Solid Waste, Storm Water BMPS	All New Trash Customers
10/30/08	Informational Letter	Irrigation Runoff/ Storm Water BMPs	80
12/26/08	Informational Letter	Erosion Control/ Storm Water BMPs	17
3/02/09	Informational Letter	Irrigation Runoff/ Storm Water BMPs	91
3/19/09	Informational Letter	Erosion Control/ Storm water BMPs	10
6/26/09	Water Quality Report	Residential Storm water BMPs	38,000

Carlsbad Conserves, the Environmental Programs newsletter was mailed once each quarter during FY 2008-09. The newsletter informs residents of environmental issues facing Carlsbad, services provided by the City, tips of how to protect the environment, storm water BMPs, and a calendar of important dates.

The Environmental Programs Guide was sent to all new customers requesting trash service during the period during FY 2008-09. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution.

Four different informational letters were sent to a total of 198 residences, as part of complaint investigations in residential areas where inspectors found multiple possible sources of storm water pollution. Issues addressed included erosion control, irrigation runoff, and proper storm water BMPs.

Written Materials

Written materials including various brochures and fact sheets detailing storm water BMPs were distributed as necessary to residents through the avenues listed above.

Promotional Items

The Storm Water Protection Program distributed various promotional items with the storm water hotline and pollution prevention messages. The city had several new promotional items in FY 2008-09, including a book titled All the Way to the Ocean, a six pack cooler bag, recycle stickers for children, and a Recycled Bag Clip.

6.4.3 HHW, Used Oil, Bulky Items, and Environmental Programs Hotline

The City continued to operate the Household Hazardous Waste (HHW) and used oil recycling program outlined in the JURMP. During FY 2008-09 the City collected and disposed of approximately 167 tons of HHW (including recycled or diverted).

On April 18, 2009, the City sponsored a free HHW disposal day where Carlsbad residents could dispose of up to 15 gallons or 125 pounds of HHW materials. The City collected and disposed of

55,155 pounds of HHW during this event. Table 6.3 shows the types and quantities of HHW collected at the event.

Table 6.3: Items Collected During April 18, 2009 HHW Event

Type of Material	Weight In Pounds
1. Flammable & Poison	33,000
2. Acid	350
3. Base	400
4. Oxidizer	150
5. PCB-containing	0
6. Aerosol	1,600
7. Reclaimable	
a. Antifreeze	425
b. Car Batteries	1,680
c. HH Batteries	1000
d. Rechargeable Batteries	0
e. Fluorescent bulbs	880
f. Motor Oil/products	2,635
g. Oil Filters	60
h. thermostats/thermometers	5
8. Other	
a. Compressed Gas	399
b. CRT	0
c. E-Waste	11,421
d. Other	1,150
9. Asbestos	0
10. Grand Total	**55,155**

Carlsbad residents may dispose of two large bulky household items at no charge five times per year. In FY 2008-09 bulky item pick-up days were September 20, 2008, November 8, 2008, January 24, 2009, March 21, 2009 and June 20, 2009.

Residents used the Environmental Programs hotline and e-mail address to request information about the HHW program, trash, and recycling. The City s RFA system was used to track calls about Environmental Programs comments and questions from residents. During FY 2008-09 the Environmental Programs Division responded to 44 complaints/questions related to HHW, recycling, and solid waste. Table 6.3 includes a summary of these complaints.

Table 6.4 Summary of Environmental Programs Division Complaints

Issue Type Subtype	Total
HHW General Information	3
Recycling: Comment/Suggestion	1
Recycling: Complaint	5
Recycling: General Information	6
Recycling: Single Stream Request	14
Solid Waste: Complaint	5
Solid Waste: General Information	4
Solid Waste: Missed Collection	6
Total	**44**

6.4.4 Oversight of Residential Areas

The Water Conservation Specialist conducted regularly scheduled patrols of different residential areas within the City. The City was divided into 4 hydrologic areas. Patrols were conducted for a specified period for each area. Evidence of excess runoff from irrigation were investigated and on a case-by-case basis. Door hangers were left and a follow-up phone call or a site visit conducted to evaluate irrigation. When there were large areas or neighborhoods with extensive irrigation runoff mailings were conducted to educate residents of the problem.

6.4.5 Enforcement in Residential Areas

Storm water staff handled all residential complaints and subsequent enforcement actions in accordance with the City s existing procedures and Carlsbad Municipal Code. Each observed violation was documented using the RFA system.

During FY 2008-09, the Storm Water Protection Program received 195 storm water related complaints. Of those complaints, 116 occurred in residential areas. 35 of the complaints that occurred in residential areas involved mobile sources. Enforcement actions for those are outlined in the Section 7, submitted in December 2009. Seven complaints were referred for action , meaning, that the investigation or resolution of the issue did not fall under the jurisdiction of the Storm Water Protection Program. Examples include wastewater discharge or cleanup of street or storm drain. There were 33 residential complaints in which no violation was found, due to either the source not being found or the reported pollutant discharge not being found. There were 41 enforcement actions for residential complaints. Table 6.4 and Figure 6.1 show a summary of residential enforcement actions. A summary of all complaints responded to can be found in Appendix 7.3, submitted in December 2009.

Table 6.5: Summary of Residential Enforcement Actions FY 2008-09

Enforcement Action	Number
Informational Letter	15
Notice of Violation	3
Verbal Warning	21
Written Warning	2
Total	**41**

Figure 6.1: Residential Enforcement Actions FY 2008-09

6.5 Notable Activities

As mentioned in the Executive Summary, the City considers a notable activity to be any activity above compliance requirements.

Notable activities for FY 2008-09 include:

- Stormwater and BMP information included in the annual Water Quality Report mailed to 38,000 households in the Carlsbad Municipal Water District.
- Four informational letters sent to a total of 198 households addressing storm water pollution issues in the neighborhood, in response to complaint investigations.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION (IDDE)

The City s Illicit Discharge Detection and Elimination (IDDE) will be submitted in December 2009 as approved by the Regional Board in Addendum 2, Order 2007-0001.

8.0 OUTREACH AND EDUCATION COMPONENT

8.1 Introduction

Public and municipal employee education is integral to the success of Carlsbad s urban runoff management program. The City continues to increase public awareness about pollution prevention and promote behavioral changes and environmental stewardship. The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent. The City continued to be actively involved in outreach and education efforts at the local level, the watershed level (North County Storm Water Program), and the regional level (Project Clean Water Outreach Workgroup). These efforts are further discussed in the following subsections by target audience.

8.2 Staff Training Element

Storm water training for municipal employees included general training and job specific training for designated departments and personnel. The objectives of the employee training programs are as follows:

- Promote a clear understanding of the urban runoff and water quality issues, including activities that can potentially pollute receiving water bodies.
- Identify and implement strategies for BMPs.
- Promote employee ownership of the problems and their ability to apply solutions.
- Integrate employee feedback into training and BMP implementation.

8.2.1 General Employee Training

During FY 2008-09, City employees received storm water training covering issues such as the causes of storm water pollution, how it affects the environment, and the overall structure of the storm water program. Messages related to general training may include, where applicable, the topics listed in the Permit. City staff received information and general storm water training through various communication methods including:

1. Storm Water Webpage: Employees were able to download BMP brochures and the JURMP directly from the City s website.
2. Intranet: The City s intranet was used to post messages and inform employees of various events and opportunities for participation, such as the Coastal Cleanup Day and Earth Day activities.
3. Public Works Newsletters: During FY 2008-09 every edition of Public Works newsletters featured updates on the Storm Water Protection Program and Environmental Programs. Employees were notified by e-mail when these newsletters were published and posted on the City s intranet, and hard copies were given to maintenance personnel.
4. Promotional Items: Items such as water bottles, notepads, mouse pads, cups, and pens with the hotline numbers and other pollution prevention messages continued to be distributed to employees.
5. Hotline Decals and Notepads: Car window decals and notepads with the storm water hotline were distributed for employee use in the field.
6. Paycheck Stuffer: City employees received a double-sided training fact sheet detailing urban runoff concepts, storm water BMP information, permit requirements and regulations, and other topics such as GIS mapping of the storm water conveyance system, the

expanded purchase program of clean city vehicles, and the implementation of the Waste Reduction Strategy.

7. First Mondays: During FY 2008-09, all new employees attended an orientation training called First Mondays. The training session includes general information about the City and regular Human Resources issues, as well as NPDES regulations, the City's JURMP and Storm Water Pollution Prevention BMPs applicable to municipal personnel.

8.2.2 Job Specific Training

Several job positions were identified that require activity or job specific storm water training. A summary of municipal employee training is in Appendix 8.2. Table 8.1 identifies the departments with personnel that should receive job specific training.

Table 8.1. Department and Positions for Job Specific Storm Water Training

MSA	Department	Positions
PW	Engineering, Construction Inspections	Construction Inspectors
PW	Engineering, Engineering Development Services	Associate Engineer, Assistant Engineer
PW	Environmental Programs, Storm Water	Environmental Specialists, Interns
PW	Environmental Programs, Water Conservation	Water Conservation Specialist
PW	General Services, Streets Division	Street Maintenance Workers
PW	General Services, Facilities Maintenance	Building Maintenance Workers
PW	General Services, Parks	Maintenance Workers
PW	General Services, Landscape Maintenance	Maintenance Workers
PW	General Services, Vehicle Maintenance	Equipment Technicians, Equipment Service Worker, Shop Assistant
PW	Maintenance and Operations, Utility Operations	Meter Services Workers; Sanitation System Operators; Water System Operators
PW	Maintenance and Operations, Construction/Maintenance	Utility Workers; Maintenance Workers
Com-Dev	Planning, Building, Code Enforcement	Building Inspectors, Planners, Code Enforcement,
Safety	Fire Department	Fire Fighters

8.2.3 Storm Water Committee

The Storm Water Committee continued to meet monthly to discuss and develop a calendar of storm water training activities for staff, coordinate compliance activities and documentation, create and distribute job specific storm water training information, and standardize documentation of training activities. A summary of Storm Water Committee meeting topics during FY 2008-09 can be found in Appendix 8.3.

8.2.4 Storm Water Leadership Team

In FY 2008-09, the City of Carlsbad's City Manager continued the Storm Water Leadership Team (SWLT). Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City's major service areas and Directors. Agenda items covered areas of the City's compliance with Order No. R9-2007-0001.

8.2.5 Special Events Committee

Construction management and inspection staff and environmental programs staff attend the monthly Special Events Committee meeting to coordinate upcoming event operations and activities. As a standing agenda item, storm water and NPDES compliance are discussed at each meeting to ensure staff understand their role in pollution prevention.

8.2.6 Other Training

During FY 2008-09, the City continued to implement the waste reduction program. Education continued with the internal single stream recycling program. The larger recycling containers placed in public meeting areas throughout the City continue to be utilized. Seen as an effective program, the City implemented new waste reduction programs at all City facilities: double siding copies and print jobs, and reusing beverage containers. Roll out of these new programs included the development of posters, fact sheets, and a presentation to educate and inform employees about the importance and benefits of recycling, reducing and reusing.

On October 21, 2008, the City of Carlsbad s Special Events Committee hosted a Special Events Workshop for promoters and event organizers. The workshop provided event promoters and organizers with assistance and training about City parks, storm water pollution prevention, sanitation and recycling, the application process, and new NPDES requirements. Featured speakers and members from the Special Events Committee were on hand to provide the most current information about each component of the special events process and answer questions.

In addition, staff coordinated with the Finance Department to insert a Storm Water Training Fact Sheet into all employee paychecks on April 23, 2009. This fact sheet can be found in Appendix 8.1.

8.3 Educational Outreach Element

8.3.1 New Development and Construction Communities

The City continued to educate these communities during FY 2008-09 through the distribution of print materials in person and through the mail, as well as through website postings.

City inspectors worked with new businesses and construction communities during inspections and investigations to identify storm water compliance issues, detail corrective actions and assess the appropriateness of BMPs.

8.3.2 Construction Site Owners and Developers

The City of Carlsbad is committed to working with developers and contractors to ensure that BMPs are implemented at all construction sites. The *Pollution Prevention Guide for the Construction Industry* brochure continues to be distributed at pre-construction meetings. In addition, storm water and NPDES compliance were a part of the regular agenda for each of the meetings. Pre-construction meetings are required for all new development, CIP, and major construction projects in Carlsbad.

Construction and Development Services provided information and education to applicants and developers during one-on-one or small group meetings, inspections, complaint investigations, and during pre-construction meetings. They also provided sample SWPPPs and SWMPs for engineers, developers, and applicants to use as guides when preparing documents for proposed development projects. Copies of these documents and the SUSMP are available at the City s Permits Counter. The SUSMP is also available through the City s internet site.

The Storm Water Protection Program also continued to distribute the *Pollution Prevention Guide for the Construction Industry*. This brochure was developed to provide BMP and pollution prevention information related to materials storage, perimeter controls, building and staging areas, dumpsters and port-a-potty services, tracking controls, concrete trucks and pumpers, washout areas, dirt and grading, earthmoving equipment, and storm drain protection. The brochure was distributed to commercial businesses that conduct small remodeling or home improvement projects.

The City continued to conduct and participate in workshops to educate external parties, which include project applicants, developers, contractors, and property owners on the implementation of the storm water program and requirements for construction sites.

8.3.3 Commercial and Industrial Owners and Operators

The City continued to educate commercial and industrial owners and operators through various methods. This included the distribution of printed materials, participation at workshops, presentations to business community groups, direct mailings, inspections and site visits. Accomplishments are detailed below.

1. Printed Material

During FY 2008-09, the new *Best Management Practices for Mobile Service Providers* brochure continued to be provided to residents during complaint investigations related to mobile service provider discharges.

The brochure on Best Management Practices for Restaurants and Lawn & Garden Care was revised, printed and distributed through public events and public displays in FY 2008-09.

Most of the storm water protection printed materials were available for download from the City s website and Environmental Programs website. There were 44,944 annual or over 123 daily visits to the Environmental Programs web pages during this reporting period.

Various Storm Water Protection Program brochures continued to be stocked at City kiosks and display racks.

During FY 2008-09, the City continued to distribute the *Best Management Practices for Businesses – Commercial and Industrial* brochure listing and describing minimum BMPs. This brochure was distributed to businesses during inspections and by direct mail.

In June 2009, the City mailed 38,000 copies of the Carlsbad Municipal Water Districts Drinking Water Quality Report to residents, which included reference to residential Storm Water BMPs.

2. Website and Hotline

The storm water hotline continued to be listed on all printed material. Industries and commercial businesses can call the hotline to request BMP information. All brochures also continued to be available through the City website. During FY 2008-09, there were 44,944 visits to the Environmental Programs web page.

The hotline has a continuous on-hold message that provides residents with information about events in the City. Staff used the information line to inform residents of the Environmental Programs web page, telephone number, upcoming outreach events, City services, bulky item collection day, and HHW collection facilities.

New methods to track calls were implemented July 1, 2008. In FY 2008-09 there were a total of 564 calls to the storm water hotline.

3. Inspections and Site Visits

City inspectors worked with businesses, construction sites, and special event promoters during inspections and investigations to identify storm water compliance issues, detail corrective actions, and assess the appropriateness of BMPs.

8.3.4 Quasi-Government Agencies/Districts (i.e. Educational Institutions, Water Districts, Sanitation Districts, etc.)

The City continued to educate these communities during this reporting period through the distribution of printed materials in person and through the mail, as well as through website postings.

The City meets bi-monthly with agencies within the Carlsbad jurisdiction to discuss construction projects that impact various utility operations. As a standing item on the Utility Coordination Committee Meeting agenda, storm water and NPDES is discussed to ensure other agencies that work in Carlsbad understand the requirements of the Permit, JURMP, and CMC.

During this reporting period, the City inspected seven water and sanitation facilities as part of the industrial inspection program. Educational information was provided during the inspections, as well as in written inspection reports.

8.3.5 Residential Community, General Public, and School Children

Carlsbad continued its ongoing outreach to the residential community, school children, and the general public during this reporting period. This included the development and distribution of printed materials, public outreach events, presentations, published articles, videos, website access, and direct interaction with the public. Carlsbad actively pursued a comprehensive environmental education and outreach program, combining the activities of storm water, solid waste and water conservation under the umbrella of Environmental Programs. The purpose was to create a unified message, better educate the public, and allow easy access to information. These accomplishments are described below.

1. Printed Material

Since the spring of 2006, the City of Carlsbad has been offering a door-to-door Household Hazardous Waste collection program. Residents gather their HHW, and then call for an

appointment to have these items collected and disposed of properly. The City continued to distribute this brochure on Household Hazardous Waste during this reporting period.

A Household Hazardous Waste Recycling Used Motor Oil flyer was developed in FY 2008-09. This flyer contained information, tips and best management practices on how to protect our waterways and dispose of used motor oil and filters properly.

Most of the storm water protection printed materials were available for download from the City's website and Environmental Programs website. There were 44,944 visits to the Environmental Programs web pages during this reporting period.

Various Storm Water Protection Program brochures continued to be stocked at City kiosks and display racks.

2. Direct Mailings

Carlsbad Conserves, the Environmental Programs Newsletter was mailed to all residents four times during FY 2008-09. The newsletter is intended to inform residents of environmental issues facing Carlsbad, services provided by the City, tips of how to protect the environment, including storm water BMPs, and a calendar of important environmental dates (household hazardous waste disposal, bulky item pick up, etc.). Copies of all four editions can be found in Appendix 6.1.

The Carlsbad Community Services Guide was mailed three times a year to all Carlsbad households (approx. 40,000). The Fall 2008 and Spring 2009 editions included residential storm water BMPs and Environmental Programs information in full-page advertisements. A copy can be found in Appendix 8.4.

The Environmental Programs Guide was sent to all new customers requesting trash service. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution. A copy of the brochure can be found in Appendix 6.2.

3. Underserved Target Audiences, High Risk Behaviors, and Allowable Behaviors and Discharges

The educational material presented in the school education program, explained below, reaches out to the Spanish-speaking communities and Low-Socio-Economic Status families increasing knowledge and awareness with less complicated and/or confusing messages.

During this reporting period, the City of Carlsbad offered brochures in the Spanish language, providing important information on Automotive Service and Repair Shops, Lawn and Garden Care and Restaurants. These brochures were developed to raise awareness in the Spanish-speaking community about the difference between storm water conveyance systems and sanitary sewer systems, the connection of storm drains to local waterways, and common residential sources of urban run-off. The brochures include BMPs, the City's logo, website address and the City's storm water phone number. These materials are available at various City facilities, through public events and the City's storm water web page, accessed at www.carlsbadconserves.org.

Staff collaborates with the Regional Education and Residential Sources workgroup focusing on the development of a regional brand, a regional website, mass media and public relations, materials development and distribution, underserved target audience, market research and assessment tools, partnership development and regional events. Staff will continue to participate in these areas with accomplishments reported in the next annual report.

4. Classroom Education

During this reporting period, the Solana Center for Environmental Innovation (Solana Center) continued to conduct the *Classroom Watershed Program* for the City. The Solana Center used the *EnviroScape* interactive model to teach students about watershed stewardship and pollution prevention. Outreach materials and workbooks were provided to the students and teachers. Storm water fliers announcing the free presentations were distributed to teachers.

The education material presented reaches out to the Spanish-speaking communities and Low-Socio-Economic Status families increasing knowledge and awareness with less complicated and/or confusing messages.

Each classroom was given a watershed poster, handouts for ten simple ways to help protect the ocean, guides to HHW alternatives and disposal (English and Spanish), and a recycling guide for students to take home. Students were also given pledge cards to sign and take home. The pledge cards read as follows:

1) I pledge not to dump anything down the storm drain.
2) I pledge to remind my family to properly dispose of toxic materials such as paint, cleaners, and pesticides.
3) I pledge to pick up after my dog (given only to those with dogs).

Table 8.2 lists all of the schools and the number of classrooms and students that attended the watershed classroom presentation during this reporting period.

City Stuff is an outreach program which evolved through a partnership between the City of Carlsbad and Junior Achievement program. The program reaches over 50 3rd-grade classrooms in Carlsbad (across district lines) and information filters home to the parents/residents. Students learn how Cities are planned, operated, and what services are offered. They also learn about important businesses in a City. Out of the six lessons taught, three of the lessons are Carlsbad specific, and one lesson is focused on City departmental programs, including reference to Storm Water Pollution Prevention.

4) Advertisements

From July 01, 2008 to June 30, 2009, advertisements were published in the Carlsbad Magazine and the Community Services Guide. Table 8.3 lists the published ad and the estimated circulation.

Table 8.3. Dates of Publication of the Environmental Programs Advertisements

Ad	Month	Publication	Circulation
Environmental Programs Ad	Mar-Apr 2009	Carlsbad Magazine	80,000
Environmental Programs Ad	May-June 2009	Carlsbad Magazine	80,000
Environmental Programs Ad	May 2009	Community Service Guide	40,000

5) Website and Hotline

Most of the printed materials were available for download from the City s website and Environmental Programs website. There were 44,944 annual or over 123 daily visits to the Environmental Programs web pages during this reporting period.

6) Information Line/On-hold Messages

A continuous on-hold message provides residents with information about events in the City. Staff used the information line to inform residents of the Environmental Programs web page, telephone number, upcoming outreach events, City services, Bulky Item Collection Day, and HHW collection facilities.

7) Kiosks/Display Racks

Various Storm Water Protection Program brochures continued to be stocked at City kiosks and display racks.

8) Targeted Neighborhood Outreach Campaign

The 2009 Calendar and Community Guide, a 122-page bound calendar, was mailed during the year to all Carlsbad residents. An advertisement related to water quality was included during FY 2008-09. Approximately 47,000 were printed for distribution.

Table 8.4 includes a summary of the number of homes targeted and the information they received mailed in Fall and Winter of 2008 and Spring of 2009.

Table 8.4: Targeted Neighborhood Education.

Neighborhood Site	Number of Homes	Brochures Distributed
Rancho Carillo	80	Over-watering, landscape maintenance
Elmwood Drive	17	Erosion control, landscape maintenance
Calavera	91	Irrigation Runoff Reduction Watershed Pilot Project
Alga	10	Erosion control, landscape maintenance
Total	**198**	

9) Prompts and Promotional items

Environmental Programs distributed recycling bags to residents at the Citizen s Academy Event. The recycling bags displayed the Environmental Programs logo and phone number. The bags were also designed to encourage residents to recycle aluminum, glass, paper, and other materials.

In FY 2008-09, the City distributed 400 *Bags on Board* dispensers to residents as part of the education and outreach program. The product promotes proper pet waste disposal and the prevention of storm water pollution.

The Storm Water Protection Program continued to distribute pollution prevention message pens to Carlsbad residents and City employees. Several existing storm water, solid waste, and water conservation materials were also distributed, including oil funnels and rags, key chains, buttons, notepads, cups, Frisbees, magnets, and a variety of other products.

10) Public Events

The City hosted or participated in several public events, which provided opportunities for residents, school children, and the general public to learn about storm water pollution prevention. During most of these events, a staffed booth was set up, and residents and children had the opportunity to pick up printed materials, view an *EnviroScape* model demonstration, and speak directly with City storm water representatives. Table 8.5 includes a summary of these public events for FY 2008-09.

Table 8.5. Outreach Events for Residents, General Public, and School Children

Event	Date	Type	Audience	Attendance
Employee Health Day	7/12/2008	Booth	General Public	500
Coastal Cleanup Day	9/20/2008	Booth	General Public	130
Citizen s Academy	10/09/2008	Booth	General Public	30
Agua Hedionda Water Festival	3/21/2009	Booth	General Public	850
Children s Day at the Flower Fields	3/28/2009	Booth	General Public	4,500
Citizen s Academy	04/02/2009	Booth	Residents	38
Earth Day Cleanup	04/18/2009	Booth	General public	250
Household Hazardous Waste Event	04/25/2009	Drive-thru	Residents	501
Beach Fest Cleanup	05/02/2009	Booth	General public	1000
Hosp Grove Cleanup	05/02/2009	Booth	General public	200

11) Direct Interactions

Residents were also educated about pollution prevention and BMPs during complaint investigations. City inspectors met with residents to explain storm water regulations and pollution prevention. When a resident was not available, a door hanger and other outreach materials were left to provide information about the reported discharge. Typically, follow-up informational letters were sent to homeowners and/or contractors after an investigation. These correspondences included brochures and fact sheets about storm water. Additional information on residential complaint investigations is provided in Section 6.4.5.

9.0 PUBLIC PARTICIPATION

9.1 Introduction

This section describes the activities of the City for the FY 2008-09 reporting period with respect to the implementation of the Public Participation Component of the 2008 JURMP.

9.2 Public Meetings and Hearings

The public had numerous opportunities to attend meetings at the local, watershed and regional levels, in order to learn about the City s implementation of the Permit and to have their concerns addressed.

City Council Meetings were held in the Council Chambers at Carlsbad City Hall and were open to the public. The City of Carlsbad also offers residents and visitors the opportunity to view City Council meetings via the Internet. Regularly scheduled Carlsbad Council meetings air live on Tuesday evenings at 6 pm. Local viewers could also watch Council Meetings live on the local cable channel. Each meeting and agenda was posted online approximately two hours after the conclusion of each meeting. Past meetings are available for up to a year on the City's own archive video portal. Users can conveniently "keyword search" through the audio/video content and "jump to" meeting discussion items in real-time by using a drop down menu. Agendas from previous meetings can be accessed through the City's Document Management System.

The Planning Commission is comprised of seven members appointed by the City Council. This commission makes recommendations to the City Council regarding implementation and updating of the General Plan. When needed, they also provide recommendations to the Council regarding policy issues that affect long-range planning. They review development projects, provide recommendations to the City Council, provide reports to the City Council on the Local Facilities Management Plans, review the annual CIP for consistency with Growth Management Program, identify potential problems and opportunities facing the City, and suggest special studies when appropriate. During this reporting period the City also provided live streaming of Planning Meetings that are typically held on the first and third Wednesday of each month at 6 pm. Table 9.1 contains a list of Regularly Scheduled City Council and Planning Commission Meetings during FY 2008-09.

Table 9.1: Carlsbad Public Meetings FY 2008-09

City Council Meetings			Planning Commission Meetings		
07/01/2008	12/02/2008	04/01/2009	03/03/2008	11/05/2008	03/04/2009
07/15/2008	11/18/2008	04/07/2009	07/02/2008	11/19/2008	03/18/2009
07/22/2008	12/09/2008	04/14/2009	07/16/2008	12/03/2008	04/01/2009
08/05/2008	12/12/2008	04/21/2009	08/06/2008	12/17/2008	04/15/2009
08/12/2008	01/06/2009	04/28/2009	08/20/2008	01/07/2009	05/06/2009
09/09/2008	01/13/2009	05/05/2009	09/17/2008	01/21/2009	05/20/2009
09/16/2008	01/27/2009	05/12/2009	10/01/2008	02/04/2009	06/03/2009
09/23/2008	02/10/2009	05/19/2009	10/15/2008	02/18/2009	06/17/2009
10/07/2008	02/17/2009	06/02/2009			
10/14/2008	03/10/2009	06/09/2009

11/04/2008	03/24/2009	06/23/2009			

Residents could also become representatives on various City committees. The City Clerk's office maintained a current list of City Boards, Commissions, and Committees, current vacancies, meeting dates and times, and coordinated all appointments to these positions.

In addition, the public could attend the Copermittee Management Committee Meetings and other Copermittee meetings. Notices of these meetings were available from the Project Clean Water website at www.projectcleanwater.org. Table 9.2 lists the dates of these meetings.

Table 9.2 Copermittee Public Meetings FY 2008-09

Municipal Storm Water Copermittee Meetings				
Management Committee	Outreach Workgroup	Regional Monitoring Workgroup	Coastal Storm Drain Monitoring Sub-Workgroup	Dry Weather Monitoring Sub-Workgroup
07/17/2008 01/15/2009 03/19/2009	01/19/2008 01/21/2009 03/18/2009 05/20/2009	07/22/2008 10/28/2008 11/25/2008 12/18/2008 01/27/2009 02/24/2009 03/24/2009 04/28/2009 06/10/2009 06/30/2009	10/15/2008 11/13/2008 01/14/2009 04/02/2009	10/14/2008 10/28/2008 02/18/2009 03/17/2009 04/22/2009

9.3 Feedback Mechanisms

In addition to the public participation opportunities available through public meetings and hearings, numerous other feedback mechanisms promoted public involvement.

9.3.1 Hotline and E-mail Address

The public was encouraged to provide input and feedback on the Storm Water Protection Program implementation. In addition to the public meeting opportunities detailed above, the public could call the storm water hotline to request information, provide comments, or make illegal discharge reports. The public could also send e-mails directly to the Storm Water Protection Program at stormwater carlsbadca.gov. There were several other public contact phone numbers and City e-mail addresses available for public use. Other City departments forwarded comments and questions to the Storm Water Protection Program as needed. The public accessed the Storm Water Protection Program web page through the City s website, which provided information about the storm water requirements and BMPs.

The public used the Environmental Programs hotline and e-mail address to obtain information about HHW, trash, and recycling programs. The City s Request for Action (RFA) system was used to track calls about Environmental Programs comments and questions from residents. During FY 2008-09 the Environmental Programs Division responded to 44 complaints/questions related to HHW, recycling, and solid waste.

9.3.2 Direct interaction

The City relied on interactions between City staff and the public to convey messages about storm water and pollution prevention. City staff received targeted training to increase their understanding of urban runoff issues. Staff interaction with the public also provided additional opportunities for the City to obtain direct feedback about BMPs, ordinances, and pollution prevention efforts.

9.3.3 General Outreach

Efforts through printed ads, newspapers, press releases, media interviews, PSA s, the Community Calendar, City guides, brochures, water bill stuffers, and other publications were used to keep the public informed of storm water requirements, updates, and public participation opportunities. Specific outreach efforts are discussed in Section 8 of this report.

9.3.4 Storm Drain Stenciling

Stenciling storm drain inlets with *No Dumping – Drains to Ocean* messages reminds citizens and businesses not to pollute waterways. Stencils were available upon request to businesses and residents who were interested in stenciling private storm drains. Public inlets are marked by the Streets Department.

9.3.5 Public Surveys

The BW Research Partnership, on behalf of the City, conducted an annual *Public Opinion Survey* of Carlsbad residents. The city-wide telephone survey of residents was administered from September 3 through 18, 2008 and averaged 20 minutes in length. In total, a statistically representative sample of 1,000 Carlsbad residents 18 years and older completed a telephone survey, resulting in a maximum margin of error /- 3.08 percent (at the 95 percent level of confidence) for questions answered by all 1,000 respondents. There were three questions related to storm water quality on the 2008 survey. The results of these questions are summarized in Section 11 of this report. The entire report is available for download from the City s website. Surveys helped the City understand how the public perceives storm water which can help foster better planning and management programs.

9.4 Community Events and Volunteer Efforts

The City s Community Volunteer Coordinator administered outreach and involvement programs for Carlsbad residents. This position continued to find volunteers to assist the Storm Water Protection Program with various activities, including cleanup events. The City participated in several community events held in Carlsbad and other locations across the county. These events are summarized in Table 9.3.

Table 9.3: Community Events FY 2008-09

Event	Date	Type	Audience	Attendance
San Diego County Fair	6/21/08-07/06/08	Booth	General Public	1.2 million
Health Fair	7/12/08	Booth	General Public	500
Beach Cleanup	9/20/08	Booth	General Public	130
Citizen s Academy	10/9/08	Presentation	Carlsbad Residents	30
Aqua Hedionda Water Festival	3/21/09	Booth	General Public	850
Children s Day at The Flower Fields	3/28/09	Booth	General Public	4500
Citizen s Academy	4/2/09	Presentation	Carlsbad Residents	38
Earth Day Cleanup	4/18/09	Booth	General Public	250
Beach Cleanup	5/2/09	Booth	General Public	1000
Hosp Grove Cleanup	5/2/09	Booth	General Public	200

9.5 Other Public Participation Opportunities

During FY 2008-09 the Storm Water Protection Program had an intern working on various projects, including complaint response, commercial and industrial inspections, data management, outreach and education, and coastal storm drain monitoring. She participated in inspections, water quality studies and monitoring, data entry, and investigations. Her university background and coursework added valuable insight and academic perspective to overall programs.

10.0 FISCAL ANALYSIS

10.1 Introduction

This section provides a Fiscal Analysis of the Storm Water Pollution Prevention activities in the City of Carlsbad. This methodology was developed by the Copermittees in January 2009 in accordance with sections, G, J.1 a(3)(k) and J.1.c(1)(d) of NPDES Order No. R9-2007-0001. The data provided in this section is based on actual expenditures for the period from July 1, 2008 through June 30, 2009.

10.2 General Budget Information

In FY 2002-03 and 2003-04, the City conducted a fee study to evaluate possible financing mechanisms for the Storm Water Protection Program. The new financing mechanism was detailed in the □*City of Carlsbad Storm Water Pollution Protection Program Regulatory Fee Study Report*□, dated September 12, 2003. The report recommended funding the storm water program through an increase in the City□s Solid Waste Service fees and new development processing fees. Nearly all of the pollutants discharged into the MS4 are classified as solid waste under state and local codes. Based on this information and other findings, the City implemented a *Solid Waste Service* fee increase for residential and commercial service users to fund certain Storm Water Protection Program activities. The amount of the fee increase is calculated based upon the apportioned costs to the business and residential service users and their contribution to the pollutant loading. This fee was last reviewed in June 2007, and updated to reflect current workloads. The current fee is □3.46 per month for residential customers, and 23.09□ of the base trash rate for commercial customers.

The total operating costs to fund the storm water program activities related to existing development for FY 2008-09 were budgeted at □3,025,171. This is a slight reduction from FY 2007-08, due to lower costs of implementing the Permit in year two, coupled with the downturn in the economy and the City□s efforts to reduce budgets in lieu of having to lay-off staff, without any adverse impact to compliance levels. Additionally, expenditures were expected to decrease during this year due to having a better understanding of the resources necessary to implement the NPDES permit. A summary of expenditures for the City of Carlsbad□s Storm Water Program is included as Appendix 10.1.

10.3 Fiscal Analysis Methods

The data presented here was derived from the City of Carlsbad□s financial reporting system, IFAS. Some estimates are made where specific activities are not clearly delineated in the budget.

10.4 Fiscal Analysis Results

10.4.1 Expenditures

For FY 2008-09 ending June 30, 2009, a total of □2,561,593 was spent, with □2,282,989 spent on JURMP activities, □184,956 spent on WURMP activities, and □93,647 spent on RURMP activities. A breakdown of expenses is reported in appendix 10.1.

10.4.2 Funding Sources

The Permit requires the City to secure the resources necessary to meet the requirements of the Permit and the JURMP, and to conduct an annual fiscal analysis. The analysis must evaluate the expenditures necessary to accomplish the activities identified in the JURMP and describe the sources of the funds used to meet the expenditures. The Storm Water Protection Program is comprised of numerous program activities funded from a variety of sources. Table 10.1 summarizes the storm water protection program activities and identifies the current funding source:

Table 10.1. Summary of Program Activities and Current Funding Sources

Program Activity	Funding Source(s)
Storm Water Facility Capital Improvement Program	Developer Impact Fees, Developer Exactions, General Fund, Gas Tax, TransNet Sales Tax, Federal and State Grants
Storm Water Facility Maintenance and Operation Program including Street Sweeping, Litter Removal and Storm Event Readiness and Patrolling	Solid Waste Service Fees, General Fund
Storm Water Program Administration	Solid Waste Service Fees
Illicit Detection and Illegal Discharge Enforcement Program	Solid Waste Service Fees
Commercial/Industrial SWPPP Inspection Program	Solid Waste Service Fees (charged to commercial service customers only)
Construction Related SWPPP Review and Inspection Program	Developer Fees

11.0 EFFECTIVENESS ASSESSMENT

The effectiveness assessment is based on data for Fiscal Year 2008-09 and focuses on the assessment of three areas, as required in Section I.1.a.(1) of Order No. R9-2007-0001: significant activities, components, and an integrated assessment.

- Section 11.1 assesses the significant activities as listed in the City s JURMP. Each significant activity has an associated measure and targeted outcome. These measures relate to various levels in the range of Levels 1-4 outcome levels, assessing permit compliance, changes in knowledge and awareness, changes in behavior/BMP implementation, and load reductions.

- Section 11.2 assesses each component identified in Section I.1.a.(1)(b). The components include Development Planning, Construction, Municipal, Industrial/Commercial, Residential, Illicit Discharge Detection and Elimination, and Education. Each component assessment uses various levels in the range of Levels 1-4 outcome levels where measures have been developed applicable to the component.

- Section 11.3 provides an integrated assessment, combining conclusions from the individual component assessments and water quality data. At this time, it is not always feasible to link jurisdictional activities and components to changes in discharge and receiving water quality. This assessment draws conclusions where possible and may be further developed as more water quality data is collected in future years.

11.1 Significant Activity Assessment

The identification of significant activities was performed during the development of the JURMP. These significant activities targeted measurable outcomes, and results for FY 2008-09 are listed in Table 11.1. Some of the measurable goals are related to Levels 1-4 of the Effectiveness Assessment Outcomes as defined in Attachment C of Order No. R9-2007-0001.

Level 1: Compliance with Activity Based Permit Requirements

Where required during this fiscal year, all compliance based permit activities were completed successfully at or above 100 compliance. These measures are effective at determining the City s compliance with the permit.

The compliance measure for the Land Development Category is a new permit requirement that must be completed prior to the onset of the rainy season, October 1 each year. All required inspections were performed prior to October 1, 2008 for the 2008 Dry Season. For 2009 Dry Season, 2/5 of the total number of inspections were required prior to June 30, 2009. Other measures appear to be appropriate for assessing compliance this year and the City was in compliance on all counts.

Level 2: Changes in Knowledge/Awareness

Changes in knowledge and awareness of storm water requirements were assessed using two significant activities or measures as described in Table 11.1.

As a part of the business inspection program, the City implemented a rating system to assess the general knowledge of storm water requirements during inspections. This measure has been used for several years in the industrial and commercial inspections programs. For this measure, data collected during FY 2008-09 was compared to data collected during FY 2007-08. As shown in the table, the average knowledge/awareness at these businesses remains consistent this year. Slight variances from year to year may reflect the difference in assessments by the various inspectors.

The second method to assess changes in knowledge and awareness compares quiz scores that are administered before and after class room presentations to school aged children. In general, the knowledge base before the presentation is low. Quizzes administered this year showed only 6 of the children had an awareness of storm water prior to the presentation. After the presentation, the number of children aware of storm water issues rose to 89 of the children. This demonstrates an increase in storm water awareness in 83 of the students that were present during the presentations. By measuring this change, it appears that the presentations are effective at increasing the children s knowledge of storm water issues.

Level 3: Behavioral Change/BMP Implementation

The mechanism the City used to assess behavior change is the BMP inspection ratings for industrial and commercial businesses, assessed during site inspections.

As a part of the business inspection program, the City used the one to five rating system to assess BMP implementation (i.e. behavior change) at the establishments during industrial and commercial inspections. Because this measure has been used for several years data collected during FY 2008-09 was compared to data collected during FY 2007-08. As shown in Table 11.1, the average measured BMP implementation at these businesses was consistent with previous years. In general, BMP implementation remained relatively high this fiscal year. A comparison of the changes over the past four years is discussed below in Section 11.2.

Level 4: Load Reductions

There are two significant activities that provide direct load reductions of various pollutants. These include storm drain cleaning and street sweeping activities, providing estimations of the removal of trash, sediments, and debris from these facilities. These activities account for the removal of 55 tons of trash, sediment, and debris from the storm drain system and 1080 tons from street sweeping activities.

Additionally, the City uses two estimations of load reductions related to residential outreach and education activities in an attempt to quantify the amount of nutrients and bacteria prevented from entering the MS4. These estimations are dependent on the types of education and outreach utilized and relate this education to reductions in fertilizer usage (i.e. nitrogen and phosphorous reductions) and reductions in pet waste (i.e. bacteria) entering the MS4.

Table 11.1 contains relevant information pertaining to the significant activities defined in the City's JURMP. This data is used to determine if these activities are considered effective.

Table 11.1 Significant Activity Assessment Table

Component	Significant Activity	Method	Measure	Level	Targeted Outcome	Data	Result	Program Effective? YES/NO			
								Compliance	Knowledge Change	Behavior Change	Load Reduction
								Level 1	Level 2	Level 3	Level 4
Land Development	1. Post construction BMP inspection: inspections performed/inspections required.[1]	Confirmation	Performed /Required	Compliance (1)	05/01/08 to 10/01/08 *100% High Priority *50% Medium Priority	85/85 H 81/41 M	100% H 197.6% M	Yes	N/A	N/A	N/A
					05/01/09 to 06/30/08 *40% High Priority *20% Medium Priority	112/52 H 228/65 M	215.4% H 351% M	Yes	N/A	N/A	N/A
Construction	1. Were all required inspections performed during the wet season?	Confirmation	Performed /Required	Compliance (1)	100%	1855 /1415	127%	Yes	N/A	N/A	N/A
Municipal	1. Were all required facility inspections performed under Order 2007-0001?	Confirmation	Performed/ Required	Compliance (1)	100%	63/63	100%	Yes	N/A	N/A	Yes
	2. Were all required catch basin inspections performed?	Confirmation	Performed /Required	Compliance (1)	100%	3446/ 3446	100%				
	3. How much debris was removed from the MS4?	Direct Measure	Tons	Load Reduction (4)	N/A	55	N/A				
	4. How much debris was removed from street sweeping activities?	Direct Measure	Tons	Load Reduction (4)	N/A	1080	N/A				

	5. Were all special events applications reviewed for potential coverage under City requirements?	Confirmation	# Reviewed /Total	Compliance (1)	100%	37/37	100%				
Commercial-Industrial	1. Were all inspections performed as required?	Confirmation	Performed /Required	Compliance (1)	100%	370/288	128%	Yes	Yes	Yes	N/A
	2. Were knowledge scores, on average, for current fiscal year higher than previous fiscal year?	Analysis	Average Score	Knowledge Change (2)	Upward Average	3.23 FY07-08, 3.87 FY 08-09	17%				
	3. Were behavioral change/BMP implementation scores, on average, for current fiscal year higher than previous fiscal year?	Analysis	Average Score	Behavior Change (3)	Upward Average	3.73 FY07-08, 4.12 FY 08-09	9.5%				
IDDE	1. Were all urban runoff related complaints responded to and resolved?	Confirmation	# Responses /Total Complaints	Compliance (1)	100%	195/195	100%	Yes	N/A	N/A	N/A
Education	1. Were changes in knowledge demonstrated or verified (i.e. quizzes?)[2]	Analysis	Average Score Before/After	Knowledge Change (2)	%Change	6% aware in pre-test, 89% aware in post test	67%	N/A	Yes	N/A	Yes
	2. How much nutrient load reduction occurred as a result of the "Lawn Care Education" Program?	WTM	Tons	Load Reduction (4)	N/A	N=5.2, P=0.11	N/A				
	3. How much bacteria load reduction occurred as a result of the "Pet Waste Education" Program?	WTM	billion/year	Load Reduction (4)	N/A	45,946	N/A				

[1]During the Dry Season of 2008 inspections performed met and exceeded Permit requirements and were conducted in FY 2008-09. For Dry Season 2009, a targeted outcome of 40% for High Priority and 20% for Medium Priority was used since only two months of the Dry Season was included in FY 2008-09.

[2]Quiz results based on acquisition of knowledge or not, as opposed to based on a raw score.

11.2 Component Assessment

11.2.1 Development Planning

During FY 2008-09, the City has experienced measurable changes in outcome levels 1, 2, and 3 regarding compliance with the Development Planning Component.

Level 1: Compliance with Activity Based Permit Requirements

Outcome Level 1 improvements included the adoption of new procedures for acquisition and management of the City's private treatment control BMP inventory and annual inspection and verification program.

Level 2: Changes in Knowledge/Awareness

The Outcome Level 2 improvements included the ongoing raising of awareness of existing and new storm water compliance requirements among City development review staff, developers and the City's Planning Commission. Through a combination of training during weekly staff meetings, webinars and outside training courses, City staff significantly increased their knowledge and understanding of the updated SUSMP requirements, LID designs, hydromodification principles and City storm water compliance processes. Developers were seen to increase their knowledge of the updated SUSMP requirements, LID designs, and City storm water compliance requirements through revised plan review checklists, City plan review comments, the City's updated Storm Water Standards Manual and outside training courses.

Level 3: Behavioral Change/BMP Implementation

Outcome Level 3 improvements were seen in the development community. An increased number of development project submittals included acceptable LID, source control and treatment control measures with the initial submittal resulting in fewer project re-designs. The LID designs submitted by developers are showing increased sophistication, effectiveness and cover more significant portions of the project design.

11.2.2 Construction

Outcome levels 1, 3, and 4 are used to assess the effectiveness of the City's Construction Component.

Level 1: Compliance with Activity Based Permit Requirements

Overall, the Construction, Management, and Inspections Division (CM&I) was successful at maintaining full compliance with the permit requirements during FY 2008-09. Table 11.2 contains examples of permit requirements and confirmation that these requirements were met.

Table 11.2 Examples of Construction Related Permit Requirements and Compliance

Permit Requirements	Requirement	Performed
Ordinance updates to comply with order	As Necessary	Yes
Designate a set of minimum BMPs	In JURMP	Yes
Require implementation of designated minimum BMPs	All sites	Yes
Maintain and update a watershed based inventory	Monthly	Yes
Require advanced treatment	Sites determined to be an exceptional threat to water quality	Yes, none identified.
Inspections of sites meeting criteria in D.2.d.(1)	Every 2 weeks during wet season	Yes
Implement follow-up actions	As needed based on inspection results	Yes
Inspect according to requirements in Section D.2.d.(6)	Each inspection	Yes
Track number of inspections for the inventoried sites	Continuous	Yes
Develop escalating enforcement process	JURMP	Yes
Implement escalating enforcement process	As needed based on inspections	Yes
Report non-compliant sites to Regional Board	Stop Work order or higher level of enforcement	Yes

Level 3: Behavioral Change/BMP Implementation

Changes in behavior and implementation of BMPs on construction sites are evident throughout the City. In general, contractors are more aware of the BMP requirements and are more willing to cooperate with inspectors, resulting in timely and proper implementation of the required BMPs. This may be due to increased presence and knowledge from the inspectors, allowing the inspectors to better understand and convey the necessary information to the contractors, and increased enforcement actions in previous years pertaining to erosion and sediment controls.

One method used to draw comparison of BMP implementation from year to year is to track the number and types of enforcement actions, normalized by the number of inspections each year. This may allow for a comparison of overall changes in compliance levels over time. Due to new

procedures and permit requirements, comparisons cannot be made from the current fiscal year to previous years. The enforcement information for FY 2008-09 may be used as a baseline for comparison with future years. Table 11.3 contains enforcement actions for FY 2008-09.

Table 11.3 Comparison of Enforcement Actions on Construction Sites

	FY 2008-09		
Enforcement Actions	Number	Total Inspections	Percentage
Written Warning / Correction Notice	160	1858	8.61
Stop Work	3		0.16

Staff will continue to develop ideas and implement those deemed appropriate in the future to assist in assessing the changes in knowledge and awareness in the construction community.

Level 4: Load Reductions

Load reductions are estimated for the construction program using a Watershed Treatment Model (WTM) developed by USEPA. The efficiency of the erosion and sediment control program is based on a best case scenario: a sediment control program that emphasizes erosion control measures, including practices that limit clearing and grading or use of phased construction methods (Brown and Caraco, 1997), and requires advanced sediment control measures to reduce sediment runoff from leaving the site. The WTM default efficiency for erosion and sediment control is 80 .

The user assigns the discount factors related to the fraction of the erosion practices installed and the fraction installed/maintained properly. There is a range of discount factors based on the level of program implementation and oversight. For example, if there were few inspectors, with no pre-construction meetings and poor practices allowed by codes and regulations, the input value would be 0.4. If inspectors visit sites weekly and if there are education programs for inspectors and contractors, the input value is 0.9 (the highest discount value in the WTM). City inspectors prioritize each grading site using approved procedures and perform inspections and enforcement actions as required in the permit. This allows for high discount input values. Due to continued improvements made to the program in FY 2008-09, as described in detail in Section 3 of this report, a discount value of 0.8 was used.

A discount factor is also calculated based on the fraction of practices installed and maintained properly. Based on input from CMI with regular inspections, education programs, and guidance on BMP selection, a high discount value of 0.8 was used. Based on the estimated acres under construction and the discount factors applied, this results in an annual loading reduction of 12,481 pounds of nitrogen, 37,444 pounds of phosphorus, and 12,481,275 pounds of Total Suspended Solids per year (Table 11.4).

Table 11.4: Loading Reduction from Existing Erosion and Sediment Control Programs

	N (lbs/year)	P (lbs/year)	TSS (lbs/year)
Erosion and Sediment Control	12,481	37,444	12,481,275

11.2.3 Municipal

Level 1: Compliance with Activity-Based Permit Requirements

This level of effectiveness assessment is based on compliance with Activity Based Permit Requirements. The City was in compliance with all municipal requirements of Order No. R9-2007-0001 during the past fiscal year. Table 11.5 tracks some of the City's Municipal Program activity measures, which are discussed in detail in the previous report sections. Tracking of many of these activities was useful in assessing compliance with the program, but is not yet tied to long-term assessment or improved water quality.

Table 11.5: FY 2008-09 Program Activity Measures

	Permit Requirements	Requirement	Performed
	Develop Inventory of Areas and Activities	Update with JURMP	Yes
	Develop and Implement Minimum BMPs	Update with JURMP	Yes
Special Events	Require Minimum BMPs	Establish and Require Implementation	Yes
	Inspections	Inspection all Special Event venues following events	Yes
MS4 Maintenance	Catch Basins	Inspect all, clean those exceeding 33% criteria	3446 inspections, cleaned all trash and 224 exceeding 33% criteria
	Pipelines (miles)	As needed	Cleaned 0.95 miles.
	Open Channels (miles)	Inspect all and clean in a timely manner	Inspected and removed trash from 6 miles
	Desilting Basins	Inspect all, clean as needed	Inspected 3, removed all trash from 3
	Treatment Controls	Inspection and Maintenance	Annually
	High Volumes of Trash	Inspection between May 1 and September 30	Yes
	Tracking of Quantities of Waste Removed	Track Quantities	Yes
Integrated Pest Management	Implement Program	Develop and Implement	Yes
Street Sweeping	High Volume Streets (miles)	2 times/month	weekly
	Moderate Volume Streets (miles)	monthly	biweekly
	Low Volume Streets (miles)	annual	biweekly
	Parking Lots (acres)	Depends on volume, see above	biweekly

	Permit Requirements	Requirement	Performed
Infiltration from Sanitary Sewer to MS4	Preventative Maintenance of Sanitary Sewer	Perform	Yes
	Preventative Maintenance of MS4	Perform	Yes
	High Priority Facilities	Inspect all facilities	63 of 63 inspected

Based on the permit requirements presented above in Table 11.5, the municipal program remains in compliance with the requirements of Order No. R9-2007-0001. Several of the measures will continue to be developed, and improved with better tracking mechanisms and improved coordination between departments.

Level 2: Changes in Knowledge / Awareness

Changes in knowledge and awareness of storm water requirements are evident across City staff. Although not specifically measured, all staff are trained regularly on storm water compliance, as required in Section D.5 of Order No. R9-2007-0001. Appendix 8.1 contains all municipal training performed for FY 2008-09.

An assessment of the numbers of complaints reported by City staff is one measurement that may lead to a better understanding of the effects of training on municipal staff. Over the last four years, the number of complaints related to storm water has shown an increasing trend. The numbers of complaints reported by City staff has also shown an increasing trend. See Figure 11.1 below for an illustration of these data.

Each year for the past four years, a significant portion of the increase in complaints reported has been attributable to City staff. It is possible that the increase in complaints in general has caused the increase in staff reporting. However, assuming the number of actual storm water related incidents within the community is the same or decreasing, it is likely that more complaints are being reported by staff because of an increased awareness of storm water issues from improved, consistent training as the Storm Water Program has developed.

Level 3: Behavioral Change / BMP Implementation

One way to assess the amount of behavioral change and the actual implementation of BMPs for storm water is to look at the results of the municipal inspections. In general, all facilities have improved over the years. In past years, corrective actions have been more complicated and numerous. This year the most common corrective actions found during municipal inspections were minor and less numerous and pertained to organic debris (i.e. leaves) in the parking and storage areas, stenciling storm drains, and updating of SWPPP documents.

In addition, several departments and facilities have invested in new structural BMPs at their sites which are effective at mitigating potential pollutants at the sites. Three examples of new BMPs implemented this year include:

- Vacuum equipment was used to recover and contain wash water from vehicle washing activities occurring at the Fire Station 5.
- A pilot BMP was implemented using Drivable Grass which slows down the velocity of water from parking areas, allows rainwater to infiltrate through the BMP into a subsurface drainage system to reduce storm water flowing directly into MS4.
- Site specific SWPPPs were developed and updated for many of the high priority municipal facilities including: six fire stations, all maintenance yards, pump stations, and the Carlsbad Recycled Water Facility.
- Temporary tarps were replaced by permanent storage containers for outdoor storage at the Fleet Facility.

Level 4: Load Reductions

As described in Table 11.1, there are several methods of calculating load reductions available from data collected in the municipal program. Refer to Section 11.1 and Table 11.1 for more detail on estimated load reductions resulting from activities performed in the municipal program.

11.2.4 Industrial and Commercial

Level 1: Compliance with Activity Based Permit Requirements

As seen in Table 11.6, inspections completed during FY 2008-09 exceeded the requirements set forth by Order No. R9-2007-0001.

Table 11.6 Inspections of sites sources FY 2008-09

Order No. R9-2007-0001 (July 1, 2008 to June 30, 2009)				
High Threat to WQ	**Inventory**	**Inspected**	**Target Percentage**	**Percent Completed**
Ind/Comm Sites/Sources	566	370	50 [1]	65

[1] Based on requirement in Order No. R9-2007-0001 to inspect 50 of high priority businesses during Permit Year 1

Level 2: Changes in Knowledge / Awareness

For Knowledge Assessment, inspectors rank personnel from one to five. Refer to Section 5 of this report for details on the rating scale.

Since the implementation of the rating system, the majority of businesses have ranked at three or better for storm water knowledge and awareness. Figure 11.2 illustrates that on average the majority of the sites inspected had a relatively high knowledge of storm water and ranked greater than or equal to 3.

11.2.5 Residential

Level 1: Compliance with Activity-Based Requirements

Residential activities outlined in the March 2008 JURMP were completed as described in Section 6 of this report. Activities include various outreach events and activities, used oil and waste collection services, and complaint response followed by enforcement action.

Level 2: Changes in Knowledge/ Awareness

<u>City of Carlsbad Public Opinion Survey</u>
An annual public telephone survey was conducted this year by the City, as part of the *Performance Measurement Program* and *State-of-Effectiveness Report.* Carlsbad households were selected using *Random-Digit-Dial* methodology with a minimum sample size of 1,000. This survey had a margin of error of /- 3 at the 95 confidence level. Storm water pollution was addressed briefly in this survey. The City survey asked, *Have you seen or heard any information about how residents can prevent the pollution of creeks, lagoons, and the ocean?* This question was used to gauge the public s perception of ocean water pollution and was asked previously in 2003, 2006 and 2007. The results, with Don t Know or N/A factored out, are presented in Table 11.7 below.

Table 11.7: Results of Environmental Question 1

Answer:	2003 (%)	2006 (%)	2007 (%)	2008 (%)
1. Yes	58.1	64.6	61.1	59.2
2. No	41.9	35.4	38.9	40.8

This question illustrates a steady awareness of storm water and urban runoff pollution from 2003 to 2007 among residents.

An additional question was asked again this year to assess the most effective educational methods by asking, "Where do you recall seeing or hearing about ways to prevent pollution?" The top two responses were TV and newspaper, respectively comprising over 65% of the total responses. Newsletters, curb signs, and brochures were the next highest, making up over 35% of the responses. Other responses included radio, posters, website, word of mouth, schools, and public events.

Level 3: Behavioral Change/BMP Implementation

The City asked a behavioral question during the survey to those who answered affirmatively to the question, "*Have you seen or heard any information about how residents can prevent the pollution of creeks, lagoons, and the ocean?*" The 59.2% who answered question one affirmatively were asked the follow-up question, "*What things are you doing to reduce water pollution?*" Results for this question are presented in Table 11.8.

Table 11.8: Top Responses to "*What things are you doing to reduce water pollution*?"

Answer:	Percent
1. Properly disposing of hazardous waste.	27.9
2. Cleaned up trash at Beach, Roadside, Etc.	14.9
3. Using environmentally friendly soaps, pesticides, etc.	14.0
4. Used a commercial carwash.	14.9
5. Cleaned up animal waste.	4.4
6. Did nothing.	18.1
7. Other (recycling, reduced runoff)	31.3
8. Don't know.	6.1

Continued survey data should help to show if long-term behavior change has occurred. Over seventy-five percent of residents who answered question one affirmatively, consciously chose an environmentally friendly method over others in certain instances.

Level 4: Load Reduction

The primary goal of BMP implementation is to reduce pollutant loads in storm water discharges. An important emphasis of annual program assessments is to estimate the load reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important intermediate endpoint for assessments. The Regional Board wrote the following in October 2004:

> *Program effectiveness can be assessed by quantifying the pollutant load reductions attributable to various program activities. An effective program will compare pollutant load reductions of various program activities and implement*

those activities which result in the largest pollutant load reductions. It is expected that by implementing program activities which maximize pollutant load reductions, Copermittees will be implementing effective programs which will improve receiving water quality.

The City used the Watershed Treatment Model (WTM) as a tool for rapid assessment of effectiveness of the storm water programs. The WTM (version 3.1) was prepared by Deb Caraco of the Center for Watershed Protection for the U.S. EPA Region V - Office of Wetlands, Oceans and Watersheds. The 2008 WURMP identified bacteria, sediment, and nutrients as water quality problems. The WTM estimates the pollutant loading reductions for sediment, bacteria and nutrients for various program activities, such as residential education, erosion and sediment control programs, and street sweeping, among others. The results of some of these storm water management programs are discussed below. Complete explanations and assumptions are found in the WTM book.

Public Education

A variety of public education programs may help to reduce the concentration of nutrients, sediment and bacteria in urban streams. The model currently focuses only on a few of these, including programs to address lawn care, septic system maintenance, and pet waste. Several other residential pollution prevention programs improve water quality, but have little effect on nutrients, suspended solids, and bacteria. For example, HHW programs are effective at reducing toxics but do not have a quantifiable impact on pollutants such as suspended solids, nutrients, or bacteria.

Lawn Care: The ideal pollutant removal associated with lawn care would be achieved if all of the additional fertilizer applied to turf were eliminated. The model uses equations to estimate optimal nutrient load reduction from a lawn care program combined with a calculation of the residential lawn area. The model calculates the residential lawn area based on the City's input of residential acres taken from GIS. The user inputs the information on how the education campaign was conducted. Default values were given for the fraction of the audience willing to change behavior based on nationwide data. The City conducted lawn care education through brochure distribution, workshops and newspaper ads.

The model allows the user to input the media type, which determines the portion of the population that *remembers* the message ("Awareness of Message"). This number is largest with television (0.4), followed by newspaper (0.3), radio (0.25), billboard (0.13), brochures (0.08) and workshops (0.07). Because residents have been exposed to five of these mechanisms in FY 2007-08, the input value entered was an average for brochures, workshops and newspaper, radio, and television (0.22). This results in an annual nutrient load reduction of 6,068 pounds of nitrogen and 121 pounds of phosphorus (Table 11.9).

Table 11.9: Loading Reduction from Existing Lawn Care Education

	N (lbs/year)	P (lbs/year)
Lawn Care Education	6,068	121

Pet Waste: The Storm Water Protection Program also conducted a *Pet Waste Education Program* during FY 07-08. In the urban watershed, dogs are a significant contributor of bacteria and nutrients. Ideally, a *Pet Waste Education Program* would reduce this source to zero, with all homeowners properly disposing of waste. The model provides estimated values for the fraction of households with a dog, the fraction of owners who walk their dog, the fraction of owners who cleanup after their dog, and the fraction willing to change their behavior. As with

the lawn care education, the portion of the population that remembers the message is based on the media used for the education. This past year, the City delivered this message through brochures and the newspaper. Residents were also exposed to regional education efforts on television and radio. In addition, the City distributed free pet waste bag dispensers at local events and provided animal care facilities with these dispensers. These activities were considered similar to a workshop, so an averaged value of 0.22 was used for this calculation. This results in an annual pollutant loading removal of 3,059 pounds of nitrogen, 399 pounds of phosphorus, and 26,600 billion bacteria per year (Table 11.10).

Table 11.10: Loading Reduction from Existing Pet Waste Education Program

	N (lbs/year)	P (lbs/year)	Bacteria (billion/year)
Pet Waste Education	3,059	399	26,600

The overall assessments of these education programs show that the media significantly affected the associated pollutant removal due to the increased audience that *remembers* the message. For instance, if the City had the financial resources to use mass media (television and radio), the estimated pollutant reduction would be increased significantly. The City's annual phone survey confirms that most people recall hearing these messages through mass media. However, mass media is significantly more expensive than brochures and workshops. Large campaigns for mass media may be best conducted on a regional basis with Copermittees sharing the expense or pursuing grant funds for these expensive activities. Due to an increase in mass media educational tools used at the Regional level this year, it is expected that many of the residents in Carlsbad were exposed to these campaigns, accounting for the increase in load reductions associated with lawn care and pet waste.

11.2.6 Illicit Discharge Detection and Elimination

Effectiveness assessment for the IDDE Program will be submitted with Section 7 of this year's Annual Report to be submitted to the Regional Board by December 15, 2009.

11.2.7 Outreach and Education

Level 1: Compliance with Activity Based Permit Requirements

Table 11.11 below illustrates examples of the permit requirements in the outreach and education section and what activities the City implemented to comply with each.

Table 11.11 Outreach and Education Permit Requirements

Municipal Training	Compliance Activity
• Development Planning	Staff training specific to development planning activities 9/20/08
• Construction	Various staff training events specific to construction activities referenced in Appendix 8.2
• Inspection Staff (industrial/commercial)	Various training events specific to inspections of businesses referenced in Appendix 8.2
• Other Activities	Various activity specific training events for fire, water and waste water, parks departments
New Development and Construction	Various outreach activities as described in Section 8.3
Residential	
General Public	
School Children	

Level 2: Changes in Knowledge/Awareness

Measurably increase the knowledge/awareness of target communities:

- Municipal Departments and Personnel

  During FY 2008-09, a detailed municipal training program continued to be implemented to ensure compliance with Order No. R9-2007-0001. This training program assesses each position within the City to determine the applicable (i.e. required) training and groups the positions into separate modules to make training easier for the various departments. Staff will continue to determine ways to assess the changes in knowledge and awareness of municipal personnel throughout the permit cycle.

  In June 2007, the City implemented a new internal waste reduction strategy as a pilot program. This included the purchase and distribution of larger single stream recycling containers and a small trash can for employee work stations. There were also several new larger recycling containers placed in public meeting areas throughout the City. Seen as an effective program, the City implemented new waste reduction programs, promoted double siding copies and print jobs, and distributed reusable beverage containers at all City facilities. Rollout of these new programs included the development of posters, fact sheets and a presentation to educate and inform employees about the importance and benefits of recycling, reducing and reusing.

- Construction Site Owners and Developers

  The City conducts outreach activities specific to construction site owners and developers as described in Section 8.3. The activities occur throughout the development process.

- Industrial and Commercial Owners and Operators

  The City uses a program to assess changes in knowledge at industrial and commercial facilities based on a numeric ranking from one to five, with one representing a lack of knowledge and five representing adequate knowledge of storm water BMPs and requirements as applicable to their facility. The results are compiled each year and reported in the industrial/commercial section of the Annual Reports. Results are also presented in Figure 11.2 of this section. Over time, these site assessments can be compiled and compared.

- Residential Community, General Public, and School Children

  There are various outreach efforts in place to increase storm water knowledge and awareness for residents, the general public, and for school children. Changes in the knowledge and awareness of the residents and general public are assessed and tracked via an annual telephone survey of the citizens of Carlsbad. The survey includes several questions used to assess these changes in awareness. Survey results, tracked over the past three surveys are described above in Section 11.6.

Level 3: Changes in Behavior/BMP Implementation

Measurably change the behavior of target communities:

- Municipal Departments and Personnel

  Behavior changes are evident throughout municipal departments and personnel and can be attributed to targeted outreach and training for municipal staff. Awareness of Storm Water issues continues to increase, as evidenced by the numbers of calls to the storm water hotline by City staff. All levels of staff are continually seeking advice from the Storm Water Program on how to implement BMPs allowing them to continue to perform their necessary activities. There have also been programmatic changes in the Development Services Division, ensuring that required BMPs and submittals are provided on all projects, and are tracked and approved.

- Construction Site Owners and Developers

  Changes in behavior on construction sites and by developers are also evident throughout the development community. These changes are manifested throughout the development process, from submitting appropriate BMPs on plans and better Storm Water Management Plans, to installation and maintenance of proper BMPs during construction, to the development, installation, and maintenance of BMPs on projects after construction is complete.

- Industrial/Commercial Owners and Operators

  Industrial and commercial owners and operators are continually educated on storm water issues during inspections, mailers, and interactions during outreach events. Behavioral changes at industrial and commercial sites are most evident through assessment of proper BMP implementation during inspections and site visits. Using the rating system of one through five, with one being no implementation of BMPs and five being effective implementation of all BMPs, businesses have on average scored close to four, as shown in Figure 11.3. These results indicate that businesses owners and operators have altered and maintained behavior consistent with storm water rules and regulations. This method of assessment will continue to be used to measure behavior changes among industrial and commercial sites.

- Residential Community, General Public, and School Children

Outreach to the residential community, general public, and school children continues to be effective in conveying storm water information. At this time, it is difficult to measure the changes in BMP implementation in these target audience. Several methods have been discussed previously and will continue to be utilized. One of the best feedback mechanisms that the City has in place is its annual citizen survey. Answers to the question, What things are you doing to reduce water pollution? helps the Storm Water Program track BMP implementation over time and changes in the community, as discussed previously in the report.

The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent. The messages were delivered by various means including presentations, workshops, inspections, investigations, and outreach events, in addition to use of direct mail, the website and newspaper advertisements.

The City continued to actively promote and advertise the Storm Water Protection Program as part of Environmental Programs. This merger of programs has allowed the Storm Water Protection Program to work in conjunction with the *Used Oil Block Grant Funds* program to conduct related education and outreach. The merger also created a unified City Environmental Programs message to help foster a better understanding of the relationship between residential activities and sources of pollution.

The City conducted the annual (telephone) Public Opinion Survey in FY 2008-09, which included questions on storm water pollution prevention. The results from this survey provide important information on the public s awareness and knowledge of storm water pollution prevention issues and activities. This information can help focus future education and outreach messages and events, and is also used on a *Performance Measure* to gauge the effectiveness of the outreach and education program.

The Storm Water Protection Program and Environmental Programs staff worked with the Communications Department and the Information Technology Department to revise the web pages and provide updated information about pollution prevention.

During FY 2006-07, staff developed a new Environmental Programs education campaign entitled Think-Act targeting various environmental concerns, including storm water pollution. The program released advertisements in FY 2007-08 and they continued to be used in FY 2008-09.

Staff collaborated regionally with the Storm Water Regional Education and Residential Sources Workgroup, consisting of 21 Copermittees, throughout the year. During FY 08-09, the workgroup developed a Regional Residential Education Plan.

In addition to the development and completion of the documents, the workgroup also began to focus on the development of a regional brand, a regional website, mass media and public relations, materials development and distribution, underserved target audience, market research and assessment tools, partnership development and regional events. Staff will continue to participate in these areas with accomplishments reported in the next annual report.

11.3 Integrated Assessment

11.3.1 Changes in MS4 Discharge Water Quality

Dry Weather Field Screening and Analytical Monitoring Program

The City has conducted an annual *Dry Weather Field Screening and Analytical Monitoring Program* since 1995. The purpose of the monitoring program is to detect and eliminate illicit connections and illegal discharges to the storm drain system.

Historically, the results for field analyses indicate a decreasing trend in ammonia-nitrogen concentrations. No discernable trend is apparent for other field constituents. Bacteria levels have varied over the years, with a slight upward trend in Enterococcus counts. Diazinon and chlorpyrifos have only been detected once and oil and grease exceedances have been infrequent.

Over the course of the Dry Weather Monitoring Program, repeated testing at the same sampling sites can allow for a historical comparison of certain water quality parameters. While any trends or historical analysis of this data can be useful for current and future evaluations of potential pollutant sources to the MS4, this is not the stated purpose of the Dry Weather Monitoring Program. This program is designed to detect and eliminate illicit connections and/or acute discharges through sampling. Following a confirmed exceedance, an investigation is performed within two business days to determine and abate, if possible, the source of the exceedance.

The Dry Weather Monitoring Program report for FY 2008-09 and follow-up activities will be provided under separate cover, due to the Regional Board by December 15, 2009.

Coastal Outfall Monitoring Program

The City continued to collect samples from various storm drain outfalls as part of the *Coastal Outfall Monitoring Program*. As stated in the *Adaptive Monitoring Plan*, if water was flowing from a storm drain outfall, samples were collected and analyzed for total coliform, fecal coliform and enterococci and sample results were compared to the 95th percentile criteria. Where storm drain flow reaches the receiving water, protocol states to collect a paired receiving water sample to assess the impacts of the storm drains on the receiving waters. The receiving water samples would then be compared to Rec-1 standards to determine exceedances. Where storm drain bacteria concentrations exceeded 95th percentile criteria or receiving water samples exceeded Rec-1 objectives, follow-up sampling and/or investigations would be performed.

Recent years indicate a decrease in storm drain exceedances for all three bacterial indicators, showing possible improvements in water quality. In all cases, the flow from outfalls was intermittent, low volume and did not actually reach the receiving waters but dissipated into the sand or sediment. The City will continue to conduct the Coastal Outfall Monitoring Program and to conduct follow-up investigations as detailed in the Adaptive Plan.

11.3.2 Level 6: Changes in Receiving Water Quality

It is important to note that receiving water quality reflects considerably more than the quality of the City s MS4 discharges. In addition, receiving water quality can be adversely impacted by other events that are not under the control of the City, such as other permitted NPDES discharges, wildlife (impacting bacteria levels), atmospheric deposition, and other events and activities.

Watershed Receiving Water Additional Study

As part of the Carlsbad Watershed WURMP activities, the City conducted an Additional Study from 2003-2008 in four separate hydrologic areas in Buena Vista Creek, Agua Hedionda Creek, Encinas Creek and San Marcos Creek.

The program was performed concurrently with the Dry Weather Monitoring Program, using the same test methods and quality assurance/quality control measures. At each of the creek sites, the field crew measured flow rates, conducted field testing, and collected water samples for laboratory analyses. Field screening included testing for: temperature, pH, specific conductance, turbidity, ammonia-nitrogen, nitrate-nitrogen, orthophosphate-phosphorus, surfactants (MBAS). Water samples were collected and submitted for laboratory analysis for the following constituents: dissolved metals (cadmium, copper, lead, zinc), total hardness, total coliform, fecal coliform, enterococcus, diazinon, chlorpyrifos, oil and grease.

A brief summary is presented below:

- From 2003-08, turbidity levels in Buena Vista Creek and San Marcos Creek have showed statistically significant decreasing trends.
- Aside from the trends in turbidity, no other statistically significant trends have been observed.
- Orthophosphate-phosphorus measurements have been higher in Encinas Creek in recent years, but no statistically significant trend was observed. Orthophosphate-phosphorus levels have been relatively constant at other sites throughout the study.
- Nitrate-nitrogen levels have been relatively constant over the course of the study. No trend was observed for nitrate-nitrogen concentrations at any of the sites.

- Total coliform levels have been lower in recent years compared to the earlier years of the study.
- Fecal coliform and Enterococcus counts were highly variable, with standard deviations typically close to or above the mean and the median.
- Diazinon, chlorpyrifos, and oil and grease have not been detected since 2003. Dissolved lead and cadmium were not detected during the program, and dissolved copper and zinc were occasionally detected but always at low levels.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this additional study. Other water chemistry constituents in the creeks appear to be within standards.

Coastal Outfall Monitoring Program Receiving Waters

During FY 2008-09, there were no samples collected in the receiving waters as part of the Coastal Outfall Monitoring Program, since no storm drain outfall discharges reached the receiving water.

11.3.3 Overall Assessment

Program implementation in areas of construction, residential, MS4 maintenance, and street sweeping are properly targeted for protection of and improvement of water quality, as evidenced by direct load reductions in these programs.

Other program implementation in areas of industrial and commercial inspections, municipal, residential, construction, and outreach and education appear to be properly targeted for the protection of and improvement of water quality, as evidenced by changes in knowledge and awareness and in behavior.

In addition, the City has had a steady revenue source to fund the Storm Water Protection Program over the past year. Adjustments to the Solid Waste Fee funding mechanism for Storm Water-related programs were made last year to ensure adequate funding for anticipated programs over the next fiscal year. City Staff will continue to monitor revenue and expenditures to determine if further adjustments are needed in FY 2009-10.

In FY 2008-09, the City also updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.

12.0 SPECIAL INVESTIGATIONS

12.1 Introduction

This section summarizes two special investigations conducted by the City of Carlsbad in FY 2008-09.

12.2 Special Investigations

Lagoon TMDL Investigative Order

The City of Carlsbad continued to participate in the San Diego Coastal Lagoon TMDL Monitoring Program that is described in San Diego Coastal Lagoons Monitoring Workplan (Mclauglin et al, June 2008). Results and conclusions of the monitoring program will be in the final report, written by Southern California Coastal Research Project, expected to be completed in the third quarter of 2010.

Watershed Receiving Water Additional Study

As part of the Carlsbad Watershed WURMP activities, the City conducted an Additional Study from 2003-2008 in four separate hydrologic areas in Buena Vista Creek, Agua Hedionda Creek, Encinas Creek and San Marcos Creek.

The program was performed concurrently with the Dry Weather Monitoring Program, using the same test methods and quality assurance/quality control measures. At each of the creek sites, the field crew measured flow rates, conducted field testing, and collected water samples for laboratory analyses. Field screening included testing for: temperature, pH, specific conductance, turbidity, ammonia-nitrogen, nitrate-nitrogen, orthophosphate-phosphorus, surfactants (MBAS). Water samples were collected and submitted for laboratory analysis for the following constituents: dissolved metals (cadmium, copper, lead, zinc), total hardness, total coliform, fecal coliform, enterococcus, diazinon, chlorpyrifos, oil and grease.

A brief summary is presented below:

- From 2003-08, turbidity levels in Buena Vista Creek and San Marcos Creek have showed statistically significant decreasing trends.
- Aside from the trends in turbidity, no other statistically significant trends have been observed.
- Orthophosphate-phosphorus measurements have been higher in Encinas Creek in recent years, but no statistically significant trend was observed. Orthophosphate-phosphorus levels have been relatively constant at other sites throughout the study.
- Nitrate-nitrogen levels have been relatively constant over the course of the study. No trend was observed for nitrate-nitrogen concentrations at any of the sites.
- Total coliform levels have been lower in recent years compared to the earlier years of the study.
- Fecal coliform and Enterococcus counts were highly variable, with standard deviations typically close to or above the mean and the median.
- Diazinon, chlorpyrifos, and oil and grease have not been detected since 2003. Dissolved lead and cadmium were not detected during the program, and dissolved copper and zinc were occasionally detected but always at low levels.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this additional study. Other water chemistry constituents in the creeks appear to be within standards.

13.0 NON-EMERGENCY FIRE-FIGHTING

13.1 Introduction

The Carlsbad Fire Department (CFD) has developed the Non-Emergency Fire Fighting Program to meet the requirements of Order No. R9-2007-0001, as written in the City s 2008 JURMP. This section describes the City s program to reduce pollutants from non-emergency fire fighting flows (i.e., flows from controlled or practice blazes and maintenance activities) conducted in FY 2008-09 from July 1, 2008 to June 30, 2009.

13.2 Overall Program Definition

The CFD is a dedicated team of professionals whose mission is to enhance the quality of life in our community by delivering exceptional services in safeguarding lives, property and the environment. By default, the definition of non-emergency fire-fighting flows are flows generated by the Fire Department other than emergency situations. The duration of an emergency exists from alarm notification until, in the opinion of the Incident Commander, the emergency has concluded and equipment is returned to service. Outside of this duration of time, Fire Department flows are considered non-emergency.

13.3 BMP Implementation

In order to reduce pollutant discharges from non-emergency fire-fighting flows, the City of Carlsbad s Fire Department has implemented several BMPs. During this reporting period, the CFD maintained a Storm Water Manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water. The BMPs incorporated at Fire Stations are listed below:

Pollution Prevention

- Storm Water Manuals were developed for each station which include SWPPPs with site maps, inspection reports, facility specific spill response procedures, training records, and department policies. Training on storm water and spill response was provided regularly.
- Dry cleanup methods were used to reduce water use. The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations. Awareness was heightened at fire scenes to minimize the potential for excessive water flow.
- Materials were recycled where possible.
- Spill Prevention, Control, and Cleanup: Spill response equipment and materials are clearly identified and staged in accessible locations at each station. Awareness was heightened at incident scenes to contain potential discharges (once the scene had been stabilized) to prevent pollutants from entering the MS4. The Department continued implementation of the City s spill response procedure for incidents that occur on City streets. Absorbent materials are kept on all engines and at all the stations. The spill response plan is to apply absorbent, sweep material, place in bags, and remove from site for proper disposal.
- Vehicle and Equipment Cleaning: The department continued to implement a department policy limiting outside water use as applicable to vehicle, hose, and equipment washing. Vacuum equipment was purchased to recover and contain all wash water from washing activities occurring at the Fire Stations. Fire Station 5 currently has a pressure washer for

vehicle and equipment cleaning to minimize the amount of water being used. Five more pressure washers have been approved and purchased for the other five fire stations. Fire Station 6 is equipped with a strip drain in the driveway which allows Fire Department employees to wash Fire vehicles onsite, with any excess wash water diverted to sewer.

- Waste Handling and Disposal: Waste containers were inspected regularly for leaks and to ensure that lids remained closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter. Recycling was implemented where possible; bins were provided.
- Parking/Storage Area Maintenance: Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations.
- Housekeeping Practices: Fire stations were kept clean and orderly. Wash water was disposed of properly. Sweeping material was disposed of properly.
- Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; timing improvements on irrigation system have reduced water usage; blowing and sweeping are used wherever possible; pesticides, herbicides, and fertilizers are stored inside and used sparingly in accordance with required application practices.
-

13.4 Training and Education

The CFD continued to communicate with other City departments to improve coordination and education with regards to storm water. The CFD s Storm Water Committee met quarterly to address new and ongoing storm water topics and how they relate to the responsibilities of the Fire Department, and included personnel from each Fire Department rank. Other activities CFD participated in are as follows:

- A representative from the Fire Department attended and participated in the City s Storm Water Committee meetings as available.
- The CFD worked closely with the Storm Water Protection Program to conduct a series of meetings to review BMP implementation and perform one-on-one training;
- The City s Reclaimed Water Facility continued to be utilized for fire engineer training and testing. A training trailer facilitated engineer operations, pump testing, and other wet training opportunities. The Facility allowed for wet training and testing opportunities while ensuring that no water is discharged to the MS4;
- The CFD conducted training and testing at other fire agencies and training facilities which recycle the water that it is being discharged (i.e. Rancho Sante Fe and San Marcos Fire Departments). Suitable locations were selected to provide wet training opportunities for personnel, while ensuring that appropriate BMPs were in place to protect the storm drains and eliminate discharges to the MS4. These sites were generally located on pervious surfaces with no potential for discharge to the storm drain system;
- The CFD explored CIP opportunities for potential funding for permanent structural BMPs at the fire stations to serve wash areas;
- The CFD worked extensively with the design and construction committee for new fire stations to ensure that storm water requirements were 1) addressed early in the process and 2) met during and after construction.
- The CFD continued current annual training levels to ensure that all CFD personnel were versed in storm water as it relates to fire stations and fire fighting activities.

13.5 Fire Prevention Program

Fire prevention is itself a Best Management Practice (BMP). During this reporting period, fire prevention activities included those activities not directly associated with emergency scene operations, post fire scene or mop-up operations.

Perhaps the most effective way to eliminate water runoff from fires is to eliminate or reduce the magnitude of fires. The CFD has shown that an aggressive Fire Prevention Program has a significant impact on the number and magnitude of fires. Procedures or actions that lead to early fire detection/notification, automatic suppression, confinement, or enhanced suppression capabilities can reduce or control fires and ultimately reduce water runoff. The installation and maintenance of these procedures, devices, or features can significantly reduce potential flows in the event of an emergency.

An example of this type of prevention was weed abatement which included the encouragement of mowing. When mowing was not practical for perimeter breaks, and after considering topography, roughing the slope in a manner that would not increase soil or sediment releases was utilized, such as disking.

The City of Carlsbad continued its Fire Prevention Program during this reporting period.

14.0 JURMP REVISIONS

The City's 2008 JURMP was developed in response to the issuance of Order No. R9-2007-0001. The City began implementing the 2008 JURMP on March 24, 2008 as required under the new permit.

There were a few minor changes to the City's 2008 JURMP during FY 2008-09 and they are discussed below.

As stated in the Introduction of this JURMP Annual Report, the City of Carlsbad is now a Charter City as opposed to a General Law City as reported in the Introduction of the JURMP.

In Section 2 of this Annual Report, the Treatment Control BMP inventory was updated in accordance with the Permit.

In Section 3 of this JURMP Annual Report, changes were made to the Construction program including updating the construction site inspection inventory, creating a new procedure for Inventory Construction Site Prioritization, and revising the Construction Inspection Form.

In Section 4 of this Annual Report, changes were made to the Special Events Program. New procedures for Inspections and Inventory Management were implemented this fiscal year.

The City's Municipal inventory was updated in accordance with the Permit and the City's procedures. The updated inventory is contained in Section 4 of this Annual Report.

In Section 5 of this Annual Report, the Industrial/Commercial inventory was updated in accordance with the Permit and the City's procedures. The updated inventory is contained in Section 5 of the JURMP Annual Report.

15.0 CONCLUSIONS AND RECOMMENDATIONS

15.1 Overview

From July 1, 2008 to June 30, 2009, the City continued to implement Permit Order No. R9-2007-0001. This section of the JURMP Annual Report describes activities that the City undertook to reduce discharges of pollutants and urban runoff flow to the MS4 to the maximum extent practicable. It also provides an overall account of the activities conducted and the programs implemented to address the new Permit requirements for major components: Development Planning, Construction, Municipal, Industrial/Commercial, Residential, Illicit Discharge Detection and Elimination, and Education.

Several highlights are listed below, including specific discussion of activities conducted per Permit requirements, as well as those that exceeded requirements and are considered notable activities. Note that these are highlights only and do not represent all activities conducted by the City to maintain compliance. Comprehensive details are reported in the applicable preceding sections.

15.2 Highlighted Activities Performed to Meet Permit Requirements

The City continued activities that were consistent with Permit Order No. R9-2007-0001. For comprehensive details, please refer to the applicable preceding sections of the report. Highlights for July 1, 2008 to June 30, 2009 are listed below.

The City:

- Continued updating and revising the Treatment Control BMP (TCBMP) database of private and public TCBMPs.
- Continued to distribute a copy of the Pollution Prevention Guide to the Construction Industry with each construction related permit application.
- Inspected all high priority construction sites at required frequencies, conducted outreach to project proponents and City staff, and issued 164 enforcement actions to obtain compliance during 1858 inspections.
- Continued to review inventory management, prioritization practices, inspection and enforcement procedures, training programs, record-keeping, and reporting procedures related to construction activities.
- Updated and mapped the municipal inventory and inspected high priority municipal facilities.
- Conducted cleaning and maintenance activities to reduce pollutant discharges from the MS4.
- Inspected 100 of catch basins.
- Continued evaluating and inspecting Special Events.
- Updated and revised the Special Events inventory.
- Updated and mapped the High Threat to Water Quality Industrial/Commercial inventory, and conducted 370 inspections, or 65 of the total inventory. The City issued 46 enforcement actions to obtain compliance from July 1, 2008 to June 30, 2009.
- Continued using the *Knowledge and BMP Assessment*s at commercial and industrial facilities.
- Continued distributing the new brochure for mobile service providers, including carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, and any other mobile businesses that provide services at various off-site locations. This brochure was

designed for mobile service providers, their employees, and anyone that hires a mobile service provider.

- Distributed educational information for residential activities, continued an advertising campaign, hosted or participated in 10 community outreach events, and collaborated in offering five oil recycling and two HHW drop-off sites for residential use.
- Collaborated with other internal departments to assist with investigations and remediation during field incidents. The Storm Drain Maintenance Division was key to prompt, effective responses to complaints involving clean ups of incidents on public streets. Regular meetings and discussions about compliance issues and consistent contacts facilitates this inter-departmental coordination.
- Conducted a proactive program to detect and eliminate illegal discharges to the MS4. The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. The Storm Water Protection Program responded to 195 reports of illegal discharges to the storm drain system, discovered one illicit connection, and issued 86 enforcement actions.
- Continued implementation of the *Dry Weather Field Screening and Analytical Program*, analyzing conditions and samples from up to 60 sites in the MS4.
- Continued implementation of the *Coastal Outfall Program* by routinely monitoring 8 active outfall sites on a regular basis, and inactive sites semi-annually.
- Continued involvement in outreach and education at the local level, the watershed level, and the regional level with the Project Clean Water Outreach Workgroup, and the Think Blue campaign.
- Continued distributing storm water educational brochures and continued the Environmental Programs advertising campaign.
- Distributed information through direct mail, during inspections and investigations, on the website, at workshops, during presentations, training seminars, and other public outreach events.
- Conducted a Public Opinion Survey of 1,000 residents and included questions on storm water.
- Distributed promotional items such as notepads, pens, and Bags on Board with pollution prevention messages.

15.3 Notable Activities in Addition to Permit Requirements

The City implemented several initiatives in addition to the requirements of the Permit Order No. R9-2007-0001 which are considered Notable Activities. Some of these are internal program goals and should not be viewed as enforceable under the Permit, and will be continued and enhanced as resources allow. For comprehensive details on all City activities, please refer to the applicable preceding sections of this report. Notable Activities for FY 2008-09 are as follows:

The City:

- Continued educating Developers and applicants about the new Development Planning Permit requirements early to ensure compliance would be achieved.
- Continued using storm water BMP maintenance agreements as part of standard operating procedures. The BMP maintenance agreements provide increased control over property owner compliance with storm water BMP requirements. These agreements provide the City with legal authority to access, inspect and if necessary

maintain onsite BMPs. In addition, the agreements allow the City to place a lien on a property if BMPs are not maintained as required.

- During FY 2008-09, the City hired a qualified storm water professional to prepare and conduct an in-house training program for the City's Development Services staff (planning, engineering, building and inspection), specific to the City's requirements.
- During FY 2008-09, the City instituted a new procedure to define the process for inspecting, tracking, and enforcing compliance for structures listed on the privately owned treatment control BMP Inventory List (Procedure CMI-300).
- The City also instituted a new procedure that defines the process for managing and updating the privately owned treatment control BMP Inventory List (Procedure CMI-310).
- The City instituted a new procedure that defines the process for verifying and tracking compliance with the treatment control BMP verification of maintenance requirements (Procedure CMI-320).
- The City developed two new outreach handouts to assist private property owners in understanding and complying with the new annual treatment control BMP verification program including the "*What You Need to Know About Privately Owned Treatment Control BMPs*" brochure and the "*Frequently Asked Questions About Treatment Control BMPs*" fact sheet.
- In FY 2008-09, the City updated and restructured the development processing fees for the plan review and inspection of Construction Storm Water Pollution Prevention Plans and post-construction Storm Water Management Plans.
- This reporting period the City also initiated use of standard findings of storm water compliance on administrative minor subdivision approvals.
- Revised the construction site inspection form and developed three procedures for inspection and inventory maintenance.
- Conducted 1858 inspections of active construction sites, exceeding the Permit requirement of 1415 inspections.
- For the Municipal Program, continued using and adding treatment control BMPs to prevent pollutants from reaching receiving waters.
- The City completed and implemented a strip drain in the driveway at the new Fire Station 6 facility which allows Fire Department employees to wash Fire vehicles onsite, with any excess wash water diverted to sewer.
- The City's street sweeping program exceeded both Permit requirements throughout the fiscal year with twice weekly downtown sweeping routes.
- The City used the Reclaimed Water Facility and a training trailer which allowed the Fire Department to perform wet training and testing with no discharge to the MS4 and recapture 100% of the water used for reclamation.
- Swept both the Maintenance and Operations Yard and the Oak Yard parking lots twice a month by a street sweeper and weekly by hand when necessary.
- Spot-cleaned the Maintenance and Operations Yard parking areas for all spills weekly.
- The CMI department developed new procedures for inspecting, tracking and enforcing special events as well as managing and updating information on the special events inventory.
- Continued to implement a computerized asset management/work order system that allows the Storm Drain Maintenance Division to better manage the MS4 inventory, inspections, and maintenance activities conducted.
- Continued Storm Water Committee meetings which included members from Public Works, the Fire Department, Recreation, Planning, and the Building Department.

- Conducted 370 industrial/commercial inspections, or 65 of the total inventory. This exceeds the Permit requirement of 50 of businesses inspected.
- Continued using the Industrial/Commercial inspection report revised in FY 2007-08 so that businesses could promptly implement corrective actions. The revised inspection form includes spaces to report previous enforcement actions, new storm water contacts, and a detailed list of necessary corrective actions. The revised form has proven to be successful in attaining compliance from regulated facilities.
- Continued to maintain regular communications with the Industrial Compliance Unit of the Regional Board. In addition to copies of inspection reports and other correspondence with high and medium industries covered under the Permit, the City regularly coordinated compliance issues with Regional Board representatives over the phone and through emails. On several occasions, the Regional Board expressed their appreciation of the City s professionalism, responsiveness, and implementation of the storm water program.
- Posted minimum BMPs on the City s website for access by the public, permit applicants, developers, and property owners.
- Included storm water and BMP information in the annual Water Quality Report mailed to 38,000 households in the Carlsbad Municipal Water District.
- Sent four informational letters to a total of 198 households addressing storm water pollution issues in the neighborhood, in response to complaint investigations.
- Continued the Environmental Resources Management Team (ERMT) initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles.
- Supported the ERMT s work implementing Environmental Guiding Principles for City decision-making approved by Council in August of 2007.
- Continued Storm Water Leadership Team (SWLT) meetings. Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City s major service areas and Directors. Agenda items covered all areas of the City s compliance with Order No. R9-2007-0001.
- Continued to collect data for Performance Measures and the *Maintenance Assessment Program* to analyze improved work methods to balance scheduled versus unscheduled maintenance.

15.4 Recommendations for Improvements

As the City continued to implement the 2008 JURMP in this reporting period, some areas for improvement were noted for the future:

The City will:

- Continue to research, observe, and evaluate the performance of various types of BMPs.
- Continue to evaluate and update internal procedures for Industrial/Commercial inventory prioritization and management and revise as appropriate.
- Continue working on a *Best Management Practices Manual* that includes the minimum and required BMPs for activities and pollutant types.
- Continue to develop effectiveness assessment mechanisms for each significant activity, for each major component, as well as an integrated assessment of the overall program.
- Continue to work at the watershed level and help focus activities on high priority pollutants.

15.5 Water Quality Improvements or Degradation

The complete 2009 Dry Weather report and the full IDDE Section of the Annual Report will be submitted in December of 2009. Please refer to the *Carlsbad Watershed 2009 WURMP* for data trends supporting the focus on *High Priority Pollutants* on a watershed basis. The following text highlights some of the observations on water quality.

MS4 Water Quality
With seven years of data from the Dry Weather Program, ranging from nutrient and physical measurements to bio-available metals and pesticides, collected at 60 sites covering the entire MS4, a picture of water quality within the system is starting to appear. While data are only collected once annually, improvements can be seen for nutrient concentrations, pH, fecal coliform, ammonia, and surfactants within the MS4.

Exceedances of bacteria 95th percentile criteria in the *Coastal Storm Drain Monitoring Program* have stabilized or declined in recent years.

Receiving Water Quality
In FY 2008-09, programs assessing receiving water quality included the Coastal and Lagoon Outfall Monitoring Program, the Watershed Receiving Waters Additional Study, and mass loading station monitoring under the Regional program.

No receiving water samples were collected as part of the Coastal Monitoring Program because the flow from outfalls was intermittent, low volume and did not actually reach the receiving waters but dissipated into the sand or sediment.

In the Watershed Receiving Waters Additional Study, nearly all constituents were undetected in the four additional creek sites water samples including: MBAS, oil and grease, dissolved cadmium, dissolved copper, dissolved lead, diazinon, and chlorpyrifos. Water quality at the four locations was relatively good and appears to be within both Basin Plan Water Quality Objectives and Dry Weather Program Action Levels. Other water chemistry constituents appear to be within standards.

Data related to the Mass Loading Station will be submitted with the Copermittees Regional Monitoring Annual Report in January 2010.

15.6 Conclusion

The Storm Water Protection Program continues to evolve over time in response to the iterative process of implementing BMPs, assessing effectiveness, and evaluating results. As more procedures, programs and activities are implemented, there is a clear need for better databases to track and report activities and BMPs being implemented. Tying these activities to changes in water quality still presents a considerable challenge. This is part of the long-term assessment strategy that will take time to develop trends and to determine cause and effect relationships between pollution prevention and water quality management. The City will continue to work

individually and with the Copermittees to further develop existing compliance programs and create new opportunities for improvement.

This section of the Annual Report demonstrated the City s compliance with Permit Order No R9-2007-0001 and continued implementation of the 2008 JURMP. Other sections of this report show that knowledge has increased in target communities, BMP implementation and behavior changes are improving, pollutant loadings are being reduced from storm water management programs, the MS4 water quality is improving, and pollutant loads to receiving waters are being reduced. These are encouraging signs worth noting. The City recognizes that measurable changes occur over time and that continued program improvements and effectiveness measures are needed for long-term success.

Acronyms

BGPD	Billion gallons/day

2.0 Development Planning Component

Permit Annual Reporting Requirement Section J.3.a.(3).(a)	Section
i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements.	2.2.1, 2.2.3, 2.3, 2.4.1
ii. Confirmation that all development projects were required to undergo the Copermittee s urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked.	2.4.4, Appendix 2.12
iii. A listing of the development projects to which SUSMP requirements were applied.	2.4.4, Appendix 2.2 and 2.3
iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked.	2.4.4, Appendix 2.2
v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs.	2.4.4. Appendix 2.4
vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible.	2.4.4
vii. An updated treatment control BMP inventory.	2.4.4 Appendix2.4
viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings.	2.4.4, Appendix 2.8
ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings.	2.4.4, Appendix 2.6, 2.7, 2.10
x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked.	2.4.4
xi. A listing of any projects which received a SUSMP waiver.	2.4.4
xii. A description of implementation of any SUSMP waiver mitigation program.	2.4.4
xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation.	2.4.4
xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented.	2.4.4
xv. A listing of priority development projects not required to meet HMP require ments, including a description of why the projects were found to be exempt from the requirements.	2.4.4
xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project.	2.4.4
xvii. The number of violation and enforcement action (including types) taken for development projects, including information on any necessary follow-up action taken. The discussion should exhibit that compliance has been achieved, or describe action that are being taken to achieve compliance.	2.4.4
xviii. A description of notable activities conducted to manage urban runoff from development projects.	2.5

3.0 Construction

Permit Annual Reporting Requirement Section J.3.a.(3).(b)	Section
i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked.	3.2
ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed.	3.2
ii. A description of modifications made to the construction and grading ordinances and approval processes.	3.3
iii. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites.	3.4
iv. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites.	3.4
v. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites.	3.4
vi. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites.	3.5, Appendix 3.1
vii. A description of the general results of the inspections.	3.5
viii. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	3.5
ix. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	3.5
x. A description of notable activities conducted to manage urban runoff from construction sites.	3.6

4.0 Municipal

Permit Annual Reporting Requirement Section J.3.a.(3).(c)	Section
i. Any updates to the municipal inventory and prioritization.	4.16.2, App 4.1
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events.	4.2, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4, 4.8.4, 4.9.4, 4.10.4, 4.11.4, 4.12.4, 4.13.4, 4.15.4

iii. A description of inspections and maintenance conducted for municipal treatment controls.	4.4.4
iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned.	4.4.4
v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned.	4.4.4
vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned.	4.4.4
vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category.	4.4.4
viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding .	N/A
ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal are as and activities.	4.11.4
x. Identification of the total distance of curb-miles of improved roads, streets, a nd highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4
xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads , streets, and highways.	4.3.4
xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4
xiii. Identification of the total distance of curb-miles swept.	4.3.4
xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping.	4.3.4, App. 4.1
xv. Amount of material (tons) collected from street and parking lot sweeping.	4.3.4
xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4	4.4.4
xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections.	4.16.4, App 4.5
xviii. A description of the general results of the inspections.	App 4.5

xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	App 4.5
xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	4.16.4, App 4.5
xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities.	4.17

5.0 Industrial and Commercial

Permit Annual Reporting Requirement Section J.3.a.(3).(d)	Section
i. Any updates to the industrial and commercial inventory.	App 5.1
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources.	5.2.3.2, 5.2.3.3, 5.2.4.1
iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses.	5.2.3.2, 5.3.4
iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected.	5.2.4.1
v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection.	5.2.2
vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance.	5.2.4.1
vii. Identification of the number of third party inspections conducted.	5.2.4.1
viii. Identification of efforts conducted to verify third party inspection effectiveness.	5.2.4.1
ix. A description of efforts implemented to address mobile businesses.	5.3
x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	5.2.4.2
xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees.	5.2.2
xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources.	5.4

6.0 Residential

Permit Annual Reporting Requirement Section J.3.a.(3).(e)	Section
i. Identification of the high threat to water quality residential areas and activities that were focused on.	6.2
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities.	6.3,6.4.2

iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials.	6.4.3
iv. Types and amounts of household hazardous wastes collected, if applicable.	6.4.3
v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation.	6.4.4
vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	6.4.5
vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program.	6.4.1
viii. A description of notable activities conducted to manage urban runoff from residential areas and activities.	6.4

7.0 IDDE

Permit Annual Reporting Requirement Section J.3.a.(3).(f)	**Section**
i. Correction of any inaccuracies in either the MS4 map or Dry Weather Field Screening and Analytical Monitoring Stations Map.	To be submitted in December 2009
ii. Reporting of all dry weather field screening and analytical monitoring results. The data should be presented in tabular and graphical form. The reporting shall include station locations, all dry weather field screening and analytical monitoring results, identification of sites where results exceeded action levels, follow-up and elimination activities for potential illicit discharges and connections, the rationale for why follow-up investigations were not conducted at sites where action levels were exceeded, any Copermittee or consultant program recommendations/changes resulting from the monitoring, and documentation that these recommendations/changes have been implemented. Dry weather field screening and analytical monitoring reporting shall comply with all monitoring and standard reporting requirements in Attachment B of Order NO. R9-2007-0001 and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001.	To be submitted in December 2009
iii. Any dry weather field screening and analytical monitoring consultant reports generated, to be provided as an attachment to the annual report.	To be submitted in December 2009
iv. A brief description of any other investigation and follow-up activities for illicit discharges and connections.	To be submitted in December 2009
v. The number and brief description of illicit discharges and connections identified.	To be submitted in December 2009
vi. The number of illicit discharges and connections eliminated	To be submitted in December 2009
vii. Identification and description of all spills to the MS4 and response to the spills.	To be submitted in December 2009

viii. A description of activities implemented to prevent sewage and other spills from entering the MS4.	To be submitted in December 2009
ix. A description of the mechanism whereby notification of sewage spills from private laterals and septic systems is received.	To be submitted in December 2009
x. Number of times the hotline was called, as compared to previous reporting periods, and a summary of the calls.	To be submitted in December 2009
xi. A description of efforts to publicize and facilitate public reporting of illicit discharges	To be submitted in December 2009
xii. The number of violations and enforcement actions (including types) taken for illicit discharges and connections, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	To be submitted in December 2009
xiii. A description of notable activities conducted to manage illicit discharges and connections.	To be submitted in December 2009

8.0 Education

Permit Annual Reporting Requirement Section J.3.a.(3).(g)	Section
i. A description of education efforts conducted for each target community.	8.2, 8.3
ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and allowable behaviors and discharges.	8.3.5
iii. A description of education efforts conducted for municipal departments and personnel.	8.3
iv. A description of education efforts conducted for the new development and construction communities.	8.3.1, 8.3.2
v. A description of jurisdictional education efforts conducted for residents, the general public, and school children.	8.3.5

9.0 Public Participation

Permit Annual Reporting Requirement Section J.3.a.(3).(h)	Section
i. A description of public participation efforts conducted.	9.2 to 9.5

10.0 Fiscal Analysis

Permit Annual Reporting Requirement Section J.3.a.(3).(j)	Section
i. A fiscal analysis of the Copermittees urban runoff management programs which meets all requirements of section G of this Order.	10.1 to 10.4

11.0 Effectiveness Assessment

Permit Annual Reporting Requirement Section J.3.a.(3).(i)	Section
i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order.	11.1 to 11.3

12.0 Special Investigations

Permit Annual Reporting Requirement Section J.3.a.(3).(k)	Section
i. A description of any special investigations conducted.	12.2

13.0 Non-Emergency Firefighting

Permit Annual Reporting Requirement Section J.3.a.(3).(l)	Section
i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows.	13.1 to 13.5

14.0 JURMP Revisions

Permit Annual Reporting Requirement Section J.3.a.(3).(m)	Section
i. A description of any proposed revisions to the JURMP.	14.0

City of Carlsbad
Standard Engineering Storm Water Compliance
Conditions of Development Approval

8. Developer shall submit to the City Engineer an acceptable instrument, via CC&R's and/or other recorded document, addressing the maintenance, repair, and replacement of shared private improvements within this subdivision, including but not limited to private (STREETS, UTILITIES, STREET TREES, SIDEWALKS, LANDSCAPING, STREET LIGHTING, RAISED MEDIANS, ENHANCED PAVING, WATER QUALITY TREATMENT MEASURES, LOW IMPACT DEVELOPMENT FEATURES, STORM DRAIN FACILITIES, etc.) located therein and to distribute the costs of such maintenance in an equitable manner among the owners of the properties within this subdivision.

18. Developer shall cause property owner to process, execute and submit an executed copy to the City Engineer for recordation a City standard Permanent Stormwater Quality Best Management Practice Maintenance Agreement for the perpetual maintenance of all treatment control, applicable site design and source control, post-construction permanent Best Management Practices prior to the issuance of a grading permit or building permit, or the recordation of a (FINAL/PARCEL) map, whichever occurs first for this Project.

35. Developer shall comply with the City's Stormwater Regulations, latest version, and shall implement best management practices at all times. Best management practices include but are not limited to pollution treatment practices or devices, erosion control to prevent silt runoff during construction, general housekeeping practices, pollution prevention and educational practices, maintenance procedures, and other management practices or devices to prevent or reduce the discharge of pollutants to stormwater, receiving water or stormwater conveyance system to the maximum extent practicable. Developer shall notify prospective owners and tenants of the above requirements.

(USE NEXT TWO CONDITIONS ONLY IF PROJECT QUALIFIES AS TIER 3 SWPPP)

36. Prior to the issuance of a grading permit, Developer shall submit to the City Engineer receipt of a Notice of Intention from the State Water Resources Control Board.

37. Prior to the issuance of grading permit or building permit, whichever occurs first, Developer shall submit for City approval a Tier 3 Storm Water Pollution Prevention Plan (TIER 3 SWPPP). The TIER 3 SWPPP shall be in compliance with current requirements and provisions established by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Requirements. The TIER 3 SWPPP shall address measures to reduce to the maximum extent practicable storm water pollutant runoff during construction of the project.

(USE NEXT CONDITION ONLY IF UNSURE WHICH TIER SWPPP IS NEEDED FOR PROJECT)

38. Developer shall complete and submit to the City Engineer a Project Threat Assessment Form (PTAF) pursuant to City Engineering Standards. Concurrent with the PTAF, Developer shall also submit the appropriate Tier level Storm Water Compliance form and Tier level Storm Water Pollution Prevention Plan (SWPPP) as determined by the completed PTAF all to the satisfaction of the City Engineer.

(USE NEXT CONDITION ONLY IF MEETS PRIORITY PROJECT DESIGNATION)

39. Developer shall submit for City approval a "Storm Water Management Plan (SWMP)." The SWMP shall demonstrate compliance with the City of Carlsbad Standard Urban Stormwater Mitigation Plan (SUSMP), Order R9-2007-0001 issued by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Municipal Code all to the satisfaction of the City Engineer.

(USE AS FYI FOR LID TECHNIQUES)

40. Developer shall incorporate Low Impact Development (LID) design techniques, on all final design plans submitted to the City, to reduce the amount of run-off by mimicking the natural hydrologic function of the site by preserving natural open-spaces and natural drainage channels, minimizing impervious surfaces, promoting infiltration and evaporation of run-off before run-off leaves the site. Developer shall incorporate LID techniques using current County of San Diego Low Impact Development Handbook (Stormwater Management Strategies). LID techniques include, but are not limited to: vegetated swale/strip, rain gardens, and porous pavement, which can greatly reduce the volume, peak flow rate, velocity and pollutants.

(USE IF PROJECT REQUIRES HYDROMODIFICATION THRESHOLDS)

41. Developer shall submit documentation, subject to City Engineer approval, demonstrating how this project complies with Interim Hydromodification requirements per the City's SUSMP, latest version. Documentation shall be included within the Storm Water Management Plan (SWMP).

(USE NEXT TWO CONDITIONS FOR CONDITIONAL USE PERMIT EXTENSIONS AS APPLICABLE)

42. Within 6 months of approval of this Conditional Use Permit extension, developer shall submit and receive approval for a Storm Water Management Plan (SWMP) to the City of Carlsbad Engineering Department. This project qualifies as a "priority project" as defined by City of Carlsbad Standard Urban Storm Water Mitigation Plan (SUSMP), and therefore, the project is required to capture and reduce pollutants to a level of insignificance. The organization and content of the SWMP shall be prepared in accordance with the guidelines established by the City of Carlsbad. The SWMP shall address the anticipated pollutants of concern associated with the Project. The SWMP shall also suggest the type(s) of post-construction (structural) Best Management Practices (BMP's) required to capture and filter said pollutants of concern and establish maintenance provisions for said BMP's.

43. Prior to the next annual review of this Conditional Use Permit, developer shall have constructed the BMP measures necessary to capture and filter the anticipated pollutants of concern associated with the project in accordance with the SWMP.

(FINDING TO BE ADDED TO ALL ADMINISTRATIVE APPROVALS FOR MINOR SUBDIVISIONS)

d) The design of the subdivision and improvements are not likely to cause serious public health problems, and the discharge of storm water from the subdivision complies with current California Regional Water Quality Control Board requirements and the City of Carlsbad Standard Urban Stormwater Mitigation Plan (SUSMP) requirements, (fill in reason why project complies with City storm water requirements): and,
