Most field samples for detergents using the field test kits were below the Basin Plan WQO of 0.5 mg/l. In Buena Vista Creek, there were no concentrations above the WQO. The sample collected in 2007 for Agua Hedionda Creek was equal to the WQO, while samples collected during the four preceding years were within standards. In Encinas Creek and San Marcos Creek, detergents measured at or above the WQO for three of the last five years. In all cases, the detergent concentrations were below the dry weather action level. Also in all cases, where the sample analyzed using the field test kit was exceeding WQO, the same sample run at the laboratory did not have any detectable concentrations of MBAS (detergents/surfactants). Due to the accuracy of the laboratory analyses, these concentrations (all non-detects) are reliable data and are truly representative of the water quality in the creeks. Both methods are used to allow for immediate investigation in the field where elevated concentrations are detected.

The test kits detection limits do not have the capability to detect ammonia-N concentrations as low as the WQO in the Basin Plan. Therefore, the results from the kits could not be compared to the Basin Plan WQO. These test kits are used in the Dry Weather Monitoring Program to give a general idea of the water quality, with the capability of triggering investigations to track illicit discharges. However, all measurements for ammonia-N were well below the Dry Weather Monitoring Program action level of 1.0 mg/l, indicative of an illicit discharge.

There is currently no WQO established in the Basin Plan for ortho-phosphate, however the USEPA Multisector General Permit does include a WQO of 2.0 mg/l. This WQO was used in analyzing ortho-phosphate data. Ortho-phosphate data collected in all four creeks across five years were well below the WQO established in the Multisector Permit.

The Basin Plan WQO objective for nitrate-N is equal to the drinking water standard of 10 mg/l. Samples collected at all four creeks across five years were all well below this WQO, with the highest concentration detected at 2.5 mg/l.

Analytical Laboratory Data

Analytical measurements in the creeks include surfactants (MBAS), oil and grease, dissolved metals, diazinon, chlorpyrifos, and bacteria. The dissolved metals analyzed are cadmium, copper, lead, and zinc. Hardness values are also measured to allow comparison of dissolved metal concentrations to California Toxics Rule (CTR) standards.

Through all five years, across all four creeks there were no surfactants detected in any sample. A reporting limit of 0.5 mg/l was used which is equal to the WQO in the Basin Plan.

Samples for oil and grease were non-detect in 19 of 20 samples collected. One sample collected in Agua Hedionda Creek in 2003 did have detectable levels of oil and grease, at 3.0 mg/l. The Basin Plan WQO is a visible film on the surface of the water. Although a sheen was observed while sampling, the concentration was well below the established objective of 15 mg/l in the USEPA Multisector General Permit. In all four subsequent years at this site, no samples contained detectable levels of oil and grease.

Dissolved metals, including cadmium, copper, lead, and zinc were rarely detected in the creek samples. None of the detected concentrations exceeded CTR objectives. There were no samples with concentrations of dissolved cadmium or dissolved lead above detection limits. Four out of 20 samples analyzed for dissolved copper were above detection limits, two in Encinas Creek and two in San Marcos Creek. However, none of these four samples exceeded WQO set by the California Toxics Rule (CTR). Dissolved zinc was above detection levels in four of 20 samples collected, however none of the four exceeded water quality objectives established by CTR.

The organophosphorous pesticides diazinon and chlorpyrifos were measured at all four sites for each of the five years. Of the 20 samples collected, there was one sample collected in 2003 at Buena Vista Creek that was above the standard used by the California Department of Fish and Game, 0.08 ug/l, for diazinon. The Basin Plan does not establish numeric WQO objectives for these constituents. All other samples were below detection limits for diazinon and for chlorpyrifos.

Samples are also analyzed for total coliform, fecal coliform, and enterococcus. Currently there is no established WQO for total coliform concentrations in inland surface waters in the Basin Plan.
The single sample REC-1 WQO for fecal coliform in the Basin Plan is 400 cfu/100 ml. The single sample enterococcus standard for freshwater inland surface waters in infrequently used areas is 151 cfu/100 ml. These objectives are the basis of the discussion below.

Many of the samples collected in the creeks over five years exceeded the WQO for fecal coliform and enterococcus. Over the past 5 years in Buena Vista Creek, three of the five samples collected exceeded the WQO for at least one indictor, fecal coliform and/or enterococcus. In Agua Hedionda Creek, Encinas Creek, and San Marcos Creek, four of five samples collected exceeded REC-1 standards for at least one indicator in the past 5 years.

Understanding the nature of bacteria in the region, the fecal coliform may be coming from a variety of sources including homeless encampments in the area and natural sources such as wildlife in the riparian corridor. It is worth noting that all fecal coliform and enterococcus concentrations over the five years are below established 95th percentile action levels used in the Dry Weather Monitoring Program.

Conclusions

This special study was initiated in support of the Carlsbad Watershed Copermittees' efforts to learn more about the quality of receiving waters in the Carlsbad Hydrologic Unit. The high priority pollutants in the Carlsbad Watershed are sediment and bacteria. Data collected in this study is insufficient in quality to provide information on nutrients due to the methodology used in analyzing nutrient concentrations. The prioritization of sediment as a high priority pollutant may be warranted but is not supported by data collected in this study. This is likely because all samples were collected during dry weather and sediment is potentially more prevalent during wet weather. Turbidity data collected as a representative of sediment in the water column is presented below in Figure 13.1.

Bacteria is also listed as a high priority pollutant in the Carlsbad Watershed and data has been shown to exceed REC-1 water quality objectives during wet and dry weather. As shown in Figures 13.2 and 13.3 for Fecal Coliform and Enterococcus, respectively, this special study supports the Watershed's prioritization of bacteria during dry weather.

Overall, water quality in these creeks appears to be within both Basin Plan water quality objectives and dry weather action levels for the constituents monitored in this special study. These data support the findings of previous monitoring in the Carlsbad Watershed indicating that bacterial indicators are a constituent of concern in the Carlsbad Hydrologic Unit. Other water chemistry constituents in the creeks appear to be within standards. Because this is a limited set of data, the watershed is in need of additional data to validate these findings. With the onset of the new municipal stormwater permit, temporary watershed assessment stations will be located on Buena Vista Creek and on Agua Hedionda Creek collecting samples for analysis during wet and dry weather. 0

13.2 Carlsbad Golf Course Water Quality Monitoring

Study Design

Beginning in June 2006 and ending in June 2007, the City implemented a monitoring program as required and approved by the California Coastal Commission (CCC). A simple study design was approved consisting of four sample locations: two in surface waters and two wells to access groundwater. Sites were selected upstream of the golf course in the surface water and in a groundwater monitoring well, and downstream of the course in the surface water and in a second groundwater well. Three rounds of sampling were conducted prior to construction (baseline) and three rounds were conducted after construction of the course. Constituents monitored include: pH, dissolved oxygen (DO), total suspended solids, nitrate, nitrite, phosphorous, conductivity, hardness, alkalinity, and toxicity.

Results

Surface Water

No nutrient related impacts were detected in the surface water data collected. In surface waters, nitrate concentrations appear to improve downstream of the golf course before and after construction, indicating that nitrates may actually be removed from the water column in the riparian corridor. No nitrites were detected in any surface water samples up or downstream, before or after construction. Phosphate

concentrations appear to have increased from the upstream to the downstream sample prior to golf course construction; however in samples collected after construction, there is no shown increase.

Total suspended solids were also measured in all monitoring events. Based on the water quality data collected, there appears to be no adverse impacts on suspended solids by the construction of the golf course. In the surface waters, no dry weather samples contained TSS above the detection limit. One sample collected downstream after construction following a storm event contained measurable suspended solids; however the value was well below the WQO of 100 mg/l and was not considered to be indicative of adverse impacts from the course.

Surface water measurements of pH appear in the neutral range. All measurements were within the acceptable Basin Plan range of 6.5-8.5.

Surface water dissolved oxygen levels are slightly higher upstream and downstream in samples collected after construction. This does not appear to be a result of the golf course since the upstream sample is also increased. There is very little change in DO concentrations upstream to downstream, regardless of when the samples were collected.

Toxicity results indicated some toxicity; however it was shown to be driven by the elevated conductivity levels in the samples. Conductivity measurements in surface waters show very little change from upstream to downstream in pre-construction samples. However, in post construction samples a decrease in conductivity in the downstream sample is observed, indicating improvements in water quality, potentially attributable to an improved riparian corridor as required during construction of the golf course.

Ground Water

No nutrient related impacts were detected in the ground water data collected. In ground waters, nitrate concentrations pre and post construction were low at the upstream site and increased at the downstream well. This is evident prior to construction as well as after. Nitrite concentrations were below detection levels in four of six samples collected. Small amounts were noted in two samples collected in the downstream well, one pre and one post construction. Phosphorous concentrations appear to increase slightly downstream in the pre-construction samples but are reduced in the post construction sampling.

Total suspended solids were also measured in all monitoring events. TSS levels in the groundwater samples largely reflect the stirring up of sediment within the well casing when the water is purged prior to collecting the sample. Because of the sampling technique, these values may not be representative of true conditions in the groundwater.

The average pH values downstream of the golf course for pre and post conditions are nearly equal and in the neutral range.

DO levels are low in the groundwater samples. Concentrations appear to increase from upstream to downstream samples, and are slightly higher in samples collected post construction.

Toxicity results indicated some toxicity; however it was shown to be driven by the elevated conductivity levels in the samples. Conductivity measurements in ground waters increase from upstream to downstream in pre and post construction samples.

Section 14
Conclusions and Recommendations

14.0 Overview

During FY 06-07, the City implemented the Permit requirements and the program components of the JURMP. This report described the activities that the City undertook to reduce discharges of pollutants and urban runoff flow to the MS4 to the maximum extent practicable. This Annual Report also provided an overall account of the activities conducted and the programs implemented to address the inspection, monitoring, investigation, education, and enforcement requirements. Identified program strengths as well as improvement areas for FY 07-08 are outlined in each report section.

Several highlights are listed below, including specific discussion of activities conducted related to meeting Permit requirements, internal program goals that met or exceeded Permit requirements, and recommended improvements. Note that these are highlights only and do not represent all activities conducted by the City to maintain and exceed compliance. Comprehensive details are reported in the applicable preceding sections.

14.1 Highlighted Activities Performed to Meet Permit Requirements

The City continued activities to maintain compliance with the Permit. For comprehensive details, please refer to the applicable preceding sections of the report. Highlights for FY 06-07 are listed below.

The City:

- Updated and mapped the municipal inventory and inspected all high priority municipal facilities.
- Conducted cleaning and maintenance activities to reduce pollutant discharges from the MS4.
- Updated and mapped the industrial inventory, inspected 294 industries (including all high priority industries), conducted outreach, and issued 14 enforcement actions to obtain compliance.
- Updated and mapped the commercial inventory, provided outreach on BMPs, inspected 385 commercial sites, and issued 43 enforcement actions to obtain compliance.
- Continued using the *Knowledge and BMP Assessment*s at commercial and industrial facilities.
- Collaborated with other internal departments to assist with investigations and remediation during field incidents. The Storm Drain Maintenance Crew was key to prompt, effective responses to complaints involving clean ups of incidents on public streets. Regular meetings and discussions about compliance issues and consistent contacts facilitates this inter-departmental coordination.
- Distributed educational information for residential activities, continued an advertising campaign, hosted or participated in 25 community outreach events, collaborated in offering five oil recycling and two HHW drop-off sites for residential use, responded to 154 reports of illegal discharges, and issued 37 enforcement actions to obtain compliance.
- Inspected all high priority construction sites at required frequencies, conducted outreach to project proponents and City staff, and issued 128 enforcement actions to obtain compliance.
- Continued implementation of the *Dry Weather Field Screening and Analytical Program*, analyzing conditions and samples from 60 sites in the MS4.
- Continued implementation of the *Coastal Outfall Program* by routinely monitoring 22 “active” outfall sites on a regular basis, and “inactive” sites semi-annually.
- Updated the *Rough Pad Stabilization* example to improve project proponents’ knowledge of the City’s expectations.

- Distributed a copy of the Pollution Prevention Guide to the Construction Industry brochure with each construction related permit application.
- Improved the formal "*Catch Basin Inspection Program*" by reassigning resources to dedicate a work order system that tracks routine and scheduled catch basin inspections and cleaning activities. As a result of this formal program, the City inspected 100% of catch basins during FY 06-07.
- Conducted a proactive program to detect and eliminate illegal discharges to the MS4. The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. The Storm Water Protection Program responded to 154 reports of illegal discharges to the storm drain system. In addition, the City responded to 434 complaints or requests for action related to storm water quality, the sewer system, or MS4 maintenance.
- Continued implementation of the *Sewer Overflow Prevention Plan/Response Plan* and responded to 12 sewage spills or overflow reports, with a total of 18,000 gallons recovered and approximately 635 gallons entering the environment.
- Continued involvement in outreach and education at the local level, the watershed level, and the regional level with the Project Clean Water Outreach Workgroup.
- Continued distributing new storm water educational brochures and continued the Environmental Programs advertising campaign.
- Distributed information through direct mail, during inspections and investigations, on the website, at workshops, during presentations, training seminars, and other public outreach events.
- Conducted a Public Opinion Survey of 1,000 residents and included questions on storm water.
- Distributed promotional items such as notepads, pens, Bags on Board, and key chains with pollution prevention messages.
- Decreased illegal discharges from commercial mobile businesses.
- Improved the Carlsbad Municipal Code by working with the City Attorney's office to revise the ordinance to reflect current enforcement levels and mechanisms.
- Reviewed internal NPDES programs for compliance with Order No. 2001-01 prior to implementing Order No. R9-2007-0001.
- Continued to review inventory management, prioritization practices, inspection and enforcement procedures, training programs, record-keeping, and reporting procedures related to construction activities.

14.2 Highlighted Activities In Addition to Permit Requirements

The City implemented several initiatives in addition to the requirements of the Permit. Some of these highlights are internal program goals and should not be viewed as enforceable under the Permit. These internal program goals will be continued and enhanced as resources allow. For comprehensive details, please refer to the applicable preceding sections of this report. Highlights for FY 06-07 are as follows:

The City:

- Continued to maintain regular communications with the Industrial Compliance Unit of the Regional Board. In addition to copies of inspection reports and other correspondence with high and medium industries covered under the Permit, the City regularly coordinated compliance issues with Regional Board representatives over the phone and through emails. On several occasions, the Regional Board expressed their appreciation of the City's professionalism, responsiveness, and implementation of the storm water program
- Continued using the streamlined inspection report revised in FY 05-06 so that businesses could promptly implement corrective actions. The revised streamlined inspection form now includes spaces to report previous enforcement actions, new storm water contacts, and a detailed list of

necessary corrective actions. The revised form has proven to be successful in attaining compliance from regulated facilities.

- Created the Environmental Resources Management Team initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles.
- In FY 06-07, the City of Carlsbad's City Manager initiated the Storm Water Leadership Team (SWLT). Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City's major service areas and Directors. Agenda items covered all areas of the City's compliance with Order No. 2001-001, as well as review of the new Order No. R9-2007-0001.
- Continued working on the BMP manual including minimum BMPs for Existing Development activities and pollutant types.
- Adopted the use of BMP maintenance agreements for privately-maintained BMPs
- Continued distributing the new brochure for mobile service providers, including carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, and any other mobile businesses that provide services at various off-site locations. This brochure was designed for mobile service providers, their employees, and anyone that hires a mobile service provider.
- Posted minimum BMPs on the City's website for access by the public, permit applicants, developers, and property owners.
- Adopted new storm water BMP maintenance agreements and incorporated into standard operating procedures. The new BMP maintenance agreements provide increased control over property owner compliance with storm water BMP requirements. These new agreements will also provide the City with legal authority to access, inspect and if necessary maintain onsite BMPs. In addition, the agreements will allow the City to place a lien on a property if BMPs are not maintained as required.
- Continued to collect data for Performance Measures and the *Maintenance Assessment Program* to analyze improved work methods to balance scheduled versus unscheduled maintenance.
- Continued Storm Water Committee monthly meetings which included members from Public Works, the Fire Department, Recreation, Planning, and the Building Department.
- Continued to use the new database to track private treatment BMPs implemented under SUSMP.
- Continued the implementation of a new HHW pick up program. The program provides a means for Carlsbad residents to have HHW picked up from their homes and hauled away for a nominal fee. In addition, the City hosted a one-day HHW drop-off event.
- Continued to track measures in the *Performance Measurement System* to monitor various environmental goals, including annual sewage overflow spills and responses, # of catch basins inspected, bacteria exceedance investigation response time, and storm water complaint response time.
- Continued to implement a *Maintenance Assessment Program* to measure the level of care being provided at various City facilities.
- Continued to implement a computerized asset management/work order system that will allow the Storm Drain Maintenance Division to manage of the MS4 inventory, inspections, and maintenance activities conducted.

14.3 Highlighted Recommendations for Improvement

As the City implemented the JURMP in FY 06-07, some areas for improvement were noted for FY 06-07. Comprehensive details are included in applicable preceding sections of the report, but highlights are listed below. Areas targeted for improvement in FY 07-08 include the following:

The City will:

- Continue to research, observe, and evaluate the performance of various types of BMPs.
- Continue working on a "*Best Management Practices Manual*" that includes the minimum and required BMPs for activities and pollutant types. The manual should be completed by early FY 07-08.
- Continue to revise existing and add new programs to implement the new NPDES Municipal permit Order No. R9-2007-0001.
- Revise brochures and fact sheets to reflect changes in the program. A complete revision of all brochures it is expected to be completed in FY 07-08.
- Continue to work at the watershed level and help focus activities on high priority pollutants.

14.4 Water Quality Improvements or Degradation

The complete 2007 Dry Weather report is under separate cover accompanying this report. Additional analyses of the MS4 water quality are found in Section 11 of this report. Special receiving water studies were also conducted with results listed in Section 13 of this report. Please refer to the *Carlsbad Watershed FY 06-07 WURMP Annual Report* for data trends supporting the focus on *High Priority Pollutants* on a watershed basis. The following text highlights some of the observations on water quality. References to specific charts are given in parentheses.

MS4 Water Quality

With five years of data from the Dry Weather Program, ranging from nutrient and physical measurements to bio-available metals and pesticides, collected at 60 sites covering the entire MS4, a picture of water quality within the system is starting to appear. While data is only collected once annually, improvements can be seen for nutrient concentrations, pH, fecal coliform, MBAS, ammonia, and surfactants within the MS4.

Exceedances of bacteria 95th percentile criteria in the *Coastal Storm Drain Monitoring Program* have declined in recent years. FY 06-07 had continued decreases in fecal coliform exceedances. Specific water quality information from these programs is highlighted in Sections 8, 11, and 13 of this report. All these programs were conducted under dry weather conditions.

Receiving Water Quality

The City is continuing to conduct additional receiving water monitoring to assess receiving water quality in Carlsbad. Current programs include the *Coastal and Lagoon Outfall Monitoring Program*, the addition of four creek sites to the *Dry Weather Program*, re-installation of a dataSonde at Agua Hedionda Creek, and mass loading station monitoring. Specific water quality information from these programs is highlighted in Sections 8, 11 and 13 of this report, and in the *San Diego County Municipal Copermittees Urban Runoff Monitoring Annual Report*. All of these programs were conducted under dry weather conditions, except for the mass loading station data collection, which was conducted during wet weather events.

Coastal Monitoring Program data indicate no water quality exceedances for bacteria in the ocean and only a few in the enclosed lagoons. The exceedances in the lagoons have declined in recent monitoring seasons and water quality appears to be improving.

Receiving Waters Monitoring during Dry Weather found that nearly all constituents were undetected in the four additional creek sites' water samples including: MBAS, oil and grease, dissolved cadmium, dissolved copper, dissolved lead, diazinon, and chlorpyrifos. Water quality at the four locations was relatively good.

A dataSonde was re-installed at Agua Hedionda Creek to collect continuous water quality data. The Sonde is currently in a testing phase in which all data collected is not accessible for inclusion in this report. However, in the future, the Sonde is expected to provide real time data for dry weather that will be useful in assessing conditions and changes in the Creek water quality and in future TMDL development monitoring.

The regional monitoring program includes a mass loading monitoring station at Agua Hedionda Creek that monitors a number of water quality parameters during storm events. During three storm events in FY 06-07, no water quality objectives were exceeded for dissolved metals, oil and grease, surfactants, nutrients, or chlorpyrifos. In the future, this data may be used for long term water quality assessments and for TMDL monitoring information.

14.5 Conclusion

The Storm Water Protection Program continues to evolve over time in response to the iterative process of implementing BMPs, assessing effectiveness, and evaluating results. As more procedures, programs and activities are implemented, there is a clear need for better databases to track and report activities and BMPs being implemented. Tying these activities to changes in water quality still presents a considerable challenge. This is part of the long-term assessment strategy that will take time to develop trends and to determine cause and effect relationships between pollution prevention and water quality management. The City will continue to work individually and with the Copermittees to further develop existing compliance programs and create new opportunities for improvement.

This Annual Report demonstrates the City's compliance with the Permit and success implementing the JURMP. Previous sections of this report show that knowledge has increased in target communities, improved BMP implementation and behavior changes are occurring, pollutant loadings are being reduced from storm water management programs, the MS4 quality is improving, and some pollutants in receiving waters are improving. These are encouraging signs that are worth noting. The City recognizes that changes are likely to happen slowly and that continued program improvements and effectiveness measures are needed for long-term success.

Acronyms

The high priority industrial, commercial, and municipal locations shown on this map were created by geocoding each location's address first against the City of Carlsbad parcel base map, and then the remaining unmatched sites were geocoded to the City's street center line layer. Locations matched to the parcel base were mapped to the parcel centroid, locations matched to the street center lines were mapped to the estimated location within the address range of the street center line segment.

Title 8 PUBLIC PEACE, MORALS AND SAFETY

Chapter 8.17 SPECIAL EVENTS

8.17.010 Purpose and intent.
8.17.020 Definitions.
8.17.030 Permit required.
8.17.040 Exceptions to special event permit requirement.
8.17.050 Special events committee.
8.17.060 Application.
8.17.070 Fees.
8.17.080 Police protection and other emergency services.
8.17.090 Release and indemnification requirement.
8.17.100 Insurance requirements.
8.17.110 Signs.
8.17.120 Notification.
8.17.130 Reasons for denial of a special event permit.
8.17.140 Notice of denial of application.
8.17.150 Alternatives to permit application.
8.17.160 Appeal procedure.
8.17.170 Notice to city and other officials.
8.17.180 Special events calendar.
8.17.190 Contents of permit.
8.17.200 Violations.
8.17.210 Revocation of permit.
8.17.220 Severability.
8.17.010 Purpose and intent.

The city council recognizes that special events enhance the city's lifestyle and provide benefits to area residents, visitors, and businesses through the creation of unique venues for expression, recreation, and entertainment that are not normally provided as a part of governmental services. However, the city council also recognizes that special events, if unregulated, can have an adverse effect on the public health, safety and welfare due to noise, traffic, safety, and health hazard impacts. The purpose and intent of this chapter is to set forth reasonable regulations by establishing a process for permitting special events within the city, to protect the rights and interest granted to special event permit holders, to ensure the health and safety of patrons of special events, to prohibit illegal activity from occurring within special event venues, and to minimize any adverse effects from special events while ensuring the orderly and efficient use of public property and city services. It is further intended to create a mechanism for cost recovery for special events without having an adverse effect on those special events that contribute to the community. It is also the intent of the council to protect the rights of citizens to engage in protected free speech expression activities and yet allow for the least restrictive and reasonable, time, place and manner regulation of those activities within the overall context of rationally regulating special

events that have an impact upon public facilities and services. (Ord. NS-811 § 2 (part), 2006)

8.17.020 Definitions.

Except where the context otherwise requires, for the purposes of this chapter, the following definitions apply:

A. “Affected parties” means businesses and residents located within three hundred feet of the area around the special event that are likely to experience impact from the special event.

B. “City manager” means the city manager or his authorized designee.

C. “Demonstration” means any formation, procession or assembly of fifty or more persons which,for the purposes of expressive activity, is:

(i) To assemble or travel in unison on any street in a manner that does not comply with normal traffic regulations or controls; or

(ii) To gather at a public park or other public area.

D. “Event” includes special event or a demonstration.

E. “Event organizer” means any person who conducts, manages, promotes, organizes, aids or solicits attendance at a special event.

F. “Expressive activity” includes conduct, the sole or principal object of which is the means of opinion, views, or ideas and for which no fee or donation is charged or required as a condition of participation in or attendance at such activity. It includes public oratory and distribution of literature.

G. “Major event” means a special event that requires a traffic control plan for three or more intersections of any street or requires a traffic control plan for a secondary arterial, major arterial or a prime arterial.

H. “Minor event” means a special event that does not require a traffic control plan or that requires a traffic control plan for two or fewer intersections and does not involve a secondary arterial, major arterial or a prime arterial.

I. “Private property permit” means an administrative permit issued by the community development director for a function held entirely on private property that does not require a use of public property in a manner which impacts or restricts the public’s normal or typical use of such property or does not comply with the normal or usual traffic regulations or controls or that require

the provision of extraordinary city services and are therefore not governed by this chapter.

J. “Permittee” means a person to whom a special events permit has been issued.

K. “Person” means any person, firm, partnership, association, corporation, company or organization of any kind.

L. “Police chief” means the chief of police or his authorized designee.

M. “Sidewalk” means any area or way set aside or open to the general public for purposes of pedestrian travel, whether or not it is paved.

N. “Sound-amplifying system” means any system, apparatus, equipment, device, instrument or machine designed for or intended to be used for the purpose of amplifying the sound or increasing the volume of human voice, musical tone, vibration or sound wave.

O. “Special event” means:

(i) Any organized formation, parade, procession or assembly consisting of fifty or more persons, and which may include animals, vehicles or any combination thereof, which is to assemble or travel in unison on any street which does not comply with normal or usual traffic regulations or controls; or

(ii) Any commercial or noncommercial organized assemblage of fifty or more persons at any public beach, public park, public water ways, street, or sidewalk which is to gather for a common purpose under the direction and control of a person; or

(iii) Any other organized activity conducted by a person for a common or collective use, purpose or benefit which involves the use of, or has an impact on, other public property or facilities and the provision of city public safety services in response thereto;

(iv) Examples of special events include concerts, parades, circuses, fairs, festivals, block parties, community events, mass participation sports (such as marathons and running events, bicycle races or tours, tournaments), or spectator sports (such as football, baseball and basketball games, golf tournaments, surfing contests or other water competitions).

P. “Special event permit” means a permit as required by this chapter.

Q. “Spontaneous demonstration” is an event occasioned by news or affairs coming into public knowledge less than forty-eight hours prior to such event.

R. “Street” means any place or way set aside or open to the general public for purposes of vehicular traffic, including but not limited to any berm or shoulder, parkway, public parking lot, right-of-way, alley or median. (Ord. NS-811 § 2 (part), 2006)

8.17.030 Permit required.

No person shall engage in or conduct any special event unless a special event permit is issued by the city manager or his authorized designee. (Ord. NS-811 § 2 (part), 2006)
8.17.040 Exceptions to special event permit requirement.

A special event permit is not required for any of the following:

A. Any organized activity within the scope of a conditional use permit, other land use approval or a private property permit given or required for that use; or

B. Spontaneous demonstration, consisting of fifty or less persons, that do not involve the use of vehicles, animals, fireworks, pyrotechnics or equipment (other than sound equipment), provided that:

(i) No fee or donation is charged or required as a condition of participation in or attendance at such demonstration; and

(ii) The chief of police is notified at least thirty-six hours in advance of the commencement of the demonstration; or

C. Lawful picketing; or

D. Funeral processions by a licensed mortuary; or

E. Activities conducted by a government agency acting within the scope of its authority. (Ord. NS-811 § 2 (part), 2006)

8.17.050 Special events committee.

A. The special events committee shall be comprised of the assistant city manager, community development director, public works director, fire chief, police chief, housing and redevelopment director, recreation director and risk manager or their designated representatives. The police chief will chair the committee.

B. The special events committee is charged with reviewing and providing recommendations to the city manager regarding the approval or modification of an application for a special event permit based upon the information required in the application with regard to considerations of public safety, traffic flow and

control, the disruption to residences and businesses; availability of resources of city personnel and equipment to adequately ensure the public health, safety and welfare.

C. The special events committee shall not recommend for approval a new event for the date, time or location of a previously established reoccurring event unless the applicant of the previously established reoccurring event notifies the city of their intent to not hold the event or no application has been received by the city at the minimum application filing date. (Ord. NS-811 § 2 (part), 2006)

8.17.060 Application.

A. A person requesting a special event permit shall file an application, certified by affidavit on forms provided by the police department. The police chief will forward the application to the special events committee for review and recommendation to the city manager.

B. The application shall be filed at least ninety days and not more than two years before the special event is proposed to commence except for spontaneous demonstration held to react to current events, which shall provide a minimum of thirty-six hours' notice. The minimum ninety-day notice requirement may be waived by the police chief upon written finding that the limited scope of the event, both in size and magnitude, allows it to be adequately reviewed in the time provided.

C. The application for a special event permit shall set forth all of the following information, if applicable:

The name, address, e-mail address and telephone number of the applicant and event organizer and its officers;

The names, addresses and telephone numbers of the headquarters of any organization for which the special event is to be conducted, and proof of the authorized representatives of the organization;
An acknowledgment of financial responsibility for any city fees or costs that may be imposed for the special event by the applicant and any person authorizing the applicant to apply for the permit on its behalf;

A description of the nature or purpose of the special event, including a description of activities planned during the special event;

A statement of fees to be charged participants in the special event;

Identification of the Carlsbad location where special event sales will be reported to the franchise tax board, a city of Carlsbad business license or a copy of a document showing proof the applicant is a tax-exempt non-profit organization;

Proof of insurance required by this chapter;

The date(s), time(s), and location(s) where the special event is to be conducted, including assembly and disbanding;

A site plan including but not limited to:

a. Portable structures,

b. Prefabricated structures,

c. Site-built structures,

d. Staging,

e. Reviewing stand(s),

f. Elevated platforms,

g. Temporary pedestrian bridges,

h. Tents or canopies,

i. On-site grading,

j. Portable restrooms,

k. All on-site signs and banners that have a face area larger than sixteen square feet and/or stand more than four feet above the ground,

l. Any travel routes,

m. Assembly or production areas,

n. Electrical sources and connections,

o. Fuel storage,

p. Cooking and open fires,

q. Water supply,

r. Run-off containment features,

s. Waste recycling containers,

t. Accessible parking,

u. Access points and routes for disabled persons,

v. Access points for emergency fire and ambulance equipment,

w. Emergency medical services area(s),

x. Any vehicles located in an enclosed area,

y. Pyrotechnics,

z. Inflatable(s),

aa. Animals and animal rides,

bb. Carnival rides,

cc. Location to accommodate individuals desiring to express opinions not consistent with the purpose or intent of the event, and dd. Other similar information that will describe the components of the event;

The location and description of all off-site signs, banners or attention getting devices;

A detailed traffic control plan (TCP) for a major event and parking management plan, consistent with standards set forth in the National Manual on Uniform Traffic Control Devices or the California Supplement to the National Manual on Uniform Traffic Control Devices for all streets, sidewalks and parking lots which the special event will impact by restricting the public's normal, typical or customary use thereof;

The approximate number of participants, spectators, animals and vehicles;

The number of persons proposed or required to monitor or facilitate the special event and to provide spectator or participant control and direction for events using city streets, sidewalks, or facilities;

Provisions for first aid and emergency medical services;

The number, type and location of sanitation facilities;

Provisions for recycling per Public Resources Code Sections 42648 through 42648.7;

Pollution prevention in compliance with city's municipal National Pollutant Discharge
Elimination System permit, city ordinances and the city "Jurisdictional Urban Runoff

Management Plan (JURMP)";

A description of any recording equipment, sound amplification equipment, or other attention-getting devices to be used in connection with the special event.

D. Applications for special event permits for spontaneous demonstration held to react to current events shall provide the information in subsections ©(1), ©(7), ©(11) and ©(18) of this section only.

E. Applicants for a repeated event held on private property (such as fireworks) may file one annual special event application identifying the event dates for one calendar year. (Ord. NS-811 § 2 (part), 2006)

8.17.070 Fees.

A. Major Event Fee. A nonrefundable fee, as set forth in the schedule of service costs approved by city council resolution, reasonably calculated to reimburse the city for its reasonable andnecessary costs in receiving, processing and reviewing applications for permits to hold a major event, must be paid to the city of Carlsbad when an application is filed.

B. Minor Event Fee. A nonrefundable fee, as set forth in the schedule of service costs approved by city council resolution, reasonably calculated to reimburse the city for its reasonable andnecessary costs in receiving, processing and reviewing applications for permits to hold a minor event, must be paid to the city of Carlsbad when an application is filed.

C. If the application includes the use of any city facility and/or property, or if any city services are required for the special event, the applicant must agree to pay for the services in accordance with a schedule of service costs approved by city council resolution. (Ord. NS-811 § 2 (part), 2006)

8.17.080 Police protection and other emergency services.

A. The police chief will determine whether and to what extent additional police protection, civilian traffic control personnel, private security and volunteer staff are reasonably necessary to ensuretraffic control and public safety for the special event. The police chief will base this decision on the size, location, duration, time and date of the special event, the expected sale or service of alcoholic beverages, the number of streets and intersections blocked off from use by the public, and the need to detour or preempt pedestrian and vehicular travel from the use of public streets and sidewalks. The police chief shall provide, if police protection and/or other emergency andsafety services or equipment is deemed necessary for the special event, an estimate of the cost of extraordinary city services and equipment required in writing. The applicant will be billed for services after the event.

B. When the police chief is determining the size of the event and the security needed to protect participants and spectators, the estimate, based upon reasonably known information, of participants shall be determinative. The numbers of persons attending in response to an event, to heckle, protest or oppose the sponsor's viewpoint shall not be considered in the cost of providing police protection. (Ord. NS-811 § 2 (part), 2006)

8.17.090 Release and indemnification requirement.

Permittee agrees to waive and release the city of Carlsbad and its officers, agents, employees and volunteers from and against any and all claims, costs, liabilities, expenses or judgments including attorney's fees and court costs arising out of the activities of this special event or any illness or injury resulting therefrom, and hereby agree to indemnify and hold harmless the city of Carlsbad from and against any and all such claims, whether caused by negligence or otherwise, except for illness and injury resulting directly from gross negligence or wilful misconduct on the part of the city or its employees. (Ord. NS-811 § 2 (part), 2006)

8.17.100 Insurance requirements.

Whenever a special event, including but not limited to exhibits, fairs, athletic events, trade shows, concerts, or conventions, requires a permit under the provisions of this code, the sponsor, promoter or person conducting the special event shall provide evidence of commercial general liability insurance in a form acceptable to the risk manager (and additional coverage(s) as appropriate for the activities of the event), naming the city of Carlsbad as an additional insured, and with a coverage amount to be determined by the risk manager according to the size and risk factors of the event.
When determining the size of the event and the risk to participants and spectators, the estimate of participants shall be determinative. The person conducting the special event shall not be required to insure any risk arising from persons attending in response to an event, to heckle or oppose the sponsor's viewpoint. The insurance company or

companies shall meet the requirements established by city council resolution for all insurance required by the city. The insurance policy required by this section shall not be cancelled, limited or not renewed without thirty days' prior written notice has been given to the city. (Ord. NS-811 § 2 (part), 2006)

8.17.110 Signs.

A. The permittee shall post street closure notification signs at locations approved by the city manager which include the name of the event, date, time and location of the closure and which:

Shall not exceed sixteen square feet in sign area with a minimum letter size of four inches;

Shall be posted on any street on which more than two intersections will be closed, and any secondary arterial, major arterial, or prime arterial that will be closed as a result of the special event;

Shall be posted a maximum of fifteen days and a minimum of ten days prior to the scheduledclosure; and

Shall be removed within two days following the conclusion of the event.

B. The permittee may post a maximum of four signs that promote the event at locations approved by the city manager. Event promotion signs shall meet the following conditions:

The event promotion sign(s) shall not exceed sixteen square feet in sign area;

Shall not be posted more than sixteen days prior to the event; and

Shall be removed immediately but in no event more than two days following the event.

C. The permittee shall post traffic control and/or directional signs the day or days of the special event as required by the permit. Traffic control and/or directional signs shall meet the following conditions:

The location of all traffic control and/or directional signs shall require approval of the city manager; and

Traffic control and/or directional signs shall not be posted more than four hours prior to the start of the special event and shall be removed not more than four hours after the conclusion ofthe special event. Signs left

out after four hours may be removed by city staff and disposed of without compensation to event organizer.

D. The permittee for a special event permit may post signs and banners during the special event at the special event venue.

All venue sign(s) with more than sixteen square feet of sign area or signs that are more than four feet above ground level shall be identified on the site plan.

Each venue signs and/or banners shall be less than fifty square feet of sign area. (Ord. NS 811 § 2 (part), 2006)

8.17.120 Notification.

A. The applicant for:

A first time major event;

A major event that has not been held for more than two years;

A first time event at a city facility that is not authorized by facility use permit; or

An event at a city facility that is not authorized by facility use permit and that has not been held for more than two years; shall sponsor a meeting for all affected parties. This meeting must be held not more than one hundred eighty days prior or less than eighty days prior to the special event date. Affected parties must be notified by the applicant via the United States Postal Service of the meeting a minimum of ten days prior to the meeting. The purpose of this meeting will be to allow the special event sponsor to identify and address concerns of affected parties regarding the time, place and manner in which the special event is to be held. Concerns regarding the message or viewpoint of the event sponsor shall not be considered. The police chief may waive the minimum eighty-day time limit for the affected party meeting with a written finding of good cause if, after due consideration, the police chief determines that because of the limited scope and complexity of the event when considering the application criteria, there will be adequate time for review by and input of concerned affected parties.

B. The applicant for a major special event permit that is not subject to the notification described in subsection A shall notify all affected parties of the event not more forty days nor less than thirty days prior to the special event date via the United States Postal Service. The notification shall contain information

concerning the event and information on how to contact the applicant and the special events committee before and after the event.

C. All applicants for a special event permit shall notify via the United States Postal Service or by direct distribution to all affected parties of the event not more than fifteen days prior or less than ten days prior to the special event date with information concerning the event and information on how to contact the applicant and the special events committee before and after the event. (Ord. NS-811 § 2 (part), 2006)

8.17.130 Reasons for denial of a special event permit.

A. The city manager may only deny a special event permit to an applicant when any of the following applies:

The application for the permit (including any attachments) is not fully completed and executed.

The application for the permit contains a material falsehood or misrepresentation.

The applicant has failed to conduct a previously authorized event in accordance with law or the terms of a permit, or both.

The use or activity would conflict with previously planned programs organized and conducted by the city and previously scheduled for the same place and time.

A fully executed prior application for the same time and place has been received and a permit has been or is likely to be granted authorizing uses or activities which do not reasonably permit multiple occupancy of the particular site or part thereof.

The applicant has not complied or cannot comply with applicable federal, state or local laws, regulations, ordinances or city council policy.

The applicant has not tendered the required application, indemnification agreement and endorsement(s), insurance certificate, or security deposit for police and emergency services and equipment within the times prescribed.

The applicant has not provided for the services of a required number of police officers, fire and/or paramedic personnel, private security, civilian traffic controllers or event volunteers/staff to ensure the safety of the event.

The applicant has not provided adequate sanitation and other required health facilities on or adjacent to any public assembly area.

The applicant has not provided sufficient off-site parking or shuttle service, or both, required to minimize any adverse impacts on public parking and traffic circulation in the vicinity of the special event.

The applicant has not obtained the approval of any other public agency within whose jurisdiction the special event or portion thereof will occur.

The use or activity would present an unreasonable danger to the health or safety of the applicant, other users of the site, or the public.

The special event will require the exclusive use of beach or park areas during any period in a manner which will have adverse impact on the reasonable use or access to those areas by the general public.

The special event will create the imminent possibility of violent disorderly conduct likely to endanger public health, safety and welfare or to result in property damage.

The special event will interfere with the normal access and function of businesses and/or residences during any period in a manner, which will have adverse impact on the reasonable use or access to those areas.

The special event will require the diversion of a great number of police employees from their normal duties, thereby preventing reasonable police protection to the remainder of the city.

The conduct of the special event will substantially interrupt the safe and orderly movement of other pedestrian or vehicular traffic, including public transportation, contiguous to its route or location.

B. The city manager shall not deny a special event permit to an applicant based upon the message, content or viewpoint of the event sponsor. (Ord. NS-811 § 2 (part), 2006)

8.17.140 Notice of denial of application.

The city manager will act promptly upon a timely filed application for a special event permit and will make a determination not less than twenty-eight calendar days prior to the event. The applicant will be notified within two working days of said determination. If the city manager does not act on a special event application at least twenty-eight calendar days prior to the event, the application shall be deemed denied. (Ord. NS-811 § 2 (part), 2006)

8.17.150 Alternatives to permit application.

The city manager, in denying an application for a special event permit, may authorize the conduct of the special event at a date, time, location, or route different from that named by the applicant and shall propose alternative measures, which would cure any defects in the application. An applicant desiring to accept the modifications to the application will, within five days after notice of the action of the city manager, file a written notice of acceptance with the city manager. (Ord. NS-811 § 2 (part), 2006)

8.17.160 Appeal procedure.

A. Any applicant has the right to appeal the denial of a special event permit to the city council. The denied applicant must make the appeal within five days after receipt of the denial by filing a written notice with the city clerk and a copy of the notice with the police chief. The city council will act upon the appeal at the next regularly scheduled meeting following receipt of the notice of appeal, which decision will be final.

B. In the event that the city council denies an applicant's appeal, the applicant shall be afforded prompt judicial review of that decision as provided by California Code of Civil Procedure Section 1094.8. (Ord. NS-811 § 2 (part), 2006)

8.17.170 Notice to city and other officials.

Immediately upon the issuance of a special event permit, the police chief will send a copy thereof to the city manager, the city attorney, the fire chief, the public works director, the community development director, the recreation director (when permits are issued which impact city parks and recreation facilities), the postmaster, and the manager or responsible head of each public transportation utility, the regular routes of whose vehicles will be affected by the route or location of the proposed special event. (Ord. NS-811 § 2 (part), 2006)

8.17.180 Special events calendar.

The city will maintain a special events calendar. Events will be registered on the special events calendar as "approved" or as "pending." (Ord. NS-811 § 2 (part), 2006)

8.17.190 Contents of permit.

Each special event permit will contain the following information or conditions, which is pertinent to the event:

A. The dates and times when the special event is to be held;

B. The dates and time roads will be closed;

C. The set-up or staging time;

D. The time clean-up or dismantling will be completed;

E. The location of the special event venue, including set-up or staging area, if any, and clean-up or dismantling area, if any;

F. The specific route of the special event;

G. Minimum and maximum speed of vehicles or people in the special event;

H. The number of persons, and type and number of animals and vehicles, the number of bands, other musical elements and equipment capable of producing sound, if any, and noise limitationsthereon;

I. The location of reviewing or audience stands;

J. A copy of the traffic control plan (TCP) and/or parking management plan including the numberand location of traffic controllers, monitors, other personnel and equipment and barricades to be furnished by the special event permittee;

K. Conditions or restrictions on the use of alcoholic beverages and authorization for the conditions of the exclusive control or regulation of vendors and related sales activity by the permittee during the special event;

L. Provisions for any required emergency medical services;

M. The applicant's recycling plan;
N. The applicant's plan to control water run-off and other contaminates that may enter the city storm drain system;

O. Provisions for cleaning-up and restoration of the area or route of the event both during and upon completion of the event;

P. The requirement for the on-site presence of the special event organizer or a designated representative for event coordination and management purposes who

shall carry the special event permit upon his/her person during the special event. (Ord. NS-811 § 2 (part), 2006)

8.17.200 Violations.

A. Violations of the terms and conditions of any of the following prohibitions in this chapter will constitute a misdemeanor punishable by a fine of up to one thousand dollars, or by imprisonment in the county jail for a term not exceeding six months, or by both:

To stage, present, or conduct any special event without first having obtained a permit under this chapter;

To hamper, obstruct, impede, or interfere with any special event or with any person, vehicle oranimal participating or used in the special event;

To carry any sign, poster, plaque, or notice, whether or not mounted on a length of material, unless such sign, poster, plaque, or notice is constructed or made of a cloth, paper, or cardboard material;

For any person participating in any special event to carry or possess any length of metal, lumber, wood, or similar material for purposes of displaying a sign, poster, plaque or notice, unless such object is one and one-fourth inch or less in thickness and two inches or less in width, or if not generally rectangular in shape, such object may not exceed three-fourths inch in its thickest dimension.

B. Violations of the terms and conditions of any of the following prohibitions in this chapter will constitute an infraction and shall be punished as provided for in Chapter 1.08 of this code:

To participate in a special event for which the person knows a permit has not been granted;

To knowingly fail to comply with any condition of the permit;

For a participant in or spectator at a special event to knowingly violate any conditions or prohibitions contained in the special events permit;

For any driver of a vehicle to drive between the vehicles or persons comprising a special event when the vehicles or persons are in motion and are conspicuously designated as a special event;

The police chief may prohibit or restrict the parking of vehicles along a street constituting a part of a special event if the police chief posts or

cause to be posted signs to that effect. It is unlawful for any person to park or leave unattended any vehicle in violation of the posted signs.

C. The police chief may, when reasonably necessary, waive parking regulations along a street constituting a part of a special event. (Ord. NS-811 § 2 (part), 2006)

8.17.210 Revocation of permit.

The police chief may revoke a special event permit without prior notice upon violation of the permit or when a public emergency arises where the police resources required for that emergency are so great that deployment of police services for the special event would have an immediate and adverse effect upon the health, safety and welfare of persons or property. Written notice of the revocation setting forth the reasons therefor, shall be hand delivered or mailed to the applicant at the address provided on the application. (Ord. NS-811 § 2 (part), 2006)

8.17.220 Severability.

If any section, subsection, sentence, clause or phrase of this chapter is for any reason held invalid or unconstitutional by the decision of any court of competent jurisdiction, the decision will not affect the validity of the remaining portions of this chapter. The city council declares that it would have passed the ordinance codified in this chapter and each section, subsection, sentence, clause or phrase contained in it irrespective of the fact that any one or more sections, subsections, sentences, clauses or phrases are declared invalid or unconstitutional. (Ord. NS-811 § 2 (part), 2006)

Storm Water Protection... It's OUR Business!

What You Need to Know…

The City of Carlsbad's storm water conveyance system consist of pipes, concrete ditches, basins, drains and inlets, as well as natural drainage areas, such as canyons, gullies and streams. The purpose of the system is to carry rainwater away from developed areas to prevent flooding.

Storm drains are **not** connected to sanitary sewer systems or treatment plants. Rainwater and the pollutants it carries flow directly to our creeks, lagoons and ocean. Pollutants of concern include:

- Sediments
- Fertilizers
- Metals
- Detergents
- Pesticides
- Organic Compounds
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

.

What is the Storm Water Protection Program?

The City's Storm Water Protection Program regulates storm water activities for existing development (residential, commercial and industrial), investigates illegal discharges to the storm water system, educates the public about pollution prevention, and oversees the water quality monitoring program.

What does the Municipal Permit require?

The Municipal Permit requires the City to prevent storm water pollution during all three phases of urban development land use planning for new development, construction, and existing development.

The Permit also requires the City - **employees, residents, and businesses** - to improve the quality of the water flowing into the storm water system to the maximum extent practical. This is accomplished through the implementation of Best Management Practices (BMPs). In addition, the Municipal Permit requires the City to investigate and eliminate illegal discharges, develop an outreach and education program, and implement BMPs at municipal facilities.

I've heard the term NPDES. What does it mean?

NPDES stands for National Pollutant Discharge Elimination System and is the name of a permit system implemented under the 1972 Federal Clean Water Act. The 1987 amendments to this Act required municipalities discharging storm water runoff into surface waters (i.e., ocean, lagoon, etc.) to obtain a permit. In California, these permits are issued by the Regional Water Quality Control Board.

Our current municipal storm water permit was issued February 21, 2001 and applies to all 18 cities in San Diego County, the Unified Port District, and the County of San Diego. To view a copy of the Permit, please go to http://www.swrcb.ca.gov/rwqcb9/programs/sd_stormwater.html.

Who is responsible for protecting storm water?

EVERYONE! Storm water pollution prevention is a shared duty between the City of Carlsbad and the community. Storm drains on ***public*** streets, property, or easements are monitored and cleaned by the City. Everyone has a part to play in keeping our storm drains free of trash, debris, excessive vegetation, and other materials that may pollute, contaminate or block the flow of water through the storm drain system.

- **City Employees**
- **Residents**
- **Business Community**
- **Developers and construction workers**
- **YOU!!**

Only Rain in the Storm Drain!

Are all non-storm water discharges illegal?

The Municipal Permit prohibits **all** non-storm water discharges into the storm water system, with some exemptions:

- Landscape irrigation and lawn watering runoff
- Dechlorinated pool water
- Individual Residential car washing
- Potable water sources
- Foundation drains, crawl spaces
- Air conditioning condensate
- Emergency Fire Fighting Flows

What are Best Management Practices?

Best Management Practices or BMPs are procedures that help to prevent pollutants from entering our storm drains. Once potential and existing sources of pollution have been identified, the next step is to select proper BMPs to eliminate or reduce storm water pollution.

What are some BMPs I can use in my daily work?

- Instead of using a hose or pressure washing system, **try a dry clean up method!** Use mops, brooms or wire brushes to clean dumpsters, sidewalks, buildings, equipment, pavement, driveways, or other impervious surfaces. Never dispose of wash water to the storm drain.

- When possible, store materials indoors or under covered areas not exposed to rain. If materials can not be stored under cover, place materials on pallets and cover with a tarp to avoid contact with storm water run-on and runoff.
- Dumpsters should always be kept closed to prevent rainwater from entering. Never place liquid waste, leaky garbage bags or hazardous waste in a dumpster or trash bin.
- Wash vehicles at a commercial car wash, whenever possible. City employees and/or mobile detailers can not wash vehicles on public streets or on public property, including City Hall and all public parking lots.

How do I report a storm water violation?

The Storm Water Protection Program operates a hotline and e-mail address to receive referrals about storm water pollution and illegal discharges. If you see someone dumping or washing waste or pollutants to the street or storm drain, please call the **hotline** at **760-602-2799** or send an email to stormwater ci.carlsbad.ca.us. This information is entered into the City s Request for Action system and is routed to the appropriate person for response.

Storm Water Hotline

760-602-2799

What is the City doing to comply with the Permit?

- A Jurisdictional Urban Runoff Management Plan (JURMP) that specifies how the City will implement the storm water program has been developed and implemented.
- The Carlsbad Municipal Code includes regulations for storm water protection and pollution prevention.
- Several informative brochures and fact sheets have been developed to educate the public and City employees about storm water pollution prevention.
- An extensive education and inspection program has been implemented to ensure the community is aware of and complying with the storm water requirements.
- Reports of illegal discharges are fully investigated and resolved to the maximum extent practical.
- Storm water pollution prevention measures have been incorporated into the new construction and building permit process.
- Storm water pollution prevention plans (SWPPP) have been developed and implemented at all high priority municipal facilities throughout the City.
- City employees have been trained and will continue to be trained on the requirements of the storm water program.
- The General Plan and Environmental Review process includes storm water and pollution prevention requirements.
- The City has completed a Standard Urban Storm Water Mitigation Plan (SUSMP) to address storm water requirements for new development and significant redevelopment.
- Water quality monitoring is being conducted at lagoon and ocean outlets within the City s jurisdiction.
- The storm drain conveyance system has been mapped and the information made available in a GIS format.
- A Watershed Urban Runoff Management Plan (WURMP) has been developed in association with other North County cities.

Be A Part of the Pollution Solution!!

FY 06 - 07 Storm Water Committee Meeting Topics Summary		
DATE	**in attendance**	**AGENDA ITEMS**
07/12/2006	10	training, spill procedures, new swim complex plan review
08/16/2006	5	municipal High Priority facility inspections, golf course ACL, Dry Weather Program findings
09/14/2006	8	review facility-specific spill procedures, JURMP Annual Report FY 04-05 comment letter from the Regional Board, JURMP Annual Report preparation for FY 05-06
10/12/2006	16	contractor BMPs, watershed activities, news articles, complaint response
11/08/2006	7	JURMP Annual Report FY 05-06 preparation, new NPDES MS4 permit, watershed activities, duty list for after-hours callouts, training requirements in the permit
12/06/2006	7	EPA webcast on MS4 programs
01/10/2007	7	EPA webcast on construction inspection programs, new permit discussion
02/13/2007	13	review of JURMP Annual Report FY 05-06 submission, discussion of recent NOVs and Required Technical Report, upcoming field demo and training on BMPs, review of water quality results, new permit overview
03/07/2007	7	EPA webcast municipal compliance guidebook published
05/24/2007	10	BMP demo at UV facility in City of Encinitas
06/12/2007	11	new permit and new JURMP, TMDL Investigative Order, Municipal High Priority facility inspections

Inspection of Municipal Areas, Activities, and Recommendations

Inspection Report Recommendations		
Oak Maintenance Yard		**Corrective Actions Taken**
1. Keep site free of sediment and debris to maximum extent practicable.		Maintenance yard cleaning and sweeping has been increased to weekly, with bi-weekly visual inspections.
Public Works Operations and Maintenance Facility		**Corrective Actions Taken**
1. No corrective actions were given for this site.		
Swim and Recreation Complex		**Corrective Actions Taken**
1. Consider developing a general spill response plan, in addition to a SWPPP and site map.		The Swim Complex has developed a SWPPP and a site map. A spill response plan is already in place and has been incorporated in the SWPPP. Both documents will be reviewed during FY 07-08 for any necessary updates.
2. Keep parking area free of trash and debris.		Staff inspect and sweep/clean the parking on a daily basis and will continue to do so.
3. Use dry methods to clean pool deck as previously instructed by the City.		As required by the County Health Department the deck is cleaned on a regularly basis. The entire area was replumbed to ensure the most waste water goes to the sanitary sewer. Any other potential runoff is precluded from reaching the storm drain system.
Fleet Maintenance Facility		**Corrective Actions Taken**
1. Keep lot free of sediment and debris to the maximum extent practicable.		The Fleet Maintenance Facility is sweep bi-monthly by a City contracted sweeper. In addition, staff conduct weekly inspections of the yard and remove accumulated sediment and debris.

Municipal Inspection Report Corrective Actions
FY 06-07

Parks Yards		Corrective Actions Taken
Parks Maintenance Storage		
1. Keep site free of organic debris to maximum extent practicable.		Trimmed large Eucalyptus trees and continued a weekly yard clean up program to keep the yard free of sediment and debris.
2. Ensure spill response plan contains appropriate site specific information.		The existing Spill Response Plan has been updated and modified to reflect changes due to new personnel and employees newly trained in Hazwoper duties.
Poinsettia Maintenance Station		
1. Keep training logs onsite.		All Storm Water Training Logs are kept up to date and on-site.
2. Keep equipment covered and raised off the ground to the maximum extent practicable.		All outdoor storage and equipment is off the ground and covered.
3. Stabilize un-landscaped dirt area next to road.		Installed straw wattles to stabilize the unlandscaped areas next to road.
Stagecoach Maintenance Station		
1. Keep lot and parking areas free of organic debris to the maximum extent practicable.		Paved dirt storage equipment area and initiated a rigorous weekly lot clean up to ensure the organic debris is removed.

Municipal Inspection Report Corrective Actions
FY 06-07

Fire Station 1		Corrective Actions Taken
1. Control erosion from un-landscaped slope on east edge of the site.		Sweeping and removal of organic material, including sediments from un-landscaped slope is completed on a weekly or as needed basis at all fire stations.
2. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.
Fire Station 2		**Corrective Actions Taken**
1. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.
2. Keep parking lot free of organic debris to maximum extent practicable.		Sweeping and removal of organic material from parking lots and walkways is completed on a weekly or as needed basis at all fire stations.
3. Consider keeping a spill kit onsite.		Spill response equipment and materials are clearly identified and staged in accessible locations.
Fire Station 3		
1. Keep parking area free of organic debris to maximum extent practicable, especially around catch basin.		Sweeping and removal of organic material from parking lots and walkways is completed on a weekly or as needed basis at all fire stations.
2. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.
Fire Station 4		**Corrective Actions Taken**
1. Keep outdoor areas free of organic debris to maximum extent practicable.		Sweeping and removal of organic material from parking lots and walkways is completed on a weekly or as needed basis at all fire stations.
2. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.

Municipal Inspection Report Corrective Actions
FY 06-07

Fire Station 5		**Corrective Actions Taken**
1. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.
2. Keep dumpster lids closed and the area surrounding the dumpster free of trash.		Staff has been trained onproper waste disposal and dumpsters are routninely kept cllosed when not in use.
Fire Station 6		**Corrective Actions Taken**
1. Prevent stockpiles containing soil and concrete waste from tracking to paved areas.		Sweeping and removal of organic material from parking lots and walkways is completed on a weekly or as needed basis at all fire stations.
2. Consider developing a site specific SWPPP and site map.		The Fire Department developed a storm water manual specific to each fire station to serve as a central location for all storm water documents, training, and BMP descriptions, as well as departmental policies related to storm water.
3. Consider keeping a spill response kit onsite.		Spill response equipment and materials are clearly identified and staged in accessible locations.

The high priority industrial, commercial, and municipal locations shown on this map were created by geocoding each location's address first against the City of Carlsbad parcel base map, and then the remaining unmatched sites were geocoded to the City's street center line layer. Locations matched to the parcel base were mapped to the parcel centroid, locations matched to the street center lines were mapped to the estimated location within the address range of the street center line segment.
Map created by the City of Carlsbad GIS. Portions of this DERIVED PRODUCT contain geographic information copyrighted by SanGIS. All Rights Reserved.

The high priority industrial, commercial, and municipal locations shown on this map were created by geocoding each location s address first against the City of Carlsbad parcel base map, and then the remaining unmatched sites were geocoded to the City s street center line layer. Locations matched to the parcel base were mapped to the parcel centroid, locations matched to the street center lines were mapped to the estimated location within the address range of the street center line segment.

Dear Carlsbad Resident:

The City of Carlsbad is now offering door-to-door Household Hazardous Waste collection. Gather your Household Hazardous Waste, then call for an appointment to have these items collected and disposed of. This service requires you pay a $10 copayment per pick-up; the City pays $80 per pick-up. Your participation will ensure that all of us are safe and that our City and its natural beauty stay clean.

To reduce the amount of Household Hazardous Waste you generate, please buy only what you need and use it up. Choose less toxic alternatives and recyclable products.

Remember, Household Hazardous Waste cannot be thrown in the trash!

Thank you for your participation.

Household Hazardous Waste Collection

What is Household Hazardous Waste?

Household Hazardous Waste (HHW) includes items used every day in most homes. Items like paint, motor oil, batteries, household cleaners, lawn chemicals, fluorescent light bulbs, televisions and computer monitors contain unsafe materials and need to be disposed of in different ways than household garbage.

Why Participate?

The State of California requires by law that residents not mix HHW with their normal trash because HHW cannot be put into landfills.

Carlsbad residents have been able to take their HHW to permanent facilities in Vista, Poway or Oceanside for disposal. These facilities are still available to residents wishing to transport their own HHW and use of the facilities is free with an appointment.

How Do You Use This Service?

The City of Carlsbad recognizes that residents need an option for HHW disposal within the City's borders. Carlsbad has contracted with Clean Harbors, Inc., for the door-to-door collection of HHW. This service means that you call the toll-free number, schedule an appointment, and have your HHW picked up at your home.

Now Carlsbad residents have two options for disposal of Household Hazardous Waste:

1. You can still take your HHW to Vista, Poway or Oceanside and dispose of it for free; or,
2. You can take advantage of this new door-to-door collection service and, with a $10 copayment, have Clean Harbors come to your home and dispose of the HHW for you.

To Take Advantage of HHW Door-to-Door Collection

- **Collect HHW items from around your home.** Please place your HHW in sealed, non-leaking containers. If possible, leave products in the original container. Products labeled *Dangerous, Caution, Flammable, Poison, Toxic* or *Corrosive* are considered Household Hazardous Waste and should be disposed of properly. It is dangerous, and illegal, to discard HHW into the trash, into a storm drain, or down the sewer drain. If you think you have some HHW but are not sure, please call Clean Harbors to check!
- **Call Clean Harbors at 1-800-444-4244 and schedule an appointment.**

CALL

Clean Harbors
1-800-444-4244

to schedule an appointment or for additional information

On Your Appointment Date

- **Place the HHW in a safe place outside your home** — either on your porch or on your driveway close to your home.
- **Place your $10 copayment check made out to Clean Harbors, Inc., with the HHW.** Clean Harbors, Inc., will collect the HHW materials and dispose of them for you.
- The total weight that is considered per collection is up to 15 gallons or 125 lbs. of waste per pickup. If there is more, it is considered two pickups and you will need to leave a $20 copayment check.

How Often Can You Call?

You may call Clean Harbors as often as you need to. This service simply requires an appointment and a $10 copayment.

Household Hazardous Waste includes:

- ☑ Aerosols
- ☑ Asbestos (3-foot sections)
- ☑ All Purpose Cleaners
- ☑ Antifreeze
- ☑ Auto Batteries
- ☑ Auto Fluids
- ☑ Computer Monitors
- ☑ Disinfectants
- ☑ Drain Opener
- ☑ Fertilizers
- ☑ Fluorescent Light Bulbs
- ☑ Furniture Polishes and Stains
- ☑ Gasoline
- ☑ Glue
- ☑ Household Batteries
- ☑ Household Cleaners
- ☑ Insecticides
- ☑ Kerosene
- ☑ Lighter Fluid
- ☑ Mercury Thermostats
- ☑ Motor Oil
- ☑ Oil Filters
- ☑ Oven Cleaner
- ☑ Latex Paint
- ☑ Oil-Based Paint
- ☑ Pesticides and Herbicides
- ☑ Pool Chemicals
- ☑ Solvents
- ☑ Televisions
- ☑ Thinners
- ☑ Varnishes

If you think you have HHW but are not sure, please call Clean Harbors to check!

Reduce

... by purchasing only the amount you need.

Reuse

... the products by donating unused portions to friends or community organizations.

Recycle

... leftover household hazardous products that are recyclable and dispose of the others safely by participating in a household hazardous waste collection program.

Used Oil

- **Oil does not wear out.** The same processes that refine crude oil into lubricating oil can re-refine your used oil into certified lubricating oil using one-third the energy.
- **Do not dump your oil. It is illegal.** Please do not contaminate your oil by placing it in old containers. Take your used oil to one of these convenient centers, and close the loop by purchasing re-refined lubricating oil.

Electronic Waste

Computer monitors and televisions containing cathode ray tubes (CRTs) cannot go in the trash. Discarded CRTs are considered hazardous because of the amount of lead they contain and must be handled appropriately. All electronic equipment should be reused or recycled to recover useful materials and reduce disposal.

Electronic Waste also includes:
- Large household appliances (ovens, refrigerators, etc.)
- Small household appliances (toasters, vacuum cleaners, etc.)
- Office and communication (PCs, printers, phones, faxes, etc.)
- Entertainment electronics (TVs, HiFis, portable CD players, etc.)
- Fluorescent light tubes
- Sports and leisure equipment (electronic toys, training machines, etc.)

Environmental Programs Newsletter · Winter 2006-2007

Reduce, Reuse and Recycle!

CARLSBAD ENVIRONMENTAL PROGRAMS encourages all residents to remember that every day is Earth Day and the holiday season is the perfect time for using less. Thanksgiving, Christmas, Hanukkah, or Kwanzaa, the holiday season is an opportunity for most of us to spread holiday cheer through gifts and large family dinners. We buy and use large volumes of food, toys and material goods... but do we still remember to recycle where possible?

Remember that every day is Earth Day.

- Each year around the holidays the amount of trash generated increases approximately 25%.
- Plan meals light on volume. Portion control will help your waistline, the bottom line and won't line our trash containers with wasted food.

Here is a simple chart with some recommended portions that could be useful in planning your holiday meals:

FOOD/DRINK	PORTION PER PERSON
Eggnog	1/2 cup
Turkey for up to 10 people	12-14 pounds
Stuffing	1/4 pound
Sweet Potato Casserole	1/4 pound
Green Beans	1/4 pound
Cranberry relish	3 tablespoons
Pumpkin Pie	1/8 of a 9" pie

- Full freezers and refrigerators help keep the temperature down with all the cold food.
- Run the dishwasher only when you have a full load; use the no-heat fan or air-dry setting for overnight washing.
- Walk to neighborhood parties or carpool (with a designated driver!) with friends if it's too far to walk.
- Think of gift ideas that do not require just buying "stuff" – savings accounts, movie tickets, stock shares, concert tickets, and sports tickets are heavy on value but light on environmental impact.
- Reduce the wrapping paper that you use to cover gifts or even better, put gifts in reusable gift bags.
- Consider energy use when planning for the holidays. Electricity usage can spike during the holidays when we decorate trees and homes with elaborate displays.
- Turn down the heat before the guests arrive. You'll save energy while the extra body heat of your guests will warm up the room.
- Purchase holiday lights with small or LED bulbs. Low wattage has two advantages: it consumes less energy and gives off less heat, making your lights safer. LED can be more expensive initially but they require less electricity and are very durable.
- When buying electronic toys and other portable items that are used regularly, remember to buy rechargeable batteries to go with them.
- Clean it up! Keeping the coils on your fridge free of dust bunnies will use less energy and help it last longer.
- Turn off computers, TVs, VCRs and so forth, when not in use.

Did You Know?

Storm Water Tips

- Call 602-2799 to report a potential storm water violation.
- Provide Who, What, Where, When, and Why (if you know it). The more details you can provide (exact address, license plate number, etc.), the better our response.
- Call at the time you see something happening, if possible. It is okay to leave a message. If it is the dumping of hazardous materials, calling the hotline after business hours will connect you to Police Dispatch.
- If the discharge is coming from a new construction site, please call 602-2780.

We follow up on all calls we receive on the hotline, and greatly appreciate those who call to help prevent pollution from getting into our waterways and ocean. We all want clean beaches and water in Carlsbad!

PETER NAGAINIS

Household Hazardous Waste and Used Oil

Did You Know...?

Did you know that if properly processed, recycling motor oil requires less oil than creating new oil? Did you know that you can request re-refined oil when you get your oil changed?

Carlsbad sponsors three collection centers that are State-certified to collect used motor oil. When residents drop off uncontaminated motor oil to these locations, in an approved (clean) container, the oil gets recycled and residents can get a 4 cents per quart rebate! That may not seem like much but consider that you're being paid to do the right thing. You can feel great about yourself AND have a little change in your pocket.

Used Oil: What Carlsbad Residents Can Do

There are five actions a citizen can take in order to be the ideal recycler of used oil:

- Handle used oil properly
- Do not spill it or dump it onto land or water
- Avoid contaminating used oil with other liquids such as water, antifreeze, gasoline or parts cleaner
- Recycle your oil
- Demand re-refined oil

By offering the Used Oil Program, the city is hoping citizens will model this ideal behavior.

Where Can I Recycle My Used Motor Oil?

Carlsbad residents can drop off used motor oil during business hours at a certified collection center:

- Big O Tires at 2615 State Street
- Firestone at 2545 El Camino Real
- Jiffy Lube at 6021 Paseo Del Norte

If your used oil is contaminated, you can take up to 15 gallons to your nearest Household Hazardous Waste Facility. You should call ahead of time for hours of operation and instructions, and bring proof of residency.

- Clean Harbors (phone: 800-444-4244) will pick up your used oil (up to 15 gallons) for a $10 co-pay.
- The Vista Household Hazardous Waste Collection Facility is located at 1145 East Taylor Street, across the street from the City of Vista Public Works Yard. This facility is open Saturdays from 9 am to 3 pm, except for holiday weekends. Please call (800) 444-4244 for more information. No charge to residents; proof of residency is required.

- Oceanside HHW Collection Facility. Located at 2880 Industry Street. Alternating Saturdays from 9 am to 1 pm. By APPOINTMENT ONLY. Please call (760) 929-9400. Residents may bring up to 15 gallons or 125 pounds per visit. No charge to residents; proof of residency is required.

Free Bulky Item Collections Increase!

In 2007 the City of Carlsbad will offer residents an additional free date for disposing of unwanted large or "bulky" items. Using the City's bulky item collection service is easy and is the responsible way to dispose of large items such as appliances and furniture that cannot be collected during the weekly trash collections.

- In 2007 there will be five opportunities for a free bulky item collection.
- Each household may dispose of two free bulky items at each bulky item collection event.
- To participate in these collections, schedule an appointment by calling Waste Management at **(760) 929-9400** during the appointment period.
- Place your items on the curb outside your residence on the collection day.

Collection Date	Appointment Period
January 27th	January 5th – 16th
March 24th	March 2nd – 13th
June 23rd	June 4th – 14th
September 22nd	September 3rd – 12th
November 10th	October 22nd – 31st

NOTE: Bulky item collection can be done at any time during the year – to schedule a collection residents should call (760) 929-9400. The cost of a regular bulky item collection is $30 for the first item and $5 for each subsequent collection.

Storm Water Protection

Anything that enters a storm drain will flow directly into streams, lagoons or the ocean.

Storm drains are not connected to any filtration system and anything that enters a storm drain will flow directly into streams, lagoons, or the ocean and can pollute water for fish and wildlife.

ENVIRONMENTAL HEALTH is one of the City's top priorities. Storm Water Protection is an integral part of the City of Carlsbad's Environmental Programs Division. This group's job is to maintain a clean and healthy Carlsbad. They do this in two important ways. First, by managing a program aimed at reducing pollutants in storm water to the Maximum Extent Practicable (MEP) through the use of Best Management Practices (BMPs). And secondly, by protecting water quality during the three major phases of urban development:

1. Land use planning for new development
2. Construction
3. "Use" or existing development phase

When you encounter illegal dumping or discharge in the storm drain system please call the Storm Water Hotline (760) 602-2799. It is important that you call this number when the event is happening so that City personnel can stop it – after the fact there is little that can be done.

Sources of pollutants into the waters in and around Carlsbad are:

- Paved Roads
- Buildings and Parking lots
- Landscaping
- Residences
- Construction Sites
- Illegal Dumping

Water Conservation

THE CITY OF CARLSBAD'S Environmental Programs staff is working with restaurants throughout Carlsbad to raise awareness about the importance of conserving water. Water is a limited and precious resource throughout Southern California because we live in a semi-arid area. Carlsbad currently imports all of its drinking water – most from the Colorado River or from Northern California.

At local restaurants there are placards and menu stickers provided by Environmental Programs that explain to customers that they must ask for glasses of water. This program was initiated in the past during drought conditions in summer months; we are instituting it now as a reminder to residents that water is a resource and a limited one. Thirsty customers will find the water available and as tasty as ever but by having to ask for it only those people who really want water will get it – reducing wasted water.

You can reduce water use at home!

- Monitor sprinkler usage – grass and plants need less water than you think!
- Get a water use audit from the City of Carlsbad. Call (760) 602-4646
- Run dishwasher only when full – it uses the same amount of water each time
- Don't leave the water running when doing dishes in the sink
- Take shorter showers

Environmental Programs Guide

THE CITY OF CARLSBAD and Coast Waste Management partnered in the creation of an Environmental Programs Guide that was sent to residents in January. This publication is designed to offer information about how to dispose of all sorts of waste from trash and recycling to household hazardous waste (HHW). There is also information included on ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution.

The Environmental Programs Guide is available from the City at the Faraday Center or by calling the City's Environmental Programs Hotline, or from Coast Waste Management at (760) 929-9400. Residents are encouraged to read the guide and hold onto it for reference regarding the City's Environmental Programs.

Calendar of Important Dates

- **March 2-13:** Appointment period for Bulky Item Collection
- **March 24:** Bulky Item Collection Day (two items are free!)
- **April 21:** Earth Day
- **April 21, 9 am-1 pm:** Special HHW Collection Event for Carlsbad residents only, appointments required. For appointments please call (760) 602-2720 or go to *http://www.carlsbadca.gov/waste/hhwsched.html*
- **May 5:** Compost Bin Sale Event. For more information about Environmental Programs please refer to *www.carlsbadconserves.org*
- **May 23:** Public Works Fair. Carlsbad Community Library, 1775 Dove Lane (North Parking Lot)
- **June 4-14:** Appointment period for Bulky Item Collection
- **June 23:** Bulky Item Collection Day (two items are free!)

Compost Program

IMPORTANT DATES – FREE Master Composter course will be offered for four weeks between February 24th and March 17th. The classes will be on Saturdays from 9 am until noon. To register for the classes please contact the City's designated contractor, the Solana Center for Environmental Innovation, (760) 436-7986, ext 216.

For those interested in learning more about how to compost and how compost can be beneficial for their gardens but not sure that they want to commit to becoming a Master Composter, there are also free workshops that will teach basics. The next classes will be:

- Saturday, March 17th: 10-11:30 at the Flower Fields
- Saturday, March 24th: 10-11:30 at the Agua Hedionda Discovery Center

Think Recycling

EVERYONE WANTS TO do the right thing for the environment. We all have a responsibility to take care of Carlsbad's natural beauty and we can start at home. The Carlsbad Environmental Programs works using the principles of reduce, reuse, and recycle. This means that first we reduce what we use, then reuse what we buy where possible and then recycle what we use.

The reach of each person is well beyond their home. Think about adopting some environmentally sensitive behavior when you're out.

Here are some tips to consider:

- Reuse where you can
- Try to use fewer materials that end up in the trash
- Dispose of your trash in a covered container
- Dispose of your paint, toxic cleaners and oil properly
- Reduce your use of water
- Recycle materials at home and at play
- Do not litter
- Walk when its possible instead of driving
- Report materials being discharged into storm drains; call (760) 602-2799

Quality

The Carlsbad Municipal Water District is providing this report to customers as an overview of how your potable water is delivered and how the City works to ensure that the highest quality is achieved.

This report includes information about the quality of the water delivered to Carlsbad Municipal Water District customers in 2006.

Clean Environment

Clean waterways not only provide recreational opportunities for us and habitat for animals and plants, but also add beauty to our natural landscape. Everyone benefits from clean water and plays a role in keeping our creeks, lagoons, and ocean clean.

Water Quality

One of the most important environmental issues today is prevention of storm water run-off

Did you know that storm drains are not connected to sanitary sewer systems and treatment plants? The primary purpose of storm drains is to carry rain water away from developed areas to prevent flooding. Untreated storm water and the pollutants it carries flow directly to creeks, lagoons, and the ocean.

Storm water pollution comes from a variety of sources including oil, fuel, and fluids from vehicles and heavy equipment, lawn clippings, pesticide, and fertilizer runoff from landscaping, concrete and sediment from construction and landscaping activities, bacteria from human and animal waste, and litter.

The City of Carlsbad is committed to improving water quality and reducing the amount of pollutants that enter our precious waterways.

Storm water protection is a shared duty between the City of Carlsbad and the community. The City monitors and cleans storm drains on public streets, property, or easements. The community's role is to keep our storm drains free of trash, debris, excessive vegetation, and other materials that may pollute, contaminate, or block the flow of water through the storm drain system.

What You Can Do To Help

1. Sweep or Rake

Sweep up debris and put it in a trash can. Do not use a hose to wash off sidewalks, parking areas, and garages. Rake up yard waste and start a compost pile.

2. Dispose of Yard Waste More Frequently

By disposing of grass, leaves, shrubs, and other organic matter more frequently, less will wash into storm drains.

3. Reduce Use of Landscape Chemicals

Decrease the use of lawn and garden care products such as pesticides, insecticides, weed killers, fertilizers, herbicides, and other chemicals. Avoid over-irrigation which washes landscape chemicals into the gutter and storm drains.

4. Use Soap Sparingly

When washing your car at home use soap sparingly, divert wash water to landscaped areas, and pour your bucket of soapy water down the sink. NEVER wash your car in the street.

5. Clean Up After Your Pets

Take a bag when you walk your pets and be sure to always clean up after them. Flush pet waste down the toilet or seal it in a plastic bag and throw it in the trash.

6. Buy Non-Toxic Products

When possible, use non-toxic products in household cleaning. If you must use a toxic cleaning product, buy small quantities, use it sparingly and properly dispose of unused portions. For the household hazardous waste collection facility nearest you, call: (800) CLEANUP or (760) 602-4646.

Conserve

The Carlsbad Water Ethic promotes responsible and efficient water use in our Community. If Carlsbad residents adopt these behaviors as a way of life, there will be plenty of clean water for generations to come.

- New landscaping shall incorporate drought-tolerant plant materials and micro-irrigation (drip) systems wherever possible.
- Water can never leave the user's property due to over-irrigation of landscape.
- Watering must be done during the early morning or evening hours to minimize evaporation (between 4:00 pm and 9:00 am the following morning).
- All leaks must be investigated and repaired.
- Water cannot be used to clean paved surfaces, such as sidewalks, driveways, parking areas, etc., except to alleviate immediate safety or sanitation hazards.
- Reclaimed or recycled water shall be used wherever and whenever possible.

For more information on water conservation programs, call: (760) 602-4646.

Supply

Since there are no local sources of fresh drinking water, CMWD imports all of its water supply. This supply is treated by and purchased from the Metropolitan Water District of Southern California (MWD) via our wholesaler, the San Diego County Water Authority (SDCWA).

MWD receives water from two sources: the Colorado River through the Colorado River Aqueduct, and Northern California through the California Aqueduct (also known as the State Water Project). These waters are blended and rigorously treated at MWD's Lake Skinner Treatment Plant in southern Riverside County and delivered to Carlsbad through the San Diego Aqueduct, owned by SDCWA.

An average of 67% of Carlsbad's water comes from the Colorado River, with the remaining 33% coming from the State Water Project.

Safety

The sources of drinking water (both tap and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and can pick up substances resulting from the presence of animal or human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk.

Contaminants that may be present in source water include:

- Microbial contaminants, such as viruses and bacteria. These may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

- Inorganic contaminants, such as salts and metals, that can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses.
- Organic chemical contaminants, including synthetic and volatile organic chemicals that are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- Radioactive contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

The water quality data contained in this report is obtained from MWD based on their sampling of waters combined at the Lake Skinner Plants.

More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at: (800) 426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have had organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. Information is also available from the Safe Drinking Water Hotline at: (800) 426-4791.

How to Contact Us

This report covers testing for contaminants in 2006. For questions or concerns regarding the quality of Carlsbad's water, contact Jim Ball at: (760) 438-2722 or by email at jball@ci.carlsbad.ca.us. For more detailed information on testing procedures, results, and source water assessments, contact the Metropolitan Water District of Southern California's Water Quality Division at: (800) CALL MWD.

This report is mailed to all CMWD customers at their billing address and is available at most City facilities. This report may be photocopied and distributed or posted in a prominent place at your facility. Additional copies are available on the Internet at www.ci.carlsbad.ca.us/cserv/water.html or by calling the Carlsbad Municipal Water District at: (760) 438-2722.

How to Read this Report

As you read the water quality tables in this report, compare the level of constituents found in CMWD's water in the "Combined Skinner Plant Effluents" column with the standards set for them in the MCL and PHG columns. You'll see that CMWD's water did not violate any drinking water standards in 2006.

The following are key terms to help you understand the standards we use to measure drinking water safety.

Public Health Goals (PHGs)
Reflect the level of a contaminant in drinking water below which there is no known or expected risk to health. PHGs are set by the California Environmental Protection Agency.

Maximum Contaminant Level Goals (MCLGs)
Reflect the same levels as PHGs, but are set by the U.S. Environmental Protection Agency.

Maximum Contaminant Levels (MCLs)
Reflect the highest level of a contaminant that is allowed in drinking water. MCLs are divided into two categories: primary and secondary.

Maximum Residual Disinfectant Levels (MRDLs)
Reflect the level of a disinfectant added for water treatment that may not be exceeded at the consumer's tap.

Maximum Residual Disinfectant Level Goals (MRDLGs)
Reflect the level of a disinfectant added for water treatment below which there is no known or expected risk to health. MRDLs are set by the U.S. Environmental Protection Agency.

Maximum Residual Disinfectant Level (MRDL)
The level of disinfectant added for water treatment that may not be exceeded at the consumer's tap.

Maximum Residual Disinfectant Level Goal (MRDLG)
The level of disinfectant added for water treatment below which there is no known or expected risk to health. MEDLGs are set by the U.S. Environmental Protection Agency.

Treatment Technique
A required process intended to reduce the level of a contaminant in drinking water.

Regulatory Action Level
The concentration of a contaminant, which if exceeded, triggers treatment or other requirements, which a water system must follow.

Abbreviations

[illegible]	Colony-Forming Units per Milliliter
[illegible]	DimethylTetrachloroterephthalate
[illegible]	Disinfection By-Products
[illegible]	Detection Limits for purposes of Reporting
[illegible]	Haloacetic Acids (five)
[illegible]	Methylene Blue Active Substances
[illegible]	Maximum Contaminant Level
[illegible]	Maximum Contaminant Level Goal
[illegible]	Million Fibers per Liter
[illegible]	Most Probable Number
[illegible]	parts per million or milligrams per liter (mg/L)
[illegible]	parts per quadrillion or picograms per liter (pg/L)
[illegible]	parts per trillion or nanograms per liter (ng/L)
[illegible]	Running Annual Average
[illegible]	Saturation Index (Langelier)
[illegible]	Total Organic Carbon
[illegible]	Total Trihalomethanes
[illegible]	Treatment Technique
[illegible]	microSiemen per centimeter;also equivalent to µmho/cm (micromho per centimeter)

Footnotes

- The turbidity level of the filtered water shall be less than or equal to 0.3 NTU in 95% of the measurements taken each month and shall not exceed 1 NTU at any time. Turbidity is a measure of the cloudiness of the water and is an indicator of treatment performance. The monthly averages and ranges of turbidity shown in the Secondary Standards section were based on the plant effluents.
- Total coliform MCLs: No more than 5.0% of the monthly samples may be total coliform-positive. Compliance is based on the combined distribution system sampling from all the treatment plants. In 2006, 8,813 samples were analyzed. The MCL was not violated.
- Fecal coliform/E.coli MCLs: The occurrence of 2 consecutive total coliform-positive samples, one of which contains fecal coliform/E. coli, constitutes an acute MCL violation. The MCL was not violated in 2006.
- HPC values were based on the monthly averages of the plant effluent samples. In 2006, all distribution samples collected had detectable total chlorine residuals and no HPC was required. Method detection limit is < 1 CFU/mL.
- In 2006, the effluent from the five treatment plants had no detectable Cryptosporidium, Giardia, or Total Culturable Viruses. Two hundred liters of water were collected monthly for Cryptosporidium and Giardia analysis. One thousand liters of water were collected quarterly for Total Culturable Viruses analysis. Reported results ("P" for presence or "A" for absence) were taken from the first three quarters of 2006.
- Aluminum, copper, MTBE, and thiobencarb have both primary and secondary standards.
- MTBE reporting level is 0.5 ppb.
- Lead and copper are regulated as a Treatment Technique under the Lead and Copper Rule. It requires systems to take water samples at the consumers' tap. The action level, which triggers water systems into taking treatment steps if exceeded in more than 10% of the tap water samples, is 1.3 ppm for copper and 15 ppb for lead.
- State MCL is 45 mg/L as nitrate, which equals 10 mg/L as N.
- Metropolitan conducted four quarters of monitoring from August 2005 to April 2006. Reported results were taken from the first two quarters of 2006. Effective June 11, 2006, the gross beta particle activity MCL is 4 millirem/year annual dose equivalent to the total body or any internal organ. The screening level is 50 pCi/L.
- Standard is for Radium-226 and -228 combined.
- Average and range for the treatment plant effluent were taken from weekly samples for TTHM and monthly samples for HAA5. Distribution system-wide average and range were taken from 47 samples collected quarterly. In 2006, Metropolitan was in compliance with all provisions of the Stage 1 Disinfectants/Disinfection By-Products (D/DBP) Rule. The State of California has adopted the D/DBP Rule effective June 2006. TOC provides a medium for the formation of DBPs. Metropolitan was also in compliance with the DBP precursor (TOC) control portion of the Stage 1 D/DBP regulation.
- DLR = 1.0 ppb for each HAA5 analyte (dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid) except for monochloroacetic acid which has a DLR = 2.0 ppb.
- Running annual average was calculated from weekly samples. Bromate reporting level is 3 ppb.
- SI measures the tendency for a water to precipitate or dissolve calcium carbonate (a natural mineral in water). Positive indices indicate the tendency to precipitate and/or deposit scale on pipes and are assumed to be non-corrosive. Negative indices indicate the tendency to dissolve calcium carbonate and are assumed to be corrosive. Effective September 2006, corrosivity is no longer part of the Secondary Standards for drinking water in the State of California.
- Metropolitan has developed a flavor-profile analysis method that can more accurately detect odor occurrences. For more information, contact MWD at (213) 217-6850.
- Chromium VI reporting level is 0.03 ppb.
- Both PHG (issued by the Office of Environmental Health Hazard Assessment) and NL (issued by CA Department of Health Services) were set at 6 ppb. Perchlorate reporting level is 2 ppb.
- Data collected from January 2002 to January 2003. Minimum reporting levels are as stipulated in the Federal Unregulated Contaminants Monitoring Rule (UCMR). List 1 - Assessment Monitoring consists of 12 chemical contaminants for which standard analytical methods are available. List 2 - Screening Survey consists of 16 contaminants for which new analytical methods are used.
- Ranges for the plant effluent and the distribution system were taken from two quarterly samples. Distribution system samples were taken from three locations.
- AI measures the aggressiveness of water transported through pipes. Water with AI <10.0 is highly aggressive and would be very corrosive to almost all materials found in a typical water system. AI > 12.0 indicates non-aggressive water. AI between 10.0 and 11.9 indicates moderately aggressive water.
- Ranges for the plant effluent were taken from quarterly samples. The distribution system-wide range was taken from 19 samples collected quarterly. The PHG was established at 3 ppt in December 2006. The California NL is 10 ppt.
- Average and range for TOC were taken from weekly samples collected at the combined filter effluent.

think globally. act neighborly.
www.carlsbadconserves.org

Welcome to the City of Carlsbad

This brochure provides guidelines and helpful hints on the environmental services available to Carlsbad residents.

Solid Waste Collection

The Solid Waste section will assist residents in understanding the services provided for refuse, recycling and yard waste collection in the City of Carlsbad. The Additional Waste Services section of this flyer instructs residents how and where to properly dispose of household hazardous waste, electronic waste and used oil.

Water Conservation

This section provides residents with cost saving options that will aid them in their efforts to conserve water. Resources such as toilet and clothes washer voucher programs and free on-site water audits are available.

Storm Water Protection

Storm water pollution affects everyone who lives, works and plays in the City of Carlsbad. Litter, fertilizers, pet waste, oil and soap can be washed from our yards, driveways and streets into the storm drain system and directly into our creeks, lagoons, and onto our beaches. This pollutes our water and endangers wildlife. The Storm Water section of this flyer identifies some preventative measures residents can take to minimize the source of these pollutants and the number to call to report illegal discharges in the storm drain system.

Brought to you in partnership by the City of Carlsbad and Waste Management, the City's refuse and recycling provider.

Storm Water Protection

Did you know that storm drains are NOT connected to sanitary sewer systems and treatment plants? The primary purpose of storm drains is to prevent flooding by carring rainwater away from developed areas . Untreated storm water flows directly into our creeks, lagoons and the ocean, carrying any pollutants from the roads.

Storm water pollution comes from a variety of sources, including:

- Oil from vehicles
- Excess pesticides and fertilizer from landscaping
- Bacteria from pet waste
- Sediment from construction and landscaping projects
- Soap from car washing
- Litter
- Lawn and garden debris
- Improperly disposed home improvement products (paint, stucco, grout, cement, solvent)
- Washing driveways and sidewalks

Pollution prevention is up to YOU!

Please help us protect OUR environment. Here are some tips to help keep creeks, lagoons and the ocean clean:

- Bag and dispose of pet waste in a trash can, not a yard waste container
- Use fertilizers and pesticides sparingly
- Adjust sprinklers to prevent over-watering
- When possible, take your car to a commercial car wash

- Keep automobiles properly maintained to prevent fluid leaks
- Properly dispose of trash and cigarette butts
- Volunteer at cleanup events in Carlsbad

"Only rain in the storm drain"

To report an illegal discharge or for more information, call our hotline at (760) 602-4646.

www.carlsbadconserves.org

Water Conservation

The Carlsbad Water Ethic promotes responsible and efficient water use in our arid city. Our residents should follow this Water Ethic even when we are not in a drought situation. We encourage residents to adopt these behaviors as a way of life.

- Incorporate drought-tolerant plant materials and micro-irrigation (drip) systems wherever possible into new landscaping
- Water should not leave the user´s property due to over-irrigation of landscape
- Water during the early morning or evening hours to minimize evaporation
- Investigate and repair all leaks
- Water cannot be used to clean paved surfaces, such as sidewalks, driveways, parking areas, etc., except to alleviate immediate safety or sanitation hazards
- Recycled water shall be used wherever and whenever possible.

Residential Voucher Programs

Carlsbad participates in a voucher/rebate program with other San Diego County Water Agencies. The goal of this program is to reduce the amount of water residents use - thus increasing the available supply to all residents. Vouchers are available for money off of the purchase and installation of water saving devices like ultra low flow toilets, high-efficiency clothes washers, landscaping and Weather-Based Irrigation Controllers.
Interested residents and Home Owners Associations can contact the Voucher Processing Center at (800) 986-4538. The center is open Monday through Friday from 8:00 a.m. to 5:00 p.m., and Saturday from 8:00 a.m. to 3:00 p.m.

Residential Survey

Carlsbad residents can receive a free, on-site water conservation survey. This will include a review of indoor and outdoor water saving opportunities, a leak check, and an irrigation system and water schedule review. Customers are also shown how to read their water meter and are given literature promoting other conservation programs.
For ideas on water conservation at home refer to www.h2ouse.org

How to contact us

City of Carlsbad Environmental Programs
1635 Faraday Avenue
Carlsbad, California 92008
(760) 602-4646

Hours: Monday - Thursday 7:30 a.m. - 5:30 p.m.
Friday 8:00 a.m.- 5:00 p.m.

www.carlsbadconserves.org

Waste Management
5960 El Camino Real
Carlsbad, California 92008
(760) 929-9400

Hours: Monday - Friday 8:00 a.m. - 5:00 p.m

http://northcounty.wm.com

Holiday Schedule

Waste Management does not offer service on the following holidays:

- New Year's Day
- Memorial Day
- Independence Day
- Labor Day
- Thanksgiving Day
- Christmas Day

When a holiday falls on a weekday, collection will be delayed one day for the remainder of the week.

Holiday announcements will be published in your local newspaper.

www.carlsbadconserves.org

Buyback Center

Redeemable items

- Newspaper
- CRV aluminum cans
- CRV glass bottles
- CRV plastic bottles
- CRV bi-metal cans

CRV = California Redemption Value. Ready-to-drink beverage containers which are packaged in aluminum, glass, plastic, bi-metal or any combination of these materials.

Also accepted:

- Electronic devices
- Household batteries

(For more information see Household Hazardous Waste)

Donation items

- Non CRV aluminum
- Non CRV glass
- Non CRV plastic
- Tin cans
- White ledger paper
- Computer paper
- Mixed paper
- Corrugated cardboard

Hours: Tuesday - Saturday
8:00 a.m. - 4:00 p.m.
Closed:
1:00 p.m. - 1:40 p.m.
(760) 929-9400

Bulky Item Pickup

Need to dispose of such items as furniture (couch, chair, dresser, cabinet, bookshelf, mattress) or appliances (toilet, washer, stove, sink)? FREE bulky item collection days are scheduled periodically in your community. Residents may dispose of two items per event. Special pickups are available for a fee. Call Waste Management at (760) 929-9400 to schedule an appointment or for additional information.

Electronic Waste

What is E-Waste?

The rapid advances in new technology and demand for new electronic equipment have increased the disposal of outdated electronic equipment known as "E-Waste."

Proper disposal of "E-Waste" through recycling and reuse prevents them from reaching landfills. This also helps to minimize waste, and provide usable items to organizations that need them as well as recapture valuable resources.

- Cell phones
- Computers
- Televisions
- VCRs/DVDs
- Stereos
- Printers
- Fax machines
- Monitors
- Microwaves ovens

Universal Waste

(Including household batteries)

As of February 9, 2006, it is now illegal in the State of California to dispose of common household items such as alkaline batteries*, mercury thermometers and thermostats, and fluorescent light bulbs into the trash. These items are now classified as Universal Waste, and must be disposed of properly through the Household Hazardous Waste (HHW) program. However, in an effort to make the disposal of common household batteries including re-chargeable ones, more efficient, the City has partnered with Waste Management to allow residents to drop off the batteries at the Waste Management Recycling Center located at 1145 East Taylor St., Vista, free of charge. The City recommends storing your used fluorescent light bulbs in a safe place until they can be brought to the HHW facilities or scheduled for a home pick-up.

**Note - rechargeable batteries can also be brought to a participating retail store that provides free drop-off bins for proper disposal.*

Where to recycle Electronic and Universal waste

Door-to-door: Call (800) 444-4244

Waste Management
5960 El Camino Real, Carlsbad
Hours: Tuesday - Saturday 8:00 a.m. - 4:00 p.m.
Closed: 1:00 p.m. - 1:40 p.m.
For additional information please call (760) 929-9400
COST: CRTs (television, laptops, monitors): no charge
All others electronic devices fee at drop-off.

Household Hazardous Waste Collection Facility
1145 East Taylor Street, Vista
Hours: Saturdays 9:00 a.m. - 3:00 p.m.
For additional information please call (800) 714-1195
COST: Currently there is no cost to Carlsbad residents.

www.carlsbadconserves.org

Household Hazardous Waste

MATERIALS ACCEPTED:

- Used motor oil and filters
- Pool cleaners
- Automobile fluids (antifreeze, gasoline, brake, transmission)
- Household cleaners
- Landscaping chemicals
- Automotive batteries
- Mercury thermostats
- Mercury thermometers
- Non-empty aerosol cans
- Lamps with fluorescent tubes, sodium vapor lamps
- Household batteries
- Paint
- Mercury switches(automotive or non-automotive light switches)
- Novelties such as some singing greeting cards or flashing athletic shoes

Drop-off

Residents may bring up to 15 gallons or 125 pounds per visit.

A proof of residency required (California driver license, utility bill or other).

No charge to residents at either location.

Door-to-door collection

The City has implemented a door-to-door program that allows residents to make an appointment to have their HHW picked up at their residence for a small co-pay of $10. This door-to-door program is available to all residents. For more information on this program, or to set up an appointment, call (800) 444-4244.

Drop-off locations

VISTA
Hours: Saturdays:
9:00 a.m.- 3:00 p.m.
No appointment necessary
(800) 714-1195

1145 E Taylor St., Vista

OCEANSIDE
Hours: Alternating Saturdays:
9:00 a.m. - 1:00 p.m.
Appointment ONLY.
For additional information, please call
(760) 929-9400.

2880 Industry St., Oceanside

PUT TOXIC WASTE IN ITS PLACE

Funded by a grant from the California Integrated Waste Management Board.

Overflow Trash

5960 El Camino Real, Carlsbad

PALOMAR TRANSFER STATION
(760) 603-0153

Residents can dispose of overflow trash at the Palomar Transfer Station. A fee will be charged at the time of disposal. For additional information please call the Palomar Transfer Station at (760) 603-0153.

No hazardous or regulated waste is accepted at this facility including batteries, paint, tires, liquids and electronic waste.

Open to residents
Saturday & Sunday
7:30 a.m. to 4:00 p.m

Holiday Trees

The City, in partnership with Waste Management, has a holiday tree recycling and collection program that allows residents to drop off their trees for recycling or be picked up at the curb for collection. This service is free to all Carlsbad residents and it operates the day after Christmas through the first two weeks in January. For locations where residents may drop-off the trees for recycling check the City's website or the Community Services Guide.

For curbside pick-up remove stands, tinsel and ornaments from trees, cut in sections no longer than 4 feet and place out on the curb for collection. Flocked trees are not recyclable and will be collected by the trash drivers.

Holiday schedule announcements will be published.

www.carlsbadconserves.org

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Project Address	Assessors Parcel Number(s):	Project # (city use only):

Complete Sections 1 and 2 of the following checklist to determine your project's permanent and construction storm water best management practices requirements. This form must be completed and submitted with your permit application.

Section 1. Permanent Storm Water BMP Requirements:
If any answers to Part A are answered "Yes," your project is subject to the "Priority Project Permanent Storm Water BMP Requirements," and "Standard Permanent Storm Water BMP Requirements" in Section III, "Permanent Storm Water BMP Selection Procedure" in the Storm Water Standards manual.

If all answers to Part A are "No," and any answers to Part B are "Yes," your project is only subject to the "Standard Permanent Storm Water BMP Requirements". If every question in Part A and B is answered "No," your project is exempt from permanent storm water requirements.

Part A: Determine Priority Project Permanent Storm Water BMP Requirements.

Does the project meet the definition of one or more of the priority project categories?*	Yes	No
1. Detached residential development of 10 or more units.	☐	☐
2. Attached residential development of 10 or more units.	☐	☐
3. Commercial development greater than 100,000 square feet.	☐	☐
4. Automotive repair shop.	☐	☐
5. Restaurant.	☐	☐
6. Steep hillside development greater than 5,000 square feet.	☐	☐
7. Project discharging to receiving waters within Environmentally Sensitive Areas.	☐	☐
8. Parking lots greater than or equal to 5,000 ft^2 or with at least 15 parking spaces, and potentially exposed to urban runoff.	☐	☐
9. Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater	☐	☐
* Refer to the definitions section in the Storm Water Standards for expanded definitions of the priority project categories.		
Limited Exclusion: Trenching and resurfacing work associated with utility projects are not considered priority projects. Parking lots, buildings and other structures associated with utility projects are priority projects if one or more of the criteria in Part A is met. If all answers to Part A are "No", continue to Part B.		

Part B: Determine Standard Permanent Storm Water Requirements.

Does the project propose:	Yes	No
1. New impervious areas, such as rooftops, roads, parking lots, driveways, paths and sidewalks?	☐	☐
2. New pervious landscape areas and irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Trash storage areas?	☐	☐
5. Liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. Require a General NPDES Permit for Storm Water Discharges Associated with Industrial Activities (Except construction)?*	☐	☐
8. Commercial or industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. Any grading or ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?	☐	☐
*To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/stormwtr/industrial.html		

Section 2. Construction Storm Water BMP Requirements:

If the answer to question 1 of Part C is answered "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Storm Water Pollution Prevention Plan (SWPPP). If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Water Pollution Control Plan (WPCP). If every question in Part C is answered "No," your project is exempt from any construction storm water BMP requirements. If any of the answers to the questions in Part C are "Yes," complete the construction site prioritization in Part D, below.

Part C: Determine Construction Phase Storm Water Requirements.

Would the project meet any of these criteria during construction?	Yes	No
1. Is the project subject to California's statewide General NPDES Permit for Storm Water Discharges Associated With Construction Activities?	☐	☐
2. Does the project propose grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as, paints, solvents, concrete, and stucco)?	☐	☐

Part D: Determine Construction Site Priority

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans, and included in the SWPPP or WPCP. Indicate the project's priority in one of the check boxes using the criteria below, and existing and surrounding conditions of the project, the type of activities necessary to complete the construction and any other extenuating circumstances that may pose a threat to water quality. The City reserves the right to adjust the priority of the projects both before and during construction. [Note: The construction priority does NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority does affect the frequency of inspections that will be conducted by City staff. See Section IV.1 for more details on construction BMP requirements.]

☐ ***A) High Priority***

1) Projects where the site is 50 acres or more and grading will occur during the rainy season
2) Projects 1 acre or more.
3) Projects 1 acre or more within or directly adjacent to or discharging directly to a coastal lagoon or other receiving water within an environmentally sensitive area
4) Projects, active or inactive, adjacent or tributary to sensitive water bodies

☐ ***B) Medium Priority***

5) Capital Improvement Projects where grading occurs, however a Storm Water Pollution Prevention Plan (SWPPP) is not required under the State General Construction Permit (i.e., water and sewer replacement projects, intersection and street re-alignments, widening, comfort stations, etc.)
6) Permit projects in the public right-of-way where grading occurs, such as installation of sidewalk, substantial retaining walls, curb and gutter for an entire street frontage, etc. , however SWPPPs are not required.
7) Permit projects on private property where grading permits are required, however, Notice Of Intents (NOIs) and SWPPPs are not required.

☐ ***C) Low Priority***

8) Capital Projects where minimal to no grading occurs, such as signal light and loop installations, street light installations, etc.
9) Permit projects in the public right-of-way where minimal to no grading occurs, such as pedestrian ramps, driveway additions, small retaining walls, etc.
10) Permit projects on private property where grading permits are not required, such as small retaining walls, single-family homes, small tenant improvements, etc.

SECTION A-A

PLAN

NOTES

1). USE EC-3, EC-4, EC-6, EC-7 OR EC-13 AS APPLICABLE AND APPROVED BY INSPECTOR.

2). BEST MANAGEMENT PRACTICE (BMP) FACT SHEETS AS REFERENCED CAN BE DOWNLOADED FROM THE CALIFORNIA STORMWATER QUALITY ASSOCIATION (CASQA) WEBSITE AT WWW.CABMPHANDBOOKS.COM/CONSTRUCTION.ASP

3). DEPENDING ON SITE CONDITIONS, ADDITIONAL BMP'S MAY BE REQUIRED BY THE INSPECTOR.

Construction Site NPDES Compliance Inspection Checklist

Construction Management & Inspection Division

Permit #: Date:

Inspection Type: Weather:

Inspected By: Project #/Name:

Mark (√) box "Yes", "No", or "N/A"; if there are comments, mark (√) box "Comment".

Yes	No	N/A	Comment	Inspection Description
☐	☐	☐	☐	1. Are slopes steeper than 3:1 properly covered?
☐	☐	☐	☐	2. Are areas flatter than 3:1 covered or protected by desilting basins?
☐	☐	☐	☐	3. Is the SWPPP wall map up to date and accurate?
☐	☐	☐	☐	4. Are all gravel bags, straw waddles, silt fences, and other linear sediment barriers in place in accordance with the SWPPP, and are they functioning properly?
☐	☐	☐	☐	5. Are basins designed and maintained to provide the required retention/detention?
☐	☐	☐	☐	6. Is the stabilized construction entrance preventing tracking (i.e. working properly)?
☐	☐	☐	☐	7. Are all downstream storm drain inlets protected with devices that are in working order and being properly maintained?
☐	☐	☐	☐	8. Are non-storm-water BMP's being used? (e.g. concrete washouts)
☐	☐	☐	☐	9. Are all material and equipment handling, storage, and maintenance areas clean, and free of spills, leaks, or other deleterious materials?
☐	☐	☐	☐	10. Is the site free from litter and the litter collected and placed in covered containers?
☐	☐	☐	☐	11. Are temporary stockpiles and/or construction materials in approved areas and protected/covered?
☐	☐	☐	☐	12. Are all areas designated to be seeded or landscaped properly maintained (i.e. irrigation functioning properly, 90-100% coverage)? NO BMP's REQUIRED
☐	☐	☐	☐	13. Are all natural drainage courses and open spaces in proximity to this project protected?
☐	☐	☐	☐	14. Are all BMP's maintained in functional order? (e.g. sediment removed, basins pumped down, repairs made, etc.)

Minimum BMPs for Construction Projects within the City of Carlsbad

The City of Carlsbad is working with developers and contractors to ensure that Best Management Practices (BMP) are implemented at all construction sites. Protecting our water resources improves our water quality. All BMPs must be identified in site specific Storm Water Pollution Prevention Plans (SWPPP) and erosion control plans prior to commencement of construction activities. These plans must address the following minimum BMPs required by the City:

1. Erosion Control Methods for graded slopes
2. Erosion Control method for graded flat areas (slope <5%)
3. Sediment control for perimeter boundaries;
4. Offsite tracking control of sediment;
5. Materials management control;
6. Waste management control; and
7. Non-storm water management control.

To address each of the required BMPs, the City requires the implementation of the following types of BMP's as applicable, depending on site-specific requirements:

- Hydroseed applications, Bonded fiber matrix application, Geotextiles & Mats, straw waddles, silt fences, and fiber rolls are incorporated into the City approved erosion control plans and project SWPPP's as applicable.
- Irrigated and non-irrigated hydroseed mixes, gravel bag and/or sandbag barriers, silt fence, and fiber rolls are incorporated into City approved erosion control plans and project SWPPPs as applicable.
- Silt fences, earthen berms, velocity dissipators, gravel bag and/or sandbag barriers, and drainage swales are incorporated into City approved erosion control plans and project SWPPPs as applicable.
- Construction entrances and tire washing stations are incorporated into City approved erosion control plans and project SWPPPs as applicable.
- Vehicle and equipment maintenance, fueling and cleaning stations, material storage and delivery yards that are protected, and concrete washout basins are incorporated into City approved erosion control plans and project SWPPPs as applicable.
- Covered receptacles are incorporated into all projects at strategic locations, litter removal programs are incorporated into the project schedules, ensuring material storage is isolated from drainage facilities and watercourses, and other source control BMPs are incorporated into City approved erosion control plans and project SWPPPs as applicable.
- Non-storm water management control are generally source control BMPs. These include such things as paving and grinding operations, dewatering operations, water practices, etc. These BMPs are incorporated into City approved erosion control plans and project SWPPP's as applicable.

For more information about the required BMPs, please contact the Public Works Inspector assigned to your project. You may also find additional information about Construction Management and Inspection Division on the City website at

www.carlsbadca.gov

Dry Weather Program Exceedance Investigations 2007

Site	Exceedance Constituent	Initial Sample Investigation Results	Followup Investigation
AH-04	Surfactants	Immediate investigation led to identification of source at 5600 Avenida Encinas on 7/16/07. Confirmation sample collected the following day was also above action level for MBAS and source appeared to be from outdoor washing (7/17/07).	Educational materials regarding vehicle washing BMPs and regulations as they pertain to industrial and commercial businesses scheduled to be sent to the responsible parties for the businesses located in the building at 5600 Avenida Encinas in January 08. Potential responsible businesses scheduled for inspection January 08.
AH-10	Nitrate	Initial sample collected on 7/11/07 had nitrates above action level and elevated turbidity.	Confirmation samples on 7/13/07 had lower turbidity but continued to have elevated nitrate concentrations. Upstream investigations confirmed that the source of the flow and the nitrate concentrations originate from seepage below the flower fields, not a direct connection into the system. Nitrates in seepage may originate from historical agricultural use or present fertilization practices. Inspections of potential responsible parties scheduled for Jan. 08
AH-13	Nitrate	Initial sample collected on 7/11/07 had nitrates above action level and elevated turbidity.	Confirmation samples on 7/13/07 had lower turbidity but continued to have elevated nitrate concentrations. Upstream investigations confirmed that the source of the flow and the nitrate concentrations originate from seepage below the flower fields, not a direct connection into the system. Nitrates in seepage may originate from historical agricultural use or present fertilization practices. Inspections of potential responsible parties scheduled for Jan. 08
AH-65	orthophosphate-P	Immediate investigation led to landscapers irrigating area where fertilizer had been applied and was likely source.	Confirmation sample was collected the following day and the ortho-phosphate concentrations had dropped below the action level of 2.0 mg/l. Educational materials regarding BMPs for fertilizer used and minimizing irrigation runoff mailed to all residents in area upstream of the site, January 2008. Distribution to the landscape management company responsible for the landscaping between Victoria Avenue and Auburn Avenue scheduled for Feb. 08.

Dry Weather Program Exceedance Investigations 2007

Site	Exceedance Constituent	Initial Sample Investigation Results	Followup Investigation
BA-06	Total Coliform, Enteroccocus	Initial sample collected on 7/12/07	Confirmation sample collected on 7/16/07. Total coliform concentrations had decreased below action level however, enterococcus concentrations were above action levels in the second sample. Several additional upstream samples were collected in an attempt to identify the enterococcus source. Upstream investigations performed after second sample collection showed organic debris (leaves and grass clippings) and irrigation runoff in the curblines, likely the source of total coliform. On 8/15/07, all manholes and storm drain inlets in the area were inspected. The lines were observed to be clean while some organic debris was observed in the inlets. Pet waste was observed above ground at several locations and may contribute to the elevated enterococcus concentrations. All storm drain inlets in the drainage area were cleaned by City personnel and educational information was distributed to residents in the neighborhood in August 07.
BA-13	Turbidity	Initial sample contained elevated turbidity, collected on 7/12/07. An immediate upstream investigation was conducted for the turbidity.	The likely source was located at a residence on Lotus Court constructing a new driveway. The area around the driveway was damp, although no actual runoff was observed. An informational letter containing two educational brochures was sent to the homeowner on August 15, 2007.
BA-13	Total Coliform	The initial sample contained elevated concentrations of total coliform, collected on 7/12/07. An investigation was performed to locate the source of bacteria.	Follow-up sample was collected on 7/16/07. The sample contained elevated total coliform and enterococcus concentrations above action levels. Investigation narrowed suspected source area to a vacant lot on the North side of Aviara Parkway. This site was inspected 8-28-07 with small amounts of trash present, however there was no evidence of human waste on the site. On 9-25-07, the storm drain lines and inlets were inspected, as well as the vacant lot. with increased amounts of trash and fecal matter present on the vacant lot. However, there was no evidence of trash or waste in the storm drain system. The case was referred to Code Enforcement to have the vacant lot cleaned. As a precaution, the storm drain system was also cleaned with a Vactor truck on 9-26-07. No definitive source of bacteria was located, although encampment activity on the vacant lot is suspected to contribute significantly.

Dry Weather Program Exceedance Investigations 2007

Site	Exceedance Constituent	Initial Sample Investigation Results	Followup Investigation
BA-40	Fecal Coliform	Initial sample was collected on 7/12/07 and contained elevated concentrations of fecal coliform.	A follow-up sample was collected on 7/25/07 and all three bacterial indicators were below action levels. Upstream investigation at this time showed that flow above the sample location was limited and the small amount of water entering the system was from a residential area. Educational information was sent to all residents in the neighborhood regarding storm water pollution and residential sources in October 2007.
BA-47	pH	Initial sample was collected on 7/24/07.	A confirmation sample was collected on 7/25/07 which was within acceptable limits. Source of water investigated and appears to be possible groundwater seepage from subdrains installed into hillside.
BV-02	Total Coliform, Enteroccocus	Initial sample collected on 7/11/07 had TC and ENT concentrations above action levels.	A confirmation sample was collected on 7/16/07 and all three bacteria indicators were below action levels. Upstream investigations performed on 7/16 found little to no flow (□1 gpm) in manholes upstream. The access points were all clean, with no trash or decomposing organic materials inside the MS4. Additional surveys were conducted above and below ground on 7/19 and 7/20 in an attempt to locate sources of bacteria. No sources were found. This leads staff to believe that the source of bacteria at the site is associated with transient encampment activity at the outfall. Remove trash and other anthropogenic debris from site on a regular basis.
EN-02C	Nitrate	Initial and follow up samples exceeded action level. Flow at site was minimal at approximately 1 gpm during each visit.	Storm drain services Cal Trans Rights of Way and small area of street drainage. Nitrates likely originate from irrigation and/or groundwater draining from this ROW.
EN-14A	pH	Initial and follow up samples exceeded action level.	Historical exceedance likely attributable to groundwater. Site directly upstream at EN-14 has a pH of 7.8, therefore suspected groundwater intrusion into MS4 between EN-14 and EN-14A.
EN-23	pH, turbidity	Initial and follow up samples were exceeding action levels for pH and turbididty. Low pH and elevated turbidity were tracked upstream to a segment of pipe between manhole at 6211 Yarrow and 6150	There are no known connections in this segment of pipe. Low pH is likey from groundwater intrusion into pipe along this segment. Turbidity may be attributable to bacterial die-off in the water due to the low pH.
Additional follow up activities			
BA-36		pet waste found in residential area	educational materials sent to all residents in area, January 08
AH-11		vegetation downstream of site blocking drainage	referred to Maintenance and Operations Jan 08
BV-08		washing activities and improper grease storage upstream of site in commercial complex	inspections completed in commercial complex, covering washing activities and grease disposal in Summer/Fall 2007

Recycling-Complaint				
6RKNPV	7/10/2006	7/10/2006	Returning CRV items to Palomar Transfer Station for cash but not getting amount requested.	7/10/2006 10:42:50AM - XXX Status Change Previous: Open New: Closed Reason: Emailed resident with information answering her complaint.
6RMTLM	7/12/2006	7/12/2006	A Carlsbad resident, xxx xxx just called to lodge a complaint about Liberty Recycling in Carlsbad. She and her husband were told that they needed to count the bottles (plastic) and would be paid the same amount for the large bottles as for the small ones. They were also told there was a 50 bottle per trip limit, and they had 450 bottles. The attendant was rude, and xxx was very upset about it.	7/14/2006 9:53:04AM - XXX Status Change Previous: Open New: Closed Reason: Customer spoke with Department of Recycling staff memember (XXX) and arranged to drop 50 bottles/person at the recycling center - so she and her husband will each be able to return 50 bottles at a time. Resident was amenable to that plan.
6UWQMJ	10/25/2006	10/25/2006	Forum shopping center does not offer recycling to businesses within the shopping center.	11/9/2006 3:33:09PM - XXX Status Change Previous: Pending New: Closed Reason: This matter is being reviewed with Waste Management and the Forum in the hopes of better publicizing what recycling is done and improving recycling at the Forum for businesses and customers.

DETAILED ISSUE REPORT

7 1 2006-6 30 2007

Issue N0.	Date Opened	Date Closed	Issue Description	Action History - Closed Action
6W7TEF	12/5/2006	12/5/2006	Collection at residence missed two large cardboard boxes that had been placed on top of trash. Boxes are empty but were not broken down.	12/6/2006 3:44:26PM - XXX Status Change Previous: Open New: Closed Reason: Per Waste Management, boxes were picked up 12-5-06.
6XWPFE	1/29/2007	1/29/2007	Resident complaining about the small recycling bins offered by City, also experiences missed collections on occasion because she uses a large 65gallon container for recyclables. Says it often gets collected but occasionally it does not.	1/29/2007 10:20:35AM - XXX Status Change Previous: Open New: Closed Reason: Resident's issue seemed the overall recycling program, occasional missed pickup. She seemed satisfied with explanation.
Solid Waste-Complaint				
6RZLZA	7/24/2006	7/24/2006	Trash cans were damaged in collection process and he has called to complain and has been verbally abusive and belligerent to City staff.	8/8/2006 2:18:09PM - XXX Status Change Previous: Open New: Closed Reason: New cans delivered to customer by Waste Management manager.
6V4QV3	10/31/2006	10/31/2006	xxx is disabled and working with a church group to help a homeless family locate into an apartment in Carlsbad. She was able to secure furniture but the donated furniture is apparently contaminated with cat urine. She called WM to schedule them for collection. Operator (xxx?) mistook her address for an Oceanside address and told her collection would be free. Apparently because its a Carlsbad address collection should be 45 - xxx cannot afford that charge and also feels that WM mistake should entitle her to free collection. Items included are a chouch, box spring and mattress. She was also told that until she paid the charge for the collection she would not be able to talk with a manager/supervisor at WM. She was told this by a Theresa. Mrs. Kinser has called several times in the last days to reach a supervisor without a call back.	11/9/2006 2:32:26PM - XXX Status Change Previous: Open New: Closed Reason: Free collection occurred.

Vactored out roots to let flow go through in main.	N	Y	N	Storm drain inlet on Nutmeg	Storm drain system	Storm drain box	Y	N	N	N/A	0	None
Private company snaked out lateral. Recommend that Restaurant cleans their private lateral more often.	N	Y	N	Storm drain box	None	Storm drain box	Y	N	N	N/A	0	Private lateral
Televised lateral, take appropriate steps to replace or rehab.	N	N	N	None	None	Recaptured with shop vac	Y	N	N	N/A	0	None
Investigate overflow cause, televise it. Inform resident that they should remove tree from over our sewer easement.	N	Y	N	Storm drain box	Storm Drain	Storm drain	Y	N	N	N/A	0	Minor spill in bathroom of 3500 Catalina, clean up was done. Strom drain outlet was not flowing. Stagnant water standing there.
Rehab or replace 4" sewer lateral	N	N	N	Gutter	None	Recaptured overflow in gutter	Y	N	N	N/A	0	None
Routine cleaning and inspections of manholes	N	Y	Y	Desilt basin	None	Desilt Basin	Y	Y	N	N/A	0	Desilt basin not accessible to human contact
We pumped out desilt basin to recapture overflow from yesterday, pumped back into sewer system.	N	Y	Y	Desilt basin	None	Desilt Basin	Y	Y	N	N/A	0	Revised final
Used router to clear, will research replacing lateral	N	N	N	None	None	Sidewalk	Y	N	N	N/A	0	None
Instruct contractor to televise the sewer system to determine overflow cause	Y	N	N	Gutter along College Blvd	None	We recaptured small overflow along with wash down water	Y	N	N	N/A	0	None
Routed out roots to let sewer flow go through in main, pulled root out	N	N	N	Brow ditch	None	We vacuumed overflow at brow ditch	Y	N	N	N/A	0	None
Televise main. Instruct contractors to keep debris out of sanitary sewer system	Y	Y	N	Storm drain box on Aston	None	We flushed out and recaptured out of the storm drain system	Y	N	N	N/A	0	Crew recaptured overflow.
Routed out roots to clear sewer lateral so sewer lateral can flow to main	N	N	N	None	None	None	Y	N	N	N/A	0	Washed down and recaptured
Cleared stoppage, will televise to investigate	N	Y	N	None	None	Recaptured at storm drain manholes on Carlsbad Blvd	Y	N	N	N/A	0	Upon further investigation, more flushing of storm drain system was required, flushed additional 1000 gallons and recaptured all sewage
City crew cleared stoppage, Inspector Joe McMahon instructed contractor to recapture overflow and wash down water	N	Y	N	Storm drain box on Peninsula	Desilt basin	Overflow was recaptured	Y	N	N	N/A	0	Overflow was recaptured
City crew cleared stoppage, cleaned up and recaptured overflow	N	Y	N	Strom drain box on Madison	Strom drain box	Overflow was recaptured	Y	N	N	N/A	0	Overflow was recaptured
Routed out roots to clear sewer lateral so sewer can flow to main line	N	N	N	None	None	In the ground	Y	N	N	N/A	0	None
Used sewer drain cleaning machine to clear out roots	N	N	N	None	None	Grass area	Y	N	N	N/A	0	None
Recommended to School District to regularly clean their sewer system. Regulate grease into their sewer system	Y	Y	N	None	None	Recaptured within School District storm drain system	Y	N	N	N/A	0	School District sewer system overflowed.
Snaked out line	N	N	N	None	None	None	Y	N	N	N/A	0	None
Advised homeowner to clear the stoppage. Have plumber make repairs to their piping	Y	N	N	None	None	Recaptured	Y	N	N	N/A	0	Private lateral
Line repaired	N	N	Y	San Marcos Creek	Batiquitos Lagoon	None	Y	N	N	N/A	0	None
None	N	N	Y	Buena Vista Lagoon	None	Buena Vista Lagoon - No evidence that overflow reached Ocean as of today (4-5-07)	Y	Y	y	Around Lagoon, along beach, North and South of Buena Vista lagoon opening to Ocean	0	None
Jetted main and cleared blockage. Recaptured overflow and wash down water.	N	Y	N	Storm drain box	None	Crew recaptured overflow and wash down water	Y	N	N	N/A	0	None
Thoroughly clean the main, televise to locate root problem	N	Y	N	Recaptured in storm drain box	None	Recaptured in gutter line and storm drain box, washed down street	Y	N	N	N/A	0	All overflow recaptured.
Will push for removal of tree	N	Y	N	None	None	Storm drain 300 feet west	Y	N	N	N/A	0	None
Inspector will instruct developer to re-clean and televise the sewer main.	N	Y	N	Next to Encinas Creek	None	None	Y	N	N	N/A	0	None
Have shopping center televise their lateral	N	Y	N	Storm drain box in parking lot	None	Small amount of overflow in storm drain system along I-5 freeway	Y	N	N	N/A	0	None

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am 9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

Appendix 8-4

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am 9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

Appendix 8-4

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am 9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

Appendix 8-4

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am 9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

- Resident called spill to Olivenhain Municipal Water District around 8:30 am, June 30, 2007 to report overflowing manhole in front of 2403 Jacaranda Avenue, Carlsbad, CA 92009 (33.068N, 117.257 W)
- LWD Duty operator contacted at 8:52 am
- LWD on scene around 9:15 am, unable to contain spill due to flow
- LWD cleared blockage at 9:25 am
- SSO rate estimated at 50 gallons per minute, Volume estimated at 2750 gallons (50 gpm X 55 minutes)
- OES notified at 10:12 am (OES 07-3931)
- San Diego Regional Water Quality Control Board (RWQCB) notified at 10:21 am, left message
- County Health (after hours) notified at 10:24 am
- Carlsbad PD notified at 10:28am
- Discussed spill with County Health (Brad Long); distance from Lagoon 1.6 miles, distance from beach 4.5 miles
- Discussed spill with RWQCB (John Anderson)
- LWD staff observed flow in creek at Levante Street, no odor no evidence of sewage at 11:14 am
- Discussed observations with County Health who decided not to post spill or sample beach due to likelihood spill contained in Creek at 11:21 am
- Informed RWQCB of decision not to post beach at 11:25 am
- LWD staff stood down after cleaning Jacaranda Avenue and vactoring wash water at 11:42am
- Sewer line is 8 inch Vitrified Clay pipe constructed in 1974, located in an easement
- Sewer line on annual cleaning cycle and last cleaned August 2006
- CCTV inspection of pipe indicated joint offset by intruding root, insitu repair to be evaluated by Sept 2007
- Line to be cleaned quarterly until line repaired

Appendix 8-4

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am □9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

Appendix 8-4

2750 gallon Sanitary Sewer Overflow (0 gallons recovered)
8:30 am □ 9:25 am, Saturday June 30, 2007
2403 Jacaranda Avenue, Carlsbad, CA 92009
Leucadia Wastewater District (760) 753-0155
Overflow entered storm drain

Carlsbad, CA 92008

Re: 2007 Dry Weather Field Screening and Analytical Monitoring Program City of Carlsbad

Dear Ms. Lukey:

Per your request D-MAX Engineering, Inc (D-MAX) conducted the routine phase of the Dry Weather Field Screening and Analytical Monitoring Program for the City of Carlsbad during the summer of 2007. Subsequently, we conducted follow-up investigations to identify the sources of pollutants detected during the monitoring program.

This report presents the results of the monitoring program and follow-up investigations. The contents include field screening data and analytical laboratory test results, analysis of collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. It has been our pleasure working with the City of Carlsbad on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

1.0 INTRODUCTION

1.1 Regulatory Requirements

San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (the recently adopted Municipal Permit) requires that the Dry Weather Field Screening Program in 2007 be conducted in accordance with RWQCB Order 2001-01 (the previous Municipal Permit) requirement. Under Order No. 2001-01, each of the Copermittees, including the City of Carlsbad, must annually conduct dry weather field screening of discharges into its storm drain system. This procedure consists of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season (May 1st through September 30th). The Permit also requires Copermittees to conduct laboratory analysis for at least 25 percent of the visited sites that have flowing or ponded water. At each sampling location that exhibits no flowing or ponded water, an alternate sampling station must be selected and sampled. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required.

1.2 Program Overview

To comply with the San Diego Municipal Storm Water Permit adopted by the RWQCB, the City of Carlsbad is required to conduct field screening and analytical monitoring at different sampling locations throughout the City during the dry weather season (May 1st through September 30th). The purpose of the Dry Weather Field Screening and Analytical Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. The dry weather monitoring program consists of the following three components:

- Field screening observations
- Field analytical testing
- Laboratory analytical testing

Information collected from the dry weather monitoring is also used to characterize dry weather discharges in the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations were conducted as necessary, to detect and eliminate the sources of these pollutants. This report presents the results of the City of Carlsbad 2007 Dry Weather Field Screening and Analytical Monitoring Program.

1.3 Hydrologic Setting

The City of Carlsbad (City) lies entirely within the Carlsbad Hydrologic Unit (904). The City is naturally divided into four separate sub-watersheds. Land use within each watershed determines the potential for generating both runoff and pollutants into receiving water bodies. The four major receiving water bodies or drainage basins that collect the City's storm water are:

- Agua Hedionda Creek and Lagoon

- Buena Vista Creek and Lagoon
- Encina Creek
- San Marcos Creek and Batiquitos Lagoon.

Much of the runoff within the City discharges into three coastal lagoons and eventually into the Pacific Ocean. Agua Hedionda Creek discharges into Agua Hedionda Lagoon. Buena Vista Creek discharges into Buena Vista Lagoon. San Marcos Creek discharges into Batiquitos Lagoon. Encina Creek discharges directly into the Pacific Ocean. The City of Carlsbad makes up 100% of the land area of the Encinas sub-watershed, 41% of the Agua Hedionda sub-watershed, 29% of San Marcos and 19% of the Buena Vista sub-watershed.

1.4 Previous Work

The City of Carlsbad has conducted dry weather field screening programs since 1995. The results of the previous field screening programs (1995 through 2006) are discussed below and summarized in Table 1-1.

In **1995,** the City conducted one round of field screening at 71 sites within the City's storm drain system. Flowing water was observed at 33 of the sites, 16 sites had ponded water, 14 sites were dry, six sites had trickle flow and two sites were submerged. Chemical testing revealed chlorine levels ranging from less than 0.1 milligrams per liter (mg/L) to 1.0 mg/L. Chlorine was detected at all sites tested with flowing or ponded water. Surfactants ranged from less than 0.25 mg/L to 15.0 mg/L. Site AH12 had the highest level of surfactants (15.0 mg/L). Phenols, ammonia and copper were below detection limits. The pH levels ranged from 4.7 to 9.5. Site EN14A had the lowest pH reading of 4.7 during initial and follow-up visits. Foam was observed at six sites. White and light brown dry foam was observed at Sites EN14A and EN23 while the other four sites had soapy, bubbly foam.

In **1996,** the City conducted one round of field screening at 74 locations within the City's storm drain system. The results of the field screening for 1996 indicated that 36 sites had flowing water, 16 sites had ponded water, nine sites were dry, 11 had trickle flows and two sites were submerged. Chemical testing revealed chlorine levels ranging from less than 0.1 mg/L to 1.5 mg/L. Surfactants ranged from less than 0.25 mg/L to 2.0 mg/L. Sites AH11 and AH12 had the highest surfactant readings of 2.0 mg/L during initial site visits. Phenols, ammonia and copper were not detected during the field screening program. The pH readings ranged from 4.3 to 9.3. Site EN-14A had the lowest pH readings of 4.5 upon the first visit and 4.3 during the second visit. Foam was observed at several sites. Sites BA47, EN14A, EN17, EN20 and EN23 had white or light brown dry foam while Sites AH03, AH13, and BA27 had soapy, bubbly foam.

In **1997,** the City conducted one round of field screening at 75 locations within the City's storm drain system. The results of the field screening indicated flowing water at 34 of the sites, ponded water at 18 sites, eight sites had trickle flow, 13 were dry, and two sites were submerged by lagoon water. Chemical testing revealed chlorine levels ranging from 0.1 mg/L to 0.6 mg/L. Surfactants ranged from 0.25 mg/L to 6.0 mg/L with highest surfactant readings at Sites AH11 and AH12. Phenols were detected at low levels (0.1 mg/L) at Sites BV14 and AH31. Copper was detected at

three sites and ranged from 0.1 mg/L to 0.3 mg/L. Ammonia concentrations ranged from below the field test kit detection limit (non-detect) to 10.7 mg/L. The pH readings ranged from 4.2 to 9.9, with Site EN14A having the lowest readings of 4.2 upon the first visit and 4.6 during the second visit. Foam and soap bubbles were observed at Sites BV02, EN14A, EN23, BA27, BA36, BA47 and BA48.

In **1998,** the City conducted one round of field screening tests at 54 locations. 21 sites that had been dry or did not show noticeable pollutant concentrations during the past screening programs were eliminated from the program. The results of the field screening indicated flowing water at 36 of the sites, ponded water at 16 sites, and two sites were dry. Chemical testing revealed chlorine levels ranging from non-detect to 0.4 mg/L. Surfactants ranged from less than 0.25 mg/L to greater than 3.0 mg/L. The highest surfactant readings occurred at Sites AH11 and AH12. Phenols were detected at 27 sites, and the highest reading of 1.0 mg/L was observed at Site EN23. Copper was detected only at Site EN23, where it measured 0.2 mg/L. Ammonia concentrations ranged from non-detect to 10.0 mg/L. The highest ammonia concentration of 10.0 mg/L was detected at Site AH12, while the ammonia concentration at Site BA41 was below the detection limit. The pH values ranged from 4.1 to 10.7. Site EN02B had the highest pH reading of 10.7, and Site EN23 had the lowest pH measurement of 4.1. Dry brown/white foam was observed at Sites EN14A and EN23, while Sites BA36 and BA41 had traces of soapy, bubbly suds.

In **1999,** the City field screened a total of 79 sites. The sites that had been omitted from the program in 1998 were re-added to the program in 1999. Among the sites visited, 32 sites had measurable flowing water, 23 sites had ponded water, eight sites had trickle flow, 14 sites were dry and two sites were submerged. Ammonia concentrations varied from non-detect to 10 mg/L. Surfactant concentrations in excess of 1.0 mg/L were detected at 10 sites. Lower concentration levels of surfactants were detected at all of the sites tested with ponded or flowing water. Chlorine levels at the tested sites were generally low throughout the City. The concentration of chlorine reached 1.0 mg/L only during the first visit to Site BV08. Several sites had low concentrations of phenols. The maximum phenol concentration of 0.4 mg/L was detected at Sites AH46, AH59, EN14, EN14A, EN20 and EN24. A copper concentration of 0.5 mg/L was the highest detected level and was found at Site AH12. Site BA47 had a copper concentration of 0.3 mg/L.

In **2000,** the City performed field screening at a total of 65 sites. 14 sites tested in the previous year were eliminated because they were found to be consistently dry or did not have significant problems. This allowed more detailed investigations to be conducted at sites with chronic problems. Among the visited sites, 42 had measurable flowing water, nine sites had ponded water, one site had trickle flow and nine sites were dry. Four of the sites were observed to have flowing water during one visit but were ponded, dry, or had only trickling water upon follow-up visits. Ammonia concentrations varied from non-detect at a few of the sites to approximately 10 mg/L at Site AH04. Surfactant concentrations ranged from non-detect to greater than 3.0 mg/L, the highest of which was measured at Site AH12. Chlorine levels at the tested sites were found to vary from non-detect to 2.5 mg/L. The highest chlorine level detected was at Site BV09. Both phenol and copper

levels ranged from non-detect to 0.2 mg/L. The pH levels varied from 4.3 to 10.0. Low pH levels were recorded at Sites BA47, EN14A, EN21 and EN23.

In **2001,** the City performed field screening at a total of 67 sites. Among the sites visited, 52 sites had measurable flowing water, six sites had ponded water, and six sites were dry. Three of the sites were observed to have flowing water during one visit but were either ponded or dry upon follow-up visits. Ammonia concentrations of 1 mg/L or higher were detected at seven sites, with all of the sites containing ponded water or measurable flow indicating the presence of ammonia. Six of the sites had surfactant concentrations in excess of 1 mg/L. Both phenol and chlorine concentrations were generally low, and were only detected at 15 of the sites. The highest chlorine concentration of 0.8 mg/L was found at Site AH03, while the highest phenol concentration of 0.2 mg/L was measured at Site BA04. Copper was not detected at any of the selected sites during the 2001 dry weather program. Floatable materials such as scum, foam, suds, oily sheens, wood debris, plastic, paper and aluminum cans were found at several of the sites. Scum was observed at six sites, foam covered the water surface at five sites, 10 sites had significant suds present, an oily sheen was noted at three sites, and floatable materials such as paper, plastics, and other trash were found at three sites. Site EN09 had excessive sediment, which reduced the flow capacity in two of the four corrugated metal pipes (CMPs).

In **2002**, the City conducted field screening at a total of 60 sites. Measurable flow was observed at 48 of the primary sites, while 11 sites were ponded, and one site was dry. Since one of the stations was observed to be dry, an alternate site (BV08) was selected for monitoring with this site having measurable flow. Ammonia concentrations of 1.0 mg/L or higher were found at 14 of the sites, with the highest concentration at Site BA27 of 56 mg/L. Nitrate was found at concentrations of 10 mg/L or higher at six of the sites, with four of these sites having nitrate concentrations exceeding 40 mg/L. Only one site, Site BA47, had a concentration of orthophosphate phosphorus above 2.0 mg/L. The orthophosphate phosphorus concentration at this site measured 6.5 mg/L, but dropped to at or below 0.5 mg/L on two follow-up visits. Surfactants were measured at or greater than 1.0 mg/L at four of the sites and all the sites had at least a small amount of surfactant present. Measurements of pH found that three sites had pH levels below 6.5 and one site had a pH above 9.0. Laboratory analysis for oil and grease found four sites with elevated concentrations and bacterial analysis found contamination at three of the sites. Laboratory results for surfactants, pesticides and metals all had concentrations either at non-detect or below the action level. Floatable materials such as scum, foam, oily sheens, organic films, wood debris, plastic, paper and aluminum cans were found at several of the sites. Foam or scum covered the water surface at four sites, bubbles were observed at 10 sites and an oily sheen or organic film was noted at 11 sites.

In **2003** 60 sites were selected for field screening. 54 of the sites had measurable flow, six sites were ponded, and Site BV15 was dry, so it was replaced with alternate Site BV08. Measurements of pH were 6.5 or lower at four of the sites. Conductivity was measured above 10,000 µmhos/cm at three sites, and an ammonia concentration of 1.0 mg/L or higher was found at 11 sites. Six sites had

nitrate concentrations at or above the action level of 10 mg, with two of sites having concentrations exceeding 40 mg/L. No sites tested above the action level for reactive phosphorus. Surfactant concentrations at or above the action level of 1.0 mg/L were observed at four sites. Bacterial contamination was recorded at eight sites. Dissolved metal concentrations were not detected or below the action level at all sites. Diazinon and chlorpyrifos were not detected or below their action levels at all sites except Site BA06, which exceeded the action level for chlorpyrifos. Laboratory analysis did not detect surfactants (surfactants) at any sites, and oil and grease did not exceed the action level at any sites. Trash was observed at 22 of the visited sites, and five dusty or oily sheens were noted. Results of the additional study on the City's creeks found the diazinon concentration measured at Site BV Creek-1 and the fecal coliform count measured at Site EN Creek-1 exceeded established action levels. No other measured field and lab parameters exceeded action levels; most fell well below action levels or were not detected.

In **2004** 61 sites were visited; 52 sites had measurable flowing water. Eight sites had ponded water. One site, Site BV15, was dry so it was replaced by Site BV08. Measurements of pH were below 6.5 at three of the sites and at 9.0 at one site. An ammonia concentration of 1.0 mg/L NH_3-N or higher was found at four of the sites; tests performed at all of the remaining sites indicated the presence of ammonia at lower concentrations. Nitrate concentrations at or above 10 mg/L NO_3-N were observed at five sites, and two of the sites had concentrations of at least 50 mg/L NO_3-N. Lower concentrations of nitrate were detected at all of the remaining sites with ponded or flowing water. Reactive phosphorous concentrations were below 1.0 mg/L PO_4-P at all sampled sites. A surfactant concentration of at least 1.0 mg/L was observed only at Site BA41. Five of the sites exceeded the established action level for total coliform bacteria; two of these sites also exceeded action levels for fecal coliform and *Enterococcus* bacteria. Dissolved metal concentrations were not detected or were below the action level at all sites. No sites had detectable concentrations of the organophosphate pesticides diazinon or chlorpyrifos. Oil and grease concentrations were below the action level at all sites and surfactants (surfactants) were not detected at any sites. Trash was observed at 24 of the visited sites. Bubbles or foam were observed at six of the sites, and a dull, organic sheen was observed at one site.

In **2005** all 60 primary monitoring sites were visited, but as in 2004, Site BV15 was dry and was thus replaced by Site BV08. Therefore, a total of 61 site visits were conducted. Five sites had ponded water, while the rest of the sampled sites had measurable flows ranging from less than 1 gallon per minute (gpm) to 196 gpm. The pH readings at three of the sites were below the action level of 6.5; these three sites also had low pH readings in 2004. One site had a pH greater than 9.0. Two ammonia concentrations were found to be at or above the action level of 1.0 mg/L NH_3-N, but both were below the action level upon follow-up. Sites AH08, AH10, AH12, AH13 and EN02C had nitrate concentrations above the action level of 10 mg/L NO_3-N, as they had in each Dry Weather Monitoring Program since 2002. The highest nitrate concentration, 100 mg/L NO_3-N, was measured at Site EN02C. Five sites exhibited a surfactant concentration at or above the action level of 1.0 mg/L. At four of these sites, the concentration dropped below the action level by the time of the follow-up visit. Laboratory analysis detected bacterial indicators at or above

the action level at 11 of the sites. Eight of the sites exceeded the total coliform action level, while Site BA06 had an elevated *Enterococcus* count and Site BA40 had an elevated fecal coliform count. Site BA13 showed elevated levels of all three bacterial indicators. None of the sites had detectable levels of the organophosphate pesticides diazinon or chlorpyrifos. Oil and grease was detected at 16 mg/L at Site AH10, but it was not detected in a second sample taken during a later follow-up visit.

In **2006** all 60 primary monitoring sites were visited, but as in previous years, Site BV15 was dry and was thus replaced by alternate Site BV08. Therefore, a total of 61 site visits were conducted. Most sites had measurable flows, ranging from less than 1 gpm to over 200 gpm. The pH levels at four sites were below the action level of 6.5, and one site had a pH greater than 9.0. At six sites ammonia concentrations were at or above the action level of 1.0 mg/L NH_3-N, but three of these sites were below the action level within 24 hours. Sites AH10, AH12, AH13 and EN02C had nitrate concentrations above the action level of 10 mg/L NO_3-N, as in previous years dating back to 2002. Two sites had an orthophosphate concentration at or above the action level of 2.0 mg/L PO_4-P, but the concentrations dropped below the action level at both sites by the time of the follow-up visits. Surfactants were measured at or above the action level of 1.0 mg/L at two sites. Laboratory analyses showed bacteria action level exceedances for 13 sites. Nine of the sites exceeded only the total coliform action level, but one site had total and fecal coliform counts above action levels. In addition, three sites had exceedances for total coliform, fecal coliform, and *Enterococcus* counts. None of the sites had detectable levels of organophosphate pesticides diazinon or chlorpyrifos. Neither surfactants nor oil and grease were detected in laboratory samples.

1.5 Report Outline

This report is presented in the following order:

Section 1 provides a regulatory background, discusses the hydrologic setting of the City of Carlsbad, describes the objectives of the dry weather monitoring program, summarizes historical field screening data and provides an outline to the report.

Section 2 describes the sampling locations and the site selection criteria.

Section 3 describes the field screening and laboratory analytical procedures. This section also discusses quality assurance protocols used during sampling and lists appropriate action levels for initiating follow-up investigations.

Section 4 discusses the results of the field screening analyses.

Section 5 discusses the results of the laboratory analyses.

Section 6 provides a thorough analysis of the collected field and laboratory data and includes descriptions of each site with evidence of physical, chemical, or biological pollution.

Section 7 details the results of follow up investigations undertaken to isolate the source(s) of water contamination detected during the field screening program.

Section 8 provides a summary of the program results and recommendations for follow-up actions.

Appendix A contains photographs of each of the investigated sites.

Appendix B contains the laboratory analytical reports.

Appendix C contains original copies of the field data sheets.

2.0 SAMPLING LOCATIONS

In February of 2002, the City prepared a Jurisdictional Urban Runoff Management Plan (JURMP) document that identified 60 primary monitoring stations and 14 alternate stations where data would be collected during the dry weather monitoring program. The additional 14 alternate stations would be monitored if any of the primary stations did not have ponded or flowing water. During the 2007 monitoring program, all 60 primary sampling locations were visited and samples were collected when flowing or ponded water was observed. Only one of the pre-selected sampling locations, Site BV15, was found dry and thus an alternate sampling location, Site BV08, was selected for monitoring.

Table 2-1 provides the site number, location, conveyance configuration, primary and secondary land uses, hydrologic unit, and Global Positioning Satellite (GPS) coordinates of the sampling sites that were visited. Photographs of sampling locations are included in Appendix A. Sites are categorized according to the respective watershed using the following abbreviations: AH = Agua Hedionda Lagoon, BA = Batiquitos Lagoon (San Marcos Creek), BV = Buena Vista Lagoon, and EN = Encina Creek. A complete map of the MS4 system, including sampling locations and drainage basins, is included as Figure 1. The City's sub-watersheds are shown in Figure 2.

Notes:
* Alternate station BV08 was selected to substitute for dry primary monitoring station BV15

3.0 FIELD AND LABORATORY ANALYTICAL METHODS

3.1 Field Screening Procedures and Methods

Field screening techniques consisted of qualitative field observations, flow measurement, and field analyses of selected water quality parameters. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance was recorded. Specific observations and results of the field water quality analyses were documented on field data sheets, which are included in Appendix C. The data sheets also serve as a record of the field visit and were completed for every site visit regardless of whether or not samples were collected.

Field screening and analyses were conducted according to the following procedures and methods.

Qualitative Observations

Qualitative field observations were made during each site visit whether or not ponded or flowing water was observed. These observations were intended to provide a general assessment of the site and include variables like odor, water clarity, the presence of floatables, visible deposits, stains, and biological status. Evidence of present or past illicit connections and illegal discharges (IC/ID) to the storm drain system may be ascertained by careful field observations. Each field screening location was photographed to provide additional information and documentation of site conditions. Photos are included in Appendix A.

Field Water Quality Analyses

At each site with ponded or flowing water, water samples were collected and analyzed in the field for the following constituents:

- Specific conductance
- Temperature
- pH
- Turbidity
- Surfactants (MBAS)*
- Nitrate-N
- Ammonia-N
- Orthophosphate-P (reactive phosphorus)

* Surfactants are also referred to as detergents, specifically with respect to discussion of field test kit results. Due to the importance of surfactants, the City conducted analysis for this parameter in both the field and laboratory. Surfactant concentration was measured using the Methylene Blue Active Substances (MBAS) concentration.

Flow Measurement

Flow measurements can be used to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may be indicative of an illegal release upstream. Various field methods can be used to estimate the discharge rate. These include measuring the velocity, depth, and width of the flowing water, or recording the amount of time required to fill a bottle of known volume with sample water.

The methods that were used to perform the above field analyses, along with the detection limit, range and accuracy of each method, are listed in Table 3-2 at the end of this section.

3.2 Laboratory Analytical Methods

In accordance with Order 2001-01, laboratory samples were collected at 15 sites, representing 25 percent of the sites where ponded or flowing water was observed. Samples were submitted to EnviroMatrix Analytical, Inc, a California Department of Health Services certified laboratory, for analysis of the following constituents:

- Total hardness
- Surfactants (MBAS)
- Oil and grease
- Diazinon and Chlorpyrifos
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)

Samples for bacteria were submitted to Encina Wastewater Authority Laboratory for analysis of following indicators:

- Total Coliform bacteria
- Fecal Coliform bacteria
- *Enterococcus* bacteria

The methods used to perform each of the above analyses along with method detection limits and holding times are listed in Tables 3-1 and 3-2 at the end of this section.

3.3 Quality Assurance and Quality Control (QA/QC)

The Quality Assurance/Quality Control (QA/QC) Plan utilized for this project included applying Environmental Protection Agency (EPA) approved test methods for the field and laboratory analysis of water samples, frequent calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials when necessary. Key components of the QA/QC Plan are described below.

3.3.1 Field Sampling and Analysis QA/QC

The pH meters were calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 7.00 ± 0.01 and 10.00 ± 0.01 units. The glass electrode tube was kept moist to preserve the meter's accuracy during field work. The turbidity meter was calibrated and periodically checked for accuracy using standard solutions. The conductivity meter was checked periodically with standard solutions and calibrated as necessary.

Field sample collection containers were first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water.

The accuracy of field analytical techniques was assessed at the beginning of the sampling program by analyzing solutions of known concentrations for ammonia, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in the table below.

TABLE 3-1 FIELD ANALYSIS QA/QC RESULTS

Date	Analyte	Known Concentration	Acceptable Range*	Field Test Kit Results
7/11/07	Ammonia - N	1.0 mg/L	0.8 – 1.2 mg/L	1.0 mg/L
7/11/07	Surfactants	1.0 mg/L	0.75 -1.25 mg/L	1.0 mg/L
7/11/07	Nitrate - N	10.0 mg/L	7.0 - 13.0 mg/L	10.4 mg/L
7/11/07	Orthophosphate	3.0 mg/L	2.5 – 3.5 mg/L	2.9 mg/L

Note

* Acceptable range is calculated based on the error associated with the methods as listed in Table 3-2.

3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis were collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles were obtained from the laboratories, so they did not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples were kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures were followed, and samples were delivered and analyzed within the appropriate holding times, as listed in Table 3-3 below. Completed chain of custody forms are included in Appendix B.

3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation was necessary, numeric action levels and best professional judgment (described below) were used to interpret the field screening results. If visual and/or analytical evidence of gross contamination was present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation was initiated. Sites that exceeded numeric action levels but were not perceived as an immediate threat to water quality were re-sampled within 24 hours. A source investigation was conducted thereafter if elevated concentrations persisted; the results of those investigations are included in

Section 7 of this report. Recommendations based on these investigations are included in Section 8.

If elevated levels of pollutants were detected in the laboratory analyses, a comprehensive follow-up investigation including re-sampling was conducted after receiving the analytical reports from the laboratory. The following three methods were employed to determine whether immediate or comprehensive follow-up investigations were necessary: (1) Numeric action levels; (2) California Toxics Rule; and (3) best professional judgment. All three approaches are described in detail below and presented in Table 3-4.

Numeric Action Levels

Numeric action levels were used as the primary approach for interpreting pH, orthophosphate, nitrate, ammonia, methylene blue active substances (MBAS), oil and grease, diazinon, chlorpyrifos, total coliform, fecal coliform, and *Enterococcus* levels (Table 3-4). If pH, orthophosphate, nitrate, ammonia, or surfactants were observed above the numeric action level, a follow-up investigation was conducted within one business day to investigate the source unless best professional judgment indicated otherwise. If oil and grease, diazinon, chlorpyrifos, total coliform, fecal coliform, or *Enterococcus* laboratory analytical results exceeded numeric action levels, then source investigations were conducted, upon receiving results from the lab.

California Toxics Rule

The California Toxics Rule (CTR) Criterion Maximum Concentration (CMC) was used to determine appropriate action levels for dissolved trace metals cadmium, copper, lead, and zinc. The CTR equations provide action levels for each dissolved metal based on the measured total hardness value of the water sample. More information on the CTR can be found at http://www.epa.gov/region09/water/ctr.

Best Professional Judgment

Best professional judgment was utilized as the primary approach for interpreting conductivity, turbidity, and water temperature and as the secondary approach for interpreting the results of all other field and laboratory analyses. Best professional judgment may conclude that results that exceed action levels or are statistical outliers are likely the result of natural or background factors.

TABLE 3-2
FIELD ANALYTICAL METHODS

Parameter	Method	Reporting Limit	Range	Accuracy
Specific conductance	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.01 mS/cm	0 – 20 mS/cm	± 2% of functional sensitivity[1]

Notes:

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L NO_3. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the NO_3 molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14 g/mol) to NO_3 (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range. "Full range" is equal to the upper limit of the test kit's range.

[6] This method determines the concentration of orthophosphate in mg/L PO_4. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the PO_4 molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31 g/mol) to PO_4 (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate-P is lowered due to the conversion.

*Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com. Additional information regarding CHEMetrics accuracy was obtained from the manufacturer via email.

**Reporting limit, range, and accuracy information taken from Hanna Instruments manuals, available online at www.hannainst.com

TABLE 3-3
LABORATORY ANALYTICAL METHODS

Analyte	Analytical Method	Method Reporting Limit	Maximum Holding Time
Surfactants (MBAS)	SM 5540 C	0.5 mg/L	48 hours
Oil and grease	EPA 1664	5 mg/L	28 days
Total Hardness	EPA 200.7	10 mg/L	14 days
Cadmium	EPA 6010, 6020, 200.8	0.005 mg/L	6 months
Copper	EPA 6010, 6020 200.8	0.005 mg/L	6 months
Lead	EPA 6010, 6020 200.8	0.005 mg/L	6 months
Zinc	EPA 6010, 6020, 200.8	0.020 mg/L	6 months
Diazinon	EPA 8141A	0.05 µg/L	7 days
Chlorpyrifos	EPA 8141A	0.05 µg/L	7 days
Total Coliform	SM 9222 B*	20 – 1,600,000 CFU/100 mL	6 hours
Fecal Coliform	SM 9222 D*	20 – 160,000 CFU/100 mL	6 hours
Enterococcus	SM 9230 C*	20 – 160,000 CFU/100 mL	6 hours

Note

*For Site BA36, the bacteria analyses were conducted using multiple tube fermentation methods (SM 9221 B, SM 9221 E, and SM 9230) instead of the membrane filtration methods used for the other sites. The reporting limits and holding times are the same for both types of methods.

TABLE 3-4
ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

Field Screening Analytes	Action Levels[1]	Source/ Notes
pH	<6.5 or >9.0	Basin Plan, with allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia.
Orthophosphate-P (mg/L)	2.0	USEPA Multi-sector General Permit
Nitrate-N (mg/L)	10.0	Basin Plan, and drinking water standards
Ammonia-N (mg/L)	1.0	Based on Workgroup experience. May also consider unionized ammonia fraction.
Turbidity (NTU)	Best Professional Judgment	WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity), and unusual odors.
Temperature (°C)	Best Professional Judgment	Base judgment on season, air temperature, channel type, shading, etc.
Conductivity (mS/cm)	Best Professional Judgment	Values > 5.00 mS/ cm may indicate IC/ID; however, EC may be highly elevated in some regions due to high TDS groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values <0.75 may indicate excessive potable water discharge or flushing.
Laboratory Analytes	**Action Levels**	**Source/ Notes**
Surfactants (MBAS) (mg/L)	1.0	Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences.
Oil and Grease (mg/L)	15	USEPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation.
Diazinon (µg/L)	0.5	Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs.
Chlorpyrifos (µg/L)	0.5	
Dissolved Cadmium	California Toxic Rule	Use California Toxics Rule Table, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb.
Dissolved Copper	California Toxic Rule	
Dissolved Lead	California Toxic Rule	
Dissolved Zinc	California Toxic Rule	
Total Coliform (MPN/ 100 mL)	50,000	Action levels are based on upper 90% confidence interval of Copermittee 2002 dry weather analytical monitoring data.
Fecal Coliform (MPN/ 100 mL)	20,000	
Enterococcus (MPN/ 100 mL)	10,000	

Notes

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry weather monitoring data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

°C	degrees Celsius
mS/cm	millisiemens per centimeter
mg/L	milligram per liter
IC/ID	illegal connection/illicit discharge
MBAS	methylene blue active substances
MPN/100 mL	most probable number (of colony forming units) per 100 milliliters
NTU	nephelometric turbidity unit
ppb	parts per billion
USEPA	United States Environment Protection Agency
WQO	Water Quality Objectives

4.0 FIELD SCREENING RESULTS

The dry weather monitoring program commenced on July 11, 2007 and completed on July 25, 2007. A total of 61 monitoring stations were visited. Field screening was conducted at the 60 sites where ponded or flowing water was observed. Fifty-four sites had measurable flow, six sites were ponded, and one site was dry. Primary sampling station Site BV15 was observed to be dry; therefore, alternate Sites BV08 was selected as replacements. Altogether, a total of 76 site visits were performed, including visual surveys at the aforementioned dry sites and 15 follow-up visits to sites where one or more constituents were found to exceed specified action levels.

4.1 Qualitative Observations

Qualitative observations are a routine and important part of the field screening program. Weather conditions were recorded at each site and any evidence of dry weather flows was documented. Visual observations of the sample water and the vicinity of the sampling location such as odor, color, clarity, floatable materials, vegetation, and biological organisms were also recorded. Observations are summarized below and presented in Table 4-1.

Light Conditions
The weather condition was most often sunny during field screening. Partly cloudy and overcast conditions were also observed during visits to almost half of the sites.

Odor
Most sites visited during the 2007 field screening program had no observable odors. However, Site AH11 had a chemical odor, and Site BV10 smelled of rotten eggs.

Color
Water samples taken from the majority of the sites were colorless. However, 21 sites had water with a yellow tint, and samples taken from Site AH04 were red in color.

Clarity
The majority of the water samples collected from the visited sites were clear, with negligible suspended particles observed. At eight of the sites water samples were slightly cloudy. The water sample taken at Site BA36 was observed to be initially opaque, but was clear at the time of the follow-up visit for the site.

Floatable Materials
During routine field screening visits, 18 of the 60 sites were observed to have trash in or around the sampling location. The amount of trash encountered at these sites was relatively small, and generally included materials such as paper, plastics, Styrofoam, aluminum cans, and glass bottles. A total of eight sites were observed to have bubbles on the water surface. Foam was observed at sites BA41, BA47, BA48 and EN23. Fecal matter was observed at sites AH09 and BA32.

Vegetation
Vegetative growth ranged from no growth to naturally vegetated riparian areas to excessive amounts of vegetation. Site AH11 had excessive vegetation. 25 sites had normal vegetation, and Site EN02B had limited vegetation. No growth was observed at the rest of

sites including manholes and catch basins, which receive no sunlight, and concrete channels, which usually have no soil.

Biology

Twenty-nine of the sites exposed to sunlight had algal growth, which indicates that water flow is persistent at the site. Insects were observed at 35 sites during field screening. Several of the sampling locations were also inhabited by other organisms such as fish, snails, tadpoles, and crawfish.

Deposits

Fine particulate deposition was observed at approximately 37 sites, while 14 sites had course and fine particulate deposition. The remaining sites had no observable deposits of any kind.

* Site BV08 was substituted for dry Site BV15

4.2 Field Analytical Results

Field analyses were conducted at all sites with ponded or flowing water. Chemical analyses were conducted using a CHEMetrics field test kits for surfactants. A CHEMetrics V-2000 Multi-Analyte LED Photometer and Vacu-vials® was used for nitrate, ammonia and orthophosphate-P measurements. pH, conductivity, and temperature were measured using a Hanna Instruments Portable pH/EC/TDS/Temperature Meter (HI 991301); and turbidity was measured using a Hanna Instruments Portable Turbidity Meter (HI 93203-11). A summary of the field analytical results is presented in Table 4-2. Table 4-3 presents the results of all field analyses conducted at the sampled sites. Graphs of each parameter analyzed and appropriate action levels for follow-up investigations are included at the end of this section.

TABLE 4-2
FIELD ANALYSIS STATISTICAL SUMMARY

Parameter (units)	Maximum	Minimum	Average	Median	Number of Exceedances
Flow Rate (gpm)	299	<1	14.3	3.0	na
Temperature (ºC)	33.8	19.6	23.0	22.8	na
pH	8.8	4.9	7.59	7.7	3
Turbidity (NTU)	68.0	0.1	7.27	3.47	5
Conductivity (mS/cm)	9.74	0.85	3.63	3.22	0
Ammonia Nitrogen (mg/L NH_3-N)	0.8	nd	0.25	0.2	0
Surfactants (mg/L MBAS)	>3.0	0.25	0.54	0.50	1
Nitrate Nitrogen (mg/L NO_3-N)	48.6	0.1	3.58	1.21	3
Orthophosphate Phosphorus (mg/L PO_4-P)	2.02	0.01	0.37	0.26	1

Note: Statistics are calculated from the results of the routine site visits. A total of 60 sites were sampled
nd = not detected
na = not applicable

Flow rates are the measurement of the volume of fluid passing through a given surface per unit time. Flow rate measurements are particularly important because they are needed when calculating the load or particular amount of a pollutant discharged. Best professional judgment is used when determining whether or not the flow rate at a particular site is abnormal or possibly indicating an IC/ID. Sites with measurable flow ranged from less than 1.0 gpm to 299 gpm, with an average of 14.3 gpm and a median of 3.0 gpm, as shown in Table 4-2. The highest flow rate was measured at Site BA51. None of the sites sampled had flow rates potentially indicating an IC/ID.

Water temperature is an important physical parameter because it is needed to assess the significance of other parameters such as pH and conductivity. Furthermore, the aquatic

habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. There is no established action level for water temperature. However, the field crew uses best professional judgment when determining whether or not water temperature is abnormal or possibly indicating an IC/ID. Water temperature was measured in the field immediately upon sample collection at each site with ponded or flowing water. Temperature readings ranged from 19.6 to 33.8 degrees Celsius (℃), with an average of 23℃ and a median of 22.75℃. The maximum water temperature of 33.8℃ was recorded at Site AH04, in the late afternoon. The minimum water temperature of 19.6℃ was measured in the morning at Site AH08. Graph 4-1 presents the results of temperature readings at all sites. None of the sites sampled had temperatures potentially indicating an IC/ID.

The **pH** is an expression of the acidity or alkalinity of a water sample. This is a critical factor in determining water quality, as the pH of an aquatic system will drive a multitude of chemical reactions, including the availability of nutrients and the solubility of chemical substances, especially heavy metals. The accepted action level range for pH is from 6.5 to 9.0. The pH values measured during field screening ranged from 4.9 to 8.8, with an average of 7.6 and a median of 7.7. The highest pH reading of 8.8 was observed at AH63 around noon, and the lowest pH during routine field screening was 4.9 recorded at EN23 during the first visit to the site. A total of three sites, BA47, EN14A and EN23, had pH values above or below the accepted action level range. Graph 4-2 presents the results of pH readings at all sites.

Turbidity indicates the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation (thus reducing photosynthetic capacity), but excessive suspended particles can also absorb heat and elevate water temperatures. There is no established action level for turbidity, therefore the field crew used best professional judgment when determining whether or not a turbidity measurement required further investigation. Turbidity measurements ranged from 0.1 to 68 NTU, with an average of 7.27 NTU and a median of 3.47 NTU. The highest turbidity reading of 68 NTU was recorded at Site BA36, and the lowest measurement of 0.1 NTU was observed at Sites AH45, BV04A and BV09. A total of five sites, AH10, BA13, BA36, EN21 and EN23, required further investigation for elevated turbidity measurements. Graph 4-3 presents the results of turbidity measurements at all sites.

Conductivity values indicate the total concentration of ions in an aquatic system and the ability of water to conduct electricity. This parameter can be used to assess the mineral content of water or to help determine the presence of dissolved pollutants. There is no established action level for conductivity, therefore the field crew used best professional judgment when determining whether or not conductivity results required further investigation. Conductivity readings ranged from 0.85 to 9.74 mS/cm, with an average of 3.63 mS/cm and a median of 3.22 mS/cm. The highest conductivity measurement of 9.74 mS/cm was recorded at Site BA13, while the lowest reading of 0.85 mS/cm was taken at Site AH09. None of the sites sampled required further investigation for abnormally high conductivity measurements. Graph 4-4 illustrates the results of conductivity measurements at all sites.

Ammonia Nitrogen is a common indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment, however, in higher quantities it can become toxic to fish and other organisms. The established action level for ammonia is 1.0 mg/L. Ammonia concentrations measured in sampled water ranged from not detected to 0.8 mg/L NH_3-N, with an average of 0.25 mg/L and a median of 0.2 mg/L. The highest ammonia concentration was observed at Sites AH61 and BA36, while Sites AH03 AH30, AH63 and BA06 had no measurable ammonia concentration. Sixteen sites had an ammonia concentration of 0.1 mg/L. None of the sites sampled had ammonia concentrations exceeding the action level. Graph 4-5 shows the results of the ammonia analyses at all sampling locations.

Surfactants in water samples often indicate illegal discharges from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms. The established action level for surfactant concentration is 1.0 mg/L MBAS. During field analysis, surfactant concentrations ranged from 0.25 mg/L to greater than 3.0 mg/L, with an average of 0.54 mg/L and a median of 0.5 mg/L. More than half of the sites had a surfactant concentration of 0.5 mg/L or less. The highest concentration of surfactants, greater than 3.0 mg/L, was found at Site AH04. This was the only site to exceed the action level for surfactant concentration. Graph 4-6 reflects the results of the surfactant analyses at all sampling locations.

Nitrate Nitrogen is a common indicator of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can later cause the suffocation of fish and other aquatic organisms by depleting oxygen from the water during decomposition. During the field analysis, nitrate was measured in mg/L NO_3 and converted into mg/L nitrate-N using a conversion factor of 0.226. This process is explained in footnote 3 of Table 3-2. The established action level for nitrate nitrogen concentration is 10.0 mg/L. Measured nitrate concentrations ranged from 0.1 to 48.6 mg/L NO_3-N, with an average of 3.58 mg/L and a median of 1.2 mg/L. The highest nitrate concentration of 48.6 mg/L was observed at Site AH13 during first visit to the site. The lowest measurable amount of nitrate, of 0.1 mg/L, was recorded at Site EN09. Three sites, AH10, AH13 and EN02C, each had nitrate nitrogen concentrations exceeding the action level. Graph 4-7 presents the results of the nitrate analyses at all sampling locations.

Orthophosphate Phosphorus, also known as reactive phosphorus, is also a common indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate, phosphate pollution can cause nutrient enrichment (eutrophication), which stimulates algal growth and eventually lowers aquatic dissolved oxygen to levels that are dangerous for aquatic life. Because it is commonly the limiting nutrient in plant growth, even low levels of phosphate can cause significant algal growth. During the field analysis, orthophosphate was measured in mg/L PO_4 and converted into mg/L orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 6 of Table 3-2. The established action level for orthophosphate phosphorus is 2.0 mg/L. Orthophosphate phosphorus was measured at concentrations ranging from not detected to 2.02 mg/L PO_4-P, with an average of 0.37 mg/L and a median of 0.26 mg/L. Sites EN18, EN19 and EN20 had no measurable orthophosphate concentration, while Site AH 65 had an orthophosphate phosphorus concentration of 2.02 mg/L during the initial visit to the site and dropped to 1.0

mg/L during the second visit to the site. Site AH65 was the only site with an orthophosphate phosphorus concentration recorded above the action level. Graph 4-8 illustrates the results of orthophosphate-P at all sampling locations.

5.0 LABORATORY ANALYTICAL RESULTS

5.1 Summary

Laboratory analyses were conducted at 15 sites, representing 25 percent of all sites with ponded or flowing water. A summary of the laboratory analytical results from routine (initial) site visits is presented in Table 5-1. Complete laboratory test results are presented in Table 5-2. Laboratory reports are included as Appendix B.

TABLE 5-1
LABORATORY ANALYSIS SUMMARY: ROUTINE VISITS

Parameter (units)	Maximum	Minimum	Number of Exceedances
Total Hardness (mg/L $CaCO_3$)	3,820	372	na
Surfactants (mg/L MBAS)	0.5	nd	0
Oil and grease (mg/L)	nd	nd	0
Diazinon (µg/L)	nd	nd	0
Chlorpyrifos (µg/L)	nd	nd	0
Cadmium (dissolved, mg/L)	0.01	nd	0
Copper (dissolved, mg/L)	0.009	nd	0
Lead (dissolved, mg/L)	nd	nd	0
Zinc (dissolved, mg/L)	0.068	nd	0
Total Coliform (CFU/100 mL)	66,000	<50	3
Fecal Coliform (CFU/100 mL)	22,700	225	1
Enterococcus Bacteria (CFU/100 mL)	82,800	140	2

Note: nd = not detected
na = not applicable

Total hardness measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Although it is not itself considered a pollutant, total hardness is measured in order to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions. Total hardness values ranged from 372 to 3,820 mg/L $CaCO_3$. The highest total hardness value was observed at Site BA13, and the lowest value was found at Site BV02.

Surfactants (MBAS) are analyzed to detect detergent pollution from residential, commercial, or industrial washing activities. As mentioned in Section 4.2, pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms The established action level for surfactant concentration is 1.0 mg/L MBAS. A surfactant concentration of 0.5 mg/L was recorded at Site AH10. All other samples collected contained MBAS concentrations below the reporting limit.

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities. The action level for oil and grease is 15 mg/L. Oil and grease levels were below the reporting limit for all 15 tested sites.

Diazinon and **chlorpyrifos** are organophosphate pesticides that are detrimental to birds, mammals, beneficial insects, freshwater fish, invertebrates, and other aquatic organisms. The established action level for both diazinon and chlorpyrifos is 0.5 µg/L. Neither diazinon nor chlorpyrifos were detected at any of the sampled sites.

Metal contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms, including fish and waterfowl. The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. Therefore, each dissolved metal has an action level or CMC for a particular total hardness. The laboratory samples collected were analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Dissolved cadmium, at a concentration of 0.010 mg/L, was detected only at Site BA13. Dissolved copper was detected at seven sites, with the highest concentration of 0.009 mg/L found at Site AH10. Dissolved zinc was detected at five sites. The highest concentration of zinc was found at Site BA13, at 0.068 mg/L. Dissolved lead was not detected at any sites. All samples collected had dissolved metal concentrations below applicable action levels as calculated using CTR criteria. Table 5-2 provides a summary of those sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

Coliform bacteria are relatively harmless to humans and are typically present at high levels in mammalian digestive tracts, as well as naturally found in most surface waters and soils. Testing water samples for total coliform bacteria is a standard practice in public health because a high level of total coliform bacteria often, although not always, indicates the presence of other more harmful, pathogenic organisms, usually from fecal contamination. Total coliform is used as a surrogate for these pathogens because they are generally present in much smaller quantities and are therefore difficult to test for directly. A concentration of 50,000 colony forming units per 100 mL (CFU/100 mL) is used as the action level for total coliform bacteria. During the 2007 routine dry weather monitoring program, total coliform counts ranged from less than 50 to 66,000 CFU/100 mL. The highest level of 66,000 CFU/100 mL was found at Site BV02. Sites BA06 and BA13 exceeded the action level for total coliform bacteria, as well. However, during the follow-up investigation, a sample test from Site BA13 indicated a count of 151,000 CFU/100mL. Upstream investigations were conducted at all three sites in 2007; the results are detailed in Section 7 of this report.

Fecal coliform, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastro-intestinal (GI) tracts of humans and animals, so they are commonly used as indicators of water contamination by fecal matter. A host of human diseases, particularly those of the GI tract, are spread through water contaminated with fecal matter. The action level for fecal coliform bacteria is 20,000 CFU/100 mL. Fecal coliform counts ranged from 225 to 22,700 CFU/100mL. Only Site BA40 exceeded the action level for fecal coliform bacteria. The action level for *Enterococcus* 10,000 CFU/100 mL. *Enterococcus* counts ranged from 140 to 82,800 CFU/100 mL. Sites BA06 and BV02 were the only sites to have *Enterococcus* counts above the action level.

TABLE 5.2
CTR – CMC FOR DISSOLVED METALS[1]

Dissolved Cadmium			
Site	**Total Hardness (mg/L)**	**CMC (mg/L)**	**Concentration (mg/L)**
BA13	3,820	0.218	0.010
Dissolved Copper			
Site	**Total Hardness (mg/L)**	**CMC (mg/L)**	**Concentration (mg/L)**

Notes:

Red values were at or above the measured constituent's action level
nd = not detected
nt = not tested
CTR = California Toxics Rule (based on hardness)
* = Total hardness is not considered a pollutant (see section 3.4 for details), and thus has no established action level for the purposes of dry weather monitoring. Total hardness is measured because the CTR action levels for metals are dependent on the total hardness value of the water sample.
** = Bacteria results are from resample conducted on 9/6/07 at 8:34; results from 7/12/07 sample could not be used due to laboratory complications. Units are MPN/100 mL.

6.0 DATA ANALYSIS

Based on the visual observations and the field and laboratory analytical testing conducted at the visited sites, the following sites demonstrated physical and chemical evidence of possible illegal discharges and/or illicit connections.

Site AH04

Site AH04 is a concrete channel located behind the 5600 Avenida Encinas flower shops (see Appendix A for photo). On the initial site visit, the water in the concrete channel was ponded, and bubbles could be observed on top of the water. When sampled, the water appeared slightly cloudy with a reddish color to it. Surfactants were measured at a concentration greater than 3.0 mg/L MBAS, exceeding the 1.0 mg/L MBAS action level. During the follow-up visit to the site, a slight flow of water (less than 1 gpm) could be observed running in the channel. The sample appeared slightly cloudy with a reddish color, similar to the initial visit. Surfactants were again measured above the action level at a concentration of 2.0 mg/L MBAS. A number of commercial businesses, including some that could conduct washing activities, are located in the area immediately upstream of the sites. An upstream investigation for the source of surfactants at Site AH04 was conducted. The investigation is described in more detail in Section 7 of this report.

Site AH10

Site AH10 is an earthen channel located West of Avenida Encinas, near the Manzano Drive and El Arbol Drive intersection (see Appendix A for photo). Water from the channel flows West through two 60-inch diameter RCP inlets and passes underneath the railroad tracks. During the initial visit to the site a flow of 48 gpm was sampled. The sample appeared slightly yellow in color. Turbidity was measured at 28.70 NTU, which is slightly high for typical dry weather conditions. Nitrate levels were measured at 32.10 mg/L NO_3-N, above the 10.0 mg/L NO_3-N action level. During the follow-up visit to the site a flow of 27 gpm was sampled. The turbidity of the sample collected was measured at 9.67 NTU. This indicated that the turbid water initially sampled at the site was most likely transient. Nitrate was still measured above the action level at 26.89 mg/L NO_3-N. Nitrate levels have been measured above the action level for Site AH10 in the past. Site AH10 is also located downstream of Site AH13. The area upstream of sites AH10 and AH13 has agricultural and commercial land uses located East of the sites. Previous years' investigations have identified the source of the nitrates to likely be from seepage water originating East of the site. A detailed description of the upstream investigation for nitrates at this site can be found in Section 7.

Site AH13

Site AH13 consists of two 48-inch diameter RCP outlets which drain into a concrete channel just West of Paseo Del Norte (see Appendix A for photo). The water sampled at the site appeared clear, colorless, and odorless and was flowing at approximately 11 gpm. Similar to previous years, nitrate was measured above the 10.0 mg/L NO_3-N action level, at a concentration of 48.60 mg/L. During the follow-up visit the condition of the site was similar to the initial visit, except for a slight decrease in flow rate to 9 gpm. Nitrate levels were measured at 30.70 mg/L, still above the established action level of 10.0 mg/L. The upstream land uses associated with this site are commercial and agricultural. In previous

years the source of the nitrate has been attributed to flows originating East of the site. A detailed description of the upstream investigation conducted is included in Section 7.

Site AH65

Site AH65 is a manhole located on Pontiac Drive, across from South Hampton Road (see Appendix A for photo). Two lines drain to the site, one 48-inch RCP from the North and one 24 inch RCP from the Northeast. The water at this site is comprised primarily of runoff from the surrounding residential area. During the initial investigation, water was observed flowing at approximately 2 gpm. The water sampled had a slight yellowish color, but was clear and odorless. No trash could be observed inside the manhole. The concentration of orthophosphate-P was measured slightly above the action level at 2.02 mg/L PO_4-P. An immediate upstream investigation was conducted to determine the source of orthophosphate-P (see Section 7 for more detail). During the follow-up visit to the site, slightly more flow was observed in the manhole, approximately 3 gpm. The sample collected appeared colorless and had an orthophosphate-P concentration of 1.01 mg/L, which is below the action level. The area upstream of the site is primarily well landscaped residential areas. A detailed description of the upstream investigation conducted is included in Section 7.

Site BA06

Site BA06 is a 36-inch RCP in manhole located along the Eastern sidewalk of Batiquitos Drive, between Poinsettia Lane and Daisy Avenue (see Appendix A for photo). During the initial visit to the site, the water sampled was flowing at roughly 2 gpm. The water appeared slightly yellow in color, and dried organic debris (leaves) could be observed inside the manhole. All field screening parameters tested were measured below their respective action levels and required no further investigation. However, both total coliform and *Enterococcus* bacterial indicators were counted above their respective action levels of 50,000 CFU/100 mL and 10,000 CFU/100 mL. Total coliform was counted at 55,400 CFU/100 mL, while *Enterococcus* was counted at 82,800 CFU/100 mL. During the follow-up visit to the site, the water in the manhole was ponded and no longer had a yellowish color. Decaying organic debris (leaves) was still noted in the water at the site. Total coliform was counted at 26,800 CFU/100 mL, below the action level of 50,000 CFU/100 mL. *Enterococcus* counts also decreased but were counted at 19,600 CFU/100 mL, still above the action level of 10,000 CFU/100 mL. The land use of the area upstream of the site is primarily residential. A detailed description of the upstream investigation conducted for this site is included in Section 7.

Site BA13

Site BA13 is a 60-inch RCP debris basin outlet to Batiquitos Lagoon, located on Arenal Road, Southwest of El Camino Real (see Appendix A for photo). During the initial visit to the site, a flow of 5 gpm was observed. The sample collected appeared yellow, and slightly cloudy. Water was ponded at the site and at the manhole just upstream of the site on Arenal Road. So that the sampled water would be more representative of conditions typically present at Site BA13, the sample was taken from flowing water (5 gpm) in the conveyance slightly upstream of the manhole on Arenal Road. The field crew confirmed that no flow was entering the conveyance between the location where the sampling was conducted and the standard monitoring site location. Turbidity was measured at 30.97

NTU. Due to the high turbidity reading, the field crew immediately investigated upstream of the site for any potential IC/IDs that could be contributing to the turbid water (see Section 7 for further details). The field crew observed construction activities taking place on a residential driveway located on Lotus Court. Samples collected from BA13 were also tested for bacterial indicators. During the initial visit, only total coliform was counted above the action level, at 56,000 CFU/100 mL. The action level for total coliform bacteria is 50,000 CFU/100 mL. *Enterococcus* was counted at 9,300 CFU/100 mL, just below the action level of 10,000 CFU/100 mL.

A follow-up visit was conducted for this site the following day for turbidity. A flow of 5 gpm was observed. The water sampled no longer appeared slightly cloudy, and the turbidity was measured at 12.07 NTU. A second follow-up visit for bacterial indicators was performed a few days later, after receiving the initial bacteria results from the laboratory. A flow of 5 gpm was again observed. Laboratory analysis of the samples collected indicated both total coliform and *Enterococcus* bacteria were above their respective action levels. Total coliform was counted at 151,000 CFU/100 mL, and *Enterococcus* was counted at 22,050 CFU/100 mL. The land use of the area upstream of the site is largely residential, with a large commercial shopping center also located farther North of the site. A detailed description of the upstream investigation conducted for this site is included in Section 7.

Site BA36

Site BA36 is a 36-inch RCP outlet located in the Southeast corner of the La Costa Golf Course, behind 7525 Gibraltar Street and the Round Tree Apartments (see Appendix A for photo). The water sampled from the site was flowing at roughly 10 gpm, and appeared slightly yellow and opaque. The turbidity of the sample was measured at 68 NTU. No sources were identified that would potentially explain the turbid water observed at the site. All other constituents were measured below their respective action levels, including those sent off for laboratory analysis. During the follow-up visit to the site, the water sampled appeared clear and colorless. A flow of 10 gpm was again observed. Turbidity was measured at 7.36 NTU, much lower than when initially sampled. The area upstream of the site is comprised of residential and open areas. It is possible that an unidentified source was responsible for the turbid water initially observed at the site. However, due to the significant drop in turbidity and change in the water's appearance between visits, the source of the turbid water is most likely transient. No further upstream investigation was conducted for this site.

Site BA40

Site BA40 is an 84-inch RCP outlet located approximately 30 feet Southwest of the Melrose Drive and Rancho Santa Fe Road intersection (see Appendix A for photo). Algae, insects, and worms were all noted during the initial visit to the site. A small amount of trash, including plastic bottles and food wrappers was observed in the channel downstream of the outfall. All parameters measured in the field tested below their respective action levels. Samples collected at this site were also sent off for laboratory analysis. Fecal coliform bacteria were measured at 22,700 CFU/100 mL, above the established action level of 20,000 CFU/100 mL. The field crew returned to the site a few days later to collect another sample for bacterial analysis, during which trash was again observed at the site. No sources that would contribute fecal coliform bacteria were observed in the immediate area around the site. The area upstream of the site is primarily commercial land use, although

several residential areas are also located farther upstream of the site. A description of the upstream investigation is provided in Section 7.

Site BA47

Site BA47 is a manhole located on Camino Alvaro, just West of the Camino Alvaro and Rancho Santa Fe Road intersection (see Appendix A for photo). This site is comprised of three different conveyance lines that combine inside a junction box and then discharge down a single 30-inch RCP. A sample of the combined flow, flowing at 10 gpm, was collected. The water appeared slightly cloudy, and foam was observed floating on the water toward the Northeast corner of the manhole. The pH of the combined flow was measured at 6.2, below the action level of 6.5. During the follow-up visit, an increase in flow to 15 gpm was observed inside the junction box. The pH of the sample collected was measured at 6.5, exactly that of the action level. Previous investigations for low pH at this site have identified a small PVC pipe within the junction box as likely being the source of the acidic water. The area upstream of the site is almost entirely residential. The upstream investigation conducted for this site is detailed in Section 7 of this report.

Site BV02

Site BV02 consists of two 36-inch RCP outlets located on the East side of State Street, South of the Carlsbad Boulevard and State Street intersection (see Appendix A for photo). During the initial visit, articles such as sleeping bags and clothing were observed around the site, likely indicating human inhabitation of the area near the site. The water sampled was slightly yellow and flowing at 3 gpm. Laboratory analysis indicated action level exceedances for both total coliform and *Enterococcus* bacteria. Total coliform bacteria were counted at 66,000 CFU/100 mL, above the 50,000 CFU/100 mL action level and *Enterococcus* bacteria were counted at 12,550 CFU/100 mL, above the 10,000 CFU/100 mL action level. None of the parameters measured in the field exceeded any action level. The area surrounding the site and upstream is primarily commercial, with some industrial land use. Human inhabitation in the vicinity of the site has been noted in the past. The results of the upstream investigation conducted for Site BV02 are included in Section 7.

Site BV08

Site BV08 is a 66-inch RCP outfall to Buena Vista Creek located close to El Camino Real. At the initial visit to the site, an oily sheen was noted. The City was immediately contacted and responded to the site to meet with the field crew. Further investigation by the City determined that food grease had accumulated in the conveyance upstream of the site. City crews removed the grease using a vactor truck, and BMPs to prevent discharge to the creek during the cleanup were implemented. All field screening parameters tested at the site were measured within acceptable ranges.

Site EN02C

Site EN02C is a 39-inch diameter outfall located on the North bank of Encina Creek, underneath the Interstate-5 Freeway overpass (see Appendix A for photo). This site is accessed through the Encinas Wastewater Plant. During the initial visit to the site, a small flow of 1 gpm was measured. The water sampled appeared, clear, colorless and odorless. Similar to previous years, nitrate levels were again measured above the 10.0 mg/L NO_3-N

action level at 40.60 mg/L NO_3-N. All other field parameters tested for, were measured below their respective action levels. During the follow-up visit to the site the following day, a flow of 1 gpm was again observed. Nitrate levels were measured above the action level at 72.30 mg/L NO_3-N. The area surrounding the site has both commercial and industrial land uses, but Site EN02C primarily drains a section of Interstate 5. The results of the upstream investigation for Site EN02C are included in Section 7.

Site EN14A

Site EN14A is a 48-inch diameter RCP outfall located roughly 30 yards West of 1911 Palomar Oaks Way, in the bottom of a canyon (see Appendix A for photo). Historically, samples collected at this site have had low pH readings. During the initial visit to the site, a flow of 2 gpm was sampled. The sample appeared clear, colorless and odorless. The pH was measured at 5.9, below the 6.5 action level. A few plastic bottles and bags were observed around the site, but nothing that appeared it would influence pH readings. None of the other parameters tested for in the field exceeded their respective action levels. During the follow-up visit to the site a flow of 2 gpm was observed, and the pH was recorded at 5.5. Industrial and commercial business parks comprise most of the area around and upstream of the site. The upstream investigation for this site is described in Section 7.

Site EN21

Site EN21 is a manhole that accesses a 36-inch RCP, located on Camino Vida Roble, approximately half-way between Palomar Airport Road and Owens Avenue (see Appendix A for photo). During the initial visit to the site the flow was 2 gpm, and the sample appeared slightly cloudy. The pH was recorded at 6.9, within the accepted action level range for pH measurements. The turbidity of the sample was slightly high and measured at 28.20 NTU. A follow-up visit to the site was conducted the next day. Conditions at the site were similar to the previous day, except the sample collected no longer appeared slightly cloudy. During the follow-up visit, the turbidity was measured at 4.32 NTU. Since no source of the turbid water was observed during the initial inspection and the measured turbidity significantly dropped by the time of the follow-up inspection, the source of the turbid water is most likely transient. The pH of the sample was 6.3, just below the 6.5 action level. Since pH values are typically within the accepted action level range at this site, including the measurement during the initial site visit, the low pH measured during the follow-up was likely transient. No further upstream investigation was conducted for this site.

Site EN23

Site EN23 is a 24-inch RCP outlet located in the Northwest corner of the Yarrow Drive and Camino Vida Roble intersection. During the initial site visit, bubbles and foam were observed floating on top of the water, and the site smelled of rotten eggs. A sample was collected from the slow flowing water (less than 1 gpm). The sample collected was slightly cloudy and milky in appearance. No discernable odor could be detected from the water, indicating that the conditions present around Site EN23 were responsible for the smell of rotten eggs. A low pH of 4.9 measured from the sample, which is below the 6.5 action level. The turbidity of the sample was measured at 47.87 NTU, warranting further investigation. All other field parameters tested were measured below their respective action levels. During the follow-up visit another low pH reading of 5.9 was measured. The

turbidity of the sample was still high, measured at 36.51 NTU. The conditions present at the site were similar to the initial site visit. The site itself still smelled of rotten eggs and the sampled water appeared slightly cloudy and milky. The area upstream of the site is has both commercial and industrial land uses. It is possible that seepage water from this area is responsible for the low pH measured at this site. The upstream investigation conducted for Site EN23 is described in detail in Section 7.

7.0 FOLLOW UP INVESTIGATIONS

7.1 Purpose

The purpose of the follow-up investigations is to find the source of the pollutants that were identified during initial field screening and laboratory testing.

The field screening program performed in July 2007 found action level exceedances for surfactants at one site, nitrate at three sites, orthophosphate phosphorus at one site, and pH at three sites. In the best professional judgment of the field crew, turbidity levels at five sites were also unusually high and warranted follow-up visits within 24 hours of the initial visit. At sites where field screening parameters were measured above their respective action levels during both visits, upstream investigations were conducted. Upstream investigations are also conducted immediately if pollutant levels are well above the established action levels during the first visit.

Samples were collected for laboratory analysis at 15 sites during the initial round of field screening. Complete results of these analyses indicated bacteria action level exceedances at four sites. Follow-up investigations were conducted at each of these four sites to identify the source(s) of the high bacteria counts. The results of source investigations are detailed below.

7.2 Investigation Procedure

Follow-up investigations were conducted in two rounds. The first follow-up investigations were for the sites at which field tests indicated action level exceedances. These investigations were conducted immediately after confirming the elevated concentrations via additional field testing. The second round of follow-up investigations was carried out for the sites at which laboratory testing had found elevated constituent levels. These investigations were conducted after receiving the test results from the laboratory(s).

During the investigations flow rates were measured, visual observations were performed, and field testing was conducted. Visual observations, such as water color, clarity, odor, floatable materials, vegetation and biology, and physical parameters, such as temperature, pH, and conductivity, were recorded on field data sheets at each dry weather monitoring sampling site. Observations and data for locations upstream of the sites were recorded in the field crew's log notebooks. Field data sheets are included in Appendix C.

Source identification investigations began by testing the water at the site itself; then gradually worked upstream until potential pollutant sources could be identified. If follow-up testing at a site resulted in constituent concentrations below specified action levels, it was concluded that the pollution found during the initial field screening and laboratory analysis phase was due to a transient flow. If follow-up testing at a site found constituent concentrations again above the specified action levels, an upstream investigation was conducted.

Upstream investigations were conducted by checking a number of upstream branches for any potential sources of the constituent of concern. The estimated flow rate in each branch and any relevant observations were recorded in the field crew's notebook. At key upstream

locations in the MS4 samples were taken for field or laboratory analysis, depending on the type of investigation. With this information the field crew was able to identify the sources or areas likely to contribute the particular constituent of concern.

7.3 Investigated Sites

Site AH04

The surfactant concentration of the sample collected from this site was measured greater than 3.0 mg/L MBAS. The water sampled was ponded, with a reddish color and bubbles on the surface. Since the surfactant concentration was measured above the action level of 1.0 mg/L MBAS, an immediate upstream investigation was conducted to determine the source of the surfactants.

Site AH04 is located near an outlet leading into the concrete channel. Upstream of the outlet is a grated catch basin that drains the runoff from behind the 5600 Avenida Encinas flower shops. No flow was observed entering the catch basin, but the field crew was able to collect a small sample of ponded water from within the catch basin. The sample collected also had a surfactant concentration greater than 3.0 mg/L MBAS. The only conveyance line leading to the catch basin is one above ground concrete swale that drains the surrounding lot. Both the swale and surrounding pavement were dry during the initial visit.

A follow-up visit was conducted for Site AH04 the next day. This time the field crew observed a small flow (less than 1 gpm) of water discharging into the concrete channel from the outfall. Again, the water appeared to have a reddish color and bubbles were observed on top of the water. The surfactant concentration measured during the follow-up was at 2.0 mg/L MBAS, still above the action level. Upstream of the site, evidence of washing or dumping activities was observed near the catch basin behind 5600 Avenida Encinas (see Photo 7-1). The source of the water appeared to originate from nearby the trucks in the loading zone behind the flower shops. Farther upstream the concrete swale was dry, the only source of the water appeared to be from the loading dock. Nearby the trucks and loading zone, red colored plants and organic debris were observed. Inside the loading dock red stains (likely dye used to color the plants) were observed on the floor and on some of the employees clothing. The field crew contacted some of the employees in an attempt to determine what party was responsible for the washing activities. Employees were able to confirm that the source of the water was from outdoor washing activities, but it was unclear who was responsible for the washing.

Photo 7-1 Evidence of uncontained washing activities discharging into catch basin upstream of Site AH04

In conclusion, the source of the surfactants at Site AH04 may be from uncontained washing occurring behind the 5600 Avenida Encinas flower shops. The red dye observed on the ground around the loading docks explains the reddish tint in the water.

Sites AH10 and AH13

Site AH13 is located upstream of AH10. Because some of the same sources drain to these two sites, the upstream investigations for these two sites are discussed jointly to avoid

repetition. Due to the high turbidity (28.70 NTU) and nitrate concentration (32.1 mg/L NO_3-N) measured during the initial visit to Site AH10, a follow-up visit to the site was needed. Nitrate concentrations measured at this site and some of the upstream sites have historically been measured above the action level of 10 mg/L. Site AH13 is located upstream of Site AH10, and also had a nitrate concentration exceeding the action level at a concentration of 48.6 mg/L. Nitrate has been measured in excess of the action level at these sites every year since 2002, when nitrate testing was added to the City's Dry weather Monitoring Program. The area upstream of the site has both agricultural and commercial land uses. The source of the nitrate has typically been attributed to seepage water originating upstream of the Carlsbad Premium Outlets.

During the follow-up visit to Site AH10, turbidity was measured at 9.67 NTU. Since the turbidity had significantly dropped between the two visits, it was assumed that the source of the turbid water as transient and therefore no upstream investigation for the source of the turbidity was needed. The nitrate concentration measured during the follow-up visit to Site AH10 was 26.7 mg/L NO_3-N, still well above the action level. The main source of flow to Site AH10 is from the earthen channel running from East to West, originating from East of I-5. The lines from sites AH11, AH12 and AH13 all lead to the earthen channel. A second line is also connected to Site AH10. A concrete channel running from South to North parallel to the railroad tracks also connects to the earthen channel just upstream of Site AH10. During both the initial and follow-up investigations of this site, the water in the concrete channel (from Site AH04) did not reach Site AH10. Similar to previous years, this indicates that the source of the nitrate measured at Site AH10 likely originates upstream of the earthen channel.

During the follow-up visit to Site AH13, the nitrate concentration was measured above the action level at 30.7 mg/L. A flow of 9 gpm was observed, and the sample appeared clear and colorless. Sites AH11 and AH12 are also upstream of Site AH10, but nitrate concentrations at each of those sites were below the action level. This indicates that the elevated nitrate levels at Site AH10 originate from the line upstream of Site AH13.

An upstream investigation was performed to identify the source of nitrates to sites AH10 and AH13. The field crew followed the line draining to Site AH13 to a catch basin (AH13-1) in the Western parking lot of the Carlsbad Premium Outlets, East of Paseo Del Norte. A flow rate of 9 gpm, similar to Site AH13, was observed. The sample collected from the catch basin had a nitrate concentration of 34.4 mg/L. The field crew continued to follow this line farther upstream to another catch basin located behind the Carlsbad Premium Outlets, just below the Carlsbad flower fields. Historical data shows that high levels of nitrates have been measured at this catch basin during previous upstream investigations.

The catch basin behind the Carlsbad Premium Outlets was sampled twice, on separate visits as part of the upstream investigations for Site AH10 and for Site AH13. The first sample was part of the upstream investigation for Site AH10 (AH10-2). A flow of approximately 10 gpm was observed, and the nitrate concentration was measured at 37.0 mg/L. The second time the catch basin was sampled (AH13-2) a similar flow of 10 gpm was observed, and the nitrate concentration was 42.7 mg/L.

Based on past observations and the City's MS4 map, it appears that the storm drain line starts at this boundary and that there are no upstream connections or lines. Flow can be observed in the conveyance in this area, and the most likely source is seepage from the agricultural area upstream of the mall. As described above, the seepage water contains

high levels of nitrate, which is likely from fertilization practices at the flower fields and historical agricultural use in the area. No surface runoff was observed entering the MS4 during the upstream investigation; therefore it seems that all flows are from sub-surface water seeping into the system. Eventually the water from Site AH13 flows North along the concrete channel that runs parallel to I-5 and discharges to the earthen channel that leads to Site AH10.

TABLE 7-1 SITES AH10 AND AH13 UPSTREAM INVESTIGATION LOCATIONS

ID	Location
AH10	West of Avenida Encinas, near Manzano/El Arbol intersection, near railroad tracks.
AH13	Concrete channel West of Paseo del Norte, approximately 250 feet North of Peas Soup Andersons.
AH13-1	Catch basin located in the Western parking lot of the Carlsbad Premium Outlets, East of Paseo del Norte.
AH10-2	Catch basin in back of the Carlsbad Premium Outlets, just below the flower fields
AH13-2	Catch basin in back of the Carlsbad Premium Outlets, just below the flower fields

FIGURE 7-1 SITES AH10 AND AH13 UPSTREAM INVESTIGATION

Base Data Sources: USGS, SanGIS, SANDAG, City of Carlsbad

Site AH65

The orthophosphate-P concentration of the sample collected from this site was measured above the 2.0 mg/L action level, at 2.02 mg/L PO_4-P. During the initial visit to the site, two individuals were observed spraying sections of the landscaping located upstream of the site. When questioned, the individuals reported to the field crew that they were spraying fertilizer for the plants. The bag of fertilizer the individuals were using indicated that the fertilizer was 15 percent phosphorus. When the field crew returned to the site the following day, individuals were no longer observed spraying. The orthophosphate-P concentration was 1.01 mg/L PO_4-P when the site was re-sampled. A slight increase in flow rate from 2 gpm to 3 gpm was noted between the initial and follow-up visits. It is likely that irrigation water from the surrounding residential area transported phosphorus from the fertilizer downstream to Site AH65, resulting in the high orthophosphate-P measurement. In conclusion, the slightly elevated orthophosphate-P concentration was the result of upstream fertilizer use transported to the site by irrigation runoff.

Site BA06

Laboratory analysis of the sample collected from this site indicated both total coliform bacteria counts and *Enterococcus* bacteria counts were above their respective action levels. Total coliform bacteria were measured at 55,400 CFU/100 mL, above the 50,000 CFU/100 mL action level. *Enterococcus* was reported at 82,800 CFU/100 mL, above the 10,000 CFU/100 mL action level. Leaves and organic debris, along with a flow of 2 gpm were observed inside the manhole. A follow-up sample was collected from the site on July 16, 2007. Laboratory analysis of the sample indicated the total coliform count had dropped to 26,800 CFU/100 mL. The *Enterococcus* count also dropped to 19,600 CFU/100 mL, but was still above the action level.

Directly upstream of Site BA06 is Site BA04. There are no known or observed lateral connections between sites BA06 and BA04. The field crew followed the line up to Site BA04 (BA06-1) to conduct an upstream investigation for the source of bacteria. Both trash and organic debris were observed inside the manhole. Grass clippings, leaves and algae were all noted in the gutters leading up to the curb inlet above Site BA04. A small trickle of water was also observed in several of the upstream gutters. The field crew then followed the line upstream to another manhole located at the intersection of Rosemary Avenue and Snapdragon Drive (BA06-2). The flow inside the manhole was slightly less than that observed downstream at Site BA04. Again grass clippings, leaves and algae were all noted in the gutters upstream of the site. A small amount of water from irrigation was also observed along many of the upstream gutters. The growth of algae indicates that water and nutrients are typically present in the gutters around this residential area. Upstream investigations conducted in previous years have indicated irrigation water combined with the decaying organic debris within the gutters and manholes is the most likely source of total coliform bacteria to Site BA06. No sources that would directly contribute to the elevated *Enterococcus* bacteria levels measured at Site BA06 were observed during the upstream investigation for the site.

BA06-2	Manhole located at the intersection of Rosemary Avenue and Snapdragon Drive

Site BA13

During the initial visit to the site, the water sampled appeared slightly cloudy and yellow and the turbidity was measured at 30.97 NTU. Since the turbidity measurement was unusually high for this site, an immediate upstream investigation was conducted. The field crew witnessed construction of a driveway occurring upstream to the site outside of a house on Lotus Court. Nearby the house where the construction was observed, sits a curb inlet which drains to Site BA13. Some of the pavement around the driveway and curb inlet appeared damp, but no actual runoff was observed. During the second visit of the site the following day, the water appeared clear. When tested, the turbidity was measured to be 12.07 NTU. The field crew then traveled upstream to the house where the construction had been witnessed the previous day. The driveway and the pavement around the curb inlet appeared dry. It appeared that the responsible party was no longer working on driveway, but rather were constructing a small wooden fence for the yard. The source of the turbid water at Site BA13 is most likely transient, originating from construction of the driveway witnessed on Lotus Court. The City was also notified regarding this exceedance, and the City provided educational information to the homeowner.

Site BA13 is also one of the several sites selected for laboratory sampling and analysis. The results from the initial round of sampling indicated total coliform bacteria count was 56,000 CFU/100 mL, above the 50,000 CFU/100 mL action level. Since the lab results were not available by the time the field crew conducted the follow-up investigation for elevated turbidity, the field crew had to come back for a second follow-up visit to Site BA13. The results of the follow-up samples collected indicated that both total coliform bacteria counts and *Enterococcus* bacteria counts were above their respective action levels. Total coliform was 151,000 CFU/100 mL and *Enterococcus* was 22,050 CFU/100 mL, above the 10,000 CFU/100 mL action level. After collecting the follow-up sample for Site BA13, the field crew began to conduct an upstream investigation in order to determine the most likely source of bacteria to the system.

Site BA13 receives flow from two lines, one originating from the North and one originating from the West. The Western line was investigated first. Following the line West along Arenal Drive, the field crew stopped at a catch basin at the end of Columbine Drive (BA13-1). Only a very small volume of ponded water was observed inside the catch basin. Farther upstream along the Western line, a manhole located at the Southern end of Mimosa Drive (BA13-2) was checked. No water was observed inside the manhole. Since only a small volume of ponded water was observed along the Western line, it is unlikely that the source of bacteria at Site BA13 originated from the Western line.

Along the Northern line the manhole located on Lotus Court (BA13-3), nearby the location of the residential construction was investigated first. A flow of 5 gpm was observed inside the manhole, the same flow rate observed at Site BA13. The investigation conducted farther North to the intersection of Manzanita Street and Aviara Parkway, where two lateral lines connect to the system. Both the Eastern (BA13-6) and Western (BA13-5) laterals were observed to be dry along Aviara Parkway. The main line (BA13-4) was traced farther North to a manhole located outside of the Carlsbad City Library, within the Plaza Paseo Real commercial complex (BA13-7). Again a flow of 5 gpm was measured coming from the Northern line. The Northern line was then checked at a manhole on Dove Lane, just North of the library. This line receives flow from two lines, one from the channel in the open to the North (BA13-8) and one from the residential area on the hill to the Northwest (BA13-9).

Flow was observed in both lines, a majority of it from the Northwestern line (about 4 of the combined 5 gpm).

Photo 7-2 Trash observed in the concrete channel, North of Dove Lane.

The flow observed in the Northwestern line originates from the hill to the West of the library and from runoff farther to the Northwest along Dove Lane. The area upstream of the Northwestern line is primarily residential. No potential sources that would significantly contribute to the elevated total coliform or *Enterococcus* bacteria measured at Site BA13 were observed in this residential area during the upstream investigation. As mentioned earlier, the manhole checked on Dove Lane also received flow from the open area and channel to the North. A flow of approximately 1 gpm was observed coming from the open area and detention basin to the North. On the other side of Dove Lane trash could be observed in the concrete channel that drains this open area. The water in the channel appeared slightly brown and orange in color. The trash observed included food wrappers, plastic bottles, and glass bottles. Since the trash was in direct contact with the water (see Photo 7-2) it seems likely that the channel and surrounding open area could be a contributing source of bacteria to the system. Our understanding is that City investigations related to bacteria at Site BA13 identified this area as the main source of bacteria to Site BA13. D-MAX did not take any upstream bacteria samples during its investigation due to the City's ongoing parallel investigation of the area. Follow-up recommendations for this site are discussed in Section 8 of this report.

7-3 SITE BA13 UPSTREAM INVESTIGATION

Base Data Sources: USGS, SanGIS, SANDAG, City of Carlsbad

Site BA40

The area immediately surrounding the site was under construction during both visits to the site. Algae and some trash were observed at the site and a flow of 20 gpm was sampled. Laboratory analysis of the sample collected from Site BA40 indicated that fecal coliform bacteria counts were 22,700 CFU/100 mL, above the action level of 20,000 CFU/100 mL. The field crew returned to the site for a follow-up visit and to collect a second set of samples for bacterial analysis. Similar conditions were noted around the site and a flow of 31 gpm was sampled. The results from the second set of sampling showed that the fecal coliform count decreased to 8,250 CFU/100 mL by the time of the follow-up visit. After collecting samples during the follow-up visit to the site, an upstream investigation was conducted to identify any potential sources of bacteria.

Although the source of bacteria in this sampling period may have been transient, elevated levels of bacteria have been measured at Site BA40 in the past. The site primarily drains the commercial and residential area to the North of the outlet; however Site BA40 is also influenced by any runoff from the surrounding construction site as well. The main conveyance line discharging to the site originates along Melrose Drive, approximately 200 yards North of the Alga Road and Melrose Drive intersection. Typically only a small volume of flow, if any, can be observed at the beginning of the line. Similar circumstances were again observed upstream along the main line (BA40-1). During the upstream investigation the majority of the water in the system was observed to be originating from the residential area to the West of Melrose Drive and South of Alga Road. Runoff from this area drains to the main line just West of Melrose Drive, between 6840 and 6842 Via Verano (BA40-2). Irrigation runoff appeared to be the primary source of the water from this residential area. Leaves, algae, and other organic material were noted at several points in the storm drain system upstream of Site BA40, but no direct sources of fecal matter were noted. Since no sources that would directly contribute fecal coliform bacteria were noted upstream, and the fecal coliform count was below the action level when re-sampled, it seems most likely that the elevated fecal coliform bacteria at Site BA40 were transient

FIGURE 7-4 SITE BA40 UPSTREAM INVESTIGATION

Site BA47

Inside the manhole at this site, is a junction box that drains three main lines, one from the Southwest, one from the West, and one from the Northwest. The line from the Northwest is actually comprised of two lines, one of which is an eight inch, perforated, PVC pipe. During the initial investigation the line from the Southwest was observed to be dry, a flow of roughly 1 gpm was observed coming from the PVC pipe of the combined Northwest line, and a majority of the flow (~ 10 gpm) was observed coming from the Western line. A sample was collected from the combined flow as it was exiting the junction box. The pH was measured to be 6.2, below the action level of 6.5. In the past the pH has been measured below the action level for this site.

Photo 7-3 Excess irrigation water running downstream to Site BA47

A follow-up investigation was conducted the next day. This time a combined flow of 15 gpm was observed inside the manhole. A pH of 6.5 was measured from the sample. Previous years investigations have indicated that flow from the small PVC pipe is the source of low pH. To confirm this, the field crew took samples from each of the lines. No flow was observed entering from the Southwestern line. The main line from the West had a flow rate of 10 gpm with a pH of 7.7. Unlike the initial visit to the site, a combined flow of approximately 4 gpm was observed coming from the Northwestern line. A sample of the combined flow from the Western line had a pH of 5.7. The field crew continued to investigate upstream in order to determine the source of the increased flow observed coming form the Northwestern line. Almost immediately the field crew observed irrigation runoff from some of the upstream residences on Camino Alvaro running in the gutters and entering an upstream catch basin (see Photo 7-3). As concluded in previous years, the small PVC pipe from the Northwest is likely the source of low pH. Irrigation runoff from the upstream residences likely combined in the Northwestern line with the low pH water from the PVC pipe, resulting in the slightly higher pH reading recorded during the follow-up visit to the site.

Site BV02

Site BV02 tested above the action level for both total coliform and *Enterococcus* bacteria counts during the initial round of sampling. Total coliform bacteria was measured at 66,000 CFU/100 mL, above the 50,000 CFU/100 mL action level. *Enterococcus* bacteria was measured at 12,550 CFU/100 mL, above the 10,000 CFU/100 mL action level. An initial flow of 3 gpm was measured at the site. Sleeping bags and clothing were observed nearby the site, indicating human inhabitation of the site (see Photo 7-4). During the follow-up visit the condition appeared the same. Clothes and sleeping bags were still present and trash could be observed in the water and around the site. A flow of 2 gpm was measured at the site. Samples were again collected and sent to the laboratory for bacterial analysis. The results indicated that both total coliform and *Enterococcus* bacteria

Photo 7-4 Evidence of human inhabitation, nearby Site BV02

were below their respective action levels. The total coliform bacteria count was 31,500 CFU/100 mL, and the *Enterococcus* count was 6,350 CFU/100 mL.

After collecting the follow-up samples, an immediate upstream investigation began in order to identify possible sources contributing bacteria to Site BV02. There are two main lines that contribute flow to Site BV02, one line from Laguna Drive to the East, and one from State Street to the South. Along the Eastern line, the field crew checked a manhole (BV02-1) on Laguna Drive approximately 100 feet West of Madison Street. A flow of less than 1 gpm was observed. The inside of the manhole was clean; no trash or decomposing material was observed. The line originating from the South of the site was checked at two different upstream locations. Site BV15 (BV02-2) on State Street was observed to be dry. A manhole in the cul-de-sac directly behind 2551 State Street (BV02-3) was also checked. A flow of 1 gpm was observed. The area inside the manhole appeared clean and free of trash and debris as well. In conclusion, the bacteria levels present during the initial round of sampling appeared to be transient and a result of human inhabitation of the site. It did not appear that the conditions observed upstream of the site would contribute a significant amount of bacteria to the storm drain system.

FIGURE 7-5 SITE BV02 UPSTREAM INVESTIGATION

Site EN02C

Field screening tests performed during the initial visit to the site measured elevated nitrate levels in the sample collected. The nitrate nitrogen concentration was measured at 40.6 mg/L, above the action level of 10.0 mg/L. The sample collected during the follow-up visit had a nitrate concentration of 72.3 mg/L. A flow rate of 1 gpm was noted during both visits

to the site. Nitrate has been measured above the action level at this site in the past. The available GIS layer of the City's storm drain system shows only one underground line draining to Site EN02C; that line is located within the center divider along I-5, with no known major lateral connections, but several minor connections and surface drainage points. Previous upstream investigations have noted that fertilization of the landscaping along I-5 should be investigated as a possible source of the nitrate. However, investigations conducted by the City in 2005 and 2006 concluded that CalTrans median landscape maintenance practices were not the source of the nitrate measured at Site EN02C. No previously unknown laterals connecting to the line for Site EN02C were identified in 2007. Based on the results of investigations in 2007 and previous years, the most likely source of the elevated nitrate levels measured at Site EN02C is groundwater seepage into the main conveyance pipe upstream of the site. Since 2002, when conductivity measurements were first taken as part of the Dry Weather Monitoring Program, the conductivity values at EN02C have been within the range of about 4.0 to 6.0 mS/cm. These relatively high conductivity values are more characteristic of groundwater than typical surface water. A review of aerial photographs, topography, and hydrologic maps indicates that groundwater generally migrates to the Southwest in this area, supporting the idea of groundwater influence at the site. Recommendations for this site are listed in Section 8.

Site EN14A

During both the initial and follow-up visits to the site pH was measured at 5.9 and 5.5 respectively; both readings are below the action level of 6.5. During both visits a clear, colorless, odorless flow of 2 gpm was observed. All other constituents were below action levels. Low pH values have been recorded at this site every year since 1995. Upstream investigations conducted previous years have been unable to identify any above ground sources responsible for the low pH. Historically the low pH has been attributed to groundwater seepage somewhere along the line between sites EN14 and EN14A. Site EN14 is located upstream of Site EN14A, and the pH values measured at Site EN14 have typically been within acceptable dry weather monitoring action levels. This year the pH measured at Site EN14 was 7.8. No overland runoff or illicit connections were observed between sites EN14 and EN14A during the upstream investigation. It appears that groundwater seepage between sites EN14 and EN14A is responsible for the low pH measured at Site EN14A.

Site EN23

Low pH readings of 4.9 and 5.9 were recorded during the initial and follow-up visits, respectively. Turbidity measurements were also unusually high, 47.87 NTU during the initial visit and 36.51 during the follow-up visit. During both visits, the site smelled of rotten eggs, and the samples collected appeared slightly cloudy and milky in appearance. The milky appearance of the water does not appear consistent with samples of turbid water from erosion or sediment pollution.

After confirming the low pH reading and high turbidity readings at the site, the field crew traced the line upstream to a manhole located in front of 6211 Yarrow Drive. Inside the manhole are two lines of potential flow, a main line coming from the North and two small PVC pipes connected to a French drain at 6211 Yarrow Drive. No flow was observed coming from the PVC pipes, but a sample was collected from the flow of the mainline. The pH was 4.5 and the turbidity was 25.15 NTU. The line was followed farther upstream to a

manhole located at the Carlsbad Executive Plaza, West of 6150 Yarrow Drive. The pH of this sample was 7.5, with a turbidity of 1.16 NTU.

There are no known connections between the manhole measuring a pH of 4.5 and the manhole measuring a pH of 7.5. No discharges were observed entering the line between Site EN23 and the upstream locations either. This seems to indicate that the source of the low pH water is likely groundwater seepage somewhere along the line between the two upstream manholes. The source of the elevated turbidity is uncertain. As mentioned earlier, the milky appearance of the samples do not appear consistent with samples of turbid water caused by erosion and sedimentation. The milky appearance of the water has been observed at this site in the past, but not consistently. One hypothesis for the cause of the milky appearance is that the low pH of the water kills any bacteria or microorganisms present in the water. If there had been enough bacteria initially present in the water, the dead cells may give the sample a slightly cloudy milky appearance, which would then explain the elevated turbidity. Recommendations for this site are listed in Section 8.

8.0 SUMMARY AND RECOMMENDATIONS

8.1.1 Summary of Field Screening and Laboratory Analysis Data

Sixty primary monitoring locations were visited during the 2007 dry weather program. Because Site BV15 was dry, the alternate Site BV08 was selected to replace it. A total of 15 sites were sampled for laboratory analyses. During field screening and lab sampling, 14 sites had at least one parameter test above its corresponding action level. Table 8.1 provides a summary of sites exceeding the action level for a particular analyte.

TABLE 8-1
SUMMARY OF ACTION LEVEL EXCEEDANCES

Field Screening (60 Samples)			
Analyte	**Number of Exceedances**	**Percentage of Sites with Exceedance**	**Site(s) Exceeding Action Level**
pH	3	5%	BA47, EN14A, EN23
Conductivity	0	0%	None
Turbidity	5	8%	AH10, BA13, BA36, EN21, EN23
Surfactants (Field Test)	1	2%	AH04
Ammonia Nitrogen	0	0%	None
Nitrate Nitrogen	3	5%	AH10, AH13, EN02C
Orthophosphate Phosphorus	1	2%	AH65
Laboratory Analyses (15 Samples)			
Analyte	**Number of Exceedances**	**Percentage of Sites with Exceedance**	**Site(s) Exceeding Action Level**
Surfactants (Laboratory)	0	0%	None
Oil & Grease	0	0%	None
Cadmium	0	0%	None
Copper	0	0%	None
Lead	0	0%	None
Zinc	0	0%	None
Diazinon	0	0%	None
Chlorpyrifos	0	0%	None
Total Coliform	3	20%	BA06, BA13, BV02
Fecal Coliform	1	7%	BA40
Enterococcus	2	13%	BA06, BV02

Note: Table incorporates the results from the initial site visits only.

Most sites had flowing water, with the flow rates ranging from less than 1 gpm to 299 gpm. Trash was observed at 18 of the 60 sites were samples were collected. Items included plastic, glass, aluminum cans, Styrofoam, and paper containers. Bubbles were observed at

a total of eight sites, and foam was observed at four sites. Algae was observed at 29 of the sites that receive sunlight. Other organisms such as snails, insects and larvae, fish, and/or crawfish were present at most of the sites. Sediments were deposited at all but nine of the sites visited.

8.1.2 Summary of Upstream Investigation Data

The table on the following page presents the conclusions based on the results of the upstream investigations conducted at 12 sites for the 2007 Dry Weather Monitoring Program.

TABLE 8-2
SUMMARY OF UPSTREAM INVESTIGATIONS

Site	Upstream Investigation Target Constituent(s)		Results/Likely Source
	Field	Laboratory	
AH04	Surfactants		Upstream washing activities originating from behind 5600 Avenida Encinas.
AH10	Nitrate		Nitrate may originate from ground water seepage from the East.
AH13	Nitrate		Nitrate may originate from ground water seepage from the East.
AH65	Orthophosphate-P		Observed application of fertilizer upstream from site. Phosphorus used in the fertilizer is likely transported to the site via irrigation runoff.
BA06		Total Coliform, *Enterococcus*	No direct sources of *Enterococcus* were observed. Total coliforms were measured below the action level when resampled. Decomposition of organic debris is a possible source of total coliform bacteria.
BA13		Total Coliform	Total coliform was likely from decomposing organic material and trash noted in the open area North of Dove Lane.
BA40		Fecal Coliform	No direct sources of fecal coliform were observed upstream of the site. Fecal coliform dropped below the action level when resampled.
BA47	pH		Irrigation leach line from upstream residential area. Low pH readings have been measured in this line in the past.
BV02		Total Coliform, *Enterococcus*	Human inhabitation of the site along with trash and the influence of transient communities.
EN02C	Nitrate		Nitrate may originate from ground water seepage.
EN14A	pH		Seepage water with low pH.
EN23	pH, Turbidity		Seepage water with low pH. Turbidity may result from impacts of low pH on microorganisms in the water.

8.2 Recommendations

Based on the results of the year 2007 Dry Weather Field Screening Program for the City of Carlsbad, the following actions are recommended for consideration.

8.2.1 Education

- Provide educational material regarding vehicle washing BMPs and regulations as they pertain to industrial and commercial businesses to the responsible parties for the businesses located in the building at 5600 Avenida Encinas.

- Provide educational materials regarding BMPs for fertilizer use and minimizing irrigation runoff for the residential area upstream of Site AH65. Also distribute to the landscape management company responsible for the landscaping between Victoria Avenue and Auburn Avenue.

- Consider providing education regarding proper disposal of pet waste to residents in the vicinity of Site BA36, located along the Southern boundary of the La Costa golf course near Gibraltar Street.

8.2.2 Inspection and Maintenance

- As a proactive measure, consider cleaning out the storm drain system upstream of Site BA06. No clear source of bacteria was observed during the upstream investigation, but it is possible that material accumulated in the conveyances upstream of the site could be contributing to the high counts recorded.

- Remove trash and other anthropogenic debris from site BV02 on a regular basis.

- Remove trash and debris from the area around the channel North of Dove Lane. Trash and waste in the open upstream area are likely sources of the bacteria measured at Site BA13. Investigations the City conducted in response to recommendations in last year's dry weather report identified this area as the main source of bacteria to Site BA13.

- Clean out the conveyance lines in the immediate vicinity (just upstream and downstream) of the Site BA13 to ensure proper drainage to Site BA13, especially the manhole directly upstream on Arenal Road.

- Remove trash accumulating around Site AH03. Also remove trash as needed from the other sites at which trash was observed; Table 4-1 lists those sites.

- To the extent allowable, consider clearing out vegetation downstream of Site AH11 to allow proper drainage.

- Conduct inspections and/or education in the commercial complex upstream of Site BV08 to promote proper washing and grease disposal practices.

- Remove Site BA04 from the primary site list and replace it with another site in the Batiquitos Basin. This site is located in close proximity to Site BA06 and does not provide substantially different data. As part of its JURMP update, the City may also

consider adding sites in areas of the City that have been developed since the dry weather monitoring locations were selected as part of the preparation of the original JURMP.

8.2.3 Further Investigation

- Contact the company responsible for the maintenance practices of the flower fields East of the Carlsbad Premium Outlets. Work with the company to minimize irrigation runoff and any potential nitrates transported into the groundwater.

- Conduct further investigation as to the source of *Enterococcus* bacteria measured at Site BA06. No sources that would directly contribute *Enterococcus* bacteria were observed during the upstream investigation of the site.

- Conduct further investigation as to the source of bacteria measured at Site BA13. Previous investigations have identified the area North of Dove Lane as the most likely source of bacteria to Site BA13, and along the upstream branch Northwest of the Carlsbad City Library at the intersection of Dove Lane and Moorhen Place. It is unclear in which of the two lines the source of bacteria originates.

- Determine the responsible party for cleanup of accumulated pet waste in the open area close to Site BA36. The responsible party should be directed to clean up the pet waste and encouraged to consider having a sign stating that improper pet waste disposal is prohibited, a pet waste bag dispenser, or other similar measures installed in the area.

- Consider further analysis of the conditions that lead to low pH in water from the irrigation leach line at Site BA47.

- Consider further investigation to eliminate the possibility of an illicit connection to the storm drain system upstream of Site EN02C.

- Continue working with commercial sources upstream of EN02C on pollution prevention and over irrigation.

- Consider further investigation as to the source of the low pH measured at Site EN14A. It is likely that the source of the water originates somewhere along the line between Sites EN14 and EN14A.

- Consider further investigation as to the source of the low pH measured at Site EN23 and the cause of the milky appearance or turbid water intermittently observed at the site.

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

Bacterial Analysis Using Multiple Tube Fermentation/MPN

Methods: SM 9221B & E and SM 9230B

Microorganisms Tested: Total/Fecal Coliforms and Enterococci

Bacterial Summary

Coliform analyses based on dilutions providing results between 20-1,600,000 MPN/100mL
Analyses for Enterococci are based on dilutions providing results between 20-160,000 MPN/100mL

Re: Dry Weather Monitoring, September 6, 2007

Dear Paul:

Enclosed, please find the completed report for total and fecal coliform and enterococcus testing performed on 1 sample dated September 6, 2007.

All testing was performed consistent with our internal SOP's, laboratory's quality assurance program and ELAP Certification. The sample met the quality control criteria specified in the above.

If you have any questions please feel free to call me at (760) 795-6915, or e-mail me at Anthony.Trinh@westonsolutions.com. Thank you for using the bacterial testing services of Weston Solutions, Inc.

Sincerely,

Anthony Trinh
Microbiology Lab Supervisor

Re: 2008 Dry Weather Field Screening and Analytical Monitoring Program City of Carlsbad

Dear Ms. Lukey:

Per your request D-MAX Engineering, Inc (D-MAX) conducted the routine phase of the Dry Weather Field Screening and Analytical Monitoring Program for the City of Carlsbad prior to September 30, 2008. Subsequently, we conducted follow-up investigations to identify the sources of pollutants detected during the monitoring program.

This report presents the results of the monitoring program and follow-up investigations. The contents include field screening data and analytical laboratory test results, analyses of collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations and our recommendations for additional actions.

Review comments from the draft report submitted to the City have been incorporated into this final report. It has been our pleasure working with the City of Carlsbad on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.
Project Manager

1.0 INTRODUCTION

1.1 Regulatory Requirements

In accordance with San Diego Regional Water Quality Control Board (RWQCB) Municipal Storm Water Permit Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of Carlsbad, is required to annually perform dry weather field screening of discharges into its storm drain system. This procedure is comprised of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season, May 1 through September 30. The Municipal Permit also necessitates that Copermittees conduct laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station should be visited. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. A detailed trash assessment component is also now required by the Municipal Permit.

1.2 Program Overview

The purpose of the Dry Weather Monitoring Program is to detect and eliminate illicit connections and illicit discharges (IC/ID) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following three components:

- Field screening observations
- Field screening analytical monitoring
- Laboratory analytical monitoring

The data gathered from dry weather monitoring is used to characterize discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. As needed, follow-up studies and source investigations are conducted to detect and eliminate the sources of these pollutants.

1.3 Previous Work

The City of Carlsbad (City) has conducted dry weather monitoring programs since 1995. The results of the previous programs are summarized in Table 1-1.

TABLE 1-1
SUMMARY OF HISTORICAL DRY WEATHER SITES

Year	Number of Sites Screened [1]	Number of Flowing Sites	Number of Ponded Sites	Number of Dry Sites	Number of Lab Analysis Sites [2]
1995	49	33	16	14	---
1996	65	47	18	9	---
1997	62	42	20	13	---
1998	52	36	16	2	---
1999	65	40	25	14	---
2000	52	43	9	9	---

Year	Number of Sites Screened [1]	Number of Flowing Sites	Number of Ponded Sites	Number of Dry Sites	Number of Lab Analysis Sites [2]
2001	58	52	6	6	---
2002	59	48	11	1	15
2003	60	54	6	1	15
2004	60	52	8	1	15
2005	60	55	5	1	15
2006	60	54	6	1	15
2007	60	54	6	1	15

Notes:
[1] Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site.
[2] Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001.

1.4 Hydrologic Setting

The City of Carlsbad encompasses approximately 42 square miles, constituting about 18% of the Carlsbad Hydrologic Unit (904). The City is naturally divided into five separate sub-watersheds. Land use within each watershed determines the potential for generating both runoff and pollutants into receiving water bodies. The five major receiving water bodies or drainage basins that collect the City's storm water are:

- Buena Vista Creek and Lagoon
- Agua Hedionda Creek and Lagoon
- Encinas Creek
- San Marcos Creek and Batiquitos Lagoon
- Escondido Creek and San Elijo Lagoon

Table 1-2 presents the sub-watersheds within the City of Carlsbad, the respective hydrologic units and receiving water bodies, and the percent of the watershed that is located within the City of Carlsbad's jurisdiction.

TABLE 1-2
CITY OF CARLSBAD SUB-WATERSHEDS

Sub-Watershed	Hydrologic Area	Receiving Water Bodies	% in Carlsbad Jurisdiction
Buena Vista	904.20	Buena Vista Creek and Lagoon	19
Agua Hedionda	904.30	Agua Hedionda Creek and Lagoon	41
Encinas	904.40	Encinas Creek	100
San Marcos Creek	904.50	San Marcos Creek, Batiquitos Lagoon	29
Escondido Creek	904.60	Escondido Creek, San Elijo Lagoon	< 1

The Carlsbad Watershed Urban Runoff Management Program (WURMP) Workgroup has identified constituents of concern (COC) for each sub-watershed. For Agua Hedionda and Escondido Creek, COCs are bacteria/pathogens, nutrients, and sediment. The COC for Buena Vista is bacteria/pathogens, and for San Marcos Creek the COC is nutrients. No COCs were identified for the Encinas hydrologic area.

1.5 Report Outline

Section 1, Introduction, includes regulatory background, a program overview, a discussion of the City of Carlsbad's hydrologic setting and constituents of concern, a summary of historical field screening data, and the report outline.

Section 2, Sampling Locations, describes the field screening sampling locations and site selection criteria.

Section 3, Field and Laboratory Analytical Methods, includes field screening and laboratory analytical procedures, quality assurance protocols, and follow-up action levels.

Section 4, Field Screening Results, presents qualitative observations of the sampling locations and results of the field screening analyses.

Section 5, Laboratory Analytical Results, presents results of the laboratory analyses.

Section 6, Data Analysis, provides an analysis of field and laboratory data collected in 2008, as well as a comparison of past results.

Section 7, Upstream Investigations, details the results of follow-up investigations undertaken to isolate the sources of water contamination detected during the field screening program.

Section 8, Summary and Recommendations, provides a summary of the program results and recommendations for follow-up actions.

Appendix E Trash Assessment

2.0 SAMPLING LOCATIONS

The City has identified 60 primary monitoring stations and 14 alternate stations where data could be collected during the Dry Weather Monitoring Program. Alternate stations are monitored if any of the primary stations do not have ponded or flowing water. Sites are selected to provide coverage of the MS4 taking into account various factors. Some of these factors are previously identified or suspected pollution problems, location in drainage area, hydrologic condition such as the total drainage area of the site, and land use.

For 2008, the City has changed its dry weather monitoring site naming system to match the designations assigned to those locations by City maintenance staff. Site 42C-41 (previously BA04) was also removed from the 2008 dry weather monitoring site list because its location was redundant with Site 42C-92 (previously BA06). Site 42C-41 was replaced by new Site 48C-25 for the 2008 program. Of the 60 primary monitoring stations visited this year, only Site 9B-7 was dry. It was replaced by alternate sampling location 1D-20.

Table 2-1 provides the previous site number, new site number, location, conveyance configuration, primary and secondary land uses, hydrologic subarea, and Global Positioning Satellite (GPS) coordinates of the sampling sites that were visited. Photographs of sampling locations are included in Appendix B. Sites are categorized according to the respective sub-watershed using the following abbreviations: AH = Agua Hedionda Lagoon, BA = Batiquitos Lagoon (San Marcos Creek), BV = Buena Vista Lagoon, and EN = Encinas Creek. As it constitutes only a very small portion of the City with minimal storm drain infrastructure, no sampling sites are present in the Escondido Creek sub-watershed. A complete map of the MS4 system, including sampling locations and drainage basins, is included as Figure A. The City's sub-watersheds are shown in Figure B.

Notes:
* Alternate Site 1D-20 was substituted for dry primary monitoring Site 9B-7.
** Site 42C-41 (previously BA04) was removed from the 2008 dry weather monitoring site list and replaced by new Site 48C-25.

3.0 FIELD AND LABORATORY ANALYTICAL METHODS

3.1 Field Screening Procedures and Methods

Field screening techniques consist of flow measurement, quantitative field analyses of selected water quality parameters, and qualitative field observations. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance are recorded. Specific observations and results of the field water quality analyses are documented on field data sheets, which are included in Appendix D. The data sheets also serve as a record of the field visit and are completed for every site visit regardless of whether or not samples were collected.

For 2008, field data sheets were updated to include three categories of visits. Previously the sheets included check boxes for either routine field screening or follow-up visits. This year there are check boxes for routine field screening, confirmation and IC/ID follow-up visits. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. For the purposes of this report, confirmation and IC/ID follow-up visits are both referred to as "follow-up" visits.

Field screening and analyses were conducted according to the following procedures and methods:

Qualitative Observations

Irrespective of flow, qualitative field observations are made during each site visit. These observations provide a general site assessment and describe factors like water odor, clarity, the presence of floatables, visible deposits or stains, vegetation and biological organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system may also be ascertained through careful field observations. Each field screening location is photographed to provide additional information and documentation of site conditions. Photographs are included in Appendix B.

Flow Measurement

Flow measurements can be utilized to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may indicate an illegal discharge upstream. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

Field Water Quality Analyses

At each site with ponded or flowing water, water samples were collected and analyzed in the field for the following constituents:

- Specific Conductance
- Temperature
- pH
- Turbidity
- Surfactants, measured as methylene blue active substances (MBAS)*
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)
- Orthophosphate-Phosphorus (Orthophosphate-P)

* Surfactants are also referred to as detergents, specifically with respect to discussion of field test kit results.

The methods used to perform the above field analyses, along with the detection limit, range, and accuracy of each method, are listed in Table 3-1.

3.2 Laboratory Analytical Methods

In accordance with Order R9-2007-0001, laboratory samples were collected at 15 sites, representing 25 percent of field screening sites. Samples were submitted to EnviroMatrix Analytical, Inc, a laboratory certified by the California Department of Health Services, for analysis of the following constituents:

- Total hardness
- Oil and grease
- Diazinon
- Chlorpyrifos
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)

Samples for bacteria were submitted to Encina Wastewater Authority Laboratory for analysis of following indicators:

- Total Coliform bacteria
- Fecal Coliform bacteria
- *Enterococcus* bacteria

The methods used to perform each of the above analyses along with method reporting limits and holding times are listed in Table 3-1 and Table 3-2.

3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project includes the United States Environmental Protection Agency (EPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

3.3.1 Field Sampling and Analysis QA/QC

The pH meters are calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter is calibrated and periodically checked for accuracy using standard solutions. The conductivity meter is checked periodically with standard solutions and calibrated as necessary.

TABLE 3-1
FIELD ANALYTICAL METHODS

Parameter	Method	Reporting Limit	Range	Accuracy
Specific Conductance	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.01 mS/cm	0 – 20 mS/cm	± 2% of functional sensitivity[1]
Temperature	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.1 °C	0.0 °C – 60.0 °C	± 0.5 °C
pH	Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter***	0.01	0.00 – 14.00	± 0.01 pH
Turbidity	Hanna Instruments HI 93703-11 Portable Turbidity Meter***	0.01 NTU	0.01 – 50.00 NTU and 50 – 1000 NTU	± 0.5 NTU or 5% of reading (whichever is greater)
Surfactants	CHEMetrics CHEMets Kit (K-9400) Methylene Blue Active Substances	0.13 mg/L	0.0 mg/L – 3.0 mg/L*	± 0.13 & ± 0.5 mg/L[2]
Nitrate-N	CHEMetrics V-2000 Multi-Analyte LED Photometer – Nitrate 3 Vacu-vials® (K-6933) Cadmium reduction[3]***	2.26 mg/L**	2.26 mg/L –13.6 mg/L**	± 30%
Ammonia-N	CHEMetrics V-2000 Multi-Analyte LED Photometer – Ammonia 3 Vacu-vials® (K-1403) Salicylate***	0.10 mg/L**	0.10 mg/L – 3.00 mg/L**	Varies with measured concetration[4,5]
Orthophosphate-P	CHEMetrics V-2000 Multi-Analyte LED Photometer – Phosphate 2 Vacu-vials® (K-8513) Stannous chloride chemistry[6]***	0.25 mg/L**	0.25 mg/L – 2.61 mg/L**	Varies with measured concetration[4,5]

Notes:

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L NO_3. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the NO_3 molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14 g/mol) to NO_3 (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range. "Full range" is equal to the upper limit of the test kit's range.

[6] This method determines the concentration of orthophosphate in mg/L PO_4. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the PO_4 molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31 g/mol) to PO_4 (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate-P is lowered due to the conversion.

*Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com. Additional information regarding CHEMetrics accuracy was obtained from the manufacturer via email.

TABLE 3-2
LABORATORY ANALYTICAL METHODS

Analyte	Analytical Method	Method Reporting Limit	Maximum Holding Time [1]
Oil and Grease	EPA 1664	5 mg/L	28 days
Total Hardness	EPA 200.7	10 mg/L	14 days
Dissolved Cadmium	EPA 6020	0.00200 mg/L [2]	24 hours
Dissolved Copper	EPA 6020	0.00200 mg/L [2]	24 hours
Dissolved Lead	EPA 6020	0.00200 mg/L [2]	24 hours
Dissolved Zinc	EPA 6020	0.0100 mg/L [2]	24 hours
Diazinon	EPA 8141A	0.05 µg/L	7 days
Chlorpyrifos	EPA 8141A	0.05 µg/L	7 days
Total Coliforms	SM 9221 B	1 CFU/100 mL [3]	6 hours
Fecal Coliforms	SM 9222 D	1 CFU/100 mL [3]	6 hours
Enterococci	EPA 1600	1 CFU/100 mL [3]	6 hours

Notes:

[1] Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.

[2] These reporting limits apply to results from all sites except 36A-79, 42C-92, and 45G-13. Reporting limits of 0.00100 for cadmium, copper, and lead and 0.00500 for zinc were used by the lab for analysis of samples taken at those three sites.

[3] Based on dilution; reporting limit with no dilution is 1 CFU/ 100mL

Field sample collection containers are first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

The accuracy of field analytical techniques is assessed at the beginning of each sampling week by analyzing solutions of known concentrations for ammonia-nitrogen, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in Table 3-3.

TABLE 3-3
FIELD ANALYSIS QA/QC RESULTS

Date	Analyte	Known Concentration (mg/L)	Acceptable Range [1] (mg/L)	Field Test Kit Results (mg/L)
09/03/08	Ammonia-Nitrogen	1.0	0.8 – 1.2	0.905
09/03/08	Surfactants	1.0	0.75 – 1.25	1.0
09/03/08	Nitrate [2]	44.3	31.0 – 57.6	51.32
09/03/08	Orthophosphate [2]	1.0	0.75 – 1.25	0.814
09/08/08	Ammonia-Nitrogen	1.0	0.8 – 1.2	0.965
09/08/08	Surfactants	1.0	0.75 – 1.25	0.875
09/08/08	Nitrate	44.3	31.0 – 57.6	52.74
09/08/08	Orthophosphate	1.0	0.75 – 1.25	0.861
09/15/08	Ammonia-Nitrogen	1.0	0.8 – 1.2	0.802
09/15/08	Surfactants	1.0	0.75 – 1.25	1.0
09/15/08	Nitrate	44.3	31.0 – 57.6	55.93
09/15/08	Orthophosphate	1.0	0.75 – 1.25	0.904

Notes:

[1] Acceptable range is calculated based on the error associated with the methods as listed in Table 3-1.

[2] Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by dividing the results by 4.43 for nitrate and 3.06 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis are collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles are obtained from the laboratory and thus do not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples are kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures are followed, and samples are delivered and analyzed within the appropriate holding times, as listed in Table 3-2. Completed chain of custody forms are included in Appendix C.

3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation was necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a re-sampling is conducted within one day. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two days of receiving the analytical reports from the lab. The results of these investigations are included in

Section 7 of this report. Recommendations based on these investigations are included in Section 8.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

Numeric Action Levels

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels, which are based on county-wide sampling data and have been used by all Copermittees since the 2003 dry weather season. If pH, orthophosphate-P, nitrate-N, ammonia-N, or surfactants are observed above the numeric action level, a follow-up investigation is conducted within one business day to investigate the source unless best professional judgment indicated otherwise. If oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, or *Enterococcus* laboratory analytical results exceeded numeric action levels, then source investigations are conducted within two business days of receiving the test results from the lab.

California Toxics Rule

The CTR criterion maximum concentration (CMC) is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in EPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

Best Professional Judgment

Best professional judgment is utilized as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the D-MAX field crew due to their familiarity with the City of Carlsbad Dry Weather Monitoring Program and their knowledge of typical levels for the tested parameters. Best professional judgment may indicate that results which either exceed certain action levels or statistical outliers may be the result of natural or background factors.

TABLE 3-4
ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

Field Screening Analytes	Action Levels[1]	Source/ Notes
pH	<6.5 or >9.0	Basin Plan, with allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia.
Orthophosphate-P (mg/L)	2.0	EPA Multi-sector General Permit
Nitrate-N (mg/L)	10.0	Basin Plan, and drinking water standards
Ammonia-N (mg/L)	1.0	Based on Workgroup experience. May also consider unionized ammonia fraction.
Surfactants (MBAS) (mg/L)	1.0	Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences.
Turbidity (NTU)	Best Professional Judgment	WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity), and unusual odors.
Temperature (°C)	Best Professional Judgment	Base judgment on season, air temperature, channel type, shading, etc.
Conductivity (mS/cm)	Best Professional Judgment	Values > 5.00 mS/ cm may indicate IC/ID; however, EC may be highly elevated in some regions due to high TDS groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values <0.75 may indicate excessive potable water discharge or flushing.
Laboratory Analytes	**Action Levels**	**Source/ Notes**
Oil and Grease (mg/L)	15	EPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation.
Diazinon (µg/L)	0.5	Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs.
Chlorpyrifos (µg/L)	0.5	
Dissolved Cadmium	California Toxic Rule	Use California Toxics Rule Table, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb.
Dissolved Copper	California Toxic Rule	
Dissolved Lead	California Toxic Rule	
Dissolved Zinc	California Toxic Rule	
Total Coliform (MPN/ 100 mL)	50,000	Action levels are based on upper 90% confidence interval of Copermittee 2002 dry weather analytical monitoring data.
Fecal Coliform (MPN/ 100 mL)	20,000	
Enterococcus (MPN/ 100 mL)	10,000	

Notes:

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry weather monitoring data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

°C	degrees Celsius
mS/cm	millisiemens per centimeter
mg/L	milligram per liter
IC/ID	illegal connection/illicit discharge
MBAS	methylene blue active substances
MPN/100 mL	most probable number (of colony forming units) per 100 milliliters
NTU	nephelometric turbidity unit
ppb	parts per billion
EPA	Environment Protection Agency
WQO	Water Quality Objectives

4.0 FIELD SCREENING RESULTS

The 2008 Dry Weather Monitoring Program began September 3, 2008. All initial and the majority of follow-up investigations were completed before September 30, 2008. The 60 primary monitoring stations were visited. Since primary sampling Site 9B-7 was dry, alternate Site 1D-20 was selected as a replacement. Field screening was conducted at the 60 sites where ponded or flowing water was observed. Completed field data sheets for each site visit are included in Appendix D.

4.1 Qualitative Observations

Qualitative observations, which are a routine part of the Dry Weather Monitoring Program, are summarized below and presented in Table 4-1. Results discussed below include routine and confirmation visit data only, not follow-up visits.

Light Conditions
Light conditions ranged were primarily sunny, with a several occurrences of overcast and partly cloudy weather.

Odor
Water samples from the majority of sites were odorless. Nine sites had water with a musty odor. None of the samples smelled of sewage, chemicals or rotten eggs.

Color
Water samples taken from most of the sites were colorless, with the exception of nine sites displaying water with a yellow hue and one site with brown water.

Clarity
Despite showing negligible suspended particles, water samples were clear at all but six sites. These sites had slightly cloudy water. No sites produced opaque samples.

Floatable Materials
During routine field screening visits, trash was noted at several sites. Appendix E 5 of this report includes a complete Trash Assessment. Some sites also had bubbles, foam, or a dusty sheen.

Deposits
Sediment, gravel or fine particulates were observed at almost all sites. There were no sites showing stains or oily deposits.

Vegetation
Taking into account exposure to sunlight and soil, all sites displayed appropriate vegetation. Manholes lacking soil and sunlight showed no vegetation. Concrete channels displayed either limited or normal vegetation; earthen channels had limited growth; natural creeks showed normal vegetative growth; and the outlets sampled showed a range of vegetation. No sites showed excessive vegetation that would significantly impaired flow.

Biology
The presence of biological organisms typically implies healthy water conditions. Also, algal growth indicates that water flow is persistent at the site. No sites visited displayed excessive algal growth, which can indicate nutrient enrichment (eutrophication). Many of the sampling locations were host to other biological organisms including various insects, crayfish, snails, fish, and turtles.

denotes a confirmation visit

ns = not sampled (dry site)

* Site 9B-7 was dry

4.2 Field Analytical Results

Field analyses are conducted at all sites with flowing or ponded water. The measured constituents are described below.

Flow rates are the measurements of the volume of fluid passing through a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

Water temperature is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. In the field, water temperature is measured immediately upon sample collection at each site with ponded or flowing water.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will drive a variety of chemical reactions, including the availability of nutrients or the solubility of chemical substances, particularly heavy metals.

Turbidity describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

Specific Conductance (Conductivity) values indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

Surfactant concentrations in water samples often reflect illegal discharge from industrial, commercial or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms

Ammonia-Nitrogen (Ammonia-N) is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

Nitrate-Nitrogen (Nitrate-N) is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can deplete oxygen from the water during decomposition and eventually suffocate other aquatic life. During the field analysis, nitrate is measured in milligrams per liter (mg/L) NO_3 and converted into mg/L nitrate-N using a conversion factor of 0.226. This process is explained in Note 4 of Table 3-1.

Orthophosphate-Phosphorus (Orthophosphate-P) is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment (eutrophication), stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient in plant growth. During the field analysis, orthophosphate is measured in mg/L PO_4 and converted into mg/L orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 7 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the various parameter s and appropriate action levels for follow-up investigations are included at the end of this section.

TABLE 4-2
FIELD ANALYSIS STATISTICAL SUMMARY

Parameter (units)	Maximum	Minimum	Average	Median	Standard Deviation	Number of Exceed-ances	Graph Number
Flow Rate (gpm)	187	0, ponded	6.6	2	24.2	--	4-1

5.0 LABORATORY ANALYTICAL RESULTS

5.1 Summary

Laboratory analyses were conducted at 15 sites, representing 25 percent of all sites with ponded or flowing water. The laboratory constituents measured are defined below.

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

Total hardness measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

Diazinon and **chlorpyrifos** are organophosphate pesticides that can be harmful to aquatic organisms if transported in urban runoff. Diazinon and chlorpyrifos are highly toxic to birds, mammals, and insects. They are also highly toxic to freshwater fish and invertebrates following acute exposure.

Metal contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. Therefore, each dissolved metal has a CMC for a specific total hardness. The laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 5-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

Coliform bacteria are relatively harmless to humans and are present in mammalian digestive tracts and are naturally found in most surface waters and soils. Testing water samples for total coliform bacteria is a standard practice in public health since a high level of total coliform bacteria often may indicate the presence of other more harmful, pathogenic organisms, sometimes of fecal origin. Total coliform is measured in lieu of these pathogens since the various pathogens are generally present in much smaller quantities and are difficult to detect.

Fecal coliform, a subset of coliform bacteria, and ***Enterococci*** are found primarily in the gastro-intestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. A host of human diseases, particularly those of the gastro-intestinal tract, are spread through water contaminated with fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material was human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

Note:
- For equations and constants used in California Toxics Rule calculations, see http://www.epa.gov/ost/standards/ctr/toxic.pdf
- Only sites where a particular dissolved metal was detected are listed. Lead was not detected in any of the samples.

A summary of the laboratory analytical results is presented in Table 5-2. Table 5-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

TABLE 5-2
LABORATORY ANALYSES SUMMARY

Parameter (units)	Maximum	Minimum	Number of Exceedances
Total Hardness (mg/L $CaCO_3$)	3,370	460	*
Oil and Grease (mg/L)	nd	nd	0
Diazinon (µg/L)	nd	nd	0
Chlorpyrifos (µg/L)	nd	nd	0
Cadmium (dissolved, mg/L)	0.0118	nd	0
Copper (dissolved, mg/L)	0.01980	0.00453	0
Lead (dissolved, mg/L)	nd	nd	0
Zinc (dissolved, mg/L)	0.1970	0.00661	0
Total Coliform (MPN/100 mL)	78,000	1,350	3
Fecal Coliform (MPN/100 mL)	39,000	1,050	3
Enterococci (MPN/100 mL)	38,000	50	3

Notes:
* Total hardness is not considered a pollutant and does not have an established action level.
- nd = not detected
- Calculations include complete routine visit data only. Confirmation visits, follow-up visits and dry sites not incorporated.

Notes:
Red Bold Type = value exceeds action level
[ ] denotes a confirmation visit
nd = not detected
na = not analyzed
CTR = California Toxics Rule; CTR action levels for metals are calculated based upon on the total hardness value of the water sample.
* Total hardness is not considered a pollutant and thus has no established action level for the purposes of dry weather monitoring
** These reporting limits apply to results from all sites except 36A-79, 42C-92, and 45G-13. Reporting limits of 0.00100 mg/L for cadmium, copper, and lead and 0.00500 for zinc were used by the lab for analysis of samples taken at those three sites.

6.0 DATA ANALYSIS

This first part of this section provides an overall evaluation of test results obtained from the 2008 Dry Weather Monitoring Program. The second portion of this section describes historical trends for various constituent exceedances.

6.1 2008 Results

The constituent with the greatest number of exceedances this year was nitrate-nitrogen, measuring above the action level at eight sites and remaining high at the confirmation visits. The three pH values that were outside the acceptable range also were outside that range at the confirmation visits. Conversely, the ammonia-nitrogen, orthophosphate-phosphorus and surfactant exceedances were below the action level at the confirmation visits. Table 6-1 presents a snapshot of the exceedances in 2008.

6.2 Previous Results

Historical results of exceedances are presented in Table 6-2, Graph 6-1 and Graph 6-2. Table 6-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 6-1 illustrates the percentage of exceedances for field constituents, and Graph 6-2 presents the percentage exceedances by year for laboratory analyses.

Since 2002, no exceedances were measured in water temperature, cadmium, copper, lead, zinc, or diazinon. Thus, these constituents have not been included in the following table and graphs.

The historical data for the results of field analyses presented in Graph 6-1 indicate a decreasing trend in ammonia-nitrogen. No discernable trend is apparent for other field constituents.

Historical data for laboratory analyses presented in Graph 6-2 shows that there were exceedances for oil and grease in the year 2002, but none thereafter. Chlorpyrifos was also above the action level for one year, in 2003, but not in subsequent years. Bacteria levels have varied over the years with no clear trend.

TABLE 6-2

GRAPH 6-2
PERCENT OF SITES WITH LABORATORY ANALYSIS EXCEEDANCES BY YEAR

7.0 FOLLOW UP INVESTIGATIONS

One of the main purposes of the Dry Weather Monitoring Program is to identify IC/IDs. Both field screening and laboratory analytical results are compared to regionally developed action levels (Table 3-4). When a parameter is measured at or above its action level, it is possible that an IC/ID is present. To further investigate potential IC/IDs, additional investigation is initiated whenever action levels are exceeded. Procedures for such investigations are described below.

7.1 Investigation Procedures

When Dry Weather Monitoring Program results exceed action levels, the City either conducts an investigation to identify the source of the discharge or provides rationale for why the discharge does not pose a threat to water quality and does not need further investigation. An immediate source identification investigation is initiated if visual and/or analytical evidence of gross contamination is present at a site during a routine investigation. Examples of gross contamination include substantial petroleum sheens, constituent concentrations well above action levels, abnormal colors or odors not attributable to natural site conditions, or evidence of a sewage release; such conditions may be considered a threat to human health or the environment. Immediate source identification investigations are also often conducted when surfactants exceedances are noted. Past experience has shown that an immediate investigation is much more likely to identify the source of the exceedance for this particular constituent. This is because such exceedances are often related to washing activities, which are typically intermittent in nature.

When further investigation is needed but an immediate upstream investigation is not necessary, the City initially confirms the results by resampling within two business days of being informed of the exceedance. For field screening, this is within two business days of the initial test. The overall time frame for laboratory analytical results depends on the time that results are received from the lab, but investigations will be conducted within two days of receiving the data, where applicable. These investigations are labeled as “confirmation” visits in this report, and they are used to guide further upstream investigations where necessary.

When confirmation sampling confirms continued exceedance of action levels, then the City conducts further investigation to identify the source of the exceedance. This type of investigation is referred to as “follow-up” in this report. Additional investigation is not conducted when exceedances are not noted during the confirmation visit or when the exceedance is known not to be the result of IC/IDs. As noted earlier, when gross contamination is observed during a routine visit, an immediate upstream source investigation is initiated. Prior to beginning an upstream source investigation, field staff review previous dry weather monitoring reports and consult MS4 maps to plan the investigation.

Dry weather flows are generally traced from the site in an upstream direction along the conveyance system. Photos, narrative descriptions of relevant visual observations made, and GPS coordinates are recorded to aid in documentation and in potential enforcement procedures. Water samples are collected at upstream confluences for analyses of the constituent(s) being tracked. All samples are documented through the completion of field data sheets, which are provided in Appendix D. If the samples are being submitted for

laboratory analysis, they are delivered within the appropriate holding time, and all appropriate chain-of-custody procedures are followed.

If the results of the upstream investigation indicate that an IC/ID may be present, appropriate City personnel will be notified. Where appropriate and feasible, field staff may also contact the party responsible for the discharge directly regarding the IC/IDs and potential BMPs.

7.2 Investigated Sites

Site 5A-72

Site 5A-72 is an outlet located on the east bank of Buena Vista Lagoon Ecological Reserve. There was a small amount of litter, and the water was clear, colorless, and odorless. Nitrate-nitrogen was measured at 24.68 mg/L at the initial visit and 27.30 mg/L during the confirmation visit, both over the action level of 10 mg/L.

From a manhole on the sidewalk a few feet upstream of the site, ponded water around the joint of the MS4 pipe was visible. The next upstream manhole was located across the street and was dry, and no other upstream lines connected to the site. A potential source of water and nitrates to Site 5A-72 is seepage water around the pipe joint.

Site 9B-38

Site 9B-38 consists of two outlets on the east side of State Street, south of the State Street and Carlsbad Boulevard intersection. The nitrate-nitrogen level was 14.49 mg/L during routine field screening. At the confirmation and follow-up visits to the site, nitrate measured at 16.22 mg/L and 18.31 mg/L.

Two main lines contribute to Site 9B-38, one from the south along State Street and the other from the east along Laguna Drive (Figure 7-1). Located on the State Street branch upstream of Site 9B-38 is Site 9B-7, which was dry this year. Several other manholes and catch basins examined along State Street were dry, indicating that the elevated nitrogen flow originated from the Laguna Drive line.

PHOTO 7-1: Ponded water from the east, inside the manhole at location 9B-38-3

The line on Laguna Drive primarily drains residential areas. Upstream location 9B-38-1, a manhole on this line, was sampled twice. Nitrate-nitrogen levels here were 19.00 mg/L and 19.96 mg/L. Further east prior to reaching Interstate 5 (I-5), upstream location 9B-38-3 had a nitrate-nitrogen level of 12.89 mg/L. This location is a manhole that had ponded water at the time of testing (Photo 7-1). No surface flow was observed in the vicinity.

North of the main line, irrigation runoff was witnessed extending nearly a quarter of a mile (Photo 7-2). The water was traced to a set

of sprinklers on the corner of Lewis Avenue and Knowles Avenue, producing a flow of 2 gpm in the gutter. The portion of landscaping did not clearly belong to a particular house. A resident on Lewis Avenue reported that the sprinklers had turned on recently that morning, indicating that they were not broken but perhaps routinely over-water this area. A sample was taken from the gutter, yielding a 9.35 mg/L nitrate-nitrogen level, slightly below the action level.

The MS4 pipe on Laguna Drive appears to connect to a pipe running underneath I-5. The freeway has landscaping in the center divider and on both sides. At the time of the upstream investigation, no runoff from landscaping along I-5 was observed. East of the freeway, all inspected manholes and catch basins were dry.

PHOTO 7-2: Over-irrigation on Lewis Avenue

Although no obvious source of nitrate-nitrogen could be identified at the time of the investigation, it appears that fertilizer and over-irrigation are contributors.

At location 9B-38-2, nitrate-nitrogen levels were not above the action level but were still relatively high. Nitrate-based fertilizer may have been used in the landscaped areas upstream of the site and transported by over-irrigation. It is also possible that water is coming from landscaping along I-5 since the ponded water downstream of the freeway at location 9B-38-3 was high in nitrate.

TABLE 7-1

FIGURE 7-1
SITE 9B-38 UPSTREAM INVESTIGATION

Site 19C-1

PHOTO 7-3: Dense vegetation at Site 19C-1

Site 19C-1 is an outlet off of Sunny Creek Road, in an open area behind a vacant horse stable (Photo 7-3). The site was densely vegetated, and a flow of 5 gpm was observed. Discharge from the outfall joins Agua Hedionda Creek approximately 200 feet downstream of the site.

Initial laboratory analyses yielded a total coliform count of 78,000 CFU/100mL, a fecal coliform reading of 39,000 CFU/100mL and an *Enterococcus* count of 31,000 CFU/100mL. Upon the confirmation visit, total coliform and *Enterococcus* levels had dropped below the action level, but fecal coliforms continued to be high at 23,000 CFU/100mL. A follow-up visit to the site produced similar results, with no exceedances for total coliforms and *Enterococci* but fecal coliforms at 34,000 CFU/100mL.

To pursue the source of fecal coliforms, a manhole was examined at the intersection of Sunny Creek Road and College Boulevard. This manhole is at the junction of the line from a small residential area to the east and the main line from College Boulevard. The smaller line was dry, and thus the line following College Boulevard was traced upstream.

Just south of the intersection of College Boulevard and El Camino Real, a line from the south and southeast converge at a manhole, upstream location 19C-1-1. The flow was the same as observed at Site 19C-1. There was animal waste inside the manhole, although apart from the water's flow at the time of the visit. Laboratory results for a sample taken at Site 19C-1-1 show all bacteria results below respective action levels. A visual survey of the streets that drain to Site 19C-1 and various manholes along the main line did not reveal any additional sources of fecal coliforms.

The most probable source of fecal coliforms is wildlife in the area of the site. Since it is located in an open area with thick vegetation, the site is likely frequented by wildlife leaving behind fecal matter. The animal waste found at Site 19C-1-1 confirms that animals enter the storm drain system in this area.

PHOTO 7-4: Animal waste inside the manhole at upstream location 19C-1-1

TABLE 7-2

Note: **Red Bold Type** = value exceeds action level

FIGURE 7-2
SITE 19C-1 UPSTREAM INVESTIGATION

Site 21D-34

Site 21D-34 is an outfall located inside Encina Power Station with a flow of approximately 7 gpm. Nitrate-nitrogen levels were initially measured at 14.07 mg/L, followed by 16.04 mg/L at the confirmation visit.

The main line leading to Site 21D-34 begins on Cannon Road, east of Paseo del Norte. It moves west until curving northward near El Arbol Drive. On the main line, a manhole east of the El Arbol Drive and Cannon Road intersection was examined. It contained only a trickle of flow, indicating that the main line upstream of this area was not the source of the 7 gpm flow to Site 21D-34. This manhole has been inspected in past upstream investigations and was typically dry or had low nitrate levels.

Due to the natural gradient, water moves downhill and westward in this area. It is likely that water was seeping into the MS4 somewhere between the inspected manhole and Site 21D-34. Nitrate levels have been high at Site 21D-34 in the past, but the manhole on Arbol Drive and Cannon Road has consistently been dry or has had nitrate-nitrogen levels below the action level. This is consistent with the explanation of seepage water carrying nitrates entering the MS4 from the hillside between the examined manhole and the site.

A possible source of nitrates is fertilization of the agricultural fields immediately to the east, carried by interflow to the pipes downhill.

Sites 27D-17, 28C-70 and 28C-73

At both the routine visits and confirmation visits to sites 27D-17, 28C-70, and 28C-73, nitrate-nitrogen measured above the action level. Due to their proximity to each other and location on interconnected lines, the follow-up investigations of these sites are discussed together below.

Sites 28C-70 and 28C-73 are outlets located off of Paseo del Norte. Both sites are upstream of Site 27D-17, an earthen channel off of Avenida Encinas. The land use in this area is mainly commercial and agricultural. Table 7-3 displays the flow and nitrate-nitrogen levels of these sites and other locations visited during the upstream investigation. Figure 7-3 provides a map of site locations and the MS4.

All three of these sites have historically shown exceedances in nitrate-nitrogen levels. Past studies have attributed the exceedances to nitrate-enriched water seeping into the storm drain system south of the agricultural fields upstream.

In addition to routine and confirmation visits, two upstream sites were tested. Site 28C-73-1 is a manhole at the Carlsbad Premium Outlets' north entrance. Site 28C-73-2 is a catch basin on the eastern most branch of this MS4 pipe, just west of the flower fields. Both sites 28C-73-1 and 28C-73-2 showed high nitrate-nitrogen levels. Moving eastward closer to the agricultural area, nitrate-nitrogen levels increased. Therefore, the high concentrations most likely originate in the vicinity of the agricultural area to the east of the Carlsbad Premium Outlets.

TABLE 7-3
SITES 27D-17, 28C-70 AND 28C-73 FOLLOW-UP INVESTIGATIONS

Note: **Red Bold Type** = value exceeds action level

FIGURE 7-3
SITES 27D-17, 28C-70 AND 28C-73 FOLLOW-UP INVESTIGATIONS

Site 35C-85

Site 35C-85 is an outlet located on the north bank of Encinas Creek with colorless, odorless, slightly cloudy water and a flow of 2 gpm. During the routine visit, surfactants were at the action level of 1.0 mg/L, nitrate-nitrogen was measured at 63.91 mg/L, and orthophosphate-phosphorus was 8.53 mg/L. An immediate upstream investigation did not reveal any obvious sources of the exceedances.

During the confirmation visit, the water no longer had a cloudy appearance. Surfactant levels decreased to 0.75 mg/L and orthophosphate-phosphorus to 0.93 mg/L, both of which are below the action level. Nitrate-nitrogen continued to be elevated at 72.43 mg/L.

The conveyance contributing to Site 35C-85 is an underground pipe from the north that runs along the center divider of I-5. There are a few minor connections and surface drainage points along the line but no major lateral lines. The City has conducted investigations of Caltrans' landscaping practices along the freeway in 2005 and 2006. It was concluded that landscaping was not the main source of nitrates to this site.

It is likely that seepage water into the main pipe has caused nitrate-nitrogen exceedances. One indicator is that conductivity has been relatively high at this site compared with what is typically measured in irrigation runoff. The levels of 4.83 and 5.24 mS/cm measured this year are more characteristic of groundwater conductivity. Additionally, past studies have reviewed aerial photographs and topographical data, and concluded that groundwater flows southwest in this area. Nitrate-containing water may travel from the agricultural fields to the north east, adding to the conveyance's flow.

FIGURE 8-4
SITE 35C-85 AND MS4 LINES

As orthophosphate-phosphorus was no longer above the action level at the confirmation visit, it was concluded that the initial high level was due to a transient flow. Also, it is unlikely to find runoff containing surfactants along the median of I-5. The initial elevated surfactant reading may have been influenced by the high nitrate levels. Nitrate is a negatively charged ion, and large amounts of negatively charged ions may interfere with the MBAS method of measuring anionic surfactants[1].

[1] CHEMetrics, Inc. "Technical Data Sheet (Draft Version): Detergents, (Anionic Surfactants, MBAS), Methylene Blue Method". Available from CHEMetrics, (800) 356-3072.

Site 36B-6

Site 36B-6 is an outlet with located east of the intersection of Camino Vida Roble and Palomar Oaks Way. In 2008 the water had a foamy surface and a flow rate of approximately 1 gpm. This site has had low pH recordings since 1995. This year, the pH was 5.5 during routine screening and 5.2 at the confirmation visit, below the 6.5 action level. No other constituents were outside the acceptable ranges.

PHOTO 7-5: Foam on the water's surface at Site 36B-6

Upstream of Site 36B-6 is Site 36B-4, a manhole located at the intersection of Palomar Oaks Way and Camino Vida Roble. Site 36B-4 is just a few hundred feet west of Site 36B-6, but it is at a higher elevation. The pH at Site 36B-4 was 7.9, within normal limits. The source of low pH was therefore isolated to the region between Site 36B-6 and Site 36B-4.

From Site 36B-4, located at about street level, water flows downhill to Site 36B-6, which is situated lower in a canyon. No overland runoff or illicit connections were observed between the sites. Therefore, the most likely cause of the low pH at Site 36B-6 is seepage water into the MS4 between Site 36B-4 and Site 36B-6. The relatively high conductivity of 6.50 mS/cm at Site 36B-6, as opposed to 2.84 mS/cm at Site 36B-4, is also consistent with the higher conductivity characteristic of groundwater. This source was confirmed in January 2008 in the CCTV investigation conducted by the City.

FIGURE 7-5
SITES 36B-6 AND 36B-4

Site 36B-95

Site 36B-95 is located in a canyon, approximately 10 yards north of 1925 Palomar Oaks Way. It had an ammonia-nitrogen exceedance at 2.3 mg/L and an orthophosphate-phosphorus exceedance of 2.85 mg/L. An upstream investigation was initiated immediately through Palomar Oaks Way and the surrounding area, but no obvious sources of ammonia-nitrogen were observed. Much of the area was landscaped, and irrigation runoff was noted. Fertilizer use in the landscaping is a possible source of orthophosphate, which can be washed into the storm drain system with over watering.

PHOTO 7-6: Irrigation runoff upstream of Site 36B-95.

At the confirmation visit, the ammonia-nitrogen level was 0.2 mg/L, and the orthophosphate-phosphorus level was 0.03 mg/L. Another survey of the upstream area did not reveal any sources of the previously elevated constituents. It was concluded that the constituent elevations were the results of a transient flow.

Site 37B-22

Site 37B-22 is an outlet at the northwest corner of the Yarrow Drive and Camino Vida Roble intersection. The sample water from this site was slightly cloudy, with a pH of 5.7 during the routine visit and 5.0 at the confirmation visit. Both of these values are outside the acceptable range of 6.5 to 9.0. The turbidity of 37.02 NTU, although not considered an exceedance, is on the higher side. Low pH has been noted at Site 37B-22 in the past. High turbidity and a cloudy appearance have also been noted in previous studies.

A manhole upstream, Site 27B-22-1, had a pH of 5.1. Three pipes connected to this manhole; the main conveyance from Yarrow Drive contributed less than 1 gpm of flow, and the two lateral PVC pipes were dry. Further upstream, Site 27B-22-2 had a normal pH of 7.6. Thus, the source of low pH to Site 37B-22 is located between sites 27B-22-1 and 27B-22-B. No surface runoff or illicit connections were observed in the vicinity. It was concluded that seepage water entering the MS4 between sites 27B-22-1 and 27B-22-B was the source of the low pH. This was confirmed in the CCTV investigation conducted by the City in January 2008.

Consistent with this conclusion, conductivity was relatively high at Site 37B-22, measuring at 4.21 mS/cm and 5.36 mS/cm during the routine and confirmation visits, respectively. This higher conductivity is more characteristic of groundwater than surface runoff. Upstream at Site 37B-22-2, which had a normal pH level, the conductivity was lower at 1.82 mS/cm.

The cloudy appearance and higher turbidity may also be influenced by the pH. Some microorganisms found in the water may not be able to survive in low pH levels. It is possible that dead cells may be clouding the water and raising turbidity readings.

FIGURE 7-6
SITE 37B-22 UPSTREAM INVESTIGATION

Site 42C-92

PHOTO 7-7: Manhole on Nutmeg Way and Rosemary Avenue.

Site 42C-92 is a manhole on Batiquitos Drive, midway between Poinsettia Lane and Daisy Avenue. The site had yellow, musty-smelling water at the routine visit. Total coliforms were measured at 56,000 CFU/100mL and fecal coliforms at 37,000 CFU/100mL, both above the respective action levels. Exceedances were also reported from the samples taken during the confirmation visit; total coliforms were 63,000 CFU/100mL, fecal coliforms were 53,000 CFU/100mL, and *Enterococci* were also in exceedance at 15,200 CFU/100mL.

An investigation was conducted through the residential areas upstream. A manhole on the corner of Rosemary Avenue and Nutmeg Way contained decaying leaves and a shallow, slow-moving flow of 1 gpm. A substantial amount of irrigation runoff was noted on Rosemary Avenue, sometimes mixed with dead leaves and small amounts of trash. No fecal matter was observed in this area.

The decomposition of organic material such as leaves and trash is one of the probable sources of bacteria to Site 42C-92. No additional sources were clearly identified during the upstream investigation. Flow was only observed upstream of the area between Batiquitos Drive and Snapdragon Drive, a relatively small area.

PHOTO 7-8: Irrigation runoff on Rosemary Avenue

FIGURE 7-7
SITE 42C-92 AND MS4 LINES

Site 45G-13

Site 45G-13 is an outlet 30 feet southwest of the Melrose Drive and Rancho Santa Fe Road intersection. The *Enterococcus* level at the site was slightly elevated above 10,000 CFU/100mL action level, measuring at 11,000 CFU/100mL. The site was revisited to take a confirmation sample, and the area upstream of the site was visually investigated in accordance with standard procedure.

PHOTO 7-9: Decomposing organic debris in a manhole upstream of Site 45G-13

The immediate area around the site is open space, and the remainder of the upstream land use is a mix of commercial and residential developments. The streets and several manholes upstream were examined. No source of *Enterococci* was observed during the confirmation visit and upstream investigation. Results from the analysis of the confirmation sample found that the *Enterococci* count was 4,600 CFU/100mL, no longer in exceedance, as shown Table 7-5. It was concluded that the initial *Enterococcus* exceedance was due to a transient flow.

TABLE 7-5
SITE 45G-13 FOLLOW-UP INVESTIGATION

Site	Location	*Enterococci* (CFU/100mL)
45D-13	30 feet southwest of the Melrose Drive and Rancho Santa Fe Road intersection	**11,000**
45D-13 (Confirmation)	"	4,600

Note: **Red Bold Type** = value exceeds action level

Site 48D-24

Site 48D-24 is a debris basin outlet to Batiquitos Lagoon, located southwest of the El Camino Real and Arenal Road intersection. Exceedances for both bacterial indicators and nitrate were noted at this site. The investigation of the bacteria exceedance is discussed first below, and the nitrate investigation description follows.

PHOTO 7-10: Toilet paper and trash at the desiltation basin.

Total coliforms, fecal coliforms and *Enterococci* were above the action level during the routine visit to Site 48D-24. Total coliforms were measured at 52,000 CFU/100mL, fecal coliforms at 29,000 CFU/100mL and *Enterococci* at 38,000 CFU/mL. The site was revisited to take a confirmation sample, and the area

upstream of the site was visually investigated in accordance with standard procedure.

Land use upstream of the site is primarily residential, with an open space to the north. The residential streets were examined, but no obvious fecal sources of bacteria was seen in those areas during the confirmation visit. Previous investigations have identified the desiltation basin located northeast of the Carlsbad City Library on Dove Lane as the main source of bacteria to Site 48D-24, so the basin was also visited during the upstream visual investigation in 2008. Food wrappers and plastic bags were observed in the water, and what appeared to be used toilet paper was located several feet away from the water (Photo 7-10).

The results of the bacteria analyses for the confirmation sample showed all three bacterial indicators were measured below the action level. The data for these constituents are presented Table 7-6. The site was referred to the City regarding the trash and debris observed in the upstream desiltation basin.

TABLE 7-6
SITE 48D-24 BACTERIA FOLLOW-UP INVESTIGATION

Site	Location	Total Coliforms (CFU/100mL)	Fecal Coliforms (CFU/100mL)	*Enterococci* (CFU/100mL)
48D-24	Debris basin outlet to Batiquitos Lagoon, southwest of the El Camino Real and Arenal intersection	**52,000**	**29,000**	**38,000**
48D-24 (Confirmation)	"	15,000	12,000	2,000

Note: **Red Bold Type** = value exceeds action level

Nitrate-nitrogen was also above the action level at Site 48D-24, measuring at 12.10 mg/L during the first visit and 16.82 mg/L and 12.30 mg/L during two different confirmation visits. Nitrate levels were tested at various other locations upstream, as presented in Table 7-7 and Figure 7-8.

TABLE 7-7

48D-24 (Confirmation 2)	Debris basin outlet to Batiquitos Lagoon, southwest of the El Camino Real and Arenal Road intersection	**12.30**
48D-24-1	Parking lot of Carlsbad City Library, 1775 Dove Lane	**33.09**
48D-24-2A	Northern line; northeast of Carlsbad City Library on Dove Lane	9.77
48D-24-2B	Northwestern line, northeast of Carlsbad City Library on Dove Lane	**32.45**

Note: **Red Bold Type** = value exceeds action level

Upstream at Site 48D-24-1, nitrate-nitrogen levels were more than triple the action level. Sites 48D-24-2A and 48D-24-2B are separate lines converging at a manhole further upstream. Field testing demonstrated that the nitrate-nitrogen elevation originated from the northwestern conveyance.

The northwestern line with the highest nitrate-nitrogen level drains a relatively new residential development on a hill, indicating that the high nitrate-nitrogen levels originate in this area. Some irrigation runoff has been observed in this residential area, but no major amounts of surface runoff are typically observed. Based on historical data, nitrate measurements at Site 48D-24 have been trending upward over the past several years. Conductivity measurements have been relatively high ever since measurement for that parameter began in 2002, but an increasing trend has still been seen in recent years, with a value of 14.57 mS/cm recorded during the 2008 confirmation visit. Since a change has been seen over the years, it is possible that irrigation activities at the relatively new residential area upstream of upstream location 48D-24-2B have resulted in a higher groundwater table and greater contribution of groundwater flows to Site 48D-24. It is unknown if groundwater in this area is naturally high in nitrates or if landscaping practices may be a contributing factor.

FIGURE 7-8
SITE 48D-24 FOLLOW-UP INVESTIGATION MAP

Site 49D-12

Site 49D-12 is an outlet at the northern end of La Costa Golf Course. The site had clear, colorless, odorless water, and no trash. At the routine visit, ammonia-nitrogen was measured at 1.3 mg/L. A survey of the drainage area was conducted but no clear source of ammonia was apparent. Upon the confirmation visit the following day, the ammonia-nitrogen reading had fallen to 0.2 mg/L. It was concluded that the initial exceedance was due to a transient flow.

Site 58A-13

During routine field screening, water at site 58A-13 had a cloudy appearance, and turbidity was measured at 83 NTU. The residential streets east of the site were investigated to identify potential sources of high turbidity. On the curb around 2012 and 2022 Ladera Court, a relatively small amount of fine sediment was observed in addition to signs of irrigation runoff, which could carry the sediment to the site. Upon the confirmation visit the following day, the water was clear and colorless, and turbidity levels were measured at 6.34 NTU. The likely cause of the high turbidity was a transient flow transporting the fine sediment observed upstream.

Site 62B-4

Site 62B-4 is a manhole at the intersection of Rancho Santa Fe Road and Camino Alvaro that had slightly cloudy water and a low pH of 5.4. At the confirmation visit, the pH was 5.2, and the water continued to appear cloudy. The site has historically had low pH levels.

The routine sample was taken of the combined flow from three converging lines: one from the southwest, the main line from the west, and another line from the northwest. These three flows combined in the manhole, stirring up sediment and giving the water a cloudy appearance. Each line was sampled separately, and the individual flows were clear with low turbidity readings.

The separate samples taken from each line confirm previous findings that the northwestern flow was the source of low pH. The northwestern line had a pH of 4.7, whereas the western line had a pH of 7.8 and the southern line's pH was 7.6. The northwestern line is a PVC pipe, draining a residential neighborhood. Some irrigation runoff was seen in the upstream area, but no clear discharge of acidic water was observed.

One possible explanation for the low pH is that the soil and interflow in this area have a low pH. This flow may be seeping into the storm water conveyances through corroded pipes. Consistent with this explanation, the northwestern line also has a higher conductivity, a characteristic of groundwater. The City has conducted additional investigations related to this pipe in the past, but the exact origin of groundwater or similar flows to the pipe are unclear.

8.0 SUMMARY AND RECOMMENDATIONS

8.1 Summary of Field Screening and Laboratory Analysis Data

In the City of Carlsbad 2008 Dry Weather Monitoring Program, 60 primary field sampling sites were visited. Since primary monitoring Site 9B-7 was dry, alternate Site 1D-20 was sampled in its place. Fifteen of the field sampling sites were also sampled for laboratory analyses. Confirmation visits and upstream investigations were performed for 17 sites at which constituents were measured at or above their respective action levels during the routine visit.

Appendix E of this report discusses the new trash assessment component that has been adopted by the Municipal Permit. This program includes classifying sites into one of five categories based on the level of trash observed. Including one dry site, 36 sites were rated "optimal," 24 sites were "suboptimal," and one site was rated "marginal" in the trash assessment. No sites were rated "submarginal" or "poor."

The following summaries of action level exceedances and conclusions of follow-up investigations are presented by sub-watershed.

Agua Hedionda Sub-watershed

The City's 2008 Dry Weather Monitoring Program included 21 sites within the Agua Hedionda sub-watershed. Of these, four had nitrate-nitrogen exceedances that were likely related to seepage water from upstream agricultural activities. Table 8-1 presents a summary of action level exceedances in this watershed. Table 8-2 displays the conclusions based on confirmation and upstream investigations conducted for these sites.

TABLE 8-1
AGUA HEDIONDA SUB-WATERSHED ACTION LEVEL EXCEEDANCES

Field Screening (21 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
Nitrate-N	4	21D-34, 27D-17, 28C-70, 28C-73
Laboratory Analyses (6 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
Total Coliforms	1	19C-1
Fecal Coliforms	1	19C-1
Enterococci	1	19C-1

TABLE 8-2
AGUA HEDIONDA SUB-WATERSHED SUMMARY OF UPSTREAM INVESTIGATIONS

Site	Upstream Investigation Target Constituent(s)		Results/Probable Source
	Field	Laboratory	
19C-1		Total Coliforms Fecal Coliforms *Enterococci*	Wildlife waste in open space around the site and accumulation of trash and waste in dense vegetation; Note that only fecal coliforms were still above the action level in the confirmation sample.
21D-34	Nitrate-N		Seepage water containing nitrate, likely originating from agricultural areas upstream
27D-17	Nitrate-N		Seepage water containing nitrates, probably from agricultural areas upstream
28C-70	Nitrate-N		
28C-73	Nitrate-N		

Buena Vista Sub-watershed

Seven of the City's 2008 dry weather monitoring sites are located within the Buena Vista sub-watershed in 2008. At two of the sites, nitrate-nitrogen measuring above the action level was believed to be related to seepage water containing nitrates. See Table 8-3 and Table 8-4.

TABLE 8-3
BUENA VISTA SUB-WATERSHED ACTION LEVEL EXCEEDANCES

Field Screening (7 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
Nitrate-N	2	5A-72, 9B-38
Laboratory Analyses (1 Sample)		
There were no laboratory analysis exceedances in the Buena Vista sub-watershed.		

TABLE 8-4
BUENA VISTA SUB-WATERSHED FOLLOW-UP INVESTIGATIONS

Site	Upstream Investigation Target Constituent(s)		Results/Probable Source
	Field	Laboratory	
5A-72	Nitrate-N		Seepage water containing nitrates entering cracked MS4 pipe
9B-38	Nitrate-N		Seepage water containing nitrates

Encinas Sub-Watershed

Thirteen of the City's dry weather monitoring sites are situated within the Encinas sub-watershed. In 2008 low pH levels at two sites were believed to be related to groundwater seepage water. Tables 8-5 and 8-6 display the various constituent exceedances and conclusions regarding their sources within the Encinas sub-watershed.

TABLE 8-5
ENCINAS SUB-WATERSHED SUMMARY OF ACTION LEVEL EXCEEDANCES FOR

Field Screening (13 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
pH	2	36B-4, 37B-22
Surfactants	1	35C-85
Ammonia-N	1	36B-95
Nitrate-N	1	35C-85
Orthophosphate-P	2	35C-85, 36B-95
Laboratory Analyses (3 Samples)		
There were no laboratory analysis exceedances in the Encinas sub-watershed.		

TABLE 8-6
ENCINAS SUB-WATERSHED FOLLOW-UP INVESTIGATIONS

Site	Upstream Investigation Target Constituent(s)		Results/Probable Source
	Field	Laboratory	
35C-85	Surfactants, Nitrate-N, Orthophosphate-P		Surfactants: Interference with the test method caused by high levels of nitrate ions Nitrate-N: Seepage water containing nitrates Orthophosphate-P: Transient flow
36B-6	pH		Seepage water with low pH
36B-95	Ammonia-N Orthophosphate-P		Transient flow
37B-22	pH		Seepage water with low pH

San Marcos Creek Sub-Watershed

The City's 2008 Dry Weather Monitoring Program includes 19 sites within the San Marcos Creek sub-watershed, which drains to Batiquitos Lagoon. Several of the exceedances were attributed to transient flows. Groundwater seepage was a possible source of nitrate-nitrogen to Site 48D-24 and low pH to Site 62B-4. Table 8-7 and Table 8-8 summarize the San Marcos Creek exceedances and follow-up investigation conclusions.

TABLE 8-7
SAN MARCOS CREEK SUB-WATERSHED ACTION LEVEL EXCEEDANCES

Field Screening (19 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
pH	1	62B-4
Turbidity	1	58A-13
Ammonia-N	1	49D-12
Nitrate-N	1	48D-24
Laboratory Analyses (5 Samples)		
Analyte	**Number of Exceedances**	**Site(s) Exceeding Action Level**
Total Coliforms	2	42C-92, 48D-24
Fecal Coliforms	2	42C-92, 48D-24
Enterococci	2	45G-13, 48D-24

TABLE 8-8
SAN MARCOS CREEK SUB-WATERSHED FOLLOW-UP INVESTIGATIONS

Site	Upstream Investigation Target Constituent(s)		Results/Probable Source
	Field	Laboratory	
42C-92		Total Coliforms Fecal Coliforms	Decaying organic material in storm drains of Rosemary Avenue
45G-13		*Enterococci*	Transient flow, possibly related to wildlife in surrounding open space
48D-24	Nitrate-N	Total Coliforms Fecal Coliforms *Enterococci*	Nitrate-N: Possible seepage water from residential developments Bacteria: Some trash and indicators of human use were noted in the desiltation basin upstream of the site close to Dove Lane during the upstream investigation. However the results of the confirmation sample at the site showed no exceedances.
49D-12	Ammonia-N		Transient flow
58A-13	Turbidity		Transient flow containing fine sediment
62B-4	pH		Seepage water with low pH from the small PVC pipe from the northwest

8.2 Recommendations

Based on the results of the 2008 Dry Weather Monitoring Program, the following actions are recommended for consideration.

8.2.1 Inspection and Maintenance

- Work with the responsible parties of the agricultural areas upstream of sites 27D-17, 28C-70, 28C-73 and 35C-85 to reduce nitrate levels.
- Consider removing trash from "marginal" Site 37B-19, between 2225 and 2265 Camino Vida Roble.
- Clean up trash from the area northeast of Dove Lane, across from Carlsbad City Library (upstream of Site 48D-24).

8.2.2 Education

- Work with the residents or property manager responsible for landscaping on Lewis Avenue and Knowles Avenue to reduce over-irrigation upstream of Site 9B-38.
- Provide educational materials regarding BMPs to minimize irrigation runoff to the residents of Rosemary Avenue, upstream of Site 42C-92.
- Consider providing educational materials to the residents between 4860 and 4862 Park Drive, upstream of Site 22B-17, regarding BMPs to minimize irrigation runoff. Although no exceedances were found at Site 22B-17, a substantial amount of runoff was observed in front of these residences. Algal growth was present in the curb, indicating that runoff is regularly present.

8.2.3 Further Investigation

- Contact Caltrans to investigate landscaping practices along I-5, upstream of Site 9B-38.
- Contact responsible parties of the agricultural fields east of Site 21D-34 to investigate nitrate use.
- Consider further investigation of the source of the low pH of the water at Site 62B-4.
- Contact parties responsible for landscaping and property management of residential areas upstream of location 48D-24-2B (Moorhen Place and Mimosa Drive) to identify landscaping practices related to fertilization and irrigation.
- Continue additional investigation upstream of Site 42C-92 related to bacterial exceedances.

Laboratory Analytical Reports

EnviroMatrix Analytical, Inc.

15 September 2008

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

EMA Log #: 0809071

Project Name: Carlsbad Dry Weather
Project Desc./#:200836W-1

Enclosed are the results of analyses for samples received by the laboratory on 09/03/08 13:48. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

Dan Verdon
Laboratory Director

CA ELAP Certification #: 2564

4340 Viewridge Avenue, Suite A - San Diego, California 92123 - (858) 560-7717 - Fax (858) 560-7763
Analytical Chemistry Laboratory

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon
Laboratory Director

Calscience Environmental Laboratories, Inc.

Subject: **Calscience Work Order No.: 08-09-0947**
Client Reference: 0809071

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-0947

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon
Laboratory Director

Calscience Environmental Laboratories, Inc.

Subject: **Calscience Work Order No.: 08-09-0946**
Client Reference: 0809100

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

RPD - Relative Percent Difference , CL - Control Limit

Calscience Environmental Laboratories, Inc.

Glossary of Terms and Qualifiers

Work Order Number: 08-09-0946

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon
Laboratory Director

Subject: **Calscience Work Order No.: 08-09-0944**
Client Reference: 0809119

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-0944

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon

Subject: **Calscience Work Order No.: 08-09-0942**
Client Reference: 0809156

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-0942

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.

Dan Verdon
Laboratory Director

Calscience Environmental Laboratories, Inc.

Subject: **Calscience Work Order No.: 08-09-0941**
Client Reference: 0809186

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/10/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-0941

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

SAMPLE RECEIPT FORM

CLIENT: EMA

DATE: 9/10/8

TEMPERATURE – SAMPLES RECEIVED BY:

CALSCIENCE COURIER:

- ____ Chilled, cooler with temperature blank provided.
- ____ Chilled, cooler without temperature blank.
- ✓ Chilled and placed in cooler with wet ice.
- ____ Ambient and placed in cooler with wet ice.
- ____ Ambient temperature (For Air & Filter only).

LABORATORY (Other than Calscience Courier):

- ___.___ °C Temperature blank.
- ___.___ °C IR thermometer.
- ____ Ambient temperature (For Air & Filter only).

3.8 °C Temperature blank.

Initial: [signature]

CUSTODY SEAL INTACT:

Sample(s): ____ Cooler: ____ No (Not Intact) : ____ Not Present: ✓

Initial: [signature]

SAMPLE CONDITION:

	Yes	No	N/A
Chain-Of-Custody document(s) received with samples	✓		
Sampler's name indicated on COC		✓	
Sample container label(s) consistent with custody papers	✓		
Sample container(s) intact and good condition	✓		
Correct containers and volume for analyses requested	✓		
Proper preservation noted on sample label(s)			✓
VOA vial(s) free of headspace.			✓
Tedlar bag(s) free of condensation			✓

Initial: [signature]

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
GC-05	Results confirmed by GCMS.
G-04	This sample contains analytes identified by the method but were not requested for reporting.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Subject: **Calscience Work Order No.: 08-09-1130**
Client Reference: 0809225

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/11/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

Glossary of Terms and Qualifiers

Work Order Number: 08-09-1130

Qualifier	Definition
*	See applicable analysis comment.
1	Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification.
2	Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification.
3	Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification.
4	The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification.
5	The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required.
A	Result is the average of all dilutions, as defined by the method.
B	Analyte was present in the associated method blank.
C	Analyte presence was not confirmed on primary column.
E	Concentration exceeds the calibration range.
H	Sample received and/or analyzed past the recommended holding time.
J	Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated.
ME	LCS Recovery Percentage is within LCS ME Control Limit range.
N	Nontarget Analyte.
ND	Parameter not detected at the indicated reporting limit.
Q	Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater.
U	Undetected at the laboratory method detection limit.
X	% Recovery and/or RPD out-of-range.
Z	Analyte presence was not confirmed by second column or GC/MS analysis.

Trash Assessment Form

SITE ID: 1D-20 **DATE:** ~~8~~ 09/04/08

LOCATION: south bank of Buena Vista creek, ten yards east of El Camino Real **TIME:** 9:40

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 3 x 3

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

COMMENTS: Trash - soda cans, drink cups, plastic bags stuck in vegetation; trash not reaching receiving water. Sample taken from MS4 only.

Trash Assessment Form

SITE ID: 1D-31 DATE: 09/04/2008

LOCATION: 50' west of S Vista Way Bridge on the south side of Buena Vista Creek TIME: 8:50

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 4

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☒ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 9B-7 DATE: 9/11/2008

LOCATION: Laguna Dr & State St intersection, across from 2531 State St TIME: 10:00

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 5 x 4

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 11B-46 **DATE:** 9/05/2008

LOCATION: East of Sierra Morena Ave, south of Valewood Ave **TIME:** 15:15

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 5 x 3

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 3 x 3

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ Optimal	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ Suboptimal	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ Marginal	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ Submarginal	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ Poor	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ Threat Human Health	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ Threat to Aquatic Health	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Trash Assessment Form

SITE ID: 21D-34 **DATE:** 9/09/2008

LOCATION: inside Encinas Power Plant, east of plant tower, outfall at south end of the open channel **TIME:** 9:15

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 8 x 2

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☒ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 27B-75 **DATE:** 9/10/08

LOCATION: main line east of I-5, south of Cannon Rd, west of the Car Country Carlsbad sign **TIME:** 15:10

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 3 x 3

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☒ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 35C-51A **DATE:** 9/09/08

LOCATION: Inside Encinas Wastewater Plant **TIME:** 11:40

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L X W (FT): 200 x 10

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☒ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 36B-95 DATE: 9/12/08

LOCATION: 10 yards north of 1925 Palomar Oaks Wy, in canyon TIME: 13:45

OBSERVER: MD, DM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): ~~4x5~~ 5x4

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☒ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 37C-28 DATE: 9/15/08

LOCATION: Across from 1979 Palomar Oaks Way TIME: 10:40

OBSERVER: MD, DM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 5

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Comments should be added for clarification.
☐ Threat to Aquatic Health	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 44B-45 DATE: 9/15/08

LOCATION: Between 2526 & 2532 California St. TIME: 16:20

OBSERVER: MD, DM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 3 x 6

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☒ Optimal	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ Suboptimal	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ Marginal	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ Submarginal	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ Poor	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ Threat Human Health	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ Threat to Aquatic Health	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

OBSERVER: MD, DM

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): ~~10 X~~ 15 X 10

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☒ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 49A-69 DATE: 9/05/2008

LOCATION: Alga Rd. east of El Camino Real, between 2035 & 2043 TIME: 12:00

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 10

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☑ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ **Threat Human Health**	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ **Threat to Aquatic Health**	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 59C - 96 DATE: 9/17/08

LOCATION: 500 ft south of the intersection of camino de los codos & Rancho Santa Fe Rd TIME: 15:10

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 10 x 30

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☒ Optimal	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ Suboptimal	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ Marginal	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ Submarginal	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ Poor	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ Threat Human Health	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ Threat to Aquatic Health	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Trash Assessment Form

SITE ID: 62B-4 DATE: 9/16/08

LOCATION: Northeast part of street at intersection of Corte Pedro & Camino Alvaro, near Camino Alvaro and Rancho Santa Fe intersection TIME: 12:50

OBSERVER: MD, SD

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):

ESTIMATED AREA OF ASSESSMENT L x W (FT): 4x4

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES*: ☒ MS4 ☐ RECEIVING WATER ☐ BOTH	
☒ Optimal	On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ Suboptimal	On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area.
☐ Marginal	Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ Submarginal	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ Poor	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Threat to Human Health and/or Aquatic Health	
☐ Threat Human Health	Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification.
☐ Threat to Aquatic Health	Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification.

Signed Certification Statement

City of Carlsbad
Jurisdictional Urban Runoff Management Plan
Annual Report for July 1, 2007 – June 30, 2008

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Glenn T. Pruim R.E.

Public Works Director 9/26/08

Title Date

Executive Summary

Overview

The City of Carlsbad's (City) Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report addresses the implementation of the Municipal Storm Water Permit - Order 2001-01, NPDES No. CAS018758 (Permit) issued February 21, 2001, and the beginning of implementation of the new Permit, Order No. R9-2007-0001, issued January 24, 2007 and effective March 24, 2008. This Annual Report therefore is divided into two main sections with the first section covering Order No. 2001-01 from July 1, 2007 through March 23, 2008, and the second section covering the new Permit Order No. R9-2007-0001 from March 24, 2008 to June 30, 2008, for Chapters 1 through 9, and 15. Chapters 10, 11, 12, 13 and 14 were written to cover the full fiscal year, and are provided in the 2007-0001 section of this annual report.

In the full Fiscal Year 07-08 (FY 07-08), many procedures have been streamlined to efficiently manage data, monitor sites, track inspections and investigations, and manage other storm water related activities. Planning, Construction, and Existing Development activities have implemented improved processes to further incorporate storm water pollution prevention practices into internal activities as well as activities enforced by City departments. Highlights of each major component of the JURMP are listed below, and correspond to Section headings in this JURMP Annual Report.

Section 1: Introduction

The Introduction chapter for each section of the report gives some background on the City, explains the reporting period covered, as well as the report organization.

Section 2: Development Planning

The 2001-01 Permit requires the City to evaluate land use planning policies and principles, revise the environmental review processes, and develop an approval process to minimize the impacts of development activities on receiving water quality. Land-use planning gives the community an opportunity to comment on and shape policies that guide community development and interests. The City has developed goals that balance environmental protection with smart, long-term economic growth. By laying out a vision for local growth and coastal development, projects are consistent with the state and federal regulatory requirements and the City's land-use planning efforts.

Also during this reporting period, the City performed an in-depth review of the land-use development processes in preparation for the adoption of the new 2008 JURMP submitted in March, 2008. The City continued to implement the Standard Urban Stormwater Mitigation Plan (SUSMP), and all applicable projects were subject to a thorough discretionary and plan check review process to ensure compliance. From July 1, 2007 to March 23, 2008, there were 55 discretionary projects that were reviewed and required to submit applicable storm water pollution prevention plans (SWPPP). SUSMP requirements were applied to 45 private development/redevelopment projects and 10 City Capital Improvement Projects (CIP). Of the 45 private development/redevelopment projects, 25 were priority development projects subject to site design, source control and treatment control requirements and 20 were standard projects

subject only to site design and source control BMP requirements. Of the 10 City CIPs, 1 was a priority development project and 9 were standard projects.

Between July 1, 2007 and March 23, 2008, the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements and, to address the requirements of Order No, 2007-0001. The City also completely rewrote and updated its Storm Water Standards Manual which includes the updated 2008 Carlsbad SUSMP and updated Construction SWPPP Standards and Requirements.

From March 24, 2008 to June 30, 2008, SUSMP requirements were applied to 20 private development/redevelopment projects and 4 City Capital Improvement Projects (CIP). Of the 20 private development/redevelopment projects, 12 were priority development projects subject to site design, source control and treatment control requirements and 8 were standard projects subject only to site design and source control BMP requirements. Of the 4 City CIPs, 0 were a priority development project and all 4 were standard projects.

Section 3: Construction

The Permits require the City to implement activities that address and minimize short and long-term impacts on receiving water quality related to runoff from new construction sites. The City requires, prior to approval of a construction or grading permit, that project proponents implement measures to ensure that pollutants will be reduced to the maximum extent practicable and will not cause or contribute to an exceedance of water quality objectives. The City met these requirements by amending or conditioning existing permits, procedures and ordinances.

During July 1, 2007 to December 31, 2008, the City updated the construction inventory, inspected all high priority sites, conducted outreach and education to developers, engineers, contractors, and City staff, and used enforcement actions to obtain compliance when necessary. All active grading permits were ranked as high priority and inspected weekly during the rainy season. All required inspections were completed. There were 3148 required inspections and 3148 inspections were completed in this reporting period. Inspectors used enforcement actions as necessary to achieve compliance, including issuing 24 Written Warnings and 4 Stop Work Notices. The City continued to distribute the *Pollution Prevention Guide to the Construction Industry* brochure.

During January 1, 2008 to June 30, 2008, the City updated the construction inventory, conducted inspections, delivered outreach and education to developers, engineers, contractors, and City staff, and used enforcement actions to obtain compliance when necessary. All required inspections were completed. There were 3044 required inspections and 3044 inspections were completed in this reporting period. Inspectors used enforcement actions as necessary to achieve compliance, including issuing 30 Written Warnings. The City continued to distribute the *Pollution Prevention Guide to the Construction Industry* brochure.

Section 4: Municipal

The City's municipal facilities include administration buildings, recreational areas, maintenance and storage yards, water reservoirs, water pump stations, sewer lift stations, a road system, parking facilities, the storm drain system, pressure regulator vaults, and fire stations. Municipal facilities maintain the City's infrastructure that supports Carlsbad's quality of life. These

municipal facilities and their activities have the potential to contribute to water pollution if Best Management Practices (BMPs) are not properly implemented.

During both reporting periods, throughout FY 07-08, the Storm Water Committee continued to meet to discuss municipal storm water BMPs and pollution prevention issues. The Committee is comprised of approximately 14 members representing various City departments including Public Works, Fire Department, Recreation, and the Building Department. The intent is to communicate problems and solutions among the group in order to share knowledge, discuss training opportunities, enhance compliance with the Permit, and to pass along any new information from the Regional Water Quality Control Board (Regional Board). SWPPPs were developed for appropriate High Priority municipal facilities.

In FY 07-08, the City of Carlsbad's City Manager continued support for the Storm Water Leadership Team (SWLT). Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City's major service areas and Directors. Agenda items covered all areas of the City's compliance with Order No. 2001-001, as well as review of the new Order No. R9-2007-0001.

The City's street sweeping program exceeded both Permit requirements throughout the FY with twice weekly downtown sweeping routes.

Also during FY 07-08, inspections were conducted on High Priority Municipal facilities by both internal City staff and external consultants. With the annual inspections by the State Department of Pesticide Regulations (DPR for Parks activities), municipal inspections by internal and external inspectors, and staff training on storm water BMPs, personnel are more aware of the required maintenance practices in preventing storm water pollution.

The City also continued the Environmental Resources Management Team (ERMT) initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles. Support for the ERMT's work creating the Environmental Guiding Principles for City decision-making continued, and ERMT obtained approval from City Council on the formal principles.

The City's Municipal facilities and departments also continued to implement Integrated Pest Management practices where possible, to reduce the City's use of pesticides.

Section 5: Industrial/Commercial

The City currently tracks almost 300 industrial facilities within its jurisdiction. Major industry types include airport services, refuse and sewage management, pharmaceutical research and development, high technology and electronics, golf apparel and equipment manufacturers, and several light industry parks. Industrial activities have the potential to contribute to water pollution if BMPs are not implemented properly.

Under Order 2001-01, the City updated the prioritized industrial inventory, mapped all industries, inspected High, Medium, and Low industries. There were 42 required High Priority inspections and 42 were conducted. An additional 91 inspections of Medium and Low priority industries occurred as well. Education and outreach was also conducted to industries, and 2 enforcement actions were taken to obtain compliance when necessary. The City also worked closely with the Industrial Compliance Unit of the Regional Board by submitting copies of inspection reports and correspondence with high and medium priority industries.

The Storm Water Protection Program developed and continues to use *Knowledge and BMP Effectiveness Assessment* measures for industries. These assessments continued to be conducted by inspectors during onsite facility inspections.

The City currently tracks over 700 commercial facilities. Commercial facilities can generate a variety of pollutants depending on the types and locations of activities performed. Major commercial types include automobile maintenance, restaurants, pressure washing, masonry and concrete work, carpet cleaning, and landscaping activities. The City continued to implement a comprehensive program to reduce urban runoff originating from existing commercial sites and sources.

During this reporting period, the City updated the commercial inventory, mapped all high priority commercial facilities, provided education and outreach on BMPs, inspected 385 commercial sites, and conducted 31 enforcement activities to ensure compliance.

Between March 24, 2008 and June 30, 2008, the City combined and reprioritized its Industrial and Commercial Inspection inventory to reflect the new High Threat to Water Quality criteria. The City conducted 72 inspections (one fourth of the 50 required in implementing year 1) and issued 6 enforcement actions to obtain compliance.

Section 6: Residential

The City encompasses approximately 42 square miles and has an estimated population of 98,607 residents. At build out, sometime beyond year 2010, there will be nearly 54,599 residential units, housing approximately 135,000 residents. The residential community has a significant potential to contribute to water quality degradation. The focus of the City s pollution prevention strategy is a proactive information and education program that utilizes public presentations, fact sheets, direct mailers, brochures, website, and other media to increase knowledge and awareness of storm water pollution prevention efforts.

Targeted activities for residential areas include vehicle washing, storage and maintenance, lawn and garden care, home improvement projects, pet waste disposal, swimming pool maintenance, household hazardous waste (HHW) disposal, and trash and debris cleanup and disposal. The Storm Water Protection Program continued to distribute information addressing these residential BMPs and required several minimum BMPs to be implemented.

The City continued to distribute a new brochure developed in FY 05-06 for the mobile service providers including carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, and any other mobile business that provide services at various off-site locations. Mobile service materials and residuals such as cleaners, grease, soapy water, dirt, debris, and other pollutants often find their way to our streets and storm drains. This brochure was designed for mobile service providers, their employees and anyone that hires a mobile service provider.

Between July 1, 2007 to March 23, 2008 the City distributed storm water educational information for residential activities, continued an advertising campaign, hosted or participated in 12 residential outreach events, offered five oil recycling drop-off sites and two HHW collection sites for residential use, initiated a door-to-door residential HHW pick up program, hosted a HHW drop-off disposal day for Carlsbad residents, responded to 161 reports of illegal discharge, and issued 44 enforcement actions to achieve compliance.

In FY 07-08, the Storm Water Protection Program continued to work closely with other City programs and departments to address such issues as water conservation, code enforcement, outreach, and pollution prevention.

The Storm Water Protection Program received several complaints directly related to or caused by poor water conservation practices (over irrigation etc.). The Storm Water Protection Program continues to work closely with the City's Water Conservation Specialist to address these issues with residents.

From March 24, 2008 to June 30, 2008 the City responded to 66 reports of illegal discharge, and issued 25 enforcement actions to achieve compliance.

Section 7: Illegal Discharge Detection and Elimination

The City continued to conduct a comprehensive and proactive program for detecting and eliminating illegal discharges to the storm drain system. The City's program actively seeks to identify and eliminate illicit discharges and connections by conducting investigations, responding to spills and sewage overflows, conducting monitoring, and performing routine cleaning and maintenance activities on the sewer and MS4.

The Illegal Discharge Detection and Elimination (IDDE) report will be submitted in December 2008, as per Addendum 2, Order 2007-0001.

Section 8: Outreach and Education

The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent, though these messages often took varied forms. During FY 07-08, the City continued to be actively involved in outreach and education at the local level, the watershed level with the North County Storm Water Program (NCSWP), and at the regional level with the Project Clean Water Outreach Workgroup and the Think Blue campaign.

The City sent storm water educational information to all city employees distributed via paychecks in FY 07-08, participated in EPA webcasts as training opportunities, collaborated with local non-governmental organizations, hosted or participated in 12 outreach events, presented urban runoff and watershed concepts to 732 school-aged children, and distributed information through various media. The City also distributed promotional items such as notepads, pens and key chains with pollution prevention messages.

From March 24, 2008 to June 30, 2008 the City also educated 604 school-aged children, continued distributing outreach materials through various media, and participated in 4 outreach events for residents, the general public, and school-aged children.

Section 9: Public Participation

The City led and/or contributed to several public participation opportunities this reporting period including the development, implementation, and review of storm water management programs, BMPs, new requirements, and other JURMP and storm water related issues. During the reporting period, citizens, business owners and representatives, and other interested parties

were invited to attend public meetings, outreach events, workshops, City Council meetings, and other events related to storm water pollution prevention at the local and watershed levels. During this reporting period, the City conducted a Public Opinion Survey of 1,000 residents that included questions about storm water pollution, and held 5 community events.

During FY 07-08, the City's Community Volunteer Coordinator continued to find volunteers to assist the Storm Water Protection Program with various activities, including cleanup and outreach events. The City continued to recruit students from the University of California, San Diego to participate in an internship program with the Storm Water Protection Program. Interns worked on a variety of activities including commercial and industrial inspections, data management, and outreach and education.

Section 10: Fiscal Analysis

The total operating costs to fund the Storm Water Protection Program activities for FY 07-08 related to existing development was budgeted at $3, 083, 049. This includes actual expenditures for personnel, operating costs, and capital outlay from the Storm Water Protection Program budget, along with costs for street sweeping and litter pick-up, but does not include the *Storm Water Capital Improvement Program* costs.

Section 11: Effectiveness Assessment

Information collected in surveys, public comments, inspections, investigations, monitoring and other activities during the year were assessed on a full fiscal year basis to identify any trends and determine new or modified courses of action. During FY 07-08, the City continued participating in a Copermittee workgroup to draft common elements for effectiveness assessment.

The City made progress with effectiveness assessment measures during FY 07-08, using the Watershed Treatment Model to assess the effectiveness of storm water programs (Deb Caraco, Center for Watershed Protection). Assessment of each significant activity, each component, and an integrated assessment of the overall jurisdictional program is provided in Chapter 11 of the 2007-0001 section of this Annual Report.

Section 12: Special Investigations

The City participated in the San Diego Coastal lagoon TMDL Monitoring Program that is described in "San Diego Coastal Lagoons Monitoring Workplan" (Mclauglin et al, June 2008). Samples were taken in February and April 2008 in this FY. Results and conclusions of the monitoring program will be in the final report, written by Southern California Coastal Waters Research Project, near the end of the calendar year 2010.

Section 13: Non-emergency Fire-fighting

For FY 07-08, the Carlsbad Fire Department (CFD) developed this section to meet the requirements of Order No. R9-2007-0001. Several BMPs have been developed and incorporated at all 6 of the City's Fire Stations during implementation of Order 2001-01 and continued this FY. Each station has a storm water manual, spill response equipment, regular cleanup and removal of organic debris from parking lots, and portable BMPs to contain and collect equipment and vehicle wash water. Training is conducted on property with no runoff or

discharge potential into the MS4, or at the City's Reclaimed Water Facility where water is collected into the Reclaimed Water reservoirs. Fire Prevention activities were also continued during this reporting period.

Section 14: JURMP Revisions

The City updated the JURMP in March 2008 in accordance with Order 2007-0001. The new JURMP was implemented for the remainder of the Fiscal Year. There are no specific revisions to be made to the JURMP at this time.

Section 15: Conclusion

During FY 07-08, the City successfully implemented the Permit requirements and the program activities described in the JURMP. Identified program strengths as well as improvement areas for FY 08-09 are outlined in each report section. As more programs and activities are implemented as part of Order no. R9-2007-0001, there is a clear need for better databases for tracking and reporting all of these activities and the BMPs being implemented. Tying all of these activities to changes in water quality still presents a considerable challenge. This is part of the long-term assessment strategy to develop trends and to determine cause and effect relationships of pollution prevention and water quality management. The City will continue to work with the Copermittees to develop additional effectiveness measures, in addition to implementing the identified measures on program effectiveness within the City.

Information from JURMP activities, WURMP activities, as well as the 303(d) List indicated that bacteria and sediment are high priority pollutants in the Carlsbad Watershed. The City proposes to continue addressing these pollutants through a number of existing or new activities, which include education, inspections, monitoring and maintenance through Order No. R9-2007-0001 implementation.

8.2 Storm Water Committee Meeting Summary

1.0 INTRODUCTION

This section of the City of Carlsbad s (City) Jurisdictional Urban Runoff Management Plan (JURMP) Annual Report addresses the continued implementation of the Regional Water Quality Control Board (Regional Board) Order No. 2001-01 (NPDES Permit CAS0108758), commonly known as the Municipal Storm Water Permit. The Permit was issued February 21, 2001, and replaced the City s first municipal storm water permit issued in 1990 (Order 90-42). The Regional Board issued this Permit to prevent and control polluted urban runoff from Municipal Separate Storm Sewer Systems (MS4s) to downstream water bodies. As runoff flows through urban areas, it can carry harmful pollutants such as pathogens, sediments, fertilizers, pesticides, heavy metals, and petroleum products. Pollutants entering a receiving water body through the MS4 may harm aquatic life through toxicity and habitat degradation.

Each of the Copermittees listed in the Permit was required to develop a JURMP outlining their approach to protecting water quality and preventing harmful impacts from polluted urban runoff. The Permit requires the submittal of an Annual Report to the Regional Board to document the progress and implementation of the JURMP. This Annual Report details the activities conducted during the reporting period of July 1, 2007 through March 23, 2008, which corresponds to implementation of Order No. 2001-01, and in a separate section, those activities occurring from March 24, 2008 through June 30, 2008, under the implementation of Order No. 2007-0001.

The Permit requires each Copermittee to protect water quality during the three major phases of urban development: (1) land use planning for new development; (2) construction; and (3) the use or existing development phase.

The City is a municipal corporation, following the Council-Manager form of government. City Departments fall under one of five major service areas (MSA s): Public Safety, Administrative Services, Public Works, Community Development, and Community Services. While the City created the Storm Water Protection Program to help implement the Permit, program implementation is carried out by several departments within different MSA s. This allows for program implementation and new requirements to be incorporated into daily activities of City employees, instead of being viewed as completely new requirements without a connection to on-going services.

The City encompasses just over 42 square miles and borders 6 miles of coastline. Carlsbad also contains or borders three coastal lagoons (Buena Vista, Agua Hedionda and Batiquitos lagoons). The City is part of the Carlsbad Hydrologic Unit (Watershed), which includes four separate sub-watersheds that run through Carlsbad. These include each of the three lagoons and their respective drainage areas, in addition to a fourth watershed commonly known as Encinas Creek. Portions of Agua Hedionda Lagoon and Buena Vista Lagoon are listed as impaired for bacterial indicators and sedimentation/siltation on the Federal Clean Water Act Section 303(d) Impaired Water Bodies list. Buena Vista Lagoon is also impaired for nutrients. While this report focuses on the City s implementation of the JURMP and not the Watershed program, the two are becoming more intertwined as waterbodies and implementation strategies cross programmatic and jurisdictional boundaries.

1.1 Report Organization

This section of the Annual Report was prepared in accordance with the requirements of the Permit and contains a comprehensive description of the activities conducted by the City of Carlsbad. A list of acronyms is provided in Appendix 1.1.

The organization of this report follows the table of contents agreed to and submitted by the Copermittees to the Regional Board under Order No. R9-2007-0001. The Annual Report is divided into sections matching major sections in the Permit and the JURMP. As with the JURMP, many of the activities described in separate JURMP sections overlap with one another, so an activity may be referenced in more than one report section. The Annual Report is organized as follows:

Section 1 - Introduction
Section 2 Development Planning Component
Section 3 Construction Component
Section 4 - Municipal Component
Section 5 Industrial/Commercial Component
Section 6 - Residential Component
Section 7 Illicit Discharge Detection and Elimination Component
Section 8 Outreach and Education Component
Section 9 Public Participation Component
Section 10 Fiscal Analysis Component
Section 11 - Assessment of JURMP Effectiveness Component
Section 12 Special Investigations Component
Section 13 Non Emergency Fire Fighting Flows
Section 14 JURMP Revisions
Section 15 - Conclusions and Recommendations

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

This section outlines the Development Planning actions implemented by the City under San Diego Municipal Permit Order No. 2001-01 (the 2001 Municipal Permit) and covers the period from July 1, 2007 through and including March 23, 2008. The Development Planning actions implemented by the City under San Diego Municipal Permit Order No. 2007-001 (the 2007 Municipal Permit) are described in the second component to this annual report covering the period from March 24, 2008 through and including June 30, 2008.

During this reporting period (July 1, 2007 to March 23, 2008) the City maintained compliance with all land-use planning requirements of the City's Jurisdictional Urban Runoff Management Plan dated February 2002 (the 2002 Carlsbad JURMP). The City also continued to evaluate and modify its development review processes to minimize development impacts on storm water quality. The improvements and modifications made to the land-use development process during this reporting period (July 1, 2007 to March 23, 2008) are outlined below. In addition to those improvements outlined below, the City performed an in-depth review of the land-use development processes in preparation for the adoption of the new Carlsbad JURMP submitted to the Regional Board on March 24, 2008 (the 2008 Carlsbad JURMP) prepared in compliance with the 2007 Municipal Permit. The second component to this annual report covering the period from March 24, 2008 to July 30, 2008 will discuss and describe in detail the changes to the land-use development processes made in compliance with the 2007 Municipal Permit.

2.2 Land Use Planning

2.2.1 Background

In July 1986, the City adopted a *Growth Management Plan* into its General Plan to guide development and anticipate the types and numbers of facilities needed to accommodate the Carlsbad community at build out. Those facilities include sewer plant capacity, sewage pipelines, reclaimed water system, and storm drain system with flood and pollution control basins.

In September, 1994 the City adopted a Comprehensive Update of its General Plan. The General Plan includes goals that balance environmental protection with smart, long-term economic growth. By laying out a clear vision for environmentally sensitive development within this coastal community, development projects are required to be consistent with various City ordinances (i.e.; Grading and Erosion Control, Storm Water Management, Hillside Development, Coastal Resource Protection) and other regulatory requirements.

The General Plan is reviewed annually and revised as necessary to ensure that the public facilities are considered and City goals are met. On February 19, 2002, the City Council adopted General Plan Amendment GPA 01-15. This General Plan Amendment revised and supplemented various policies regarding storm water quality protection in the Open Space and Conservation Element of the General Plan. The revised and supplemented policies reflect all storm water quality and watershed protection principles found in both the 2001 and 2007 Municipal Permits pertaining to storm water pollution.

City staff again reviewed the storm water protection policies of the General Plan in FY 07-08 and no revisions were found necessary. The existing General Plan storm water protection policies are listed below:

a.) Develop and implement a JURMP consistent with the Permit and any amendments thereof.

b.) Adopt and implement a Master Drainage Plan and Standard Urban Storm Water Mitigation Plan (SUSMP) consistent with the Permit and any amendments thereof.

c.) Prior to making land use decisions, utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City requires developments to incorporate structural and non-structural BMPs to mitigate any increases in pollutant loads.

d.) Implement storm water pollution prevention methods to the maximum extent practicable, supplemented by pollutant source controls and treatment. Use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into the municipal separate storm sewer system (MS4).

e.) Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

f.) Developments shall implement appropriate recommendations to protect water quality found in the San Diego Association of Government s (SANDAG s) Water Quality Element of its Regional Growth Management Strategy.

g.) Development projects should be designed to comply with the following site design principles:

- Protect slopes and channels to decrease the potential for slopes and/or channels from eroding and impacting storm water runoff.
- To the extent practicable, cluster development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural undisturbed condition.
- Preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands and buffer zones. Encourage land acquisition of such areas.
- Provide buffer zones for natural water bodies.
- Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment.
- Where feasible implement site design/landscape features to slow runoff and maximize on-site infiltration of runoff.
- Properly design outdoor material storage areas (including the use of roof or awning covers) to minimize the opportunity for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids and other pollutants from entering the storm water conveyance system.

- Incorporate roof or awning covers over trash storage areas to prevent off-site transport of trash and other pollutants from entering the storm water conveyance system.
- Limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways and bridges.
- Design streets and circulation systems to reduce pollutants associated with vehicles and traffic resulting from development.

In addition to the General Plan, the City has adopted various storm water protection policies in other land use planning documents including the City s Local Coastal Program and Habitat Management Plan.

The Carlsbad Local Coastal Program covers that part of the City lying within the Coastal Zone. The Carlsbad City Council adopted a Zone Code Amendment (ZCA 01-08), Local Coastal Program Amendment (LCPA 01-15) and Municipal Code Amendments (MCA 01-05, 01-06, and 02-01) to revise/add new policies, standards, procedures and requirements regarding water quality and watershed protection to the Local Coastal Program Land Use Plans, Chapters 21.203 (Coastal Resource Protection Overlay Zone) and 21.205 (Coastal Resource Overlay Zone Mello I LCP Segment Local Coastal Program) of the Zoning Ordinance of Carlsbad's Municipal Code. One of the notable storm water requirements of the Carlsbad Local Coastal Program (LCP) is the inclusion of an additional criterion for determining a priority development project. Per the amended LCP, any project located within 200 feet of the Pacific Ocean that creates more than 2500 square feet of impervious surface or increases the project impervious area more than 10 over the existing impervious area is to be considered a priority development project.

Under the California Natural Community Conservation Program (NCCP), the City and six other cities in north San Diego County participated in the preparation of the Multiple Habitat Conservation Program (MHCP). The MHCP is a comprehensive planning program designed to develop an extensive ecological preserve in northwestern San Diego County. The City has prepared a subarea plan, called the Carlsbad Habitat Management Plan that was adopted in November 2004. The Carlsbad HMP contains the specific conservation, management, facility planning, land use, and other actions the City will take to implement the goals, guidelines, and standards of the MHCP plan. This Habitat Management Plan prohibits development in or near natural habitat areas including creeks and lagoons. Those areas act as a buffer between urban development pollutants and receiving waters. They also protect a significant percentage of natural area that are pervious leading to natural groundwater recharge and reduction in peak run off rates.

On November 1, 2002, the revised Zoning Ordinance, Municipal Code, and Local Coastal Plan Amendments were submitted to the California Coastal Commission. In August, 2006, the California Coastal Commission approved these municipal code amendments. All requirements of these documents were implemented in FY 07-08 and previous years including the years the City waited for Coastal Commission approval. The Local Coastal Program and Habitat Management Plan were evaluated during FY 07-08 and no revisions were found necessary.

2.2.2 Source Characterization

Land Use Planning is the process whereby the City determines appropriate land use designations for a property consistent with the City's General Plan requirements. As such, source characterization of pollutants is addressed generically in association with the type of land use proposed (i.e. low density residential, high density residential, commercial, and industrial, etc). Each land use decision made during the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008) was found consistent with the storm water protection policies as contained in the City's General Plan, Local Coastal Program (if applicable) and Habitat Management Plan.

In many cases, land use planning applications are accompanied by specific project development applications. In such cases, the project was required to identify specific project pollutant sources consistent with the City's Standard Urban Storm Water Mitigation Plan dated April 2003 (the "2003 Carlsbad SUSMP") and to identify project specific Best Management Practices (BMPs) to eliminate or minimize any negative impacts to storm water quality. For more specifics on source characterization applied to development projects during the project approval and verification process reference Section 2.4.2 below.

2.2.3 Best Management Practice Requirements

The City reviewed the existing storm water quality and watershed protection goals and policies within the City General Plan and found them to be adequate to meet the requirements of the 2001 Municipal Permit as well as the 2007 Municipal Permit. No modification was made to BMP requirements of the General Plan during FY 07-08.

2.2.4 Program Implementation

Every General Plan Amendment and land use planning application approved by the City during FY 07-08 was found in conformance with all storm water protection policies of the Carlsbad General Plan, Local Coastal Program (as appropriate), Habitat Management Plan and the Carlsbad Municipal Code (CMC). This includes compliance findings for all the storm water quality goals and objectives of the City's Grading and Drainage Ordinances (Title 15 of the CMC).

For the period covered by this component of the annual report (July 1, 2007 to March 23, 2008) the land use planning review process began with the submittal of a planning application at the City's development services counter. Concurrent with the land use application the city requires submittal of the Storm Water Requirements Applicability Checklist which determines if the project is a priority or non-priority development project. Each project was then reviewed for conformance with the storm water protection policies and requirements of the 2003 Carlsbad SUSMP, the General Plan, any applicable Local Coastal Plan, the Habitat Management Plan and all City Codes. Concurrent with each project approval in FY 07-08, the City made specific written findings in the project approval document that the project complied with all appropriate General Plan, Local Coastal Plan (as appropriate), Habitat Management Plan and City Codes including all relevant storm water protections policies and requirements. A copy of written findings for an actual project approval is included within the examples of priority project approvals included in Appendix 2.5.

2.3 Environmental Review Process

The City's Environmental Review Process begins with the Initial Study Checklist (CEQA Guidelines). Based on the results of the checklist, the City requires the project applicant to provide additional studies to elaborate on the environmental impacts or recommend denial of the permit that the project applicant is seeking. The Initial Study Checklist includes specific hydrology and water quality analysis as follows:

HYDROLOGY AND WATER QUALITY. *Could the project:*
a. Violate any water quality standards or waste discharge requirements, including but not limited to increasing pollutant discharges to receiving waters (consider temperature, dissolved oxygen, turbidity, and other typical storm water pollutants)?
b. Have potentially significant adverse impacts on ground water quality, including but not limited to substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?
c. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in substantial/increased erosion or siltation on- or offsite?
d. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner that would result in flooding on- or off-site and/or significant adverse environmental impacts?
e. Cause significant alteration of receiving water quality during or following construction?
f. Cause an increase in impervious surfaces and associated runoff?
g. Cause potentially significant adverse impact on ground water quality?
h. Cause or contribute to an exceedance of applicable surface or ground water receiving water quality objectives or degradation of beneficial uses?
i. Is the project tributary to an already impaired water body, as listed on the Clean Water Act Section 303(d) list of impaired waterbodies? If so, can it result in an increase in any pollutant for which the water body is already impaired?
j. Create or exacerbate already existing environmentally sensitive areas (ESAs)?
k. Create potentially significant environmental impact on surface water quality, to either marine, fresh, or wetland waters?
l. Impact aquatic, wetland, or riparian habitat?

The City reviewed the existing Environmental Review Process Initial Study Checklist during FY 07-08 and found that it adequately addresses the Environmental Review requirements of the 2001 Municipal Permit and the 2007 Municipal Permit; therefore, no revisions were made to the storm water quality compliance requirements of the Initial Study Checklist.

2.4 Development Project Approval and Verification Process

2.4.1 Background

The City requires new development and redevelopment projects to implement measures to ensure urban runoff from proposed project sites will be treated to reduce pollutant loads to the maximum extent practicable (MEP), and will not cause or contribute to an exceedance of receiving water quality objectives.

The City is dedicated to putting into place all the administrative and regulatory tools required to implement the Land-Use Planning requirements of the 2001 Municipal Permit as well as the 2007 Municipal Permit. During the reporting period (July 1, 2007 to March 23, 2008), the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements, and to address the requirements of the 2007 Municipal permit. The City also completely rewrote and updated its Storm Water Standards Manual which includes an updated City SUSMP dated March 2008 (the 2008 Carlsbad SUSMP) and updated Construction SWPPP standards and requirements.

The City updated the Storm Water Requirements Applicability Checklist (now titled the Storm Water Standards Questionnaire) to make it more understandable (for City applicant benefit) and to address redevelopment projects. Changes were also made to the City s application submittal checklists, standard project conditions of approval and project plan review checklists to improve clarity, address the requirements of the new 2007 Municipal Permit and ensure greater compliance with the storm water standards and requirements.

All of the process improvement, code and standards changes became effective after March 24, 2008, with the exception of the standard project conditions of approval and will be discussed and described in greater detail in the second component to the annual report covering the period from March 24, 2008 to June 30, 2008. The changes to the standard project conditions of approval were implemented prior to October 2007 to provide developers advance notice of 2007 Municipal Permit requirements since it generally takes a minimum of six months for a project to proceed from discretionary approval to construction permit stage. The City s early implementation of the updated standard project conditions of approval facilitated developer compliance with the new BMP requirements, interim LID and hydromodification requirements which became effective on March 24, 2008, and helped to avoid costly and timely delays for developers.

2.4.2 Source Characterization

Development project approval is the stage of the development process where storm water quality impacts are assessed and the project is designed to eliminate or minimize potential sources of storm water pollutants. Each priority development project submitted between July 1, 2007 and March 23, 2008, was required to prepare and submit a Storm Water Management Plan (SWMP) consistent with the 2003 City SUSMP concurrent with any discretionary or ministerial permit application. An important component of the SWMP is source identification.

Prior to March 24, 2008, project proponents were required to identify potential pollutant sources generated by their particular land use and development design in accordance with the

procedures outlined in the 2003 City SUSMP. Table 2 on page 12 of the 2003 Carlsbad SUSMP was used to assist the developer in identifying potential pollutant sources for various project categories. Additionally, project proponents were required to identify the pollutants of concern or impairment for the receiving waters into which the project runoff discharges. The project proponent was then required to determine if the proposed project included any land use activity or development design that generated or potentially added to any water quality impairment within the receiving waters. The 2006 303(d) list of water quality impairments for receiving waters in Carlsbad is shown in Table 2.4.2 below:

Table 2.4.2

2006 303(d) Listings within the City of Carlsbad		
Carlsbad Waterbody	**Drains to**	**Pollutant**
Agua Hedionda Creek	Agua Hedionda Lagoon	Manganese
		Selenium
		Sulfates
		Total Dissolved Solids (TDS)
Agua Hedionda Lagoon	Pacific Ocean	Indicator Bacteria
		Sedimentation/Siltation
Buena Vista Creek	Buena Vista Lagoon	Sediment Toxicity
Buena Vista Lagoon	Pacific Ocean	Indicator Bacteria
		Nutrients
		Sedimentation/Siltation
Pacific Ocean at Buena Vista Creek	Pacific Ocean	Indicator Bacteria
Buena Vista Creek		
Carlsbad Village Drive		
Pine Avenue		
Encinitas Creek	Batiquitos Lagoon	Phosphorus
San Marcos Creek	Batiquitos Lagoon	DDE
		Phosphorus
		Sediment Toxicity

Projects draining into one of these receiving waters were required to analyze their potential for contributing one or more of the identified pollutants to the receiving water. If a potential source was identified, then an appropriate source control, site design or treatment control BMP measure was identified to eliminate or reduce the offending pollutant to the MEP and not cause or contribute to an exceedance of receiving water quality objectives.

2.4.3 Best Management Practice Requirements

During the reporting period covered in this component of the annual report (July 1, 2007 to March 23, 2008), each land development project in the City met the minimum BMP requirements of the 2001 Municipal Permit. The City's minimum requirements are contained within the 2003 Carlsbad SUSMP and the City's Storm Water Standards Manual as specified in the 2002 Carlsbad JURMP. All approved projects were required to incorporate both site design and source control BMPs into project design. Priority projects per the 2001 Municipal Permit were required to incorporate additional treatment control BMPs into the project design.

The 2007 Municipal Permit required the City in conjunction with the other co-permittees, under the San Diego Municipal Permit, to update the regional Model SUSMP. During the reporting period covered by this supplement of the annual report (July 1, 2007 to March 23, 2008) the City worked in cooperation with the other co-permittees to develop a revised Model SUSMP which was collectively adopted by the co-permittees on November 6, 2007. Throughout the reporting period, the City compelled all priority development/redevelopment projects, including City Capital Improvement Program (CIP) projects to comply with the 2003 Carlsbad SUSMP.

Beginning in October 2007, the City began requesting new priority development and redevelopment projects to comply with the interim LID and hydro-modification BMP requirements pursuant to the 2007 Municipal Permit. The City's early implementation of the interim BMP requirements into new project design in October 2007 facilitated developer compliance with the new interim LID and hydro-modification requirements which became effective on March 24, 2008, and helped to avoid costly and timely delays for developers and the City.

The City's local SUSMP implementation document is incorporated into the City of Carlsbad Storm Water Standards Manual hereinafter referred to as "Storm Water Standards Manual", which addresses specific post-construction site design, source control and treatment control storm water BMPs that must be incorporated into Priority Development Projects. The City updated its Storm Water Standards Manual to incorporate appropriate requirements of the 2007 Municipal Permit. The updated Storm Water Standards Manual became effective on March 24, 2008, and will be discussed more thoroughly in the second supplement to the annual report covering the period from March 24, 2008 to June 30, 2008. The Storm Water Standards Manual provides information on selection and implementation of the construction, site design, source control and treatment control BMPs. Copies of the 2003 Storm Water Standards Manual and updated 2008 Storm Water Standards Manual are included as Appendices 2.9 and 2.10, respectively.

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydromodification Management Plan (HMP). The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

Each development project was assessed for its potential to generate urban pollutants using the Storm Water Requirements Applicability Checklist (a copy of the Applicability Checklist is included in Appendix A to the 2003 Carlsbad SUSMP attached as Appendix 2.10. Those specific types of projects (or project components) identified as having a high potential to generate pollutants in accordance with the 2001 Municipal Permit and Local Coastal Program requirements were classified as a "priority development projects". Each priority development project was associated with one or more of the general pollutants categories as described in Table 2 of the 2003 SUSMP. Additional pollutant categories were then determined based upon their potential of being generated from the specific priority project proposal.

Each priority project was then required to incorporate site design, source control and treatment control BMPs into the project design as specified in the 2003 Carlsbad SUSMP to eliminate or reduce the pollutants of concern to the MEP and so as to not cause or contribute to an

exceedance of receiving water quality objectives. Non-priority projects were required to incorporate site design and source control BMPs into their project design. The following is a brief listing and description of the types of BMPs incorporated into project designs during the reporting period:

Site design BMP features incorporated into Carlsbad developments during the reporting period include the following:

- Minimization of building footprints and incorporation of impervious pavements
- Conservation of natural area by clustering of development and preservation of natural drainage systems
- Directing flows from impervious surfaces across pervious pavements or landscape areas
- Preservation of existing trees and planting of new trees to maintain and increase canopy coverage
- Conveying of drainage away from slopes or provision of appropriate slope down drains
- Vegetating slopes and open space areas with drought tolerant plants
- Stabilization of permanent channel crossings and installation of energy dissipaters at drainage outlets

Source Control BMP features incorporated into Carlsbad developments during the reporting period includes the following:

- Enclosure of outdoor storage areas
- Trash enclosures that have impervious surfaces and do not allow drainage to flow through the enclosure and use of trash bins with lids that exclude rain
- Use of efficient irrigation systems with moisture sensors and properly designed flow control systems
- Stenciling and/or placement of tiles at every storm drain inlet

For projects that included one or more of the individual project categories, an appropriate BMP was utilized that include BMPs such as:

- Directing drainage from private streets across vegetated swales or into bioretention areas
- Directing drainage from dock and loading areas into bioretention areas or through filters/clarifiers prior to discharge into storm drains
- Keeping maintenance bays indoors and directing floor drainage into the sewer system
- Installation of special bacterial filter systems for outdoor eating areas
- Incorporation of landscape areas into surface parking lots
- Landscaping of hillside areas with deep rooted and drought tolerant plants

For most projects built during the reporting period (July 1, 2007 to March 23, 2008), hydrodynamic separator systems or filter inserts were the preferred method of treatment control to treat for sediment and trash. Beginning in October of 2007, new development and redevelopment projects were not permitted to use hydrodymanic separator systems or filter inserts as a primary means treatment control.

The City of Carlsbad processed a significant number of development applications during the reporting period covering a wide range of project categories including residential, commercial and industrial projects. Each high priority project included appropriate treatment control BMPs from the list of allowable treatment controls included in Table 4 of the 2003 Carlsbad SUSMP. Other than filter inserts and hydrodynamic separator systems (noted above) the types of treatment control systems approved for new developments during the reporting period included bioretention areas, vegetated swales, detention basins and filtration systems.

2.4.4 Program Implementation

Description of notable activities conducted to manage urban runoff from development projects

The City has a comprehensive set of storm water pollution prevention activities which are incorporated into its project development approval and BMP installation verification process. The measures include everything from the development of urban runoff land use planning policies, development processing procedures, project submittal and review checklist, educational pamphlets, engineering standards, ordinance updates, database inventory control, monitoring requirements, staff and developer training and project tracking and reporting. Each activity has been carefully designed to help eliminate or reduce storm water pollution to the maximum extent practicable (MEP) and to not cause or contribute to an exceedance of receiving water quality objectives.

The development process has many stages from concept review on through to construction completion and project operation and maintenance. The City conducts many notable activities meant to ensure development project compliance with the City s urban runoff management policies and requirements. Table 2.4.4 presents a brief description of the notable storm water pollution prevention activities undertaken at each stage of the development process. Also included in the table are a listing of the City reference materials and implementation documents available to developers and City staff which are applicable to each stage in the process.

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Conceptual Project Design	Developer uses the 2003 Carlsbad SUSMP and Storm Water Requirements Applicability Checklist to determine project priority and begins project layout and design. For priority projects the City recommends to developers that a preliminary SWMP should be prepared.	• Storm Water Requirements Checklist • Storm Water Standards Manual which includes the 2003 Carlsbad SUSMP • 303(d) List
Pre-application Review	Developer submits the preliminary project proposal to staff to obtain input on conceptual project layout including storm water compliance issues.	• Preliminary site plan checklist • SWMP Fact Sheet
Application for Discretionary Review	City staff review application package at front Counter for completeness of submittal including storm water compliance documents. Project is logged into the City database for tracking. A completed Environmental Initial Assessment (EIA) form is submitted with the application package.	• Project Application Submittal Checklist • City review letter
Application Review	City staff reviews application, site plans and accompanying reports and documents including any SWMP, geotechnical and hydrology/hydraulic reports. Project is reviewed for consistency with General Plan, Local Coastal Plan (LCP), Habitat Management Plan (HMP1), 2003 Carlsbad SUSMP and City Codes and other Standards including all storm water protection policies and requirements. Project location is reviewed for proximity to environmentally sensitive areas and to determine if project drains to a water body on the 303(d) list. Project EIA is reviewed and appropriate environmental review documents are requested and reviewed in compliance with California Environmental Quality Act (CEQA) requirements.	• Site plan review checklist • SWMP checklist • 303(d) List • General Plan • Local Coastal Plan • Habitat Management Plan • City Codes • Environmental Assessment Form • CEQA Guidelines • City review letter (if any)
Discretionary Approval	City denies project or approves with conditions including storm water compliance conditions. Applicable standard conditions of approval are applied to the project together with any special conditions of approval as City staff determines necessary to reduce or eliminate the projects storm water pollution impacts to the MEP. Approving authority makes required findings that project complies with the General Plan, LCP, HMP1, City Codes and any other appropriate land use planning documents. Environmental documents are certified and any mitigation monitoring requirements. are noted in the project approval.	• City s standard conditions of approval • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)
Final Project Design	Developer prepares project construction plans including grading, improvement, landscape and building detailing required BMPs. Construction SWPPP is prepared and SWMP is finalized.	• Storm Water Standards Manual • Project Conditions of Approval • Environmental mitigation and monitoring plan (if any)
Construction Plan Check Application Submittal	City staff review application package for completeness of submittal including storm water compliance documents. Applicant completes and submits Project Storm Water Threat Assessment Worksheet included as part of the Storm Water Requirements Applicability Checklist.	• Plan Check Application Submittal Checklist • Storm Water Requirements Applicability Checklist • Project Conditions of Approval
Construction Plan	City staff reviews construction plans and accompanying reports and	• Construction Plan Checklist

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Check Review	documents including any SWMP, Construction SWPPP, geotechnical and hydrology/hydraulic reports. All storm water pollution prevention requirements are checked against construction plan checklist, SWMP checklist, Construction SWPPP checklist and project conditions of approval. Construction cost estimates are approved for bonding costs including costs for structural BMPs. For priority projects a BMP Maintenance Agreement is prepared.	• SWMP Checklist • Construction SWPPP Checklist • Project conditions of approval • Storm Water Requirements Applicability Checklist • City Engineering plan review procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates
Construction Plan Approval	City approves construction plans and accompanying Construction SWPPP and SWMP. The executed BMP Maintenance Agreement is recorded and entered into the City's document management system database. All treatment control BMPs are noted on the construction plans and forwarded to the GIS group for entry into the BMP inventory. Any project design changes that differ from the approved site plan or project conditions of approval are reviewed in compliance with the City's Substantial Conformance Procedures to ensure that the project remains in compliance with all land use planning findings. Secured agreements to construct project improvements are obtained backed up with cash and/or other securities. Developer is required to note the WDID number on the project plans.	• Plan check completion letter • BMP Maintenance Agreement • BMP Inventory update procedures • Substantial Conformance Procedures • Environmental mitigation and monitoring plan (if any) • Cost estimates • Secured Agreements
Ministerial (Construction) Permit Issuance	City issues permit(s) for construction activities including grading, improvement, building, demolition and blasting. Any special storm water compliance requirements are noted on permit. City staff review plan check completion letter for any special storm water compliance requirements. Copies of the permit, construction plans, Construction SWPPP and SWMP are forwarded to the Construction Management and Inspection Division. A construction inspection level (low, medium or high) is assigned in accordance with the project's threat assessment analysis. The project tracking database is updated with the project threat assessment construction level and permit issuance status.	• Plan check completion letter • Project SWMP • Project Construction SWPPP • Construction Threat Assessment Worksheet • Pollution Prevention Guide for the Construction Industry • Construction SWPPP Fact Sheet
Preconstruction Meeting	City staff meets with contractor and other parties to review project construction issues, schedule, storm water BMP implementation, monitoring, and testing requirements. Contractor is informed of storm water inspection and enforcement procedures and reminded to maintain compliance with the City's storm water pollution prevention requirements. City inspector verifies the NOI has been filed with the Regional Board and a WDID number has been assigned to the project.	• Preconstruction checklist • Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry
Construction and	Developer constructs project including temporary and permanent BMPs.	• Construction SWPPP

Table 2.4.4 Storm Water Compliance Process for Development Activities

Development Process Stage	Activity Description	Process Review Documents References
Inspection	City inspectors enforce compliance with SWPPP, SWMP and Municipal Permit. During construction City project inspector reviews construction for compliance with all plans, the Construction SWPPP, SWMP and City Standards. Regular storm water compliance inspections are scheduled and tracked per City procedures and the requirements of the 2003 or 2008 JURMP, as applicable. Enforcement actions are taken as necessary in accordance with City inspection and enforcement procedures. City inspector reviews and approves any minor construction revisions. Major construction revisions are referred to the Engineering Development Services Division for review and approval.	• SWMP • Construction plans • City inspection and enforcement procedures • Pollution Prevention Guide for the Construction Industry • Inspection reports • Enforcement action reports • Secured Agreements
Project Completion	Construction plans are as-built, securities released, and BMP construction verified. As-Built plans prepared and forwarded to the GIS Group to update the BMP inventory. Public Improvements are accepted for maintenance including any public structural control BMPs.	• Construction SWPPP • SWMP • Construction plans • Pollution Prevention Guide for the Construction Industry • Punch list • Secured Agreements • Project Acceptance Forms
Post Construction Annual Treatment Control BMP Inspections	BMP owners maintain BMPs in accordance with recommended and regulatory maintenance schedules.	• SWMP • BMP Inventory List • Site BMP Inspection Report • BMP Maintenance Agreement

Confirmation that all development projects were required to undergo the City's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), all new development projects and redevelopment projects including City Capital Improvement Program (CIP) projects were required to undergo the City's urban runoff approval process in accordance with the requirements of the 2001 Municipal Permit and 2002 Carlsbad JURMP.

Project compliance was tracked through a variety of paper and computer tracking systems. During the reporting period (July 1, 2007 to March 23, 2008), tracking of projects through the discretionary project approval process consisted of paper records kept in individual files. As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specified whether the project had to comply with the priority or non-priority project requirements of the 2003 Carlsbad SUSMP. For priority development projects, a written Storm Water Management Plan (SWMP) was prepared detailing all proposed site design, source control and treatment control BMPs. Structural site design, source control and treatment control BMPs are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority status (Priority, Non-Priority or Exempt). A listing of the development project approvals is included as Appendix 2.2.

During the construction plan review stage, a final design SWMP is submitted and approved. In addition, each project's required structural BMPs are incorporated into the project plans. For priority projects a table is placed on the title sheet identifying each treatment control facility including manufacturer's information and maintenance schedules and specifying which page of the plans contain the details of each required BMP. A separate table is included on the detail sheet providing additional information including the number of BMP units located on the specified plan sheet. The tables are used to highlight BMP requirements to the contractor and project inspector. The table also makes it easier for City GIS staff to locate treatment control BMPs for entry into the City's GIS database.

At the project permitting stage, the projects priority status and construction inspection threat assessment level (low, medium or high), as determined by the Storm Water Requirements Checklist, was entered into the City's Permits Plus software program for automated tracking. The Permit Plus program links the various ministerial construction permits (building, right-of-way, blasting and grading) to the "master" development project. The Permits Plus program is used to automatically generate storm water inspection requests for development projects with active permits. The program is also used to track inspection results and follow-up enforcement inspections.

A listing of the development projects to which SUSMP requirements were applied

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), the 2003 Carlsbad SUSMP requirements were applied to 45 private development/redevelopment projects and 10 City Capital Improvement Program (CIP) projects.

Of the 45 private development/redevelopment projects, 25 were priority development projects subject to site design, source control and treatment control requirements and 20 were standard projects subject only to site design and source control BMP requirements. Of the 10 City CIP projects, 1 was a priority development project subject to site design, source control and treatment control requirements and 9 were standard projects subject only to site design and source control BMP requirements. Copies of the development and CIP project lists showing project priority are attached as Appendices 2.2 and 2.3, respectively.

Confirmation that all applicable 2003 Carlsbad SUSMP BMP requirements were applied to all priority development projects, including a description of how the information was tracked

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), all applicable requirements of the 2003 Carlsbad SUSMP were applied to all priority development projects. The City required submittal of a completed Storm Water Requirements Applicability Checklist for every discretionary application made to the City during the reporting period. Projects determined to be priority development projects per the Applicability Checklist were additionally required to submit a preliminary Storm Water Management Plan (SWMP).

As projects are approved, standard and special conditions of approval are placed in the written project conditions of approval. These conditions specify whether the project must comply with the priority project or standard project requirements of the 2003 Carlsbad SUSMP. For priority projects, a written Storm Water Management Plan (SWMP) is prepared detailing all proposed site design, source control and treatment control BMPs. Structural site design, source control and treatment control BMPs are also reflected on the site plan or tentative map. The tentative map/site plan, conditions of approval and SWMP document are used at the construction plan review and ministerial permitting stage of the project to ensure compliance with the appropriate storm water pollution prevention requirements.

The City maintains a database of project discretionary approvals which includes project approval date, approving authority, appropriate resolution numbers and the project priority status (Priority, Non-Priority or Exempt). A list of the project discretionary approvals is included as Appendix 2.2.

At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs

Appendix 2.5 of the annual report includes a sample project which received discretionary approval during the review period (July 1, 2007 to March 23, 2008). The sample project for this reporting period is an 18,578 s.f. office condominium project on a 1.48 acre parcel, known as El Camino Terrace that drains to Agua Hedionda Creek. The anticipated and potential pollutants generated by the project, as determined by Table 2 of the 2003 Carlsbad SUSMP, include sediments, nutrients, trash and debris, oxygen demanding substances, oil and grease, bacteria and viruses and pesticides. The Agua Hedionda Creek is impaired for total dissolved solids, and the Agua Hedionda Lagoon is impaired with indicator bacteria and sediment as noted on the 303(d) list. The required BMPs for the El Camino Terrace project included the following:

1. Site Design
    a. Minimized Impervious Footprint
        i. Building designed to maximum height allowed by Code
        ii. Used existing pavement for a portion of the access drive
        iii. Conserved portions of the onsite existing natural vegetation

b. Provide Buffer Zones Between Natural Water Bodies and the Project Footprint
    i. Used natural drainage systems (vegetated swales) instead of pipes or lined channels
c. Minimized Directly Connected Impervious Areas
    i. Roof drains and parking lot drainage directed to bioswales
    ii. Drain sidewalks to landscape areas
    iii. Driveway and underground parking area drain to detention basin and Filtera bio-filtration unit prior to storm drain
    iv. Maximized canopy using native or drought tolerant trees and large shrubs

2. Source Control
    a. Trash receptacles to be stored under cover
    b. Efficient irrigation with rain shut-off devices for landscaped areas
    c. All storm drain inlets in the project area to be stenciled and signed with porcelain tiles
    d. Property owners to be provided with storm water pollution prevention informational packages
    e. Integrated Pest Management practices to be used
    f. All storage inside no outdoor storage proposed
3. Individual Project Category
    a. The runoff from private driveway directed over filter strips and into vegetated swale
    b. Project slopes to be landscaped with deep-rooted drought-tolerant plants
4. Treatment Control
    a. A high-rate bio-filtration unit (Filtera) sized in accordance with Municipal Permit requirements
    b. Bioswales sized in accordance with the Municipal Permit requirements
    c. Vegetated filter strip
    d. Filter inserts

A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible

No priority projects were allowed to develop using primary treatment control BMPs with low removal efficiency rankings during the reporting period (July 1, 2007 to March 23, 2008).

An updated treatment control BMP inventory

The City has a watershed-based inventory of publicly and privately owned treatment control BMPs. The inventory has been used to track and document information about each of these structures, including, BMP type, inspection dates and findings, maintenance frequencies and requirements, verifications, and other Permit requirements. Development of the inventory is an ongoing process as new structures are researched, verified, and added to the database on a continual basis.

During this reporting period, the City updated the watershed based inventory and prioritized all verified structures into high, medium, and low categories as required by the Permit according to BMP type, location, and proximity to the nearest ESA. During the last quarter of FY 07-08, the City was able to confirm 232 privately owned treatment control BMPs, which includes 85 high priority, 82 medium priority, and 65 low priority structures. In addition, there were 57 publicly owned treatment control BMPs on the inventory, which included 11 high priority, 46, medium

priority, and no low priority structures. A copy of the updated treatment control BMP inventory for both publicly and privately owned facilities is included as Appendix 2.4.

The number of treatment control BMPs inspected, including a summary of inspection results and findings

During FY 07-08, staff worked to confirm the accuracy of information on the inventory, research certifications and maintenance requirements, verify ownership and responsible parties, and develop inspection procedures, forms, and outreach materials for this new program. A new treatment control BMP inspection form for privately owned structures was developed and a copy can be found in Appendix 2.6. Inspection of privately owned treatment control BMPs identified on the updated inventory will be conducted as required by the Permit by October 1, 2008 and the results will be reported in the FY 08-09 annual report.

A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings

During FY 07-08, the City developed a new treatment control verification form. The form will be mailed to all private property owners and other responsible parties identified on the updated inventory prior to the rainy season. The mailers will include an information letter, treatment control BMP brochure, and the verification form. Private property owners will also be able to download information about treatment control BMPs from the City's webpage at www.carlsbadca.gov/cmi. It is anticipated that there will be a learning curve for responsible parties because they have not been required to provide verification of the maintenance and operation of the treatment control BMPs in the past. The City will work with the responsible parties for the first year of the verification program implementation. In the event that a responsible party does not respond the City may use its enforcement authority to escalate efforts. A copy of the new treatment control verification form can be found in Appendix 2.7.

Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), the installation of all structural BMPs required of priority projects were verified prior to occupancy. The process is initiated when a request for occupancy is made to the City by the building contractor or developer. Both the building inspector and public works inspector are notified of the request for occupancy and final inspections are schedule. The building inspector and public works inspectors review the project site for compliance with all City requirements including verification of BMP installation. If all the requirements are satisfactory, the building inspector and public works inspector sign off on the occupancy permit and occupancy is granted. The City maintains a copy of the signed occupancy permit in the building permit file. The City Building Department staff then updates the status of the permit in the building permit database.

A listing of any projects which received a SUSMP waiver

No projects received a SUSMP waiver during the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008).

A description of any SUSMP waiver mitigation program

The City did not incorporate a SUSMP waiver program within the 2003 Carlsbad SUSMP or the updated 2008 Carlsbad SUSMP. No SUSMP waivers were requested or granted during the reporting period. If a SUSMP waiver is requested in the future, the City will follow the waiver provisions as provided in the 2007 Municipal Permit.

A description of Hydro-modification Management Plan development collaboration and participation

In addition to participating in the Model SUSMP update, the City participated and will continue to participate in the development of the regional Hydromodification Management Plan (HMP). City staff attended the copermittee meetings held on the HMP during FY 07-08 and provided input into the discussion process. The City of Carlsbad participated in the cost sharing for the consultant firms retained to prepare the San Diego regional HMP. The HMP, similar to the Model SUSMP document, will require that development projects incorporate BMPs into their design to maximize infiltration and mimic pre-project hydrologic characteristics. Once the HMP is complete and acceptable to the RWQCB, the City will revise its JURMP and Storm Water Standards Manual to reflect the HMP requirements.

A listing of priority development projects required to meet Hydromodification Management Plan (HMP) requirements, including a description of hydrologic control measures implemented

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), the interim HMP requirements were not in effect; therefore, no projects were required to meet the interim HMP requirements.

A listing of priority development projects not required to meet Hydromodification Management Plan requirements, including a description of why the projects were found to be exempt from the requirements

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), the interim HMP requirements were not in effect; therefore, no list was prepared.

A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project

During the reporting period covered by this component of the annual report (July 1, 2007 to March 23, 2008), the interim HMP requirements were not in effect; therefore, no list was prepared.

The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance

There were no violations that occurred or enforcement actions taken during the reporting period (July 1, 2007 to March 23, 2008) regarding installation of permanent BMPs. The City achieved compliance with the 2003 SUSMP through the permitting process. Development approvals are not granted until the project shows complete compliance with the City's storm water pollution prevention requirements. The City will not issue a construction permit until all applicable BMP requirements are incorporated into the project plans. For projects involving grading and/or street and utility improvements, the City requires that the developer enter into secured agreements to guarantee developer performance on the grading or improvement work including associated structural BMPs. City inspectors review the project sites during construction to ensure that all work is being done in compliance with the construction plans and City Standards and procedures. Prior to issuance of a certificate of occupancy or release of any security, the City inspector reviews the project site to ensure that all applicable structural BMPs have been

installed per the approved plans and specifications. Only when the BMP installations have been verified will the certificate of occupancy be issued or any security be released.

2.5 Development Planning Component Effectiveness Assessment

During the reporting period, the City has experienced measurable changes in outcome levels 1, 2 and 3 regarding compliance with the Land-Use Planning Component. Outcome Level 1 improvements included the many changes and improvements made to the City's storm water standards, procedures, and Codes. The changes which became effective March 24, 2008, were primarily made to ensure compliance with the 2007 Municipal Permit. However, additional changes were made to clarify and simplify storm water compliance requirements and to enhance the City's storm water protection standards. A more detailed description of the specific changes made will be discussed in the second component to this annual report covering the period from March 24, 2008 to June 30, 2008.

The Outcome Level 2 improvements included the raising of awareness of existing and new storm water compliance requirements among City development review staff, developers and the City's Planning Commission. Through a combination of training during weekly staff meetings, webinars and outside training courses, City staff significantly increased their knowledge and understanding of the new Municipal Permit requirements, LID designs, hydromodification principles and City storm water compliance processes. Developers were seen to increase their knowledge of the new Municipal Permit requirements, LID designs, and City storm water compliance requirements through revised plan review checklists, City plan review comments, the City's updated Storm Water Standards Manual and outside training courses. The City Planning Commission increased their knowledge on LID design principles and general storm water regulatory requirements thorough a staff presentation made at a regularly scheduled Planning Commission meeting.

Outcome Level 3 improvements were seen in the development community. With the adoption of the interim LID and hydromodification criteria on March 23, 2008, the City no longer accepted the use of hydrodynamic separator systems and filter inserts as a primary treatment control BMP. To facilitate compliance to the new LID standards, the City began requesting new development/redevelopment compliance with the new interim criteria in October 2007. By March 24, 2008 when the new interim criteria became effective, the development community was already showing a marked increase in compliance with the interim criteria at the initial project submittal stage.

2.6 Program Review and Modification

The greatest strength of Carlsbad's Land-Use Planning Component is its motivated and well informed project review staff. The project review staff holds weekly meetings where issues of storm water pollution prevention are discussed including issues of new regulatory requirements, new and evolving BMP standards, inventory collection and reporting, LID application in new development design and BMP effectiveness (a list of the Engineering Development Services training meetings is included in Appendix 2.8). The weekly meetings, combined with internal and external training sessions, help to keep the staff knowledgeable on the evolving standards of storm water quality and ensure consistent application of storm water quality requirements for development projects within the City including the City's own Capital Improvement Program (CIP) projects.

The City is dedicated to putting into place all the administrative and regulatory tools required to implement the Land-Use Planning requirements of the 2001 Municipal Permit as well as the 2007 Municipal Permit. During the reporting period (July 1, 2007 to March 23, 2008), the City updated its Storm Water Pollution Prevention, Grading and Drainage, Public Property and Building ordinances to strengthen and clarify its storm water permitting requirements and, to address the requirements of the 2007 Municipal permit. The City also completely rewrote and updated its Storm Water Standards Manual which includes the updated 2008 Carlsbad SUSMP and updated Construction SWPPP Standards and Requirements (a copy of which is included as Appendix 2.10).

With the exception of the standard project conditions of approval, all of the process improvement, code and standards changes became effective on March 24, 2008, and will be discussed and described in greater detail in the second component to the annual report covering the period from March 24, 2008 to June 30, 2008. The changes to the standard project conditions of approval were implemented prior to October 2007 to provide developers advance notice of 2007 Municipal Permit requirements since it generally takes a minimum of six months for a project to proceed from discretionary approval to construction permit. Early implementation of the updated standard conditions of approval ensured compliance with the new interim LID and hydro-modification requirements while avoiding costly and timely delays to the developer once the requirements became effective on March 24, 2008. A copy of the revised and updated standard project conditions of approval is included in Appendix 2.1.

The City will continue to evaluate the storm water quality policies, procedures, codes, standards and other requirements of its Land-Use Planning processes to ensure complete compliance with the 2007 Municipal Permit in FY 08-09. A primary area of focus for next year will be the development of effectiveness review and evaluation procedures for the Land-Use planning process. Another area of focus will be the improvement of the BMP inventory tracking and reporting metrics. Strengthening of these two areas will help to promote more reliable and effective storm water prevention measures and to communicate effectiveness results using measurable parameters.

3.0 CONSTRUCTION COMPONENT

3.1 Introduction

The City of Carlsbad has continued to stress the importance of storm water pollution prevention throughout its construction component. The following annual report for construction will identify those activities which occurred from July 01, 2007 through December 31, 2007 and will cover the requirements of Order No. 2001-01. The Construction Management and Inspection Division (CMI) began implementing the requirements of Order No. R9-2007-0001, starting January 01, 2008.

The City continued to implement activities that address and minimize impacts on receiving water quality related to run off from construction sites. Performance goals are used to assess the completeness of this component and the effectiveness of action plans. These performance goals include construction site inspections, BMP implementation reviews, corrective actions, enforcement, and reporting requirements. During July 1, 2007 through December 31, 2007 of FY 07-08, the City updated the construction inventory weekly, inspected all construction sites, responded to construction related inquiries and complaints, provided outreach and education to developers, engineers, contractors and City staff, and used enforcement actions to obtain compliance when necessary. These activities are described in the following subsections.

3.2 Source Characterization

The City uses a Permits Plus database during the construction permitting process to develop and update a watershed based inventory of all construction sites that require construction (grading and/or construction) permits regardless of site size or ownership. Please refer to Appendix 3.1 for a Construction Site inventory. Construction sites with grading permits may include sites where activities such as grading, excavation, clearing, road construction, structure construction, or demolition results in the disturbance of soil. Building Construction permits that do not require a grading permit (sites that will not conduct grading onsite) may include sites where activities such as single family residence, remodels, or additions, home demolitions, tenant improvements, or commercial / industrial buildings that are constructed resulting in the need for water quality protection.

The Development Services Division updates the grading permit database throughout the permitting process until the project is ready to begin construction. The CMI then issues the permit, provides inspection services and updates the active construction database throughout the construction process. Construction permits are updated by the Development Services and Building Department throughout the permitting process. Once the permit is issued by the Building Department, CMI provides inspections for storm water pollution prevention inspections throughout the construction phase for the Building Permit projects.

3.3 Updates to Ordinances and Approval Processes

Extensive ordinance and project approval process changes were prepared during the reporting period to meet the new 2007 Municipal Permit requirements, to clarify and improve upon the existing storm water pollution prevention measures. The updates and changes became effective after March 24, 2008. The ordinance updates included changes to the Public Property,

Grading/Drainage, and Building ordinances in the Carlsbad Municipal Code. The project approval process changes included changes to the City's Storm Water Requirements Checklist, application submittal checklist, standard project conditions of approval, project plan review checklist, BMP criteria, Construction SWPPP requirements and LID standards. With the exception of the standard project conditions of approval, all of the process improvement, code and standards changes became effective on March 24, 2008, and will be discussed and described in greater detail in the second component to the annual report covering the period from March 24, 2008 to June 30, 2008.

The changes to the standard project conditions of approval were implemented prior to October 2007 to provide developers advance notice of 2007 Municipal Permit requirements since it generally takes a minimum of six months for a project to proceed from discretionary approval to construction permit. Early implementation of the updated standard conditions of approval ensured compliance with the new interim LID and hydro-modification requirements while avoiding costly and timely delays to the developer once the requirements became effective on March 24, 2008. A copy of the revised and updated standard project conditions of approval is included in Appendix 2.1.

3.4 Best Management Practice Requirements

The City has established required minimum BMPs, as identified in the JURMP and Carlsbad Municipal Code, for all construction sites. SWPPPs and Erosion Control Plans are reviewed prior to commencement of construction activities to ensure that the required minimum BMPs are implemented for all grading sites. As described in the City's JURMP, the seven required minimum BMPs are:

1. Erosion control methods for graded slopes;
2. Erosion control method for graded flat areas (slope 5);
3. Sediment control for perimeter boundaries;
4. Offsite tracking control of sediment;
5. Materials management control;
6. Waste management control; and
7. Non-storm water management control.

The City continues to utilize the pollution prevention measures contained in the Storm Water Best Management Practice Handbooks, published by the California Storm Water Quality Association (CASQA), Caltrans Storm Water Quality Handbooks, and Standards for Design & Construction of Public Works Improvements in the City of Carlsbad. All CMI staff is trained throughout the year on construction site BMPs and their appropriate application.

Pollution prevention consists of procedures and practices that eliminate or reduce the pollutants

at the source. The City has identified and required implementation of the following pollution prevention controls for all applicable construction sites:

- SWPPPs and Erosion Control Plans are required for grading permits and appropriate construction projects. These plans are checked by the City to ensure they adequately address the provisions of the General Construction Permit.
- CMI and contracted Construction Storm Water inspectors enforce the implementation and effectiveness of BMP's described in approved erosion control plans and SWPPPs.

To address each of the required BMPs, the City ensures the SWPPPs and/or erosion control plans include descriptions of the specific BMPs as applicable, depending on site-specific requirements:

1. Hydroseed applications, bonded fiber matrix application, Geotextiles and Mats, straw waddles, silt fences, and fiber rolls are incorporated into the City approved Erosion Control Plans and project SWPPPs as applicable.
2. Irrigated and non-irrigated hydro-seed mixes, gravel bag and/or sandbag barriers, silt fence, and fiber rolls are incorporated into approved Erosion Control Plans and SWPPPs as applicable.
3. Silt fences, earthen berms, velocity dissipaters, gravel bag and/or sandbag barriers, and drainage swales are incorporated into approved Erosion Control Plans and project SWPPPs as applicable.
4. Construction entrances and tire washing stations are incorporated into approved Erosion Control Plans and project SWPPPs as applicable.
5. Vehicle and equipment maintenance, fueling and cleaning stations, material storage and delivery yards are protected and concrete washout basins are incorporated into approved Erosion Control Plans and project SWPPPs as applicable.
6. Covered receptacles are incorporated into all projects at strategic locations, litter removal programs are incorporated into the project schedules, ensuring material storage is isolated from drainage facilities and watercourses, and other source control BMPs are incorporated into City approved Erosion Control Plans and project SWPPPs as applicable. Additionally, all temporary construction relief stations are required to have, at a minimum, secondary containment units directly beneath them.

Non-storm water management generally includes source control BMPs such as paving and grinding operations, dewatering operations, water practices, etc. These BMPs are incorporated into City approved erosion control plans and project SWPPPs as applicable.

3.5 Program Implementation

During the first half of FY 07-08 the City experienced a greater ability to monitor and enforce storm water regulations by diversifying the construction components into two areas: ministerial construction permits and grading construction permits. CMI oversees the inspections of grading permitted sites while contracted storm water inspectors ensure ministerial permitted sites (construction sites without a grading permit) are compliant, with two inspectors designated with 100 responsibility for storm water compliance at ministerial permitted sites.

The City continued to prioritize all construction sites with active grading permits as high priority. These sites were at a minimum, inspected on a weekly basis during the wet season and once a month during the dry season, at a minimum, to ensure proper installation and maintenance of pollution prevention BMPs.

Engineering inspectors were responsible for inspections on all active grading and CIP sites. Storm water issues (compliance with the grading ordinances and Order No. 2001-01) have remained one of their main focuses, especially during the rainy season. During the required inspections, staff would review the site SWPPP and erosion control plans to further ensure the sites compliance with the installation of designated BMPs. Engineering inspectors were onsite inspecting grading sites on a regular basis and monitoring changing site conditions and the status and effectiveness of BMPs installed. All required inspections were documented and placed in the project files.

The current construction site storm water checklist used by the inspectors covers ll phases of the construction process. Documented inspections cover administrative requirements such as SWPPPs and updates wall maps, and field requirements such as desiltation basins, materials and waste management, temporary BMPs, and slope protection. The inspection form also provides a comment section to further describe site conditions and interactions.

In addition, the City continued verifying the Notice of Intent (NOI) validity prior to issuance of a grading permit or Notice to Proceed for CIP projects. Prior to holding a pre-construction meeting and issuing a grading permit, CMI verifies a valid NOI is in place for projects that triggered Statewide General Construction Permit requirements. The Construction Manager reviews the State s online database to ensure an NOI has been issued prior to assigning the project to an inspector for grading permit issuance.

Grading Permit Site Inspections:

The inspectors were onsite daily on most sites verifying proper BMP implementation in addition to the formal weekly inspection that is documented. The current construction site storm water checklist is included in Appendix 3.2. Table 3.1 demonstrates the grading permit inspections conducted from July 01, 2007 to December 31, 2007:

Table 3.1 Grading Permit Site Compliance Inspections

Required Inspections	Inspections Conducted
1844	1844

Building Construction Permit Site Inspections:

Contracted storm water inspectors were onsite inspecting all locations as required by the priority of the site. During the first half of the wet season (Oct. 01 through Dec. 31) high priority sites were inspected weekly while medium and low priority sites were inspected biweekly. All required inspections were documented. Table 3.2 describes the building construction permit inspections conducted from July 01, 2007 to December 31, 2007:

Table 3.2 Building Permit Site Compliance Inspections

Required Inspections	Inspections Conducted
1068	1068

Capital Improvement Site Inspections:

Inspectors were out on CIP project sites daily covering a number of issues including storm water issues. Please refer to Appendix 3.3 for the Capital Improvement Project (CIP) site inventory. It is important to note that not all sites on the inventory were active during the entire rainy season. The City currently has a system of tracking required inspections, which is monitored on a weekly basis to ensure compliance. Information from completed inspections is entered into a database and annual reports are processed from this database for reporting purposes. Table 3.3 summarizes the CIP project inspections conducted from July 01, 2007 to December 31, 2007:

Table 3.3 CIP Site Compliance Inspections

Required Inspections	Inspections Conducted
236	236

During required inspections, staff generally found sites to be compliant in terms of adherence to SWPPP, erosion control plans, and BMP implementation. Most observed deficiencies were found with BMP maintenance (i.e. broken gravel bags). These deficiencies were brought to the attention of the responsible site superintendent and direction was given by the project inspector to have the deficiencies immediately corrected. This interaction has proven to be productive in correcting minor deficiencies.

The current construction site storm water checklist used by the inspectors covers all phases of the construction process. Documented inspections cover administrative requirements such as SWPPPs and updated wall maps, and field requirements such as desiltation basins, materials and waste management, temporary BMPs, slope protection. The inspection form also provides a comment section to further describe site conditions and interactions.

In addition, the City continued verifying the Notice of Intent (NOI) validity prior to issuance of a grading permit or Notice to Proceed for CIP projects. Prior to having a pre-construction meeting and issuing a grading permit, CMI verifies a valid NOI is in place for projects as required by the State. The Construction Manager reviews the State's online database to ensure a NOI has been issued prior to assigning the project to an inspector for grading permit issuance.

There were no changes in the enforcement escalation procedures described in the City s 2001 JURMP during July 01, 2007 to December 31, 2007. Table 3.4 is a summary of enforcement actions taken by the City from July 01, 2007 to December 31, 2007.

Table 3.4 Summary of Enforcement Actions at Construction Sites

Actions Taken	Number of Actions
Written Warning	24
Stop Work Notice	4
Total Actions	28

If a site was found to have minor deficiencies, in terms of storm water compliance, it was typically corrected at the time of the inspection. If a written warning was issued, a specific deadline for correction was noted and a follow up inspection was conducted. Generally, follow up inspections found sites to be in compliance.

The sites that were issued a Stop Work Notice were required to take immediate corrective action. Stop Work Notices were generally a final step in escalating enforcement actions because of the impact to the contractors for having to stop work. This corrective action has continually achieved compliance. In order to have the Stop Work Notice lifted, the site must be in strict compliance with all City requirements.

In September 2007, the CMI division was notified by City field staff that potentially unpermitted clearing and grubbing was occurring in the Agua Hedionda Creek just West of El Camino Real. CMI division staff immediately investigated the claim and found that a contractor was in the creek channel removing vegetation with a small excavator. A Stop Work Notice was immediately issued and the contractor was directed to leave the site. CMI staff then notified the required agencies.

The contractor was hired by a neighboring HOA to clean and maintain a nearby desiltation basin. However, there was a miscommunication and the contractor inadvertently began to clear the creek channel. City staff received direction from CA Fish and Game, Fish and Wildlife Service, Army Corps of Engineers, and the San Diego Regional Water Quality Control Board to have the contractor remove any remaining cut vegetation by hand. The contractor complied immediately. City staff was not directed to initiate any further corrective actions.

In December 2007, the City received a formal complaint regarding the presence of anthropogenic fecal matter in a wildlife crossing at the Carlsbad Raceway project. The project inspector and project Superintendent conducted a field inspection of the wildlife crossing and found the material present. A written notice with corrective action, including a required weekly inspection and cleaning, if necessary, was immediately issued to the project Superintendent. The site was cleaned of any foreign matter and has been inspected and maintained on a weekly basis.

4.0 MUNICIPAL COMPONENT

4.1 Introduction

Municipal facilities are required to implement the minimum BMPs identified and described in the City's JURMP dated February 2002 (good housekeeping, preventive maintenance, material handling and storage, employee training, solid waste handling, record keeping, self inspection, and spill response), as applicable. Specific BMPs are identified in SWPPPs and/or inspection reports. Specific pollution prevention measures may vary from one site to another and are evaluated separately at each facility. The City implements and assesses the effectiveness of BMPs through regular staff training, self-inspections, third party inspections by a contractor, and SWPPP implementation. The following sections include a description of specific pollution prevention activities and storm water BMPs implemented from July 1, 2007 through March 23, 2008 per Order 2001-01 by various City departments at all high priority facilities in the inventory. All BMPs were implemented as required per the JURMP.

Municipal areas and activities are subdivided by categories in the sections below. Prioritization of these municipal areas is presented in the classification column of the municipal inventory for Order 2001-01, located in Appendix 4.1.

All high priority areas and activities were inspected annually as required. Under Order 2001-01, there were a total of 63 high priority areas and activities, covering the time period from July 1, 2007 through March 23, 2008. All of the high threat areas and activities were inspected during the spring of 2008. A summary of inspection findings and corrective actions is included in Appendix 4.5 in the 2007-0001 permit section of this Annual Report. Through regular staff training, self-inspections, third party inspections by a contractor, and SWPPP implementation, all required BMPs were implemented and verified at municipal facilities during FY 07-08.

4.2 Minimum BMP Requirements

The following minimum BMPs were implemented at all of the facilities listed in sections 4.3 through 4.10 below.

4.2.1 Employee Training

Municipal departments provided training at least annually to all employees with responsibility for actions that have a potential to cause storm water pollution. A list of all Municipal storm water training is included in Appendix 8.1. Training generally addresses:

- Storm water awareness
- Applicable regulations
- Discharge prohibitions
- Importance of pollution prevention practices (good housekeeping, recycling, waste management, source control, etc.)
- Applicable best management practices (including those called out in the facility storm water pollution prevention plan [SWPPP]), where applicable
- Integrated pest management
- Self-inspections
- Record keeping

Documentation of training is maintained on-site at the location(s) where operations or activities are conducted. Where the operations are covered in a SWPPP, training records are filed with the SWPPP.

4.2.2 Pollution Prevention

The City implements urban runoff pollution prevention practices that are generally recognized for that facility s activity as being effective and economically advantageous.

Pollution prevention is defined in Order 2001-01 as *practices and processes that reduce or eliminate the generation of pollutants. Recycling, use of different types of products or chemicals, and altering operational procedures are all types of pollution prevention practices that reduce the amounts of pollutants generated by a facility*.

The City s approach is to promote pollution prevention as an activity for all municipal employees and locations. Since 1991, the City has implemented a procurement policy that directs the purchase and use of recycled products. Purchasing staff are encouraged to use *Green Purchasing* principles. This refers to buying products and services with reduced effects on human health and the environment (also called *Environmental Purchasing*). While some of these products are office and janitorial supplies, the policy also applies to construction supplies, landscape materials and equipment, automotive, road and highway supplies.

Specific pollution prevention measures may vary from one site to another, so they are evaluated separately at each facility. Where appropriate, high priority municipal facilities implemented site specific Storm Water Pollution Prevention Plans (SWPPP). In depth storm water training programs were also given for appropriate staff. Furthermore, the pollution prevention BMPs identified in the 2002 JURMP were implemented at all municipal facilities. These pollution prevention BMPs include:

- Affirmative Procurement Use alternative, safer, or recycled products.
- Reduce the amount of hazardous materials used by implementing natural controls.
- Redirect storm water flows away from areas of concern.
- Reduce use of water.
- Reduce storm water flow across facility site.
- Recycle and reuse waste products and waste flows.
- Move or cover potential pollution from storm water contact.

In addition, the City required the following minimum pollution prevention practices (detailed in SWPPPs or inspection reports) at municipal facilities where appropriate:

- <u>Reduce use of water or use dry cleanup methods:</u> Employees used dry cleanup methods when possible (sweeping, etc.). Any washing activities required containment and recovery, with no discharge to the storm drain system. These BMPs are also required for City contractors.
- <u>Conduct storm drain maintenance:</u> Employees performed regular visual inspections of the storm drains to identified unauthorized discharges and cleaned as needed.

- Recycle: City departments must recycle appropriate items and implement the City procurement policy to purchase and use recycled products.
- Move or cover potential pollution sources from storm water contact: Corporate yards protected materials and products that could potentially contribute to storm water pollution by storing them indoors, or covering them, and providing them with secondary containment as needed.

4.2.3 Good Housekeeping

Good housekeeping practices employed simple common sense in creating and maintaining a clean, orderly environment that reduces the risk of accidents and urban runoff contamination.

- **Routine Housekeeping Inspections.** Locations with higher risk of impacting storm water quality (e.g., storm water outfalls, loading and unloading areas, materials, products and wastes storage areas, equipment and vehicle maintenance and cleaning areas) were inspected regularly. Inspections focused on leaks or conditions that may lead to discharges of pollutants to the Storm Water Conveyance or Receiving Waters.

- **Maintenance of Clean Ground Surfaces.** Sweeping of all paved areas exposed to precipitation or storm water was conducted on a regular basis. Litter controls of all exposed surfaces were also conducted on a regular basis. The frequency of sweeping and litter control was based on site conditions.

- **Waste Management.** Each facility conducted regular pickup and disposal of garbage and waste materials/products to prevent overfill of waste storage containers.

- **Equipment Inspection.** Each facility conducted routine inspection of equipment to ensure proper functioning. Where problems were identified during inspection, proper and prompt maintenance or repair was conducted.

- **Storage.** Raw materials, intermediate products, finished products, byproducts and waste products were stored in covered areas or sealed containers unless the materials or products were not a threat to urban runoff quality. To prevent accidental spills, materials or products were stored away from direct traffic routes. All containers were stacked according to applicable federal, state, and city regulations as well as manufacturers' instructions to avoid damage from improper weight distribution. Pallets or similar devices were used to prevent corrosion of the containers that can result when containers come in contact with moisture on the ground.

- **Limitations on Handling Hazardous Materials.** Each facility limited the handling of hazardous materials to those personnel specially trained to handle these materials.

- **Employee Training.** All good housekeeping practices were incorporated into a facility's employee-training program.

In addition to the BMPs listed above, good housekeeping was addressed as a site specific BMP for each category of facilities listed in Sections 4.3 4.10. See BMP SC-60 for site specific information on implementation.

4.2.4 Spill Response and Prevention

Municipal staff implemented BMPs at fixed facilities and field programs to prevent, control and cleanup spills. The following are general BMPs that were implemented:

- BMPs listed in SC-11, Spill Prevention, Control and Cleanup (City of Carlsbad JURMP 2008).
- Spill cleanup materials are readily available and in known locations.
- Spills were cleaned up immediately and dry methods are used where possible.
- Spill cleanup material was properly disposed of.

Spill response and prevention is also addressed as a site specific BMP for each category of facilities listed in Sections 4.3 4.10. See SC-11 for site specific information on implementation.

4.3 Roads, Streets, Highways, Parking Facilities

4.3.1 Background

This section includes an inventory of roads, streets, highways, and parking facilities which are deemed high priority areas according to Order 2001-01, Section F.3.a.(3)(b)i and associated BMPs. This section also includes information on the City s street sweeping program and BMPs for the City s street maintenance program.

4.3.2 Source Characterization

The table below lists the 20 high priority roads, streets, highways, and parking facilities on the City s municipal inventory, as revised during FY 06-07.

Table 4.1 Inventory of Roads, Streets, Highways, and Parking Facilities

1	CURBED STREETS	City service area
2	UNCURBED ROADS	City service area
3	PINE FIELD PARKING LOT	3333 HARDING ST
4	STAGE COACH PARKING LOT	3420 CAMINO DE LOS COCHES
5	POINSETTIA COMMUNITY PARK PARKING LOT	6600 HIDDEN VALLEY RD
6	HOSP GROVE PARK PARKING LOT	JEFFERSON & MONROE
7	CALAVERA HILLS PARK PARKING LOT	2997 GLASGOW DR
8	CARLSBAD UNIFIED SCHOOL DISCTRICT PARKING LOT	801 Pine Avenue
9	LA COSTA CANYON PARK PARKING LOT	3020 Pueblo Street
10	FARADAY CENTER PARKING LOT	1635 FARADAY AV
11	CITY HALL FACILITY PARKING LOT	1200 CARLSBAD VILLAGE DR
12	HOUSING/REDEVELOPMENT OFFICE PARKING LOT	2965 ROOSEVELT ST B
13	COLE LIBRARY PARKING LOT	1250 CARLSBAD VILLAGE DR
14	HARDING COMMUNITY CENTER PARKING LOT	3096 HARDING ST
15	CARLSBAD SENIOR CENTER PARKING LOT	799 PINE AVE
16	ARTS OFFICE PARKING LOT	2955 ELMWOOD ST
17	DOVE LIBRARY PARKING LOT	1775 DOVE LN
18	SAFETY CENTER PARKING LOT	2560 ORION WY
19	SKATEPARK PARKING LOT	2560 ORION WY
20	ADULT LEARNING PROGRAM PARKING LOT	1207 CARLSBAD VILLAGE DR STE O

4.3.3 Site Specific BMP Requirements

The following site specific BMPs were implemented where applicable at the 20 high priority facilities listed above in Table 4.1.

Table 4.2 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-70 Road and Street Maintenance
SC-71 Plaza and Sidewalk Cleaning
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.3.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.2 were implemented at the facilities listed in Table 4.1 and are further described below:

- SC-11 Spill Prevention, Control, and Cleanup: Spill kits are located in all vehicles.

- SC-20 Vehicle and Equipment Fueling: No vehicle or equipment fueling took place as part of these activities or at these locations.
- SC-21 Vehicle and Equipment Cleaning: No vehicle or equipment cleaning took place as part of these activities or at these locations.
- SC-22 Vehicle and Equipment Repair: No vehicle or equipment repair took place as a part of these activities or at these locations.
- SC-33 Outdoor Storage of Raw Materials: Plastic tarps cover raw materials in the yard, equipment is covered by canopies, and the material is covered by a permanent overhead structure or stored indoors. Materials associated with street maintenance activities are stored at the Maintenance and Operations Facility.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a contained area in case of any accidental spillage. These containers are clearly marked and stored until arrangements are made for a certified waste management company to remove them and transfer them to an approved facility. Four cigarette butt collectors have been placed along the sea wall, providing a place for proper disposal.
- SC-41 Building and Grounds Maintenance: In the event that any pressure washing is necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking and Storage Area Maintenance: Parking lots and storage areas were swept biweekly.
- SC-60 Housekeeping Practices: Work sites were swept and all debris was removed upon completion of any asphalt or concrete repair. Water was used when sweeping to keep dust down.
- SC-70 Road and Street Maintenance: Storm drain inlets were protected using rock bags prior to the start of any maintenance activities. Concrete wash out was performed on a plastic tarp and contained to prevent any discharge to the storm drain. Street sweeping was performed for all curbed streets and municipal parking lots in the City. Table 4.3 below indicates the distance swept, frequency, and amount of materials removed as a result of the street sweeping activities.

Table 4.3 Street Sweeping Data

Priority	Description	Distance	Frequency	Material Removed
High	Arterials/seawall	100 miles	Weekly	90 tons/month
Medium	Residential	900 miles	Biweekly	
Low	Alleys	50 miles	Biweekly	
Parking Lots		53 acres	Biweekly	

Downtown areas were swept twice weekly

- SC-71 Plaza and Sidewalk Cleaning: A self-contained wet sweeper was used on all tile sidewalks in the downtown area on a scheduled basis.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.

- SC-75 Waste Handling and Disposal: All materials were hauled directly to transfer station and were covered.

4.4 Flood Management Projects Flood Control Devices

4.4.1 Background

This section includes BMPs and an inventory of the City s Flood Management Projects and Flood Control Devices which are deemed high priority areas according to Order 2001-01, Section F.3.a.(3)(b)ii and associated BMPs. This section also includes a description of the Storm Drain Maintenance Program activities.

4.4.2 Source Characterization

The table below lists the high priority Flood Management Projects and Flood Control Devices on the City s municipal inventory, as revised during FY 06-07.

Table 4.4 Flood Control Projects/Devices

1	DESILTATION BASIN 13	SW END FARADAY AV SO OF LOT 102 OF CRC
2	DESILTATION BASIN 30	SW CORNER MARRON AND MONROE
3	DESILTATION BASIN 43	CAMINO HILLS AND FARADAY NE CORNER
4	BUENA VISTA CHANNEL	Buena Vista Creek along Haymar
5	KELLY DRIVE CHANNEL	Kelly Drive
6	PARK AND KELLY OUTFALL	Kelly Drive at Park Ave
7	PARK AND ANDREA OUTFALL	Andrea at Park
8	PARK AND VALENCIA OUTFALL	Valencia at Park
9	PARK AND NEBLINA OUTFALL	Nebline at Park
10	OTHER OUTFALLS	City service area
11	CATCH BASINS/INLETS	City service area
12	MS4 PIPELINES	City service area
13	CONCRETE CHANNELS	City service area
14	V DITCH CHANNELS	City service area
15	OTHER OPEN CHANNELS	City service area

4.4.3 Site Specific BMP Requirements

The following site specific BMPs were implemented where applicable at the high priority facilities listed above in Table 4.4.

Table 4.5 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal

4.4.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.5 were implemented at the facilities listed in Table 4.4 and are described below:

- SC-11 Spill prevention, Control, and Cleanup: All vehicles have spill kits and key vehicles carry hydrocarbon booms. All trash was placed in 55 gallon trash bags. The maintenance sweeper truck was called out to assist in spill cleanup when necessary.
- SC-21 Vehicle and Equipment Cleaning: All vehicles used in flood control device cleaning were washed at fleet maintenance using an enclosed pressure wash system. The system has a secondary water and oil separator plumbed into the sanitary sewer system.
- SC-34 Waste Handling and Disposal: Trash was hauled to Palomar Transfer Station. Debris and other organic material transferred and deposited at 2400 Tamarack Avenue in three concrete covered bins. The material was then tested for contaminants and disposed of properly upon receipt of permissible test results.
- SC-60 Housekeeping Practices: Trash was removed from these areas of the MS4 on a routine basis.
- SC-74 Drainage System Maintenance: A small self-contained vacuum with pressure washer was used to clean the drainage system. All material in the drain box was removed by the vacuum. Disposal of the water and material occurred using a filter sock, allowing water to be decanted into the sanitary sewer system. The solid material was taken to the Tamarack site described above. All trash was removed from the MS4, placed in 55 gallon trash bags, and placed in a 40 cubic yard roll off dumpster that was covered. The material was then transported to Palomar Transfer Station for disposal. Data pertaining to maintenance activities of the MS4 is in Table 4.6.

Table 4.6 MS4 Maintenance Activities

Structure	Inspected	Cleaned	Amount of Material Removed (tons)
Catch Basin/Inlet	2380 units[1]	Anthropogenic trash removed 100□	37.5[2]
MS4 miles	□15,000 linear feet	15,000 linear feet	3
Open Channel miles	32,000 linear feet	1100 linear feet	150

[1]Number represents inspections from July 01, 2007 to March 23, 2008, balance inspected after March 24, 2008 four and described in JURMP Annual Report for Order 2007-0001, March 24 □June 30, 2008.
[2]Estimation based on total material removed for Fiscal Year □50 tons x □ (representing □ year).

The cleaning of cement lined channels requires special permits through the California Department of Fish and Game, San Diego Regional Water Quality Control Board, and the US Army Corps of Engineers. A consultant was hired to draft the necessary permits to clean Kelly Channel during this past year. The channel was cleaned using a contractor the week of March 10, 2008.

A Maintenance District funds the annual routine maintenance of the Buena Vista Creek Channel. 100-year flood protection is maintained by removing 50□ of the channel vegetation over a five year period. Annually, at the end of the growing season (October or November), crews cut back 10□ of the channel using hand removal (or 20□ of the northern half of the channel). This maintenance includes removal of any invasive and/or exotic vegetation for the entire length of the channel.

- SC-75 □Waste Handling and Disposal: Described under SC-34 and SC-74 above.
- BMPS to limit infiltration from sanitary sewer to storm drain system: A preventive maintenance schedule was implemented that includes jet rodding, and vactoring the sanitary lines throughout the city of Carlsbad. Closed circuit television was used for investigations in sewer lines.
- Storm Drain Inserts including fossil filters, rapid flow BMPs, and debris catchers with zinc filters are in place at various storm drain locations throughout the City. Fossil filters removed trash and hydrocarbons, while debris catchers were installed to prohibit anthropogenic trash and debris from entering the storm drain system. All structural BMPs are inspected and maintained annually.

4.5 Fire Stations

4.5.1 Background

There are six fire stations in the City. BMPs for these facilities are described below.

4.5.2 Source Characterization

Table 4.7 below lists the high priority Fire Stations on the City's municipal inventory.

Table 4.7 Fire Stations

1	FIRE STATION 1	1275 CARLSBAD VILLAGE DR
2	FIRE STATION 2	1906 ARENAL RD
3	FIRE STATION 3	3701 CATALINA DR
4	FIRE STATION 4	6885 BATAQUITOS DR
5	FIRE STATION 5	2540 ORION WY
6	FIRE STATION 6	3131 LEVANTE ST

4.5.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.8 were implemented at the high priority facilities listed in Table 4.7.

Table 4.8 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.5.4 Program Implementation

Each of the applicable BMPs listed above in Table 4.8 were implemented at the facilities listed in Table 4.7 and are described below. In addition, training and pollution prevention BMPs specific to the Fire Department are described below.

Training

- The City's Reclaimed Water Facility continued to be utilized for fire engineer training and testing. A training trailer facilitated engineer operations, pump testing, and other wet training opportunities. The Facility allowed for wet training and testing opportunities while ensuring that no water was discharged to the MS4.
- Suitable locations were selected to provide wet training opportunities for personnel, while ensuring that appropriate BMPs were in place to protect the storm drains and eliminate discharges to the MS4. These sites were generally located on pervious surfaces with no potential for discharge to the storm drain system.
- A representative from the Fire Department attended and participated in the City's Storm Water Committee meetings on a regular basis.

Pollution Prevention

- Reducing the use of water using dry cleanup methods. The department continued to implement a department policy limiting outside water use applicable to vehicle, hose, and equipment washing. Sweeping and removal of organic material from parking lots and walkways were completed on a weekly or as needed basis at all fire stations. Awareness was heightened at fire scenes to minimize the potential for excessive water flow.
- Materials were recycled where possible.
- Storm Water Manuals were developed for each station which included SWPPPs with site maps, inspection reports, facility specific spill response procedures, training records, and department policies.
- SC-11 Spill Prevention, Control, and Cleanup: Spill response equipment and materials are clearly identified and staged in accessible locations at each station. Awareness was heightened at incident scenes to contain potential discharges (once the scene had been stabilized) to prevent pollutants from entering the MS4. The Department continued implementation of the City s spill response procedure for incidents that occur on City streets. Absorbent materials are kept on all engines. The spill response plan is to apply absorbent, sweep material, place in bags, and remove from site for proper disposal. A large spill kit is also kept at Station 5.
- SC-21 Vehicle and Equipment Cleaning: The department continued to implement a department policy limiting outside water use that is applicable to vehicle, hose, and equipment washing. Vacuum equipment was purchased to recover and contain all wash water from vehicle washing activities occurring at the Fire Stations.
- SC-22 Vehicle and Equipment Repair: All vehicle and equipment repair was performed at the City s Fleet Maintenance Facility.
- SC-34 Waste Handling and Disposal: Waste containers were inspected regularly for leaks and to ensure that lids remain closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter.
- SC-41 Building and Grounds Maintenance: In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths are used where possible. Paint brushes and tools were always cleaned in a way that prevents any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Sweeping and removal of organic material from parking lots and walkways was completed on a weekly or as needed basis at all fire stations.
- SC-60 Housekeeping Practices: Fire stations are kept clean and orderly. Wash water was disposed of properly. Sweeping material was disposed of properly. Training on storm water and spill response as provided regularly.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: Solid waste was collected and disposed of properly at appropriate disposal facilities (Palomar Transfer Station, Waste Management) in accordance with all applicable laws and regulations. Waste containers were inspected regularly for leaks and to ensure that lids remain closed. Waste container areas were inspected and swept as necessary to keep area free of trash and litter. Liquids were not

disposed of in waste containers. Recycling was implemented where possible; bins were provided.

4.6 Recreation Facilities

4.6.1 Background

The swim complex is the only recreation facility on the City's municipal inventory as a high priority area. This is primarily due to the chemicals stored on-site. BMPs implemented at this facility are described below.

4.6.2 Source Characterization

The Swim Complex is the only high priority Recreation Facility on the City's municipal inventory.

4.6.3 Site Specific BMP Requirements

The site specific BMPs listed below in Table 4.9 were implemented at the Swim Complex.

Table 4.9 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-31 Outdoor Container Storage
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-60 Housekeeping Practices
SC-72 Fountains & Pools Maintenance
SC-73 Landscape Maintenance
SC-75 Waste Handling and Disposal

4.6.4 Program Implementation

BMPs listed in Table 4.9 above were implemented at the Swim Complex and are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Commercial spill kits are kept onsite. A facility specific SWPPP was developed and kept onsite. The SWPPP includes a spill response plan.
- SC-31 Outdoor Container Storage: The caustic soda is stored under cover. The majority of materials stored on-site are kept inside sheds. These areas were cleaned up and maintained regularly.
- SC-34 Waste Handling and Disposal: Trash bins and containers are enclosed and covered. Lids remained closed at all times.
- SC-41 Building and Grounds Maintenance: (parks/facilities) Staff performed daily parking lot inspections looking for litter, debris, and leaking vehicles. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.

- SC-60 Housekeeping Practices: Cleaning of pool decks was performed by sweeping in most cases. Occasionally wash down was necessary and all wash water was directed to a pervious area for percolation (football field).
- SC-72 Fountains and Pools Maintenance: Water was de-chlorinated if discharge to storm drain was necessary; however, this is a rare occurrence. All filter backwash was discharged to sewer; overflow from pool decks was directed to earthen swale and percolates.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices.
- SC-75 Waste Handling and Disposal: The dumpster remained closed and locked at all times and were serviced weekly.

4.7 Publicly Owned Treatment Works

4.7.1 Background

The City of Carlsbad is an owner in the Encina Wastewater Authority, a Joint Powers Authority. Encina treats raw sewage to the secondary treatment level.

The Carlsbad Water Recycling Facility intakes secondary treated water and treats it again to the tertiary level of treatment which is used as recycled water throughout the City of Carlsbad

This facility was determined to be a high priority area as required in Order 2001-01, Section F.3.a.(3)(b)iv. The BMPs listed below were implemented at this facility.

4.7.2 Source Characterization

The Carlsbad Recycled Water Facility is the only high priority Publicly Owned Treatment Works on the City s municipal inventory.

4.7.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.10 were implemented at the Recycled Water Facility.

Table 4.10 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-60 Housekeeping Practices
SC-75 Waste Handling and Disposal

4.7.4 Program Implementation

Each of the applicable BMPs listed above were implemented at the Carlsbad Recycled Water Facility and are described below.

- Employee Training: Employees were informed of activities that could potentially cause contamination of storm water and the importance of carefully conducting these activities in areas that do not discharge/drain to storm drains. Storm water pollution prevention and BMP brochures were available to everyone who works at the materials storage area. Subcontractors were informed about the storm water requirements and their responsibilities. Training consisted of informal tailgate meetings, formal classroom training, or self-guided training activities. Employees in targeted positions were trained annually on the requirements of the SWPPP. Employee training, at a minimum, included: SWPPP requirements; spill response and reporting; good housekeeping; BMP updates and implementation; and materials and waste handling and storage procedures.
- SC-11 Spill Prevention, Control, and Clean-up: A current spill response plan was provided in the SWPPP. The spill response plan addresses measures to clean, abate, and prevent spills and leaks from entering the storm drain. Employees were trained on the elements of the plan. Rags, damp mops, and absorbents were readily accessible. Waste was disposed of properly. Dry cleanup methods were used whenever possible. Spills on dirt areas were cleaned up by digging up and properly disposing of contaminated soil. Spills over 10 gallons were reported to the Storm Water Protection Program and/or the appropriate spill response agencies immediately. Employees were trained to routinely check for leaks and spills.
- SC-20 Vehicle and Equipment Fueling: All vehicles were fueled off-site. Equipment is run with electricity and no equipment fueling is necessary.
- SC-22 Vehicle and Equipment Repair: All vehicle repairs were performed off-site. When equipment repair was necessary, work was performed in covered, contained areas that were not susceptible to storm water runoff.
- SC-31 Outdoor Container Storage: There were several chemical storage tanks stored outside under cover and in full secondary containment structures. See SC-33 below for more information.
- SC-33 Outdoor Storage of Raw Materials: Secondary containment was implemented where materials were stored outside. Examples of temporary BMPs utilized are: a dike, berm, or filter on the down slope sides of any stockpiles. All containment devices used around stockpiles were maintained to work effectively and were replaced when necessary. The chemical storage tanks were contained within a concrete parapet wall enclosure. Spills within the chemical storage areas were contained within the concrete walls and drain to a sump. Where chemical deliveries occur, a concrete pad conveys flow to a curb inlet. From the curb inlet, flow is controlled by plug valves, directing the flow to the sump.
- SC-34 Waste Handling and Disposal: Dumpsters were covered and maintained and checked frequently for leaks. Lids were kept closed at all times. Dumpsters were never cleaned out using water. When cleaning the containers, all rinse water from cleaning was routed to the sanitary sewer system. All wastes and construction debris were disposed of properly. Many materials and wastes were recycled including broken asphalt and concrete, cleared vegetation, scrap metals, aluminum cans, and plastic bottles. Materials and debris that cannot be recycled were taken to an appropriate landfill or transfer station, or properly disposed of as hazardous waste. The waste storage area was swept or otherwise cleaned frequently using dry methods to collect all loose solids for proper disposal. If the amount of waste accumulated appears to frequently exceed the capacity of the dumpster, then another container was obtained and utilized or collection frequency is increased. Green waste consisting of clippings, cuttings and droppings of leafy and woody materials was disposed of properly at an approved composting location or permitted landfill.
- SC-60 Housekeeping Practices: Site was kept free of litter and debris. Trash cans and recycling receptacles were located around the site to minimize litter. Material moving and

transfer activities were scheduled during dry weather periods, where possible. Heavy equipment was maintained in good working condition. Areas are inspected frequently for leaks and repaired as needed. Major equipment repairs were performed away from the storage area. Paved surfaces were swept that drain to storm drains, creeks, or channels. Cleanup materials such as brooms, shovels, dustpans, and sweepers are stocked near the storage area. Paved storage areas were swept weekly for collection and disposal of loose solid materials, and are not hosed into a storm drain or conveyance ditch. Information was distributed on good housekeeping practices during employee training sessions and discussed at employee meetings. Good housekeeping tips and reminders were posted on employee bulletin boards.

- SC-75 Waste Handling and Disposal: See SC-34 above.
- Source Control BMPs:
  - Flo-Guard inlet baskets at all curb inlets on site to collect oil and grease and debris from site.
  - Vegetated swale (approximately 400 feet) collects and treats runoff from a portion of the site.
  - Roof over chemical storage area.
  - Permanent secondary containment is in place around all chemical storage areas.
  - By-pass valves are installed at containment areas to divert rain water.

4.8 Sanitary Sewer Facilities

4.8.1 Background

The facilities listed in Table 4.8.2 are sewer lift stations owned and operated by the City. The table also includes the City s collection system. These have been determined to be high priority areas, primarily due to the presence of sewage and potential for contamination of surface waters resulting from sewer overflows. BMPs implemented at these facilities and BMPs applicable to maintenance of the collection system are described below.

4.8.2 Source Characterization

Table 4.11 below lists the high priority Sanitary Sewer Facilities on the City s JURMP inventory.

Table 4.11 Sanitary Sewer Facilities

1	CANNON SEWER LIFT STATION	2301 CANNON RD
2	CHINQUAPIN SEWER LIFT STATION	4010 CARLSBAD BL
3	FOXES LANDING LIFT STATION	4155 HARRISON ST
4	GATESHEAD SEWER LIFT STATION	4779 GATESHEAD RD
5	KNOTS SEWER LIFT STATION	501 KNOTS LN
6	LA GOLONDRINA SEWER LIFT STATION	2516 LA GOLONDRINA ST
7	POINSETTIA SEWER LIFT STATION	2425 POINSETTIA LN
8	SIMSBURY SEWER LIFT STATION	3086 TAMARACK AV
9	TERRAMAR SEWER LIFT STATION	300 CANNON RD
10	VANCOUVER SEWER LIFT STATION	2690 VANCOUVER ST
11	VILLAS SEWER LIFT STATION	2860 WINTHROP AV
12	CITY'S SANITARY SEWAGE COLLECTION SYSTEM	City service area

4.8.3 Site Specific BMP Requirements

The site specific BMPs listed in Table 4.12 were implemented at all Sanitary Sewer Facilities.

Table 4.12 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-22 Vehicle and Equipment Repair
SC-60 Housekeeping Practices
SC-76 Sewer Utility Maintenance

4.8.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities listed in Table 4.11 and are described below.

- SC-11 Spill Prevention, Control, and Cleanup: Spill kits are kept inside at all facilities; secondary containment structures were implemented around generator fuel cells and around all chemicals stored on-site; overflow response included immediate Vactor response, containment, and cleanup, per the City's SSORP spill mitigation and clean-up; all vehicles have spill kits.
- SC-22 Vehicle and Equipment Repair: Pump repair occurred indoors on site and was generally performed in the wet well; all material went back to the head works and was transferred to the Encinas treatment plant; wet wells were cleaned every 6 weeks with Vactor equipment and staff ensured that there were no leaks or spills at the facilities.
- SC-60 - Good Housekeeping: Sweep and vacuuming instead of washing down; blowers were used to clean off concrete and asphalt.
- SC-76 Sewer Utility Maintenance: All stations were inspected and cleaned daily; Vactors were checked for leaks during pre-trip inspections; all materials were discharged at Encina Wastewater Authority: solids into grit bin, liquids at headworks; recently the City began to implement FOG requirements as per Order 2006-003 including revision of ordinances, public outreach, and inspections of FOG generating facilities.

4.9 Water Facilities

4.9.1 Background

There is one high priority facility on the City's municipal inventory related to water facilities, primarily due to the chemical storage on-site. BMPs implemented at the site are described below.

4.9.2 Source Characterization

The Maerkle Dam Reservoir, Pump Station, and Chlorination Station is the only high priority Water Facility on the City's JURMP inventory.

4.9.3 Site Specific BMP Requirments

The site specific BMPs listed in Table 4.13 were implemented at the Maerkle Dam and Reservoir.

Table 4.13 Best Management Practices

SC-11 Spill Prevention, Control & Cleanup
SC-22 Vehicle and Equipment Repair
SC-60 Housekeeping Practices
REPAIRS AND NEW LINE INSTALLATION (LATERALS, MAINS, HYDRANTS)
RESERVOIR CLEANING
DEWATERING

4.9.4 Program Implementation

Each of the BMPs listed above were implemented at the facilities Maerkle Dam Reservoir, Pump Station, and Chlorination Station and are described below.

- Pollution Prevention replaced existing chlorine scrubber media from caustic soda to an environmentally friendly carbon-based media. Installed automatic shut-off valve units to accompany the chlorine vacuum regulator assembly providing three separate means of isolation in the event of a chlorine problem.
- SC-11 Spill Prevention, Control, and Cleanup: Specialized training to mitigate a chlorine release. In addition to the training all chemicals are stored in containment structures designed to contain stored amount. All chemicals were inspected prior to off loading for containment defects and returned if noted. Operations Staff was trained in Hazardous Material Emergency Response, technician level (HAZWOPER), specialized in chlorine mitigation
- SC-22 Vehicle and Equipment Repair: Vehicle maintenance was performed at the Fleet Maintenance Yard. Equipment repair work was performed with all appropriate BMPs in place.
- SC-60 - Good Housekeeping Increased sweeping schedule of asphalted areas. Chemical supplies were kept at a minimum to reduce potential releases.
- Repairs and New Line Installation: All flushing requirements followed established BMP's regarding de-chlorination and related sediment recovery concerns.
- Reservoir Cleaning and Dewatering: All reservoir de-watering followed pre-established BMP's addressing daily water volume discharge amounts, de-chlorination, monitoring of chlorine residuals and sediment removal and disposal.
- All storm drain collectors were regularly inspected and cleaned accordingly. All building floor drains were inspected and verified to be isolated from discharge system.

4.10 Municipal Yards

4.10.1 Background

Table 4.14 below lists the City's municipal yards that were determined to be high priority areas as required per Order 2001-01, Section F.3.a.(3)(b)iv. Site specific BMPs implemented at each facility are listed in Table 4.15 and described below.

4.10.2 Source Characterization

The table below lists the High Priority Municipal Yards on the City's municipal inventory.

Table 4.14 Municipal Yards

1	POINSETTIA MAINTENANCE STATION	6600 HIDDEN VALLEY RD
2	STAGECOACH MAINTENANCE STATION	3420 CAMINO DE LOS COCHES
3	FLEET MAINTENANCE FACILITY	2480 IMPALA DR
4	M&O OPERATIONS YARD	5950 EL CAMINO REAL
5	OAK OPERATIONS YARD	405 OAK AV
6	PARKS MAINTENANCE/STORAGE	1166 CARLSBAD VILLAGE DR

4.10.3 Site Specific BMP Requirements

Site specific BMPs listed in Table 4.15 were implemented at Municipal Yards, where applicable. For example, vehicle and equipment repair was not performed at all facilities; therefore SC-22 does not apply to all yards.

Table 4.15 Best Management Practices

Storm Water Pollution Control Plan
SC-11 Spill Prevention, Control & Cleanup
SC-20 Vehicle and Equipment Fueling
SC-21 Vehicle and Equipment Cleaning
SC-22 Vehicle and Equipment Repair
SC-31 Outdoor Container Storage
SC-33 Outdoor Storage of Raw Materials
SC-34 Waste Handling and Disposal
SC-41 Building and Grounds Maintenance
SC-43 Parking/Storage Area Maintenance
SC-60 Housekeeping Practices
SC-61 Safer Alternative Products
SC-70 Road and Street Maintenance
SC-71 Plaza and Sidewalk Cleaning
SC-72 Fountains & Pools Maintenance
SC-73 Landscape Maintenance
SC-74 Drainage System Maintenance
SC-75 Waste Handling and Disposal

4.10.4 Program Implementation

BMPs listed in Table 4.15 were implemented specific to each facility and are described below:

<u>POINSETTIA MAINTENANCE STATION; STAGECOACH MAINTENANCE STATION; PARKS MAINTENANCE YARD</u>

- Storm Water Pollution Control Plan (SWPPP description): Site specific SWPPPs were developed and implemented at each of these three sites.

- SC-11 Spill Prevention, Control, and Clean-up; Spill kits located on-site; drip pans were placed under all equipment kept on-site; spill kits are located in all vehicles; spill response plan was updated and kept on-site.
- SC-20 Vehicle and Equipment Fueling: No vehicle or equipment fueling was performed on-site.
- SC-21 Vehicle and Equipment Cleaning: Most equipment was dry-cleaned in designated areas located away from storm drains; where wet cleaning was necessary, it was performed over pervious surfaces in a manner that allowed all water to percolate, generating no runoff to the storm drain system.
- SC-22 Vehicle and Equipment Repair: All equipment was repaired in designated areas away from storm drains; no vehicle repair was performed on-site.
- SC-31 Outdoor Container Storage: All chemical products were kept in locked storage bins with overhead coverage and containment.
- SC-33 Outdoor Storage of Raw Materials: All bagged materials were stored on skids (pallets) and covered with canopies; canopies were also used to cover scrap metals and equipment.
- SC-34 Waste Handling and Disposal: All waste containers were covered.
- SC-41 Building and Grounds Maintenance: Mulch was used extensively for erosion control and weed suppression; pervious areas were landscaped to reduce erosion. In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: Dry-cleaning methods were used for debris control.
- SC-60 Housekeeping Practices: Weekly yard clean-up and litter removal and monthly site inspections.
- SC-61 Safer Alternative Products: IPM practices and green waste applications were in use and are described in detail below.

  In conjunction with the Integrated Pest Management (IPM) program, the Parks Maintenance Division continued to utilize slow release fertilizers in an effort to reduce the frequency of applications while minimizing the potential of fertilizer runoff. In some cases, staff reduced the recommended amount of fertilizer per 1,000 square feet by 50 to minimize flush of growth on turf which in turn reduced the amount of clippings. To help monitor fertilizer applications, the Parks Maintenance Division instituted a soil testing program which defines soil properties allowing the correct monitoring of fertilization applications for proper use and desired outcome. In accordance with the new IPM practices, weed control applications were applied per the Healthy Schools Act in accordance with the School Districts policies and guidelines. Staff continued searching for alternative methods for pest control that have been proven to be safe and effective.

  As required by the Department of Pesticide Regulation, all chemical applications were reported to the County Agriculture Department on a monthly basis. As identified in the JURMP, all BMPs were implemented to address pesticide, herbicide, and fertilizers sources of pollution. Specific, BMPs implemented during FY 07-08 include:

- **Education:** A training program for identifying and defining chemicals, proper handling, applying, storage, disposal, irrigating, and using non-synthetic alternatives was implemented. At many of the training seminars, new IPM methods were often presented for consideration by the department. All training information including BMPs were provided to personnel to keep in personalized folders for individual use. In addition, a master application manual that includes all Storm Water BMPs, training, and inspections was also prepared.

- **Non-chemical applications:** Some pest problems can be eliminated or controlled by handpicking, pruning, or high pressure spraying with water. Many pest problems can be reduced or eliminated by removing affected leaves or plant parts. During FY 07-08, efforts have been made to improve upon our IPM system in the City s Parks and Downtown Village areas. The release of lady-bird beetles at Pine Park and the Downtown Fountain areas to combat infestations of aphids have proven successful in eradicating the bugs. Other methods used to decrease the departments dependency on chemical sprays during FY 07-08 include:

    - Increased mulching of planter beds to smother weed germination
    - Increased tilling of planter beds to kill young weed sprouts
    - The use of organic plant derivative sprays such as Safer Products
    - The use of water to spray plants infested with giant whitefly
    - The removal of dying or diseased plant material to decrease the presence of harmful organisms.

- Insecticide application was performed on an as needed basis and was treated internally or by an outside pest control contractor after diagnosis.

- **Native Vegetation:** The Parks Maintenance Division continued to explore opportunities to use native vegetation to control pests, reduce chemical application, and maintain the aesthetic values of the Parks and Medians.

- **Schedules for Irrigation and Application** Irrigation systems were monitored and inspected on a weekly basis in an effort to minimize water loss. In addition, the use of evapo-transpiration (ET) gauges for controlling the irrigation system helped to reduce watering times based on evaporation and transpiration of plants and turf. ET gauges were installed at Poinsettia, Stagecoach, Pine, Aviara and Calavera Park. These gauges also helped staff to adjust watering times at other locations that were not connected to the gauge. During FY 07-08, all irrigation systems were inspected weekly and repaired as necessary to prevent excess runoff. At Poinsettia, Aviara, Stagecoach, and Pine Parks synthetic turf was installed on the soccer and sports fields, which requires minimal maintenance, fertilization, weed control or watering. The synthetic turf has proven to be successful in eliminating the use of water for irrigation.

- SC-70 Road and Street Maintenance: Not applicable at yard sites.
- SC-71 Plaza and Sidewalk Cleaning: In the event that pressure washing was necessary, all wash water was recovered for proper disposal or redirected to a pervious surface to ensure that no water was allowed to enter the storm drain system; any storm drains in proximity were protected from discharges.
- SC-72 Fountains and Pools Maintenance: Not applicable at park sites.

- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers were stored inside and used sparingly in accordance with required application practices. Also refer to IPM practices described in SC-61.
- SC-74 Drainage System Maintenance: Storm drain inlets were maintained by City s Storm Drain Maintenance Division on an annual basis.
- SC-75 Waste Handling and Disposal: All non-recyclable waste was disposed of at or transferred to an appropriate transfer station or facility.
- Site Design - Stagecoach Facility drains to grassy field for percolation prior to discharge from site; the Parks Maintenance/Storage Yard also drains to a pervious area allowing low flows to infiltrate into the soils instead of running into the storm drain.

FLEET MAINTENANCE YARD

- Employee Training Storm water protection was covered as part of safety meetings.
- Pollution Prevention Recycling containers were provided at the ends of the fuel pump islands.
- Storm Water Pollution Control Plan: A site specific SWPPP was developed and is maintained on-site.
- SC-11 Spill Prevention: Spill kits containing absorbents and booms continued to be located at the fuel island and south west of the fuel island within the yard, including the shop area.
- SC-20 Vehicle and Equipment Fueling: Spill kits are located adjacent to the vehicle fueling area.
- SC-21 Vehicle and Equipment Cleaning: All vehicle washing was performed on the wash rack, inside the wash bay. This included pressure washing and hand washing of vehicles and equipment. Wash waste water was treated prior to release to the sewer system.
- SC-22 Vehicle and Equipment Repair: All maintenance and repairs to Fleet vehicles were performed inside the shop bays. Any vehicle on the dead line that had a leak will have a drip pan put under it until it was brought into the shop. Any leaks or spills were handled immediately, with either the drip pans or an absorbent. The absorbent was picked up immediately and stored in the drums labeled for waste absorbent. Damaged equipment was covered with provided tarps. Wrecked vehicles were covered with tarps.
- SC-31 Outdoor Container Storage: Outdoor containers that include full coverage and containment of materials are utilized for storage of tires and motorcycles (two 40 yard containers) and for storage of fire extinguisher service items, used batteries, and oil filters for recycling (sheds).
- SC-33 Outdoor Storage of Materials: All materials stored outside are kept under one of the provided canopies or in the shed. City generated hazardous waste is stored in the hazardous waste shed (covered) in an appropriate container and on a pallet. This includes batteries and waste metals. A chain link fence has been installed to prevent unauthorized dumping at the Facility. Signage is also in place to inform citizens that materials are not to be left at the Facility and provides information on proper disposal facilities.
- SC-34 Waste Handling and Disposal: Waste oil was drained into the waste oil containers or into a drip pan and then into a waste oil container. The containers were emptied as needed into the waste oil in ground tank as needed. Used batteries are stored in the provided container inside the shed. Used anti freeze was drained into one of the large drip

pans, then transferred to the poly drums inside the shed. Scrap metal is stored in the provided container and covered. Used tires are stored in the covered tire storage bunker.

- SC-41 Building and Grounds Maintenance: Language was included in contracts requiring storm water compliance and allowing the City to implement BMPs as needed with all associated costs recovered from the contractor. In the event that any pressure washing was necessary, all washwater was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The Fleet Yard was swept via Sweeper-truck on a monthly schedule; clean ups of spills were done with dry absorbent and picked up directly, all leaks were captured with drip pans and brought into the shop for service.
- SC-60 Housekeeping Practices: The shop is either swept or mopped. All debris was either picked up and put into appropriate containers or, in the case of wet mopping, all water was directed to the drains inside the shop that flow to our separator. All contaminated floor sweep was stored in labeled containers and removed by our hazardous waste contractor. The Fleet yard will be inspected regularly. Areas inspected were the shed and tire storage area at the north end of the shop, the waste tire and hazardous waste bunker along the north fence line, the two large dumpsters, the two trash and two recyclables cans at the fuel pumps, the spill kits for the fuel island, the storm drains on-site and the paved lot and dirt area at the east end (which is now fenced). Inspection criteria: all waste drums/containers are to have secondary containment, all materials are to be stored in covered areas. Appropriate areas included a shed and two canopies plus the hazardous waste container and waste metal containers. The dumpsters, trash cans, recyclables cans and metal storage must be closed and no trash falling out of them. The filters at the storm drains were inspected for cleaning or replacement. The lot was inspected for spills and cleaned as needed. Vehicles in the lot are inspected for leaks; action was taken to contain leaks as needed. The wash rack area, trash containers area, and drains were inspected for clogging from debris. All employees took immediate action to correct any issues found during inspections of the Fleet yard directly.
- SC-71 Sidewalk Cleaning: Where power washing was necessary, wash water was not allowed to drain to the storm drain system and was directed to sanitary sewer or to pervious surfaces where possible.
- SC-73 Landscape Maintenance: Irrigation systems were checked regularly to avoid run-off; soil testing was utilized to assess need for fertilizers and irrigation; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: Fossil filters have been installed at storm drain inlets in yard and are inspected and maintained regularly.
- SC-75 Waste Handling and Disposal: Updated signage has been installed for Household Hazardous Waste disposal.

MAINTENANCE AND OPERATIONS YARD

- Pollution Prevention Native soils were used whenever possible to backfill trenches: the amount of dirt and soil stockpiled on site was minimized; filtration socks were used to dewater trenches.
- Storm Water Pollution Prevention Plan: A site specific SWPPP is kept on-site and maintained regularly.
- SC-11 Spill Prevention, Control, and Cleanup: Secondary containment where fuel and oil are stored, also yard has spill kits in each vehicle. A hazmat plan has been implemented and is located in the SWPPP.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was performed in the secondary containment area or over pervious surfaces.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks, otherwise no cleaning or washing was and is allowed at M&O yard.
- SC-22 Vehicle and Equipment Repair: No repairs are performed at yard.
- SC-31 Outdoor Container Storage: Container storage areas are covered using overhead canopies.
- SC-33 Outdoor Storage of Materials: Where necessary, plastic tarps cover raw materials in the yard; equipment is covered by canopies; material is covered by a permanent overhead structure or stored indoors.
- SC-34 Waste Handling and Disposal: All material was put into a covered roll-off container.
- SC-41 Building and Grounds Maintenance: The grounds and parking lot were swept twice a month by street sweeper and weekly by hand when necessary. Trash was removed daily. Erosive areas and slopes were protected by hydroseed, coconut mats, sand bags, and fiber rolls. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths were used where possible. Where feasible, work was performed under cover and over pervious areas. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The parking lot was swept twice a month by a street sweeper; ingress/egress to unpaved area of yard is protected by rocks and shaker plates.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans covered and kept closed.
- SC-61 Safer Alternative Products: Used less hazardous cleaning materials and water-soluble paints for mark outs.
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Swept and/or vacuumed sidewalks.
- SC-72 Fountain and Pools Maintenance: Contractor maintains fountain at facility. No water was discharged during maintenance activities; all filter material was retained on-site for proper disposal.
- SC-73 Landscape Maintenance: All material was cut and carried off by hand in burlap bags; no residue remains on site. Irrigation systems checked regularly to avoid run-off; timing improvements on irrigation system have reduced water usage; blowing and sweeping were used wherever possible; pesticide, herbicide, and fertilizers are stored inside and used sparingly in accordance with required application practices.
- SC-74 Drainage System Maintenance: Rapid Flow filters and storm drain structures are cleaned annually.
- SC-75 Waste Handling and Disposal: All material was handled properly and covered in yard roll-off dumpsters, or other appropriate containers.

OAK YARD

- Storm Water Pollution Control Plan (SWPPP description): A site specific SWPPP has been developed and implemented at the Oak Yard.
- SC-11 Spill Prevention, Control, and Cleanup: All liquids and hazardous materials are stored in locked containment lockers. These are located within secondary containment areas. Large spill containment kits are strategically located within the yard. MSDS binders are strategically placed throughout the yard.
- SC-20 Vehicle and Equipment Fueling: Small equipment fueling was done only in the secondary containment area.
- SC-21 Vehicle and Equipment Cleaning: Trash was removed daily from the work trucks. No cleaning or washing was allowed in the Oak yard
- SC-22 Vehicle and Equipment Repairs: No repairs were done at the Oak yard.
- SC-31 Outdoor Container Storage: Oak yard has storage areas covered with overhead canopies.
- SC-33 Outdoor Storage of Raw Materials: No raw materials are stored at the Oak yard.
- SC-34 Waste Handling and Disposal: Paint waste was returned to the maintenance yard where it was transferred directly from the generating vehicle to secured storage containers. This was done within a proper containment area in case of any accidental spillage. These containers are clearly marked and stored until arrangements are made for a certified waste management company to remove them and transfer them to an approved facility. Any other debris was placed in a canopy covered 40 yd roll-off. Dumpsters remained covered and all other trash receptacles have lids.
- SC-41 Building and Grounds Maintenance: The Oak yard was swept twice a month by a self-contained street sweeper and weekly by hand. Trash was removed daily. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal. Where painting, scraping, or sandblasting were necessary, all material was disposed of properly and drop cloths are used where possible. Paint brushes and tools were always cleaned in a way that prevented any discharge from entering the storm drain. For grounds maintenance, refer to SC-73, landscape maintenance.
- SC-43 Parking/Storage Area Maintenance: The Oak yard was swept twice a month by a self-contained street sweeper and weekly by hand. Trash was removed daily. In the event that any pressure washing was necessary, all wash water was recovered for proper disposal.
- SC-60 Housekeeping Practices: Recycle bins, dumpsters, and cans remained covered. Yard clean-up was performed by-weekly with monthly site inspections.
- SC-61 Safer Alternative Products: Not Applicable
- SC-70 Road and Street Maintenance: Not Applicable
- SC-71 Sidewalk Cleaning: Not Applicable
- SC-72 Fountain and Pools Maintenance: Not Applicable
- SC-73 Landscape Maintenance: Not Applicable
- SC-74 Drainage System Maintenance: Debris was captured prior to entry into the vegetated swale.

5.0 INDUSTRIAL AND COMMERCIAL COMPONENT

5.1 Introduction

The City continued to track, inspect, and monitor all industrial and commercial facilities on its inventory from July 1, 2007 to March 23, 2008 per Order No. 2001-01. Section 5.2 describes the Industrial Program and Section 5.3 describes the Commercial Program.

5.2 Industrial Sites Sources Element

5.2.1 Background

Major industry types in Carlsbad include airport services, refuse and sewage management, a power plant, pharmaceutical research and development, golf equipment manufacturers, and several light industry parks. The City has implemented a program to inspect industrial facilities, improve compliance, and reduce pollutant runoff.

There were 42 High priority industries on the inventory as of March 23, 2008. Of those 42, all were inspected between July 1, 2007 and March 23, 2008, representing 36 individual businesses on the Inventory.

From July 1, 2007 to March 23, 2008, the City maintained an inventory of 299 industrial facilities prioritized into High, Medium, and Low. The City updated the industrial inventory, mapped all industries, and inspected **all** High Priority industries, as required by RWQCB Order 2001-01.

The total High, Medium and Low priority industrial inspections conducted during this reporting period equaled 133, representing 42 High-Priority, 54 Medium-Priority, and 37 Low-Priority inspections. These 133 inspections not only included physical inspections, but also reviews, phone contacts, and drive by surveillance to determine business status, provide education and outreach materials, and require BMP implementation in accordance with the City ordinance, Permit, and/or General Industrial Storm Water Permit (General Permit). These activities are described in the following subsections.

5.2.2 Source Characterization

Storm water inspectors identify potential pollution sources, assess their threat to water quality, and require the implementation of BMPs to eliminate sources at industrial facilities. The Storm Water Protection Program works closely with the Finance Department to obtain accurate information about new business activities, types (home based or commercial locations), contacts, and other related data. Each quarter, the Storm Water Protection Program downloads, sorts, maps, and prioritizes new businesses.

New businesses are then added to the inventory list and scheduled for inspection. In some cases information provided on business license applications is not correct and other information must be gathered before an inspection can be scheduled. These pre-inspection evaluations help the City determine if a business activities are subject to the Permit requirements. The two types of pre-inspection evaluations the Storm Water Protection Program uses are:

1. Reviews: Business license and other relevant information reviewed to determine whether the businesses should be inspected by the Storm Water Protection Program.

2. Telephone Contacts: If the review fails to provide enough information about the business, the business is contacted by phone to determine their status and schedule an inspection if necessary.

After physical inspections, reviews, or telephone contacts any changes to a business priority or status were recorded on the Storm Water Inventory List and in the Permits Plus database. The inventory as of March 23, 2008 is in Appendix 5.1. Data related to industrial businesses is managed on a continual basis as per departmental procedures and JURMP requirements. Appendix 5.2 contains a map of all prioritized industries on the inventory as of March 23, 2008.

Table 5.1: SIC Groupings by Type, High Priority Industrial

Industrial Sector	Ind High
2675: Die-Cut Paper, Paperboard, and Cardboard	1
28XX: Drugs	3
28XX: Chemical and Allied Products	2
2951: Asphalt Paving Mixtures and Blocks	1
36XX: Electronic and Other Electrical Equipment and Components	1
39XX: Miscellaneous Manufacturing	4
4119: Local Passenger Transportation, NEC	2
42XX: Motor Freight Transportation and Warehousing	2
42XX: Public Warehousing and Storage	1
45XX: Transportation By Air	18
49XX: Electric, Gas, and Sanitary Services	7
TOTAL	42

5.2.3 Best Management Practice Requirements

Pollution prevention activities are proactive approaches industries can take to identify and reduce sources of pollution. Proactive pollution prevention when framed in the context of appropriate BMP identification, use, and maintenance is a key component to improving regional water quality. Pollution prevention measures are specific to industrial types and activities. Industries were informed of pollution prevention opportunities during site inspections, in outreach materials, and through correspondences. City inspectors required the following minimum best management practices (detailed in individual facility inspection reports and/or brochures) for all High Priority industrial facilities.

- Move or cover potential pollution sources from storm water contact. Protect materials and products that could potentially pollute storm water from rain, run-on, runoff, and wind dispersal by storing them indoors or covering them, and providing them with secondary containment as needed. For industries with conditional SIC codes, moving stored materials indoors may allow an exemption from the General Permit requirements.
- Use dry cleanup methods. Washing or cleaning activities that involve the use of a water hose or pressure washing system require the use dry clean up methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible).
- Redirect storm water flows and conduct storm drain maintenance. Perform regular visual inspections of the storm drain to identify unauthorized discharges or pollutants and clean as needed. Industries may be required to modify downspout locations in order to redirect storm water flows away from potential pollutant sources.

- Trash Management. Sweep up around dumpsters and other areas to prevent trash and debris from accumulating. Dumpsters must be kept closed when not in use. All trash must be kept in appropriate sized containers until it can be hauled away.
- Recycle, Reduce and Reuse. Recycle cans, bottles, newspaper, office paper, and cardboard whenever possible. When inspecting solid waste collection areas, inspectors noted if recyclable materials (cardboard, green waste, etc.) were placed in dumpsters.

All High Priority industries were also required to develop and implement a Storm Water Pollution Prevention Plan (SWPPP). In addition, some Medium and Low priority facilities were also required to develop and implement SWPPPs if their activities had the potential to contribute to storm water pollution. These businesses were usually given 60-90 days to develop and submit the SWPPP to the Storm Water Protection Program for review and approval. During follow up compliance inspections, businesses were required to show documentation that the SWPPPs had been implemented as required. If the inspector found deficiencies, the facility operator was required to revise the SWPPP and ensure compliance procedures and BMPs were implemented as outlined in the plan.

The City continued to provide a sample SWPPP template to industries as a guide for preparing site specific plans. The sample SWPPP was also provided upon request when the current SWPPP was found to be deficient.

5.2.4 Program Implementation

Best Management Practices Implementation
The City required all inspected industries to implement minimum BMPs and other BMPs applicable to specific industrial activities. BMP information was made available during inspections, in printed materials and direct mailings, at workshops, on the storm water website and hotline, during presentations, and at outreach events. A complete listing of all education and outreach events held during this reporting period can be found in Section 8 of this report.

Printed Material and Direct Mailings
From July 1, 2007 to March 23, 2008, the City continued to distribute the *Best Management Practices for Businesses – Commercial and Industrial* brochure containing the list and description of the required minimum BMPs.

Inspections and Site Visits
Industrial operators select and implement appropriate source and treatment control BMPs as directed by the Storm Water Protection Program, City Planning Department, and/or City Engineering Department. BMPs are considered effective if they address the pollutants of concern and are specific enough to prevent or reduce the likelihood of an illegal discharge. The City may require BMP implementation based on problems identified during site inspections. All industrial facilities were required to implement minimum BMPs, additional BMPs identified for specific industrial activities, or as directed by the City.

Website and Hotline
Information about water conservation, trash management, and storm water was combined on a centralized hotline and web page accessed at www.carlsbadconserves.org. The hotline was answered by Storm Water Protection Program staff during business hours Monday through Friday and provided a detailed voice message after hours. In addition, outreach materials continued to be revised to include the Environmental Program s hotline number, storm water hotline number, and web page address. Industries can call the hotline to request BMP

information or download the information from the Environmental Programs and the Storm Water Protection Program web pages. From July 1, 2007 to March 23, 2008, there were 31,856 hits on the Environmental Programs web page.

The Environmental Programs webpage included all fact sheets and BMP brochures produced by the Storm Water Protection Program, links to related web pages, and additional information about storm water pollution prevention.

BMP and Knowledge Assessment Tools

During this reporting period, the Storm Water Protection Program continued to use the *BMP and Knowledge Assessment* tool to measure an individual industrial operator's knowledge of storm water issues and assess the implementation of BMPs onsite. The assessment tool was used by inspectors during site visits where industrial operators are rated using the following criteria:

Overall Knowledge Assessment

For Knowledge Assessment, inspectors ranked personnel from 1-5 per the following scale:

Level 1: Individual has never heard of the storm water program, requirements, or BMPs. This individual does not know what BMPs are or understand how to implement them.

Level 2: Individual has a general awareness of water quality issues, but does not understand the requirements of the storm water program, BMPs, or pollution prevention.

Level 3: Individual has a general understanding of storm water issues (*I've heard something about that*), but not specific storm water requirements or BMPs required for the facility.

Level 4: Individual has a clear understanding of BMPs but may not have a clear awareness of the connection between pollution prevention and water quality.

Level 5: Individual demonstrated an in-depth knowledge of the storm water program and BMPs consistent with the facility's activities and operations.

Overall BMP Assessment

For BMP Assessment, inspectors ranked the facility from 1-5 per the following scale:

Level 1: An illegal discharge was noted during the inspection. Enforcement actions such as a NOV and/or citation are required.

Level 2: BMPs have not been implemented. Several violations were noted during the inspection, however an illegal discharge was not observed. A detailed inspection report and/or written warning was issued.

Level 3: BMPs have been implemented throughout the site, but not properly or adequately maintained. Violations were noted during the inspection and a verbal warning was issued. A detailed inspection report or written Warning Notice may follow.

Level 4: BMPs implemented effectively, however minor violations associated with communal areas or good housekeeping practices (i.e., dumpsters open, leaves in the parking lot, etc.) were noted during the inspection.

Level 5: All BMPs implemented effectively. No violations noted during the inspection.

Table 5.2: Industrial Businesses Rated for Each Score

Rating	Knowledge Assessment (raw score)	Knowledge Assessment (□)	BMP Implementation (raw score)	BMP Implementation (□)
1	4	3□	8	6□
2	20	14□	10	8□
3	69	50□	21	16□
4	23	17□	23	17□
5	22	16□	70	53□
Total	138	100□	132	100□

Table 5.2 shows the number of instances in raw score and percentage that industrial businesses rated for each score, with 5 being the highest score possible. For BMP implementation, the results show that the City continued to be successful in ensuring that the businesses have implemented BMPs throughout the city. The City will continue to work with businesses to not only educate them about storm water issues, but also ensure BMPs are implemented and maintained.

The Regional Board requires regulated industries to conduct monitoring as outlined in the General Permit. Permitted facilities are required by the State to maintain self-audit reports, SWPPPs, monitoring reports, and annual reports onsite.

The City ensures that annual water quality monitoring is conducted at each high priority industrial facility by reviewing monitoring results during annual inspections to verify that monitoring was conducted as required. If and when monitoring was not completed as required the City issued NOVs and notified the Regional Board of non-compliance issues. During FY 07-08, the City analyzed monitoring results, made comparisons, and provided recommendation to those industrial facilities that exceeded benchmark values. These recommendations included, but were not limited to, SWPPP revisions, implementation of new BMPs, reinforcement of implemented BMPs, and increased employee training.

The City will continue to annually inspect the industries governed by the Industrial permit, collect monitoring data, and provide feedback to industries on the effectiveness of the monitoring program and BMPs. If benchmark values routinely exceed the established parameters, the City will follow up with written notification to the facility and Regional Board and require corrective actions and/or additional BMPs to prevent or reduce the identified pollutant at its source.

Inspection of Industrial Sites

All 42 high priority industrial sites were inspected by the City during this reporting period. In addition, the City conducted industrial inspections at 34□ of industrial medium facilities and 37□ of industrial low facilities in accordance with the City□s JURMP submitted in 2002. Medium and Low Priority industries were inspected in response to a complaint or as needed. More frequent inspections or follow-ups were conducted for sites found to be non-compliant or placed on a compliance schedule.

Each month, several businesses were selected from the master inventory list for inspection and/or review. The City usually conducted unscheduled, follow-up, and compliance inspections at businesses that had been previously inspected. If a new business could not be excluded by review or telephone survey, then a site visit was scheduled and a comprehensive inspection conducted. Inspections were scheduled within two weeks of contacting the business.

In addition to physical inspections and telephone surveys, the City also reviewed (including home based businesses) industries and evaluated the industry using relevant information from other City departments, databases, or licensing programs. A business could be excluded during the review process if it was found that their activities were not regulated by the City or General Permit. The most common reason businesses were excluded was because of an incorrect SIC code designation. Of the industries reviewed during this reporting period, 3 had moved, 11 were found to be out of business, 69 were found to be active, 2 were duplicate entries, 1 was excluded or did not require an additional inspection. If the business was found to be active and not a home-based location, a physical inspection was conducted to assess potential threat to water quality. Appendix 5.1 includes the name, location, SIC, priority, and types of industrial inspections conducted during the reporting period.

Enforcement of Industrial Sites

The City conducted follow-up inspections to determine compliance with the corrective actions outlined in the inspection report or enforcement notices. The City also continued to use the Notice to Clean form and NOV form developed in FY 05-06 to facilitate prompt and proactive responses from businesses.

When a storm water complaint was received about an industrial site or source, or an illegal discharge was observed or suspected, the City conducted a storm water inspection or investigation. If a significant and/or immediate threat to water quality was observed, appropriate actions were taken to require the responsible party to immediately cease the discharge and/or implement corrective actions. In judging the degree of severity, City inspectors also took into account any history of similar incidents or discharges. Table 5.3 includes a summary of inspections and any corrective or enforcement actions required by the City after inspections at High Priority industrial facilities. This table also includes 36 individual businesses representing 42 different high priority locations inspected as required during this reporting period.

Table 5.3: Summary of Inspections, Corrective and Enforcement Actions Required at High Priority Industrial Facilities from July 1, 2007 to March 23, 2008.

	Business Name	Insp. Date	Corrective Actions	Enforcement Action
1	ACUSHNET COMPANY	8/24/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors.	None
2	HAWTHORNE RENT-IT SERVICE	8/27/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors. Store metals parts in covered areas. Replace BMPs where necessary. Inspect and clean in and around storm drains as needed	None
3	HANSON AGGREGATES	9/18/07	None required.	None
4	NRG CABRILLO POWER STATION	9/20/07	None required.	None
5	GRAPHIC CONVERTING, INC.	9/25/07	Inspect and clean in and around storm drains as needed.	None

	Business Name	Insp. Date	Corrective Actions	Enforcement Action
			Protect materials stored outdoors.	
6	RANDALL INTERNATIONAL	10/16/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors. Clean parking area of any spills or leaks.	Written Warning
7	ISIS PHARMACEUTICALS	10/30/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors.	None
8	BECKMAN COULTER	10/31/07	Protect materials stored outdoors Inspect and clean in and around storm drains as needed.	None
9	LEGOLAND	11/6/07	Regularly inspect and sweep outdoor areas. Clean in and around storm drains.	None
10	FEDERAL EXPRESS CORPORATION	11/14/07	Regularly inspect and sweep outdoor areas.	None
11	A & P AIRCRAFT DETAILING	11/19/07	None required.	None
12	BARNSTORMING ADVENTURES	11/19/07	None required.	None
13	CIVIC HELICOPTER INC	11/19/07	None required.	None
14	HANGAR ONE, INC	11/19/07	None required.	None
15	JET SOURCE, INC.	11/19/07	None required.	None
16	JET SOURCE, INC.	11/19/07	None required.	None
17	JET SOURCE, INC.	11/19/07	None required.	None
18	JET SOURCE, INC.	11/19/07	None required.	None
19	LEADING EDGE AVIATION	11/19/07	None required.	None
20	MCCLELLAN-PALOMAR AIRPORT	11/19/07	Protect materials stored outdoors. Ensure tenants are trained on storm water requirements.	None
21	MERCY AIR	11/19/07	None required.	None
22	NORTH COASTAL (PALOMAR) LANDFILL	11/19/07	None required.	None
23	PREMIER JET	11/20/07	None required.	None
24	QUALITY AIRCRAFT CARE	11/20/07	None required.	None
25	WEST COAST JET SERVICES, LLC	11/20/07	None required.	None
26	WESTERN FLIGHT, INC.	11/20/07	None required.	None
27	WESTERN FLIGHT, INC.	11/20/07	None required.	None
28	ALLIED WASTE COMPANY	11/28/07	Regularly inspect and sweep outdoor areas. Inspect and clean in and around storm drains as needed.	None
29	COAST WASTE MANAGEMENT	11/28/07	None required.	None
30	MEADOWLARK WATER RECLAMATION	12/4/07	None required.	None
31	LA COSTA LIMOUSINE	12/6/07	None required.	None
32	SCHUMACHER CO. (AIR PRODUCTS AND CHEMICALS)	12/10/07	None required.	None
33	OLIVENHAIN MUNICIPAL WATER DISTRICT	12/13/07	Regularly inspect and sweep outdoor areas. Inspect and clean in and around storm drains as needed. Properly store hazardous materials.	None
34	AALTO SCIENTIFIC LTD	12/18/07	Inspect and clean in and around storm drains as needed. Protect materials stored outdoors.	None
35	LEUCADIA WASTE WATER DISTRICT	12/20/07	None required.	None

	Business Name	Insp. Date	Corrective Actions	Enforcement Action
36	MELLES GRIOT LASER DIVISION	12/20/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors. Inspect and clean in and around storm drains as needed.	None
37	ENCINA WATER FACILITY	12/26/07	Regularly inspect and sweep outdoor areas. Protect materials stored outdoors. Protect landscaped areas from erosion. Dispose of or properly store batteries inside.	None
38	CALLAWAY GOLF BALL COMPANY	12/27/07	None required.	None
39	CALLAWAY GOLF COMPANY	12/27/07	None required.	None
40	CALLAWAY GOLF CO (PASCAL BUILDIING)	12/27/07	None required.	None

The Enforcement Response Plan continued to be used by City inspectors to identify, document, and respond to storm water violations. See the City s *Enforcement Response Plan* (FY 01-02 JURMP Annual Report) for a detailed description of the typical escalating enforcement procedures.

The Storm Water Protection Program had two full-time environmental specialists and one part-time intern to conduct inspections from July 1, 2007 to March 23, 2008. In addition to completing the Peace Officer Orientation II Laws of Arrest Course (40 hours of a POST certified course pursuant to Section 832(a) of the California Penal Code), the Environmental Specialists are continually trained on code enforcement, inspection procedures, laws and regulations, and investigation techniques. Storm Water Protection Program staff attended the following formal training during this reporting period:

- August 2008 24 Hour HAZWOPER, San Diego, Ca.
- February 2008 EPA Webcast BMP Performance

These training courses, in addition to the Enforcement Response Plan, helped the Storm Water Protection Program appropriately identify and respond to storm water violations. The City took a total of 2 enforcement actions against industrial facilities from July 1, 2007 to March 23, 2008. These are listed in Table 5.4.

Table 5.4. Number of Industrial Enforcement Actions

Industrial Priority	Verbal Warning	Written Warning	Notice of Violation	Notice to Clean	Administrative Citation
High	0	1	0	0	0
Medium	0	0	1	0	0
Low	0	0	0	0	0
Totals	0	1	1	0	0

Escalated enforcement actions were taken when necessary to achieve compliance. In some cases, an informational letter or written warning was escalated to a NOV if compliance was not achieved with the first action. More detailed information on complaint response and illegal discharge investigations is found in Section 7.

Non-Compliance Notification Action Plan

All industrial facilities were required to maintain compliance with the Carlsbad Municipal Code and the JURMP, as applicable to their operations. The City communicated all correspondences and actions pertaining to High Priority industries to the Regional Board. Actions related to Medium Priority sites were also forwarded to the Regional Board if the facility was considered non-compliant or if the filing status needed to be documented (i.e. recommended NOI filer or NONA certification required). If an incident or practice of non-compliance occurred at an industrial facility, City inspectors determined if it posed a threat to human or environmental health by considering the following criteria:

- Characteristics, quantity, and toxicity of substances/materials involved;
- Proximity of site to a sensitive water body;
- Proximity of site to an impaired water body;
- Proximity of site to a sensitive habitat/endangered species;
- Estimated volume of actual and/or potential discharge; and
- If discharges to storm drain, condition of storm drain (clog, etc.).

If an incident of non-compliance was determined, in conjunction with Carlsbad Fire Department, to pose a threat to human or environmental health the City provided verbal notification to the Regional Board within 24 hours, followed by a written report within 5 days.

5.3 Commercial Sites Sources Element

5.3.1 Background

The City continued to track, inspect, and monitor high priority commercial businesses within its jurisdiction during this reporting period. Major commercial types in Carlsbad are automobile maintenance, restaurants, shopping centers, pressure washing, masonry and concrete work, carpet cleaning, and landscape services. These high priority activities have the potential to generate significant amounts of pollutants, if performed with disregard to the environment. The City has implemented a program to inspect high priority facilities, ensure compliance with applicable regulations, and reduce pollutant runoff from commercial sites and sources. From July 1, 2007 to March 24, 2008, the City maintained an inventory of 701 commercial businesses.

During this reporting period, the City updated and prioritized the commercial inventory, mapped all high priority commercial facilities, and inspected 385 high priority commercial businesses. Inspections not only included physical inspections, but also reviews, phone contacts, and drive by surveillance, all in an effort to conduct education and outreach, obtain compliance, ensure BMP implementation, and use escalated enforcement actions, when necessary. These activities are further described in the following subsections.

5.3.2 Source Characterization

Source Identification and Threat to Water Quality Prioritization

Storm water inspectors identified pollution sources, assessed the potential threat to water quality, and required BMP implementation to eliminate pollution sources from commercial businesses. Each year hundreds of new businesses are established in Carlsbad. The Storm

Water Protection Program worked closely with the Finance Department to obtain information about new businesses, including activities, SIC codes and descriptions, business types, and contact names and numbers. Each quarter the Storm Water Protection Program downloaded, sorted, mapped, and prioritized new businesses by SIC and business type.

These new businesses were then added to the inventory list and scheduled for inspection. In some cases information provided on business license applications was not correct and a pre-inspection evaluation was necessary. Pre-inspection evaluations helped determine if a business activities were subject to storm water requirements. Two types of pre-inspection evaluations were used:

1. Reviews: Business license information and other relevant data was reviewed to determine whether the business should be inspected and tracked by the Storm Water Protection Program.
2. Telephone Contacts: If the review fails to provide enough information, the inspector contacted the business by phone to determine their status and schedule an inspection if necessary.

After physical inspections, reviews, or telephone contacts, any changes to a business priority or status was recorded on the Storm Water Inventory List and/or in the Permits Plus database. New businesses were also found by referral from other agencies, field discovery, or business directories. The updated Commercial Inventory as of March 24, 2008 can be found in Appendix 5.1.

Data related to commercial businesses was managed on a continual basis per departmental procedures and JURMP requirements. All documents related to commercial businesses were filed according to status (active, inactive, excluded, or out of business). Appendix 5.3 contains a map of all High Priority commercial facilities on the inventory. Because restaurants and automotive facilities represent the largest commercial groups, the map contains separate symbols for the locations of these facilities.

As of March 23, 2008, the inventory included 701 high commercial businesses. The High Priority commercial businesses on the inventory continue to be reviewed in response to complaints and as resources become available. As a part of the City s watershed activities, staff conducted inspections at 91 of all restaurant facilities from July 1, 2007 to March 23, 2008.

Table 5.5 provides a summary of commercial business by sources type. A total of 28 SIC code groupings related to high priority commercial activities were identified.

Table 5.5 - Summary of Commercial Businesses for Source Types

Commercial Activity	On Inventory
01XX: Agricultural Production Crops	11
02XX: Agricultural Production Livestock and Animal Specialties	1
07XX: Agricultural Services	38
15XX: General Contractors	95

TOTAL	701

Table 5.5 shows that the greatest number of commercial sources of pollution may be from restaurants. Restaurants contribute to storm water pollution through improper housekeeping practices that allow grease, trash, and cleaning products to discharge to streets and the storm drain system. Because restaurants were identified as a watershed priority activity, the Storm Water Protection Program has intensified efforts to provide BMP information, conduct unscheduled inspections, and escalate enforcement actions, when necessary. Of the 183 active restaurants on the end of period inventory, 166 were physically inspected by the Storm Water Protection Program from July 1, 2007 to March 23, 2008.

5.3.3 Best Management Practice Requirements

Pollution Prevention

Pollution prevention activities are proactive approaches commercial businesses can use to identify and reduce pollution sources. Proactive pollution prevention, when framed in the context of appropriate and specific BMP identification and maintenance, is key to improving regional water quality. The City's approach was to promote pollution prevention and BMP implementation to the maximum extent practicable. The City encouraged the use of BMPs during inspections, public events, in outreach materials, through direct mailings, and at

workshops. City inspectors required the following minimum BMPs for all commercial businesses:

- Move or cover potential pollution sources from storm water contact. Protect materials and products that could potentially contribute to storm water pollution by storing them indoors or covering them, and providing them with secondary containment as needed.
- Use dry cleanup methods. Washing or cleaning activities that involve the use of a water hose or pressure washing system were required to use dry clean up methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible).
- Redirect storm water flows and conduct storm drain maintenance. Perform regular visual inspections of the storm drain to identify unauthorized discharges or pollutants and clean as needed. An commercial facility may be required to modify downspout locations in order to redirect storm water flows away from potential pollutant sources.
- Trash Management. Sweep up around dumpsters and other areas to prevent trash and debris from accumulating. Dumpsters must be kept closed when not in use. All trash must be kept in appropriate sized containers until it can be hauled away.
- Recycle, Reduce and Reuse. Recycle cans, bottles, newspaper, office paper and cardboard whenever possible. When inspecting solid waste collection areas, inspectors noted if recyclable materials (cardboard, green waste, etc.) were placed in dumpsters and recycled.

SWPPPs were encouraged and/or required for commercial businesses based on inspection findings and potential threat to water quality. Commercial businesses were usually given 60-90 days to develop and submit the SWPPP to the Storm Water Protection Program for review and approval. During follow up compliance inspections, businesses were expected to provide documentation that the SWPPP had been implemented as required. If the inspector found deficiencies, the business was required to revise the SWPPP and ensure procedures and BMPs were implemented as outlined in the plan. The City continued to provide the sample SWPPP to commercial businesses as a guide for preparing site specific plans. The sample SWPPP was also provided upon request or when the current SWPPP was found to be deficient.

5.3.4 Program Implementation

Best Management Practices Implementation

The City required High Priority commercial businesses to implement the minimum BMPs and specific BMPs applicable to each activity and pollutant source. BMP information was made available during inspections, in printed materials, at workshops, on the website and hotline, and at outreach events. A complete listing of all outreach and education events held during this reporting period, can be found in Section 8 of this report.

Printed Materials and Direct Mailings
During this reporting period, the City continued to distribute the *Best Management Practices for Businesses – Commercial and Industrial* brochure containing the list and description of the minimum BMPs. This brochure was distributed to all commercial businesses during inspections and by direct mail to businesses that the City verified from the inventory.

The City continued to distribute the Best Management Practices for Mobile Service Providers brochure developed in FY 05-06. The brochure was designed for mobile service provides such

as carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, their employees, and anyone that hires a mobile service provider.

The City also continued to distribute the *Pollution Prevention Guide for the Construction Industry*. This brochure was developed to provide BMP and pollution prevention information related to materials storage, perimeter controls, building and staging areas, dumpsters and port-a-potty services, concrete trucks and pumpers, washout areas, and storm drain protection. The brochure was distributed to commercial businesses that conduct small remodeling or home improvement projects.

Inspections and Site Visits

Commercial businesses select and implement source and treatment control BMPs as directed by the Planning Department, the Engineering Department or the Storm Water Protection Program. BMPs are considered effective if they address the pollutants of concern and are specific enough to prevent or reduce the likelihood of an illegal discharge. The City may require BMPs based on problems identified during site inspections. All commercial businesses were required to implement the minimum BMPs, those identified for specific commercial activities, or as directed by the City.

During this reporting period, the City continued to use the streamlined inspection report to facilitate prompt correction of violations. The streamlined inspection form includes space to report previous enforcement actions, new storm water contacts, and a detailed list of necessary corrective actions. Detailed inspection reports also continue to be used for businesses that have not been previously inspected or if the facility requires a more complex inspection (i.e. high priority facilities, egregious violators). If corrective actions were required, follow-up inspections were conducted to verify compliance.

Website and Hotline

Information about water conservation, trash management, and storm water were combined on one centralized hotline and web page accessed at www.carlsbadconserves.org. The hotline was answered by the Storm Water Protection Program during business hours, Monday through Friday, and provides a detailed voice message after hours. In addition, outreach materials continue to be revised to include the Environmental Program s web page address and hotline number. From July 1, 2007 to March 24, 2008, there were 31,856 hits on the Environmental Programs web page. The webpage includes all fact sheets and BMP brochures, links to related web pages, and additional information about storm water pollution prevention.

BMP and Knowledge Assessment Tools

The Storm Water Protection Program continued to use the *BMP and Knowledge Assessment* to measure knowledge of storm water issues and assess the implementation of BMPs onsite. The assessment tool rated a commercial operator and site using the following criteria:

Overall Knowledge Assessment:

Inspectors ranked personnel from 1-5 per the following *Knowledge Assessment* scale:

Level 1: Individual has never heard of the storm water program, requirements, or BMPs. This individual does not know what BMPs are or understand how to implement them.

Level 2: Individual has a general awareness of water quality issues, but does not understand the requirements of the storm water program, BMPs, or pollution prevention.

Level 3: Individual has a general understanding of storm water issues (*I've heard something about that*), but not specific storm water requirements or BMPs required for the facility.

Level 4: Individual has a clear understanding of BMPs but may not have a clear awareness of the connection between pollution prevention and water quality.

Level 5: Individual demonstrated an in-depth knowledge of the storm water program and BMPs consistent with the facility s activities and operations.

Overall BMP Assessment
Inspectors ranked the facility per the following 1-5 *BMP Assessment* scale:

Level 1: An illegal discharge was noted during the inspection. Enforcement actions such as a NOV and/or citation are required.

Level 2: BMPs have not been implemented. Several violations were noted during the inspection, however an illegal discharge was not observed. A detailed inspection report and/or written warning was issued.

Level 3: BMPs have been implemented throughout the site, but not properly or adequately maintained. Violations were noted during the inspection and a verbal warning was issued. A detailed inspection report or written Warning Notice may follow.

Level 4: BMPs implemented effectively, however minor violations associated with communal areas or good housekeeping practices (i.e., dumpsters open, leaves in the parking lot, etc.) were noted during the inspection.

Level 5: All BMPs implemented effectively. No violations noted during the inspection.

Table 5.6: Commercial High Businesses Rated for Each Score.

Rating	Knowledge Assessment (raw score)	Knowledge Assessment ( )	BMP Implementation (raw score)	BMP Implementation ( )
1	3	2	48	18
2	48	30	20	8
3	50	31	35	14
4	36	23	50	19
5	22	14	107	41
TOTAL	159	100	260	100

Table 5.6 shows the number of instances in raw score and percentage that commercial high businesses rated for each score, with 5 being the highest score possible. There were a total of 159 businesses assessed for Knowledge, and 260 assessed for BMP implementation. The number of *BMP Assessments* collected is usually higher than the number of *Knowledge Assessments* collected, because company representatives were not available to complete the

Knowledge Assessment. The City will continue to work with businesses to not only educate them about storm water issues, but also ensure BMPs are implemented and maintained.

Inspection of Commercial Sites

The City conducted High Priority commercial inspections at approximately 55□ of all prioritized commercial businesses in accordance with the program guidelines described in the JURMP. Site visits, reviews, and telephone contacts were the primary methods used to educate and ensure storm water compliance at commercial businesses. The City conducted inspections of commercial businesses on a complaint basis and as time and resources became available.

The City physically inspected 266 commercial businesses from July 1, 2007 to March 23, 2008 (excluding reviews, phone surveys, and drive bys). Storm water staff also reviewed, phoned, or conducted investigations at an additional 119 commercial facilities for a total of 385 businesses inspected during this reporting period. As of March 14, 2008 there were 701 commercial businesses on the storm water inventory. Of these, 27 were found to be out of business, 9 had moved out of the City, 5 were duplicate entries, 42 were excluded (based on several qualifying factors including SIC Code, location, business type, and probability to contribute to storm water pollution), 526 were active, and 92 had not been reviewed.

A large percentage of businesses on the inventory list were home-based businesses. Many commercial home-based businesses are involved in the mobile trade industry (carpet cleaning, power washing, etc.), which are considered high priority commercial activities. These home-based, mobile businesses were identified, contacted and mailed appropriate BMP information. Because site inspections are not required for home-based businesses, many were reviewed by City inspectors. During the review process the inspector evaluated a commercial business using any relevant information available in other City departments, databases, or licensing programs. A business could be excluded during a review if it was found that their activities were not regulated by the City or Permit. The most common reason businesses were excluded during the review process was because of an incorrect SIC code designation.

Telephone surveys continue to be used to determine the status of certain types of home-based businesses on the commercial inventory. Thirty-two home-based commercial businesses were surveyed by phone. In most cases, this screening procedure determined that the wrong SIC code had been applied during the business license application process. The Carlsbad Municipal Code prohibits home-based businesses from conducting activities or storing materials outdoors. Once confirmed, home-based businesses were mailed specific BMP information.

Each month several businesses were selected from the master inventory list for inspection. The City usually conducted unscheduled, follow-up and compliance inspections at businesses that had been previously inspected. If a new business could not be excluded by review or telephone survey, then a site visit was scheduled and a comprehensive inspection conducted.

Restaurants have been identified as a High-Priority business at the watershed level. Restaurants can contribute to storm water pollution through improper cleaning practices that can allow grease, food particles, and trash to be exposed to storm water or can create discharges to the street or storm drain. The City has identified 164 active restaurants within this jurisdiction. Restaurants represent over 31□ of all commercial businesses tracked by the Storm Water Protection Program. The City was able to inspect 91□ of all restaurants in Carlsbad. This effort resulted in 11 NOVs issued to restaurants for violations of the Carlsbad Municipal Code from July 1, 2007 to March 23, 2008.

Enforcement of Commercial Sites and Sources

The City conducted follow-up inspections to determine compliance with corrective actions outlined in the inspection report or enforcement notices. When a storm water complaint was received about a commercial source or an illegal discharge was observed or suspected, the City conducted a storm water compliance inspection or investigation. If a significant and/or immediate threat to water quality was observed, appropriate actions were taken to require the responsible party to immediately cease the discharge and/or correct the situation. In judging the degree of severity, City inspectors also took into account any history of similar incidents or discharges. Table 5.7 includes a summary of commercial businesses that received NOVs during this reporting period.

Table 5.7: Summary of NOVs Issued to Commercial Businesses

Commercial Business	SIC	Date of NOV	CMC Violations	
			Storm Water	Trash
Marie Callenders	5812	7/5/07	15.12.050 15.12.080 15.12.090	6.08.040 6.08.050

Mikko Japanese Cuisine	5812	12/18/07	15.12.050 15.12.080	6.08.050 6.08.090
Bellefleur Carlsbad	5812	12/20/07	15.12.050 15.12.080	6.08.050 6.08.090
Mariah's Westwind	5812	12/21/07	15.12.050 15.12.080	6.08.050 6.08.090
KoKo Beach	5812	1/4/08		6.08.030 6.08.045 6.08.090

Commercial Business	SIC	Date of NOV	CMC Violations	
			Storm Water	Trash
Macy's Department Store	5311	1/4/08	15.12.050 15.12.080 15.12.090	6.08.030 6.08.045
Plaza Camino Real	6512	1/8/08	15.12.050 15.12.080	6.08.030 6.08.045 6.08.050 6.08.090
Enterprise Rent A car	7514	1/11/08	15.12.050 15.12.080	
The Olive Garden	5812	1/23/08	15.12.080	6.08.045 6.08.050 6.08.090
Von's Grocery 2343	5411	1/28/08	15.12.080	6.08.045 6.08.050 6.08.090
Pizza Port	5812	3/13/08	15.12.080 15.12.090 15.12.110 6.08.050	6.08.050

Commercial sites or sources were also selected for inspection based on results of *Dry Weather Program* field screening indicating a potential problem. As more water quality data are collected, it is expected that commercial sites may be chosen for inspection in future years based on their potential to discharge a constituent of concern to a specific water body.

The Enforcement Response Plan continued to be used by inspectors to identify, document, and respond to storm water violations. See the City's *Enforcement Response Plan* (FY 01-02 JURMP Annual Report) for a detailed description of typical escalating enforcement procedures.

During FY 07-08, the Storm Water Protection Program had two full-time Environmental Specialists and one part-time intern to conduct inspections, with a third full-time Environmental Specialist hired in October 2007. Environmental Specialists are continually trained on code enforcement, inspection procedures, laws and regulations, and investigation techniques. Storm Water Protection Program staff attended the following training during FY 07-08:

- August 2008 24 Hour HAZWOPER, San Diego, Ca.
- February 2008 EPA Webcast BMP Performance

These training courses, in addition to the Enforcement Response Plan, helped the Storm Water Protection Program appropriately identify and respond to storm water violations. The City took a total of 31 enforcement actions against commercial businesses during from July 1, 2007 to March 23, 2008. The types and numbers of enforcement actions are listed in Table 5.8.

Table 5.8. Enforcement Actions at High Priority Commercial Businesses

Action	Total
Verbal Warning	1
Written Warning	6
Notice of Violation	17
Notice to Clean	0
Cease and Desist Order	0
Administrative Citation	7
TOTAL	31

Most of these incidents involved business such as construction and landscaping contractors, pool maintenance companies, mobile detailers, pressure washers, or carpet cleaning companies. Mobile service providers were added to the inventory and required to apply for business licenses. More detailed information on complaint response and illegal discharge investigations is found in Section 7 of this report. Escalated enforcement actions were taken when necessary to achieve compliance.

6.0 RESIDENTIAL

6.1 Introduction

The City encompasses approximately 42 square miles, with an estimated population of 103,811, (January 1, 2008, California, Department of Finance). The residential community has a significant potential to contribute to water quality degradation. This section describes the activities of the City for the reporting period of **July 1, 2007 to March 23, 2008** with respect to the implementation of the Residential Component of the JURMP and Order No. 2001-01.

6.2 Source Characterization

The City conducted activities that focused on the high threat to water quality residential areas and activities. Due to the City s location within the watershed, and the concentration of environmentally sensitive areas, all residential areas are considered high priority. Table 6.1 identifies the constituents of concern in Carlsbad and examples of residential sources.

Table 6.1: Constituents of Concern and Examples of Residential Sources.

Constituents of Concern	Examples of contributing activities
Primary	
• Bacteria	Pet waste, sanitary sewer overflows, etc.
• Sediment	Landscaping, un-permitted grading activities, etc.
Secondary	
• Nutrients	Garden-care activities, materials storage, etc.
• TDS	Fertilizers, construction, agriculture
• Pesticides	Garden-care activities, residential pest control, etc.
• Trash	Storage of solid waste, green waste, etc.

6.3 Best Management Practice Requirements

City inspectors required the following minimum BMPs (detailed in various fact sheets and brochures) for all residential sources or pollution:

- Move or cover potential pollution sources from storm water contact. Protect materials that could potentially contribute to storm water pollution by storing them indoors or covering them.
- Use dry cleanup methods. Washing or cleaning activities that involve the use of a water hose or pressure washing system were required to use dry clean up methods (mops, brooms, rags or wire brushes to clean pavement, buildings and equipment as much as possible).
- Residential car washing. Use soap sparingly, divert wash water to landscaped areas and pour buckets of soapy water down the sink. Never wash cars in the street or public right of way.
- Pet Waste. Clean up after pets. Use a bag to pick up waste when walking pets. Flush pet waste down the toilet or dispose of in a sealed plastic bag and deposit in the trash.
- Trash Management. All trash must be kept in appropriate sized containers until it can be hauled away. Frequently dispose of grass, debris, leaves, and other waste materials.

- Recycle, Reduce and Reuse. Recycle cans, bottles, paper and cardboard whenever possible.
- Reduce the Use of Landscape Chemicals: Decrease the use of lawn and garden care products such as pesticides, weed killers and chemical fertilizers. Consider using non-toxic pest control methods. Avoid over irrigation which washes these chemicals into the storm drain system.

6.4 Program Implementation

The following provides a discussion of the steps that were taken to require, encourage, and verify the implementation of the prescribed BMPs for high priority residential areas.

6.4.1 BMP Implementation

The City continued to implement a program to reduce contaminants in urban runoff originating from existing residential areas. BMP information was made available to residents via the storm water website and hotline, during presentations, at outreach events, through direct mailings, through a targeted neighborhood outreach campaign, and during investigations of suspected storm water violations. Written materials (brochures, fact sheets, etc.), promotional items, and verbal explanation of BMPs were used to convey BMP requirements. In addition, various levels of enforcement actions were used as necessary to ensure the use of required BMPs. A listing of all education and outreach events and activities for residential audiences is addressed in Section 8 of this report. Discussion of investigations and enforcement actions for residential areas and activities are discussed in Section 6.4.7 and Section 7 of this report.

Website and Hotline
Information about water conservation, trash management, and storm water was combined to one centralized web page accessed at www.carlsbadconserves.org. The Environmental Programs hotline provides information about storm water, trash, and water conservation for the public. The hotline is answered by the Storm Water Protection Program during business hours and provides a detailed voice message after hours.

In addition, outreach materials continue to be revised to include the Environmental Program s website address and hotline number. From July 1, 2007 to March 23, 2008, there were over 31,856 visits to the Environmental Programs website. The Storm Water Protection Program and Environmental Programs Division worked with the Information Technology Department to revise the Environmental Programs webpage and provide updated information about storm water BMPs. The webpage includes all fact sheets and BMP brochures, links to related web pages, and additional information about storm water pollution prevention.

Presentations
In the fall of 2007 and spring of 2008 the City hosted two *Citizen's Academy* Workshops. This is a seven-week course (one night per week) designed to teach residents about City government and how public services are provided. In September approximately 27 residents attended, and 45 attended in March. As part of each session a presentation included an overview of the Storm Water Protection Program, including Permit requirements, program activities, and residential BMPs. This has been a highly successful and popular event, which typically has a waiting list for new participants.

Outreach Events

The City hosted or participated in several public events, which provided opportunities for residents to learn about pollution prevention and storm water BMPs. During these events residents had the opportunity to pick up printed materials, and speak directly to storm water representatives. Table 6.2 is a summary of these events that took place from July 1, 2007 to March 23, 2008. Details of each event are located in Section 8.

Table 6.2: Outreach Events for Residents from July 1, 2007-March 23, 2008

Event	Date	Type	Audience	Attendance
Senior Health Fair	07/07/07	Booth	General public	600
Citizen s Academy	9/27/07	Presentation Booth	General Public	26
Fall Festival at the Ranch	11/10/07	Booth	General public	500
Citizen s Academy	03/20/08	Presentation Booth	General public	45
Agua Hedionda Lagoon Water Festival	3/22/08	Booth	General public School Children	500

Direct Mailings

Carlsbad Conserves, the Environmental Programs Newsletter was mailed to all residents in the summer and fall of 2007. The newsletter is intended to inform residents of environmental issues facing Carlsbad, services provided by the City, tips of how to protect the environment, including storm water BMPs, and a calendar of important environmental dates (clean up recycling, bulky item pick up, etc.). Copies of the summer and fall editions can be found in Appendix 6.1 and 6.2.

The Carlsbad Community Services Guide is mailed three times a year to all Carlsbad households (approx. 40,000). The Winter 2007-Spring 2008 edition included residential storm water BMPs and Environmental Programs information. A copy can be found in Appendix 6.3.

The Environmental Programs Guide was sent to all new customers requesting trash service. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution. A copy of the brochure can be found in Appendix 6.4.

Targeted Neighborhood Outreach Campaign

As a result of the *Dry Weather Monitoring Program,* several neighborhoods were identified as contributing to storm water pollution through various residential activities (eg. pet waste, over-watering, landscape waste). Follow-up investigations to water quality excedances in the *2007 Dry Weather Monitoring Program* prompted the City to educate residents in five specific neighborhoods. Storm Water Protection Program conducted a targeted outreach campaign to those identified neighborhoods, which were delineated using the City s interactive GIS. Layers were turned on to show the streets, parcels, and storm drain system in the identified neighborhoods. Table 6.3 includes a summary of the number of homes targeted and the information they received mailed in Summer and Fall of 2007.

Table 6.3: Targeted Neighborhood Education.

Neighborhood Site	Number of Homes	Brochures Distributed
AH-65	264	Over-watering, landscape maintenance
BA-06	100	Over-watering, landscape maintenance, pet waste
BV Creek (Calavera Hills)	142	Landscape waste and over-watering, pet waste
BA-36	70	Pet Waste
BA-40	251	Over-watering
Total	827	

Written Materials

Written materials, including various brochures and fact sheets detailing storm water BMPs were distributed as necessary to residents through the avenues listed above. Brochures targeted to residential activities include, Car Washing, Lawn & Garden Care, Motor Oil, Pools and Spas, and Pet Waste. They were available in printed form and can also be downloaded from the City s website.

Promotional Items

The Storm Water Protection Program continued to distribute pollution prevention message pens to municipal employees and the Carlsbad community. Other items such as water bottles, notepads, mouse pads, and cups with the storm water hotline and other pollution prevention messages were distributed to residents.

The City distributed a HHW magnet that includes information about HHW disposal location for Carlsbad residents. The magnets will continually be distributed during presentations and other outreach events.

From July 1, 2007 to June 30, 2008, the City distributed 450 *Bags on Board* dispensers to residents as part of the education and outreach program. The product promotes proper pet waste disposal and helps prevent storm water pollution.

6.4.2 HHW and Used Oil

The City continued to operate a Household Hazardous Waste (HHW), and used oil recycling program. During the entire FY 07-08 the City collected and disposed of approximately 148 tons of HHW (including recycled or diverted).

Residents used the Environmental Programs hotline, and e-mail address to request information about the HHW program, trash, and recycling. The City s RFA system was used to track calls about Environmental Programs comments and questions from residents. From July 1, 2007 to March 23, 2008 the Environmental Programs Division responded to 60 complaints/questions related to HHW, recycling, and solid waste. Table 6.4 includes a summary of these complaints.

Table 6.4: Summary of Environmental Programs Division Complaints (July 1, 2007-March 23, 2008)

Issue Type SubType	Total
HHW: Complaint	2
HHW: General Information	3
Recycling: Comment/Suggestion	1
Recycling: Complaint	10
Recycling General Information	6
Solid Waste: Comment/ Suggestion	1
Solid Waste: Complaint	28
Solid Waste: General Information	6
Solid Waste: Missed Collection	3
TOTAL	60

At the end of FY 06-07, signs were placed at the City s Fleet Facility describing proper locations for HHW drop off. This has helped reduce the amount of HHW illegally deposited at this location.

Carlsbad residents may dispose of two large bulky household items at no charge five times per year. The City worked with Waste Management schedule days for the bulky item pickup. Bulky item pickup days were November 10, 2007, January 26, 2008, and March 22, 2008.

6.4.3 Oversight of Residential Areas

In January of 2008 the city began implementing a program of residential water patrols. The Water Conservation Specialist conducted regularly scheduled patrols of different residential areas within the City. Evidence of excess runoff from irrigation were investigated handled on a case-by-case basis. Door hangers are left and follow-up phone calls or visits to evaluate irrigation habits are conducted. When there are large areas or neighborhoods that have extensive irrigation runoff, mailings are conducted to inform residents of the problem.

6.4.4 Enforcement in Residential Areas

The public can report illegal discharges or any activities that may impact water quality to the Storm Water Protection Program through the storm water hotline, email address, or to other City departments. All reports and referrals were promptly investigated and resolved to the fullest extent. When a storm water complaint was received about a residential site or source, or an illegal discharge was observed or suspected, the City conducted a complete storm water investigation. If a significant and/or immediate threat to water quality was observed, appropriate actions were taken to require the responsible party to immediately cease the discharge and/or correct the situation. Specific information on the effects of storm water pollution and how to prevent future impacts to water quality through the use of BMPs was provided to residents during investigations. This information was designed to increase the public s awareness and understanding of storm water pollution prevention efforts and water quality enhancement.

When enforcement actions were necessary, City inspectors utilized the appropriate enforcement mechanisms as allowed by the Carlsbad Municipal Code, and the Enforcement Response Plan. The Enforcement Response Plan continued to be used by inspectors to identify, document, and respond to storm water violations. While the City emphasized education as the primary method for changing behavior, City inspectors and staff with

enforcement authority could initiate enforcement actions against residents who discharged pollutants to the storm water conveyance system, or who failed to implement BMPs as required.

Escalating enforcement procedures provided flexibility in establishing appropriate compliance time frames. In judging the degree of severity, City inspectors also took into account any history of similar incidents or discharges and the impact to the environment. The inspectors, in accordance with the City□s existing procedures and Enforcement Response Plan, documented each observed violation. Depending on the severity of the violation, enforcement ranged from a warning to monetary fines.

From July 1, 2007 to March 23, 2008, the Storm Water Protection Program received 161 complaints of potential illegal discharges. Of those complaints, 74 were residential in nature. Many of the complaints that occurred in residential areas involved commercial contractors or mobile businesses. When complaints were tracked to a specific business, they were counted and documented as commercial complaints. Eight complaints were □referred for action□, meaning, the investigation or resolution of the issue did not fall under the jurisdiction of the Storm Water Protection Program. Examples include wastewater discharge or construction. There were 22 residential complaints in which no violation was found, due to either the source not being found or the reported pollutant discharge not being found. There were a total of 44 enforcement actions for residential complaints. Table 6.5 and Figure 6.1 show a summary of those actions. A summary of all complaints responded to can be found in Appendix 7.4.

Table 6.5: Summary of Residential Enforcement Actions from July 1, 2007 to March 23, 2008

Action	Total
Verbal Warning	23
Informational letter	14
Written Warning	4
Notice of Violation	3
Notice to Clean	0
Cease and Desist Order	0
Administrative Citation	0
TOTAL	44

Figure 6.1: Residential Enforcement Actions

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION (IDDE)

The City s Illicit Discharge Detection and Elimination (IDDE) will be submitted in December 2008 as approved by the Regional Board in Addendum 2, Order 2007-0001.

8.0 OUTREACH AND EDUCATION COMPONENT

8.1 Introduction

Public education is integral to the success of Carlsbad's urban runoff management program. The City continues to increase public awareness about pollution prevention and promote behavioral changes and environmental stewardship. The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent. The City continued to be actively involved in outreach and education efforts at the local level, the watershed level (North County Storm Water Program), and the regional level (Project Clean Water Outreach Workgroup). These efforts are further discussed in the following subsections by target audience.

8.2 Staff Training Element

Storm water training for municipal employees included general training and job specific training for designated departments and personnel. The objectives of the employee training programs are as follows:

- Promote a clear understanding of the urban runoff and water quality issues, including activities that can potentially pollute receiving water bodies.
- Identify and implement strategies for BMPs.
- Promote employee ownership of the problems and their ability to apply solutions.
- Integrate employee feedback into training and BMP implementation.

General Employee Training

During this reporting period, City employees received storm water training covering issues such as the causes of storm water pollution, how it affects the environment, and the overall structure of the storm water program. Messages related to general training may include, where applicable, the topics listed in the Permit. During FY 07-08, City staff received information and general storm water training through various communication methods including:

1. Storm Water Webpage: Employees were able to download BMPs and the JURMP directly from the City's website.
2. Intranet: The City's intranet was used to post messages and inform employees of various events and opportunities for participation, such as the Coastal Cleanup Day and Earth Day activities.
3. Public Works Newsletters: During FY 07-08 every edition of Public Works newsletters featured updates on the Storm Water Protection Program and Environmental Programs. Employees were notified by e-mail when these newsletters were published and posted on the City's intranet, and hard copies were given to maintenance personnel.
4. Promotional Items: Items such as water bottles, notepads, mouse pads, cups, and pens with the hotline numbers and other pollution prevention messages continued to be distributed to employees.
5. Hotline Decals and Notepads: Car window decals and notepads with the storm water hotline were distributed for employee use in the field.

Job Specific Training

Several job positions were identified that require activity or job specific storm water training. A summary of municipal employee training is in Appendix 8.1. Table 8.1 identifies the departments with personnel that should receive job specific training.

Table 8.1. Department and Positions for Job Specific Storm Water Training

MSA	Department	Positions
PW	Engineering, Construction Inspections	Construction Inspectors
PW	Engineering, Engineering Development Services	Associate Engineer, Assistant Engineer
PW	Environmental Programs, Storm Water	Environmental Specialists, Interns
PW	Environmental Programs, Water Conservation	Water Conservation Specialist
PW	General Services, Streets Division	Street Maintenance Workers
PW	General Services, Facilities Maintenance	Building Maintenance Workers
PW	General Services, Parks	Maintenance Workers
PW	General Services, Landscape Maintenance	Maintenance Workers
PW	General Services, Vehicle Maintenance	Equipment Technicians, Equipment Service Worker, Shop Assistant
PW	Maintenance and Operations, Utility Operations	Meter Services Workers; Sanitation System Operators; Water System Operators
PW	Maintenance and Operations, Construction/Maintenance	Utility Workers; Maintenance Workers
Com-Dev	Planning, Building, Code Enforcement	Building Inspectors, Planners, Code Enforcement,
Safety	Fire Department	Fire Fighters

The City also participated in EPA sponsored webcasts this fiscal year where possible. Storm Water Protection Program staff received job specific training during FY 07-08 as provided in Appendix 8.1.

Storm Water Committee

The Storm Water Committee continued to meet monthly to discuss and develop a calendar of storm water training activities for staff, coordinate compliance activities and documentation, create and distribute job specific storm water training information, and standardize documentation of training activities. A summary of Storm Water Committee meeting topics during FY 07-08 can be found in Appendix 8.2.

Storm Water Leadership Team

In FY 07-08, the City of Carlsbad s City Manager continued the Storm Water Leadership Team (SWLT). Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City s major service areas and Directors. Agenda items covered all areas of the City s compliance with Order No. 2001-01, as well as review of the new Order No. R9-2007-0001.

Other Training

During FY 07-08, the City continued to implement the waste reduction program. Larger single stream recycling containers and a small trash were provided in employee workstations. The larger recycling containers placed in public meeting areas throughout the City continue to be utilized. Seen as an effective pilot program, the City implemented the waste reduction strategy at all City facilities in September 2007. Roll out of this new program included the development

of posters, fact sheets and a presentation to educate and inform employees about the importance and benefits of recycling.

In August of 2007, the Senior Environmental Specialist and Water Conservation Specialist completed the 24-hour □*Hazardous Waste Operations and Emergency Response Training*□ in San Diego. This course is required for anyone who is expected to identify emergency situations involving hazardous materials. Staff was trained to recognize, report, and assist in emergency response. This course fulfills the requirements under OSHA 29 CFR 1910.120.

In September of 2007, the Planning Department employees attended a power point presentation in *Low Impact Development (LID)* training. The goal is to protect water quality by preserving and mimicking nature through use of storm water planning and management techniques on a project site and to prevent or remediate pollutants from discharges. The presentation was designed to provide an overview of storm water regulations, BMP practices, LID background, benefits and goals.

In November of 2007, the City□s Leadership Team employees received a power point presentation on the new requirements under Order No. R9-2007-0001.

In January of 2008, Public Works Managers attended a presentation on the National Pollution Discharge Elimination System (NPDES) Municipal Permit. The presentation covered the Clean Water Act, NPDES regulations, JURMP 2001 and 2007 Orders and new reporting requirements.

In FY 07-08, the City continued the waste reduction program. Larger single stream recycling containers for employee work stations accompanied by a small trash can have been provided to the majority of City Employees. Several larger recycling containers placed in public meeting areas throughout the City continue to be utilized. Seen as an effective pilot program, the City implemented the waste reduction strategy at all City facilities in September 2007. Roll out of this new program included the development of posters, fact sheets and a presentation to educate and inform employees about the importance and benefits of recycling.

In February of 2008, City staff from various departments attended a US EPA Storm Water Program□s Webcast Series entitled □BMP Performance.□ The purpose of the webcast was to explore the details of BMP performance, including pollutant concentrations, volume reduction, and total load reduction. During the webcast experts shared BMP performance myth of □percent (□) removal.□ In addition, it introduced EPA□s new web-based Urban BMP Performance Tool, which is a directory of hundreds of studies on BMP performance.

In March of 2008, the newly-hired Environmental Specialist I attended the PC 832 Peace Officer training. Training included effective ways to enforce stormwater regulations.

Minimum BMPs for Construction Projects within the City of Carlsbad

For more information about the required BMPs, please contact the Public Works Inspector assigned to your project. You may also find additional information about Construction Management and Inspection Division on the City website at

www.carlsbadca.gov

Figure 8.1: Minimum BMP Fact Sheet for Construction Projects

8.3 Educational Outreach Element

New Development and Construction Communities
Construction Site Owners and Developers

The City of Carlsbad is committed to working with developers and contractors to ensure that BMPs are implemented at all construction sites. A fact sheet continued to be distributed to all active construction sites during FY 07-08. The fact sheet includes information about the required minimum BMPs, site specific SWPPPs, and erosion control plans (Figure 8.1).

Construction and Development Services provided information and education to applicants and developers during one-on-one or small group meetings, inspections, complaint investigations, and during pre-construction meetings. They also provided sample SWPPPs and SWMPs for engineers, developers, and applicants to use as guides when preparing documents for proposed development projects. Copies of these documents and the SUSMP are available at the City's Permits Counter. The SUSMP is also available through the City's internet site.

The Storm Water Protection Program also continued to distribute the "*Pollution Prevention Guide for the Construction Industry*." This brochure was developed to provide BMP and pollution prevention information related to materials storage, perimeter controls, building and staging areas, dumpsters and port-a-potty services, tracking controls, concrete trucks and pumpers, washout areas, dirt and grading, earthmoving equipment, and storm drain protection. The brochure was distributed to commercial businesses that conduct small remodeling or home improvement projects.

The City continued to conduct and participate in workshops to educate external parties, which include project applicants, developers, contractors, and property owners on the implementation of the storm water program and requirements for construction sites.

Commercial and Industrial Owners and Operators
The City continued to educate commercial and industrial owners and operators through various methods. This included the distribution of printed materials, participation at workshops, presentations to business community groups, direct mailings, inspections and site visits. Accomplishments are detailed below.

Printed Material
The City continued to distribute brochures and fact sheets. These materials were distributed by direct mail, during inspections and complaint investigations, and were available at public events and presentations. These brochures are also available on the City's storm water web page, accessed at www.carlsbadconserves.org.

During FY 07-08, the City continued to distribute the "*Best Management Practices for Businesses – Commercial and Industrial*" brochure containing the list and description of minimum BMPs. This brochure was distributed to businesses during inspections and by direct mail.

Website and Hotline
The storm water hotline continued to be listed on all printed material. Industries and commercial businesses can call the hotline to request BMP information. All brochures also continued to be

available through the City website. During this permit cycle through March 23, 2008, there were 31,856 visits to the Environmental Programs web page.

Inspections and Site Visits

City storm water inspectors worked with businesses during inspections and complaint investigations to identify storm water compliance issues, detail corrective actions, and assess the appropriateness of BMPs.

Quasi-Government Agencies/Districts (i.e. Educational Institutions, Water Districts, Sanitation Districts, etc.).

Quasi-government agencies and districts typically fall under one of the existing commercial or industrial classification categories of high, medium, or low priority, based on the criteria used to identify facilities and businesses. Outreach and education for these facilities is identified during compliance inspections.

During this reporting period, the City inspected seven water and sanitation facilities as part of the industrial inspection program. Educational information was provided during the inspections, as well as in written inspection reports. Most of the water and sewer districts and educational institutions are covered under permits issued by the Regional Board. Therefore, many of these facilities already have knowledge of the storm water requirements and participate in education activities.

Residential Community, General Public, and School Children

Carlsbad continued its on-going outreach to the residential community, school children, and the general public during this reporting period. This included the development and distribution of printed materials, public outreach events, presentations, published articles, videos, website access, and direct interaction with the public. Carlsbad actively pursued a comprehensive environmental education and outreach program, combining the activities of storm water, solid waste and water conservation under the umbrella of Environmental Programs. The purpose was to create a unified message, better educate the public, and allow easy access. These accomplishments are described below.

Printed Material

Since the spring of 2006, the City of Carlsbad has been offering a door-to-door Household Hazardous Waste collection program. Residents gather their HHW, and then call for an appointment to have these items collected and disposed of properly. To further educate residents about the program, the City created a new *Household Hazardous Waste Collection* brochure in January 2007. The new brochure includes information about the types of HHW that can be disposed of, information about why residents should participate in the program, phone numbers, addresses, the Environmental Programs logo, and web addresses. The City continued to distribute this brochure during this reporting period.

During this reporting period, the new *Best Management Practices for Mobile Service Providers* brochure continued to be provided to residents during complaint investigations related to mobile service provider discharges.

The City actively participated in the North County Storm Water Program (NCSWP), which is a collaboration of the Carlsbad Watershed Copermittees and the Project Cleanwater Copermittee

Outreach Workgroup. The City distributed the printed materials previously developed with these groups.

Direct Mailings

Carlsbad Conserves, the Environmental Programs Newsletter was mailed to all residents in the summer and fall of 2007. The newsletter is intended to inform residents of environmental issues facing Carlsbad, services provided by the City, tips of how to protect the environment, including storm water BMPs, and a calendar of important environmental dates (clean up recycling, bulky item pick up, etc.). Copies of the summer and fall editions can be found in Appendix 6.1 and 6.2.

The Carlsbad Community Services Guide was mailed three times a year to all Carlsbad households (approx. 40,000). The Winter 2007-Spring 2008 edition included residential storm water BMPs and Environmental Programs information. A copy can be found in Appendix 6.3.

The Environmental Programs Guide was sent to all new customers requesting trash service. This publication offers information about proper disposal of many types of waste including trash, recycling, and household hazardous waste (HHW). Information also included ways to conserve water and how to protect Carlsbad water quality by preventing storm water pollution. A copy of the brochure can be found in Appendix 6.4.

Classroom Education

During this reporting period, the Solana Center for Environmental Innovation (Solana Center) continued to conduct the *Classroom Watershed Program* for the City. The Solana Center used the *EnviroScape* interactive model to teach students about watershed stewardship and pollution prevention. Outreach materials and workbooks were provided to the students and teachers. Storm water fliers announcing the free presentations were distributed to teachers.

Each classroom was given a watershed poster, handouts for ten simple ways to help protect the ocean, guides to HHW alternatives and disposal (English and Spanish), and a recycling guide for students to take home. Students were also given pledge cards to sign and take home. The pledge cards read as follows:

1. I pledge not to dump anything down the storm drain.
2. I pledge to remind my family to properly dispose of toxic materials such as paint, cleaners, and pesticides.
3. I pledge to pick up after my dog (given only to those with dogs).

Table 8.2 lists all of the schools and the number of classrooms and students that attended the watershed classroom presentation during this reporting period.

Table 8.2. Carlsbad Elementary Schools Watershed Awareness Programs

Date	Elementary School	of students
05/10/07	Hope Elementary	25
5/11/2007	Hope Elementary	25

City Stuff is an outreach program which evolved through a partnership between the City of Carlsbad and Junior Achievement program. The program reaches over 50 3rd-grade classrooms in Carlsbad (across district lines) and information filters home to the parents/residents. Students learn how Cities are planned, operated, and what services are offered. They also learn about important businesses in a City. Out of the six lessons taught, three of the lessons are Carlsbad specific, and one lesson is focused on City departmental programs. During FY 07-08, Storm Water Protection Program staff participated in the City Stuff program and educated over 100 students about the importance of storm water pollution prevention.

Advertisements

From July 01, 2007 to March 23, 2008, advertisements were published in the Carlsbad Magazine and the Community Services Guide. Table 8.3 lists the published ad and the estimated circulation.

Table 8.3. Dates of Publication of the Environmental Programs Advertisements

Ad	Month	Publication	Circulation
Environmental Programs Ad	Nov-Dec 2007	Carlsbad Magazine	80,000
Environmental Programs Ad	March 2008	Carlsbad Magazine	80,000

Website and Hotline

Most of the printed materials were available for download from the City s website and Environmental Programs website. There were 31,856 hits to the Environmental Programs web pages during this reporting period.

Information Line/On-hold Messages

A continuous on-hold message provides residents with information about events in the City. Staff used the information line to inform residents of the Environmental Programs web page, telephone number, upcoming outreach events, City services, Public Works Fair, Bulky Item Collection Day, and HHW collection facilities.

Kiosks/Display Racks
Various Storm Water Protection Program brochures continued to be stocked at City kiosks and display racks.

Targeted Neighborhood Outreach Campaign
As a result of the *Dry Weather Monitoring Program,* several neighborhoods were identified as contributing to storm water pollution through various residential activities. Follow-up investigations to water quality exceedances in the *2007 Dry Weather Monitoring Program* prompted the City to educate residents in five specific neighborhoods. The identified neighborhoods were delineated using the City's interactive GIS. Layers were turned on to show the streets, parcels, and storm drain system in the identified neighborhoods. The City sent an informational letter and BMPs to residential areas that were identified as potential contributors to storm water pollution (e.g., pet waste, car washing, and landscaping activities). Table 8.4 includes a summary of the number of homes targeted and the information they received mailed in Summer and Fall of 2007.

Table 8.4: Targeted Neighborhood Education.

Neighborhood Site	Number of Homes	Brochures Distributed
AH-65	264	Over-watering, landscape maintenance
BA-06	100	Over-watering, landscape maintenance, pet waste
BV Creek (Calavera Hills)	142	Landscape waste and over-watering, pet waste
BA-36	70	Pet Waste
BA-40	251	Over-watering
Total	**827**	

Direct Interactions
Residents were educated about pollution prevention and BMPs during complaint investigations. City inspectors met with residents to explain storm water regulations and pollution prevention. When a resident was not available, a door hanger and other outreach materials were left to provide information about the reported discharge. Typically, follow-up informational letters were sent to homeowners and/or contractors after an investigation. These correspondences included brochures and fact sheets about storm water. Additional information on residential complaint investigations is provided in Section 5.4.

Prompts and Promotional items
Environmental Programs distributed recycling bags to residents at the Citizen's Academy Event. The recycling bags displayed the Environmental Programs logo and phone number. The bags were also designed to encourage residents to recycle aluminum, glass, paper, and other materials.

In FY 07-08, the City distributed 450 *Bags on Board* dispensers to residents as part of the education and outreach program. The product promotes proper pet waste disposal and the prevention of storm water pollution.

The Storm Water Protection Program continued to distribute pollution prevention message pens to Carlsbad residents and City employees. Several existing storm water, solid waste, and water conservation materials were also distributed, including oil funnels and rags, key chains, buttons, notepads, cups, Frisbees, magnets, and a variety of other products.

Public Events

The City hosted or participated in several public events, which provided opportunities for residents, school children, and the general public to learn about storm water pollution prevention. During most of these events, a staffed booth was set up, and residents and children had the opportunity to pick up printed materials, view an *EnviroScape* model demonstration, and speak directly with City storm water representatives. Table 8.5 includes a summary of these public events for FY 07-08.

Table 8.5. Outreach Events for Residents, General Public, and School Children

Event	Date	Type	Audience	Attendance
Senior Health Fair	07/07/07	Booth	General public	600
Health & Education Expo	09/12/07	Booth	City Employees	200
Citizen's Academy	9/27/07	Presentation Booth	General Public	26
Fall Festival at the Ranch	11/10/07	Booth	General public	500
Citizen's Academy	03/20/08	Presentation Booth	General public	45
Agua Hedionda Lagoon Water Festival	3/22/08	Booth	General public School Children	500
Carlsbad HS Career Day	03/28/08	Booth Watershed Model	School Children and Teachers	1000
Children's Day at the Flower Fields	03/29/08	Booth	General public	4,740
Employee Appreciation Day	4/17/2008	Booth	City Employees	
Beach Cleanup	4/19/08	Booth	General Public	100
Public Works Fair	5/21/08	Booth	General Public School Children	1,300
Health & Safety Fair	6/5/08	Booth	Beckman/Coulter Employees	250

8.4 Outreach Component Effectiveness Assessment

Program Strengths

In June 2007, the City implemented a new waste reduction strategy as a pilot program. This included the purchase and distribution of larger single stream recycling containers and a small trash can for employee work stations. There were also several new larger recycling containers placed in public meeting areas throughout the City. Seen as an effective pilot program, the City implemented the waste reduction strategy at all City facilities in September 2007. Since implementation, City facilities have produced 36 more recycled products. Rollout of this new program included the development of posters, fact sheets and a presentation to educate and inform employees about the importance and benefits of recycling.

The Storm Water Protection Program collaborated locally and regionally to ensure outreach efforts and messages for storm water pollution prevention were consistent. The messages were delivered by various means including presentations, workshops, inspections, investigations, and outreach events, in addition to use of direct mail, the website and newspaper advertisements.

The City continued to actively promote and advertise the Storm Water Protection Program as part of Environmental Programs. This merger of programs has allowed the Storm Water Protection Program to work in conjunction with the *Used Oil Block Grant Funds* program to conduct related education and outreach. The merger also created a unified City Environmental Programs message to help foster a better understanding of the relationship between residential activities and sources of pollution.

The City conducted the annual (telephone) Public Opinion Survey in FY 07-08, which included questions on storm water pollution prevention. The results from this survey provide important information on the public s awareness and knowledge of storm water pollution prevention issues and activities. This information can help focus future education and outreach messages and events, and is also used on a *Performance Measure* to gauge the effectiveness of the outreach and education program.

The Storm Water Protection Program and Environmental Programs worked with the Information Technology Department to revise the web pages and provide updated information about pollution prevention.

In late FY 06-07, the Storm Water Protection Program began drafting a *Best Management Practices Manual* that includes minimum and required BMPs for activities and pollutants types. The manual was completed in FY 07-08.

During FY 06-07, staff developed a new Environmental Programs education campaign entitled Think-Act targeting various environmental concerns, including storm water pollution. The program released advertisements in FY 07-08.

8.5 Program Review and Modification

During this reporting period, staff began revising brochures and fact sheets and updating them to reflect changes in the program. A complete revision of all brochures is expected to be completed in FY 08-09.

During FY 07-08, staff played an active roll in reviewing and planning, and they are preparing to meet the new permit requirements of the JURMP Order No. R9-2007-0001.

9.0 PUBLIC PARTICIPATION

9.1 Introduction

This section describes the activities that the City of Carlsbad has taken from July 1, 2007 to March 23, 2008 with respect to the public participation requirements of the permit. Public participation is crucial to ensuring the effectiveness of the Storm Water Protection Program. Public participation allows the residents, interested parties, and stakeholders to express their concerns and provide creative solutions before final decisions are made. The City led and/or contributed to several public participation opportunities from July 1, 2007 to March 23, 2008 including the development, implementation, and review of storm water management programs, BMPs, and other JURMP and related issues. The goal has been to ensure that the Carlsbad community has a vested interest in solving storm water problems and has a general understanding of watershed protection. Citizens, the business community, and other interested parties were invited to attend public meetings, outreach events, workshops, City Council meetings, and other events during this reporting year.

9.2 Public Meetings and Hearings

The public had numerous opportunities to attend meetings, at the local, watershed and regional levels, in order to learn about the City's implementation of the Permit and have their concerns addressed.

City Council Meetings are held in the Council Chambers at Carlsbad City Hall and are open to the public. The City of Carlsbad offers residents and visitors the opportunity to view City Council meetings via the Internet. Regularly scheduled Carlsbad Council meetings air live on Tuesday evenings at 6 pm. Local viewers can also view Council Meetings live on Time Warner Cable channel 19. Each meeting and agenda is posted online approximately two hours after the conclusion of each meeting. Past meetings will be available for up to a year on the City's own archive video portal. Users can conveniently "keyword search" through the audio/video content and "jump to" meeting discussion items in real-time by using a drop down menu. Agendas from previous meeting can be accessed through the City's Document Management System.

The Planning Commission is comprised of seven members appointed by the City Council. This commission makes recommendations to the City Council regarding implementation and updating of the General Plan. When needed, they also provide recommendations to the Council regarding policy issues that affect long-range planning. They review development projects, provide recommendations to the City Council, provide reports to the City Council on the Local Facilities Management Plans, review the annual CIP for consistency with Growth Management Program, identify potential problems and opportunities facing the City, and suggest special studies when appropriate. The City also provides live streaming of Planning Meetings that are typically held on the first and third Wednesday of each month at 6 pm. Table 9.1 contains a list Regular City Council and Planning Commission Meetings from July 1, 2007 to March 23, 2008.

Table: 9.1 Carlsbad Public Meetings
(July 1, 2007-March 23, 2008)

City Council Meetings		Planning Commission Meetings	
07/10/07	11/20/07	07/18/07	01/02/08
07/17/07	12/04/07	08/01/07	01/03/08
07/24/07	12/11/07	08/15/07	01/16/08
08/07/07	12/18/07	09/05/07	02/06/08
08/14/07	01/08/08	09/15/07	02/07/08
09/11/07	01/15/08	10/03/07	02/20/08
09/18/07	01/22/08	10/17/07	03/05/08
09/25/07	02/05/08	11/07/07	03/06/08
10/02/07	02/12/08	12/05/07	03/19/08

10/23/07	03/04/08		
11/06/07	03/18/08		
11/13/07			

Residents could also become representatives on various City committees. The City Clerk's office maintains a current list of City Boards, Commissions, and Committees, current vacancies, meeting dates and times, and coordinates all appointments to these positions.

The public could also attend the Copermittee Management Committee Meetings and other Copermittee meetings. Notices of these meetings are available from the Project Clean Water website at www.projectcleanwater.org. Table 9.2 lists the dates of these meetings.

Table 9.2 Coopermittee Public Meetings (July 1, 2007- March 23, 2008)

Municipal Storm Water Copermittees

07/19/07 09/20/07 11/29/07	08/15/07 09/17/07 10/17/07 11/14/07 12/19/07 02/13/08 03/13/08	07/24/07 08/28/07 09/25/07 12/13/07	12/20/07 01/07/08 01/29/08 02/26/08	12/20/07	02/13/08 0312/08

9.3 Feedback Mechanisms

In addition to the feedback opportunities available through public meetings and hearings, there were several other mechanisms available for the public to provide feedback.

9.3.1 Hotline and E-mail Address

The public was encouraged to provide input and feedback on the Storm Water Protection Program implementation. In addition to the public meeting opportunities detailed above, the public could call the storm water hotline to request information, provide comments, or make illegal discharge reports. In addition, the public could send e-mails directly to the Storm Water Protection Program at stormwater ci.carlsbad.ca.us. There were several other public contact phone numbers and City e-mail addresses available for public use. Other City departments forwarded comments and questions to the Storm Water Protection Program as needed. The public could access the Storm Water Protection Program web page through the City s website which provides information about the storm water requirements and BMPs.

The public continued to use the Environmental Programs hotline and e-mail address to obtain information about HHW, trash, and recycling programs during this reporting period. The City s Request for Action (RFA) system was used to track calls about Environmental Programs comments and questions from residents. From July 1, 2007 to March 23, 2008 the Environmental Programs Division responded to 60 complaints/questions related to HHW, recycling, and solid waste.

9.3.2 Direct interaction

The City continues to rely on the interactions between City staff and the public to convey messages about storm water and pollution prevention. City staff received targeted training to increase their understanding of urban runoff issues. Staff interaction with the public also provided additional opportunities for the City to obtain direct feedback about BMPs, ordinances, and pollution prevention efforts.

9.3.3 Public Surveys

The BW Research Partnership, on behalf of the City, conducted an annual *Public Opinion Survey* of Carlsbad residents. The survey entails a random-Digit dial methodology of over 1,000 residents to obtain information about attitudes and knowledge of City services, facilities, and issues, and also includes demographic questions for further analysis and interpretation. There were three questions related to storm water quality on the 2007 survey. The results of these questions are summarized in Section 11 of this report. The entire report is available for download from the City s website. Surveys helped the City understand how the public perceives storm water which can help foster better planning and management programs. The City publishes the results of the *Public Opinion Survey* in the annual *State of Effectiveness Report.*

9.3.4 General Outreach

Efforts through printed ads, newspapers, press releases, media interviews, PSA s, the Community Calendar, City guides, brochures, water bill stuffers, and other publications were used to keep the public informed of storm water requirements, updates, and public participation opportunities. Specific outreach and education are detailed in Section 8 of this report.

9.4 Community Events and Volunteer Efforts

The City s Community Volunteer Coordinator administers outreach and involvement programs for Carlsbad residents. This position has continued to find volunteers to assist the Storm Water Protection Program with various activities, including cleanup events. Volunteers contributed over 31 hours towards improving storm water quality from July 1, 2007 to March 23, 2008. The City participated in several community events held in Carlsbad and other locations across the County. These events are summarized in Table 9.3.

Table 9.3 Community Events (July 1, 2007-March 23, 2008)

Date	Event	Location	Number of Participants
07/07/2007	Senior Health Fair	Carlsbad	600
09/27/2007	Citizen's Academy	Carlsbad	26
11/10/2007	Fall Festival	Carlsbad	500
03/20/2008	Citizen's Academy	Carlsbad	45
03/22/2008	Agua Hedionda Lagoon Water Festival	Carlsbad	500

9.4.1 Citizen s Academy

In the fall of 2007, and spring of 2008 the City hosted two *Citizen's Academy* Workshops. This is a seven-week course (one night per week) designed to teach residents about City government and how public services are provided. In September approximately 27 residents attended, and 45 attended in March. As part of each session, on September 27, 2007 and March 20, 2008, a presentation included an overview of the Storm Water Protection Program, including Permit requirements, program activities, and residential BMPs. This has been a highly successful and popular event, which typically has a waiting list for new participants.

9.4.2 Storm Drain Stenciling

Stenciling storm drain inlets with *No Dumping – Drains to Ocean* messages reminds citizens and businesses not to pollute waterways. Stencils are available upon request to businesses and residents who are interested in stenciling private storm drains. Public inlets were marked by the Streets Department.

9.5 Other Public Participation Opportunities

The City continued to recruit interns from local universities to work with storm water staff. From July 1, 2007 to March 23, 2008, the Storm Water Protection Program had an intern working on various projects, including commercial and industrial inspections, data management, outreach and education, and coastal storm drain monitoring. Their assistance with inspections, water quality studies and monitoring, data entry, and investigations increased productivity and helped the program achieve inspection and investigation goals.

10.0 FISCAL ANALYSIS

The City s fiscal analysis has been conducted on an annual reporting period covering July 1, 2007 to June 30, 2008. Please refer to Order No. 2007-0001, Section 10 of the Annual Report.

11.0 EFFECTIVENESS ASSESSMENT

The City s effectiveness assessment has been conducted on an annual reporting period covering July 1, 2007 to June 30, 2008. Please refer to Order No. 2007-0001, Section 11 of the Annual Report.

12.0 SPECIAL INVESTIGATIONS

The City s Special Investigations Section was written based on an annual reporting period covering July 1, 2007 to June 30, 2008. Please refer to Order No. 2007-0001, Section 12 of the Annual Report.

13.0 NON-EMERGENCY FIRE FIGHTING

The City s Non-Emergency Fire Fighting has been conducted on an annual reporting period covering July 1, 2007 to June 30, 2008. Please refer to Order No. 2007-0001, Section 13 of the Annual Report.

14.0 JURMP REVISIONS

The City's JURMP was re-written during this reporting period in response to the issuance of Order 2007-0001 and was submitted to the Regional Board prior to March 24, 2008. The new JURMP will be implemented beginning March 24, 2008 as required under the new permit. Please refer to Order No. 2007-0001, Section 14 of this Annual Report for JURMP Revisions.

15.0 CONCLUSIONS AND RECOMMENDATIONS

15.1 Overview

During this reporting period, from July 1, 2007 to March 23, 2008, the City continued to implement Permit 2001-01. This section of the JURMP Annual Report described activities that the City undertook to reduce discharges of pollutants and urban runoff flow to the MS4 to the maximum extent practicable. This section of the Annual Report also provided an overall account of the activities conducted and the programs implemented to address the inspection, monitoring, investigation, education, and enforcement requirements.

Several highlights are listed below, including specific discussion of activities conducted related to meeting Permit requirements, internal program goals that met or exceeded Permit requirements, and recommended improvements. Note that these are highlights only and do not represent all activities conducted by the City to maintain and exceed compliance. Comprehensive details are reported in the applicable preceding sections.

15.2 Highlighted Activities Performed to Meet Permit Requirements

The City continued activities to maintain compliance with the Permit. For comprehensive details, please refer to the applicable preceding sections of the report. Highlights for July 1, 2007 to March 23, 2008 are listed below.

The City:

- Updated and mapped the municipal inventory and inspected all high priority municipal facilities.
- Conducted cleaning and maintenance activities to reduce pollutant discharges from the MS4.
- Updated and mapped the High Priority industrial inventory, and inspected 42 of 42 High Priority industries.
- Updated and mapped the Medium and Low industrial inventory, inspected 91 Medium and Low industries, conducted outreach, and issued 2 enforcement actions to obtain compliance.
- Updated and mapped the commercial inventory, provided outreach on BMPs, inspected 385 commercial sites, and issued 31 enforcement actions to obtain compliance.
- Continued using the *Knowledge and BMP Assessment*s at commercial and industrial facilities.
- Collaborated with other internal departments to assist with investigations and remediation during field incidents. The Storm Drain Maintenance Division was key to prompt, effective responses to complaints involving clean ups of incidents on public streets. Regular meetings and discussions about compliance issues and consistent contacts facilitates this inter-departmental coordination.
- Distributed educational information for residential activities, continued an advertising campaign, hosted or participated in 12 community outreach events, collaborated in offering five oil recycling and two HHW drop-off sites for residential use, responded to 161 reports of illegal discharges, and issued 44 enforcement actions to obtain compliance.
- Inspected all high priority construction sites at required frequencies, conducted outreach to project proponents and City staff, and issued 28 enforcement actions to obtain compliance, during 3148 inspections.

- Continued implementation of the *Dry Weather Field Screening and Analytical Program*, analyzing conditions and samples from 60 sites in the MS4.
- Continued implementation of the *Coastal Outfall Program* by routinely monitoring 8 active outfall sites on a regular basis, and inactive sites semi-annually.
- Distributed a copy of the Pollution Prevention Guide to the Construction Industry brochure with each construction related permit application.
- Inspected 100 of catch basins and performed maintenance where necessary.
- Conducted a proactive program to detect and eliminate illegal discharges to the MS4. The public continued to use the storm water hotline and e-mail address to report illegal discharges to the storm drain system. The Storm Water Protection Program responded to 161 reports of illegal discharges to the storm drain system.
- Continued involvement in outreach and education at the local level, the watershed level, and the regional level with the Project Clean Water Outreach Workgroup.
- Continued distributing storm water educational brochures and continued the Environmental Programs advertising campaign.
- Distributed information through direct mail, during inspections and investigations, on the website, at workshops, during presentations, training seminars, and other public outreach events.
- Conducted a Public Opinion Survey of 1,000 residents and included questions on storm water.
- Distributed promotional items such as notepads, pens, Bags on Board, and key chains with pollution prevention messages.
- Decreased illegal discharges from commercial mobile businesses.
- Improved the Carlsbad Municipal Code by working with the City Attorney s office to revise the ordinance to reflect current enforcement levels and mechanisms.
- Reviewed internal NPDES programs for compliance with Order No. 2001-01 prior to implementing Order No. R9-2007-0001.
- Continued to review inventory management, prioritization practices, inspection and enforcement procedures, training programs, record-keeping, and reporting procedures related to construction activities.

15.3 Highlighted Activities in Addition to Permit Requirements

The City implemented several initiatives in addition to the requirements of the Permit. Some of these highlights are internal program goals and should not be viewed as enforceable under the Permit. These internal program goals will be continued and enhanced as resources allow. For comprehensive details, please refer to the applicable preceding sections of this report. Highlights for July 1, 2007 to March 23, 2008 are as follows:

The City:

- Continued to maintain regular communications with the Industrial Compliance Unit of the Regional Board. In addition to copies of inspection reports and other correspondence with high and medium industries covered under the Permit, the City regularly coordinated compliance issues with Regional Board representatives over the phone and through emails. On several occasions, the Regional Board expressed their appreciation of the City s professionalism, responsiveness, and implementation of the storm water program
- Continued using the streamlined inspection report revised in FY 05-06 so that businesses could promptly implement corrective actions. The revised streamlined inspection form now includes spaces to report previous enforcement actions, new storm

water contacts, and a detailed list of necessary corrective actions. The revised form has proven to be successful in attaining compliance from regulated facilities.

- Continued the Environmental Resources Management Team (ERMT) initiative to look at environmental resources from a City-wide perspective including storm water, open space, habitat management, energy use, and sustainable principles.
- Supported the ERMT's work creating Environmental Guiding Principles for City decision-making, seeking approval from City Council on the formal principles.
- Continued Storm Water Leadership Team (SWLT) meetings. Monthly meetings of the SWLT were conducted and attendees included Senior Management of the City's major service areas and Directors. Agenda items covered all areas of the City's compliance with Order No. 2001-001, as well as review of the new Order No. R9-2007-0001.
- Adopted the use of BMP maintenance agreements for privately-maintained BMPs
- Continued distributing the new brochure for mobile service providers, including carpet cleaners, plumbers, pressure washers, mechanics, porta-potty services, and any other mobile businesses that provide services at various off-site locations. This brochure was designed for mobile service providers, their employees, and anyone that hires a mobile service provider.
- Posted minimum BMPs on the City's website for access by the public, permit applicants, developers, and property owners.
- Adopted new storm water BMP maintenance agreements and incorporated into standard operating procedures. The new BMP maintenance agreements provide increased control over property owner compliance with storm water BMP requirements. These new agreements will also provide the City with legal authority to access, inspect and if necessary maintain onsite BMPs. In addition, the agreements will allow the City to place a lien on a property if BMPs are not maintained as required.
- Continued to collect data for Performance Measures and the *Maintenance Assessment Program* to analyze improved work methods to balance scheduled versus unscheduled maintenance.
- Continued Storm Water Committee meetings which included members from Public Works, the Fire Department, Recreation, Planning, and the Building Department.
- Continued to use the new database to track private treatment BMPs implemented under SUSMP.
- Continued to implement a computerized asset management/work order system that will allow the Storm Drain Maintenance Division to manage of the MS4 inventory, inspections, and maintenance activities conducted.

15.4 Recommendations for Improvements

As the City implemented the JURMP in this reporting period, some areas for improvement were noted for the future:
The City will:

- Continue to research, observe, and evaluate the performance of various types of BMPs.
- Continue working on a "*Best Management Practices Manual*" for businesses that includes the minimum and required BMPs for activities and pollutant types. The manual should be completed in FY 08-09.
- Continue to revise existing and add new programs to implement the new NPDES Municipal permit Order No. R9-2007-0001.
- Continue to work at the watershed level and help focus activities on high priority pollutants.

15.5 Water Quality Improvements or Degradation

The complete 2008 Dry Weather report and the full IDDE Section of the Annual Report will be submitted in December of 2008. Please refer to the *Carlsbad Watershed 2008 WURMP* for data trends supporting the focus on *High Priority Pollutants* on a watershed basis. The following text highlights some of the observations on water quality.

MS4 Water Quality
With five years of data from the Dry Weather Program, ranging from nutrient and physical measurements to bio-available metals and pesticides, collected at 60 sites covering the entire MS4, a picture of water quality within the system is starting to appear. While data is only collected once annually, improvements can be seen for nutrient concentrations, pH, fecal coliform, ammonia, and surfactants within the MS4.

Exceedances of bacteria 95th percentile criteria in the *Coastal Storm Drain Monitoring Program* have declined in recent years.

Receiving Water Quality
The City is continuing to conduct additional receiving water monitoring to assess receiving water quality in Carlsbad. Current programs include the *Coastal and Lagoon Outfall Monitoring Program*, the Watershed Receiving Waters samples, mass loading station monitoring, and temporary watershed assessment stations (TWAS).

Coastal Monitoring Program data indicate no water quality exceedances for bacteria in the ocean and only a few in the enclosed lagoons. The exceedances in the lagoons have declined in recent monitoring seasons and water quality appears to be improving.

In the Watershed Receiving Waters samples during dry weather nearly all constituents were undetected in the four additional creek sites water samples including: MBAS, oil and grease, dissolved cadmium, dissolved copper, dissolved lead, diazinon, and chlorpyrifos. Water quality at the four locations was relatively good.

Data related to the Mass Loading Station and TWAS will be submitted with the Copermittees Regional Monitoring Annual Report.

15.6 Conclusion

The Storm Water Protection Program continues to evolve over time in response to the iterative process of implementing BMPs, assessing effectiveness, and evaluating results. As more procedures, programs and activities are implemented, there is a clear need for better databases to track and report activities and BMPs being implemented. Tying these activities to changes in water quality still presents a considerable challenge. This is part of the long-term assessment strategy that will take time to develop trends and to determine cause and effect relationships between pollution prevention and water quality management. The City will continue to work individually and with the Copermittees to further develop existing compliance programs and create new opportunities for improvement.

This section of the Annual Report demonstrates the City s compliance with Permit 2001-01 and success implementing the JURMP. Other sections of this report show that knowledge has increased in target communities, improved BMP implementation and behavior changes are occurring, pollutant loadings are being reduced from storm water management programs, the

MS4 quality is improving, and some pollutants in receiving waters are improving. These are encouraging signs that are worth noting. The City recognizes that changes are likely to happen slowly and that continued program improvements and effectiveness measures are needed for long-term success.

Acronyms

BGPD	Billion gallons/day
BMP	Best Management Practices
CEQA	California Environmental Quality Act
CFD	Carlsbad Fire Department
CHU	Carlsbad Hydrologic Unit

City of Carlsbad
Standard Engineering Storm Water Compliance
Conditions of Development Approval

NOTE: Unless specifically stated in the condition, all of the following conditions, upon the approval of this proposed (DEVELOPMENT OR SUBDIVISION), must be met prior to approval of a (PARCEL MAP, FINAL MAP, BUILDING OR GRADING PERMIT WHICHEVER OCCURS FIRST).

7. Developer shall submit to the City Engineer an acceptable instrument, via CC&R's and/or other recorded document, addressing the maintenance, repair, and replacement of shared private improvements within this subdivision, including but not limited to private (STREETS, UTILITIES, STREET TREES, SIDEWALKS, LANDSCAPING, STREET LIGHTING, RAISED MEDIANS, ENHANCED PAVING, WATER QUALITY TREATMENT MEASURES, LOW IMPACT DEVELOPMENT FEATURES, STORM DRAIN FACILITIES, etc.) located therein and to distribute the costs of such maintenance in an equitable manner among the owners of the properties within this subdivision.

17. Developer shall cause property owner to process, execute and submit an executed copy to the City Engineer for recordation a City standard Permanent Stormwater Quality Best Management Practice Maintenance Agreement for the perpetual maintenance of all treatment control, applicable site design and source control, post-construction permanent Best Management Practices prior to the issuance of a grading permit or building permit, or the recordation of a (FINAL/PARCEL) map, whichever occurs first for this Project.

33. Developer shall comply with the City's Stormwater Regulations, latest version, and shall implement best management practices at all times. Best management practices include but are not limited to pollution treatment practices or devices, erosion control to prevent silt runoff during construction, general housekeeping practices, pollution prevention and educational practices, maintenance procedures, and other management practices or devices to prevent or reduce the discharge of pollutants to stormwater, receiving water or stormwater conveyance system to the maximum extent practicable. Developer shall notify prospective owners and tenants of the above requirements.

[USE NEXT TWO CONDITIONS ONLY IF PROJECT QUALIFIES AS TIER 3 SWPPP]

34. Prior to the issuance of a grading permit, Developer shall submit to the City Engineer receipt of a Notice of Intention from the State Water Resources Control Board.

35. Prior to the issuance of grading permit or building permit, whichever occurs first, Developer shall submit for City approval a Tier 3 Storm Water Pollution Prevention Plan (TIER 3 SWPPP). The TIER 3 SWPPP shall be in compliance with current requirements and provisions established by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Requirements. The TIER 3 SWPPP shall address measures to reduce to the maximum extent practicable storm water pollutant runoff during construction of the project.

[USE NEXT CONDITION ONLY IF UNSURE WHICH TIER SWPPP IS NEEDED FOR PROJECT]

36. Developer shall complete and submit to the City Engineer a Project Threat Assessment Form (PTAF) pursuant to City Engineering Standards. Concurrent with the PTAF, Developer shall also submit the appropriate Tier level Storm Water Compliance form and Tier level Storm Water Pollution Prevention Plan (SWPPP) as determined by the completed PTAF all to the satisfaction of the City Engineer.

[USE NEXT CONDITION ONLY IF MEETS PRIORITY PROJECT DESIGNATION]

37. Developer shall submit for City approval a "Storm Water Management Plan (SWMP)." The SWMP shall demonstrate compliance with the City of Carlsbad Standard Urban Stormwater Mitigation Plan (SUSMP), Order R9-2007-0001 issued by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Municipal Code all to the satisfaction of the City Engineer.

[USE AS FYI FOR LID TECHNIQUES]

38. Developer shall incorporate Low Impact Development (LID) design techniques, on all final design plans submitted to the City, to reduce the amount of run-off by mimicking the natural hydrologic function of the site by preserving natural open-spaces and natural drainage channels, minimizing impervious surfaces, promoting infiltration and evaporation of run-off before run-off leaves the site. Developer shall incorporate LID techniques using current County of San Diego Low Impact Development Handbook (Stormwater Management Strategies). LID techniques include, but are not limited to: vegetated swale/strip, rain gardens, and porous pavement, which can greatly reduce the volume, peak flow rate, velocity and pollutants.

[USE IF PROJECT REQUIRES HYDROMODIFICATION THRESHOLDS]

39. Developer shall submit documentation, subject to City Engineer approval, demonstrating how this project complies with Interim Hydromodification requirements per the City's SUSMP, latest version. Documentation shall be included within the Storm Water Management Plan (SWMP).

[USE NEXT TWO CONDITIONS FOR CONDITONAL USE PERMIT EXTENSIONS AS APPLICABLE]

40. Within 6 months of approval of this Conditional Use Permit extension, developer shall submit and receive approval for a Storm Water Management Plan (SWMP) to the City of Carlsbad Engineering Department. This project qualifies as a "priority project" as defined by City of Carlsbad Standard Urban Storm Water Mitigation Plan (SUSMP), and therefore, the project is required to capture and reduce pollutants to a level of insignificance. The organization and content of the SWMP shall be prepared in accordance with the guidelines established by the City of Carlsbad. The SWMP shall address the anticipated pollutants of concern associated with the Project. The SWMP shall also suggest the type(s) of post-construction (structural) Best Management Practices (BMP's) required to capture and filter said pollutants of concern and establish maintenance provisions for said BMP's.

41. Prior to the next annual review of this Conditional Use Permit, developer shall have constructed the BMP measures necessary to capture and filter the anticipated pollutants of concern associated with the project in accordance with the SWMP.

SAMPLE PRIORITY PROJECT

FOR

FIRST COMPONENT TO ANNUAL REPORT

COVERING PERIOD FROM

JULY 1, 2007 THROUGH MARCH 23, 2008

EL CAMINO TERRACE (CT 06-07)

PROJECT ADDRESS: PCL 3, M 18059
APN: 209-040-42

VI. RESOURCES & REFERENCES

APPENDIX A

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the following checklist to determine your project's permanent and construction storm water best management practices requirements. This form must be completed and submitted with your permit application.

Section 1. Permanent Storm Water BMP Requirements:
If any answers to Part A are answered "Yes," your project is subject to the "Priority Project Permanent Storm Water BMP Requirements," and "Standard Permanent Storm Water BMP Requirements" in Section III, "Permanent Storm Water BMP Selection Procedure" in the *Storm Water Standards* manual.

If all answers to Part A are "No," and any answers to Part B are "Yes," your project is only subject to the "Standard Permanent Storm Water BMP Requirements". If every question in Part A and B is answered "No," your project is exempt from permanent storm water requirements.

Part A: Determine Priority Project Permanent Storm Water BMP Requirements.

Does the project meet the definition of one or more of the priority project categories?*	Yes	No
1. Detached residential development of 10 or more units		X
2. Attached residential development of 10 or more units		X
3. Commercial development greater than 100,000 square feet		X
4. Automotive repair shop		X
5. Restaurant		X
6. Steep hillside development greater than 5,000 square feet	X	
7. Project discharging to receiving waters within Environmentally Sensitive Areas		X
8. Parking lots greater than or equal to 5,000 ft^2 or with at least 15 parking spaces, and potentially exposed to urban runoff	X	
9. Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater		X
* Refer to the definitions section in the *Storm Water Standards* for expanded definitions of the priority project categories.		
Limited Exclusion: Trenching and resurfacing work associated with utility projects are not considered priority projects. Parking lots, buildings and other structures associated with utility projects are priority projects if one or more of the criteria in Part A is met. If all answers to Part A are "No", continue to Part B.		

Part B: Determine Standard Permanent Storm Water Requirements.

Does the project propose:	Yes	No
1. New impervious areas, such as rooftops, roads, parking lots, driveways, paths and sidewalks?	X	
2. New pervious landscape areas and irrigation systems?	X	
3. Permanent structures within 100 feet of any natural water body?		X
4. Trash storage areas?	X	
5. Liquid or solid material loading and unloading areas?		X
6. Vehicle or equipment fueling, washing, or maintenance areas?		X
7. Require a General NPDES Permit for Storm Water Discharges Associated with Industrial Activities (Except construction)?*		X
8. Commercial or industrial waste handling or storage, excluding typical office or household waste?		X
9. Any grading or ground disturbance during construction?	X	
10. Any new storm drains, or alteration to existing storm drains?	X	

*To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/stormwtr/industrial.html

Section 2. Construction Storm Water BMP Requirements:

If the answer to question 1 of Part C is answered "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Storm Water Pollution Prevention Plan (SWPPP). If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Section IV, "Construction Storm Water BMP Performance Standards," and must prepare a Water Pollution Control Plan (WPCP). If every question in Part C is answered "No," your project is exempt from any construction storm water BMP requirements. If any of the answers to the questions in Part C are "Yes," complete the construction site prioritization in Part D, below.

Part C: Determine Construction Phase Storm Water Requirements.

Would the project meet any of these criteria during construction?	Yes	No
1. Is the project subject to California's statewide General NPDES Permit for Storm Water Discharges Associated With Construction Activities?	X	
2. Does the project propose grading or soil disturbance?	X	
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	X	
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as, paints, solvents, concrete, and stucco)?	X	

Part D: Determine Construction Site Priority

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans, and included in the SWPPP or WPCP. Indicate the project's priority in one of the check boxes using the criteria below, and existing and surrounding conditions of the project, the type of activities necessary to complete the construction and any other extenuating circumstances that may pose a threat to water quality. The City reserves the right to adjust the priority of the projects both before and during construction. [Note: The construction priority does NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority does affect the frequency of inspections that will be conducted by City staff. See Section IV.1 for more details on construction BMP requirements.]

☐ *A) High Priority*

1) Projects where the site is 50 acres or more and grading will occur during the rainy season
2) Projects 5 acres or more. 3) Projects 5 acres or more within or directly adjacent to or discharging directly to a coastal lagoon or other receiving water within an environmentally sensitive area

   Projects, active or inactive, adjacent or tributary to sensitive water bodies

☒ *B) Medium Priority*

1) Capital Improvement Projects where grading occurs, however a Storm Water Pollution Prevention Plan (SWPPP) is not required under the State General Construction Permit (i.e., water and sewer replacement projects, intersection and street re-alignments, widening, comfort stations, etc.)
2) Permit projects in the public right-of-way where grading occurs, such as installation of sidewalk, substantial retaining walls, curb and gutter for an entire street frontage, etc. , however SWPPPs are not required.
3) Permit projects on private property where grading permits are required, however, Notice Of Intents (NOIs) and SWPPPs are not required.

☐ *C) Low Priority*

1) Capital Projects where minimal to no grading occurs, such as signal light and loop installations, street light installations, etc.
2) Permit projects in the public right-of-way where minimal to no grading occurs, such as pedestrian ramps, driveway additions, small retaining walls, etc.
3) Permit projects on private property where grading permits are not required, such as small retaining walls, single-family homes, small tenant improvements, etc.

PLANNING COMMISSION RESOLUTION NO. 6372

A RESOLUTION OF THE PLANNING COMMISSION OF THE CITY OF CARLSBAD, CALIFORNIA, APPROVING A TENTATIVE TRACT MAP TO DEVELOP AN 18,578 SQUARE FOOT OFFICE BUILDING AND TO SUBDIVIDE THE BUILDING INTO 30 AIRSPACE OFFICE CONDOMINIUM UNITS ON A 1.48-ACRE PARCEL GENERALLY LOCATED AT THE SOUTH-EAST CORNER OF EL CAMINO REAL AND COUGAR DRIVE IN LOCAL FACILITIES MANAGEMENT ZONE 5.

CASE NAME: EL CAMINO TERRACE
CASE NO.: CT 06-17

WHEREAS, **Tycoon Development Corporation**, "Developer/Owner," has filed a verified application with the City of Carlsbad regarding property described as

> **Parcel 3 of Parcel Map No. 18059, in the City of Carlsbad, County of San Diego, State of California, according to map thereof filed in the San Diego County Recorder's Office on July 2, 1998**

("the Property"); and

WHEREAS, said verified application constitutes a request for a Tentative Tract Map as shown on Exhibits **"A" – "O"** dated **February 6, 2008**, on file in the Planning Department **EL CAMINO TERRACE – CT 06-17,** as provided by **Chapter 20.12** of the Carlsbad Municipal Code; and

WHEREAS, the Planning Commission did, on **February 6, 2008**, hold a duly noticed public hearing as prescribed by law to consider said request; and

WHEREAS, at said public hearing, upon hearing and considering all testimony and arguments, if any, of persons desiring to be heard, said Commission considered all factors relating to the Tentative Tract Map; and

NOW, THEREFORE, BE IT HEREBY RESOLVED by the Planning Commission of the City of Carlsbad as follows:

A) That the foregoing recitations are true and correct.

B) That based on the evidence presented at the public hearing, the Commission **APPROVES EL CAMINO TERRACE – CT 06-17,** based on the following findings and subject to the following conditions:

Findings:

1. That the proposed map and the proposed design and improvement of the subdivision as conditioned, is consistent with and satisfies all requirements of the General Plan, any applicable specific plans, Titles 20 and 21 of the Carlsbad Municipal Code, and the State Subdivision Map Act, and will not cause serious public health problems, in that **the proposed subdivision is designed to comply with the minimum requirements of the General Plan, Title 20 and Title 21.**

2. That the proposed project is compatible with the surrounding future land uses since surrounding properties are designated for **Planned Industrial, Open Space, Residential – High Density, Commercial, and Office and Related Commercial** development on the General Plan, in that **surrounding properties to the south, east, and west are designated for and developed with Planned Industrial and Open Space land uses, and the Residential – High Density, Commercial, and Office and Related Commercial properties to the north are sufficiently separated and buffered from the project by distance, landscaping and Cougar Drive.**

3. That the site is physically suitable for the type and density of the development since the site is adequate in size and shape to accommodate **office/industrial** development at the type proposed, in that **the project complies with all development standards and public facilities requirements without the need for variances from the development standards.**

4. That the design of the subdivision or the type of improvements will not conflict with easements of record or easements established by court judgment, or acquired by the public at large, for access through or use of property within the proposed subdivision, in that **concurrent with the recordation of the final map the developer will vacate and adjust any easements that conflict with the proposed development.**

5. That the property is not subject to a contract entered into pursuant to the Land Conservation Act of 1965 (Williamson Act).

6. That the design of the subdivision provides, to the extent feasible, for future passive or natural heating or cooling opportunities in the subdivision, in that the structures are oriented **in a manner that takes advantage of prevailing breezes.**

7. That the Planning Commission has considered, in connection with the housing proposed by this subdivision, the housing needs of the region, and balanced those housing needs against the public service needs of the City and available fiscal and environmental resources.

8. That the design of the subdivision and improvements are not likely to cause substantial environmental damage nor substantially and avoidably injure fish or wildlife or their habitat, in that **the development is considered infill, is located on a previously graded**

CEQA compliance finding

lot and no natural resources exist on the site. Additionally, the project area is not within a preserve area of the adopted Carlsbad Habitat Management Plan.

Storm water Permit compliance finding

9. That the discharge of waste from the subdivision will not result in violation of existing California Regional Water Quality Control Board requirements, in that **the project is designed in accordance with the Best Management Practices for water quality protection in accordance with the City's sewer and drainage standards and the project is conditioned to comply with the National Pollution Discharge Elimination System (NPDES) requirements.**

10. The **Planning Commission** finds that the project, as conditioned herein, is in conformance with the Elements of the City's General Plan, based on the facts set forth in the staff report dated **February 6, 2008** including, but not limited to the following:

    a. **Land Use – The proposed office/industrial uses are consistent with the Planned Industrial (PI) General Plan Land Use and Industrial (M) and Qualified Development Overlay (Q) Zoning designations for the site.**

    b. **Circulation – All roadways and improvements necessary to serve the development exist, and no additional improvements are required.**

    c. **Noise – The project is not significantly impacted by noise; however it is conditioned to comply with the General Office Interior Noise Standard of 55 dBA CNEL in accordance with City's Noise Guidelines Manual.**

11. The project is consistent with the Citywide Facilities and Improvements Plan, the Local Facilities Management Plan for Zone **5** and all City public facility policies and ordinances. The project includes elements or has been conditioned to construct or provide funding to ensure that all facilities and improvements regarding sewer collection and treatment; water; drainage; circulation; fire; schools; parks and other recreational facilities; libraries; government administrative facilities; and open space, related to the project will be installed to serve new development prior to or concurrent with need.

    a. The project has been conditioned to provide proof from the **Carlsbad Unified** School District that the project has satisfied its obligation for school facilities.

    b. The Public Facility fee is required to be paid by Council Policy No. 17 and will be collected prior to the issuance of building permit.

    c. Developer shall pay non-residential park-in-lieu fee to the City, prior to the approval of a building permit or the final map to be used for park facilities within Zone **5**.

12. The project has been conditioned to pay any increase in public facility fee, or new construction tax, or development fees, and has agreed to abide by any additional requirements established by a Local Facilities Management Plan prepared pursuant to Chapter 21.90 of the Carlsbad Municipal Code. This will ensure continued availability of public facilities and will mitigate any cumulative impacts created by the project.

13. This project has been conditioned to comply with any requirement approved as part of the Local Facilities Management Plan for Zone 5.

14. The project is consistent with the Airport Land Use Compatibility Plan (ALUCP) for the McClellan-Palomar Airport, dated October 2004, in that **the project is located within the Airport Influence Area and Flight Activity Zone and office/industrial development is considered to be a low-intensity use which does not involve assemblages of large groups of people.** The project is compatible with the projected noise levels of the ALUCP; and, based on the noise/land use compatibility matrix of the ALUCP, the proposed land use is compatible with the airport, in that **the project site is located outside of the 60 CNEL noise level contour lines, and the outdoor community noise equivalent level (CNEL) is sufficiently attenuated by conventional construction so that the indoor noise level is acceptable, and both indoor and outdoor activities associated with the land use may be carried out with essentially no interference from aircraft noise.**

15. That the Planning Director has determined that the project belongs to a class of projects that the State Secretary for Resources has found do not have a significant impact on the environment, and it is therefore categorically exempt from the requirement for the preparation of environmental documents pursuant to Section **15332** of the state CEQA Guidelines, **in that (1) the project is consistent with the General Plan designation and policies; (2) the project site is less than five acres in size and is surrounded by urban development; (3) the site has no biological value for endangered, rare or threatened species; (4) the project would not result in any significant impacts relating to traffic, noise, air quality, or water quality; and, (5) the site is adequately served by required utilities.** In making this determination, the Planning Director has found that the exceptions listed in Section 15300.2 of the state CEQA Guidelines do not apply to this project.

16. That all necessary public facilities required by the Growth Management Ordinance will be constructed or are guaranteed to be constructed concurrently with the need for them created by this project and in compliance with adopted City standards, in that **all public roads, water and sewer systems have been constructed or will be constructed concurrently with development of the site.**

17. The Planning Commission has reviewed each of the exactions imposed on the Developer contained in this resolution, and hereby finds, in this case, that the exactions are imposed to mitigate impacts caused by or reasonably related to the project, and the extent and the degree of the exaction is in rough proportionality to the impact caused by the project.

Conditions:

Note: Unless otherwise specified herein, all conditions shall be satisfied prior to **recordation of the final map**.

1. If any of the following conditions fail to occur, or if they are, by their terms, to be implemented and maintained over time, if any of such conditions fail to be so implemented and maintained according to their terms, the City shall have the right to

revoke or modify all approvals herein granted; deny or further condition issuance of all future building permits; deny, revoke, or further condition all certificates of occupancy issued under the authority of approvals herein granted; record a notice of violation on the property title; institute and prosecute litigation to compel their compliance with said conditions or seek damages for their violation. No vested rights are gained by Developer or a successor in interest by the City's approval of this **Tentative Tract Map.**

2. Staff is authorized and directed to make, or require the Developer to make, all corrections and modifications to the **Tentative Tract Map** documents, as necessary to make them internally consistent and in conformity with the final action on the project. Development shall occur substantially as shown on the approved Exhibits. Any proposed development, different from this approval, shall require an amendment to this approval.

3. Developer shall comply with all applicable provisions of federal, state, and local laws and regulations in effect at the time of building permit issuance.

4. If any condition for construction of any public improvements or facilities, or the payment of any fees in-lieu thereof, imposed by this approval or imposed by law on this Project are challenged, this approval shall be suspended as provided in Government Code Section 66020. If any such condition is determined to be invalid, this approval shall be invalid unless the City Council determines that the project without the condition complies with all requirements of law.

5. Developer/Operator shall and does hereby agree to indemnify, protect, defend, and hold harmless the City of Carlsbad, its Council members, officers, employees, agents, and representatives, from and against any and all liabilities, losses, damages, demands, claims and costs, including court costs and attorney's fees incurred by the City arising, directly or indirectly, from (a) City's approval and issuance of this **Tentative Tract Map**, (b) City's approval or issuance of any permit or action, whether discretionary or nondiscretionary, in connection with the use contemplated herein, and (c) Developer/Operator's installation and operation of the facility permitted hereby, including without limitation, any and all liabilities arising from the emission by the facility of electromagnetic fields or other energy waves or emissions. This obligation survives until all legal proceedings have been concluded and continues even if the City's approval is not validated.

6. Developer shall submit to **the Planning Department** a reproducible 24" x 36" mylar copy of the **Tentative Tract Map, Grading Plan, Site Plan and Landscape Plan** reflecting the conditions approved by the final decision-making body.

7. Prior to the issuance of a building permit, the Developer shall provide proof to the Director from the **Carlsbad Unified** School District that this project has satisfied its obligation to provide school facilities.

8. This project shall comply with all conditions and mitigation measures which are required as part of the Zone **5** Local Facilities Management Plan and any amendments made to that Plan; **specifically, the developer shall pay a growth management park fee of 40 cents**

per square foot of non-residential development to the City prior to the issuance of building permits, as required by the Zone 5 Local Facilities Management Plan.

9. Building permits will not be issued for this project unless the local agency providing water and sewer services to the project provides written certification to the City that adequate water service and sewer facilities, respectively, are available to the project at the time of the application for the building permit, and that water and sewer capacity and facilities will continue to be available until the time of occupancy. **A note to this effect shall be placed on the Final Map.**

10. This approval is granted subject to the approval of **PUD 06-15, SDP 06-07 and SUP 06-04** and is subject to all conditions contained in Planning Commission Resolutions No. **6373, 6374, and 6375** for those other approvals incorporated herein by reference.

11. Prior to the issuance of the **Final Map**, Developer shall submit to the City a Notice of Restriction executed by the owner of the real property to be developed. Said notice is to be filed in the office of the County Recorder, subject to the satisfaction of the Planning Director, notifying all interested parties and successors in interest that the City of Carlsbad has issued a **Tentative Tract Map, Non-Residential Planned Development Permit, Site Development Plan, and Special Use Permit** by Resolutions No. **6372, 6373, 6374, and 6375** on the property. Said Notice of Restriction shall note the property description, location of the file containing complete project details and all conditions of approval as well as any conditions or restrictions specified for inclusion in the Notice of Restriction. The Planning Director has the authority to execute and record an amendment to the notice which modifies or terminates said notice upon a showing of good cause by the Developer or successor in interest.

12. Approval is granted for **EL CAMINO TERRACE – CT 06-17** as shown on Exhibits **"A" – "O"** dated **February 6, 2008,** on file in the Planning Department and incorporated herein by reference. Development shall occur substantially as shown unless otherwise noted in these conditions.

13. Developer shall submit and obtain Planning Director approval of a Final Landscape and Irrigation Plan showing conformance with the approved Preliminary Landscape Plan and the City's Landscape Manual. Developer shall construct and install all landscaping as shown on the approved Final Plans, and maintain all landscaping in a healthy and thriving condition, free from weeds, trash, and debris.

14. The first submittal of Final Landscape and Irrigation Plans shall be pursuant to the landscape plancheck process on file in the Planning Department and accompanied by the project's building, improvement, and grading plans.

15. Developer shall establish a homeowner's association and corresponding covenants, conditions and restrictions (CC&Rs). **A draft copy of** said CC&Rs shall be submitted to and approved by the Planning Director prior to final map approval. **The CC&Rs shall adequately address maintenance of all common landscape areas, drainage facilities, employee eating areas, the trash enclosure, paved access and parking areas. The approved CC&Rs shall be recorded concurrently with the final map.** Prior to

issuance of a building permit, the Developer shall provide the Planning Department with a recorded copy of the official CC&Rs that have been approved by the Department of Real Estate and the Planning Director. At a minimum, the CC&Rs shall contain the following provisions:

a. General Enforcement by the City. The City shall have the right, but not the obligation, to enforce those Protective Covenants set forth in this Declaration in favor of, or in which the City has an interest.

b. Notice and Amendment. A copy of any proposed amendment shall be provided to the City in advance. If the proposed amendment affects the City, City shall have the right to disapprove. A copy of the final approved amendment shall be transmitted to City within 30 days for the official record.

c. Failure of Association to Maintain Common Area Lots and Easements. In the event that the Association fails to maintain the "Common Area Lots and/or the Association's Easements" as provided in Article_____, Section _____ the City shall have the right, but not the duty, to perform the necessary maintenance. If the City elects to perform such maintenance, the City shall give written notice to the Association, with a copy thereof to the Owners in the Project, setting forth with particularity the maintenance which the City finds to be required and requesting the same be carried out by the Association within a period of thirty (30) days from the giving of such notice. In the event that the Association fails to carry out such maintenance of the Common Area Lots and/or Association's Easements within the period specified by the City's notice, the City shall be entitled to cause such work to be completed and shall be entitled to reimbursement with respect thereto from the Owners as provided herein.

d. Special Assessments Levied by the City. In the event the City has performed the necessary maintenance to either Common Area Lots and/or Association's Easements, the City shall submit a written invoice to the Association for all costs incurred by the City to perform such maintenance of the Common Area Lots and or Association's Easements. The City shall provide a copy of such invoice to each Owner in the Project, together with a statement that if the Association fails to pay such invoice in full within the time specified, the City will pursue collection against the Owners in the Project pursuant to the provisions of this Section. Said invoice shall be due and payable by the Association within twenty (20) days of receipt by the Association. If the Association shall fail to pay such invoice in full within the period specified, payment shall be deemed delinquent and shall be subject to a late charge in an amount equal to six percent (6%) of the amount of the invoice. Thereafter the City may pursue collection from the Association by means of any remedies available at law or in equity. Without limiting the generality of the foregoing, in addition to all other rights and remedies available to the City, the City may levy a special assessment against the Owners of each Lot in the Project for an equal pro rata share of the invoice, plus the late charge. Such special assessment shall constitute a charge on the land and shall be a continuing lien upon each Lot against which the special assessment is levied. Each Owner in the Project hereby vests the City with the right and power to levy such special

assessment, to impose a lien upon their respective Lot and to bring all legal actions and/or to pursue lien foreclosure procedures against any Owner and his/her respective Lot for purposes of collecting such special assessment in accordance with the procedures set forth in Article _____ of this Declaration.

e. **The location and size of all employee eating areas, parking areas, and landscape areas associated with the project as shown on Exhibits "B" and "N" shall not be altered, reduced, fenced or divided to preclude the equal use by all owners/employees of the site.**

f. **All roof appurtenances, including air conditioners, shall be architecturally integrated and concealed from view and sound buffered from adjacent properties and streets consistent with Building Department Policy No. 80-6, and to the satisfaction of the Directors of Community Development and Planning.**

g. **Parking lot and building lighting shall be shielded so as to prevent light spillage off of the site onto the adjacent residential care facility.**

16. Prior to issuance of building permits, the Developer shall submit to the Planning Director a recorded copy of the Condominium Plan filed with the Department of Real Estate which is in conformance with the City-approved documents and exhibits.

17. Developer shall pay the citywide Public Facilities Fee imposed by City Council Policy #17, the License Tax on new construction imposed by Carlsbad Municipal Code Section 5.09.030, and CFD #1 special tax (if applicable), subject to any credits authorized by Carlsbad Municipal Code Section 5.09.040. Developer shall also pay any applicable Local Facilities Management Plan fee for Zone **5,** pursuant to Chapter 21.90. All such taxes/fees shall be paid at issuance of building permit. If the taxes/fees are not paid, this approval will not be consistent with the General Plan and shall become void.

18. All roof appurtenances, including air conditioners, shall be architecturally integrated and concealed from view and the sound buffered from adjacent properties and streets, in substance as provided in Building Department Policy No. 80-6, to the satisfaction of the Directors of Community Development and Planning.

19. Prior to the recordation of the final **tract** map, the Developer shall prepare and record a Notice that this property may be subject to noise impacts from the proposed or existing Transportation Corridor, in a form meeting the approval of the Planning Director and the City Attorney (see Noise Form #1 on file in the Planning Department).

20. Developer shall construct trash receptacle and recycling areas enclosed by a six-foot-high masonry wall with gates pursuant to City Engineering Standards and Carlsbad Municipal Code Chapter 21.105. Location of said receptacles shall be approved by the Planning Director. Enclosure shall be of similar colors and/or materials to the project to the satisfaction of the Planning Director.

21. No outdoor storage of materials shall occur onsite unless required by the Fire Chief. When so required, the Developer shall submit and obtain approval of the Fire Chief and the Planning Director of an Outdoor Storage Plan, and thereafter comply with the approved plan.

22. Developer shall submit and obtain Planning Director approval of an exterior lighting plan including parking areas. All lighting shall be designed to reflect downward and avoid any impacts on adjacent homes or property. **This exterior lighting plan shall include a photometric analysis that shows no lighting impacts will occur on the adjacent residential care facility to the north.**

23. Developer shall construct, install, and stripe not less than **74** parking spaces, as shown on Exhibit **"B"**.

24. **Prior to building permit issuance, the Developer shall prepare and submit to the Planning Department an interior acoustical analysis to ensure interior noise levels do not exceed 55 dBA CNEL.**

25. **All retaining walls shall be a plantable keystone type wall of a tan color to match the building, designed and constructed to the satisfaction of the Planning Director. The walls shall be planted and irrigated so as to provide sufficient plant cover within one year after installation to the satisfaction of the City's Landscape Plancheck Consultant and the Planning Director.**

Engineering:

General

26. Prior to hauling dirt or construction materials to or from any proposed construction site within this project, Developer shall apply for and obtain approval from, the City Engineer for the proposed haul route.

27. This approval is subject to the approval and conditions of PUD 06-15, SDP 06-07, and SUP 06-04.

BMP Maintenance condition

28. Developer shall provide to the City Engineer, an acceptable means, CC&Rs and/or other recorded document, for maintaining the private easements within the subdivision and all the private improvements: streets, sidewalks, street lights, storm drain facilities and storm water Best Management Practice facilities located therein and to distribute the costs of such maintenance in an equitable manner among the owners of the properties within the subdivision.

29. There shall be one Final Map recorded for this project.

30. Developer shall install sight distance corridors at all street intersections and driveways in accordance with City Engineering Standards.

...

Fees/Agreements

31. Developer shall cause property owner to execute and submit to the City Engineer for recordation, the City's standard form Geologic Failure Hold Harmless Agreement.

32. Developer shall cause property owner to execute and submit to the City Engineer for recordation the City's standard form Drainage Hold Harmless Agreement regarding drainage across the adjacent property.

33. Prior to approval of any grading or building permits for this project, Developer shall cause Owner to give written consent to the City Engineer to the annexation of the area shown within the boundaries of the site plan into the existing City of Carlsbad Street Lighting and Landscaping District No. 1 and/or to the formation or annexation into an additional Street Lighting and Landscaping District. Said written consent shall be on a form provided by the City Engineer.

Grading

34. Based upon a review of the proposed grading and the grading quantities shown on the Site Plan, a grading permit for this project is required. Developer shall apply for and obtain a grading permit from the City Engineer prior to issuance of a building permit for the project.

NOI Requirement

35. Prior to the issuance of a grading permit or building permit, whichever occurs first, Developer shall submit to the City Engineer proof that a Notice of Intention for the start of work has been submitted to the State Water Resources Control Board.

Construction BMP compliance condition

36. Developer shall comply with the City's requirements of the National Pollutant Discharge Elimination System (NPDES) permit and the City's latest Standard Urban Storm Water Mitigation Plan (SUSMP). Developer shall provide improvements constructed pursuant to best management practices as referenced in the "California Storm Water Best Management Practices Handbook" to reduce surface pollutants to an acceptable level prior to discharge to sensitive areas. Plans for such improvements shall be submitted to and subject to the approval of the City Engineer. Said plans shall include but not be limited to notifying prospective owners and tenants of the following:

A. All owners and tenants shall coordinate efforts to establish or work with established disposal programs to remove and properly dispose of toxic and hazardous waste products.

B. Toxic chemicals or hydrocarbon compounds such as gasoline, motor oil, antifreeze, solvents, paints, paint thinners, wood preservatives, and other such fluids shall not be discharged into any street, public or private, or into storm drain or storm water conveyance systems. Use and disposal of pesticides, fungicides, herbicides, insecticides, fertilizers and other such chemical treatments shall meet Federal, State, County and City requirements as prescribed in their respective containers.

C. Best Management Practices shall be used to eliminate or reduce surface pollutants when planning any changes to the landscaping and surface improvements.

Construction SWPPP condition

37. Prior to the issuance of grading permit or building permit, whichever occurs first, Developer shall submit for City approval a "Storm Water Pollution Prevention Plan (SWPPP)." The SWPPP shall be in compliance with latest requirements and provisions established by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Requirements. The SWPPP shall address measures to reduce to the maximum extent practicable storm water pollutant runoff during construction of the project.

SWMP Permanent BMP condition

38. Prior to the issuance of grading permit or building permit, whichever occurs first, Developer shall submit for City approval a "Storm Water Management Plan (SWMP)." The SWMP shall demonstrate compliance with the latest City of Carlsbad Standard Urban Stormwater Mitigation Plan (SUSMP), Order R-9-2007-01 issued by the San Diego Region of the California Regional Water Quality Control Board and City of Carlsbad Municipal Code. The SWMP shall address measures to avoid contact or filter said pollutants from storm water, to the maximum extent practicable, for the post-construction stage of the project. At a minimum, the SWMP shall:

a. Identify existing and post-development on-site pollutants-of-concern.

b. Identify the hydrologic unit this project contributes to and impaired water bodies that could be impacted by this project.

c. Recommend source control, Low Impact Development (LID) BMPs and treatment control BMPs that will be implemented with this project to avoid contact or filter said pollutants from storm water to the maximum extent practicable before discharging offsite.

Low Impact Development (LID) Design must conform to the current County of San Diego Low Impact Development Handbook (Storm water Management Strategies). The design shall help preserve and restore the natural hydrologic cycle of the site by allowing filtration and infiltration of urban run-off using LID BMPs including but not limited to vegetated swale/strip, rain garden, and porous pavement, which can greatly reduce the volume, peak flow rate, velocity and pollutants.

d. Establish specific procedures for handling spills and routine cleanup. Special considerations and effort shall be applied to employee education on the proper procedures for handling cleanup and disposal of pollutants.

e. Ensure long-term maintenance of all post-construction BMPs in perpetuity.

f. Identify how post-construction runoff rates and velocities from the site will not exceed the pre-construction runoff rates and velocities to the maximum extent practicable.

Permanent BMP Maintenance condition

39. Developer shall cause property owner to process, execute and submit an executed copy to the City Engineer for recordation a City standard Permanent Stormwater Quality Best Management Practice Maintenance Agreement for the perpetual maintenance of all treatment control, applicable site design and source control, post-construction permanent Best Management Practices prior to the issuance of a grading permit or building permit, or recordation of the final map whichever occurs first for this Project.

Dedications/Improvements

40. Developer shall cause Owner to dedicate to the City the public water easement shown on the map. The offer shall be made by a separate recorded document. All land so offered shall be offered free and clear of all liens and encumbrances and without cost. Streets that already public are not required to be rededicated.

41. Developer shall execute and record a City standard Subdivision Improvement Agreement to install and secure with appropriate security as provided by law, public improvements shown on the Site Plan and the following improvements including, but not limited to grading, clearing and grubbing, sewer, water, fire hydrants, street lights, and reclaimed water, to City Standards to the satisfaction of the City Engineer. The improvements are:

    a) **Onsite public water main and fire hydrants.**

    Improvements listed above shall be constructed within 18 months of approval of the subdivision or development improvement agreement or such other time as provided in said agreement.

42. Prior to grading permit issuance, Developer shall have design, apply for and obtain approval of the City Engineer, for the structural section for the access aisles with a traffic index of 5.0 in accordance with City Standards due to truck access through the parking area and/or aisles with an ADT greater than 500. The structural pavement design of the aisle ways shall be submitted together with required R-value soil test information and approved by the City Engineer as part of the building or grading plan review whichever occurs first.

Final Map Notes

Add the following notes to the final map as non-mapping data.

43. All improvements are privately owned and are to be privately maintained with the exception of the following:

    a) **Onsite public water main and fire hydrants.**

44. Building permits will not be issued for development of the subject property unless the appropriate agency determines that sewer and water facilities are available.

45. The owner of this property on behalf of itself and all of its successors in interest has agreed to hold harmless and indemnify the City of Carlsbad from any action that may

arise through any diversion of waters, the alteration of the normal flow of surface waters or drainage, or the concentration of surface waters or drainage from the drainage system or other improvements identified in the City approved development plans; or by the design, construction or maintenance of the drainage system or other improvements identified in the City approved development plans.

Utilities

46. Prior to approval of improvement plans or final map, Developer shall meet with the Fire Marshal to determine if fire protection measures (fire flows, fire hydrant locations, building sprinklers) are required to serve the project. Fire hydrants, if proposed, shall be considered public improvements and shall be served by public water mains to the satisfaction of the District Engineer.

47. The Developer shall design and construct public facilities within public right-of-way or within minimum 20-feet wide easements granted to the District or the City of Carlsbad. At the discretion of the District Engineer, wider easements may be required for adequate maintenance, access and/or joint utility purposes.

48. Prior to issuance of building permits, Developer shall pay all fees, deposits, and charges for connection to public facilities. Developer shall pay the San Diego County Water Authority capacity charge(s) prior to issuance of Building Permits.

49. The Developer shall install potable water and recycled water services and meters at a locations approved by the District Engineer. The locations of said services shall be reflected on public improvement plans.

50. The Developer shall install sewer laterals and clean-outs at a location approved by the District Engineer. The locations of sewer laterals shall be reflected on public improvement plans.

51. **Prior to approval of the grading plan, the Developer shall obtain approval from Kinder Morgan Energy Partners LP for the abandonment of the existing 10" pressurized Fuel Transmission Pipe as shown on the Tentative Map. The Developer shall provide evidence of this approval to the City Engineer.**

52. **The design and operation of the proposed water system shall comply with the following:**

    a) **A sub-meter shall be installed for each individually owned unit.**

    b) **Wording within CC&Rs related to water meters cannot be changed without the approval of the City Engineer.**

    c) **Prior to sale of any unit, the owner shall create an impound account to be funded with an amount equal to an estimated three months of water bill payments.**

d) **Owners and tenants of the units shall be notified that the City may shutoff water service to the entire building if adequate payment of the water bill is not made.**

Code Reminders:

53. The tentative map shall expire twenty-four (24) months from the date this tentative map approval becomes final.

54. Approval of this request shall not excuse compliance with all applicable sections of the Zoning Ordinance and all other applicable City ordinances in effect at time of building permit issuance, except as otherwise specifically provided herein.

55. The project shall comply with the latest nonresidential disabled access requirements pursuant to Title 24 of the State Building Code.

56. Any signs proposed for this development shall at a minimum be designed in conformance with the City's Sign Ordinance **and the El Camino Real Corridor Standards,** and shall require review and approval of the Planning Director prior to installation of such signs.

57. Developer shall pay a landscape plancheck and inspection fee as required by Section 20.08.050 of the Carlsbad Municipal Code.

58. Premise identification (addresses) shall be provided consistent with Carlsbad Municipal Code Section 18.04.320.

Construction BMP reminder

59. Developer shall exercise special care during the construction phase of this project to prevent offsite siltation. Planting and erosion control shall be provided in accordance with Carlsbad Municipal Code Chapter 15.16 (the Grading Ordinance) to the satisfaction of the City Engineer.

60. The Average Daily Trips (ADT) and floor area contained in the staff report and shown on the Site Plan are for planning purposes only. Developer shall pay traffic impact and sewer impact fees based on Section 18.42 and Section 13.10 of the City of Carlsbad Municipal Code, respectively.

. . .

NOTICE

Please take NOTICE that approval of your project includes the "imposition" of fees, dedications, reservations, or other exactions hereafter collectively referred to for convenience as "fees/exactions."

You have 90 days from date of approval to protest imposition of these fees/exactions. If you protest them, you must follow the protest procedure set forth in Government Code Section 66020(a), and file the protest and any other required information with the City Manager for processing in accordance with Carlsbad Municipal Code Section 3.32.030. Failure to timely follow that procedure will bar any subsequent legal action to attack, review, set aside, void, or annul their imposition.

You are hereby FURTHER NOTIFIED that your right to protest the specified fees/exactions DOES NOT APPLY to water and sewer connection fees and capacity charges, nor planning, zoning, grading, or other similar application processing or service fees in connection with this project; NOR DOES IT APPLY to any fees/exactions of which you have previously been given a NOTICE similar to this, or as to which the statute of limitations has previously otherwise expired.

PASSED, APPROVED, AND ADOPTED at a regular meeting of the Planning Commission of the City of Carlsbad, California, held on **February 6, 2008**, by the following vote, to wit:

AYES: Chairperson Baker, Commissioners Boddy, Cardosa, Dominguez, Douglas, Montgomery, and Whitton

C **STORM WATER APPLICABILITY CHECKLIST**

1.0 INTRODUCTION

The California State Water Quality Control Board approved Order Number 2007-01 (Order) on January 24, 2007. The Order updates the original NPDES Storm Water Permit, Order No. 2001-01 and outlines the storm water discharge requirements for municipal separate storm sewer systems (MS4s), which drain "development" areas from watersheds within:

1.) The County of San Diego,
2.) Incorporated cities of San Diego County, and
3.) San Diego Unified Port District.

The City of Carlsbad is one of the municipal co-permittees identified in the order and, therefore, subject to its requirements.

In general, the order requires that Best Management Practices (BMPs):

- Control the post-development peak storm water storm discharge rates and velocities to maintain or reduce pre-development downstream erosion
- Minimize storm water pollutants of concern in urban runoff from new development through implementation of source control BMPs
- Remove pollutants of concern from urban runoff through implementation of structural treatment BMPs
- Include proof of a mechanism, to be provided by the project proposal, which will ensure ongoing long-term structural BMP maintenance. In addition, structural BMPs shall be located to infiltrate, filter, or treat the required runoff volume or flow (*numeric sizing criteria*) prior to discharge to any receiving water body supporting beneficial uses.

This "numeric sizing criteria" is either volume or flow based. Specifically, volume based BMPs must be designed to infiltrate, filter, or treat the volume of runoff produced from a 24-hour – 85th percentile storm event. This is approximately 0.6 inches of runoff for San Diego County. Similarly, flow based BMPs must be designed to infiltrate, filter or treat a flow rate of 0.2 inches of rainfall per hour. Note that the above "numeric sizing criteria" allows the option of infiltration, filtering or treatment of this volume/flow and relates only to water quantity. Retention or detention of water volume/flow is not a requirement of the "numeric sizing criteria."

This Storm Water Management Plan (SWMP) proposes to address the possible water quality impacts from the grading and improvements of the El Camino Terrace (Project) located in the 5400 block of El Camino Real and define the potential Best Management Practice (BMP) options that satisfy the requirements, identified in the following documents:

1.) City of Carlsbad Standard Urban Storm Water Mitigation Plan, Storm Water Standards, (Standards) April 2003
2.) Standard Specifications for Public Works Construction,
3.) NPDES General permit for Storm Water Discharges Associated with Construction Activity, and
4.) County of San Diego Municipal NPDES Storm Water Permit (Order Number 2007-01).

The goal of this SWMP is to develop and implement the best available procedure policies of the Standards to insure to the maximum extent practicable that development does not increase pollutant loads from the project site and considers urban runoff flow rates, potential pollutants, and velocities. The SWMP also intends to insure the effectiveness of the Best Management Practices (BMP) through proper maintenance that is based on long-term fiscal planning.

According to the Storm Water Requirements Applicability Checklist (Appendix A of the Standards) (see Appendix C of this report), the Project is subject to:

- Part A - the Priority Project Permanent Storm Water BMP requirements
- Part B – the Standard Permanent Storm Water BMP requirements
- Part C – the Construction Storm Water BMP Performance Standards and is required to prepare a Storm Water Pollution Prevention Plan (SWPPP) and
- Part D - Medium Priority construction site ranking due to discharging to a tributary to a sensitive water body.

This SWMP is subject to revisions as needed by the engineer.

2.0 PROJECT DESCRIPTION

The Project is located on Assessors Parcel No. 209-040-42-00, more formerly known as Lot 3, of Map 18059. The 1.48 acre site is located adjacent and easterly of El Camino Real and southerly of Cougar Street.

The Project consists of the fine grading of an existing rough graded site for the construction of one commercial building and its associated parking and landscaped areas. The existing site contains driveway paving, underground storm drain piping and storm drain inlet structures that will be utilized by the Project development. Landscaped area site improvements for all permeable disturbed areas, as well as some undisturbed permeable areas, are integral elements of the proposed Project.

In general, the proposed site will surface-drain via overland flows and channelizing ribbon gutters to a proposed grated inlet in the northerly portion of the parking lot and to existing curb inlets located along the paved access drive, within a mutual use access easement. The curb inlets located in the existing driveway on the east drain to an existing storm drain system. The drainage for this project eventually flows into the Agua Hedionda Creek to the Pacific Ocean.

FIGURE 1

LOCATION MAP

NOT TO SCALE

3.0 Hydrologic Unit Contribution

According to the State of California, Regional Water Quality Control Board, San Diego Hydrologic Basin Planning Area, the Project is located in the Los Manos hydrologic sub-area (HSA) (904.31) of the Carlsbad Watershed hydrologic unit (HU). The area is characterized by mostly moderately sloping land occupied by predominately non-native grass and urban uses. Land use within the watershed is dominated by urban development. Natural habitats are scattered and occur in a matrix of agricultural and urban development, however several relatively large patches of native vegetation occur in the eastern portion of the watershed and in the central area just inland from Agua Hedionda Lagoon.The cities of Carlsbad, San Marcos, and Encinitas are located entirely within the HU. Approximately 48% of the Carlsbad HU is urbanized. The dominant land uses are residential (29%), commercial/industrial (6%), freeways/roads (12%), agriculture (12%), and vacant/undeveloped (32%). The Agua Hedionda HA comprises approximately 14% of the HU.

Constituents of concern for the HU include coliform bacteria, nutrients, sediment, trace metals, and toxics. The Agua Hedionda, Buena Vista, and San Elijo lagoons are experiencing impairments to beneficial uses due to excessive coliform bacteria and sediment loading from upstream sources. These coastal lagoons represent critical regional resources that provide freshwater and estuarine habitats for numerous plant and animal species. Other water bodies in the Carlsbad HU have been identified as impaired on the California 303(d) list for elevated coliform bacteria. Specific waterbodies affected by the Project are identified in Section 4.0.

The Project's 1.48 acres (±1.1 acres disturbed) represents an extremely small percentage of the approximately 210 square miles (134,400 acres) of the hydrologic unit area and representing 0.1% of the hydrologic unit area. The existing site contains ±0.13 acres of impervious surface area that increases to ±0.91 acres in the planned developed condition. The "Project" will not alter the overall drainage pattern of the site before entering the storm drainage system. The drainage within Cougar Drive is designed for total build-out of this development. Therefore, the increase in imperviousness of the Project will have a negligible impact on the hydrologic unit with the proper implementation and maintenance of the permanent BMPs outlined in this report and the proper implementation and maintenance of the construction phase BMPs identified in the Storm Water Pollution Prevention Plan (SWPPP).

FIGURE 2

Carlsbad Watershed Hydrologic Unit

3.1 Beneficial Use

Designated beneficial uses within the Los Manos HSA and the downstream locations of Agua Hedionda Creek and Agua Hedionda Lagoon are limited to surface water, coastal water and ground water. Those uses are identified in Table 1. The data contained in this Table is extracted from the Water Quality Control Plan for the San Diego Basin.

TABLE 1

Beneficial Uses	Inland Surface Water	Coastal Waters	Ground Water
Municipal and Domestic Supply	X		O
Agricultural Supply	X		O

FIGURE 3

Vicinity Map

4.0 CHARACTERIZATION OF PROJECT RUNOFF

According to the California 2002 303d list published by the San Diego Regional Water Quality Control Board, Agua Hedionda Creek and Agua Hedionda Lagoon are the only impaired water bodies downstream of the Project. The Project area is approximately 2.9 miles upstream from the outlet of the lagoon to the Pacific Ocean.

The Agua Hedionda Creek's impairment is for total dissolved solids for a length of 7 miles and a TMDL classification of "Low". The identified sources of the pollutant/stressor are listed as:

- urban runoff/storm sewers.
- unknown nonpoint source.
- unknown point source.

The Agua Hedionda Lagoon's pollutant/stressors are bacteria indicators and sedimentation/siltation for an area of 6.8 acres and a TMDL classification of "Low" on both. The identified source for both of the pollutant/stressors is listed as nonpoint/point source.

4.1 Constituents of Concern and Sources

There are no sampling data available for the existing site condition.

In addition, the project is not expected to generate significant amounts of non-visible pollutants. However, the constituents listed in Table 2.1 are commonly found on similar developments and could affect water quality.

TABLE 2

Priority Project Categories	*General Pollutant Categories*								
	Sediments	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Commercial Development >1 Acre	P(1)	P(1)		P(2)	X	P(3)	X	P(4)	P(3)
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Hillside Development >5,000 ft^2	X	X			X	X	X		X

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) Including solvents.
(4) A potential pollutant if land use involves food or animal waste products

Project Pollutant Categories

The potential sources for the constituents of concern for the project could be, but are not limited to those listed below:

- Sediments – Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

- Nutrients – Nutrients are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

- Metals – Metals are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary source of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

- Organic Compounds – Organic compounds are carbon-based. Commercially available or naturally occurring organic compounds are found in pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

- Trash & Debris – Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

- Oxygen-Demanding Substances – This category includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

- Oil and Grease – Oil and grease are characterized as high-molecular weight organic compounds. Primary sources of oil and grease are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

- Bacteria and Viruses – Bacteria and viruses are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. In addition, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

- Pesticides – Pesticides (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

4.2 Soil Characteristics.

The project area consists of soil group D. Soil group D soils have very slow infiltration rate when thoroughly wetted; chiefly clays that have a high shrink-swell potential, soils that have a high permanent water table, soils that have a claypan or clay layer at or near the surface, or soils that are shallow over nearly impervious material. Rate of water transmission is very slow.

4.3 Site Hydrology

Per the Hydrological Analysis (Attachment A), the existing flow rate for the Project drainage areas from a 100-year storm event is 3.19 cfs. This currently drains from the site via an existing, temporary 12" riser with weep holes. The existing drainage area of the Project drains through an underground storm drain system, ultimately outletting to Agua Hedionda Creek.

In the proposed condition, the basin area remains unchanged and the runoff coefficient increases due to the classification of the area changing from existing to commercial for the project. The flow for the proposed condition is 8.31 cfs. This increase to the total storm flow is due to the change in the 'C' factor. The existing drainage facilities, already sized for the ultimate developed conditions for the zoning, are capable of handling the increase in flow. The project continues to drain to the same underground storm drain system piping mentioned above.

5.0 MITIGATIVE MEASURES TO PROTECT WATER QUALITY

As a Priority Project, specific storm water BMP requirements must apply, where applicable. Priority projects incorporate particular BMPs to ensure that those projects reduce potential urban pollutant runoff to the maximum extent practicable (MEP). These storm water pollution prevention requirements are site specific and vary based on the project's potential impact on receiving water quality.

To address water quality for the project, BMPs will be implemented during construction and post construction phases. Per Section II, Table 1 of the Standards, the Project is best described as belonging to the Commercial Development >1 Acre, Parking Lot and Hillside Development >5,000 ft^2 categories.

Priority projects are subject to the requirements of all priority project categories that apply (as shown in Table 3):

- Site Design BMPs
- Source Control BMPs
- BMPs applicable to Priority Project specific categories:
  1. Private Roads,
  2. Dock Areas,
  3. Maintenance Bays,
  4. Outdoor Processing Areas,
  5. Surface Parking Areas and
  6. Hillside landscape

In addition, incorporated into the Project are appropriate site design and source control BMPs for Standard Projects.

5.1 Site Design BMPs

The Project has incorporated specific site design characteristics to provide a minimum of impervious areas on the site. The maximum number of compact car parking spaces allowed by code reduces the pavement areas in surface parking areas. Utilization of existing paved areas for access and existing driveway reduces impermeable areas and affords a greater level of safety on Cougar Drive by not introducing any new driveway openings.

The landscaped areas provide an efficient use of permeable areas. Roof drainage flows are directed into landscaped areas adjacent to and sloping away from building structures. Installation and monitoring of the irrigation system for these landscape areas will reduce over-irrigation, thereby reducing the oversaturation of the areas leading to excess runoff. All existing areas outside of the disturbed areas remains in a natural state or will incorporate major plantings into the new landscape scheme. The conservation preserves native trees and shrubs, lessening the impact of this development on the surrounding area. The landscaped areas of the site will utilize native or drought tolerant species in the planting scheme.

All storm flows will exit the site in the same locations as in the existing condition. The slight increase in post-development peak flow by the increase of impermeable area is accounted for in the design of the existing drainage improvements for the ultimate build-out of this developable parcel.

5.2 Source Control BMPs

Source control BMPs, including construction stage BMPs, are selected, constructed, and maintained to comply with all applicable ordinances and guidance documents. The Project SWPPP will identify and detail construction BMPs that may include, but not be limited to, the following:

Silt Fences, Fiber Rolls, Street Sweeping & Vacuuming, Storm Drain Inlet Protection, Stockpile Management, Solid Waste Management, Stabilized Construction Entrance/Exit, Vehicle & Equipment Maintenance, Gravel Bag Berms, Material Delivery & Storage, Spill Prevention & Control, Concrete Waste Management, Water Conservation Practices, Paving & Grinding Operations, Stabilization of Disturbed Areas, and Permanent Revegetation of Man-made Slopes.

TABLE 3

S = Select one or more applicable and appropriate treatment control BMPs.
(1) = Applies if the paved area totals >5,000 square feet or with >15 parking spaces and is potentially exposed to urban runoff.

Project Storm Water BMP Requirement Matrix

5.2.1 Efficient Irrigation and Landscape Design

Landscape irrigation systems will be of an efficient design and installations will be maintained on a regular and timely basis to prevent over-watering and the transport of silts, sediments, fertilizers and pesticides into the storm drain system. Fertilizers and pesticides will be applied per manufacturer's rate to reduce the potential of pollutant transporting.

5.2.2 Integrated Pest Management (IPM)

The use of an IPM strategy, an ecosystem-based pollution prevention strategy that focuses on long-term prevention of pests or their damage through a combination of techniques such as biological control, habitat manipulation, modification of cultural practices, and use of resistant plant varieties will control or eliminate certain pollutants of concern. Pesticides are used only after monitoring indicates they are needed according to established guidelines. Pest control materials selected and applied in a manner that minimize risks to human health and the environment should be used. More information may be obtained at the UC Davis website (http://www.ipm.ucdavis.edu/WATER/U/index.html). If fertilizers and pesticides are necessary, they shall be applied per manufacturer's rates and guidelines to reduce the potential of pollutant transporting.

5.2.3 Outdoor Storage

There is no planned outdoor storage of any types of materials. All material storage areas are located indoors or will be contained in an appropriate enclosure.

5.2.4 Trash Storage Areas

Trash and recycling storage areas will have concrete masonry screen wall enclosures, with gated openings. The containers themselves are to be equipped with integral, locking lids to prevent the blowing of waste materials. Emptying the containers on a regular and as needed basis lessens the likelihood of overflow leading to the distribution of waste.

5.2.5 Storm Drain Signage or Stenciling

Any existing public storm drain inlets affected by project drainage, as well as all on-site private inlets, will be stamped or stenciled (as appropriate to location) to provide notice against illegal dumping of pollutants. The owner/developer will provide information to increase the knowledge of tenants/employees/future owner regarding impacts of pollutants and urban runoff on receiving waters and potential BMPs for the specific land use to affect the behavior of tenants/employees/future owner and thereby reduce pollutant releases to the environment.

5.2.6 Spill Prevention and Control

A spill prevention and control plan applicable to site operations is to be developed and implemented by the property owner and/or the building management. An effective plan will prevent or reduce the discharge of pollutants due to leaks and spills. It should have spill prevention and response procedures that identify potential spill areas, specify material handling procedures, describe spill response procedures, and provide spill clean-up equipment. The plan should identify steps to identify and characterize potential spills, eliminate and reduce spill potential, respond to spills when they occur, and train personnel to prevent and control future spills.

5.3 BMPs Applicable to Individual Priority Project Categories

Commercial Development >1 Acre:

a) Dock Areas, – There are no loading dock areas planned for the Project. All shipping and receiving will be by individual, closed containers and handled on an as needed basis by each tenant and their respective shipping company.
b) Maintenance Bays, – There are no maintenance bays associated with the Project. Any vehicular maintenance will be performed at an off-site location.
c) Vehicle Wash Areas, – Any vehicle washing/steam cleaning is to be performed at an off-site location. If any occurs on site, appropriate BMPs for isolation of wash wastes, such as isolating wash areas with retention berms and appropriate disposal of wash wastes into a sewage wastewater clarifier before entering the municipal sewer system, shall be implemented.
d) Outdoor Processing Areas, – All processing activities are contained within the buildings. No processing allowed outdoors unless it occurs within covered or enclosed areas and discharges any drainage or wastes into a sewage wastewater clarifier before entering the municipal sewer system.

Hillside Development >5,000 ft^2:

a) Private Roads. – The design of private roadway drainage incorporates a treatment control BMP method approved by the City Engineer to reduce storm water runoff pollution in the form of a catch basin filter insert enabling the Project to utilize the existing drainage design of the adjacent properties.
b) Hillside Landscaping. - Hillside areas disturbed by project development will be landscaped with deep-rooted, drought tolerant plant species selected for erosion control, in accordance with the Carlsbad Landscape Manual.

Parking Lots:

a) Surface Parking Areas. –Surface parking areas incorporate landscape areas into the drainage design by sheet flowing to vegetated swale buffer strips before entering the storm drain system.

5.4 Treatment Control BMPs

Landscaped areas, (indicated on Figure 5) and undisturbed natural areas can act as biofilters for irrigation and drainage flow waters that cross over them. Mulching, seeding and planting of the landscaped areas provide

biofiltration of applied pesticides and fertilizers. Following manufacturer guidelines to avoid over treatment of landscaping will provide a limited occurrence of pollutants in the planted areas of the Project.

The paved parking areas will receive storm water to vegetated strips located in the mid part of the parking and along the northerly and easterly parking perimeter. The runoff received by the vegetated strip located in the mid area of the parking will surface flow into the vegetated strip and it will then, be conveyed into a proposed catch basin with filter insert. The rest of the parking runoff will enter into the vegetated strips along the parking northerly and easterly parking perimeter through six-two inch cores of he curb; this runoff will flow through the grass and then will enter into two proposed Bio-filtration systems. The filters strips function by slowing runoff velocity and filtering out sediment and other pollutants, while also providing some infiltration into underlying soil. The landscape plans specify the species used in planting in the strip. Recommended plantings for these buffer areas are low growing, drought tolerant, native species. They should be hardy plants that withstand flows and wet and dry conditions. A thick vegetative cover assures the proper filtration functioning.

The catch basin at the vegetated filter strip terminus is outfitted with catch basin filter insert (FloGard+™ by Kristar® [or City approved equal]), filter inserts are also installed in the catch basins located west of the building to collect the runoff from the rooftop. Installation of this type of inserts on the private drain inlets accepting drainage from the private access drive will treat the runoff from this paved area. The inserts are designed to collect sediment, trash, and debris during low flows (first flush); however, it will not impede peak flow and it help to reduce the hydrocarbons, oil, grease pollutants and metal debris from vehicle brake pads. Insert filters installed on appropriate inlets cleanse the runoff per square foot of effective filter area (per manufacturer efficiency specs in Attachment B). The screening mechanism of the filter inserts is highly effective in the removal of trash and debris. They will also help on the treatment of any pesticides and nutrients emanating from the landscape areas not treated through biofiltration. The use of inserts on all appropriate inlets will effectively aid the removal of pollutants of concern from the Project, preventing them from entering downstream waters.

Using the flow-based aspect of the "numeric sizing criteria," the insert BMPs must be designed to mitigate (infiltrate, filter or treat) a flow rate of 0.2 inches of rainfall per hour and relates only to water quantity. Retention or detention of water volume/flow is not a requirement of the criteria. The flow based filter insert sizing for the Project is as follows:

- Using the basin area formula A=Q/CI:
  - A 24" catch basin (4 sq ft opening) with FloGard+™ insert can treat at least 645 GPM or 1.44 cfs (per specifier chart).
    Where Q=flow rate, 1.44 cfs, C= coefficient of runoff 0.87, I= intensity 0.2"/hr
    or A=1.44/(0.87)(.2))
    Therefore, the maximum acreage draining to this catch basin could be approximately 8.57 acres.

  - A 48" curb inlet (4 ft opening) with FloGard+™ insert can treat at least 1.5 cfs (per specifier chart).

    Where Q=flow rate, 1.5 cfs, C= coefficient of runoff 0.87, I= intensity 0.2"/hr
    or A=1.5/(0.87)(.2))
    Therefore, the maximum acreage draining to this catch basin could be approximately 8.62 acres.

  - A 12"X 12" FGP-12F filter can treat 0.40 CFS (per specifier chart).
    Where Q=flow rate, 0.40 cfs, C= coefficient of runoff 0.87, I= intensity 0.2"/hr
    or A=0.40/(0.87)(.2))
    Therefore, the maximum acreage draining to this catch basin could be approximately 2.30 acres.

Consequently, the inlet filters meet the flow/volume criteria in the Order. Appendix B contains manufacturer information on the capacity of the FloGard+™ inserts to treat the required volume and the Post Construction BMP tributary area Map.

The site proposes two 8'x 4' Filterra™ Stormwater Bioretention Filtration Systems on the northeast corner of the site. The system is well—suited for the ultra-urban environment with high removal efficiencies for pollutants such as petroleum, heavy metals, phosphorus, nitrogen, TSS and bacteria.

The stormwater flows through a specially designed filter media mixture contained in landscaped concrete container. The filter media captures and immobilizes pollutants; those pollutants are then decomposed, volatilized and incorporated into biomass of Filterra™ system's micro/macro fauna and flora. Stormwater runoff flows through the media and into an under-drain system at the bottom of the container, where the treated water is discharged. Higher flows bypass the filterra™ via a downstream inlet structure (See Attachment B for manufacturer specifications).

According to manufacturer's sizing table, each 8' x 4' Filterra™ Stormwater Bioretention Filtration System for commercial areas will treat a contributing area of at least 0.36 acres to 0.44 acres.
The project tributary areas for each Filterra™ Stormwater Bioretention Filtration System are 0.35 acres and 0.21 acres; therefore, the systems will handle the contributing areas.

5.5 Summary

This project has two waterbodies identified in the 303d listing by the SWRCB. The pollutant stressors identified as impairing those waterbodies (total dissolved solids, bacteria indicators and sedimentation/siltation) are the primary pollutants of concern. Therefore, the remaining pollutants identified in Table 2 (nutrients, heavy metals, organic compounds, trash & debris, oxygen demanding substances, oil & grease and pesticides) become the secondary pollutants of concern.

With the predominant use of the site as a multi-tenant office facility with landscaped and parking areas, production of these primary pollutants of concern is a definite possibility. By instituting an effective IPM program, by limiting the appearance of bare soil areas through landscape maintenance and with the implementation of source control BMPs, the production of these pollutants will be limited. The judicious use of fertilizers and pesticides in landscaping keeps the introduction of bacteria and nutrients to a minimum. With adequately established ground plantings to prevent soil erosion, there is a limited possibility for dissolved solids production from eroded soils. Implementing the IPM procedures and preventing access of animal pests to both trash receptacles and desirable environments limits the production of fecal matter considered as a main contributor to bacterial pollution.

While infiltration basins and other infiltration methods are the most effective single treatment BMP for the bacteria indicators and detention basins, infiltration basins, wet ponds or filtration methods identified as the most effective for sediments their use is considered unfeasible for this project. The soil type of soil group D is generally unsuitable for infiltration basin technologies due to low porosity and permeability. Costs associated to modify soil infiltration capabilities is a prohibitive constraint.

Therefore, the Project utilizes a treatment train approach to the majority of storm water flows emanating from the site. Pervious area storm water flows receive treatment from Filterra™ Stormwater Bioretention Filtration Systems after traversing the some porous areas. Part of the Project impervious surface will surface and sheet flow to the filter strip before entering catch basin filter insert.

The vegetated buffer strips or grassed filter strips offer treatment to storm flows from parking lot surfaces by allowing the sheet flows to decrease velocities enabling sediments and pollutants to settle. The strips offer medium to high removal efficiencies on these pollutants: sediment, trash, metals, oil & grease and organics.

Catch basin filter inserts will serve as a secondary Treatment Control. Per the selection matrix in Table 4 (next page), filter inserts provide a low level of removal efficiency for all pollutants, except for providing a medium level for trash and debris. The proper use and adequate maintenance of the catch basin filter inserts allow these effective treatment BMPs to work to their ultimate capabilities, providing adequate filtration to remove the primary pollutants of sediments and TDS. The filtration of silts and sediment by this method will prevent those pollutants from entering downstream waters. This proprietary BMP provides some treatment of bacteria, while integrated pest management methods as well as indoor processing will limit the addition of chemical and biological pollutants to downstream waters to the maximum practicable extent.

The Filterra™ Stormwater Bioretention Filtration System, per the manufacturer's specifications Table 4(next page), can be categorized as a filtration System that provides high and medium removal efficiencies on the primary pollutants of concern. The manufacturer's specs denote the system as having a removal rate of: 82% for

total suspended solids (TSS), 76% for fecal coliform, 45% for nitrogen removal, 73% for phosphorus removal, 82% for heavy metals and >85% for predicted oil and grease.

TABLE 4

Pollutant of Concern	***Treatment Control BMP Categories***

Treatment Control BMP Selection Matrix

6.0 OPERATION AND MAINTENANCE PROGRAM

The effectiveness of any treatment or source control BMP proposed for a project relies partially on the proper operation and maintenance of any those BMPs for the duration of the existence of that particular BMP. Following are guidelines for the operation and maintenance of the Project source control and treatment BMPs. By following these guidelines on a specific schedule (a schedule of BMP maintenance indicators, actions, measurements, frequency and activities for source and treatment control BMPs is outlined in Table 5), operating efficiency of the BMPs will be maintained.

6.1 LANDSCAPING AND IRRIGATION

The operation and maintenance needs of landscaping and irrigation are:

- Trimming of lawns and plantings in landscaped areas.
- Removal and proper disposal of landscape cuttings.
- Replacement of dead growth with new plantings.
- Monitoring flows, spray areas and spray cycles to eliminate over watering of irrigated areas, thereby conserving water and preventing runoff.
- Fertilizer and pesticide applications as required per manufacturer's guidelines.

6.1.1 Inspection Frequency

Landscape and irrigation should be inspected at the following times:

- On a weekly basis during growing season.
- No less than bi-weekly during winter months.
- During fertilizer and pesticide applications to insure proper treatment to required areas.

6.1.2 Preventive Maintenance

Preventive maintenance activities for landscape and irrigation are:

- Planting Choices. – Use of plants specific for region and soil type.
- Inspection of Irrigation System. – Mechanical components and irrigation lines are inspected for leakage. Repair or replace as required or if signs of wear and tear or abuse are present.
- Scheduling. – Perform mowing, pruning, fertilizing and applications of pesticides and herbicides at optimal times of season.
- Use and Application of Fertilizers, Herbicides and Pesticides. - The application of these materials should be in strict conformance with the manufacturer's instructions and in accordance with federal, state and local regulations. Care should be taken not to over apply and to apply as needed as an augment to an IPM strategy.

6.1.3 Corrective Maintenance

Corrective maintenance for landscaping and irrigation is necessary to repair malfunctions and replace poor performing plants and components. Corrective maintenance activities include:

- Replanting. – Dieing or dead vegetation is replanted in a timely manner as soon as practicable. Removed growth is disposed of properly.
- Irrigation Monitoring. – Irrigation cycle times are monitored and adjusted to provide water at optimum time for sustaining plant growth. Utilization of rain sensing devices to avoid irrigating when not needed.
- Component Replacement. – Replace broken irrigation valves and sprayheads as soon as evident. Early replacement of defective materials prevents breakdowns of entire system.

6.1.4 Aesthetic Maintenance

Aesthetic maintenance is important for the appearance of a well maintained and a conscientiously managed site. The following activities will be included in the aesthetic maintenance program:

- Grass Trimming. – Timely and regular trimming of grass, trees, shrubs and plantings. Cuttings are removed and properly disposed.
- Healthy Plants. - Weeds will be removed as required through mechanical means. Plant health will be maintained through renewing plantings as necessary.

6.2 INTEGRATED PEST MANAGEMENT (IPM) PROGRAM

The operation and maintenance needs of an IPM program vary as to the required degree of implementation of the different facets of the site. The most important parts of an IPM consist of:

- Obtaining knowledge as to the available alternative, non-damaging, ecologically sound methods for pest control. Educating the necessary personnel involved in site maintenance.
- Gathering information pertaining to the specific needs of the site dependent upon the existing regional conditions and requirements of the site components.
- Making informed decisions based upon the knowledge gained and information gathered applicable to the site.

6.2.1 Inspection Frequency

The IPM program inspection frequency is determined by the presence of undesirable pests. Inspections are an important part of the IPM program to determine the effectiveness of pest management measures. Inspections should be performed at the following times:

- Seasonally at a minimum.
- No less than bi-weekly during winter months.
- Weekly during growing season or at normally scheduled landscape maintenance work appointments.

6.2.2 Preventive Maintenance

Preventive maintenance activities for an IPM program include:

- Planting Choices. – Use of plants for their resistance to certain pests and diseases.
- Environment Manipulation. – Maintain the site environment in a nature as to be conducive to the attraction of beneficial species that eliminate or deter undesirable/destructive species. Make the site uninviting to detrimental or nuisance species.
- Use and Application of Fertilizers, Herbicides and Pesticides. – Utilize more environmentally friendly, biodegradable products than traditional chemical based compounds.
- Record Keeping. – Maintain adequate records of dates, times, amounts and locations of all pesticide, herbicide and amendment application for future reference as to effectiveness or overuse.

6.2.3 Corrective Maintenance

Corrective maintenance for an IPM strategy is necessary to recognize and correct deficiencies. Corrective maintenance activities include:

- Recognition. – The ability to anticipate the need for application of chemical based products by implementing IPM strategies in a timely manner.
- Timing. – Use of proper timing in fertilizer, herbicide and pesticide applications as amendments to the ecologically beneficial IPM strategy.
- Healthy Growth. – Inserting healthy, pest free growth as a replacement is necessary insure a healthy greenspace that is more pest resistant.
- Good Housekeeping. – Remove infected materials and dispose of properly.

6.3 MATERIAL STORAGE

The operation and maintenance needs for material storage include:

- All material storage should be indoors.
- Limiting temporary, outdoor material storage to appropriate designated areas for control of run-on and runoff.
- Using appropriate containers for stored materials.
- General good housekeeping practices to maintain material storage facilities.

6.3.1 Inspection Frequency

Inspection of outdoor material storage areas should occur at the following times:

- On a weekly basis to discourage continued outdoor storage.
- A daily inspection of material stored outdoors during wet weather season to assure there is no possible escape of stored materials and no possible run-on or runoff of precipitation.
- During fertilizer and pesticide applications to insure proper treatment to required areas.

6.3.2 Preventive Maintenance

Preventive maintenance activities for material storage include:

- Designated Areas. – Use of appropriate designated areas for outdoor storage. All areas should be completely contained by; a cabinet or shed, or covered with a roof or impenetrable barrier and surrounded by a raised berm or dike for prevention of urban flows contacting materials.
- Containers. – Usage of appropriate, intact containers for stored materials with impermeable cover and made of leakproof material.
- Scheduling. – Perform mowing, pruning, fertilizing and applications of pesticides and herbicides at optimal times of season.
- Safety Data Sheets. – Maintain readily available material safety data sheets for all stored materials.
- Regulations. – Comply with all applicable regulations of zoning, building, health and fire codes pertaining to material storage.

6.3.3 Corrective Maintenance

Corrective maintenance activities for material storage are required on an emergency or non-routine basis to correct problems and include:

- Containment. – Having a practicable and readily deployable spill containment and clean-up procedure identified for stored materials. Maintain presence of personnel trained in implementation of the plan.
- Container Integrity. – Repair or replace storage containers when damaged or unable to contain materials stored within.
- Relocation. – Relocate outdoor material storage areas to an indoor location as soon as feasible.

6.3.4 Aesthetic Maintenance

Aesthetic maintenance is important for the appearance of a for material storage areas to give the appearance of a well managed facility. The following activities will be included in the aesthetic maintenance program:

- Graffiti Removal. - Graffiti will be removed in a timely manner to improve the appearance of a material storage areas and containers. Timely removal aids to discourage additional graffiti or other acts of vandalism.
- Good Housekeeping. – General good housekeeping practices to maintain a neat appearance for all material storage areas, whether inside or outside a shed or cabinet.

6.4 TRASH ENCLOSURES

The operation and maintenance needs of trash enclosures are:

- Regular removal of solid wastes and recyclable materials.
- Proper disposal techniques of allowed materials.
- Keeping enclosure gates and screens functioning.
- Good housekeeping to maintain a neat area around enclosures.

6.4.1 Inspection frequency

Trash enclosures should be inspected at the following times:

- Once a week at a minimum.
- Prior to predicted rain events to prevent trash and debris fro contaminating stormwater.

6.4.2 Preventive Maintenance

Preventive maintenance measures for trash enclosures are:

- Scheduling. – Provide frequent disposal as required to prevent wastes from overflowing containers to surrounding areas.
- Trash and Debris. - Debris and trash shall be placed within appropriate containers to reduce the potential for inlet structures from becoming clogged and inoperable during storm events.
- Structural Integrity. – Ensure adequate strength of construction for; enclosure structure, enclosure gates, container, container lids/covers and pavement surfaces of surrounding areas.
- Operability. – Ensure proper operability of enclosure gates and container lids/covers.
- Container. – Utilizing leakproof containers to prevent contamination of stormwater with disposed liquid wastes.
- Sign Postings. – Signage prohibiting disposal of toxic or hazardous wastes in trash dumpsters or recycling containers (if present).
- Regulations. - Comply with all applicable regulations of zoning, building, health and fire codes pertaining to trash and solid waste storage and disposal.

6.4.3 Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct deficiencies in trash enclosures and container operations. Corrective maintenance activities include:

- Damage. – Repair damage to enclosures in a timely manner. Repair or replace defective enclosure gates or screens and container lids or covers when damage affects operability. Repair or replace leaking containers when leaks are evident.
- Scheduling. – Increase the frequency of collection when wastes overflow containers.

6.4.4 Aesthetic Maintenance

Aesthetic maintenance is important for clean appearance of trash enclosures. The following activity will be included in the aesthetic maintenance program:

- Graffiti Removal. - Graffiti will be removed in a timely manner to improve the appearance of trash enclosures, gates or containers and to discourage additional graffiti or other acts of vandalism.
- General Housekeeping. – Ensure all trash is placed in appropriate containers and lids are closed or covers in place. Keep enclosure gates closed when containers are not being accessed.

6.5 STORM DRAIN SIGNAGE AND STENCILING

Storm drain signage operation and maintenance requirements are needed to keep information and guidance contained thereon legible to the general public. The requirements include:

- Maintaining legibility of graphics.
- Maintain unobstructed views of signage.

6.5.1 Inspection frequency

Storm drain signage inspections should be performed at the following times:

- At least four times per year, timed to coincide with the start of seasons.
- Monthly if signage is subject to adverse conditions.

6.5.2 Preventive Maintenance

Preventive maintenance measures for storm drain signage include:

- Material Quality. – The use of high quality, durable materials have a greater tendency to last a significantly longer time than poorer quality.
- Sizing. – Using the largest allowable signage for storm drains increase visibility and impact of message.
- Resistance to Graffiti . – Using graffiti resistant materials discourages graffiti vandalism.

6.5.2 Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct deficiencies in storm drain signage. Corrective maintenance activities include:

- Repairs. – Repair illegible signage as required.
- Replacement. – Replace missing signage as required. Modify installation to make removal more difficult.

6.5.3 Aesthetic Maintenance

Aesthetic maintenance is important to maintain legibility of storm drain signage. The following activity will be included in the aesthetic maintenance program:

- Graffiti Removal. - Graffiti will be removed in a timely manner to improve the readability of signage and to discourage additional graffiti or other acts of vandalism.
- Graphic Design. – Chose well thought out words and graphics to improve readability and effectiveness.

6.6 CATCH BASIN FILTER INSERTS

The operation and maintenance needs of filter inserts are:

- Periodic sediment removal to optimize performance.
- Removal of trash, debris, grass trimmings, tree pruning, and leaf collection to prevent obstruction of swales.
- Removal of standing water, which may contribute to the development of aquatic plant communities or mosquito breeding areas.

6.6.1 Inspection Frequency

Filter inserts will be inspected at the following times:

- No less than three inspections per year.
- After every runoff producing storm.
- On a weekly basis during extended periods of inclement weather.

6.6.2 Preventive Maintenance

Preventive maintenance activities for filter inserts are:

- Trash and Debris - Debris and trash removal shall be conducted to reduce the potential for inlet and outlet structures and other components from becoming clogged and inoperable during storm events.
- Removal of Standing Water - Standing water must be removed if it contributes to the development of aquatic plant communities or mosquito breeding areas.
- Use and Application of Fertilizers, Herbicides and Pesticides - The application of these materials should be in strict conformance with the manufacturer's instructions and in accordance with federal, state and local regulations. Care should be taken not to over-apply.

6.6.3 Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct problems and to restore the intended operation and safe function of filter inserts. Corrective maintenance activities include:

- Removal of Debris and Sediment - Sediment, debris, and trash, which impede the hydraulic functioning and prevent vegetative growth, shall be removed and properly disposed. Temporary arrangements shall be made for handling the sediments until a permanent arrangement is made.
- Structural Repairs - Once deemed necessary, repairs to Grate Inlet Skimmer Box should be performed within 10 working days.
- Adsorbent Replacement - Remove, characterize and properly dispose of spent media. Replace adsorbent media on a yearly basis (minimum) before start of wet season.

6.7 Vegetated Filter Strip

Filter strip maintenance is part of a conscientious performance of landscape maintenance. If maintained separately, the operation and maintenance needs of filter strips are:

- Vegetation management to maintain adequate hydraulic functioning
- Animal and vector control
- Periodic sediment removal to optimize performance
- Removal of trash, debris, grass trimmings, tree pruning, and leaf collection to prevent obstruction of strips
- Erosion and structural maintenance

6.7.1 Inspection frequency

Inspect filter strips at the following times:

- Once a month at a minimum
- After every runoff producing storm
- On a weekly basis during extended periods of inclement weather

6.7.2 Preventive Maintenance

Preventive maintenance activities for bio-filter swales are:

- Grass Mowing. – Design of the vegetation seed mix or sod within the filter strip is for it to be kept short and thick to maintain adequate hydraulic and filtering function. Regular mowing limits the development of faunal habitats.
- Trash and Debris. – Removal of trash and debris reduces the potential for inlet and outlet structures and other components from becoming clogged and inoperable during storm events.
- Sediment Removal. – Monitoring of sediment accumulation is once a month during the dry season (May 1 to September 30), after every large storm, and at least weekly during the rainy season (October 1 to April 30). Specifically, if sediment reaches a level at or near plant height, or could interfere with flow or operation, the sediment will be removed.
  Characterization and appropriate disposal of sediment will comply with applicable local, county, state, or federal requirements. Regrade the filter strip if the flow gradient has changed and replant with appropriate vegetation.
- Removal of Standing Water. – No standing water should occur. If it does, remove within 72 hours of appearance, and regrade to restore flow line.

- Use and Application of Fertilizers, Herbicides and Pesticides. - The application of these materials must be in strict conformance with the manufacturers' instructions with care taken not to over apply when application is necessary. Use of natural or ecologically friendly materials (per the IPM) is encouraged.

6.7.3 Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct problems and to restore the intended operation and safe function of the filter strips. Corrective maintenance activities include:

- Removal of Debris and Sediment. – Remove and properly dispose of removed sediment, debris, and trash that impede the hydraulic functioning and prevent vegetative growth. Temporary arrangements for disposal may be necessary (dependant on potential contaminations that testing will divulge) until a permanent arrangement is made. Reestablish vegetation and grade, if necessary, after sediment removal.
- Embankment and Slope Repairs. - Once deemed necessary, damage to the embankments and slopes upstream of swales will be repaired within 10 working days.
- Erosion Repair. - Where a reseeding program has been ineffective, or where other factors have created erosive conditions (i.e. pedestrian traffic, concentrated flow, etc.), take corrective steps to prevent loss of soil. Corrective actions that can be taken include; erosion control blankets, rip-rap, sodding, or reducing flow through the affected area.

6.8 FILTERRA™ STORMWATER BIORETENTION FILTRATION SYSTEM

Maintenance

A. Each correctly installed Filterra unit is to be maintained by the Supplier, or a Supplier approved contractor for a minimum period of 1 year. The cost of this service is to be included in the price of each Filterra unit. Extended maintenance contracts are available at extra cost upon request.

B. Annual included maintenance consists of a maximum of (2) scheduled visits. The visits are scheduled seasonally; the spring visit aim to clean up after winter loads that may include salts and sands. The fall visit helps the system by removing excessive leaf litter.

C. Each Included Maintenance visit consists of the following tasks.

1. Filterra unit inspection
2. Foreign debris, silt, mulch & trash removal
3. Filter media evaluation and recharge as necessary
4. Plant health evaluation and pruning or replacement as necessary
5. Replacement of mulch
6. Disposal of all maintenance refuse items
7. Maintenance records updated and stored (reports available upon request)

D. The beginning and ending date of Supplier's obligation to maintain the installed system shall be determined by the Supplier at the time the system is activated. Owners must promptly notify the Supplier of any damage to the plant(s), which constitute(s) an integral part to the bioretention technology.

6.9 HYDROSEEDING *

The operation and maintenance needs of hydroseeding are: (* - Hydroseeding only required if site not built upon for more than 30 days.)

- Vegetation management to maintain levels of vegetative cover acceptable to the City.
- Animal and vector control.
- Periodic sediment removal to optimize performance.

- Removal of trash, debris, grass trimmings, tree pruning, and leaf collection to prevent an appearance of neglect.

6.9.1 Inspection frequency

Hydroseeding should be inspected at the following times:

- Once a month at a minimum.
- After every runoff producing storm.
- On a weekly basis during extended periods of inclement weather.

6.9.2 Preventive Maintenance

Preventive maintenance activities for hydroseeding are:

- Grass Mowing. - Vegetation height will be maintained to a height designated by the City.
- Irrigation. – Design of the vegetation seed mix within the hydroseeded area is a native type mix and requires no irrigation after adequate plant establishment.
- Trash and Debris. - Debris and trash removal reduces the potential for storm water inlets becoming clogged and inoperable during storm events.
- Removal of Standing Water. – Remove standing water if present within 72 hours of a storm event to prevent the development of aquatic plant communities or mosquito breeding areas.
- Use and Application of Fertilizers, Herbicides and Pesticides. - The native mix requires no applications of these materials.

6.9.3 Corrective Maintenance

Corrective maintenance is required on an emergency or non-routine basis to correct problems and to restore the function of the hydroseeded area. Corrective maintenance activities include:

- Removal of Debris and Sediment. – Remove and properly dispose of sediment, debris, and trash as required. Vegetation shall be re-established after sediment removal.
- Structural Repairs. - Once deemed necessary, perform repairs to hydroseeded areas within 10 working days.
- Erosion Repair. - Where a reseeding program has been ineffective, or where other factors have created erosive conditions (i.e. pedestrian traffic, concentrated flow, etc.), corrective steps shall be taken to prevent loss of soil and any subsequent danger to the performance of the downstream BMPs, drainage systems and watershed. Methods to limit erosion include; erosion control blankets, rip-rap, sodding, or reduced flow through the affected area.

TABLE 5

Permanent BMP Maintenance Program

A schedule of periodic maintenance should be implemented and modified, as needed, to insure effective operation of the indicated permanent site design, source control and treatment BMPs. As a guideline, a tentative schedule of maintenance frequency follows. The schedule is based on certain indicators outlined for a particular BMP.

BMP	ROUTINE ACTIONS	MAINTENANCE INDICATORS	FIELD MEASUREMENT	FREQUENCY	MAINTENANCE ACTIVITY
Vegetated Filter Strips	Height of vegetation.	Average height of vegetation (grass) exceeds 4".	Visual inspection of vegetation.	Inspect weekly and after rainy periods.	Cut vegetation as required.
Hydroseeding*	Assess adequate cover.	Bare spots appear in planted/mulched areas or less than 70% coverage over entire area.	Visual inspection of lack of vegetative/mulch cover. Record locations to identify persistent problem areas.	Assess growth on a monthly basis. Assess mulch coverage on a monthly basis.	Reseed vegetated areas as required. No later than November. Scarify area for reseeding. Reapply mulching as required to cover bare spots.
* - Hydroseeding only necessary if site not built upon for 30 days.	Inspect for debris accumulation.	Debris or litter accumulation.	Visual inspection for trash.	During routine site landscape maintenance.	Remove and properly dispose of trash, litter and debris.
	Inspect for accumulation of sediment or erosion of soil.	Sediment is at or near vegetation height. Rills or gullies in topsoil.	Visual inspection for sediment depth. Visual inspection for rills and soil erosion.	Inspect monthly and after each significant rainfall.	Remove accumulated sediment when interfering with drainage flows.
Catch Basin Filter Insert	Sediment removal.	Sediment more than ½ height of filter body.	Visual inspection of filter body.	After each rain event.	Remove and properly dispose of sediment.
	Trash and debris removal.	Sufficient trash or debris accumulation to hinder filter performance.	Visual inspection of inlet and filter insert.	After each rain event.	Remove and properly dispose of trash and debris accumulation.
	Oil and grease removal.	Absorbent medium dark gray or darker and saturated with oil.	Visual inspection of adsorbent filter media.	After each Target 2 (0.75") rain event.	Replace adsorbent media within 10 working days. Characterize and properly dispose of spent media prior to wet season.
	Structural integrity of insert.	Broken or damaged insert with visible rips, tears, gashes and/or fallen media.	Visual inspection of insert components.	Semi-annually, May and October.	Replace insert. Contact vendor to develop preventative procedures. Effect repairs within 10 working days.
	Annual renewal of adsorbent medium.	End of wet season.	Lack of precipitation for extended period.	Annually before wet season.	Remove, characterize and properly dispose of spent media. Replace adsorbent media before start of wet season.
Landscaping & Irrigation	**Inspect for overgrown plantings.**	Grass longer than 2". Bushes and shrubs growing into traveled ways. Trees overhanging and interfering with users of walkways, parking spaces or drive aisles.	Visual observation for indicators when landscaping maintenance performed.	Weekly during growing season. Bi-weekly during winter months.	Cut and trim overgrowth as required.
	Inspect for dead or dieing plants.	Indicators vary as to species, but generally are unhealthy looking growth. Browning, drooping branches and leaves.	Visual observation for indicators.	Weekly during growing season. Bi-weekly during winter months.	Remove and replace dead or dieing plantings.
	Inspect for over irrigation.	Oversaturated ground. Standing water in low spots. Excess run-off of irrigation waters.	Visual observation for indicators.	Weekly during growing season. Bi-weekly during winter months.	Adjust timing mechanism for automatic sprinklers. Increase timing between applications. Consider more frequent, shorter operation periods.
	Inspect for over application of fertilizers or pesticides.	Indicators vary as to materials, but generally are burned spots for excessive fertilizer use and sticky residue or staining for over use of pesticides.	Visual observation for indicators.	Weekly during growing season. Bi-weekly during winter months.	Adjust amounts of materials applied. Consider Integrated Pest Management alternatives.

TABLE 5
(Continued)

BMP	ROUTINE ACTIONS	MAINTENANCE INDICATORS	FIELD MEASUREMENT	FREQUENCY	MAINTENANCE ACTIVITY
Integrated Pest Management	Inspect for evidence of undesirable plant species.	Presence of non-native plants or growth, especially in unwanted areas.	Visual observation for indicators.	Seasonally at the minimum. Weekly during growing season.	Remove unwanted species. Replace with native types.
	Inspect for evidence of undesirable insect species.	Presence of non-native or harmful insects. Plant growth destruction.	Visual observation for indicators.	Seasonally at the minimum. Weekly during growing season.	Manage unwanted insects with predatory species or plantings that discourage pest presence. Pesticide use as a last alternative.
	Inspect for evidence of undesirable vertebrate species.	Presence of undesirable animals. Plant growth destruction. Animal scratches on trash dumpsters. Footprints in wet earth, trampled plantings.	Visual observation for indicators. Olfactive presence of animal territory markings.	Weekly during growing season. Seasonally at the minimum.	Manage unwanted animals by eliminating desirable environs. Use of humane traps for relocation. Use poisons as a last alternative.
Material Storage	Inspect for outdoor storage of materials.	Uncovered, unprotected materials stored on the ground.	Visual observation for presence of material storage.	Weekly inspections for presence of stored materials. Daily inspections for stored materials.	Place materials in designated area in shed or cabinet. Bermed area with roof or impermeable cover may also be used.
Trash Enclosures	Inspect containers for overflowing trash and debris.	Trash and debris on ground in area surrounding trash dumpster.	Visual observation for trash and debris on ground.	Weekly inspections at a minimum and prior to predicted rain event.	Place trash and debris in appropriate container.
	Inspect for open containers or enclosures.	Gates of enclosures and lids of containers are open.	Visual observation for open gates and lids.	Daily inspections to prevent blowing of trash and debris and to discourage pest activity.	Close open gates or lids. Install locks for access by authorized personnel only.
Storm Drain Signage	Inspect storm drain stencils, signs or placards.	Deteriorating or missing signage.	Visual observation for illegibility or missing signage.	Seasonal observations of signage. More frequently if signage is located high traffic areas or subject to adverse conditions.	Repair illegible signage. Replace missing signage.
Stormwater Bioretention Filtration System	Inspect for evidence of undesirable plant species.	Presence of non-native plants or growth, in wetland planting areas.	Visual observation for indicators.	Seasonally at the minimum.	Remove unwanted species.
	Inspect for evidence of influent pipe obstructions.	Presence of debris in pipe or reduced inflow volume.	Visual observation for indicators. Standing water in upstream components.	Two scheduled visits in spring and after winter.	Clear debris from upstream inlet openings and influent pipe.
	Inspect skimmers for evidence of damaged components.	Weakened or damaged components, hoses, pipes or connections.	Visual observation for indicators. Tactile testing for structural integrity.		Repair or replace, as necessary, broken components, hoses, pipes or loose connections.
	Inspect for filter sack for clogging and structural integrity.		Measurement of depth of build-up.		Empty and clean filter as needed.
	Inspect for sediment accumulation.		Sediment contained within effluent from discharge pipe.		Remove sediment accumulation with vacuum truck or septic tank cleaner.

7.0 EDUCATION AND OUTREACH

The CC&R document accompanying the condominium plan will specify that the owner's association will be required to provide or designate a qualified individual or agency to provide training and information. The owner's association, on an as needed basis, will provide information regarding BMPs for utilization by anyone performing activities on the site that could impact runoff. This education and training increases the knowledge of tenants, employers and employees regarding the impacts of pollutants and urban runoff on receiving waters. Performing this education and training informs the tenants, employers and employees as to their responsibilities in preventing and reducing pollutant releases to the environment.

The owner's association will be notified of its responsibilities pertaining to the BMPs set-forth in this document, as regulated by the City of Carlsbad Municipal Code, Title 15, Chapter 15.12 and all underlying codes cited therein. Additionally, the owner's association will be advised about the responsibility for reporting illicit discharge and shall be provided with the City of Carlsbad clean water telephone hotline: (760) 602-2799).

8.0 FISCAL RESOURCES

The owner of the El Camino Terrace project will be financially responsible for the construction, installation and maintenance of the post development BMPs. The verification mechanism used by the City to assure maintenance will include the project proponent's signed statement, as part of the project application, accepting responsibility for all permanent BMP maintenance, repair and replacement. The owner is also required to implement the SWMP, until the recording of the Conditions, Covenants and Restrictions (CC&R) document with the condominium plan at the County Recorder's office establishing the owner's association. All maintenance of the permanent, private onsite source control and treatment BMPs, including filter inserts (FloGard+®) and the Filterra™ Stormwater Bioretention Filtration Systems, will be owner's association responsibility.

Most of the permanent BMPs accrue minimal maintenance costs. Mulching, seeding and plantings are part of a continuing landscape maintenance program. Encompassed within the performance of landscaping maintenance is the maintenance of irrigation system and the filter strip. The CC&R document will specify responsibilities of landscaping maintenance for permanent stabilization of graded areas.

A maintenance contract entered into with both the FloGard+® and Filterra™ providers upon installation will insure a continued monitoring of the catch basin filter inserts and the Stormwater Bioretention Filtration System, respectfully, installed as part of the Project. The contract(s) will provide for necessary maintenance and needed repairs to maintain effectiveness of both proprietary BMPs for the length of the contract(s).

The permanent responsibility of the post-development BMPs remains with the property by the use of restrictive deed language and the CC&R document. The deed language and CC&R document will place the responsibility for all future maintenance upon the owner of record.

The installation and maintenance of the post-development BMPs is the responsibility of the owner's association. The City may enter into a Permanent Storm Water Quality Best Management Practices Maintenance Agreement (Agreement) with the project proponent or owner's association obliging that the storm water BMPs are maintained, repaired and replaced as necessary throughout the "use" of the project site, satisfactory to the City Engineer or into perpetuity. The Agreement shall include a provision that gives the City the right, but not the obligation to perform the maintenance. The party responsible for BMP maintenance will pay the City for costs incurred by the City for maintaining any BMP's covered by the Agreement. The Agreement will provide a cost recovery provision in favor of the City satisfactory to the City Attorney. Security may be required in support of the Agreement to equal the cost of maintenance activities for an amount and time period determined by the City. The Agreement becomes part of the project's construction permit before City grants approval of the permit.

The Agreement includes an Operation and Maintenance (O&M) Plan approved by the City. The O&M Plan describes the designated responsible party to manage the storm water BMP(s), employee's training program and duties, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities (including maintenance of storm water conveyance system signage), copies of resource agency permits, and any other activities necessary to maintain the permanent source control and treatment BMPs.

The Agreement may also include an Access Easement/Agreement, executed and recorded, that is binding on the underlying land throughout the life of the project in favor of the party responsible for maintenance. The easement is in effect for the life of the particular BMP requiring access for maintenance until such time that removal or replacement of the permanent treatment BMP occurs rendering that access unnecessary.

TABLE 6
PERMANENT TREATMENT BMP
ESTIMATED OPERATION AND MAINTENANCE (O&M) COSTS

Permanent treatment BMPs, either existing or constructed and installed for this project, will necessitate continuous operation and maintenance (O&M) when the project is complete. O&M costs are based upon California Department of Transportation estimated costs for the pilot BMP project utilizing prevailing wage rates. Below are estimated itemized costs, based upon the pilot BMP project, manufacturer information and knowledge obtained from prior completed projects, of this project's permanent treatment BMPs as shown in Figure 5 As identified in WQTR Section 8.0, Fiscal Resources, the source for funding of BMP operation and maintenance is the responsibility of the property owner/developer or designated association.Post construction permanent BMP operation and maintenance costs include, but are not limited to the following:

BMP OPERATION & MAINTENANCE ITEM	LABOR			EQUIPMENT				MATERIALS		TOTAL COST
	Per Hrs.	Rate	Cost	Type	Days	Rate	Cost	Item	Cost	
FILTER INSERTS (Qty 4)	12.0	43.63	$523.56	1 Ton Truck	1.5	26.84	$40.26	New Adsorbent, Testing & Disposal	$800.00	$1,363.82
FILTERRA BIORETENTION (Qty2)	10.0	43.63	$436.30	1 Ton Truck	1.5	26.84	$40.26	Trimmer, Rake, Fork, Bags, Safety Equipment, Bags, Testing & Disposal	$600.00	$1,076.56
FILTRATION SYSTEM										
LANDSCAPING & IRRIGATION	96.0	43.63	$4,188.48	Hydroseeder, 1 Ton Truck	6.0	48.15	$288.90	Trimmer, Rake, Fork, Bags, Safety Equipment, Bags, Seed, Testing & Disposal	$550.00	$5,027.38
									O&M TOTAL	$7,467.76

BMP OPERATION & MAINTENANCE ITEM	LABOR			EQUIPMENT				MATERIALS		TOTAL COST
	Per Hrs.	Rate	Cost	Type	Days	Rate	Cost	Item	Cost	
HYDROSEEDING*	52.0	43.63	$2,268.76	1 Ton Truck, Hydroseeder	12.0	48.15	$577.80	Seed, Binder	$400.00	$3,246.56
									O&M TOTAL	$3,246.56

* Only Required if Site not Constructed 30 Days after Grading.

NOTE:
IN THE EVENT THAT THE CLEARED SITE REMAINS EMPTY FOR A PERIOD OF MORE THAN THIRTY DAYS, THE AREA SHALL BE HYDROSEED. THE HYDROSEED MIX SPECIFIED IS A NATIVE MIX AND WILL REQUIRE NO IRRIGATION AFTER IT HAS BEEN ESTABLISHED. IRRIGATION TO ESTABLISH SEED MIX WILL BE BY WATER TRUCK. HYDROSEED MIX:
ARTEMISIA CALIFORNICA (CALIFORNIA SAGEBRUSH) 4 LBS/ACRE
BACCHARIS LINEA (COYOTE BRUSH) 4 LBS/ACRE
BACCHARIS PILULARIS (DESERT BROOM) 3 LBS/ACRE
ENCELIA CALIFORNICA (CALIFORNIA SUNFLOWER) 6 LBS/ACRE
ERIGERON CANDIDULATUS (CONFORNIA FLEABANE) 28 LBS/ACRE
HETEROMELES ARBUTIFOLIA (TOYON) 5 LBS/ACRE
RHUS CALIFORNICA (WILD LILAC) 4 LBS/ACRE
SALVIA MELLIFERA (BLACK SAGE) 4 LBS/ACRE
1. SITE PREPARATION:
A. WATER ALL PLANTING AREAS THOROUGHLY AND CONTINUOUSLY FOR THREE (3) CONSECUTIVE DAYS TO SATURATE UPPER LAYER OF SOIL PRIOR TO HYDROSEEDING OPERATION.
B. ALLOW PLANTING AREA SOIL SURFACE TO DRY OUT FOR ONE DAY PRIOR TO THE HYDROSEEDING APPLICATION. CARE MUST BE TAKEN TO NOT ALLOW THE SOIL SURFACE TO BE SUPER SATURATED WITH WATER PRIOR TO THE HYDROSEEDING INSTALLATION. AT THE SAME TIME THE SOIL SURFACE SHOULD NOT BE BONE DRY. THERE SHOULD BE SOME REMAINING MOISTURE WITHIN THE FIRST 1/4 INCH OF SOIL SURFACE.
C. BEGIN THE HYDROSEEDING OPERATION ON ALL AREAS AS SPECIFIED HEREIN.
2. PREPARATION OF HYDROSEEDING MATERIAL:
A. THE SLURRY SHALL BE PREPARED AT THE SITE AND ITS COMPONENTS SHALL BE MIXED TO SUPPLY THE RATES OF APPLICATION AS PER SPECIFICATIONS.
B. SLURRY PREPARATION SHALL BEGIN BY ADDING WATER TO THE TANK WHEN THE TANK IS AT ONE-HALF CAPACITY. WHEN THE WATER LEVEL HAS REACHED THE LEVEL OF THE AGITATOR SHAFT AND GOOD RECIRCULATION HAS BEEN ESTABLISHED, THE FERTILIZER SHALL BE ADDED TO THE MIXTURE (THE TANK SHALL BE AT LEAST 1/3 FILLED WITH WATER AT THIS TIME).
C. THE SEEDING MIXTURE SHALL BE ADDED TO THE SLURRY WHEN THE TANK IS 1/3 FILLED WITH WATER. ALL ORGANIC AMENDMENTS, FIBER, AND CHEMICALS SHALL THEN BE ADDED BY THE TIME THE TANK IS 2-1/3 TO 3/4 FULL. AT THIS TIME THE SEED MIX SHALL ALSO BE ADDED.
D. SPRAYING SHALL COMMENCE IMMEDIATELY WHEN THE TANK IS FULL AND THE SLURRY IS MIXED.
3. APPLICATION: THE OPERATOR SHALL SPRAY THE AREA WITH A UNIFORM MULCH COAT USING THE DARK COLOR OF THE CELLULOSE FIBER AND ORGANIC AMENDMENT AS VISUAL GUIDE. THE SLURRY SHALL BE APPLIED BY A HYDRAULIC SPREADING METHOD FOR A FAN STREAM NOZZLE.
4. TIME LIMIT: THE HYDROMULCHING SLURRY COMPONENTS ARE NOT TO BE LEFT IN THE HYDROSEEDING MACHINE FOR MORE THAN TWO HOURS. IF SLURRY COMPONENTS ARE LEFT FOR MORE THAN TWO HOURS IN THE MACHINE, THE CONTRACTOR SHALL ADD 50% MORE OF THE ORIGINALLY SPECIFIED SEED MIX TO ANY SLURRY MIX WHICH HAS NOT BEEN APPLIED WITHIN THE TIME FRAME AFTER MIXING. THE CONTRACTOR SHALL ADD 75% MORE OF THE ORIGINAL SEED MIX TO ANY SLURRY MIXTURE WHICH HAS NOT BEEN APPLIED EIGHT HOURS AFTER MIXING. ANY MIXTURE NOT APPLIED AFTER EIGHT HOURS SHALL BE REJECTED AND DISPOSED OF OFF-SITE AT CONTRACTOR'S EXPENSE.
5. CLEAN UP:
AS PROJECT PROGRESSES, CONTRACTOR SHALL MAINTAIN ALL AREAS IN A NEAT MANNER AND REMOVE UNSIGHTLY DEBRIS AS NECESSARY. AFTER COMPLETION OF PROJECT, CONTRACTOR SHALL REMOVE ALL DEBRIS AND CONTAINERS USED IN ACCOMPLISHING WORK. HE SHALL SWEEP AND CLEAN ALL SIDEWALKS, ASPHALT, AND CONCRETE AREAS ADJACENT TO PLANTINGS.

9.0 CONCLUSION

This SWMP has been prepared to define potential Best Management Practices (BMPs) that satisfy the requirements identified in the following documents:

1) City of Carlsbad "Standard Urban Storm Water Mitigation Plan, Storm Water Standards" dated April 2003.
2) Standard Specifications for Public Works Construction, current edition.
3) National Pollution Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction Activity (General Permit), issued by the State Water Resources Control Board, Water Quality Order 99-08 DWQ.
4) San Diego NPDES Municipal Storm Water Permit (Order Number 2007-01).

Thus, it has been shown that this project can meet the water quality objectives as outlined in Order 2007-01 as proposed and shown on the site plan. An analysis has been performed to ensure that the site plan can accommodate the water quality BMPs. Therefore, it is anticipated that the site plan will not affect downstream waters by the implementation of these BMPs.

10.0 CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted.

Based on my inquiry of the person and persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

This Storm Water Management Plan has been prepared to comply with the requirements of the "City of Carlsbad, Standard Urban Storm Water Mitigation Plan, Storm Water Standards Manual" in effect as of the date of this report.

SECTION 1

INTRODUCTION

This manual is intended to provide information on storm water pollution prevention measures or best management practices (BMPs) for construction sites that are not required to prepare a Storm Water Pollution Prevention Plan (SWPPP). The City of Carlsbad has selected and included BMPs in this manual to be used for ministerial permits. Ministerial permits are construction permits that do not require discretionary review, such as building permits, right-of-way permits, and sign permits.

BMPs are required for all construction permits to the maximum extent practical (MEP) in the City of Carlsbad. This requirement is based on the Municipal Storm Water National Pollutant Discharge Elimination System (NPDES) Permit (Municipal Permit) issued on February 21, 2001.

The BMPs contained in this manual are the minimal BMPs that would be found on all construction sites. Additional BMPs may be required on a construction site and it is not intended that this manual imply any limitations. It is expected that BMPs will be implemented to the maximum extent practicable.

Reference to Resident Engineer in the Caltrans manual shall mean the responsible party, owner, builder, and contractor, not a representative from the City of Carlsbad.

The detail numbers, and sections referenced in this document have been obtained directly from Caltrans website www.dot.ca.gov/manuals and from California Stormwater Quality Association website www.cabmphandbooks.com. Please refer to this documents for additional BMPs and details.

SECTION 2

Carlsbad Modifications to Construction Site BMPs

TC-1 Shall be modified to provide 2" to 3" minus rock and a fence, barrier, or other approved device shall be installed to restrict access to only the construction entrance.

SECTION 3

Construction Site BMP Cross-Reference Table

It should be noted that this table is for reference, additional BMPs may be required that are not checked. Please evaluate project site conditions and scope of work for applicability of BMPs. Consult with City staff or the project consultants for assistance if necessary.

(1) Implementation depends on applicability to a project.

(2) The Contractor shall select one of the five measures listed or a combination thereof to achieve and maintain the contract's rainy season disturbed soil area (DSA) requirements.

(3) The Contractor shall select one of the two measures listed or a combination thereof to achieve and maintain the contract's rainy season disturbed soil area (DSA) requirements.

CITY OF CARLSBAD
STORM WATER QUALITY
PROJECT PRIORITY DETERMINATION
CHECKLIST

State law holds the City responsible for any type of water pollution caused within City limits. In order to help us keep pollution out of our waterways, we need your help. Please check the appropriate YES/NO box as it relates to the project you are submitting for a building permit.

This form must be completed and submitted with your permit application.

PART A – DOES YOUR PROJECT INCLUDE A:	YES	NO
1. Detached residential development of 10 or more units?	☐	☐
2. Attached residential development of 10 or more units?	☐	☐
3. Commercial development greater than 100,000 square feet?	☐	☐
4. Automotive repair shop?	☐	☐
5. Restaurant?	☐	☐
6. Hillside development with a slope greater than 15% that disturbs more than 5,000 square feet of ground?	☐	☐
7. Possible drainage of rainwater toward a waterway with natural vegetation such as: a creek, stream or wetland area with natural occurring plants?	☐	☐
8. Parking lot greater than or equal to 5,000 square feet or with at least 15 uncovered parking spaces?	☐	☐
9. Street or road which would create a new paved surface that is 5,000 square feet or greater?	☐	☐
Limited Exclusion: Trenching and resurfacing work associated with utility projects.		

If any answer in Part A is "YES", your project is subject to the "Priority Project Permanent Storm Water Best Management Practices (BMP) Requirements," and "Standard Permanent Storm Water BMP Requirements".
To find out what these requirements are, you can visit the City of Carlsbad website at: www.ci.carlsbad.ca.us/cserv/susmppdf/susmp.pdf or ask at the City's Engineering Counter to review or purchase a copy. These BMPs must be included in the design of your site.

PART B – DOES YOUR PROJECT PROPOSE:	YES	NO
1. New impervious areas, such as: rooftops, roads, parking lots, driveways, or sidewalks?	☐	☐
2. New landscape areas with irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Outdoor trash enclosures?	☐	☐
5. Permanent liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. A use that will require a permit for storm water discharge associated with industrial activities (except construction)?*	☐	☐

8. Commercial or industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. More than 100 cubic yards of grading or more than 5,000 square feet of ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?		
*To find out if your project is required to obtain a permit for storm water discharges associated with industrial activities, visit the State Water Resources Control Board web site at: www.swrcb.ca.gov/stormwtr/industrial.html		

If all answers to Part A are "NO", and any answers to Part B are "YES", your project is only subject to the "Standard Permanent Storm Water BMP Requirements". and you must fill out Part C below. **If every question in Part A and B is answered "NO", DO NOT ANSWER PARTS C OR D**, your project is exempt from permanent pollution control requirements and no further action regarding this is needed. Thank you.

PART C – WOULD YOUR PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	**YES**	**NO**
1. Is the project subject to California's statewide General NPDES Permit for storm water discharges associated with construction activities?**	☐	☐
2. Does the project propose grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete, and stucco)?	☐	☐
**To find out if your project is required to obtain a permit for storm water discharges associated with construction activities, visit the State Water Resources Control Board web site at: www.swrcb.ca.gov/stormwtr/construction.html		

- If every question in Part C is answered "NO", your project is exempt from any additional requirements.
- **If the answer to question 1 of Part C is "Yes", your project is subject to "Construction Storm Water BMP Performance Standards," and must prepare a Storm Water Pollution Prevention Plan (SWPPP)**
- If the answer to question 1 is "No" but any other question in Part C was "Yes", your project is subject to "Construction Storm Water BMP Performance Standards," and must prepare a Water Pollution Control Plan (WPCP).
- If any of the answers to the questions in Part C are "YES", **complete Part D**, below.

PART D

Please check the box next to the "priority" that best describes your project.

☐ *High Priority*

- Projects 1 acre or more
- Projects requiring grading permit

☐ *Medium Priority*

- Projects in the public right-of-way where grading occurs, such as installation of sidewalk, substantial retaining walls, or curb and gutter for a majority of street frontage.
- Projects on private property where grading permits are required.

☐ *Low Priority*

- Projects in the public right-of-way where minimal to no grading occurs, such as pedestrian ramps, driveway additions, small retaining walls, etc.
- Projects on private property where grading permits are not required, such as small retaining walls, single-family homes, small tenant improvements, etc.

I. INTRODUCTION

1. Storm Water Standards Manual Organization

This manual is intended to provide information to applicants for private projects processed through the Development Services Division of the Engineering Department (DSD), on how to comply with the permanent and construction storm water requirements for new private and public development projects in the City of Carlsbad. This manual further guides the project applicant through the selection, design, and incorporation of storm water BMPs into the project's design plan.

Section 1, "Introduction," describes storm water pollution background information and legal or regulatory requirements associated with storm water pollution control.

Section II, "Project Review & Permitting Process," outlines the project plan review and approval process for both discretionary actions and construction permits for private development projects. Applicants should use Section II as the roadmap to navigate through this manual and ensure storm water requirements are accurately and efficiently incorporated into their projects during project review. The remaining sections provide technical information necessary to incorporate the storm water requirements in the review process outlined in Section II.

Section III, "Permanent Storm Water BMP Selection Procedure," lists the permanent storm water BMP requirements, which are organized into a progression intended to dovetail with a typical project planning and design process and maximize storm water protections while minimizing project costs. Section IV, "Construction Storm Water BMP Performance Standards," describes the City's construction storm water BMP standards. Section V, "Implementation & Maintenance of Requirements," describes how implementation and maintenance of construction and permanent BMPs must be assured for both construction permits and discretionary actions. For permanent BMPs, this section provides a process and requirements for executing a maintenance agreement with the City. Section VI contains appendices to the Storm Water Standards manual that are either necessary or designed to provide guidance in completing the storm water requirements in this manual.

2. Background

Urban runoff discharged from municipal storm water conveyance systems has been identified by local, regional, and national research programs as one of the principal causes of water quality problems in most urban areas. The City of Carlsbad's storm water conveyance system, which collects runoff and rainwater from our streets, rooftops, driveways, parking lots, and other impervious areas, flows directly to our beaches and lagoons without receiving treatment (our storm water conveyance system is separate from our sanitary sewer system). Urban runoff potentially contains a host of

pollutants like trash and debris, bacteria and viruses, oil and grease, sediments, nutrients, metals, and toxic chemicals. These contaminants can adversely affect receiving and coastal waters, associated wildlife, and public health. Urban runoff pollution is not only a problem during rainy seasons, but also year-round due to many types of urban water use that discharge runoff to the storm water conveyance system.

Storm water pollution can negatively affect human health and aquatic plant and animal life. Potentially harmful viruses and bacteria are now found in our coastal waters along with soil particles, solids/debris, litter, oil, grease, and chemical compounds. Oil and grease from parking lots, pesticides, cleaning solvents, and other toxic chemicals can contaminate storm water and these contaminants can be transported into receiving waters—the beaches, lagoons and creeks we all enjoy. Fertilizer constituents from lawns and golf courses or leaking septic tanks can cause algal blooms and encourage microbial growth to create an increasing spiral of biological activity known as eutrophication. Disturbances of the soil from construction can allow silt to wash into storm channels and receiving waters making them muddy, turbid, and inhospitable to natural aquatic organisms. Many artificial surfaces of the urban environment such as galvanized metal, paint, or preserved wood containing metals, contribute to pollution by storm water run-on or leaching by storm water as the surfaces corrode, flake, dissolve, or decay. Heavy metals, such as, copper from automobile brakes, and lead and chromium from paints and primer coatings, are toxic to aquatic organisms and may bio-accumulate.

Land development and construction activities significantly alter drainage patterns and contribute pollutants to urban runoff primarily through erosion and removal or change of existing natural vegetation during construction, and the creation of new impervious surfaces, such as parking lots, which often permanently contribute pollutants throughout the "use" of the project site. When homes, work places, recreational areas, roads, parking lots, and structures are built, new impervious areas are built- creating the potential for a "double-negative" impact to water quality. First, the natural landscape's ability to infiltrate and cleanse storm water and urban runoff is "capped" by the impervious surfaces. As impervious surfaces increase, water that normally would have percolated into the soil where it could be naturally filtered now flows over the land surface directly to downstream wetlands, creeks, and eventually the Pacific Ocean. Accordingly, increases in impervious cover can increase the frequency and intensity of storm water flows. Second, new impervious surfaces often become a source of pollutants associated with development such as, automotive fluids, cleaning solvents, toxic or hazardous chemicals, detergents, sediment, metals, pesticides, oil and grease, and food wastes. These pollutants, which are often temporarily captured on impervious surfaces, are transported to the storm water conveyance system by storm water and urban runoff. The pollutants flow untreated through the storm water conveyance system and ultimately into our creeks, rivers, beaches, and lagoons. With the growing concerns of urban runoff and storm water pollution, local, state, and federal agencies devised regulations requiring development planning and construction controls to treat storm water-related pollution from new development projects before it reaches any receiving waters.

The Municipal Storm Water National Pollutant Discharge Elimination System (NPDES) Permit (Municipal Permit), issued on February 21, 2001 to the City of San Diego, the County of San Diego, the Port of San Diego, and 17 other cities in the region by the San Diego Regional Water Quality Control Board (Regional Board), requires the development and implementation of storm water regulations addressing storm water pollution issues in development planning and construction associated with private and public development projects. Specifically, private and public development projects are required to include storm water best management practices (BMPs) both during construction, and in the projects permanent design, to reduce pollutants discharged from the project site, to the maximum extent practicable (see Appendix C for a detailed description of the various types and categories of BMPs discussed in this manual). The primary objectives of the Storm Water Standards manual requirements are to: (1) Effectively prohibit non-storm water discharges; and (2) Reduce the discharge of pollutants from storm water conveyance systems to the Maximum Extent Practicable (MEP statutory standard) both during construction and throughout the use of a developed site. To address pollutants that may be generated from new development once the site is in use, the Municipal Permit further requires that the City implement a series of permanent BMPs described in a document called the Model Standard Urban Storm Water Mitigation Plan, or SUSMP (pronounced "sue-sump"), which was approved by the Regional Board on June 12, 2002.

The City's Storm Water Standards manual is intended to provide information on how to comply with all of the City's permanent and construction storm water BMP requirements, for new private and public development projects in the City of Carlsbad. The effective date of the Storm Water Standards manual is December 2, 2002, and applies to all projects requiring any permit approvals on or after December 2, 2002, even if the project is currently under review or if previous approvals have been obtained. These Standards will be modified from time to time and are effective on the date issued.

3. Legal Framework

The requirement to implement storm water BMP requirements for development projects is based on Section 402 (p) of the Clean Water Act. The Federal Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. Under the Federal Clean Water Act, municipalities throughout the nation are issued a Municipal NPDES Permit. The primary goal of the Municipal Permit is to reduce polluted discharges from entering the storm water conveyance system and local receiving and coastal waters and to ensure the beneficial uses of protected receiving waters.

In California, the State Water Resources Control Board (SWRCB), through the nine Regional Boards, administers the NPDES storm water municipal permitting program. Based on the San Diego Municipal Permit issued by the San Diego Regional Board, the City is required to develop and implement construction and permanent storm water BMPs addressing pollution from new private and public development projects.

II. PROJECT REVIEW & PERMITTING PROCESS

Per the National Pollution Discharge Elimination System (NPDES) permit (Order No. 2001-01 NPDES No. CAS0108758) the City of Carlsbad requires development and significant redevelopment, that fall under the category of "priority projects", include Best Management Practices (BMP's) be incorporated to ensure that those projects reduce potential urban pollutant runoff to the maximum extent practicable (MEP). These storm water pollution prevention requirements, which are described in detail in Sections III, "Permanent Storm Water Best Management Practices Selection Procedure," and Section IV, "Construction Storm Water Best Management Practices Performance Standards," are site specific and vary based on the project's potential impact on receiving water quality.

The steps below describe the elements of the development application plan review and permitting processes for storm water best management practice (BMP) requirements. The flow chart in Figure 1, "Review Process For Discretionary Actions" demonstrates how storm water requirements are incorporated into projects requiring subdivision approvals, development permits, discretionary actions or ministerial permits. The flow chart in Figure 2, "Construction Permit Review & Approval Process" describes how storm water requirements are incorporated into projects during the construction permit review process.

Public projects are also subject to the requirements of this Storm Water Standards manual, and although this manual is designed to address the development review process for private projects, City project managers should use this document to identify storm water requirements that must be incorporated into capital improvement projects.

Step 1: Determine Applicable Storm Water BMP Requirements

Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to permanent and construction storm water best management practice (BMP) requirements. (Note: this form must be completed for all permit applications, even if previous approvals exist. Projects with previous approvals will be required to comply with the storm water requirements in this document). This checklist must be completed, signed by the responsible party for the project, and submitted with the permit application. For private projects, the project design must include all required permanent BMPs prior to deeming the application package complete. For public projects, the City project manager shall review and approve the required BMP information prior to bidding for construction contracts.

Figure 1. Review Process for Discretionary Actions

The following figure provides an overview of the project review process for projects that require a discretionary action by the City of Carlsbad. Discretionary actions include land use plan amendments, rezonings, subdivisions, planned development permits, planned industrial permits, redevelopment permits, coastal development permits, conditional use permits, site development plans.

Figure 2. Construction Permit Review & Approval Process

The following figure provides an overview of the project review process for projects that require a construction permit from the City of Carlsbad. Construction permits include building permits, grading permits, demolition permits, ministerial permits and public right-of-way permits.

A. Permanent Storm Water BMP Requirements

i. Standard Requirements. Projects subject to standard permanent storm water requirements as appropriate will incorporate the site design and source control requirements identified in Sections III.2.A and B (requirements 1 through 15), into the project (see Table 1). Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in the BMP design process.

ii. Priority Project Requirements. Projects subject to priority project permanent storm water requirements as appropriate will incorporate all applicable requirements in Section III.2, "Establish Permanent Storm Water Best Management Practices," (requirements 1 through 35) into the project design. This includes the site design and source control BMPs, BMPs applicable to individual priority project categories, and treatment control BMP requirements. If a priority project meets more than one priority project category definition, as shown in Table 1, the project is subject to all BMPs applicable to individual priority project categories that apply. For example, if a project is proposing to build 50 attached residential units and a 6,000 square foot restaurant with a 70-space surface parking lot, the project would be subject to the individual priority project category BMP requirements for "Attached Residential Development," "Restaurants," and "Parking Lots," as shown in Table 1 below. Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in the permanent BMP design process.

Table 1. Standard Development Project & Priority Project Storm Water BMP Requirements Matrix.

			BMPs Applicable to Individual Priority Project Categories(3)										
	Site Design BMPs(1)	*Source Control BMPs(2)*	a. Private Roads	b. Residential Driveways & Guest Parking	c. Dock Areas	d. Maintenance Bays	e. Vehicle Wash Areas	f. Equipment Wash Areas	g. Outdoor Processing Areas	h. Surface Parking Areas	i. Fueling Areas	j. Hillside Landscaping	*Treatment Control BMPs(4)*
Standard Projects	R	R	O	O	O	O	O	O	O	O	O	O	O
Priority Projects:													
Detached Residential Development	R	R	R	R								R	S
Attached Residential Development	R	R	R										S
Commercial Development >100,000 ft²	R	R			R	R	R		R				S
Automotive Repair Shop	R	R			R	R	R	R			R		S
Restaurants	R	R			R			R					S
Hillside Development >5,000 ft²	R	R	R									R	S
Parking Lots	R	R								R(5)			S
Streets, Highways & Freeways	R	R											S

R = Required; select one or more applicable and appropriate BMPs from the applicable steps in Section III.2.A-D, or equivalent as identified in Appendix C.
O = Optional/ or may be required by City staff. As appropriate, applicants are encouraged to incorporate treatment control BMPs and BMPs applicable to individual priority project categories into the project design. City staff may require one or more of these BMPs, where appropriate.
S = Select one or more applicable and appropriate treatment control BMPs from Appendix C.
(1) Refer to Section III.2.A.
(2) Refer to Section III.2.B.
(3) Priority project categories must apply specific storm water BMP requirements, where applicable. Priority projects are subject to the requirements of all priority project categories that apply.
(4) Refer to Section III.2.D.
(5) Applies if the paved area totals >5,000 square feet or with >15 parking spaces and is potentially exposed to urban runoff.

B. Construction Storm Water BMP Requirements

Projects subject to the construction storm water best management practices requirements must comply with the standards included in Section IV, "Construction Storm Water BMP Performance Standards," as appropriate depending on the site conditions, season, and project design, and construction methods. Each project must be given a priority ranking (high, medium or low) for the construction phase (see Appendix A). The prioritization will determine the inspection frequency by City staff but will not change the construction BMP requirements. Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in navigating through this manual to ensure construction BMP performance standards are met.

Step 2 – Prepare & Submit Appropriate Plans.

After determining the general categories of storm water requirements that apply to the project in Step 1 (e.g., construction BMPs, standard permanent BMPs, and/or priority project permanent BMPs), refer to the instructions in this step (see below) to determine what analysis and/or specific BMP requirements in Sections III and IV of the Storm Water Standards manual must be provided and/or incorporated into the project[1].

A. Permanent Storm Water BMPs

Section III, "Permanent Best Management Practices Selection Procedure," contains a process for reviewing the project site's location and preliminary project design before progressively identifying and incorporating site design BMPs, source control BMPs, requirements for individual priority project types, and treatment control BMPs into the project design. The procedure is organized so that the level of analysis required is commensurate with the potential pollutant type and quantity, the location of the project relative to sensitive receiving waters, and with the type of storm water requirements that apply to a particular project.

i. Standard Requirements. Projects (requiring either discretionary actions or construction permits), subject to only standard permanent BMP requirements need only to complete the "Identify Pollutants from the Project Area" procedure (Section III.1.A), and then incorporate the requirements in Section III.2.A, "Site Design BMPs" and Section III.2.B, "Source Control BMPs" (requirements 1-15). Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type. Analysis of the project's anticipated pollutants of concern must also be included with the project submittal.

[1] Projects are only required to provide applicable BMPs. For example, an attached residential development project subject to the priority project requirements would not have to meet the "private road" requirements in this manual if no private roads were proposed. In addition, the City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective.

ii. Priority Project Requirements. Projects (requiring either discretionary actions or construction permits), subject to the priority project permanent BMP requirements must complete all of the analyses required in Section III.1, "Identify Pollutants and Conditions of Concern," and incorporate all of the applicable BMP requirements in Section III.2, "Establish Storm Water BMP Requirements" (requirements 1-33). Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type. In addition, projects subject to priority project requirements must prepare and submit a Water Quality Technical Report in accordance with Appendix D. Analysis of the project's anticipated pollutants of concern, anticipated pollutants of concern in downstream receiving waters, and conditions of concern, must also be included in the Water Quality Technical Report as part of the project submittal.

B. Construction Storm Water BMPs

Section IV, "Construction Storm Water BMP Performance Standards," describes the construction site management requirements that contractors must comply with. In addition, Section IV lists the performance standards that construction sites must meet, and provides a list of erosion control, sediment control, and materials management BMPs for reference. Additionally, each project must be given a priority of high, medium or low (see Appendix A). (Note: Prioritization of construction projects will determine the inspection frequency by City staff and may be changed during the construction process based on the potential for pollutants to be discharged from the site.)

i. Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in Section IV, "Construction Storm Water BMP Performance Standards." The applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by Section IV, in accordance with Order No. 99-08-DWQ of the State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). For projects that disturb 1-acre or more, and are determined to have a potential to impact water quality during construction, the applicant must provide a Water Pollution Control Plan (WPCP), which identifies all construction BMP requirements required by Section IV, with the project submittal. The WPCP shall depict the BMP's to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The WPCP shall include but not be limited to erosion and sediment control BMP's, good housekeeping measures and site and materials management.

Consistent with the State General Construction Permit, the City will require that both erosion and sediment control BMPs be installed and maintained for all applicable projects in addition to good housekeeping and site and materials management. Appendix E provides general guidelines for preparation of a SWPPP as well as a more detailed checklist to meet the requirements.

After preparing plans and supporting documents according to the requirements in this manual, submit plans to the Development Services Division of the Engineering Department for review (See Step 3).

Step 3 – Determine Adequacy of Proposed Plans.

The City Engineer will review submitted plans for compliance with the applicable storm water requirements contained in this manual. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs, and will be requested through a project issues report following the conclusion of a staff review cycle. After all storm water requirements have been approved by the City Engineer, proceed to Step 4 to assure implementation and maintenance of the approved BMPs through permit conditions, plan notes, and if necessary, maintenance agreements.

Step 4 -- Assure Implementation & Maintenance of Requirements.

Applicants must provide assurances that required permanent storm water BMPs will be constructed and permanently maintained throughout the use of a developed site, and that construction BMPs will be implemented and maintained until construction is complete. The summaries below describe how construction and permanent BMP requirements must be assured during both discretionary actions and construction permit review processes. After the City Engineer has approved all construction and/or permanent BMPs, refer to Section V, "Implementation & Maintenance of Requirements" to determine how construction and permanent BMP implementation and maintenance will be assured.

A. Discretionary Action

For any discretionary action, required permanent storm water requirements shall be incorporated into the project design and be shown on the plans. If the project will be required to provide construction BMPs, the permit/approval shall include the "Standard Construction BMP Implementation And Maintenance Condition" listed in Section V, "Implementation & Maintenance of Requirements".

B. Construction Permits

For projects requiring construction permits, construction and required permanent BMP requirements shall be incorporated into the project design and shown on the plans prior to the issuance of any permits. Construction and permanent BMP requirements shall also be noted on the plans. Any construction BMP requirements that cannot be shown graphically must be noted on the plans.

C. Public Projects

For public projects, required permanent, as well as construction, BMP requirements must be incorporated into the project design and shown on the plans prior to bidding for construction contracts, or equivalent. Public project contracts must also add the requirement for the project to implement and maintain construction BMP requirements in accordance with this manual.

III. PERMANENT BEST MANAGEMENT PRACTICES SELECTION PROCEDURE

When referred to this Section, by Step 2 of Section II, complete the analysis required for your project in the subsections of Section III.1 below.

1. IDENTIFY POLLUTANTS & CONDITIONS OF CONCERN

A. Identify Pollutants from the Project Area

Using Table 1, identify the project's anticipated pollutants. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern. Projects meeting the definition of more than one project category shall identify all general pollutant categories that apply.

Table 2. Anticipated and Potential Pollutants Generated by Land Use Type.

	General Pollutant Categories								
Project Categories	Sediments	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Detached Residential Development	X	X			X	X	X	X	X
Attached Residential Development	X	X			X	P(1)	P(2)	P(1)	X
Commercial Development >100,000 ft²	P(1)	P(1)		P(2)	X	P(5)	X	P(3)	P(5)
Automotive Repair			X	X(4)(5)	X		X		
Restaurants					X	X	X	X	
Hillside Development >5,000 ft²	X	X			X	X	X		X
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Streets, Highways & Freeways	X	P(1) X	X	X(4)	X	P(5)	X		

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

B. Identify Pollutants of Concern in Receiving Waters

For priority projects, the following analysis shall be conducted and reported in the project's Water Quality Technical Report:

1. For each of the proposed projects discharge points, identify the receiving water(s) that each discharge point proposes to discharge to, including hydrologic unit basin number(s), as identified in the most recent version of the *Water Quality Control Plan for the San Diego Basin*[2], prepared by the San Diego Regional Water Quality Control Board.
2. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies[3]. List any and all pollutants for which the receiving waters are impaired.

Sites tributary to Clean Water Act section 303(d) water bodies impaired for sediment and sites discharging directly into environmentally sensitive areas (ESA) require additional BMP implementation. These sites are by definition classified as posing a high threat to water quality. In the 1998 303(d) listing, the Agua Hedionda Lagoon is impaired for sediment and siltation. Buena Vista Lagoon also has impaired beneficial uses (aquatic life) due to high sedimentation/siltation. Portions of Carlsbad where construction sites have the potential to discharge into a tributary of a 303(d) or directly into a 303(d) water body or sites located within 200 feet of an ESA require additional BMP implementation. These water bodies include the Pacific Ocean, Buena Vista Lagoon, Encinas Creek, Agua Hedionda Lagoon, and Batiquitos Lagoon.

C. Identify Conditions of Concern

For priority projects, the following analysis shall be conducted and reported in the project's Water Quality Technical Report:

1. Evaluate the project's conditions of concern in a drainage study report prepared by a registered civil engineer in the State of California, with experience in the science of stream and river generated surface features (i.e., fluvial geomorphology) and water resources management. The report shall consider the project area's location (from the larger watershed perspective), topography, soil and vegetation conditions, percent impervious area, natural and infrastructure drainage features, and any other relevant hydrologic and environmental factors to be protected specific to the project area's watershed.
2. As part of the drainage study, the applicant's civil engineer shall conduct a field reconnaissance to observe and report on downstream conditions, including undercutting erosion, slope stability, vegetative stress (due to flooding, erosion, water quality degradation, or loss of water supplies) and the area's susceptibility to erosion or habitat alteration as a result of any future upstream development.
