Water Temperature
Water temperature was measured in the field immediately upon sample collection at each site with flowing or ponded water. Temperature readings ranged from 17.2˚C at S106 on May 29, 2007 to 30.5˚C at L040 on August 30, 2007. The average temperature during field screening was 22.7˚C degrees Celsius with a standard deviation of 2.62˚C.

pH
pH is a term used to indicate the alkalinity or acidity of a substance as ranked on a scale from 1.0 to 14.0. Acidity increases as the pH gets lower. Figure 2 presents the pH of some common liquids.

Figure 2. pH of Selected Liquids.

pH affects many chemical and biological processes in the water. For example, different organisms flourish within different ranges of pH. The largest varieties of aquatic animals prefer a range of 6.5-8.0. pH outside this range reduces the diversity in the stream because it stresses the physiological systems of most organisms and can reduce reproduction. Low pH can also allow toxic elements and compounds to become mobile and "available" for uptake by aquatic plants and animals. This can produce conditions that are toxic to aquatic life. Changes in acidity can be caused by atmospheric deposition (acid rain), surrounding rock, and certain wastewater discharges. An unusually high pH reading could be an indicator of an industrial discharge in the sample area; therefore, pH is used as an indicator of illicit discharges.

The pH values taken from the ponded or flowing water ranged from 6.6 at A013 to 9.2 at S110. The average pH value observed during the field screening was 7.81 with a standard deviation of 0.64. The three sites that were outside of the acceptable range were S111, S110, and L040. All are associated with concrete channels or pipes and both S111 and S110 were ponded. Concrete is known to be basic and have high pH values associated with the cement components. This may be a cause of the high pH values.

Conductivity
Conductivity is a measure of the ability of water to pass an electrical current. Conductivity in water is affected by the presence of inorganic dissolved solids such as chloride, nitrate, sulfate, and phosphate anions (ions that carry a negative charge) or sodium, magnesium, calcium, iron, and aluminum cations (ions that carry a positive charge). Organic compounds

like oil, phenol, alcohol, and sugar do not conduct electrical current very well and therefore have a low conductivity when in water. Conductivity is also affected by temperature: the warmer the water, the higher the conductivity. In addition, discharges to streams can also change the conductivity depending on their make-up. A failing sewage system would raise the conductivity because of the presence of chloride, phosphate, and nitrate; an oil spill would lower the conductivity. The conductivity values ranged from 1.01mS/cm at S110 to 7.1 mS/cm at B023. The average conductivity value observed during field screening was 3.13 mS/cm.

Salinity

Salinity is the measure of dissolved salts in water and is therefore linked to conductivity. Salinity is expressed in percent or parts per trillion (ppt). The ocean, on average, has a salinity of 35 ppt or is made up of about 3.5% salt. Freshwater streams usually have salinity between 0 and 3 ppt or 0 and 0.3%. The salinity values during the 2007 dry weather monitoring season ranged from 0.04% and 0.38%. The average salinity observed was 0.15%.

Turbidity

Turbidity is a measure of water clarity, how much the material suspended in water decreases the passage of light through the water. Suspended materials include soil particles (clay, silt, and sand), algae, microbes and other substances. Turbidity can affect the color of the water.

Higher turbidity increases water temperatures because suspended particles absorb more heat. This, in turn, reduces the concentration of dissolved oxygen because warm water holds less dissolved oxygen than cold. Higher turbidity also reduces the amount of light penetrating the water, which reduces photosynthesis and the production of dissolved oxygen. Suspended materials can clog fish gills, reducing resistance to disease in fish, lowering growth rates, and affecting egg and larval development. As the particles settle, they can blanket the stream bottom, especially in slower waters, and smother fish eggs.

Turbidity can be useful as an indicator of the effects of runoff from construction, agricultural practices, logging activity, discharges, and other sources. Turbidity often increases sharply during a rainfall, especially in developed watersheds, which typically have relatively high percentages of impervious surfaces. The flow of storm water runoff from impervious surfaces rapidly increases stream velocity, which increases the erosion rates of stream banks and channels. Turbidity can also rise sharply during dry weather if earth-disturbing activities are occurring in or near a stream without erosion control practices in place. The turbidity values ranged from 1 to 114 NTU. The average turbidity value observed during field screening was 16 NTU.

Dissolved Oxygen

Dissolved oxygen analysis measures the amount of gaseous oxygen dissolved in an aqueous solution. Oxygen gets into water by diffusion from the surrounding air, by aeration, and as a waste product of photosynthesis.

Adequate dissolved oxygen is necessary for good water quality. Oxygen is a necessary element to all forms of life. Natural stream purification processes require adequate oxygen

levels in order to provide for aerobic life forms. As dissolved oxygen levels in the water drop below 5.0 mg/L, aquatic life is put under stress. The lower the concentration, the greater the stress is on aquatic life. Oxygen levels that remain below 1-2 mg/L for a few hours can result in large fish kills. The dissolved oxygen values ranged from -1.5 mg/L at L002 to 19.31 mg/L at S110. The average dissolved oxygen value observed during field screening was 6.85 mg/L. All of the sites that had DO levels less than 4.0 mg/L were ponded and frequently had high turbidity and ammonia levels, indicating nutrient breakdown.

Ammonia

Ammonia is a common indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment, however, in higher quantities it can become toxic to fish and other organisms. The ammonia values range from 0.1 to 7.0 mg/L. The average ammonia value observed during the field screening was 0.92 mg/L with a standard deviation of 1.3 mg/L. Ten of the 15 sites that exceeded the action level for ammonia were ponded and were likely caused by decaying organic matter in the ponded water.

Orthophosphate-P

Both phosphorus and nitrogen are essential nutrients for the plants and animals that make up the aquatic food web. Since phosphorus is the nutrient in short supply in most fresh waters, even a modest increase in phosphorus can, under the right conditions, set off a whole chain of undesirable events in a stream including accelerated plant growth, algae blooms, low dissolved oxygen, and the death of certain fish, invertebrates, and other aquatic animals.

There are many sources of phosphorus, both natural and human. These include soil and rocks, wastewater treatment plants, runoff from fertilized lawns and cropland, failing septic systems, runoff from animal manure storage areas, disturbed land areas, drained wetlands, water treatment, and commercial cleaning preparations. The Orthophosphate-P values ranged from 0.05 mg/L to 4.15 mg/L. The average orthophosphate-P value observed during field screening was 1.25 mg/L.

Nitrate-N

Nitrate is the most readily available form of nitrogen for plant uptake and is a limiting factor in plant growth. Nitrates are naturally occurring in soil and rocks, but are also added to watersheds from anthropogenic sources such as fertilizers, failing septic systems, and animal waste. The nitrate-N values from the 2007 dry weather monitoring season ranged from 0.68 mg/L at L001 to 35.6 mg/L at S106. The average nitrate-N value was 2.28 mg/L with a standard deviation of 4.7 mg/L. The nitrate levels at S106 were three times greater than the next highest levels of just over 10 mg/L at L054 and B103.

4.3 Laboratory Water Quality Results

Laboratory analysis was conducted at 18 sites, representing 30% of the sites with ponded or flowing water. Laboratory chemistry results are summarized and presented in Table 5 and microbiology results in Table 6. If action levels were exceeded, the site was revisited to confirm the initial results and an IC/ID investigation was initiated. Follow-up investigations are presented in Section 4.4.

Surfactants (MBAS)

Surfactants are analyzed to detect detergent pollution from residential, commercial, or industrial washing activities. Surfactants were not detected at any of the dry weather sites.

Oil and Grease

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities. Oil and grease was not detected at any of the dry weather sites.

Total Hardness

Total hardness measures the amount of polyvalent cations in water. It generally represents calcium and magnesium ions in a water sample because they are the most common cations. Results are expressed in mg/L of $CaCO_3$. The California Toxics Rule (CTR) applies hardness-based water quality objectives to dissolved metals. Increasing hardness has the effect of decreasing the toxicity of metals[2]. The hardness values ranged from 289 mg/L of $CaCO_3$ at L040 to 1910 mg/L of $CaCO_3$ at A016 with an average of 940 mg/L of $CaCO_3$ and a standard deviation of 514 mg/L of Ca CO_3.

[2] US Environmental Protection Agency. 2002. National Recommended Water Quality Criteria. November 2002. EPA-822-R-02-047

Dissolved Metals
Metal concentrations in the environment can originate from a variety of sources including automobiles, automobile repair facilities, car washing, and industrial activities, as well as natural geologic processes. The laboratory samples collected during the 2007 Dry Weather Monitoring Program were analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Results were compared to the hardness-based CTR CMC (1-hour) criterion. Dissolved cadmium results were all below laboratory detection limits. Dissolved copper was detected at five sites, but they were all below the CTR criterion. Dissolved lead results were below the laboratory detection limits at all sites. Dissolved zinc was detected at seven of the sites, but they were all below the CTR criterion.

Chlorpyrifos and Diazinon
Chlorpyrifos and diazinon are organophosphate pesticides used to control insects, fleas and ticks. As of December 31, 2004, it became unlawful to sell diazinon outdoor, non-agricultural products. Chlorpyrifos can now only be used for nursery production, golf courses and road medians. Neither chlorpyrifos nor diazinon was detected at any of the laboratory sampling sites.

Total Coliform Bacteria
Total coliform bacteria are mostly harmless bacteria that are ubiquitous in the environment living in soil, water, and mammalian digestive tracts. Water samples are analyzed for total coliform bacteria to indicate the presence of other more harmful pathogenic (disease causing) organisms that are associated with coliform but are difficult to test for because they are present in much smaller quantities. During the dry weather monitoring period total coliform results ranged from 1300 MPN/100mL at S006 to ≥1,600,000 MPN/100 ml at B001.

Fecal Coliform and Enterococcus
Members of two bacteria sub-groups, fecal coliforms and enterococcus, are used as indicators of possible sewage contamination because they are specifically found in human and animal digestive tracks. Although they are generally not harmful themselves, they indicate the possible presence of pathogenic bacteria, viruses, and protozoans that also live in human and animal digestive systems. Since it is difficult, time-consuming, and expensive to test directly for the presence of a large variety of pathogens, these fecal indicator bacteria are used. Sources of fecal contamination to surface waters include wastewater treatment plants, on-site septic systems, domestic and wild animal manure, and storm water runoff.

In addition to the possible health risk associated with the presence of elevated levels of fecal bacteria, they can also cause cloudy water, unpleasant odors, and an increased oxygen demand. Fecal coliform results ranged from <20 MPN/100mL at S006 to ≥1,600,000 MPN/100 ml at B001. Enterococcus results ranged from 10 MPN/100mL at L019 to >24,196 MPN/100mL at B022.

4.4 IC/ID Investigations

Sites that exceeded one or more action level were revisited and resampled to confirm the initial result. If the confirmation result also exceeded an action level, an IC/ID investigation was initiated. Twenty eight sites had one or more action level exceedances that required confirmation. Eighteen of those sites, upon confirmation, required an IC/ID investigation

The most common exceedance was for ammonia; 15 sites had an initial exceedance. This was common in ponded water where organic matter breakdown would cause higher levels of ammonia. Where upstream investigations were possible and flowing water was sampled, the ammonia concentration would often decrease below the action level. The action level for orthophosphate-P was exceeded at 12 sites during the initial screening. The majority of these sites were also ponded. Nine of the 18 sites that were initially sampled for laboratory analysis exceeded one or more of the fecal indicator bacteria action levels. Appendix D contains a detailed description of the confirmation and IC/ID investigations at each site and the actions that were taken to reduce contaminants.

The prevailing source for ponded and flowing water was from residential and park over-irrigation. To reduce and/or eliminate the residential flow, educational material was distributed to the residences on October 25, 2007. Over 700 letters where sent out across the City, each identifying the pollutant of concern in their area and what they could do to help eliminate it. The City of Oceanside's water conservation program also reached this area through the local public television station's service announcements in August and October on smart irrigation. The Clean Water Program also teamed up with the Water Utilities' Meter Readers in August and began a residential door hanger program. The Meter Readers will continue to place door hangers on residences that they find to have water flowing from their property either from over-irrigation or an IC/ID. The door hangers have tips for good irrigation practices and a link to the City's website for more information.

To reduce and/or eliminate the runoff from the City's parks, several meetings by phone and in person were held in September and October with Clean Water Program staff and Parks' Department staff and their contractors. The Parks' maintenance staff visually inspects the City's parks weekly. Any irrigation problems are prioritized and fixed. Fertilizer is applied depending on the use of the park and the season. A slow-release fertilizer is used in the summer and best management practices are always used to keep fertilizer and grass clippings in the park and out of the storm drains and water ways. De-thatching is completed annually and aeration bi-annually to improve drainage in all of the parks. The Clean Water Program is working continuously with the Park's Department to keep BMPs in place and up-to-date in addition to seeking out funding for smart irrigation controls to improve water conservation efforts.

5 DISSCUSION

5.1 2007 Dry Weather Summary

Of the 100 sites in the historical dry weather monitoring program, 93 sites were accessible and visited in 2007. Sprinter Railway construction in the Loma Alta Watershed and Pacific Street Bridge construction in the San Luis Rey Watershed, in addition to a few other safety concerns, limited access to the remaining seven sites. Thirty six sites had measurable flowing water and 25 sites were ponded with enough water to sample, combining for a total of 61 sites where initial field screening was conducted. Eighteen of these sites were chosen for laboratory testing for chemistry and microbiology parameters.

Twenty eight of the 61 sites initially screened had one or more field or laboratory parameter exceedance. The most common exceedances for field screening were ammonia and orthophosphate. The majority of these were from ponded water where organic matter was breaking down. This causes a rise in ammonia as nitrogen fixation occurs. The prevailing source for ponded and flowing water with ammonia and/or orthophosphate exceedances was from residential and park over-irrigation. The irrigation water is also likely to carry fertilizer and may be a source of the orthophosphate exceedances. Nitrate action levels were exceeded at three sites. One of these exceedances was below the action level upon confirmation. The other two sites are part of on-going BMP selection and monitoring detailed in Appendix D. There were three pH exceedances all associated with concrete channels. Components of concrete are known to be basic and may be having an affect on ponded water in concrete channels.

Bacterial indicators were the only laboratory parameter that exceeded action levels within the City of Oceanside. There were no exceedances for MBAS, dissolved metals, oil and grease, or pesticides. The total coliform action level was exceeded at nine sites; the fecal coliform action level was exceeded at four sites; and the enterococcus action level was exceeded at two sites. There were no bacterial exceedances in the San Luis Rey watershed and confirmation of the two exceedances in the Loma Alta watershed resulted in bacteria quantities below the action levels. Possible sources in the Buena Vista and Agua Hedionda watersheds were either over-irrigation or an unknown source. One exceedance in Agua Hedionda may have been related to an illegal discharge that was identified and resolved.

Over 700 letters targeting areas in the City where the various exceedances occurred were mailed to residents. These letters focus on educating residents on the path of the storm drain system, what common pollutants come from residential areas, and suggestions and alternatives to reduce the flow of water and pollutants entering the City's water bodies.

In 2007, there were no action levels for the qualitative observations of floatable materials, biology, deposits, or vegetation. Trash and algae were the most commonly observed materials at the monitoring sites. Fifty two of the sites monitored identified trash in or near the monitoring location. Under Permit Order 2007-0001 trash will be monitored and assessed in more detail beginning with the 2008 Dry Weather Monitoring season. Type and possible sources of the trash will be recorded. Algae, an indication of nutrients in the runoff, was identified at 37 of the sites monitored.

5.2 Historical Data Comparison

In February 2001, the San Diego Regional Water Quality Control Board issued Order No. 2001-01 to the communities of San Diego County. As part of Order 2001-01, the City of Oceanside was required to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. The Dry Weather Program under this order was implemented in the 2002 Dry Weather season. This section provides a comparison of the last six years of dry weather data.

The majority of exceedances from the 2001 Permit Cycle are nutrients (nitrate, orthophosphate, and ammonia) and bacterial indicators (total coliform, fecal coliform, and Enterococcus). Table 8 provides a summary of the previous six years of dry weather monitoring including the number of sites monitored and the number of exceedances of these specific field and laboratory analytes.

Table 7. 2002-2007 Dry Weather Monitoring Report Data Comparison.

Monitoring Year	2007	2006	2005	2004	2003	2002
No. of Sites with Flowing or Ponded Water	61	61	64	46	56	56
No. of Sites Sampled for Initial Field Screening	61	54	44	18	56	56
No. of Sites Exceeding Nitrate Action Level*	3	9	8	NS	12	11
No. of Sites Exceeding Orthophosphate Action Level	12	6	8	2	14	11
No. of Sites Exceeding Ammonia Action Level	15	8	4	17	49	50
No. of Sites Sampled for Laboratory Analysis	18	19	17	19	16	11
No. of Sites Exceeding Total Coliform Action Level	9	12	17	11	0	4
No. of Sites Exceeding Fecal Coliform Action Level	4	5	4	2	0	1
No. of Sites Exceeding Enterococcus Action Level	2	2	4	3	2	0

*Number of exceedances taken from previous reports. Nitrate reported in monitoring years 2002, 2003, 2005 and 2006 may have been reported as NO_3, as opposed to NO_3-N. Without converting to the appropriate form of nitrate to compare to the set action levels, the number of exceedances may be erroneously high. See discussion below.

During the 2001 Permit Cycle, the number of sites visited with flowing or ponded water has not changed dramatically, even with an impending drought. The number of sites sampled over the years has fluctuated. In 2004, only the flowing sites were sampled, therefore reducing the number to 18. Due to safety and accessibility constraints, a reduced number of the flowing and/or ponded sites were screened in 2005 and 2006. In 2007, the inaccessible

sites were not visited and therefore it could not be determined if they were flowing and/or ponded.

Nitrate exceedances were reduced in 2007. This brought a review of the previous years' nitrate results. Based on the test kits used and discussion with previous samplers, in 2004 and 2005, the nitrate results were reported as NO_3, but compared to action levels for nitrate as N (NO_3-N). The field results should have been divided by 4.43 to convert from NO_3 to NO_3-N. Because this was not done, nitrate as N results for those two years are erroneously high and some falsely reported as exceedances. For monitoring years 2002 and 2003, it is assumed the same procedure occurred, however, no notes or discussions have been found to verify this. In correcting these reported formats, the following would stand as the correct number of nitrate (NO_3-N) exceedances:

Monitoring Year	2007	2006	2005	2004	2003	2002
No. of Sites Exceeding Nitrate Action Levels	3	3	2	NS	3	11*

*Could not be determined.

The number of sites with orthophosphate and ammonia exceedances was higher in 2007. This could be due to a greater number of ponded sites sampled. It should also be noted that in 2005, the City of Oceanside implemented a new method for ammonia analysis which gives more accurate results as well as minimizes the chance for false positives.

The sites sampled for laboratory analysis have had consistent exceedances for bacterial indicators. However, there has been a decrease from 2005 to 2006 to 2007. In the 2005 monitoring year 100% of lab sites exceeded the action level for one or more indicator bacteria; in 2006, 63% of lab sites exceeded the action level for one or more indicator; in 2007, 50% of lab sites exceeded the action level for one or more indicator.

6 CONCLUSIONS

The City of Oceanside's boundaries include two major watersheds; the San Luis Rey Watershed, which includes the San Luis Rey River, and the Carlsbad Hydrologic Unit, which consists of Loma Alta Creek, Buena Vista Creek, and Agua Hedionda Creek. As part of Order 2001-01, the San Diego Regional Water Quality Control Board required all Copermittees to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. The purpose of the program was to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain system, minimizing the negative impacts of human activities on these water bodies. This report summarizes the results of the 2007 dry weather monitoring season in detail and reviews the historical data and trends from the 2001 Permit Cycle.

Of the 100 sites in the historical dry weather monitoring program, 93 sites were accessible and visited in 2007. Thirty six sites had measurable flowing water and 25 sites were ponded with enough water to sample, combining for a total of 61 sites where initial field screening was conducted. Eighteen of these sites were chosen for laboratory testing for chemistry and microbiology parameters.

Twenty eight of the 61 sites initially screened had one or more field or laboratory parameter exceedance. The most common exceedances for field screening were ammonia and orthophosphate. The majority of these samples were from ponded water where organic matter breakdown may be causing the nutrient exceedances. Bacterial indicators were the only laboratory parameter that exceeded action levels. The prevailing source for ponded and flowing water was from residential and park over-irrigation. Over 700 letters targeting areas in the City where the various exceedances occurred were mailed to residents. Meetings were also held with Park maintenance staff and contractors to work together on reducing runoff from the City's parks.

Because the 2007 monitoring season concludes the 2001 permit cycle, a brief review of the past six years of dry weather monitoring data was conducted, including exceedance trends. In addition, variations in monitoring locations were found and incorrectly reported nitrate results from previous years were identified.

Eighteen sites of the 100 listed to visit in 2007, have had some type of variation between the past six years of sampling. During one or more monitoring seasons, a different storm drain was visited from the previous years, but labeled the same drain. For example, at Site L033, the picture of the site visited in 2006 appears to be different than the pictures taken the other five years, but it was still labeled and results recorded as L033. The majority of these sites has been dry and so do not affect historical data.

It has also been identified that for monitoring years 2005 and 2006, the nitrate results were reported as NO_3 as opposed to NO_3-N. This resulted in values that were erroneously high and some were falsely reported as exceedances. The 2002 and 2003 monitoring years appear to have followed the same procedure; however no notes or discussions have been found to

verify this. The historical data may be updated and re-submitted for Regional Urban Runoff Program use.

After these corrections were made, it appears that nitrate exceedances are consistent through the past six years. However, ammonia and orthophosphate exceedances were up in 2007, likely due to a higher number of ponded sites being sampled. Indicator bacteria exceedances have been decreasing since 2005. In the 2005 monitoring year 100% of lab sites exceeded the action level for one or more indicator bacteria; in 2006, 63% of lab sites exceeded the action level for one or more indicator; in 2007, 50% of lab sites exceeded the action level for one or more indicator.

Follow-ups continue to be conducted and ongoing monitoring and BMP selection are being analyzed at sites that have continued exceedances.

APPENDIX A

SAMPLE HISTORY OF SITES WITH STORM DRAIN VARIATION

S078 Sampling History

2003 – No field screening conducted.

2004 – Not visited.

2005 – No field screening conducted.

2006 – No field screening conducted.

2007 – Dry; no field screening conducted.

S102 Sampling History

2003 – No field screening conducted.

2004 - Not visited.

COMMENTS: _____

San Diego Stormwater Copermittees

Land Use Types for Dry Weather Monitoring

(Adopted by the Dry Weather Monitoring Workgroup, April 20, 2004)

1. **Residential**

   Residential (general)
   Single- and multi-family homes, mobile home parks, etc.

   Rural residential (For the County of San Diego and other appropriate Copermittees)
   Single family homes located in rural areas with lot sizes of approximately 1 to 10 acres. Rural residential estates may have small orchards, fields or small storage buildings associated with the residential dwelling unit, etc.

2. **Commercial**

   Offices, schools, shopping centers, auto dealerships, government/civic centers, cemeteries, churches, libraries, post offices, fire/police stations, military use, jails, prisons, border patrol holding stations, dormitories, hotels, motels, resorts, and casinos, etc.

3. **Agricultural**

   Orchards, vineyards, nurseries, greenhouses, flower fields, dairies, livestock, poultry, equine ranches, row crops and grains, pasture, fallow, etc.

4. **Industrial**

   Shipbuilding, airframe, aircraft manufacturing, industrial parks, manufacturing uses such as lumber, furniture, paper, rubber, stone, clay, and glass; auto repair services/recycling centers; warehousing, wholesale trade; mining, sand and gravel extraction, salt evaporation; junkyard, dumps/landfills; auto wrecking/dismantling and recycling centers, etc.

5. **Parks**

   Recreation areas and centers, neighborhood parks, wildlife and nature preserves, golf courses, accessible sandy areas along the coast or major water bodies allowing swimming and picnicking, etc.

6. **Open**

   Vacant and undeveloped lands, etc.

City of Oceanside

Jurisdictional Urban Runoff Management Program

2007-08 Annual Report

Prepared for:
San Diego Regional Water Quality Control Board

September 30, 2008

CITY OF OCEANSIDE
WATER UTILITIES DEPARTMENT

DATE: **September 29, 2008**

RE: **STATEMENT OF CERTIFICATION**
CITY OF OCEANSIDE JURISDICTIONAL URMP

I certify under penalty of law that the Jurisdictional Urban Runoff Management Program Annual Report for 2007-2008 was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for knowing violations.

M. A. Lahsaiezadeh

ES EXECUTIVE SUMMARY

Introduction

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the San Diego Copermittees. Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2007 – June 30, 2008).

Report Organization

Section J of Municipal Permit 2007-0001 defines the requirements for the Jurisdictional Urban Runoff Management Program (JURMP) Annual Report and states that each JURMP Annual Report shall, at a minimum, contain a comprehensive description of all activities conducted by the Copermittee for each required component. The table below presents these components and the section in which they are discussed.

Municipal Permit 2007-0001 Components	Annual Report Section
Development Planning Component	Section 2.0
Land-Use Planning	Section 2.2
Environmental Review Process	Section 2.3
Development Project Approval and Verification Process	Section 2.4
Construction Component	Section 3.0
Municipal Component	Section 4.0
Industrial and Commercial Component	Section 5.0
Residential Component	Section 6.0
Illicit Discharge Detection and Elimination Component	Section 7.0
Education Component	Section 8.0
Public Participation	Sections 9.0
Fiscal Analysis Component	Section 10.0
Effectiveness Assessment Component	Section 11.0
Special Investigations	Section 12.0
Non-Emergency Fire Fighting	Section 13.0
JURMP Revisions	Section 14.0
Conclusions and Recommendations	Section 15.0

Pursuant with the Municipal Permit this document contains all of the required information.

Program Highlights

Below is a summary of each section which describes the Clean Water Program activities appearing in this Annual Report. Please refer to the individual section for more detailed information.

Section 2.0 Development Planning Component

All new development and redevelopment projects are subject to the priority project or standard project provisions in the City's Interim SUSMP. During this reporting period the City adopted an Interim SUSMP which includes revisions that conform to the requirements of the Municipal Permit. Minimum storm water BMP requirements are part of the City's standard conditions of approval and are required of all projects receiving discretionary permits. The City will not support the entitlement of a project or issue development permits until the appropriate documents are reviewed by City staff and approved by the City Engineer. Information of the SUSMP document reviews were performed during the 2007-2008 reporting period. The City evaluated its established environmental review process for all development projects to determine compliance with the new Municipal Permit and determined that the current environmental review process adequately addresses the requirements of the Municipal Permit.

Section 3.0 Construction Component

The City of Oceanside Clean Water Program provided an updated inventory of construction sites with the 2008 JURMP. During the reporting period, the Clean Water Program inspected the 50 construction sites to ensure they were in compliance with City Code.

Section 4.0 Municipal Component

The City of Oceanside Clean Water Program utilized its 2007-08 municipally owned inventory and inspected 230 municipal areas to ensure these facilities are in compliance with City Code. A total of 2,358 tons of waste was removed as a result of street sweeping and a total of 65.5 tons of waste was removed from the storm drain system (MS4) as part of the annual cleaning. Seven thousand two hundred and fifty two (7,252) feet of City sewer lines were slip lined and manholes pressure grouted and sealed in the Loma Alta watershed.

Section 5.0 Industrial and Commercial Component

The City of Oceanside Clean Water Program utilized its industrial and commercial business inventory submitted with the 2008 JURMP. Two hundred forty one (241) industrial businesses and 846 commercial businesses were inspected during this reporting period, to ensure these facilities are in compliance with City Code.

Section 6.0 Residential Component

The City of Oceanside has developed an extensive program that aims to reduce pollutant runoff from residential areas and activities to the maximum extent practical (MEP). The City of Oceanside Clean Water Program received 55 complaints on the Urban Runoff Hotline and Code Enforcement Program received 190 complaints from residents regarding potential urban runoff violations from residential areas and activities. Extensive educational efforts were made to help Oceanside residents understand watersheds, water quality and urban runoff impacts through presentations on a local television channel, Clean Water Program newsletters mailed to each household, and through information available on the Clean Water Program Website.

Section 7.0 Illicit Discharges Detection and Elimination Component

This section is intended to document the activities conducted by the City of Oceanside during the 2007-2008 reporting period to manage illicit discharges. In accordance with the September 10, 2008 Regional Water Quality Control Board adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the entire FY 2007-08 Illicit Discharge Detection and Elimination Component, including the 2008 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2008.

Section 8.0 Education Component

The City of Oceanside Clean Water Program continued to use a variety of avenues to educate various audiences about the Clean Water Program and the requirements of Municipal Permit Order 2007-0001. These outreach activities included municipal staff training, CWP newsletters, staffing community booths, conducted watershed education presentations, implementation of a 5th grade curriculum titled Project SWELL and targeting under-served audiences with educational materials.

Section 9.0 Public Participation Component

The Clean Water Program continued to sponsor beach and creek cleanup events and supported private groups who wanted to coordinate their own cleanup events. During this reporting period a total of 1,904 volunteers participated in these events, removing more than seven tons of trash, and debris, from the local waterways. In addition the City participated in regional education events including staffing a stormwater booth at the San Diego County.

Section 10.0 Fiscal Component

The City of Oceanside Clean Water Program continued to acquire funding from various sources to implement programs to meet Municipal Permit Order 2007-08. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge that is delineated on the utility bills for each household and is based on the customer's water consumption. During this reporting period an increase in surcharge was secured in order to cover significant increases in costs due to additional requirements under Municipal Permit Order 2007-001, Investigation Orders, and TMDLs. Approximate expenditures for the 2007-08 fiscal year are provided as well as the budget for the 2008-09 reporting period.

Section 11.0 Effectiveness Component

The City implemented an effectiveness assessment program to assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The City gathered and evaluated data for some of the program components for assessment during this reporting period. This data will be valuable for incorporation into long-term effectiveness evaluation on a jurisdictional level.

Section 12.0 Special Investigations

The City of Oceanside received funding from two sources to implement two water quality related projects: the San Luis Rey Bacteria Source Tracking Study and the Loma Alta Creek Ultraviolet Treatment Facility.

Lower San Luis Rey Bacteria Source Tracking

As part of the Proposition 50 Clean Beaches Initiative, the City of Oceanside was awarded $554,375 to track the sources of bacteria in the Lower San Luis Rey River. This study project has a goal to identify the sources and quantify the loading of bacterial contamination in the lower San Luis Rey River using a tiered approach. This approach will permit prioritization for mitigation of microbial contaminants and appropriate actions will be recommended to eliminate sources of bacterial contamination.

The Loma Alta Creek Ultraviolet Treatment Facility
The City was awarded a $5,000,000 Proposition 40 Clean Beaches Initiative (CBI) grant by the State Water Resources Control Board to construct an ultraviolet (UV) light treatment facility at the existing La Salina Wastewater Treatment Facility. The anticipated project goal is to eliminate beach closures during the dry months at Buccaneer Beach in Oceanside, California. This will be achieved by diverting the flow from the Loma Alta Lagoon through a UV treatment facility prior to discharging the flow onto the shoreline.

Section 13.0 Non-Emergency Fire Fighting

Non-emergency fire fighting BMPs and educational methods for reducing the discharge of pollutants from non-emergency flows to the MEP are described in Section 113.

Section 14.0 JURMP Revisions

Since the submittal of the City's 2008 JURMP in March 2008 there have been no changes or revisions to the document. It is anticipated that there will be changes during the next reporting period, fiscal year 2008-09.

1.0 INTRODUCTION

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the County of San Diego, the incorporated Cities of San Diego County, the San Diego Unified Port District, and the San Diego County Regional Airport Authority (Copermittees) referred to in this document as the Municipal Permit (Municipal Permit). Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2007 – June 30, 2008).

This Municipal Permit is based on the Federal Clean Water Act (CWA), the Porter–Cologne Water Quality Control Act, applicable state and federal regulations, all applicable provision of statewide Water Quality control Plans and Polices adopted by the State Water Resources Control Board (SWRCB), the Water Quality control Plan for the San Diego Basin adopted by the Regional Water Quality Control Board (RWCQB), the California Toxics Rule, and the California Toxics Rule Implementation Plan. This Annual Report addresses the renewed NPDES Permit No. CAS0108758, which was first issued on July 16, 1990 (Order No. 90-42), and then renewed on February 21, 2001 (Order No. 2001-01).

In the interests of communicating consistent messages to the community regarding the most efficient and effective means of reducing storm water and urban runoff pollution, and as directed under Part J.5 of the Municipal Permit, this document was developed following the standardized format developed and agreed upon by the Copermittees. For the most part, compliance with the Municipal Permit was undertaken by the Copermittees through the development and implementation of the JURMP; therefore this Annual Report is organized in a similar format as the 2008 JURMP.

1.1 Background

Urban development typically involves conversion of natural space to developed areas that includes impervious surfaces such as streets, buildings, and parking lots. With the increase in human population and impervious surfaces associated with developed areas there tends to be higher runoff volume and velocity due to the impervious area's incapacity to absorb and hold rainwater. Also, human use of developed areas is associated with a number of pollutants that can be conveyed to the municipal separate storm sewer system (MS4) by a rain event or non-storm water discharges. This is called non-point source pollution. Non-point source pollution, such as urban runoff discharges to the MS4, is a large source of pollutants to receiving water bodies in the San Diego region and throughout the United States. Pollutants commonly associated with urban runoff include sediments, pesticides, fertilizers, herbicides, trash, oil and grease, and heavy metals. Such pollutants are generated by everyday activities such as construction, landscaping and vehicle use and maintenance.

Pollutants that reach receiving water bodies, such as streams, lakes, bays, lagoons, and the ocean, have the potential to significantly impact human and environmental health as well as wildlife that utilize these water bodies and surrounding habitat for survival. Notably, environmentally sensitive areas (ESA) are especially threatened by urban development because such areas tend to have lower capacities to withstand pollutants entering the area.

1.2 Purpose and Objectives

The purpose of this annual report is to present the activities the City conducted during the Fiscal reporting period of July 1, 2007 through June 30, 2008 to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The activities involved implementing, and improving where needed, existing programs and developing new programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. Improving the quality of the discharge from the MS4 should have beneficial effects on the local receiving water bodies.

Table 1-1 presents the organization of the City's JURMP Annual Report and a summary of the corresponding permit requirement in Order No. 2007-0001. Some Report sections and permit requirements overlap and will therefore found in multiple locations throughout the document.

Section 15.0	Conclusions and Recommendations	-

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

The development of urban areas has the potential to negatively impact the surrounding environment. The addition of impervious surfaces can alter the natural drainage patterns of the area, and development can facilitate the introduction of pollutants to the environment resulting from human activities. Accordingly, the City has developed measures to limit the potential for urban development to negatively impact the environment through careful land use planning and thoughtful design of development projects. Development projects are defined by the Municipal Permit as new development or redevelopment with land disturbing activities, structural development including construction or installation of a building or structure, the creation of impervious surfaces, public agency projects, and land subdivision. Through the implementation of the City's development planning component the City will reduce the discharge of pollutants from development projects to the Maximum Extent Practicable (MEP), protect receiving water bodies while managing increases in runoff that have the potential to increase erosion in streams or rivers.

This section documents the City Jurisdictional Urban Runoff Management Program (JURMP) Development Planning activities performed by the City of Oceanside during the reporting period of July 1, 2007 to June 30, 2008. The City has continued to implement the comprehensive Land-Use Planning component of the JURMP in order to satisfy the provisions of Section D.1 of the San Diego RWQCB Order No. R9-2007-0001, which is also referred to as the Municipal Permit. A directory of the subsections within the Municipal Permit Section J.3.a and corresponding Annual Report compliance sections are listed in Table 2.1, below.

Order R9-2007-0001 Compliance Summary

D.1.a Assess General Plan	See Section 2.2.1 of this Annual Report
D.1.b Revise Environmental Review Processes	See Section 2.3 of this Annual Report
D.1.c Modify Development Project Approval Processes	See Section 2.4 of this Annual Report
D.1.d Update SUSMP and Approval Process	See Section 2.4.4 of this Annual Report
D.5.b (1) Conduct Education Efforts Focused on New Development and Redevelopment	See Section 2.4.4 of this Annual Report

2.2 Land Use Planning

2.2.1 Background

The development planning component focuses on efforts to mitigate erosion and reduce pollutant discharges in urban runoff resulting from new development and redevelopment projects to the MEP through land use planning and development process that includes project review, approval, and verification.

The Land Use Element of the General Plan was amended in 2003 to include a number of water quality and watershed protection measures. The primary focus of the measures was to provide a more balanced relationship between the needs of the community and development interests, while managing finite natural resources. There were no water quality related amendments adopted into the General plan during this 2008 reporting period. The specific policies are detailed in Section 4.2.3 of the 2008 Jurisdictional Urban Runoff Management Program.

2.2.2 Source Characterization

Source characterization is an important component of any urban runoff program. Various land use types and activities are known to generate different combinations of pollutants that have the potential to negatively affect the surrounding environment, including the receiving waters.

The Interim SUSMP identifies ten (10) separate "Project Categories", which are cited as anticipated or potential sources of storm water pollution based upon a particular land use and specific site conditions. By identifying pollutant sources and the impairments to the receiving waters; a project may effectively mitigate storm water impacts, to the Maximum Extent Practicable (MEP) through the implementation of Low Impact Development (LID) practices and the appropriate application of a combination of Source Control, Site Design, and Treatment Control BMPs. Project Categories and General Pollutant Categories appear in Table 3 of the Interim SUSMP.

2.2.3 Best Management Practice Requirements

There are established minimum design requirements for all development projects, which are discussed in Section 4.4.3 of the 2008 JURMP. In addition, the Land Use Planning Element of the General Plan contains policies to protect water quality that are reflected in Section 4.2.3 of the 2008 JURMP. During the latter part of this reporting period (i.e. March 2008), the City adopted an Interim SUSMP which contains several new storm water requirements. The BMP requirements were influenced by the inclusion of the LID practices and the phased introduction of the Hydromodification Plan (HMP) as part of the Municipal Permit.

LID practices are included in the Site Design BMP discussion of the Interim SUSMP. The addition of LID practices lends direct support to the HMP component by providing a broad spectrum of design concepts aimed at minimizing the introduction of pollutants and offsetting the conditions of concern associated with impacts to the hydrologic regime.

The Interim SUSMP also includes Treatment Control BMP discussion which provides a direct correlation to pollutant types and physical characteristics that enable transport. This information assists the design professional in developing an effective BMP "treatment train" and facilitates the pursuit of the MEP standard. The Interim SUSMP is available at the City of Oceanside – Engineering Division counter or may be downloaded from the City website at http://www.oceansidecleanwaterprogram.org/pdf/OceansideSUSMP.pdf

2.2.4 Program Implementation

The General Plan has been adopted by the City Council and is a legally binding document; the City of Oceanside is required to abide by its policies. In addition to the General Plan, the City addresses water pollution through implementation of its Municipal Code. Chapter 40 of the

Municipal Code is the Urban Runoff Management and Discharge Control Ordinance and is commonly referred to as the Storm Water Ordinance. The Ordinance contains multiple references to the SUSMP. The City first adopted the SUSMP in 2002 as a condition of the governing Municipal Permit. The document was based on a regionally developed Model SUSMP. More recently, the SUSMP was revised to conform to the 2007 Municipal Permit and was adopted in March 2008 as the Interim SUSMP.

All new development and redevelopment projects will be subject to the priority project or standard project provisions in this Interim Local SUSMP, subject to the lawful prior approval provisions of the Municipal Permit. Development projects deemed not to be a threat to storm water quality, per the City's Urban Runoff Assessment form and on a case-by-case basis, may be exempt from SUSMP requirements. The Interim SUSMP was developed to address post-construction urban runoff pollution from various types of development projects. Certain categories of development projects were deemed more likely to discharge pollutants and are defined as Priority Development Projects (Priority Project) and are subject to additional storm water requirements. As part of the design process, Priority Projects must submit post-construction BMP plans, known as Storm Water Mitigation Plans (SWMPs). These SWMPs must list the BMPs proposed to address the potential pollutants likely to be generated by the development and conditions of concern typically associated with the type of development.

Details on the completed and planned SUSMP updates may be found in Section 4.4.4.4 of the 2008 JURMP. In addition, information pertaining to the legal authority to implement a storm water program is located in Section 2 of the 2008 JURMP.

2.3 Environmental Review Process

The City has evaluated its established environmental review process for all development projects to determine compliance with the new Municipal Permit. The City guides the developers through the filing necessary documents and identifies which reports are required to be submitted and approved before development may begin. The current environmental review process places emphasis on the evaluation of water quality impacts and related issues that may result from the project development.

The Planning Division and Engineering Division of the Development Services Department are responsible for reviewing development projects for conformance with storm water requirements. The City will continue to assess all development and redevelopment projects for compliance with the California Environmental Quality Act (CEQA) by reviewing the Environmental Initial Study checklist completed by each project applicant. A copy of this checklist is included in Appendix D of the 2008 JURMP. The checklist contains questions to evaluate potential negative impacts on receiving water bodies. Projects which are determined to have "potentially significant impacts" to the surrounding environment and receiving waters are required to prepare Environmental Impact Reports (EIRs) for City review. Development projects that do not need to prepare EIRs are allowed to proceed to the next phase of the approval process.

During the development of the 2008 JURMP the City evaluated its current established environmental review process for all new development and redevelopment projects to determine compliance with the new Municipal Permit. The City determined that the current environmental

review process adequately addresses the requirements of the Municipal Permit. While the specific requirements evaluated during the environmental review process are expected to change periodically, the basic review structure did not require revision during this reporting period. Details of the current environmental review process are provided in Section 4.3 of the City's 2008 JURMP update.

2.4 Development Project Approval and Verification Process

2.4.1 Background

The City has an established administrative and discretionary approval processes that provide multiple reviews by the Planning and Engineering Divisions. The Planning Division is responsible for determining acceptable land uses, development constraints, and identifying environmental issues. The Engineering Division is composed of various disciplines (i.e., Engineering Improvements, Grading and Drainage, Water and Sewer Utilities, Hydrology, Geotechnical, Storm Water, Traffic, and Landscape), which perform a coordinated review of all project applications. In addition, the Building Division coordinates with Storm Water Document Review to ensure that new development, remodeling projects, additions, or demolitions are reviewed for compliance with storm water regulations. The Fire Department also performs multiple reviews and notifies the appropriate division in the event of a discrepancy or nonconformance. The coordinated involvement of all Divisions and disciplines provides an elevated degree of assurance that all projects are subjected to thorough scrutiny as part of the normal review process. Particulars surrounding the project approval and process verification are discussed in the following sections.

2.4.2 Source Characterization

Understanding and identifying pollutant sources is a basic component in developing a comprehensive storm water mitigation program. Sufficient data exists to support the claim that a particular land use will generate, or potentially generate, certain types of pollutants.

Table 3 of the Interim SUSMP identifies ten (10) individual "Project Categories" that are known to contribute pollutants based upon land use type. The pollutants associated with various land uses are categorized as being anticipated or potential; depending on site specific conditions. All projects, i.e. Priority Development and Standard Development Projects, are required to identify "Pollutants of Concern from the Project Area" as part of the SWMP or Runoff Assessment Report (RAR). Once identified, the project shall implement appropriate BMPs to mitigate the pollutants generated by the project area. The Project Categories and General Pollutant Categories appear in Table 3 of the Interim SUSMP.

2.4.3 Best Management Practice Requirements

The Municipal Permit dictates minimum BMP requirements for all new development and redevelopment projects. The requirements are included in the City Storm Water Ordinance and Interim SUSMP and shall include, but not be limited to, the implementation of the following BMPs and LID practices by the project proponent:

- Source control BMPs that reduce storm water pollutants of concern in urban runoff, including storm drain stenciling and signage, properly designed outdoor material storage

areas, properly designed trash storage areas, and implementation of efficient irrigation systems;

- Low Impact Development (LID) BMPs where feasible to maximize infiltration, provide retention, slow runoff, minimize impervious footprint, direct runoff from impervious areas into landscaping, and construct impervious surfaces to minimum widths necessary;

- Buffer zones for natural water bodies, where feasible. Require the project proponent to implement other types of buffers such as trees or access restrictions where conventional setbacks are not feasible;

- Measures to mitigate discharges of pollutants that result during grading or construction activities as specified in the Section D.2 of the Municipal Permit; and

- Submittal of a mechanism under which ongoing long-term maintenance of all structural post-construction BMPs will be conducted.

These minimum storm water BMP requirements are an integral part of the City standard conditions of approval and are required of all projects receiving discretionary permits. The City will not support the entitlement of a project or issue development permits until the appropriate Interim SUSMP documents are reviewed by City staff and approved by the City Engineer. Any subsequent changes that affect the approved BMPs will be subject to an amendment process that includes review by City staff and approval by the City Engineer.

2.4.4 Program Implementation

2.4.4.1 SUSMP Revision

During this reporting period the City adopted an Interim SUSMP which includes revisions that conform to the requirements of the Municipal Permit. In addition, a permanent full-time staff member was added to the Engineering Division; assigned with the task of reviewing SUSMP documents for conformance with the Interim SUSMP and for ensuring that related engineering plans are consistent with the approved SUSMP documents.

The most significant changes to the SUSMP are related to LID practices and the Hydromodification Plan (HMP). At present, the City is collaborating with the other Copermittees to adopt a detailed Hydromodification Plan (HMP) by participating in shareholder meetings and sessions of the HMP TAC. The final HMP is not expected to be complete until the middle of 2009; however, the City has established and will continue to implement Interim Hydromodification Criteria until the final HMP is approved.

There are provisions in the Interim SUSMP that require the project to evaluate the conditions of concern as determined in a drainage study report. The drainage study report considers the project location with respect to the entire watershed, topography, soil and vegetation conditions, percent impervious area, natural and infrastructure drainage features, and other relevant hydrologic and environmental factors. The drainage study report is also required to discuss watershed conditions based upon field observations and provide an evaluation of future impacts based upon the findings and the proposed development.

The drainage study report shall compute rainfall runoff characteristics from the project area including, at a minimum, peak flow rate, velocity, time of concentration, and total runoff volume or detention volume. These characteristics shall be developed for the 2- year, 10-year, and 100-year frequency, six-hour or 24-hour, Type I storm for the coastal areas of San Diego County (as described in the San Diego County Hydrology Manual, September 2002). The largest peak flow shall be included in the drainage study report.

There are existing provisions in the SUSMP which parallel the HMP requirements for demonstrating that no adverse impacts to the downstream habitats or channels will occur as a result of development. These SUSMP provisions remain in effect for all projects during this interim period. Currently, all Priority Projects disturbing 50 or more acres are required to comply with the Interim Hydromodification Criteria, except for those sites that are considered exempt as described in Section D.1(6) of the Municipal Permit. There are no active projects in the City of Oceanside that are disturbing more than 50 acres during this reporting period. The City Interim Hydromodification Criteria and a time table for development of the HMP are located in Sections 4.4.3.1 and Section 4.4.4.4, respectively, of the 2008 JURMP.

The Municipal Permit includes LID practices. The addition of LID practices lends direct support to the HMP component by providing a broad spectrum of design concepts aimed at minimizing the introduction of pollutants and offsetting the conditions of concern associated with impacts to the hydrologic regime. LID practices are included in the Site Design BMP discussion of the Interim SUSMP.

Another inclusion from the Municipal Permit to the Interim SUSMP is a Treatment Control BMP discussion which provides a direct correlation to pollutant types and physical characteristics that enable transport. This information assists the design professional in developing an effective BMP "treatment train" and facilitates the pursuit of the MEP standard. The Interim SUSMP is available at the City of Oceanside – Engineering Division counter or may be downloaded from the City website at http://www.oceansidecleanwaterprogram.org/pdf/OceansideSUSMP.pdf

2.4.4.2 SUSMP Document Review

Each new development and redevelopment project is required to complete the Urban Runoff Threat Assessment Form – Attachment D of the Interim SUSMP. The form and associated development plans provide staff with information to perform a SUSMP determination. SUSMP determinations are performed on a case-by-case basis. A SUSMP determination typically places the vast majority of projects into a Priority Development or Standard Development category.

A very limited number of projects are not required to submit a SUSMP document and are noted as SUSMP exemptions. A SUSMP exemption differs from a SUSMP wavier of infeasibility. The City has never granted a waiver of infeasibility to a Priority Project and does not anticipate granting waivers in the future; however, if waivers are necessary, the City may elect to develop a waiver mitigation program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the project watershed.

A project with a SUSMP exemption is not categorized as a Priority or Standard Project; is not subject to permanent storm water requirements, and does not have a greater than "low" threat to water quality construction prioritization, pursuant to Section 1, Part A and Part B of the Urban Runoff Threat Assessment Form. Projects which are granted a SUSMP exemption typically involve incidental construction with negligible ground disturbance. Examples include the addition of an antenna to an existing cellular tower or interior tenant improvements to an existing building.

The overwhelming majority of new development and redevelopment projects are subject to the provisions of the Interim SUSMP. Projects are identified as Priority Development or Standard Development projects based upon land use categories and applicability of permanent storm water BMPs pursuant to Section 1 of the Urban Runoff Threat Assessment Form.

2.4.4.3 Priority Projects

Priority Projects are required to obtain an approved Storm Water Mitigation Plan (SWMP) as part of the entitlement process. The items required in a SWMP are described in Section 2.2.2 of the Interim SUSMP. In summary, Priority Projects must determine the Primary Pollutants of Concern based upon source characterization and impacts to the 303(d) impaired receiving waters. This category of development is required to provide Source Control BMPs while implementing LID practices and Site Design BMPs. The project must incorporate Structural Treatment Control BMPs into the site development. The selected Treatment Control BMPs must have a medium to high removal efficiency for the identified Primary Pollutants of Concern. The Treatment Control BMPs with low pollutant removal efficiencies are not permissible in the City of Oceanside.

Priority Projects must also have an approved Operation and Maintenance Plan (O&M Plan) and enter into a Storm Water Facilities Maintenance Agreement (SWFMA) to ensure the long-term maintenance and operation of the Treatment Control BMPs. The City Engineer will not consider Priority Project structural Treatment Control BMPs "effective," and therefore will not accept storm water BMPs as meeting the MEP standard, unless a mechanism is in place that will ensure ongoing long-term maintenance of all structural BMPs. This mechanism shall be proposed by the project proponent as part of the SWMP and will be refined though the City's review process until satisfactory verification of maintenance is provided to the City Engineer. Such verification may include but is limited to covenants, legal agreements, maintenance agreements, and/or conditional use permits. A security may be required.

2.4.4.4 Priority Project Example

An example of a Priority Project is the Camino Town & Country Shopping Center (South) (Discretionary Permit No. P-4-07 and D-3-70REV.05). The project represents a commercial redevelopment site and encompasses a 4.4 acre watershed. The site is divided into two distinct drainage basins based upon restaurant and parking lot land uses. The project Site Design BMPs include minimizing impervious area, maximizing rainfall interception, and minimizing directly connected impervious areas.

The project incorporates a number of Source Control BMPs which include prohibitive dumping signage and stenciling, outdoor and trash storage areas designed to reduce pollutant introduction. The Center also incorporates an efficient irrigation system and landscape design.

The Treatment Control BMPs are designed to mitigate the nutrients and bacteria indicators. The restaurant component is isolated from the surrounding watershed by a trench drain. Low-flows are captured in the drain and conveyed to a proprietary underground detention facility. The detained flows represent the 85th percentile volume for the restaurant watershed. Runoff contained in the detention facility is conveyed to a proprietary self-contained wetland Treatment Control BMP marketed under the trade name "StormTreat™". The treated flows are directed by underground private storm drain to an existing grated curb inlet. The grated curb inlet captures flows from the upstream parking lot. The combined parking lot and treated restaurant flows are conveyed by private storm drain to a "Nutrient Separating Baffle Box™"; a proprietary linear hydrodynamic separator. The treated flows form a confluence with an MS4 which conveys runoff from the larger area-wide watershed to a stable, established outfall location on the northern bank of the Buena Vista Creek.

2.4.4.5 Standard Projects

Standard Projects are required to obtain an approved Runoff Assessment Report (RAR). The items required in a RAR are listed in Section 2.2.2 of the Interim SUSMP. Standard Projects must also identify the anticipated and potential pollutants based upon land use. The projects are required to implement Source Control and Site Design BMPs, and LID practices. Standard Projects are not required include Treatment Control BMPs. As such, the projects are not required to provide an O&M Plan or enter into a SWFMA.

2.4.4.6 Adequacy of Proposed Plans

The City Engineer will review submitted SUSMP documents and other relevant plans for compliance with the applicable SUSMP requirements. The City Engineer may approve proposed alternatives to the BMP requirements in the City's SUSMP if they are determined to be applicable and equally or more effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs and will be requested as part of a staff review cycle. The SWMP or RAR will be deemed complete when the City Engineer determines that the project complies with the Interim SUSMP. Project status is tracked by database and confirmed by hardcopy records.

2.4.4.7 Inspection

The City has compiled Treatment Control BMP information for all approved Priority Projects. All installed Treatment Control BMPs are regularly inspected by City inspectors to ensure intended function and proper maintenance. Inspection frequencies are based on the project's assigned Threat to Water Quality (TTWQ) as determined by Interim SUSMP Attachment D, the Urban Runoff Threat Assessment form. The Municipal Permit dictates that high priority sites shall be inspected annually and medium priority sites are to be inspected every two-years. Low priority site are inspected as needed. In addition, the Municipal Permit requires a minimum of 20% of the total number of projects with approved Treatment Controls and a maximum of twice the average number of projects with Treatment Control BMPs approved per year will be inspected annually. The Municipal Permit dictates 50% of all medium priority sites with

drainage inserts will be inspected annually. City Inspection staff performed a total of 41 SUSMP inspections during this reporting period.

It is the responsibility of the inspection staff to ensure that all BMPs proposed for the project have been built according to the construction plans before signing off on each stage of construction. The inspectors will use the project's plans to identify any missing or incorrectly installed structural BMPs and deny approval for sites with observed problems. City Staff inspected all Priority Projects subject to SUSMP requirements prior to occupancy to ensure that all LID, Source Control, and Treatment Control BMPs proposed for the project have been constructed in compliance with all approved plans and City permits and ordinances. Inspections of Priority Project sites prior to occupancy allows the City to verify that all BMPs are in place before any anticipated pollutants associated with the occupied use of the site are generated.

Since installation of structural BMPs will be closely inspected and signed off during regular grading and building inspections, the City does not expect major deficiencies in BMP installation to be found once construction is completed. However, some Treatment Control BMPs, such as filter inserts, are usually installed post-construction and thus may not be checked during grading and building inspections. To address this, correct BMP installation is also examined during the final project inspection, and building inspectors sign off on the final "red line" drawings that include any approved changes that were made to the plans during the course of construction. This provides City personnel with the ability to check the constructed project against the approved storm water documents. If any BMP, including filter inserts, is noted to be missing or incorrectly installed by City inspectors during or upon completion of construction, the City will require project to correct BMP deficiencies.

Inspections will include examination of all Treatment Control BMPs at the site to verify that each Treatment Control BMP is in working order, being maintained properly, and is in compliance with all applicable City ordinances and permits. Inspection findings will be documented by the inspector using the City of Oceanside Treatment Control BMP Inspection form in Appendix D of the 2008 JURMP. Deficiencies in Treatment Control operation and maintenance are noted during the inspection, the responsible party is notified and appropriate enforcement actions take place as described in Section 4.4.4.9 of the 2008 JURMP, in order to achieve compliance. Inspection findings and follow-up actions for Treatment Control inspections are included in the City Treatment Control BMP tracking database.

The City will require annual verification of proper maintenance of all treatment control BMPs by the responsible party for maintenance prior to the start of the rainy season. The City requires all Priority Projects to include Operation and Maintenance checklists and a self-inspection log for the site's Treatment Control BMPs found in the project SWMP. The City will require these forms to be completed by the site's responsible party and be submitted to the City annually. The annual maintenance verification of Treatment Controls by the party responsible for maintenance is unlike any current program within the City. Due to this circumstance, the City anticipates re-evaluation its annual maintenance verification procedure to conform to current Municipal Permit requirements.

The City will use a variety of enforcement methods to ensure storm water requirements for all development projects within the City's jurisdiction are implemented. Enforcement measures will escalate with continued violations as necessary. A detailed description of the different enforcement measures used by the City of Oceanside to enforce its storm water regulations can be found in Section 2 of the 2008 JURMP.

The current plan check process includes steps to enforce the implementation of development requirements during construction. Since all Treatment Control BMPs are required to be shown on the project's plans, inspectors check to make sure these BMPs have been correctly installed during their routine inspections. Errors in BMP installation are noted during plan checks. Projects are required to promptly correct errors until BMP installation is consistent with the approved plan.

Enforcement of post-construction BMP maintenance after occupancy will include verbal and written warnings and monetary penalties. All enforcement actions will be documented appropriately in the development project's database file. If a development site receives frequent citations or is not responsive to previously issued enforcement actions, more severe actions, such as court actions, will be used as necessary. Details surrounding the City Treatment Control BMP inspection program may be found in Section 4.4.4.7 of the 2008 JURMP.

2.4.4.8 2007-2008 SUSMP Document Submittal and Review Summary

Numerous SUSMP document reviews were performed during the 2007-2008 reporting period. There were 184 Priority Project SWMP submittals which prompted 374 reviews with a total 36 projects receiving approval. Projects which Amended previously approved SWMPs from this reporting period and others; totaled 26 project Amendment submittals resulting in 53 reviews and yielding 22 approved SWMP Amendments.

There were a total of 12 Standard Projects which submitted RARs during the reporting period. The project submittals generated a total of 19 reviews; resulting in 4 projects receiving an approved RAR.

During the reporting period there were 27 Priority Projects that submitted O&M plans as part of the final engineering component. There were a total of 67 reviews performed with a total of 18 O&M Plans receiving approval. The SWMFA is typically submitted with O&M Plan. Some projects elect to "trail" the SWFMA submittal. During this reporting period 16 SWFMAs were submitted, prompting 30 reviews, resulting in 9 approved agreements.

All projects are subject to a SUSMP Determination. The determination process places the majority of developments into Priority Projects or Standard Projects. A small number of projects were found to be exempt from SUSMP requirements. Projects which are granted a SUSMP exemption typically involve incidental construction with negligible ground disturbance. Examples of projects that are eligible to receive an exemption include interior tenant improvements to an existing structure or the addition of an antenna to an existing cellular tower.

A SUSMP exemption differs from a SUSMP wavier of infeasibility. The City has never granted a waiver of infeasibility to a Priority Project and does not anticipate granting waivers in the future; however, if waivers are necessary, the City may elect to develop a waiver mitigation

program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the project watershed. There were no SUSMP waivers of infeasibility granted during this reporting period. See Table 2-1 for more detail on project submittals and review results.

Table 2-1. 2007-2008 SUSMP Document Submittal and Review Summary

2.4.4.9 Outreach and Staff Training

City officials involved in planning and review of development projects received a comprehensive training on storm water requirements during this reporting period. See Table 2-2 for the departments and city officials that were provided training. Training topics during this reporting period focused on general water quality concepts, specific SUMSP requirements, LID components that can be recommended for specific projects, implementation procedures and minimal information about future HMP components.

Table 2-2. Staff Training during the 2007-2008 Reporting Period.

Department/Commission	Training Date	Number in Attendance
Planning Commission	April 7, 2008	7
Planning Department Staff	June 10, 2008	10
Engineering Inspectors	June 12, 2008	10
Building Division	July 30, 2008	12

2.5 Development Planning Component Effectiveness Assessment

See Section 11.0 for an assessment of the development planning component of the City's JURMP.

2.6 Program Review and Modification

The Development Planning components of this Report, the City JURMP, and the SUSMP will be revised as necessary to conform to the future requirements of the Municipal Permit. Major revisions to the Development Planning component will be cited in Section 14 of the City JURMP.

3.0 CONSTRUCTION COMPONENT

3.1 Introduction

Construction and grading activities have the potential to impact neighboring water bodies due to the presence of disturbed soils and building materials. It is important that construction sites take appropriate measures to prevent potential pollutants from entering the storm drain system.

The purpose of the construction component section of the City's JURMP is to provide guidance in order to limit the negative impact that construction and grading activities can have on receiving water bodies. The information in this section of the annual report describes how the City of Oceanside met the minimum requirements outlined in Section D.2 of the Municipal Permit Order 2007-0001 to reduce the release of pollutants into the storm drain system to the Maximum Extent Practicable (MEP) (Table 3-1).

Table 3-1: Order 2007-0001 Compliance Summary

D.2.a Ordinance Update and Approval Process	See Section 3.3 of this Annual Report
D.2.b Source Identification	See Section 3.2 of this Annual Report
D.2.c BMP Implementation	See Section 3.4 and 3.5 of this Annual Report
D.2.d Inspection of Construction Sites	See Section 3.5.2 of this Annual Report
D.2.e Enforcement of Construction Sites	See Section 3.5.3 of this Annual Report
D.2.f Reporting of non-compliant sites	See Section 3.5.3 of this Annual Report

A large portion of the Construction Component of the City's JURMP is described in three documents:

- Chapter 40 of the City Code or Ordinances
- City's Grading Regulations Manual
- City's *Construction Urban Runoff Requirements Manual* (Construction Manual).

All of these documents are available on-line via the City's website.

This section of this annual report primarily discusses those portions of the Construction Component that are not contained within these documents and references these documents for additional information where appropriate. The information presented in this section was developed pursuant to Section D.2 of the Municipal Permit.

The Construction Manual was developed by the City to provide construction projects with guidance in order to comply with the City Code and its ordinances. The Construction Manual is a living document and will change with time to ensure an effectively implemented program. Updated versions of the manual will be made available whenever modifications have been proposed and approved by the City. During this reporting period some changes were made to the Construction Manual which are detailed below.

- Exempt projects and low priority SWPPP forms are no longer used since specific criteria are now referenced to determine if a project is required to develop a SWPPP. For updated language that complies with Permit Order 2007-0001 refer to Section 3.1 of the Construction Manual submitted as Appendix C.1 with the City's 2008 JURMP.
- Added requirement that all employees working at the construction site should be aware of the BMPs for the site.
- New BMPs have been added to meet Municipal Permit requirements. The BMP table has been altered to include a single set of BMPs required for all Regulated Construction Sites. The Manual states that these BMPs will be implemented "as applicable", which provides enough flexibility for sites of all priorities to implement only those BMPs necessary to meet the City's MEP standard.
- Updated construction site inspection frequencies in Chapter 6 to meet requirements for Permit Order 2007-0001.
- Maximum Disturbed Area limit and the Advance Treatment Methods have been added.
- Added a definition for the new Municipal Permit in the Definitions section.

3.2 Source Characterization

3.2.1 Site Inventory

The City has compiled a watershed-based inventory of all active construction sites within its jurisdiction. The inventory includes details on each construction site, including project name, location, and threat to water quality (TTWQ) as determined by the process described in Section 5.2.1.1 of the 2008 JURMP

The City's inventory process for construction sites is based on information collected from construction projects when they are applying for a grading or building permit. When the permit is approved, this information is then entered into a database developed by the City. If a permit was previously issued for a project, then the database is updated to reflect the most up-to-date information. Although the City's inventory process is an ongoing one, prior to the rainy season, the database is reviewed to ensure that it is up-to-date and cross-referenced with any other applicable databases to ensure completeness. A spreadsheet of active construction projects in the City's jurisdiction as of June 30, 2008 can be found at the end of this section as Table 3-2.

3.2.2 Construction Site Prioritization

All construction sites within the City's jurisdiction are assigned a priority of high, medium, or low TTWQ. Following are criteria used to determine the level of TTWQ.

Construction sites that meet any of the following criteria are considered a **High** TTWQ:

- A site 50 acres or more in size where grading will occur during the wet season.
- A site one acre or more and tributary to a CWA section 303(d) water body segment impaired for sediment or within, directly adjacent to, or discharging directly to a receiving water within an ESA.
- A site that has been determined by the City or the RWQCB to pose a significant threat to water quality.

Sites that are greater than one acre but do not meet any of the above criteria are considered a **Medium** TTWQ.

Sites less than one acre and are not determined to be a significant threat to water quality are considered a **Low** TTWQ. See Table 3-2 at the end of this section for a list of active construction sites and their assigned TTWQ.

Construction projects determine their TTWQ priority by completing the City's Urban Runoff Threat Assessment Form (Appendix D of the 2008 JURMP Update). This form contains information from the City's Construction Urban Runoff Requirements Manual (Construction Manual) on how to evaluate a construction site's TTWQ. The City's full Construction Manual can be found in Appendix C of the 2008 JURMP Update. The Urban Runoff Threat Assessment form requires all construction sites to respond to the following questions when assigning priority:

- Item 1: Are you grading or otherwise disturbing soil over more than one acre?
- Item 2: Will the project involve grading or soil disturbance?
- Item 3: Is the project tributary or adjacent to environmentally sensitive water bodies within the City?
- Item 4: Does the project include significant erodible slopes?
- Item 5: Does the project have the potential to produce non-storm water discharges or pollutants?
- Item 6: Will the project result in more than 5,000 square feet of impervious surface area?

All project proponents are directed to reference a prioritization matrix to determine the priority of the project. An example of the matrix is provided as Table 3-3 below. The matrix is used by first locating the appropriate row in the matrix according to the size of the project, then moving across the row. The proponent should refer to the answers given to the five questions above. If "Yes" was responded to a question, the corresponding box in the matrix provides the priority for the project. The use of this matrix was developed consistent with the requirements of the Permit Order 2007-0001. Under this process, construction sites that meet either of the following conditions must be classified as High Priority. An inventory of Development Projects with approved Treatment Control BMPs and its associated TTWQ are included as Table 3-2 at the end of this section.

Table 3-3. Construction Project TTWQ Prioritization Matrix.

Project Size	Item 2	Item 3	Item 4	Item 5	Item 6	Default Priority
Greater than 50 acres	High	High	High	High	High	Medium
5□50 acres	□	High	High	High	High	Medium
1□5 acres	□	High	Medium	Medium	Medium	Medium
Less than 1 acre	□	Medium	Medium	Medium	Medium	Low

3.3 Updates to Ordinances and Approval Processes

During this reporting period there were no updates to the City's ordinances or approval process. Storm water compliance requirements for construction activities are included in the City's Construction Manual found in Appendix C of its 2008 JURMP.

Once the City revises its SUSMP, the Construction Manual will again be reviewed and changes will be made appropriately. In addition, ordinances will be reviewed to make sure they reflect the information in the SUSMP and allow for LID components to be implemented into development projects.

3.4 Best Management Practice Requirements

The City has a set of minimum Best Management Practices (BMPs) that must be implemented at all construction sites regardless of TTWQ priority including implementing and maintaining general site management BMPs and erosion and sediment control BMPs to reduce, retain, and manage pollutant discharges to the MEP. Table 5-2 of the City's 2008 JURMP (pp. 5-4 and 5-5) outlines the minimum construction BMPs required by the City along with the reference to corresponding current fact sheets obtained from the Caltrans Storm Water Quality BMP Handbook and California Stormwater Quality Association (CASQA) for Construction Sites.

A Construction BMP brochure titled "A Pollution Prevention Guide for the Construction Industry" is provided to the developer during pre-development meetings. This brochure provides a sample drawing that illustrates the minimum BMPs that must be used at all construction sites to protect storm drains and minimize pollution. See Attachment 3-A for a copy of this brochure. This brochure is also available at both the Engineering and Building Department counters of the City. During this reporting period this brochure was reviewed, revised and reprinted.

3.5 Program Implementation

All construction sites are required to select, install, and maintain BMPs that meet or exceed the City's minimum BMP requirements listed in Section 5.4.1 of the 2008 JURMP and in the City's Construction Manual. Additionally, a construction site over one acre where grading will occur is subject to the National Pollutant Discharge Elimination System (NPDES) General Construction Permit and is required to file a Notice Of Intent (NOI) and develop a Storm Water Pollution Prevention Plan (SWPPP). SWPPPs are required to include a list of BMPs that will be implemented during each phase of construction to reduce pollution discharges to the MEP.

3.5.1 Education and Staff Training

Site owner/developer education and training

The City provides all appropriate parties involved with construction activities with training and informational materials regarding storm water quality, as applicable. These parties include but are not limited to City employees and project proponents, which can include contractors, subcontractors, developers, property owners, and superintendents. Education and training of the development community in Oceanside is typically done on a project-by-project basis during a mandatory pre-construction meeting with the City and during construction site inspections.

Prior to the issuance of permits, construction site owners and developers meet during a –pre-construction meeting with City staff and developer staff and or contractors, subcontractors and superintendents. During these meetings City staff from various departments review what is expected of the project proponent in order to develop the project. At least one engineering inspector and Code Enforcement officer trained in conducting storm water inspections are present at these meetings. Topics covered during these meetings specific to storm water pollution prevention include:

- Grading - Reference to the City of Oceanside Grading Regulations manual and the BMP Construction manual (both available on the City's website).
- Site Plan review for storm water inlets and associated BMPs
- Review of site-specific BMPs more applicable to the site and associated with the potential pollutants that could be generated from the proposed business operations
- Inspection Requirements and Frequency – Unannounced and upon call-outs from the public
- Expectations of BMPs during dry and wet seasons
- Construction BMP Brochure is provided

Prior to wet season, all currently permitted construction sites will be contacted to remind site owners and developers to assess, repair and update their sites BMPs to reduce erosion potential and prevent storm water pollution. Site owners and developers are also advised to update their erosion control plans and SWPPPs that are applicable to the site.

Municipal Staff Training

City staff directly involved with development and construction sites are provided training on a departmental basis. For further details on topics covered during the City's construction educational program, please refer to Sections 10.2.2 and 10.3.1 of the City's 2008 JURMP. During this reporting period four groups were provided training in regards to erosion control and BMP installation and maintenance for construction sites. See Table 3-4 below for those who received training.

Table 3-4. Municipal Staff Training.

Department Commission	Training Date	Number in Attendance
Planning Commission	April 7, 2008	7
Planning Department Staff	June 10, 2008	10
Engineering Inspectors	June 12, 2008	10
Building Division	July 30, 2008	12

3.5.2 Inspection of Construction Sites

Permit Order2007-0001 requires that the City develop and implement an inspection program to ensure that each construction site properly complies with the City's relevant ordinances, permits, and the Permit Order2007-0001. This section describes the City's inspection program for 2007-08 of construction sites developed in accordance with Part F.2.g of the Permit Order2007-0001.

Each project was assigned a storm water inspector who was tasked with conducting inspections at the site throughout the construction phase of the project. All storm water inspectors have been

educated in the requirements of the Permit Order2007-0001 and through in-house training and seminars, and/or construction-specific certificate training seminars.

During this reporting period the Urban Runoff Construction Site Inspection Report form for construction sited used by inspectors was revised and reprinted. A copy of this revised form is provided as Attachment 3-B.

3.5.2.1 Initial Site Inspections

Upon commencement of work at a construction site, a City inspector will visit the site and perform the following:

- Where applicable, a check for proof of coverage under the General Construction Permit.
- A review of the SWPPP (where applicable) and erosion control plans with the appropriate project proponent on site.
- A check for proper implementation of the BMPs outlined in the projects plans.
- A review of the maintenance schedule and procedures for each BMP.

All construction sites in the City's construction site inventory receive initial site inspections regardless of TTWQ priority. If any required documents or BMPs are found to be missing or deficient, the City may issue a stop work notice until the deficiencies are corrected.

3.5.2.2 Routine and Follow-Up Inspections

Once an initial site inspection is performed, additional routine inspections will be performed. The frequency of these routine inspections depends on the site's assigned TTWQ. The criteria used to determine a construction site's TTWQ presented in Section 5.2.1.1 were developed to correspond to the routine inspection frequencies required by the new Municipal Permit. Table 3-5 presents the different TTWQ categories and their corresponding minimum inspection frequencies for the wet (October 1 through April 30) and dry (May 1 through September 30) seasons.

Table 3-5. Construction Site Inspection Frequency

Construction Site TTWQ	Wet Season Inspection Frequency	Dry Season Inspection Frequency
High	Every two weeks	As needed
Medium	Monthly	
Low	As Needed	

3.5.3 Enforcement Measures for Construction Sites

The City will be responsible for enforcement of applicable local ordinances and permits at all construction sites in its jurisdiction. When violations are observed and documented during a site inspection, the City will implement appropriate enforcement measures based on the severity of the violation. Enforcement can range from written warnings to more severe enforcement such as stop work notices. Stronger enforcement measures will be used as necessary if proper corrective actions are not implemented during the allotted time frame or if the severity of the violation warrants stricter enforcement.

The typical progressive enforcement steps that the City will implement include the following:

- Written warnings
- Enforcement of contracts (Municipal projects)
- Stop work notices
- Administrative citations
- Denial or revocation of permits
- Civil and/or criminal court actions

A summary of the initial phase of enforcement actions is shown in Table 3-6 below. Copies of inspection forms and notices are on file at the City.

Table 3-6. Accounting of Initial Phase of Construction Inspection and Enforcement Actions for the 2007-2008 Reporting Period.

	Construction Sites Requiring Inspections	Routine and Follow-up Site Inspections	Meetings or Calls w Site Contact	Correction Notices	Stop-Work Notices	Cases Forwarded to Code Enforcement for Further Action
High Priority Sites	23	1,416	420	57	6	9
Medium Priority Sites	18	1,110	726	39	8	8
Low Priority Sites	9	561	210	21	15	8
Total	50	3,087	1,356	117	29	25

Enforcement actions by Code Enforcement Officers for construction sites begin with a referral from another department, a site visit, or by a complaint lodged via phone. Depending on the severity of the violation, follow up activities may include phone calls, site visits, written correction notices with specified compliance timeframes, or administrative warnings. If these actions do not produce the required improvements, administrative citations (starting at $100 with a $1,000 maximum fine) and/or stop-work notices are given.

A summary of enforcement actions conducted for construction sites by Code Enforcement Officers is included in Table 3-7. More details about enforcement actions during this reporting period are available on file at the City.

The City is required to provide notification to the RWQCB of non-compliant sites in the City that are determined to pose a threat to human or environmental health. Verbal notification is required within 24 hours of the discovery of non-compliance and a written report should be submitted to the RWQCB within 5 days of the incident. The criteria established for determining when a site is not compliant and poses a threat to human or environmental health is described in Section 3.8 of the Industrial Component. No such sites were identified this reporting period and thus no relevant notifications were sent to the RWQCB.

Table 3-7. Summary of Construction Site Code Enforcement Actions for 2007-2008 Reporting Period.

	Follow-up Phone Call	Follow-up Site Visit	Follow-up Office Visit	Written Notice	Letter Sent	Inspection Report	Admin. Warning	Administrative Monetary Citation	Referral to Other Dept	Stop Work Notice
Number of Actions	16	53	1	0	0	0	5	6	0	0

3.6 Construction Activities Effectiveness Assessment (Optional)

See Section 11.0 for an assessment of the Construction Component of the City's JURMP.

3.7 Program Review and Modification (Optional)

The Clean Water Program will continue to review and modify the construction component as needed. Staff will work with other City departments and their data tracking systems to ensure that the details of inspections, complaints, and follow-ups will be tracked appropriately to be included in future annual reports as discussed further in Section 15.

4.0 MUNICIPAL COMPONENT

4.1 Introduction

This section documents the activities conducted by the City of Oceanside at its municipally owned, leased and/or managed facilities during the 2007-2008 reporting period to meet the requirements of Section D.3 of Municipal Permit Order 2007-0001. The City of Oceanside owns and/or maintains a variety of municipal facilities including public parks, administration buildings, fire stations, a fire training facility, industrial facilities, potable reservoirs, sewage pump stations, wastewater treatment facilities, public roads, streets and parking facilities and other miscellaneous facilities. Additionally, the City conducts activities that have a high threat to water quality such as power washing, street and sidewalk repair, painting, graffiti removal, parking meter maintenance, MS4 maintenance, and regular upkeep of the sanitary sewer system to prevent overflows and leaking.

Order 2007-0001 Compliance Summary

D.3.a Municipal (Existing Development)	Section 4 of this Annual Report
D.3.a(1) Source Identification	See Section 4.1.1 of this Annual Report
D.3.a(2) BMP Implementation	See Section 4.2.3, 4.3.3, 4.4.3,4.5.3, 4.6.3, and 4.8.3 of this Annual Report
D.3.a(3) Maintenance of MS4	See Section 4.4 of this Annual Report
D.3.a(4) Management of Pesticides, Herbicides and Fertilizers	See Section 4.3.3 of this Annual Report
D.3.a(5) Sweeping of Municipal Areas	See Section 4.2 of this Annual Report
D.3.a(6) Sanitary Sewer	See Section 4.5 of this Annual Report
D.3.a(7) & (8) Inspection and Enforcement of Municipal Areas and Activities	See Sections 4.2.5,4.3.3, 4.4.2, 4.5.3, 4.6.4, and 4.7.3 of this Annual Report

To comply with the Municipal Permit, the City of Oceanside has developed a comprehensive program designed to reduce the amount of pollutants that are transported in urban runoff from municipal areas and municipal activities. Some of the prominent activities include street sweeping, inspections of municipal facilities, installation of BMPs at the City Operations Centers and educational efforts geared toward municipal personnel.

The City continues to use its Municipal Urban Runoff Procedures Manual (Municipal) as a useful reference document for training staff and developing and implementing educational programs. The Municipal Manual contains BMP requirements and related guidance for City facilities and employees and was circulated to relevant City staff directly involved with the Municipal NPDES Permit. This manual was first prepared as part of the JURMP in 2002 and updated and provided with the 2008 JURMP. See Appendix C.3 of the 2008 JURMP for this manual. Changes made to this manual during this reporting period are detailed below.

- General Changes
  - References to BMPs for specific priorities of municipal facilities were removed or changed – BMPs should be based on activity or facility type and not priority.
  - Background information was updated to include new Municipal Permit information (See Comment 1)
- Chapter 3, formerly "General Requirements for High Priority Municipal Areas and Activities" was removed entirely. All information from this section was moved to Chapter 2, "Requirements of All Municipal Areas and Activities". Information from Chapter 3 was moved because BMPs detailed in that section should be implemented by all municipal areas and activities, when applicable.
- Chapter 3 now includes activity-specific BMPs. The areas and activities discussed in this chapter are the high threat to water quality areas and activities designated by the Municipal Permit. BMPs for those that were the same in the last Municipal Permit are the same, but some areas and activities have been added. See Comments throughout Chapter 3 as some things were re-arranged. Typically, nothing was added to this section except where comments note and addition was made.
- Besides chapter numbers the Inspections, Enforcement, and Reporting and the Definitions have not been changed.

During this reporting period the Municipal Inspection Form was revised to add the municipal Permit Order Number 2007-0001. See Attachment 4-A for a copy of this form.

4.1.1 Source Identification

As required in Section D.3.a(1) of Permit Order 2007-0001, the City of Oceanside has developed a prioritized, watershed-based inventory of municipal properties and activities. The City of Oceanside maintains a number of municipal facilities, including parks, administrative buildings, fire stations, and public works yards. The inventory of municipal facilities, including areas and activities, will be updated annually. The inventory used for this fiscal year was submitted in the 2008 JURMP as Attachment B.3. An updated inventory will be submitted with subsequent annual reports. Table 4-1 provides a summary of the facility categories within the City's inventory.

Table 4-1. Summary of Municipal Facilities by Category.

Facility Category	Number of Facilities
Park and Recreation Facilities	45
Public Works Operations Facilities	3
Municipal Landfills	2
Marinas	3
Municipal Airport	1
Potable Water Facilities	13
Wastewater Facilities	37
Police and Fire Facilities	14
Other Fixed and Leased Facilities	34
Roads, Streets, Highways and Parking Facilities	33
Parks and Recreation Facilities	45
Total Facilities	**230**

4.2 First Municipal Element - Roads, Streets, Highways, and Parking Facilities

4.2.1 Background

Roads, streets, highways, and parking facilities are an integral part of any functional City. These facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control the level of pollutants, such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities. Other City activities include building new roads, resurfacing existing roads, and similar construction-related activities. All construction-related activities conducted by the City will continue to be conducted under the requirements of the construction component, which is described in detail in Section 3 of this document.

4.2.2 Source Characterization

The City of Oceanside maintains approximately 571 miles of public roads and streets throughout the City. The length of public roads was calculated in 2008 for inclusion in this annual report. A parking facility is defined as a stand-alone parking facility, which is a parking facility that is not associated and/or adjacent to other inventoried municipal facilities. Parking facilities that are associated and/or adjacent to municipal facilities will continue to be included in regular maintenance activities of the associated municipal facility. Roads, streets, highways, and parking facilities are included in the City's municipal inventory, which is included as Appendix B.3 on the City's 2008 JURMP.

4.2.3 Best Management Practice Requirements

Similar to municipal fixed facilities, the City will continue to utilize the City-developed Municipal BMP Manual to choose applicable BMPs to implement for public roads, streets, parking facilities and operational facilities within the City.

Street sweeping and cleaning continues to be the main BMP that is implemented for roads, streets, and parking facilities. The frequency of cleaning takes into account the following: variations in climate conditions, surrounding land use, design of existing structures, traffic volume, frequency and quantity of accidental spills and leaks, and areas with historical trash and/or debris problems. Treatment control BMPs will be used for road sections subject to SUSMP.

The City will continue to implement an aggressive street sweeping program to reduce the amount of pollutants discharged from roads, streets, and parking facilities in the City with a particular focus on facilities that drain to environmentally sensitive areas (ESAs). If in the future negative impacts to ESAs associated with runoff from roads, streets, highways, or parking facilities are noted, the City will take the measures necessary to mitigate the negative impacts.

4.2.4 Program Implementation

As an effort to reduce the pollutant load entering local receiving water bodies, the City continued to implement a sweeping schedule for roads, streets, highways, and parking facilities to meet the

requirements of the Municipal Permit. There have been no significant changes to the existing programs during the reporting period.

Roads, streets, and highways that have been observed as generating relatively high volumes of trash, sediment, and debris are included as high priority and will continue to be swept at least twice per month; medium priority streets are streets in the City that generate moderate volumes of trash, sediment, and debris and will continue to be swept at least monthly. Low priority streets have been observed as generating relatively low volumes of trash, sediment, and debris and will continue to be swept as needed, but not less than once per year. In the event of a National Holiday, sweeping is made up in a timely manner, usually by the next working day. Due to the City's proximity to the Pacific Ocean and as a means to target watershed constituents of concern, the City typically sweeps all streets within the City above baseline jurisdictional activity standards. Additional program details can be found in Section 6.3 of the 2008 JURMP.

All public streets in the City of Oceanside are swept at least monthly. There is a total of 571 miles of public streets that are swept regularly per the frequency outlined below. Double this length to accommodate for both east/west and north/south directions giving a total of 1,142 curb miles. Some streets are swept more frequently than others. During upcoming reporting periods these additional, curb length miles that are swept more than monthly will be calculated for a total curb mile length.

- Every Monday, Wednesday, and Friday, the downtown commercial areas and other high use areas are swept using regenerative air vacuum street sweepers. These areas include the medians on Mission Avenue, Canyon Drive, and the Civic Center Drive Bridge, Wisconsin Avenue to Pacific Street to Ditmar Street, the Strand, and all downtown parking lots.
- The majority of all other public streets, not included in the areas listed above, are swept every other week. In some low use residential areas, the streets may be swept monthly.
- As necessary, sweepers or other clean up crews will respond to public or municipal staff reports to collect debris and/or sweep.
- Inspection of streets and curbs for cleaning is continuous. City employees are encouraged to identify areas that should be cleaned and to call the municipal employee reporting line, Oceanside Eyes. Residents are encouraged to call the Public Works Maintenance Hotline.

4.2.5 Inspection and Maintenance Results

4.2.5.1 Inspections

Inspections and maintenance activities were conducted throughout the reporting period as described in the previous section. Following is a review of the results form inspection and maintenance.

There are 33 facilities in the Roads, Streets, highway and Parking Facilities categories. During this reporting period all 33 of these facilities were inspected by CWP staff. No violations were noted din these facilities during annual inspections. There was note of some debris and sediment near storm drain inlets that were taken care of immediately. Due to the fact that many of these parking facilities are swept very regularly, debris and sediment are removed on a very frequent basis.

4.2.5.2 Maintenance

Street sweeping activities resulted in the collection of over 2,358 tons of waste during the reporting period. These results are comparable with the 2,283 tons collected during the 2006-07 reporting period, the 2,538 collected during the 2004-2005 and the 2,604 tons collected during 2003-2004 reporting period. This data shows a promising trend in the reduction of street waste in the City.

4.2.6 Roads, Streets, Highways, and Parking Facilities Element Effectiveness Assessment

See Section 11.0 for an assessment of the Municipal component of the City's JURMP.

4.3 Second Municipal Element - Parks and Recreational Facilities

4.3.1 Background

The City of Oceanside is committed to providing the highest quality of service to its residents by providing the opportunity for them to enjoy a variety of recreational activities at both outdoor parks and indoor recreational facilities. Operating and maintaining 45 community attractions from public pools, beaches, parks and community centers, the City of Oceanside works hard every day to maintain the high level of service. The inspection and maintenance of these facilities in regards to storm water is important because of the number of facilities throughout the city and the public exposure that these facilities receive.

4.3.2 Source Characterization

The City regularly inspects, cleans and maintains 45 Parks and Recreational Facilities. Because of high public use these facilities have the potential to generate a variety of pollutants including trash and debris, organic material and sediment. See Table B.3-1 of the City's 2008 JURMP for the Parks and Recreational Facilities inventory.

4.3.3 Program Implementation

The City has selected BMPs to implement at Parks and Recreational Facilities to reduce the contribution of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers. These BMPs are detailed in the Municipal Manual. All 45 facilities were inspected during this reporting period with no violations noted.

Pesticides, herbicides and fertilizers are seldom used directly by the City, as it contracts out the majority of work involving these substances. To facilitate compliance with this Section of the Municipal Permit, the City has reviewed its landscaping contract and has integrated BMP requirements into the conditions of the contract.

4.4 Third Municipal Element Municipal Separate Storm Sewer System

4.4.1 Background

As required by Section D.3.a.(3) of the Municipal Permit, the City has implemented a schedule of maintenance activities for the City's entire Municipal Separate Storm Sewer System (MS4),

including any structural controls designed to reduce pollutant discharges to or from its MS4s and related drainage structures. The City has determined, through historical knowledge and records, the locations within the MS4 that require regular waste removal and those areas that are less likely to require any waste removal. The City has developed a comprehensive Flood Control Annual Maintenance Program which includes a list of the high priority areas, divided into zones, which are to be inspected annually using an inspection checklist. Approximately 110 sites are inspected and maintained annually.

4.4.2 Source Characterization

The Public Works, Street Division, performs ongoing inspection and cleaning of storm drains and flood control facilities, as well as annual maintenance of all major facilities such as creeks, desilting basins, detention basins and rock and concrete lined channels. There is approximately 10,000 feet of storm drain and 104 feet of concrete and earthen channels that are inspected and maintained throughout the city. Over 49,000 linear feet of storm drains, catch basins, and concrete and earthen channels are maintained on at least an annual basis. In addition, the Street Division performs annual maintenance/cleaning in September, October, and November for all major MS4 facilities. The results of this work are recorded on an Annual Maintenance List that is also available at the City Operations Center.

4.4.3 Best Management Practices

In order to inspect and clean storm drains as described above, during the May through September period, the City contracted with United Storm Water Inc. A total of 3252 structures (catch basins, manholes, inlets, outlets, etc.) were inspected and cleaned during the reporting period. 2,972 by United Storm Water and 280 were cleaned by City maintenance crews. A total of 65.5 tons of waste was removed. The waste generally consisted of trash, green waste, dirt, sand, roots, solids, rocks, and silt. During the inspections, it is also noted whether or not the drain is labeled. Out of the 2972 catch basins that were cleaned, 1,399 were labeled with a placard stating: “No Dumping – Drains to Creek” in both English and Spanish. During this reporting period 1,000 new drain markers were ordered for installation during Fiscal year 2008-09. See the photo below for a copy of the storm drain placard installed.

4.5 Fourth Municipal Element - Sanitary Sewer

4.5.1 Background

The City of Oceanside Sewer Division maintains the sanitary sewer system within the jurisdictional boundaries which includes sewer lines, lift stations, sewage treatment plants. This sanitary sewer system uses pipes to remove human waste from homes and businesses and

transport that waste to one of two waste water treatment plants in the City. The two treatment plants are operated by city crews.

4.5.2 Source Characterization

The City regularly inspects, cleans and maintains thousands of feet of sanitary sewer pipe, 31 sewer lift stations and two sewage treatment plants. See Table B.3-1 of the City's 2008 JURMP for the Wastewater Facilities inventory.

4.5.3 Best Management Practices

Since the City owns and operates the sewage system, these facilities are regularly inspected and maintained for proper operation and maintenance, and to ensure that BMPs are in place for the protection of receiving waters that may be impacted from the system. The City's preventive and corrective sewer maintenance programs consist of a variety of components provided for the operation, maintenance, repair and replacement of sewer mains, manholes, and pump stations.

In order to ensure that the sanitary sewer lines do not leak, the city has a long term plan to slip line the sewer pipes throughout the City. In June and July of 2008 (crossing two reporting periods), 7,252 feet of City sewer lines were slip lined and manholes pressure grouted and sealed in the Loma Alta watershed. The slip lining project was estimated to cost approximately $700,000.Since the 2005-06 reporting period the City has slip-lined a total of 13,231 feet of sewer. The City also inspected and cleaned 312 miles (1,649,702 feet) of sanitary sewer.

4.6 Fifth Municipal Element - City Operations Center

4.6.1 Background

The City Operations Center (COC) is a municipally owned and operated facility that houses several departments or divisions for the City including Public Works, fleet maintenance, road maintenance, parks and recreation maintenance and others. Because of the diverse activities of these departments and divisions, the City developed a Storm Water Pollution Prevention Plan (SWPPP) for the COC in the fall of 2002.

The COC includes the following areas: employee parking lot, COC main building (offices, storage and fleet maintenance), traffic control lot, back lot, city vehicle parking lot, large vehicle equipment lot, fueling area, waste disposal area, wash facilities, general use yard and west corner lot. The SWPPP has the following objectives:

- Identify and evaluate sources of pollutants from the facility that may affect the quality of urban runoff discharge and to identify and
- Implement site-specific best management practices to reduce or prevent pollutants in urban runoff discharges.

The SWPPP outlines BMPs to be implemented at each of the respective areas. A comprehensive training program was also developed and has been implemented in concert with the COC SWPPP.

4.6.2 Source Characterization

Due to the nature of the various activities form the departments and divisions it was determined that there are various activities that generate pollutants and have the potential to reach storm

water conveyance systems. Some of these activities include vehicle washing, disposal of street sweeping debris, temporary storage of wrecked vehicles, and storage of various materials, including paints, solvents, metal piping and infrastructure materials. In addition steep hillside landscaped areas can be a potential pollutant source if BMPs are not managed properly.

4.6.3 Best Management Practices

Since the implementation of the SWPPP at the COC some permanent BMPs have been installed and continue to be used for protection of receiving waters. Following is a brief description of the BMPs in place at the COC and any new BMPs installed during this reporting period.

4.6.3.1 Wash Facility

The main wash facility is used for washing large vehicles and equipment, and collection of street sweeper and vactor truck contents. The main wash facility is a completely contained area, surrounded on all sides by berms and curbs. The entire area drains to the eastern corner of the pad where it enters a grated inlet that leads to a clarifier and then the sewer. An overflow is available if the drain to the sewer is clogged or the volume of water exceeds its capacity, however, this is not anticipated to happen frequently because the drain is maintained daily.

4.6.3.2 Storm Drain Filters and other inlet BMPs

BMPs in place before reporting period

During previous reporting periods the Public Works Department installed two BioClean filters at the only two outlets which drain runoff from the City Operations Center: one on the south side of the COC where a 36” box outlet discharges directly into Loma Alta Creek, and one at the 12” pipe which discharges onto Oceanside Blvd. These filters were inspected and repaired as necessary during the late summer/early fall, spring and prior to forecast storms. Also a brushless filter was added to the 36” box outlet during prior reporting periods.

BMPs installed or changed during Fiscal Year 2007-08

During fiscal year 2007-08 three broom gate were installed at the COC. The outlets where these broom gates were installed at the COC are located at the southern property line next to the SDGE easement, Loma Alta Creek and Sprinter RXR. See the photo below for an example of the broom gate installed. During the next reporting period the effectiveness of the debris removal and the maintenance of these broom gates will be assessed.

During fiscal year 2007-08 the BioClean filter that was installed on the 12" pipe that discharges to Oceanside Blvd was removed due to constant clogging and replaced with fiber rolls around the inlet. This drainage area will be checked regularly to remove debris collected around the fiber rolls and to ensure that the fiber rolls in proper working order.

4.6.3.3 Structural BMPs

BMPs in place before reporting period
BMPs installed in FY 2005-2006 included a garage cover built to cover drums in the storage area, and an area was designated to hold all wrecked vehicles from police department with secondary containment installed around wrecked vehicles contain any fluid runoff from the vehicles.

BMPs installed or changed during Fiscal Year 2007-08
The water utilities department installed two structural covers to prevent rain from reaching these metal materials and causing rusting and deterioration. Metal materials that are subject to rusting and deterioration when exposed to the elements, including scrap metal are contained and covered until used or disposed of through a licensed commercial metal recycling company.

4.6.3.4 Pollution Prevention and Recycling

BMPs in place before reporting period
The COC continues to implement an aggressive pollution prevention/recycling program including: purchasing re-refined oils, recycling used oils, oil filters, fuel filters, antifreeze, used tires, and batteries. In addition solid waste recycling bins are located throughout the facility for collection of bottles, cans, glass and mixed paper. During

BMPs installed or changed during Fiscal Year 2007-08
Additional solid waste recycling bins were installed throughout the COC including ones outside of the facility so field crews can easily deposit their recyclable when cleaning the interior of their vehicles. Also, each vehicle driver was provided with a convenient recycling basket to sue in their vehicle for easy collection of their recyclables.

4.6.4 Program Implementation

4.6.4.1 Facility Inspection

A thorough walk through inspection of the COC Facility was conducted by the operation manager of the facility and staff form the Clean Water Program. Table 4-2 presents the inspection results and recommended solutions. Through a second follow-up inspection and discussions with COC staff, it was verified that the issues below had been corrected. Also, the facility operation manager was provided with an annual inspection list for his staff to regularly monitor and inspect the COC facility. This will provide for more regular maintenance of BMPs. Annual storm water inspections will continue to be done by CWP staff in addition to the more frequent inspections by the facility operation manager.

Table 4-2. City Operations Center Facility Inspection Results.

COC Area	Corrections Required	Solutions
Police Evidence Area	Gasoline container in fenced storage area	Remove container
	55 gallon drums on ground	Place secondary containment underneath all drums or hazardous materials
East Gate	Pile of sand without perimeter control	Place fiber rolls around base of pile; when rain is predicted cover with tarp and secure with gravel bags
Wrecked Vehicles	Absorbent socks around vehicles are not connected	Place absorbent socks completely around all wrecked vehicles to ensure vehicle fluids to not pass the perimeter controls; these should be in place at all times while vehicles are in storage at COC
Roll-off bin disposal area	Broken fiber rolls in landscape area	Replace old/damaged fiber rolls
	Pile of sawdust without perimeter control	Sweep and remove sawdust; or store in area with fiber rolls placed around base of pile
	Broken asphalt curb pieces	Dispose of broken pieces
Water Utilities Training Area	Rill/soil erosion occurring in dirt area with fiver rolls in place	Replace broken/damaged fiber rolls; Add more fiber rolls in middle of slope for additional erosion control
Water Utilities Storage Area	Old parts behind covered sheds	Recycle old parts or store under cover
	Diesel generator behind sheds	Dispose/recycle generator or store under cover
	Creosote poles stored outside	Remove or cover by storing indoors or under tarp.
Back lot □ Soil storage area	Containers with liquid used by street maintenance division	Secondary containment good, replace absorbent socks for per miter control
	Concrete wash out area not properly designed to avoid potential runoff	Use visquin on bottom of cleanout area; dispose of all waste material regularly
	Soil storage bins have damaged berms in front of bins	Repair asphalt berms to provide complete perimeter control
Electrical Storage Area	Street poles exposed and debris on ground	Any metal material that can rust should be covered; Dispose of debris on ground
Sewer Department Storage Area	5 gallon drums on ground □ some full some empty	Place all filled drums on pallets; dispose of empty ones

	Metal parts on ground	All metal parts that can rust should be placed on pallets/off ground and covered
Fire Hydrant	Evidence of concrete wash out with no containment	Only use the designated concrete wash out area.
Lower Lot	Dumpster lids open	Keep dumpster lids closed at all times when not in use
	Random drums on ground throughout area and behind storage bins	All drums and containers should be on secondary containment and stored indoors and under cover; check behind all storage bins for buckets and drums not stored properly
	Paint trays on ground near eyewash area	Remove all paint trays and store indoors
	Metal poles/stakes exposed outside (Parks Dept.)	Keep under cover at all times
	Buckets on ground (Sewer division area)	Store indoors or under cover
	Fast food trash and debris throughout area (Water division area, streets area)	All employees to properly dispose of trash **at all times**. Do not throw trash on the ground. Place trash containers around site if necessary.
	Buckets on ground (Water division area)	Store indoors or under cover
	Storm drain gravel bags not providing protection; filer insert is full of debris; leaf litter on top of grate	Surround storm drain with gravel bags; replace filter insert with a new one; Clean or vactor storm drain
	Large Tractor/vehicles some evidence of fluid leaking from vehicles	Place drip pans under leaking vehicles; repair leaking vehicles ASAP
	Drums and buckets in SE corner area some not stored properly	All drums and buckets should be stored off ground on secondary containment and under cover
Solid Waste/Parks Area (near gas pumps)	Metal parts and pumps exposed	Cover all metal parts or store indoors
	Miscellaneous parts strewn about	Recycle, dispose or store parts properly (under cover)
	Trash debris and leaf litter	Sweep up leaf liter and dispose of trash

4.7 Sixth Municipal Element - Other Facilities

4.7.1 Background

The City of Oceanside owns and operates two closed landfills (Maxson Street Landfill, WDID 9375005695 and Mission Avenue Landfill, WDID 9375005696). The City also operates and maintains eight fire fighting facilities including one fire fighting training facility.

4.7.2 Source Characterization

The two closed landfills maintained by the City have the potential to generate pollutants that can negatively impact receiving waters. If potential storm water discharges are identified, appropriate BMPs are implemented to prevent pollutants from entering MS4.

Also fire fighting stations have the potential to generate pollutants such as trash and debris, organic materials and fluids and wash water from fire fighting vehicles. The two closed landfills and the fire fighting facilities are included in the City's municipal inventory, which is included as Appendix B.3 of the City's 2008 JURMP.

4.7.3 Program Implementation

Closed Landfills

Both closed landfills are inspected quarterly per permit requirements and an annual report is prepared each for submittal to the Regional Water Quality Control Board. See Attachment 4-B for copies of the 2007-08 Annual Report for Storm Water Discharges Associated with Industrial Activities for these two landfills.

Fire Stations:

All fire stations were inspected during the reporting period. During the station inspections no violations or potential violations were noted.

4.8 Seventh Municipal Element - Power Washing

4.8.1 Background

The City conducts a number of activities which are not designated and/or confined to a specific location. Because such activities are not confined to a fixed facility, where BMPs may be permanently implemented, BMPs must actively be implemented during all mobile municipal activities.

4.8.2 Source Characterization

Mobile activities include:

- Power Washing

Infrastructure Maintenance

- Street and sidewalk repair
- Street striping
- Waste removal
- Traffic light maintenance
- Parking meter maintenance

Landscape/Right-of-Way Maintenance

4.8.3 Best Management Practice Requirements

As previously mentioned, the City will continue to implement good housekeeping and general pollution prevention measures during municipal activities including the mobile activities listed above. City personnel will continue to be trained to collect all water generated by power washing activities. City personnel continue to use the City's Municipal BMP Manual to choose applicable BMPs to implement for municipal areas and activities. Pesticide, herbicide, and fertilizer management BMPs similar to those discussed in Section 6.2 will continue to be implemented during landscaping of City right of way such as medians.

4.8.4 Program Implementation

City field crews will continue to be actively trained to implement BMPs during all mobile activities including how to properly contain, control, and capture any discharge generated by power washing (or any other discharge-generating activities). The City uses fiber rolls, geo logs, silt fencing, check dams, gravel bags, and filter inserts during mobile activities, where applicable. City personnel involved in mobile activities are trained to be aware of Illicit Connections/Illicit Discharges and report them to the appropriate City staff promptly. More information about the City's education program, including municipal training activities, is included in Section 10 of this document.

4.9 Municipal Component Effectiveness Assessment

See Section 11.0 for an assessment of the municipal component of the City's JURMP.

4.10 Program Modification and Review

The Clean Water Program will continue to implement its SWPPP at the City Operations Center and continue its ongoing inspection and maintenance program for the facilities listed in the Municipal Inventory. Any changes to the program will be reported in the next annual report.

5.0 INDUSTRIAL AND COMMERCIAL COMPONENT

5.1 Introduction

Industrial and commercial operations have the potential to contribute pollutants to the MS4. The City of Oceanside continues to implement a comprehensive program that aims to reduce and prevent industrial and commercial pollution discharges to and from the MS4 to the maximum extent practicable (MEP) to protect local receiving water bodies and to comply with the Municipal Permit. This section documents the activities conducted by the City of Oceanside during the 2007-2008 reporting period to meet the requirements of Section D.3.b of the Municipal Permit.

Order 2007-0001 Compliance Summary

D.3.b Implement Industrial and commercial program	See Section 5.2.1 of this Annual Report
D.3.b (1) Source Characterization	See Section 5.2.2 of this Annual Report
D.3.b (2) BMP Implementation	See Section 5.2.3 of this Annual Report
D.3.b (3) Inspections	See Section 5.2.4 of this Annual Report
D.3.b (4) Regulation of Mobile Businesses	See Sections 5.3

The City has compiled a list of industrial and commercial sources and developed BMP requirements, including pollution prevention measures, for each source and activity. Implementation of these requirements will be accomplished through education, inspection, and enforcement.

During this reporting period the City of Oceanside increased its number of employees in the Clean Water Program to ensure compliance with the inspection frequency requirements specific to the new Municipal Permit. Thus, in addition to Code Enforcement conducting industrial/commercial inspections, two Clean Water Program (CWP) staff conducted inspections and disseminated educational outreach materials where needed.

5.2 Stationary Industrial and Commercial Sites Sources Element

5.2.1 Background

Section 7 of the City's 2008 JURMP, titled Industrial and Commercial Component, requires the implementation and maintenance of applicable pollution prevention Best Management Practices (BMPs) by industrial owners and/or operators pursuant to City Code to minimize or eliminate the impacts of industrial and commercial activities on receiving waters and other sensitive environmental resources. The City uses a variety of ways to educate and ensure that BMPs are implemented at industrial and commercial facilities including dissemination of the City's industrial and commercial BMP manuals, site inspections and enforcement.

5.2.2 Source Characterization

The City annually updates its watershed-based industrial/commercial inventory which contains the name, address, and description of all industrial sites within its jurisdiction, regardless of site ownership. The original inventory was prepared in February 2002 and was provided in the 2002 JURMP document. The commercial and industrial inventories used for this reporting period were updated during this reporting period and can be referenced in Appendix B of the 2008 JURMP

All of the inventoried industrial and commercial businesses were categorized according to the watershed in which the business is located. This table does not include mobile businesses that have City of Oceanside business licenses. See section 5.3 of this report for mobile business information. See Tables 5-1 and 5-2 below for a summary of the number of industrial and commercial businesses inventoried in the City according to watershed location.

Table 5-1. Industrial Businesses in the City by Watershed.

Watershed	Number of Industrial Business
San Luis Rey	95
Loma Alta	141
Buena Vista	5
Agua Hedionda	0
Total	**241**

Table 5-2. Commercial Businesses in the City by Watershed.

Watershed	Number of Commercial Businesses
San Luis Rey & Harbor	331
Loma Alta	338
Buena Vista	151
Agua Hedionda	6
Not Verified	10
Total	**836**

Based on the 2008 inventory, the City contains approximately 241 industrial businesses. Each of these businesses was prioritized on their threat to water quality. Table 5-3 provides a summary of the prioritization for industrial businesses.

Table 5-3. Industrial Businesses in the City by Priority.

Priority	Number of Industrial Business
High	52
Medium	45
Low	144
Total	**241**

Based on the 2008 inventory, the City contains approximately 836 commercial businesses. Each of these businesses was prioritized on their threat to water quality. Table 5-4 provides a summary of the prioritization for industrial businesses.

Table 5-4. Commercial Businesses in the City by Priority.

Priority	Number of Commercial Business
High	94
Medium	449
Low	293
Total	**836**

5.2.3 Best Management Practice Requirements

BMP Manuals

Two manuals originally developed in 2001, *Industrial Urban Runoff Requirements Manual* and *Commercial Urban Runoff Requirements Manual,* detail requirements of industrial and commercial businesses to comply with the City's Urban Runoff Management and Discharge Control Regulations. In order to ensure industrial and commercial owners and operators are informed and understand the applicable pollution prevention BMPs to be implemented and/or maintained, site-specific pollution prevention methods for industrial and commercial areas and activities located within the City, are specified in these two manuals.

The manuals were first produced in FY 2001-02 as a result of requirements under Municipal Permit Order No. 2001-01 and were revised in 2004 to include additional state requirements. These manuals were again reviewed and revised during this reporting period to ensure compliance with the new Municipal Permit Order No. R9-2007-0001. The main changes were the additional of categories and a list of specific BMPs for those industrial and commercial activities. Inspections, enforcement, and reporting and the definitions have not been changed.

Industrial Manual changes

Three BMP Categories were added to Table 1 of the Industrial Manual, Summary of Industrial Facility and Activity BMP Requirements, and provides specific BMPs applicable to that category:

- Building Materials Retail and Storage
- Animal Facilities
- Power Washing

Section 3.2 was added to the Industrial manual. This section was added to target High Priority Industrial Businesses and it provides the minimum BMP requirements for industrial businesses

Commercial Manual Changes

One category was updated in the Commercial Manual to include additional businesses activities. The Eating or Drinking Establishments category now includes Food Markets.

Three BMP Categories were added to the Commercial Manual and provides specific BMPs applicable to that category:

- Building Materials Retail and Storage

- Animal Facilities
- Power Washing

An additional section was added to the Commercial Manual titled "Additional Controls." Following is the text for this new section.

> There are a number of Environmentally Sensitive Areas (ESAs) within the City. These areas are sensitive to impacts from Urban Runoff that may degrade water quality and harm aquatic life.
>
> In addition to the general requirements required for Regulated Commercial Facilities and Activities, the City may require that additional BMPs beyond the minimum BMPs for a specific area, such as ESAs, and/or activity be implemented.

The City conducted efforts to ensure industrial and commercial business owners and/or operators have received a copy of the Industrial Manual either through an annual inspection or a response to a complaint or concern reported through the Urban Runoff Hotline. In addition, copies of the Industrial Manual are available on the Clean Water Program website.

5.2.4 Program Implementation

Annual inspections of commercial and industrial businesses are conducted by Clean Water Program inspectors, Code Enforcement officers and a private contractor to ensure that applicable pollution prevention activities are implemented by industrial and commercial business owners and/or operators. In addition, inspections are conducted based on calls received on the Urban Runoff Hotline. All industrial and commercial businesses visited, through the annual inspection program or by complaint call acknowledged on the Hotline, receive follow-up visits until the industrial business is deemed in-compliance with City Code. All documentation pertaining to site visits are on file at the City. City staff conducted a total of 596 inspections during the 2007-2008 reporting year of industrial and commercial businesses.

5.2.4.1 Inspections of Industrial Businesses

Section 7.2.4.3 of the City's 2008 JURMP describes the City's program for conducting inspections of industrial businesses. This program was developed and implemented in accordance with part D.3.b.(3) of Permit Order 2007-0001. The major activities and accomplishments undertaken by the City for this requirement during the reporting period included:

- Completion of 127 site inspections of industrial businesses during the reporting period.
- Completion of 52 required annual inspections of high priority industrial businesses during the reporting period.
- Completion of 75 required annual inspections of medium and low priority industrial businesses during the reporting period.
- Completion of eight follow-up visits either in response to the initial inspection or response to a complaint.

- Dissemination of the Industrial Manual to help industrial owners and/or operators become aware of the City Code requirements for BMP implementation, and information on applicable BMPs for specific industrial businesses and activities.
- Ensuring proper and continued training of the Code Enforcement officers and Clean Water Program compliance inspectors dedicated to the Clean Water Program.

5.2.4.2 Enforcement of Industrial Businesses

Section 7.2.4.3 of the City's 2008 JURMP describes the City's program for enforcement of ordinances at an industrial site. This program was designed in accordance with part D.3.b.(3) of Municipal Permit Order 2007-0001. Table 5-5 presents the actions taken by Code Enforcement officers on industrial businesses within the City for this reporting year. The major activities and accomplishments undertaken by the City for this requirement during the reporting period included 86 inspections by Code Enforcement officers and 41 inspections by Clean Water Program inspectors. Therefore, the City conducted a total of 127 industrial business inspections during this reporting period.

Table 5-5. Accounting of Industrial Code Enforcement Actions for the 2007-2008 Reporting Year.

Action Type	Follow-up Phone Call	Follow-up Site Visit	Follow-up Office Visit	Written Notice	Letter Sent	Inspection Report	Admin. Warning	Administrative Monetary Citation	Referral to Other Dept.	Stop Work Notice
of Actions	8	131	0	4	15	86	1	3	1	0

5.2.4.3 Inspections of Commercial businesses

Section 7.2.4.3 of the City's 2008 JURMP describes the City's program for conducting inspections of commercial businesses. This program was developed and implemented in accordance with part D.3.b.(3) of the Municipal Permit Order 2007-0001. As detailed in the JURMP, inspections of High and Low Priority Commercial Businesses are conducted as deemed necessary by the Code Enforcement personnel. Some inspections are initiated in response to a public or municipal staff report, an illicit discharge source investigation, or as a follow up to a previous inspection.

The major activities and accomplishments undertaken by the City for this requirement during the reporting period included:

- Three hundred seventy one (371) eating and drinking establishments were inspected at least once for the proper implementation and maintenance of storm water BMPs and grease control devices. The inspector forwarded all facilities that were not in-compliance with storm water regulations to Code Enforcement Officers.
- Ninety four (94) inspections of high priority commercial businesses were inspected, excluding restaurants and agricultural operations

- One hundred three (103) inspections of medium and low priority commercial businesses were inspected, excluding restaurants and agricultural operations
- One inspection of each of the 28 nursery and greenhouse operations within the City of Oceanside was conducted for compliance to urban runoff regulation City Code Chapter 40.
- Ensuring proper and continuing training of the Code Enforcement Officers and Clean Water Program inspectors dedicated to the Clean Water Program.

During the 2007-08 reporting periods, all eating and drinking establishments were inspected for compliance with the City's urban runoff regulations and adequate implementation and maintenance of BMPs. The initial inspection served to educate eating and drinking establishment owners and/or operators of their storm water and grease control BMP responsibilities by inspection of current BMPs, distribution of the Commercial Manual and BMP poster, when needed, to educate employees. During the 2006-07 reporting period all restaurants were raised to high priority and will continue to be high priority throughout the duration of Municipal Order Permit No. 2007-0001. If any restaurants were not in compliance during initial inspections, follow-up inspections were conducted to determine compliance per City Code.

When CWP Inspectors and Code Enforcement Officers conduct inspections at high priority areas, they target the entire commercial/industrial complex, because these areas often contain a mix of industrial and commercial operations. Rather than just focus on the High Priority businesses located in these areas, CWP Inspectors and Code Enforcement officers inspect all businesses in the complex to ensure owners and/or operators understand their BMP requirements and can work collaboratively with their neighbors to implement BMPs or solve drainage problems.

Code Enforcement officers inspected 28 nursery and greenhouse operations according to the City's Business Licensing Department. However, only sixteen of the sites were in operation and were determined to be a priority under storm water regulations. These sites, along with the larger agricultural facilities that are annually inspected by the County Weights and Measures Department, are visited several times a year by City staff due to the evolving nature of their business. With constant plowing and crop rotation, CWP staff not only complete annual inspections, but also complete a pre-rain event inspection and visit the agricultural areas frequently during the rainy season as well as during rain events. The City has also maintained its cooperative relationship with the U.S. Department of Agriculture NRCS for assisting the agricultural community in Oceanside in design and implementation of BMPs.

In addition to calls received from the Urban Runoff Hotline concerning potential violations at a commercial business, Code Enforcement Officers also conducted the third follow-up inspection for non-compliant restaurants. All calls received from the Urban Runoff Hotline generated a case file in which Code Enforcement officers visited the facility and conducted follow-up visits and/or used enforcement mechanisms until the commercial business was deemed in-compliance with City Code. Copies of inspection reports are available from the Code Enforcement Division.

If enforcement actions did not produce the required improvements, administrative citations (starting at $100, with a $1,000 maximum fine) are given. An accounting of all enforcement actions, taken by Code Enforcement Officers, is shown in Table 5-6.

Table 5-6. Accounting of Commercial Code Enforcement Actions for the 2007-2008 Reporting Year.

Action Type	Follow-up Phone Call	Follow-up Site Visit	Follow-up Office Visit	Written Notice	Letter Sent	Inspection Report	Admin. Warning	Administrative Monetary Citation	Referral to Other Dept	Stop Work Notice
of Actions	40	167	4	2	10	52	18	5	0	0

5.2.4.4 Reporting of Noncompliant Sites

The City is required to provide notification to the RWQCB of noncompliant sites in the City that are determined to pose a threat to human or environmental health. Oral notification is required within 24 hours of the discovery of noncompliance and a written report should be submitted to the RWQCB within five days of the incident.

The Regional Water Quality Control Board was notified of businesses or operations that were not compliant after follow-up visits from CWP staff or code enforcement officers, or for operations that were not enforceable by City staff (Camp Pendleton). Following is a list of these businesses and operations.

- Eternal Hills Cemetery Expansion Project
- North County Transit District's Sprinter Rail project.
- Evergreen Nursery nutrient discharge into Loma Alta Creek.
- Camp Pendleton housing development sediment discharge to Oceanside Harbor.

5.2.5 Stationary Industrial and Commercial Sites Sources Effectiveness Assessment

See Section 11.0 for an assessment of the Industrial and Commercial Component of the City's JURMP.

5.3 Mobile Sources Element

5.3.1 Background

Due to the lack of a stationary location for proper disposal of potentially hazardous liquids and materials, there is a major area of concern about where mobile businesses discharge water used in their line of work. Due to the nature of their activities, mobile businesses will continue to be regulated differently than other businesses. Mobile businesses can be difficult to identify because they may not have a City business license, they go out of business on a relatively regular basis and, though they may have a home base, they can cross jurisdictional lines to operate their

business. For the reasons regular inspections of mobile businesses will be challenging and tiem consuming in the future.

5.3.2 Source Characterization

The mobile businesses known to operate within the City's jurisdiction are noted on the City's commercial inventory. The following business types are addressed by the mobile sources element of the City's industrial and commercial program.

- Mobile automobile or other vehicle washing
- Pest control services
- Mobile carpet, drape or furniture cleaning
- Mobile construction trades
  - Painting and coating
  - Cement mixing or cutting
  - Masonry
  - Other contractors
- Landscaping
- Pool and fountain cleaning
- Power washing services

Because not all mobile businesses have obtained business licenses in the City or have a base of operations in the City, the City expects that a continual process of refining and updating its inventory will be needed. Sources for such inventory updates will include reported incidents, general observations by City staff, and available business licenses. The City intends to participate if and when a regional inventory and/or tracking system for mobile businesses is developed. The inventory of Mobile Commercial Businesses is available in Appendix B.5 of the City's 2008 JURMP as part of the Commercial Inventory.

5.3.3 Best Management Practice Requirements

The City updated its Commercial Urban Runoff Requirements Manual during this reporting period, and now contains information on the required BMPs for both mobile and stationary sources. This updated manual can be referenced in Appendix C of the City's 2008 JURMP. One example of a BMP included in the updated manual is for outside vehicle washing and the BMP explains how to capture and contain the rinse water so that it does not enter the storm drain system. Regardless of where the activity occurs, the City categorically prohibits illegal discharges from mobile businesses.

5.3.4 Program Implementation

5.3.4.1 Education Outreach

Because a specific element of the industrial and commercial program for mobile businesses is being newly developed, it is anticipated that some mobile businesses are not aware of storm water requirements and that education will need to be a significant portion of the program. The City of Oceanside will notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the City's 2008 JURMP.

5.3.4.2 Inter-Jurisdictional Cooperation

An inter-jurisdictional program for the regulation of mobile businesses will be developed amongst the co-permittees during future years of this permit cycle, of which the City will be involved. The program may include creation of a regional inventory of mobile businesses, standardization of BMP requirements across jurisdictions, sharing of enforcement action information, and/or the development and distribution of standardized educational materials.

5.3.4.3 Staff Training

Code Enforcement Division Officers and Clean Water Program Compliance Inspectors are responsible for conducting storm water compliance inspections and enforcement of mobile sources. Officers and inspectors are trained annually on inspection and enforcement procedures and BMP implementation as they relate to mobile businesses. City staff is encouraged to report potential illegal discharges from mobile businesses when working in the City to the storm water hotline.

5.3.4.4 Inspections

During this reporting period, inspection of mobile businesses was conducted on an as needed basis. The most common triggers for these inspections were from incident reports received over the Urban Runoff Hotline and direct visual observations by City staff.

5.3.4.5 Enforcement

During this reporting period Code Enforcement officers responded to complaint calls regarding mobile businesses that were allowing water to enter the storm drain system. During the site visit, depending on the nature of the complaint, Code Enforcement officers issued notices to comply and/or educated the operator on the proper BMPs that should be in place during their operation and provided them with the power washing brochure.

5.4 Industrial and Commercial Component Effectiveness Assessment

See Section 11.0 for an assessment of the Industrial and Commercial Component of the City's JURMP.

5.5 Program Review and Modification

The Clean Water Program will continue to review and modify the Industrial and Commercial component as needed. Staff will work with other City departments and their data tracking systems to ensure that the details of inspections, complaints, and follow-ups will be tracked appropriately to be included in future annual reports as discussed further in Section 15.

6.0 RESIDENTIAL COMPONENT

6.1 Introduction

A total of 35 percent of the City's 26,983 acres is designated as either multi- or single-family residential. Since residential land use comprises such a large area of the City, residential activities can have a considerable effect on the quality of receiving waters in and around the City. The City of Oceanside has developed an extensive program that aims to reduce pollutant runoff from residential areas and activities to the MEP.

This section documents the activities conducted by the City of Oceanside during the 2007-2008 reporting period to meet the requirements of Section D.3.c of the Municipal Permit. The City continued the implementation of an enforcement program that responds to and monitors potential violation calls received on the Oceanside Urban Runoff Hotline (Hotline).

Order 2007-0001 Compliance Summary

D.3.c Residential Program	See Section 6 of this Annual Report

The City also utilizes its revised Urban Runoff Requirements Manual for Residents (Residential Manual) that contains BMP requirements and related guidance information for residents of the City. This manual has been made available to residents through the City's Clean Water Program Website. Changes to the Residential Manual during this reporting period were as follows:

- Pool water disposal BMPs
- Reference to new Municipal Permit Order 2007-0001
- Rearrangement of some chapter numbers and names

A copy of this manual can be found in Appendix C of the City's 2008 JURMP.

6.2 Source Characterization

Residential neighborhoods can be the source of a variety of pollutants depending on the activities conducted in residentially developed areas. Pursuant to Section D.3.c.(1) of the Permit Order 2007-0001, the City identified High Priority Residential Areas and Activities in the JURMP. The following residential activities have been identified by the City to be High Priority Activities:

- Automobile or boat repair and maintenance.
- Automobile washing.
- Automobile parking.
- Home and garden care activities and product use.
- Disposal of household hazardous waste.
- Disposal of pet waste.
- Disposal of green waste.
- Any other residential activity that contributes a significant pollutant load to the MS4.

The City has also identified residential areas of High Priority. These areas include the following:

- Any residential area tributary to a CWA section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired

- Any residential area within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within an ESA

6.3 Best Management Practice Requirements

The City's JURMP Residential Component requires the implementation and maintenance of applicable pollution prevention Best Management Practices (BMPs) by residents pursuant to City Code. In order to ensure residents are informed and understand the applicable pollution prevention BMPs to be implemented and/or maintained, site-specific pollution prevention methods for residential areas and activities, located within the City, are specified in the Residential Manual. This manual is found in Appendix C of the City's 2008 JURMP.

Education and outreach aimed at residents helps facilitate the implementation of BMPs, including pollution prevention methods. A detailed discussion of the City's education program can be found later in Section 10 of the 2008 JURMP. Details on education outreach to the residential community can be found in Sections 8 and 9 of this annual report.

6.4 Program Implementation

6.4.1 Outreach

The most efficient way to encourage pollution prevention and BMP implementation and to restrict polluting practices is to educate residents on how to carry out their daily activities in ways that have the smallest potentials to discharge pollutants to the MS4. During this reporting period the Clean Water Program provided educational information and training to residents, in the following ways:

- Residential BMP Manual
- Cleanup events
- Booths at public events
- Public television notices
- Mailers
- Presentations
- Website

Further outreach program details for this reporting period can be found in the Education and Public Participation, section 8 and Section 9, of this document.

6.4.2 Household Hazardous Waste

The City continued to facilitate the proper management and disposal of used oil, toxic materials, and all other HHW to the residential audience. Residents have the opportunity to take used oil to approximately 12 private auto parts stores within the jurisdiction. In addition Waste Management, Inc., the City's franchise trash hauler, accepts HHW at its Oceanside facility. Residents may bring up to five gallons per day of used motor oil, used oil filters, and anti-freeze, Tuesday through Saturday from 8 a.m. to 4 p.m. without an appointment. HHW may be brought on Saturdays by appointment only. Details of the locations mentioned above can be found in Section 8.4.2 of the City's 2008 JURMP.

During the 2007-2008 reporting period, 3,430 Oceanside households utilized the household hazardous waste disposal facility, disposing or recycling 142.8 tons of hazardous materials (including universal waste) during the reporting period. An additional 119.9 tons of E-waste was recycled in the same reporting year.

Furthermore, as part of the City's collection program, a 1,500-gallon used oil collection receptacle is provided at the City's harbor. This receptacle is available for residents who live on the boats in the Marina as well as for those boat owners and operators who rent a harbor slip to conveniently recycle the used motor oil and oil filters generated from the boats.

6.4.3 Clean Water Program Newsletters

Twice per year, educational newsletters are mailed to all homes in the City that receive water utility bills. Topics in the newsletters explain storm water pollution, effects on water quality, pollutants of concern, illegal discharges, BMP implementation, and special events.

During this reporting period two Clean Water Program Newsletters were distributed to over 42,000 households. An overview of topics in these two are listed below. A copy of these two newsletters is included in Attachment 6-A this annual report.

Fall 2007

- Water conservation and urban runoff (20 Gallon Challenge campaign promoted by the San Diego County Water Authority)
- Buena Vista Creek and Oceanside Beach Cleanup

Spring 2008

- Grease and sewer blockages
- Pool water draining tips
- Proper disposal of landscape trimmings
- Loma Alta Creek cleanup event
- Cleanup events calendar for 2008

6.4.4 Oceanside Update

In addition to printed media, the City's community television station, KOCT, airs thirty-minute public service announcements with three-minute presentations from various City departments. Those households in the City who have access to the KOCT local channel are able to view this show. During this reporting period the Clean Water Program provided seven three-minute presentations. Table 6-1 provides an overview of the topics covered during each taping.

Table 6-1. Summary of 2007-08 Oceanside Update Topics by Month

Date	Topic Discussed
August 2007	Water conservation & irrigation runoff
September 2007	Proper hookup for RV sewage dumping at RV dump station in Oceanside harbor
November 2007	Water conservation & irrigation runoff
December 2007	Irrigation runoff & its connection to polluted runoff
February 2008	BMPs for residents during rainy season

Date	Topic Discussed
April 2008	Loma Alta Creek Cleanup
June 2008	Storm drains are different than sewer systems

6.4.5 Website

The Clean Water Program maintains its own Website providing convenient electronic access to program information for residents and the general public. The address for this website is www.oceansidecleanwaterprogram.org. This Website provides the opportunity to learn about storm water pollution, the sources of this pollution, and what can be done to eliminate these pollutants from entering the storm drain system, thereby improving water quality in receiving waters. During this reporting period there were 38,146 hits to the Clean Water Program website. This number does not account for traffic from within the Oceanside network.

Specific web pages available on the Clean Water Program Website are as follows:

- Commercial Business
- Development
- Events
- Industrial Business
- Just for Kids
- Water Quality Laws
- Other Websites
- Landslide Prevention
- Clean Water Projects
- Report Violations
- Residential/General
- Just for Educators
- Waterbodies

The residential web page offers the following information:

- An overview of pollutants in receiving waters and how those pollutants get there
- The difference between the storm drain system and the sewer system
- Links to pollutant factsheets in PDF format
- Links to brochures in PDF format, including the Storm Water Pollution prevention Tips for Residents
- Links to past Clean Water Program Newsletters in PDF format
- Link to the Residential Urban Runoff Requirements Manual

The Website address is disseminated to the public in a variety of ways:

- Listed in all Clean Water Program Newsletters
- Mentioned during each Oceanside Update Taping and shown at the bottom of the screen
- Listed on promotional items
- Listed on Clean Water Program staff business cards

6.4.6 Hotline

The City will continue to encourage public reporting of illicit discharges and illegal dumping through the City's Urban Runoff Hotline, which is run by the Water Utilities Department. The Hotline phone number is (760) 435-5800. All calls related to potential urban runoff violations were documented and forwarded to Code Enforcement.

The Urban Runoff Hotline was promoted through a variety of media during this reporting period, including announcements on local television stations, placement on brochures, click-message pens, pencils, and other promotional "give-aways", advertisement on the City's Clean Water Program webpage and in Clean Water Program newsletters. During the reporting period, fifty-five (55) calls were received on the Urban Runoff Hotline by residents concerning potential urban runoff violations. This is a significant increase from the 14 calls received during the 2006-07 reporting period (a 392% increase in call volume).

6.4.7 Enforcement

Section 8.4.4 of the JURMP describes the City's program for enforcement of ordinances in residential areas. The major activities and accomplishments undertaken by the City during this reporting period included:

- Code Enforcement response to 190 urban runoff related cases, related to residential areas and activities, during the reporting period.
- An accounting of all residential enforcement actions, taken by Code Enforcement Officers, is shown in the following table.

See Table 6-2 for an accounting of Code Enforcement Actions during 2007-08.

Table 6-2. Accounting of Residential Code Enforcement Actions for the 2007-2008 Reporting Year.

Action Type	Follow-up Phone Call	Follow-up Site Visit	Follow-up Office Visit	Written Notice	Letter Sent	Inspection Report	Admin. Warning	Administrative Monetary Citation	Referral to Other Dept	Stop Work Notice
of Actions	140	219	7	26	32	10	28	4	1	0

6.5 Residential Component Effectiveness Assessment

See Section 11.0 for an assessment of the education component of the City's JURMP.

6.6 Program Review and Modification

During this reporting period it was noted that improvements in information tracking is needed to more easily gather and assess data. The City will investigate opportunities to better track data collected from Hotline calls.

Also, with the increase in phone calls to the Urban Runoff Hotline reporting parties will be asked where they learned of the Hotline phone number. Gathering this information can allow better assessment of the residential outreach programs by determining which specific program components are reaching residents more than others.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

This section is intended to document the activities conducted by the City of Oceanside during the 2007-2008 reporting period to manage illicit discharges and meet the requirements of Sections D.4 and J.3.a.(3)(f) of the 2007 Municipal Permit.

In accordance with the September 10, 2008 Regional Water Quality Control Board adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the entire FY 2007-08 Illicit Discharge Detection and Elimination Component, including the 2008 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2008.

8.0 EDUCATION COMPONENT

8.1 Introduction

Education is an important step in working towards improving receiving water quality both locally and regionally. By increasing public awareness and encouraging a change in both the attitude and the behavior of the general public and the regulated community, the City may reduce or eliminate storm water pollution caused by common daily activities.

The City of Oceanside will continue to provide a comprehensive storm water education program to achieve the following objectives:

- Measurably increase the knowledge of target communities regarding MS4s, impacts of urban runoff on receiving waters, and BMP solutions for the target audience.
- Measurably change the behavior of target communities, and thereby reduce pollutant releases to MS4s and the environment.

Educational programs and activities are tailored to meet the needs of the following target audiences:

- Municipal departments and personnel.
- Construction site owners and developers.
- Industrial and commercial owners and operators.
- Residential community, general public, and school children.
- "Underserved" target audiences, where applicable.

Many education outreach efforts are conducted on an ongoing basis, such as direct interaction during inspections, pre-construction meetings, or when taking calls from the City's Urban Runoff Hotline. Educational materials are also available throughout the year at special events and at the City's Water Utilities Department counter. Targeted mailings, focused training sessions, and other educational efforts are provided when found to be necessary through monitoring programs, records of complaints, and other similar factors.

8.2 Staff Training Element

City personnel are the eyes and ears of the City, and can provide valuable information on storm water related discharges and potential violations that may be occurring within the City. The City presents general storm water educational content, which is described in Section 10.3 of the 2008 JURMP, to all City departments. The City primarily educates its municipal personnel through classroom training, on-the-job training sessions, and the Municipal BMP Manual (Appendix C of the 2008 JURMP). Customized training programs are designed for personnel targeting fieldwork-related departments such as storm water compliance inspectors, building/engineering inspectors, public works, planning department staff, and park and recreation personnel. General informational storm water training sessions are provided for municipal personnel in other departments to review storm water regulations in the City, impacts of urban runoff and BMPs to be implemented to reduce or eliminate runoff.

During this reporting period twenty-one (21) departments or divisions were provided a training on storm water related issues. In addition one division from the solid waste and recycling trash

hauler for the City was provided with storm water training. A total of 298 City staff and 70 staff from the trash hauler attended storm water trainings.

During this reporting period one of two Storm Water Pollution Prevention Education Programs developed by a private company, EXCAL Visual, were used for municipal staff trainings. These programs include a 15-20 minute video and a quiz specific to the video.

Prior to the start of these training sessions using the programs mentioned above a multiple choice quiz was given to each participant to complete to establish a baseline of knowledge for that individual. The quiz was used as the sign-in sheet for each training session. After the completion of the video additional storm water related details were provided depending on the department or division being trained. Time is allotted for questions and answers toward the end of the training session. Prior to the end of the training session the same multiple choice quiz was given to each participant. 293 municipal employees took both a pre and post-quiz during a municipal training session. For more information on the effectiveness of these training programs based on the pre- and post-quiz scores see Section 11.0 of this report.

One program titled "Storm Water Pollution Prevention - Strom Warnings" covers Everyday Best Management Practices for Industrial Facilities. Specific BMPs are covered to address the following issues related to industrial facilities:

- Good Housekeeping
- Materials Management
- Spill Response
- Equipment Fueling & Repair
- Outdoor Manufacturing
- Preventive Maintenance
- Waste Management
- Dust Producing Processes

Departments or Divisions that received this training were:

- Water Distribution - Reverse Osmosis Plant
- Water Distribution – Operations
- Water Distribution – Maintenance
- Sewer Collections – La Salina Waste Water Treatment Plant
- Sewer Collections – San Luis Rey Waste Water Treatment Plant
- Sewer Collections – Field Staff
- Water Distribution – Weese Plant (Drinking Water Treatment Plant)

The other program titled "Municipal Storm Water Pollution Prevention – Storm Watch" covers everyday BMPs for other municipal staff activities such as Parks and Recreation and fleet maintenance. Specific BMPs covered in this course are as follows:

- Good Housekeeping and Spill Prevention
- Vehicle and Equipment Washing
- Vehicle and Equipment maintenance
- Spill Reporting and Response

- Street Maintenance
- Outdoor Storage of Materials and Wastes
- Landscaping and Lawn Care

Departments or Divisions that received this training were:

- Streets Division – Street Repair and Maintenance
- Streets Division – Street Sweepers
- Streets Division – Parking Enforcement
- Parks and Recreation Maintenance
- Fleet Maintenance
- Water Utilities Administration
- Water Meter Services
- Harbor Division – Maintenance Staff
- Harbor Division - Harbor Police
- Police Department – Police Dispatch

Other Departmental staff received customized training because of their need for specific education that was not covered in these two programs or information covered in these programs was not needed to convey to these groups due to the nature of their work as municipal employees. The following departments were trained using a customized Power Point Presentation and an interactive format to allow for questions and answers throughout the training program:

- Planning Department
- Engineering Department – Engineering Inspectors
- Building Department – Building Inspectors
- Business Licensing, Revenue and Utility Billing

Waste Management is the solid waste and recycling company that services residential and commercial/industrial businesses in the City of Oceanside. Though they are not a department division of the City, they are an important entity to target with storm water related education programs due to the nature of their business. During this reporting period one department of Waste Management was targeted with storm water education. A customized power point presentation was used to emphasize the importance of proper handling of solid waste during servicing of trash cans and dumpsters and how to report potential storm water violations to Oceanside's Clean water Program staff..

- Waste Management – Trash, Recycling and Green Waste Truck Drivers

During the training sessions two departments requested additional information to reference during their daily work activities. The Harbor Police Department requested a quick reference guide for officers to use while in the field. This reference guide provides the storm water related City code and a brief description of the violation related to that code number. Also, the Police Dispatch operators requested a Clean Water Program Phone and Code Reference List to be placed in their "Call-out" binder. This binder is used by police dispatch operators to more easily reference codes and violations. See Attachment 8-A at the end of this section for a copy of the guide provided to Harbor Police and Police Dispatch operators.

8.3 Educational Outreach Element

Residential areas make up a large portion of the land use in the City, and therefore even small pollutant discharges can be magnified significantly and have the potential to affect the quality of the receiving waters. Activities such as residential car washing and over irrigation are harmful to receiving water bodies by contributing pollutants such as heavy metals, detergents, and nutrients. Providing residents with appropriate educational materials may help to increase overall awareness, and encourage residents to change harmful behaviors and subsequently reduce the potential for pollutants to enter the storm drain system and reach receiving water bodies.

Media

Twice per year, educational newsletters are mailed to all homes in the City with water utility bills. Topics in the newsletters explain storm water pollution, effects on water quality, pollutants of concern, illegal discharges, BMP implementation, and special events.

During this reporting period two Clean Water Program Newsletters were distributed to over 42,000 households. An overview of topics in these two newsletters are as follows:

- Fall 2007: Water conservation and urban runoff (20 gallon challenge)
  Buena Vista Creek and Oceanside Beach Cleanup

- Spring 2008: Grease and sewer blockages
  Pool water draining tips
  Proper disposal of landscape trimmings
  Loma Alta Creek cleanup event
  Cleanup events calendar for 2008

A copy of these two newsletters is included in Attachment 6-A this annual report.

Website

The City's Clean Water Program website also offers electronic copies of a variety of storm water fact sheets covering topics such as proper pesticide and fertilizer use, trash disposal, pet waste and lawn waste disposal, proper chlorine and other swimming pool chemical disposal, sedimentation, effects of soaps and detergents on receiving waters, and other storm water-related topics. During this reporting period there were 38,146 hits to the Clean Water Program website. This number does not account for traffic from within the Oceanside network.

Oceanside Update

In addition to printed media, the City's community television station, KOCT, airs thirty-minute public service announcements with three-minute presentations from various City departments. During this reporting period the Clean Water Program will provided seven three-minute presentations. Table 8-1 provides an overview of the topics covered during each taping.

Table 8-1. Summary of 2007-08 Oceanside Update Topics by Month

Date	Topic Discussed
August 2007	Water conservation & irrigation runoff
September 2007	Proper hookup for RV sewage dumping at RV dump station
November 2007	Water conservation & irrigation runoff
December 2007	Irrigation runoff & its connection to polluted runoff

Date	Topic Discussed
February 2008	BMPs for residents during rainy season
April 2008	Loma Alta Creek Cleanup
June 2008	Storm drains are different than sewers

Community Events – Booths and Outreach Activities

The Clean Water Program Staff participated independently and in conjunction with other cities in the North County Storm Water Program by staffing booths at several community events in Oceanside and north San Diego County. The Clean Water Program staff talked to residents, handed out educational materials, and responded to questions and concerns.

Table 8-2 lists community events attended between July 2007 and June 2008 to encourage community participation and education of the effects of urban runoff:

Table 8-2. 2007-08 Community Events.

Date	Event	Participants (estimated)
03/30/2008	North County Earth Day at the Mission	3,000
04/20/2008	Fallbrook Avocado Festival	50,000
6/19/2008	Sunset Market - Oceanside	1,000

School Education

Educating the City's youngest residents is important in two ways: ideally the good habits/behaviors learned will be carried into adulthood, and secondly, children may educate their families and friends around them with the information they have learned. Children are impressionable at a young age, and are therefore more likely to act upon the knowledge given to them now and throughout their life.

The City continued its outreach to school age children through the use of the watershed model during presentations. A total of ten presentations were conducted reaching 165 school-age children and 36 adults. Table 8-3 provides a list of groups and classrooms who were educated about storm water pollution via these presentations.

Table 8-3. 2007-08 School Age Children Watershed Presentations.

Date	Group	Children	Adults
03/10/2008	Cub Scouts	10	7
03/26/2008	Girl Scout Troop 1215	7	2
5/07/2008	Girl Scout Troop 1370	8	3
5/14/2008	Garrison Elementary (2nd Grade)	17	2
5/14/2008	Garrison Elementary (2nd Grade)	18	2
5/14/2008	Garrison Elementary (5th Grade)	25	3
5/14/2008	Garrison Elementary (4th Grade)	33	2
5/14/2008	Garrison Elementary (Kinder.)	15	1
5/15/2008	Girl Scout Troop 4099	12	4
5/15/2008	Boy Scout Pack 756	20	10
	Totals	**165**	**36**

Project SWELL (SWELL = Stewardship: Water Education for Lifelong Leadership)

The City is collaborating with the City of San Diego, the San Diego Unified School District, and San Diego CoastKeeper to customize and implement grade level specific curricula that integrates environmental topics into the science curriculum in the Oceanside Unified School District (OUSD). This curriculum provides students with knowledge of water resources in San Diego County, watershed functions, water conservation, the effects of polluted urban runoff, and how students can help prevent water pollution. Project SWELL, a water-based science curriculum, has been customized and implemented in fifth grade classes of the OUSD. The City will work with its collaborators to move forward in customizing and implementing the 6th grade curriculum, as well as additional grade level curricula in future years.

During this reporting period details specific to the northern watersheds of San Diego County were compiled and submitted in a table format for use in the 6th grade curriculum. See the Table 8-4 below for the watershed information gathered for the curriculum. The curriculum writer and editor will continue to develop the 6th grade curriculum during the 2008-09 reporting period with anticipation of implementing the curriculum in fall 2009.

Table 8-4. SWELL Oceanside 6th Grade Curriculum Watershed Information Tables

San Luis Rey Watershed	
Major Water Bodies:	San Luis Rey River, Guajome Lake, Lake Henshaw
CWA 303(d) List:	Indicator Bacteria (Pacific Ocean Shoreline at river mouth), Chloride and Total Dissolved Solids (San Luis Rey River) and Eutrophic (Guajome Lake)
Areas of Concern:	Indicator Bacteria cause beach postings and closures during winter months at the shoreline; A landfill is proposed to be sited adjacent to he river just east of Interstate 15; Significant development projects, including residential, commercial and industrial land uses, are being proposed at the I-15 and Highway 76 interchange; An approved quarry began operation in 2008 and is permitted for operation for 30 more years;
Sources of Problems:	Urban Runoff/Storm Sewers, nonpoint and point source (Chlorides) Nonpoint/Point Source (Guajome Lake)
Human Population:	115, 371 (1990); 146,383 (2000); 178,341 (2010 Forecast); 219,353 (2020 Forecast); 249,673 (2030 Forecast)
Cities in Watershed:	Oceanside (4.4□), County of San Diego (95.2 □), Vista (0.2□) Escondido (0.00014□ □52 acres), Riverside County (0.2□)
Important hydrologic resources:	Lake Henshaw at the eastern end of the watershed is a reservoir managed by Vista Irrigation District that provides drinking water to Vista and parts of Escondido and San Marcos. Water is diverted downstream of the dam from the San Luis Rey River to reservoirs in the San Dieguito Watershed;
Major Issues/Problems:	The shoreline at the mouth of the San Luis Rey River has elevated levels of indicator bacteria during winter months causing beach postings discouraging body contact with water. A bacteria source identification project began in 2008 to identify source of the bacteria.
Land Use:	The predominant land uses in the watershed are undeveloped (50□), Agriculture (37□), Residential and Parks/Recreation (10□)

Other Facts:	This is a 558 square mile watershed with San Luis Rey River serving as the major tributary that begins 50 miles inland at Lake Henshaw. Prior to the 1960□s the SLR River only flowed on rare occasions when there was above normal precipitation. During this time groundwater withdrawals from the San Luis Rey Basin exceeded recharge to the basin which resulted in lowering of groundwater levels with these levels decreasing to 43 feet below sea level by 1953. This allowed a trough of seawater to extend for a distance of two to six miles inland from the coast.
Carlsbad Watershed Entire Watershed Management Area (WMA) See below for details on specific Hydrologic Areas (HAs) within the Carlsbad WMA	
Major Water Bodies:	Buena Vista Lagoon; Agua Hedionda Lagoon, Batiquitos Lagoon, San Elijo Lagoon; Loma Alta Creek, Buena Vista Creek, Agua Hedionda Creek, Encinas Creek, San Marcos Creek, Escondido Creek
CWA 303(d) List:	Ammonia as Nitrogen, Bacterial Indicators, DDE , DDT , Eutrophic, Manganese, Nutrients, Nitrate, Nitrite, Sedimentation/Siltation, Sediment Toxicity, Selenium, Sulfates, Total Dissolved Solids, Phosphate, Phosphorous
Sources of Problems:	Animal Facilities, Botanical/Zoological Gardens, Eating and Drinking Establishments, Landscaping
Human Population:	511,306 (2000 Census), 596,738 (2010 Forecast), 651,840 (2020 Forecast), 700,119 (2030 Forecast)
Cities in Watershed:	Carlsbad (18□), Encinitas (9□), Escondido (13□), Oceanside (8□), San Marcos (11□), Solana Beach (1□), County of San Diego (32□)
Important hydrologic resources:	The Loma Alta Slough and creek is an important wildlife corridor and supports several threatened and endangered species.
Major Issues/Problems:	Surface water quality degradation, beach closures, sedimentation, habitat degradation and loss, invasive species, eutrophication, benthic alterations
Land Use:	Residential (32□), Freeways and Roads (10□), Agricultural (6□), Commercial/Industrial (13□), Open Space (11□), Vacant/undeveloped (18□), Other (10□). (2006 data)
Other Facts:	211 square miles; Formed by six individual watersheds; Reaches inland nearly 24 miles with a maximum elevation of 2,400 feet..
Carlsbad Watershed - Loma Alta HA (904.1)	
Major Water Bodies:	Loma Alta Creek, Loma Alta Slough
CWA 303(d) List:	Indicator Bacteria (Pacific Ocean Shoreline and Loma Alta Slough) and Eutrophic (Loma Alta Slough)
Areas of Concern:	Benthic community degradation
Sources of Problems:	Nonpoint sources (Loma Alta Slough)
Cities in Watershed:	Oceanside (95□); Vista (5□)
Important hydrologic resources:	The Loma Alta Slough and creek is an important wildlife corridor and supports several threatened and endangered species.
Major Issues/Problems:	Eutrophication in Loma Alta Slough, Indicator bacteria at Pacific

	Ocean Shoreline (Buccaneer Beach)
Land Use:	6,300 acres comprising 5□ of Carlsbad Hydrologic unit. The predominant land uses in the watershed are residential, industrial/commercial and vacant undeveloped land
Other Facts:	Vacant undeveloped land occurs in the middle of the watershed most of which is planned for future development.
Carlsbad Watershed -Buena Vista Creek HA (904.2)	
Major Water Bodies:	Buena Vista Creek, Buena Vista Lagoon
CWA 303(d) List:	Sediment Toxicity (BV Creek), Indicator Bacteria, Nutrients, Sedimentation/Siltation
Areas of Concern:	Sedimentation
Sources of Problems:	Unknown sources (BV Creek), Nonpoint/point sources (BV Lagoon)
Cities in Watershed:	Oceanside (26□), Carlsbad (19□), Vista (45□), County of San Diego (11□)
Important hydrologic resources:	The Buena Vista Lagoon is a fresh water lagoon that provides important habitat and fishing opportunities; El Salto Falls is located just west of the College Boulevard crossing; The Native American Heritage Commission recently registered the El Salto Falls as a sacred site - testimony to the long term use of this area by Native Americans.
Major Issues/Problems:	Surface water quality degradation and sedimentation of the Buena Vista Lagoon; There have been discussions to return Buena Vista Lagoon into a tidally flushed lagoon. A weir located west of Interstate 5 does not allow ocean water to tidally flush the lagoon providing fresh water areas for fishing.
Land Use:	The predominant land uses in the watershed are urban/residential and commercial.
Other Facts:	As sediment reaches the Buena Vista Lagoon it falls out and provides more shallow area for tulles to expand, thereby covering the surface water. Neighbors want the tulles to be controlled to keep the surface water viewable from surrounding properties.
Carlsbad Watershed - Agua Hedionda HA (904.3)	
Major Water Bodies:	Agua Hedionda Creek, Buena Creek, Letterbox Canyon, Agua Hedionda Lagoon
CWA 303(d) List:	Manganese, Selenium, Sulfates, Total Dissolved Solids (Calavera Creek), Indicator Bacteria and Sedimentation/Siltation (Agua Hedionda Lagoon)
Areas of Concern:	Urban growth and the resulting loss of permeable soil has led to the degradation of the Agua Hedionda Watershed. Recent growth and anticipated future development mean that a watershed that is already impaired could get even worse. Already, notable bank undercutting, and bank erosion characterize creeks in the Agua Hedionda Watershed.
Sources of Problems:	Calavera Creek: Unknown sources for manganese, selenium and sulfates; Urban runoff/storm sewers for Total Dissolved Solids. Agua Hedionda Lagoon: Nonpoint/Point sources for indicator bacteria and sedimentations/siltation
Cities in Watershed:	Carlsbad (41□), Vista (24□), County of San Diego (24□);

	Oceanside (6□), San Marcos (5□)
Important hydrologic resources:	
Major Issues/Problems:	The Development of a Watershed Management Plan for this HA is scheduled for completion in 2008. The goal of the plan is to have
Land Use:	
Other Facts:	Third largest Hydrologic Area in the Carlsbad Hydrologic Unit (CHU); Extends approximately 10.6 miles inland from the coast; 18,800 acres in area; comprises 14□ of the CHU;
Carlsbad Watershed □Encinas (904.4)	
Major Water Bodies:	Encinas Creek
CWA 303(d) List:	N/A
Areas of Concern:	Invasive Plants
Sources of Problems:	Animal Facilities; Eating and Drinking Establishments; Landscaping
Cities in Watershed:	Carlsbad (100□)
Important hydrologic resources:	Encinas Creek
Major Issues/Problems:	Invasive plants along Encinas Creek
Land Use:	3,400 acres in size; Industrial and commercial
Other Facts:	Extends 2.4 miles inland from coast with the highest elevation at 430 feet above mean sea level (MSL); Second smallest within the Watershed Management Area (WMA); The HA begins behind a small industrial area where it is immediately channelized. I continues through industrial and office parks associated with Palomar Airport; Drains directly to the Pacific Ocean.
Carlsbad Watershed - San Marcos HA (904.5)	
Major Water Bodies:	San Marcos Creek; Encinitas Creek (tributary of San Marcos Creek); Batiquitos Lagoon; Cottonwood Creek (sub-basin drains a portion of Encinitas directly into pacific Ocean at Moonlight Beach)
CWA 303(d) List:	San Marcos Creek: DDE, Phosphorous, Sediment Toxicity; San Marcos Lake: Ammonia as Nitrogen, Nutrients, Phosphorous
Areas of Concern:	Lake San Marcos is
Sources of Problems:	Animal Facilities; Eating and Drinking Establishments; Landscaping
Cities in Watershed:	Carlsbad (29□), Encinitas (15□), Escondido (5□), San Marcos (33□), County of San Diego (19□)
Important hydrologic resources:	Batiquitos Lagoon is 610 acres with a drainage basin of about 55,000 acres with its primary freshwater tributaries being San Marcos Creek from the east and Encinitas Creek which flows north along Green Valley, entering the lagoon under El Camino Real and La Costa Avenue, respectively.
Major Issues/Problems:	Accumulated silt has been filling up Batiquitos Lagoon, and the lagoon was expected to fill up. A large dredging and enhancement project was begun in 1994 to open the lagoon to the ocean's tidal changes and flows, thus slowing down the filling of the lagoon with silt. This project, completed in 1997, was funded by the Port of Los Angeles.
Land Use:	36,000 acres in size (28□ of WMA).
Other Facts:	Second largest within the Hydrologic Area (HA); Extends 14.1 miles inland from the costs originates on the western slopes of Merriam

	Mountains in discharges to the ocean via Batiquitos Lagoon; Highest elevation is approximately 1,540 feet above mean sea level;
Carlsbad Watershed - Escondido Creek (904.6)	
Major Water Bodies:	Escondido Creek; Reidy Canyon; San Elijo lagoon; Lake Wohlford (reservoir); Dixon Lake (reservoir)
CWA 303(d) List:	DDT, Bacteria, Manganese, Phosphate, Selenium, Sulfates, Total Dissolved Solids, Turbidity
Areas of Concern:	Bacteria, Nutrients,
Sources of Problems:	Animal Facilities; Eating and Drinking Establishments; Landscaping
Cities in Watershed:	County of San Diego (55□); Escondido (29□), Encinitas (11□); San Marcos (4□), Solana Beach (1□)
Important hydrologic resources:	The San Elijo Lagoon is part of the San Elijo Lagoon Ecological Reserve, a county and state regional park of nearly 1,000 acres of diverse habitat including six plant communities: coastal strand, salt marsh, brackish/freshwater marsh, riparian scrub, coastal sage scrub and mixed chaparral which can accessed over seven miles of trails via eight trailheads.
Major Issues/Problems:	Four pollutants occur at high frequencies including TDS, turbidity, total coliform, and fecal coliform; invasive plants within the lagoon and upstream riparian areas;
Land Use:	54,100 acres in area (40□ of WMA).
Other Facts:	Largest and most complex system in the WMA; Extends 24.6 miles inland from the coast; Escondido Creek originates in Bear Valley in north central San Diego county and discharges to the Pacific Ocean via San Elijo Lagoon.; Elevations on the ridges above Bear Valley are 2,420 feet above MSL
San Dieguito Watershed	
Major Water Bodies:	San Dieguito River, San Dieguito Lagoon, Lake Hodges (Reservoir)
CWA 303(d) List:	Pacific Ocean Shoreline □Indicator Bacteria
Areas of Concern:	Surface water quality degradation, habitat degradation and loss, invasive species, and increased imperviousness
Sources of Problems:	Urban runoff, agricultural runoff, and domestic animals
Human Population:	129,776 (2000); 181,698 (2010 Forecast); 224,491 (2020 Forecast); 241,357 (2030 Forecast)
Cities in Watershed:	Del Mar, Escondido, Poway, San Diego, Solana Beach
Important hydrologic resources:	55-mile long, 80,000 acre San Dieguito River Park; 150 acre San Dieguito Lagoon; Five (5) water storage reservoirs including Lake Hodges, Lake Sutherland, and Lake Poway.
Major Issues/Problems:	The Pacific Ocean at the mouth of the San Dieguito River is listed as a 303(d)-impaired water body for elevated coliform bacteria. In the absence of a comprehensive watershed planning effort, large-scale future development may exasperate current water quality problems and create additional beneficial use impairments. The San Dieguito Lagoon is especially sensitive to the effects of pollutants and oxygen depletion due to restricted or intermittent tidal flushing.
Land Use:	Vacant/ undeveloped (54□), parks/ open space (29 □), and urban (18□). Nearly half of the vacant land area is open to future

	development, most of which is zoned for residential usage.
Other Facts:	

Other Education Outreach opportunities

Communities Alive in Nature, a local non-profit organization, implements education outreach programs to local school districts in San Diego County. One component of their education outreach program is to educate high school age students about water quality and how to assess water quality based on water chemistry and the biological community of benthic macroinvertebrates living within the streams. The Clean Water Program was invited to participate in a hands-on field training for these students to demonstrate how to properly use field test kits for water quality analysis and the proper protocols for collection of benthic macroinvertebrates. Clean Water Program staff participated in two training sessions for 9th grade students who attend Pacific Ridge School, a local private school. These two events were held on March 6 and March 13, 2008 at Dawson Reserve and Green Oaks Ranch respectively, both located in Vista along Agua Hedionda Creek. 42 students and ten adults participated in the training.

8.3.1 Targeting Underserved Communities

Underserved communities are communities the City has determined may require increased educational efforts. The City targeted the following underserved communities and high-risk behaviors.

Mobile Businesses

Due to their nature, mobile businesses are typically not inspected during the routine industrial and commercial inspection program; therefore they may not be receiving the same educational material as other industrial and commercial businesses. The City plans to identify mobile businesses and develop educational outreach materials and information dissemination procedures appropriate for these businesses. Code Enforcement did respond to complaint calls related to mobile businesses.

Spanish-speaking population

The City will continue to target the large Spanish-speaking population in the City by offering a number of educational brochures and handouts, including the Green Wrench Guide and Integrated Pest Management tip cards in both English and Spanish. Additional Spanish language education outreach materials will be developed in future years.

Agricultural/Nursery/Greenhouse Operations

Due to the amount of agricultural land use in the City, the City distributed a number of printed educational materials to agricultural/nursery/greenhouse site owners and operators. The City also worked closely with the Natural Resources Conservation Service to provide technical assistance to these businesses with installing and maintaining BMPs specific to their operation. City staff promoted and distributed information on two regional workshops during the reporting period that targeted the agricultural community. On September 27, 2007, the San Diego County Farm Bureau sponsored the Ag Water Outlook for 2008 were attendees learned from water experts what to expect in 2008 to plan for water cuts while managing production. On March 27, 2008, the City of Oceanside sponsored the Water Quality Runoff Management & Agricultural

Waiver Workshop for Nurseries & Agricultural Businesses. This workshop was designed to help attendees better understand water quality runoff management and how the irrigated agricultural waiver would affect their operations.

Over-Irrigation

Water meter reader personnel are trained to document and respond to IC/IDs and over-irrigation issues as they come across such activities during their normal activities. Informational door hangers about storm water runoff, including over irrigation, were left at residences and/or businesses noted to have runoff due to over-irrigation. These colorful door hangers also provide specific information about storm water runoff, how pollutants can reach local waterways, the affects of these pollutants on the waterways and what types of activities and materials can pollute waterways. Addresses of such residences and/or businesses were documented and may be used later to target problematic areas of the City. In addition, dry weather exceedance letters were sent to areas of the City determined to be a source for exceedances of nitrate, ammonia, phosphorus, and bacteria which, when found in elevated levels, are typically attributed to over-irrigation.

Residential Car Washing

Residents continued to be encouraged to use professional car washes or to implement BMPs at their homes to prevent water produced by residential car washing from entering the storm water conveyance system. Dry weather exceedance letters were sent to areas of the City determined to be a significant source of detergents. In the future, the City may target areas that continue to be a problem with additional educational materials.

Educational Signs – Pet Waste

During this reporting period it was determined that there was a need for informational signs regarding the proper removal and disposal of pet waste. The Clean Water Program received complaint calls from the public stating that in common areas and trails there are people who walk dogs and do not pickup the waste left behind. Past signs installed stated “Please pick up your pet’s waste – Poop pollutes our parks, rivers, and beaches. The City Code was also listed on the sign.

It was determined this year to install signs that were more direct about how poop pollutes our rivers creeks and streams. Signs installed during this reporting period state, “Pet waste transmits disease. Leash and clean up after your pet. Let’s keep this area clean. Up to $1,000 fine.” See the photo below for a picture of one of the signs installed.

During this reporting period five (5) signs were installed in two areas of the City. Since installation of these signs complaints regarding pet waste not picked up in these two areas have not occurred. See Table 8-5 for locations and numbers of signs installed.

Table 8-5. Pet Waste Signs Installed in the City during the 2007-08 Reporting Year.

Date Installed	Sign Location	Number of Signs	Brief Description
12/24/2007	3903 Waring Road	2	Grass area between sidewalk and curb where people walk their dogs
6/24/2008	Peacock Blvd.	3	Median area in neighborhood where people walk their dogs.
	Total Signs Installed	**5**	

In previous reporting periods, 52 pet waste signs were installed in each City park and along the San Luis Rey River bike path. A photo of these signs is shown.

Education Materials Distributed

Materials are regularly developed and updated to provide residents, the general public, and students with information about urban runoff, water quality, BMPs, Clean Water Program projects, and the Urban Runoff Hotline number. These materials include brochures and promotional items that are distributed upon request and during community events where the Clean Water Program staff a booth. No significant changes were made to any of the brochures during this reporting period. Copies of these brochures were submitted with previous annual reports. Table 8-6 lists the educational materials distributed during the 2007-2008 reporting period.

Table 8-6. Educational Brochures and Promotional Items Developed and/or Distributed.

Education Material	Description	Number Distributed
Educational Brochures		
Urban Runoff Guidelines for Residents Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from residential activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	250
Pollution Prevention Tips for Gardening Activities Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from gardening activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	150
Urban Runoff Guidelines for Commercial Businesses Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from commercial and industrial business activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	150
Urban Runoff BMPs for Construction Projects handout	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from home-improvement activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	350
Urban Runoff Guidelines for Powerwashers	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from powerwashing activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	100
Guide to Oceanside Waterbodies Booklet	A colorful introduction to the waterbodies in Oceanside. The Guide is intended to help residents develop a sense of stewardship, as well as provide information about local creeks, rivers, lakes, wetlands, and lagoons, the history behind each waterbody, and stakeholder information. In addition, the Guide includes a description of a watershed and current monitoring programs implemented to test recreational water quality.	300
	Total number of educational brochures distributed during this reporting period.	**1,300**
Promotional Items		
Urban Runoff Hotline and Website magnets	Magnets were distributed with the Clean Water Program logo, website address and Urban Runoff Hotline.	500
Poop Pollutes magnets	Magnets were developed to remind residents to pick up their pet's waste.	500

Poop Pollutes Pet Waste Bag Dispensers	Pet waste bag dispensers were distributed at community events. The Poop Pollutes education message was attached as a sticker.	50
Protect Our Water bags	These 14 inch x 12 inch bags display a list of residential BMPs, Clean Water Program address and hotline number, and the Program tagline "You are the solution to water pollution." Distributed approximately 500.	500
Click Message Pen	Each pen has Oceanside's Urban Runoff Hotline phone number as well as the following text, "Protect our Waterways: sweep sidewalks, reduce pesticide use, recycle motor oil and filters, eliminate irrigation runoff, pickup pet waste, and pickup litter and cigarette filters."	1,042
Pencils made from recycled money and denim	Each pencil has Oceanside's Urban Runoff Hotline phone number.	2,500
Decals	These static cling decals have Oceanside's Urban Runoff Hotline phone number and can be placed on the windshield for quick reference to report potential storm water violations.	250
Letter opener	These letter openers have Oceanside's Urban Runoff Hotline phone number and were distributed to City employees only during municipal training sessions.	250
Stress Earth Ball	These squeezable earth balls have Oceanside's Urban Runoff Hotline phone number and were distributed to City employees during municipal training sessions as well as at community events.	500
Gel Pen	These gel pens have Oceanside's Urban Runoff Hotline phone number and were distributed to City employees only during municipal training sessions.	300
Goodie Bags	These vinyl bags have ten ways to protect our water and Oceanside's Urban Runoff Hotline and were distributed to school and scout troops (filled with other promotional items) and handed out at community event booths.	1,000
Tote Bags	These reusable tote bags are made from recycled plastic and have Oceanside's Urban Runoff Hotline phone number and Oceanside's Recycling Hotline phone number. They were distributed to employees during municipal storm water training sessions and as give-away option for beach and creek cleanup volunteers.	500
Bracelets	These translucent blue bracelets state "I Love Clean Water City of Oceanside Clean Water Program" and were distributed to children during community events and in goodie bags for classroom presentations.	500
Flashlights	These flashlights have the Clean Water Program name on them and were provided as a raffle item during municipal training sessions.	25
	Total number of promotional items distributed during this reporting period.	**8,417**

Figure 8-1. Promotional Items Distributed During Reporting Year 2007-08.

8.4 Outreach Component Effectiveness Assessment (Optional)

See Section 11.0 for an assessment of the education component of the City's JURMP.

8.5 Program Review and Modification (Optional)

Staff Training

The Clean Water Program will continue to implement its comprehensive municipal staff training program, including the implementation of pre- and post-test quizzes. The scores from the pre- and post-quizzes will continue to be assessed to determine the effectiveness of the training programs. If specific divisions or departments are in need of educational materials or reference materials related to storm water, the Clean Water Program staff will assist in the development of these materials to provide to those departments or divisions for dissemination or reference.

During the next reporting period all brochures will be reviewed for content and updated and reprinted with revised information, where needed.

9.0 PUBLIC PARTICIPATION COMPONENT

In order to ensure success with any City-wide program, the public must be involved. Stewardship and participation by the general public will increase the acceptance and willingness to comply with new regulations. The City of Oceanside has actively pursued public involvement in the Clean Water Program through the implementation of various programs and feedback mechanisms. This section documents the activities conducted by the City of Oceanside during the 2007-2008 reporting period to meet the requirements of Section D.6 of the Municipal Permit.

Order 2007-0001 Compliance Summary

D.6 - Public Participation Component	See Entire Section 9 of this Annual Report

9.1 Local Public Participation Opportunities

The City of Oceanside encourages its residents to become involved in the Clean Water Program in various ways. The variety of ways the public can participate in the Clean Water Program include reporting potential violations to the Urban Runoff Hotline, beach and creek cleanup events, and community events.

9.1.1 Urban Runoff Hotline

With the establishment of the Urban Runoff Hotline, (760) 435-5800, the public can report potential violations that could pollute the City's receiving waters. The Urban Runoff Hotline was promoted through a variety of media during this reporting period, including announcements on local television stations, placement on brochures, click-message pens, pencils, and other promotional "give-aways", and advertisement on the City's Clean Water Program webpage.
During the reporting period, fifty-five (55) calls were received on the Urban Runoff Hotline by residents concerning potential urban runoff violations. This is a significant increase from the 14 calls received during the 2006-07 reporting period (a 392% increase in call volume). In addition, Code Enforcement Officers received over 190 calls from residents regarding potential urban runoff violations.

9.1.2 Oceanside Eyes

In addition to the Urban Runoff Hotline City Staff is encouraged to participate in the Clean Water Program through the use of a special City Enhancement Hotline specifically for Oceanside employees called "Oceanside Eyes." This hotline is call incentive driven and promoted internally. During storm water classes for municipal staff, this hotline is mentioned as an alternative for calling the Urban Runoff Hotline.

9.1.3 Cleanup Events

City Sponsored events
To increase Oceanside residents' stewardship toward our local waterways, the Clean Water Program hosts annual cleanup events at every major waterway in Oceanside including Buena Vista Creek, Loma Alta Creek, San Luis Rey River and also hosts several beach cleanup events throughout the year. Each cleanup averages anywhere between 100 to 300 participants. During the 2007-08 reporting period, approximately 1,039 volunteers removed approximately 11.11 tons

of trash, debris, appliances, furniture, shopping carts and other unwanted material from Oceanside waterways.

Private group sponsored events
Also, private groups regularly approach the city to coordinate their own beach cleanup. The city of Oceanside including the Clean Water Program, Lifeguard division and the harbor maintenance staff support these groups by providing them guidance on what areas to target for cleanup, supplies for their event (bags and gloves) and safety instructions for the group. During this reporting period six private groups coordinated their own beach cleanup event in Oceanside. A total of 865 volunteers removed 485 pounds form Oceanside beaches.

One event coordinated by I Love A Clean San Diego included an aerial art photograph opportunity. This event titled Kids Ocean Day Cleanup was held on June 6, 2008 at the Oceanside City Beach, just south of the pier. This event alone had 800 participants who removed 100 pounds of trash from the beach and then arranged themselves for an aerial photograph taken by a hovering helicopter. See Figure 9-1 below for a picture of the aerial photo.

Figure 9-1. June 6, 2008 Kids Ocean Day Cleanup and Aerial Photo.

Between the City sponsored and private group sponsored events, 1,904 volunteers removed 15,705 pounds of trash and debris from Oceanside City beaches and the three waterways that traverse the City of Oceanside including, the San Luis Rey River, Loma Alta Creek and Buena Vista Creek. Table 9-1 lists cleanup events held between July 2007 and June 2008 to encourage community participation and education of the effects of urban runoff:

Table 9-1. Cleanup Events Held during the 2007-08 Reporting Year.

Date	Event	Number of Participants	Pounds Tonnage of Waste Removed
City Sponsored Cleanup Events			
7/5/2007	Morning After Mess	60	463 pounds
9/15/2007	Buena Vista Creek Cleanup	130	5,500 pounds
9/15/2007	Oceanside Beach Cleanup	300	257 pounds

Date	Event	Number of Participants	Pounds Tonnage of Waste Removed
11/10/2007	San Luis Rey River Cleanup	136	1,000 pounds
4/26/2008	Loma Alta Creek Cleanup	413	8,000 pounds
	Total City Sponsored Events	**1,039**	**15,220 pounds**
Private Group Sponsored Events			
01/10/2008	Oceanside High School Environmental Club	10	10 pounds
02/23/2008	Oceanside High School Baseball Players	52	260 pounds
4/05/2008	Pacific Kiwanis High School Students	25	50 pounds
4/07/2008	Vista High School Key Club	5	10 pounds
4/19/2008	Black Student Union Cal State San Marcos	33	55 pounds
6/06/2008	Kid's Oceanside Beach Cleanup	800	100 pounds
	Total Private Group Events	**865**	**485 pounds**
	Grand Totals	**1,904**	**15,705 pounds**

Cleanup event mailing lists

During this reporting period and in previous years all volunteers were placed on a mailing list and were periodically mailed fliers with event information allowing them a sense of ownership and responsibility toward the Program. See Attachment 9-A for 2007-08 reporting year fliers mailed to past participants. In order to become more environmentally conscious and use less paper, during the next reporting period, the Clean Water Program will create an email distribution list as a way to inform interested parties about upcoming cleanup events. This will save time for staff to update mailing labels and eliminate the postage and printing costs for mailing these fliers.

9.1.4 Oceanside Update Show

Clean Water Program staff appear regularly on the Oceanside Update Show broadcast through Oceanside Channel KOCT. Each spot allows staff to spend three to five minutes discussing specific storm water pollution programs, pollution prevention, and BMPs to reduce impacts. The show is broadcast twice daily at 7:00 a.m. and 7:00 p.m. Topics are varied with every taping of Oceanside Update, therefore the viewing audience learns about a multitude of BMPs. While KOCT is unable to determine the actual number of residents who watch Channels 17 and 18 regularly or for any length of time, both channels broadcast to approximately 50,000 Oceanside households. Table 9-2 summarizes topics discussed each month in which the Clean Water Program aired a spot:

Table 9-2. Summary of Oceanside Update Topics by Month.

Date	Topic Discussed
August 2007	Water conservation & irrigation runoff
September 2007	Proper hookup for RV sewage dumping at the Oceanside Harbor RV dump station
November 2007	Water conservation & irrigation runoff
December 2007	Irrigation runoff & its connection to polluted runoff
February 2008	BMPs for residents during rainy season
April 2008	Loma Alta Creek Cleanup
June 2008	Strom drains are different that sewers

9.1.5 Additional Public Participation Opportunities

Other opportunities for local public participation during this reporting period are discussed below.

Interpublic Education. The City has developed programs to educate the public and various target communities of the JURMP and the numerous ways the public can contribute to reducing pollution of the City's waterways and Receiving Waters. However, the City recognizes that no matter how many educational programs it implements, there will always be a need for ongoing outreach to various audiences. Therefore, "spreading the word" is another significant effort that the public will be encouraged to participate in that will substantially contribute to the success of the JURMP. When speaking with the public about urban runoff issues, they are encouraged to speak with neighbors about how everyday activities can potentially pollute local waterways.

During this reporting period the Clean Water Program was contacted by a city resident living in a neighborhood with a Homeowners Association. This resident requested informational brochures that could be distributed to households in the neighborhood that address urban runoff and water conservation information. Brochures and information provided to the resident for distribution were as follows:

- Urban Runoff Guidelines for Residents – 125 each
- Pollution Prevention Tips for Gardening Activities - 125
- Pollution Prevention Tips for Landscape Contractors – 5
- Miscellaneous promotional items

The City will continue to provide homeowners associations with informational brochures for distribution throughout their communities.

City Staff Activities. City staff is the public at work. Staff is encouraged to report violations and provide feedback on the implementation of the JURMP. City staff is the eyes and ears of the City, and can provide valuable information on which components and programs are working and provide suggestions or recommendations on improving the programs. The City staff is provided an incentive based hotline called Oceanside Eyes for reporting potential runoff violations as well as other problems that require remediation, such as road repair or infrastructure maintenance needs. In addition, City staff provides feedback during municipal training sessions, information meetings, and by direct contact with the Clean Water Program Manager and staff. Comments are discussed and if changes can be made to better improve the program, then they are planned and implemented.

9.2 Regional Public Participation Opportunities

This section describes those mechanisms available, at the regional level, for the public to participate in to assist in the implementation of regional JURMP related programs and to provide feedback to the Copermittees and contribute to the continuing development of the numerous JURMPs in effect around the County:

9.2.1 Media

Outreach to the public through the media serves as a widespread public education BMP. These messages also promote public participation and further stewardship of the City's MS4 and receiving waters. Press releases for cleanup events were sent to local media outlets to request placing information in the publications. Media is an important element of public participation and keeps communication open between government staff and the public.

During Fiscal year 2007-08 three events were covered in the following publications:

- September 15, 2007 Coastal Cleanup Day – Article in The Coast News providing an overview of the event.
- November 10, 2007 San Luis Rey River Cleanup Event – Article in North County Times; front page of local section
- April 26, 2008 Loma Alta Creek Cleanup Event – Advertisement in local publication titled *Kids Stuff*.

Copies of the media coverage are located in Attachment 9-B.

9.2.2 Regional Events

San Diego County Fair The San Diego Regional Storm Water Copermittees sponsored the San Diego County Fair (Fair) in 2008 as an education and outreach activity. The sponsorship was a joint effort between the City of San Diego's Think Blue program and the regional Copermittees with each entity contributing approximately half towards the overall cost. The Fair was selected as a regional event due to its unique ability to potentially reach more than one million San Diegans and convey a strong environmental message. The Residential Sources and Outreach Workgroup (Outreach Workgroup) was responsible for overseeing sponsorship activities with the City of San Diego leading the coordination and implementation efforts.

The 2008 Fair was held June 14th through July 6th, spanning two fiscal years and will be included in both the FY 07/08 and FY 08/09 annual reports. The attendance for the fair was estimated at 1,235,698 persons for the 21 days the event occurred. Sponsorship for the Fair included staffing an outreach booth for 11 days, in which the majority of the jurisdictions provided staffing support. Two staff people from the City of Oceanside's Clean Water Program staffed the booth on June 21, 2008.

The outreach booth served as the primary method for educating the public about watershed protection and pollution prevention. The Outreach Workgroup elected to promote Integrated Pest Management (IPM) as the primary theme and collaborated on the distribution of IPM materials in both English and Spanish. Individual jurisdictions were invited to distribute their own materials in addition to the IPM materials. The Copermittees received credit as both a Flower & Garden Show sponsor and an Enviro-Fair sponsor.

Think Blue was designated as the brand for the Copermittees' during the event and signage demarking the symbol included banners, planter box displays and recycle bin stickers, which were visible at over 500 locations throughout the Fair. Media exposure included TV, radio and press releases. The sponsorship was printed in both the Fair program and included on the Fair map. Other promotions included newspaper advertisements, electronic messaging over the Jumbo Tron, website logos and links, and PA system announcements in both English and Spanish.

Think Blue, City of San Diego developed an event survey for the purposes of assessment. Over 1,200 survey cards were completed during the 11 days the booth was staffed. The questions focused on general storm water knowledge and awareness. The results are being tabulated and will be reported in FY 08/09.

Copermittee Meetings. Similar to Project Clean Water, the Copermittees meetings provide opportunities for public participation. Attendees include a wide variety of experts, including representatives of federal, state and local agencies, industry representatives, environmental groups, consulting firms, product vendors, general public, and academic and research institutions. Throughout the meeting, local municipality representatives are provided the opportunity to share recent water quality events. The meeting provides a venue to discuss the latest issues facing the various Copermittees and provides valuable insight into the current regional Urban Runoff issues. Public participation helps promote conversation and education on evolving industry standards.

Regional Hotlines. The regional hotlines provide a direct connection for public participation. Historically, the hotlines have worked well and should continue to increase in use as more people are educated of the hotline and the types of issues to report. The City will encourage reporting through its local hotlines, however, the regional hotlines will serve as an alternative to the local hotlines and also provide an opportunity for reporting by visitors to the City, from other areas in the County, who are not familiar with the local hotlines.

10.0 FISCAL ANALYSIS COMPONENT

The City of Oceanside acquires the funds necessary to facilitate the City's storm water program through four departments or divisions in the City: Water Utilities, Public Works, Engineering and Code Enforcement. Much of City's storm water program falls under the responsibility of these four departments/divisions. Funds obtained for use in implementing the City's storm water program are utilized for a number of different programs, including jurisdictional, watershed, and regional programs. This section documents the activities conducted by the City of Oceanside during the 2007-2008 reporting period to meet the requirements of Section G of the Municipal Permit Order 2007-0001.

Order 2007-0001 Compliance Summary

G: Fiscal Analysis Component	See Entire Section 10 of this Annual Report

Effective programs require adequate funding to implement planned activities. The first step in securing adequate funding for the JURMP is to provide a strategy for effectively conducting a fiscal analysis of the JURMP in its entirety. This year's fiscal analysis included an evaluation of the expenditures (such as capital, operation and maintenance, education, and administrative expenditures) necessary to accomplish the activities described in the JURMP and required under investigation orders and Total Maximum Daily Loads (TMDLs).

10.1 Fiscal Analysis Methods

10.1.1 Program Funding

As previously mentioned, the City secures funding for the implementation of the storm water program through the Water Utilities, Public Works, Engineering and Code Enforcement departments/divisions in the City. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge. The surcharge is based on the customer's water consumption, so the surcharge is also designed as an incentive for individuals to conserve water. During this reporting period an increase in the surcharge was secured in order to cover significant increases in costs due to additional requirements under Permit Order 2007-001, Investigation Orders, and TMDLs. This amount is equal to $.07 per unit of water used.

The Land Use Planning and Development department secures funding from development-related programs. The Engineering Division receives funding through fees assessed on developers for grading plan checks and inspections. Funding for Public Works departments is obtained through general allocations to the department.

10.1.2 Urban Runoff Management Programs

The City's storm water budget is used to support the following expenditure categories:

- Administration of the City's Clean Water Program
- Development Programs
- Capital Improvement Projects/Storm Water Pollution Compliance Programs
- Storm Drain Improvements

- Solid Waste
- Flood Control
- Street and Median Maintenance

Personnel from various City divisions/departments are involved in the implementation of the City's storm water program. Refer to Section 2 and the City's certification letter in Appendix A of the City's 2008 JURMP for further detail regarding the responsibilities of various departments. Other program expenditures include watershed and regional storm water activities.

10.1.3 Expenditure and Budget Reporting

Following are the expenditures for fiscal year 2007-08 as well as a proposed budget for the next fiscal year. The fiscal year expenditures are presented in tabular format with separate rows for different expenditure categories and the associated budget. The budget for the next fiscal year is presented in the same table.

The JURMP budgeting for the Water Clean Water Program which includes various departments is described in the following sections and summarized in Table 10-1 at the end of this section. During this reporting year two full-time positions were added under the Clean Water Program. These two positions were added to address the significant increase of inspection requirements for the industrial/commercial component. Currently there are eight staff people dedicated to the City's Clean Water Program.

- One full-time Clean Water Program/JURMP Coordinator
- Two full-time Environmental Specialists (focusing on water quality monitoring, education outreach, and program administration)
- Two full-time Code Enforcement Officers
- Two full-time CWP inspectors (new staff additions this year)
- One full-time Engineering Assistant (focusing on SUSMP and future HMP)

10.1.3.1 Water Utilities Department

The surcharge rate described above under Program Funding is listed as a separate line item on Oceanside customers' utility bills. This allows for the clear delineation of the revenue being secured for the Clean Water Program in the Water Utilities section of the utility bill. The costs to administer the Clean Water Program during Fiscal Year 2007-08 totaled $1,367,346. It is anticipated that the Water Utilities Department will expend $1,124,987 during Fiscal year 2008-09.

10.1.3.2 Public Works

The overall cost of the City's street sweeping program is estimated at $907,000 during this reporting period. This includes $442,000 for equipment costs and $465,000 for staff costs. With a total of 1,142 miles of public streets maintained in the City at a cost of $907,000, this averages out to $794.22 per mile. This cost does not account for the additional curb miles swept more frequently than others within the City and does not account for the parking lots swept. During future reporting periods, the city will develop a more refined length of curb miles to accommodate for the streets that are swept more than once monthly.

The cost for inspection and maintenance of the MS4 was $351,910 during this reporting period. These costs are expected to increase to $360,580 during fiscal year 2008-09. During Fiscal year 2007-08 the Public Works Department spent approximately $1,323,910. It is anticipated that the Public Works Department will expend $1,369,580 during Fiscal year 2008-09.

10.1.3.3 Engineering

Municipal Permit Order 2007-001 requires an increased focus and effort in development-related review and inspection, development of a Hydromodification Plan and revisions to the Standard Urban Storm Water Mitigation Plan. The approximate costs to implement this program during Fiscal year 2007-08 totaled $272,510. It is anticipated that Engineering Department will expend $275,006 during Fiscal year 2008-09.

10.1.3.4 Overall Clean Water Program Costs

During Fiscal Year 2007-08 approximately $2,963,766 was expended amongst four departments (including Code Enforcement) for the implementation of the Clean Water Program. It is anticipated that the total program costs for Fiscal Year 2008-09 will total $2,769,573. This reduction is due to the fact that the majority of the costs for the Lagoon TMDL Investigation Order was appropriated during the first year of the two year program.

Figure 10-1. JURMP Budgeting for Water Utilities, Public Works and Engineering Departments/Divisions.

Department	Item	Fiscal Year 2007-2008	Projected Fiscal Year 2008-2009
Water Utilities	Personnel (including Code Enforcement)	410,330	588,767
	Misc. office supplies, postage, uniforms	2,000	3,200
	Print Materials	0	30,000
	Monitoring Programs including lab materials, supplies and services	17,191	103,000
	Other Misc Cleanups and booths	73,000	34,500
	Consultant Fees Investigation Order, TMDL and Regional Monitoring Programs	730,440	151,678
	Independent Contractors	0	39,000
	Permits	135,000	25,000
	Dues, Travel, Advertising	9,400	16,450
	Equipment	2,000	20,000
	Regional URMP Activities	16,815	51,615
	Watershed URMP Activities	41,521	47,180
	Regional Education	10,656	11,082
	Effectiveness Assessment	3,256	3,515
Water Utilities	**Total**	**1,367,346**	**1,124,987**
Public Works	Street Sweeping (Equipment)	442,000	460,000
	Street Sweeping (staffing and /or contract costs)	465,000	484,000
	Conveyance System Cleaning (Contracted Work and City Staff	351,910	360,580
	Personnel for CWP Monitoring	65,000	65,000
Public Works	**Total**	**1,323,910**	**1,369,580**
Engineering	Personnel	250,000	260,000
	Hydromodificaiton Plan	22,510	15,006
Engineering	**Total**	**272,510**	**275,006**

11.0 EFFECTIVENESS ASSESSMENT COMPONENT

11.1 Introduction

Effectiveness assessment is an important component of the JURMP because it can assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The San Diego County Copermittees developed two guidance documents to assist in the assessment of the JURMP components as well as the jurisdictions overall JURMP program. These two documents are titled *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* and the *Baseline Long-term Effectiveness Assessment* (BLTEA). The City participated in regional efforts to develop these documents in anticipation of the requirement to assess their JURMP programs.

The City gathered and evaluated data for some of the program components for assessment during this reporting period. This data will be valuable for incorporation into long-term effectiveness evaluation on a jurisdictional level. In future reporting years the issue of standardized assessment metrics and procedures will be addressed by the Copermittees. The City anticipates participation in the further development of these work products.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes.

Next the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique. The effectiveness assessment approach developed by the Copermittees during the 2005-06 permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

- Level 1: Compliance with Activity-Based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation

- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

The establishment of measurable outcomes is necessary for both incremental program component improvements and as a basis for future establishment of relationships between implementation and water quality improvement outcomes.

11.2 Effectiveness Assessment Results

The Municipal Permit Order 2007-0001 requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Levels 1, 2, 3, 4, 5, and 6 outcomes are discussed in the text below. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome level assessments

Level 1 – Compliance with Activity-Based Permit Requirements: Documenting Activities

Compliance with Activity-based permit requirements is intended to provide a quantitative assessment that reflects the regional long-term effectiveness assessment framework through targeted outcomes for the City based on various components of the Municipal Permit. Level 1 outcomes take the form of a simple yes or no answer basically answering "Was the control measure completed?" or it may provide feedback that may be quantified, counted, or tracked over time to demonstrate effort or progress. This may take the look of the number of tasks completed

Level 2 – Changes in Knowledge/Awareness: Raising Awareness

An important goal of stormwater programs is to increase the level of knowledge and awareness among target audiences such as residents, businesses, and municipal employees. Level 2 outcomes provide program managers feedback on how effective the various control measures have been in raising awareness and changing attitudes of the target audience.

Level 3 – Behavioral Change/BMP Implementation: Changing Behavior

A key focus of the stormwater management program is to effect changes in behavior. By building increases in knowledge and awareness (Level 2), level 3 outcomes provide program managers with feedback on how effective the program elements and control measures have been in motivating target audiences to change their behaviors and implement appropriate BMPs.

Level 4 – Load Reductions: Reducing Loads from Sources

Many control measures are intended to reduce the loading of pollutants from targeted sources. Load reductions should, in turn, result in improvements to discharge and

receiving water quality. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning.

Level 5 – Changes in Discharge Quality: Improving Runoff Quality
A primary focus of stormwater management programs is to reduce pollutants in stormwater to the maximum extent practicable, and to ensure that these discharges do not cause or contribute to violations of water quality standards in receiving waters. At this level baseline measurements of runoff quality are measured to allow comparison. Measurable changes requirements frames of a year or greater. And, multi-year data sets are needed in order to have any confidence in the measured change.

Level 6 – Changes in Receiving Water Quality: Protecting Receiving Water Quality
The ultimate objective of stormwater management programs is the protection of water bodies. At level 6, program mangers will focus on outcomes such as compliance with water quality standards, protection of biological integrity, and beneficial use attainment.

Summary
Program elements and control measures will typically have outcomes at more than one of the levels described above and not all outcome levels will necessarily be applicable to all activities. The information submitted with this report will address levels 1, 2, 3 and 4. Section 7 of this report, IDDE, will be submitted prior to December 15 and will address level 5.

11.2.2 Overall Component Assessments

11.2.2.1 Development Planning

The City's review process for development projects is effectively requiring higher removal efficiency BMPs. Based on some interaction with responsible parties after the end of the reporting period and the results of the treatment control inspections, it appears that there is a consistent desire by developers to include just structural BMPs instead of a combination of structural and treatment controls BMPs. The City will work with the parties responsible for maintenance of treatment control BMPs to address this issue during 2008/2009. The following information highlights the Development Component of the City's JURMP. Table 11-1 presents the level 1 effectiveness assessment.

Revised SUSMP Manual
The City of Oceanside Interim Local SUSMP is based on the Interim Model SUSMP developed collectively by the Copermittees to address post-construction urban runoff pollution from new development and redevelopment projects that fall under both "priority project" and "standard project" categories. The general goal of the SUSMP is to develop and implement practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from a project site and urban runoff flow rates, volumes, velocities, and durations. This goal may be achieved through site-specific controls and/or drainage area-based structural treatment controls. The City's Interim Local SUSMP identifies appropriate BMPs for certain designated project types to achieve this goal. Projects that fall identified as priority projects are required to prepare a Stormwater Mitigation Plan (SWMP). Development projects not qualifying as priority projects will be required to prepare a Runoff Assessment Report (RAR) as specified in

this SUSMP. The RAR will require the applicant to incorporate LID concepts, site design BMPs, and source control BMPs in the project design, but no structural treatment control BMPs will be required. The manual is available on the Clean Water Program website.

Interdepartmental Coordination
The City's SUSMP and development review process includes multiple departments and divisions throughout the City. The City has taken necessary steps to maintain compliance with SUSMP requirements through the coordination of these multiple departments and divisions.

Dedicated Storm Water Management Program
The City established the Clean Water Program (CWP) in 2001 under the Water Utilities Department. The CWP program in conjunction with the Engineering Department provides the necessary oversight for all management components of the SUSMP. During this reporting period the Engineering Department hired a full time storm water plan check reviewer.

Table 11-1. Development Planning – Level 1: Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Development Planning D.1.e	Development Projects	Projects needing SWMP	Projects completing SWMP	Actual/Target	Percent ( ) Completion
	Priority Projects (Required SWMP)	36	36	36/36	100
		Sites needing RAR	Sites completing RAR	Actual/Target	
	Standard Projects (Require RAR)	4	4	4/4	100
	SUSMP Inspections	Sites targeted for Inspection	Sites Inspected	Actual/Target	
	High, Medium and Low Priority Sites (Total 41)	41	41	41/41	100

As the City continues to grow and evolve, challenges associated with data management emerges such as tracking of post-construction BMPs, maintenances agreements, and associated documents. It is important to update available tools with up-to-date information. This will be an issue to address during the next reporting period.

11.2.2.2 Construction

The construction component of the City's JURMP continues to be effectively implemented through inspection and enforcement, education and training and BMP

maintenance (Table 11-2). As construction activities continue, the City will maintain the level of performance established from past years, and continue to meet the regulatory standards mandated in the Municipal permit.

Table 11-2. Construction – Level 1: Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Development Planning D.2.d	Construction Projects	sites targeted for Inspection	sites inspected	Actual/Target	Percent ( ) Completion
	High Priority Sites	20	20	20/20	100
	Medium Priority	29	29	29/29	100
	Low Priority Sites	26	26	26/26	100

11.2.2.3 Municipal

The municipal component of the City's JURMP continues to provide a well-rounded approach and will continue to implement a comprehensive education program along with inspections of municipal facilities, MS4 maintenance, sanitary sewer slip-lining and street sweeping (Table 11-3).

Table 11-3. Municipal – Level 1: Compliance with Activity-Based Requirements; Level 4 - Load Reductions: Reducing Loads from Sources.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.a	Municipal Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	(High, Medium and Low priority facilities)	230	230	230/230	100
	MS4	of catch Basins to be cleaned	of catch Basins actually cleaned	Actual/Target	Percent ( ) Completion
	Catch basins cleaned	3,252	3,252	3,252/3,000	100
	Sanitary Sewer	of feet to be slip-lined	of feet actually slip-lined	Actual/Target	Percent ( ) Completion
	Feet of sewer slip-lined	5,352	7,252	7,252/5,352	135
	Street Sweeping	of miles of streets to be swept	of miles of streets actually swept	Actual/Target	Percent ( ) Completion
	Miles of street swept	571	571	571/571	100

In addition the City implemented a training program that provided pre- and post-quizzes to assess the effectiveness of the training course specific to each department or division. During the 2007-08 reporting year, 298 City staff was trained on the City's storm water program requirements. Pre- and post- tests were given to assess the level of knowledge before and after each training session. Depending on the nature of the employee's department, the employee's were given a 15 or a 20 questions test. One training program and its associated quiz targeted staff who work at and maintain industrial facilities. The other training programs targeted City staff that worked in various departments including fleet maintenance, parks and recreation and street maintenance. The average City pre-test score was 64% percent of the questions correct. The average City post-test score was 98% percent of the questions correct. Figure 11-1 presents the pre- and post-test scores by City department.

Figure 11-1. Municipal – Level 2: Changes in Knowledge/Awareness: Raising Awareness.

11.2.2.4 Industrial and Commercial

The City implements a comprehensive inspection program for industrial and commercial facilities including all restaurants and nursery and greenhouse operations. Table 11-4 provides an assessment for the inspections.

Table 11-4. Industrial and Commercial Component - Level 1: Compliance with Activity-Based Requirements.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.b	Industrial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High, priority facilities)	52	52	52/52	100
	Industrial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	Medium and Low priority facilities	As Needed	75	N/A	N/A
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High priority facilities - Restaurants	371	371	371/371	100
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High priority facilities Other than restaurants	94	94	94/94	100
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	Medium and Low priority facilities	As needed	104	N/A	N/A
	Nursery and Greenhouses	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	All High Priority	28	28	28/28	100

During inspections of industrial, commercial, and nursery and greenhouse operations, City staff and contractors rated the overall level of storm water knowledge and the level of BMP implementation while completing the inspection. The knowledge assessment ratings were designed to gauge awareness of storm water pollution prevention and implementation of effective BMPs. Table 11-5 presents the basis for the ratings.

Table 11-5. Description of Effectiveness Assessment Levels for Inspections.

Overall Level of Knowledge	
Level	**Description**
5	Individual demonstrated an in depth knowledge of the storm water program and BMPs consistent with the facility's activities and operations.
4	Individual has a clear understanding of BMPs but may not have a clear awareness of the connection between pollution prevention and water quality.
3	Individual has a general understanding of storm water issues ("*I've heard something about that*"), but not specific storm water requirements or BMPs required for the facility.
2	Individual has a general awareness of water quality issues, but does not understand the requirements of the storm water program, BMPs, or pollution prevention.
1	Individual has never heard of the storm water program, requirements, or BMPs. This individual does know what BMPs are or understand how to implement them.
Overall BMP Assessment	
5	All BMPs implemented effectively. No violations noted during the inspection.
4	BMPs implemented effectively, however minor violations associated with communal areas or good housekeeping practices (i.e., dumpsters open, leaves in the parking lot, etc.) were noted during the inspection.
3	BMPs have been implemented throughout the site, but not properly or adequately maintained. Violations were noted during the inspection and a verbal notice was issued. A detailed inspection report or written Warning Notice may follow.
2	BMPs have not been implemented. Several violations were noted during the inspection, however an illegal discharge was not observed. A detailed inspection report and/or written warning was issued.
1	**An illegal discharge was noted during the inspection**. Enforcement actions (NOV, citation, etc.) required.

During the 2007-08 reporting year, the majority of ratings for overall level of storm water knowledge was a Level 3 based on Table 11-5 above. This indicates that the facility manager or responsible party had a general understanding of storm water issues, but not specific storm water requirements of BMPs required for the facility. Figure 11-2 presents the overall level of knowledge assessment for 2007-08 industrial and commercial inspections with the levels shown by facility type.

The majority of ratings for overall BMP assessment were also a Level 3 based on Table 11-5 above (Figure 11-3). This indicates that BMPs have been implemented throughout the site, but not properly or adequately maintained. However, there were more Level 4 and Level 5 ratings indicating a high level of effective BMP implementation in all types of facilities.

Figure 11-2. Industrial and Commercial – Level 2: Changes in Knowledge/Awareness: Raising Awareness.

Figure 11-3. Industrial and Commercial – Level 2: Changes in Knowledge/Awareness: Raising Awareness.

Comparison between the two questions shows that the inspected facilities of all types show a higher rating of BMP implementation than overall storm water knowledge, except for the nurseries and greenhouses. These facilities have a higher knowledge of general storm water pollution prevention practices than the industrial, commercial, and restaurant facilities.

11.2.2.5 Residential

The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. The City is also conducting additional monitoring studies to help identify and mitigate residential sources of pollution more effectively. Although fewer households participated in dropping off household hazardous waste during this reporting period, more quantity of household hazardous waste was collected for proper disposal (Table 11-6).

Table 11-6. Residential Component - Behavioral Change/BMP Implementation Changing Behavior.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Residential D.3.e	Household Hazardous Material	Quantity of waste targeted	Quantity of waste collected	Actual/Target	Percent ( ) Completion
		130.7 tons	142.8 tons	142.8/130.7	109
	Households Participating in Program	of households targeted	of households participating	Actual/Target	Percent ( ) Completion
		3,688	3,430	3,430/3,688	93

11.2.2.6 IDDE

An assessment of this component will be provided in Section 7 when the City submits the entire FY 2007-08 Illicit Discharge Detection and Elimination Component, including the 2008 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2008.

11.2.2.7 Education and Public Participation

The City implements a comprehensive education outreach program for both municipal staff and the public as well as a comprehensive public participation program (Table 11-7). See 11.2.2.3 above for an assessment of the Municipal training program. The City prides itself on educating children within its jurisdiction through the use of a watershed model.

Table 11-7. Education and Public Participation Component - Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.g	Student Presentations	of presentations targeted	of presentations completed	Actual/Target	Percent ( ) Completion
		10	10	10/10	100
	CWP Newsletters	of newsletters targeted for completion	of newsletters completed	Actual/Target	Percent ( ) Completion
		2	2	2/2	100
	Oceanside Update Tapings	of tapings planned	of tapings completed	Actual/Target	Percent ( ) Completion
		6	7	7/6	116
	Pet Waste Signs	of signs targeted for installation	of signs installed	Actual/Target	Percent ( ) Completion
		5	5	5/5	100
	CWP Website	of targeted hits	of actual hits	Actual/Target	Percent ( ) Completion
		45,000	38,146	38,146/45,000	84.7

11.3 Program Review and Modification

No changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

12.0 SPECIAL INVESTIGATIONS

12.1 Lower San Luis Rey Bacteria Source Identification Project

12.1.1 Overview

As part of the Proposition 50 Clean Beaches Initiative, the City of Oceanside has been awarded a grant to track the sources of bacteria in the Lower San Luis Rey River. The shoreline at the outlet of the San Luis Rey (SLR) River mouth in Oceanside, California is visited by thousands of people each year. Elevated levels of fecal indicator bacteria (FIB) have affected water quality in the river mouth and the adjacent shoreline. In 2007, this beach was posted due to bacterial exceedances for 54 days; in 2006, it was posted for 71 days; in 2005, this beach was posted for 209 days and 186 of those days were during one consecutive stretch. As a result of the exceedances, the river mouth and one-half mile of shoreline is listed as an impaired water body under section 303(d) of the Clean Water Act for exceedances of indicator bacterial standards. The beach is also listed as a Clean Beach Task Force priority beach.

A major objective of the San Luis Rey Watershed Urban Runoff Management Program (WURMP) lead by the City of Oceanside is to identify sources of the FIB at the river mouth. As directed by the WURMP, the City of Oceanside and the County of San Diego have jointly sampled the San Luis Rey River since March of 2004 to determine if the river is the source of the high concentrations of FIB at the river mouth. Thus far, the results are inconclusive and indicate the need for focused sampling in the lower river and at the river mouth.

To address this issue, the City received $554,375 from the SWQCB and, with the assistance of other stakeholders, will match $141,750 to implement the source identification project in the lower river and river mouth. The City awarded MACTEC Engineering and Consulting, Inc. (MACTEC) and their team of leading scientist in the field the lead contract for the organization and completion of the two-year study.

The overall goal of the proposed study is to identify the sources and quantify the loading of bacterial contamination using a tiered approach. The project will analyze for FIB to identify "hot spots" and to assess bacterial flux. Based on these results, genetic microbial and viral analyses on selected samples will be conducted to pinpoint potential sources and identify potential public health risks. The suite of analyses include *Bacteroides spp,* ESP gene quantification, enterovirus analyses using quantitative PCR (QPCR), sequencing of the enterovirus from the field samples, community based bacterial analyses, and *Enterococcus* speciation. In addition, the joint monthly monitoring program between the City of Oceanside and the County of San Diego will continue and the bacteria monitoring data will be collected and utilized throughout the duration of the project.

This approach will permit prioritization for mitigation of microbial contaminants and appropriate actions will be recommended to eliminate sources of fecal contamination. The three following objectives will be accomplished to achieve the overall goal set forward above:

- Identify point and non-point sources of bacteria contamination in the Lower San Luis Rey River and at the river mouth during the dry and wet season,
- Estimate the bacterial loading from tributaries and along the main stem of the San Luis Rey River during the dry and wet season, and
- Recommend Best Management Practices (BMPs) to reduce and/or eliminate bacterial sources.

12.1.2 Activities completed during this reporting period

Establishment of a TAC

The first TAC meeting was held on November 1, 2007 from 9:30 to noon. Members included six representatives from the Regional Water Quality Control Board, County of San Diego, City of Vista, and San Diego CoastKeeper in addition to three representatives from the City of Oceanside. An overview of the project and historical data was presented for the benefit of the stakeholders. The role of the TAC was discussed. The TAC will be involved in all aspects of the project, including final approval of the project approach and oversight of the monitoring and reporting. The meeting was concluded with a tour of the mouth of the San Luis Rey to orient members with the complexity of the river. A final list of the TAC was submitted to the SWRCB on January 10, 2008.

A second TAC meeting was held on February 4, 2008 with six representatives from the Regional Water Quality Control Board, County of San Diego, City of Vista, and San Diego CoastKeeper in addition to two representatives from the City of Oceanside. The MACTEC project team presented the proposed project approach to the TAC. The approach was discussed and the TAC made recommendations to be included in the Monitoring Plan and QAPP.

Consultant Selection

A Request for Proposals (RFP) was sent out on November 8, 2007 to solicit proposals from interested and experienced consultants to perform a bacteria source tracking project on the San Luis Rey River. Proposals were due to the City of Oceanside by December 4, 2007 and a subcommittee of the TAC reviewed the proposals on December 7, 2007. MACTEC Engineering and Consulting, Inc. was officially awarded and given a notice to proceed by City Council on February 20, 2008.

Monitoring Plan and Quality Assurance Project Plan Approval

Other important work included the development and approval by the SWRCB of the Monitoring Plan and Quality Assurance Project Plan (QAPP) by the MACTEC project team with input from the TAC. The consultants and members of the TAC and City staff participated in a conference call to discuss the draft Monitoring Plan and QAPP on March 28, 2008. These documents were reviewed by the SWRCB and revised based upon their comments. The SWRCB approved the Monitoring Plan and QAPP on June 19, 2008.

First Monitoring Event

The first dry season monitoring event took place on June 18 and 19, 2008. Dr. Rachel Noble traveled to San Diego to prepare for the first event with the project team and participate both days of monitoring. The project team collected bacteria samples and flow measurements at six

monitoring locations in the Lower San Luis Rey River. The bacteria samples were analyzed for fecal indicator bacteria and the remaining sample volume was filtered and frozen for molecular analysis. The river mouth was not sampled, as planned, due to construction of the new Pacific Street Bridge but will be sampling in the wet season and the dry 2009 season.

The City of Oceanside and the County of San Diego implemented the changes to the joint monthly monitoring program during the June 2008 monitoring event. The program will continue using SWAMP protocols throughout the remainder of the source identification project allowing the bacteria data from monthly monitoring to supplement the dry and wet weather event data.

12.2 Loma Alta Creek Ultraviolet Light Treatment Facility

12.2.1 Overview

Loma Alta Creek Lagoon and Buccaneer Beach, located in the City of Oceanside, are currently impacted by high levels of bacteria. This is a family beach adjacent to a park with a large parking area, showers and an eating establishment that sees large crowds during the dry months. The City has determined that a key source of bacteria and nutrients in Loma Alta Creek is urban runoff that discharges into the creek. The source of water for Loma Alta Creek is from storm drain flows and hillside seepage from the Loma Alta watershed, which drains approximately 6,400 acres, and flows through densely developed residential, commercial, and industrial land uses.

Just over eight acres of the Loma Alta Slough are included on Section 303(d) of the federal Clean Water Act list of impaired water bodies for bacterial indicators and eutrophication within the and for 1.1 miles of coastline at the opening. The increased presence of bacteria and pathogens in the watershed poses a threat to REC-1 and REC-2 beneficial uses and directly impacts the ocean water quality at Buccaneer Beach. The bacteria that are present in Loma Alta Creek have resulted in numerous beach closures and postings at Buccaneer Beach. Historically, Buccaneer Beach was subject to closures that last the entire summer season. To reduce the bacterial loading on Buccaneer Beach, the City will allow the lagoon opening to sand closed as the south swell arrives in May and divert 100% of the dry weather flow through an ultraviolet light treatment facility then discharge the treated water at the high tide line into the ocean. The project, once completed, will capture up to 1,000,000 gallons per day of urban runoff

12.2.2 Project Scope

The City was awarded a $5,000,000 Proposition 40 Clean Beaches Initiative (CBI) grant by the State Water Resources Control Board to construct an ultraviolet (UV) light treatment facility at the existing La Salina Wastewater Treatment Facility. One hundred percent of the dry weather creek flows (averaging 300 to 700 gallons per minute) will be intercepted in the lagoon and diverted to the UV treatment facility, located on the northern bank of the creek. The treatment

facility consists of piping flows from an exiting diversion structure by gravity from the lagoon through a 2 micron fine screen to a wet well where the flow is pumped into two large sand filters followed by two UV disinfection units housed in a reinforced concrete building. The treated water is discharged through a pipe extended along the existing section of rip-rap that runs along the north side of the Loma Alta creek outlet at Buccaneer Beach. During wet weather months (November through April), the lagoon would be opened to allow free flow to the ocean and the UV system would be bypassed.

12.2.3 Progress Milestones Achieved Schedule

The California Coastal Commission approved Permit No. 6-06-152 for construction of the outfall pipe associated with the UV treatment facility on June 14, 2007. Loma Alta Creek UV Treatment Facility project entered into the construction phase on August 13, 2007 when the official Notice to Proceed was issued to Orion Construction Corporation. The project is expected to be completed in August 2008.

12.2.4 Project Outcomes Effectiveness Benefits

The anticipated project goal is to eliminate beach closures during the dry months at Buccaneer Beach in Oceanside, California. This will be achieved by diverting the flow from the Loma Alta Lagoon through a UV treatment facility prior to discharging the flow onto the shoreline. The City will monitor the UV treated storm drain outlet and the surf zone for bacteria for the 2008 AB411 period. The approved Monitoring Plan and Quality Assurance Project Plan developed for this project will be implemented.

13.0 NON-EMERGENCY FIRE FIGHTING

Emergency fire fighting flows (flows necessary for the protection of life or property) are allowed by the Municipal Permit and do not require implementation of BMPs. Non-emergency fire fighting BMPs and educational methods for reducing the discharge of pollutants from non-emergency flows to the MEP are described below.

Order 2007-0001 Compliance Summary

J.3.a(3)(1)iv Non-Emergency Fire Fighting	See Entire Section 13 of this Annual Report

13.1 Best Management Practices

The City developed and implemented a program to reduce pollutants from non-emergency fire fighting flows, in accordance with Section B.3 of Permit Order 2007-0001. BMPs were implemented when the following activities were conducted:

- Regular Maintenance of Fire and Emergency Vehicles and Equipment
- Training Exercises
- Facilities Maintenance
- Post-Emergency Rehabilitation of Response Equipment

These activities were conducted in a way to either minimize or eliminate the discharge of pollutants to the MS4. Detailed descriptions of BMPs are given for each activity below:

Regular Maintenance of Fire and Emergency Vehicles and Equipment

- Vehicles and equipment were cleaned where runoff was directed to either the sanitary sewer system or to a drain with an oil/water separator system.
- Vehicles and equipment were cleaned where runoff would pond and evaporate and/or where runoff would filter through landscaped areas.
- Sewer drains in a vehicle cleaning area were outfitted with a hydro screen fabric barrier to collect debris.
- Spill kits were available to promptly cleanup and contain leaking or spilled vehicle fluids.
- Use of soaps, cleaners, and detergents were minimized, and general cleaning solutions were disposed of into the sanitary sewer system.

Training Exercises

- Water used in training exercises was directed to landscaped areas whenever possible, and runoff from the training exercises was not allowed to discharge to the MS4.
- Live fire training activities were pre-planned to allow integration of barriers to off-site runoff that could contribute to non-storm water discharges.

Facilities Maintenance

- Impervious areas such as apparatus floors, maintenance bays, driveways, patios, and walkways were swept to remove debris. Debris was placed in the trash.
- Landscaped areas were maintained as required to reduce the introduction of leaves and other landscape waste into the MS4.
- Irrigation systems were monitored and maintained as required to reduce irrigation water from going off-site.

- Spills were cleaned up using spill kits provided at the work site, and disposal of spilled material was in accordance with applicable regulations.
- Spills that required a cleanup beyond the ability of the on-site employees were reported to the City's Public Works Department for assistance with appropriate resources.
- Maintenance and repair of structures were conducted using methods that do not contribute pollutants to the MS4.

Post-Emergency Rehabilitation of Response Equipment
Tools, fire hoses, ladders, and other equipment utilized at the scene of an emergency were restored to a response-ready state in a manner that does not delay the ability of the apparatus to be available for another emergency response. The use of water that could contribute to storm water discharges was used unless another practical and immediately available method was identified, and was performed in a manner that minimized discharges to the MEP.

13.2 Educational Methods

During live fire fighting training exercises all fire fighters were educated about the requirement to not allow water flows to enter the MS4. Fire fighters in attendance for training sessions about how to use high pressure fire fighting hoses were educated on how to direct the water to percolation basins that are permanently in place at the training grounds. Water that is directed to these basins was allowed to infiltrate into the soil.

Prior to building structures at the training grounds being set on fire, perimeter controls were put in place to ensure that water from the non-emergency training session did not reach the MS4. Fire fighters in attendance were educated on the proper type and installation protocol of perimeter controls. These perimeter controls were also used for training sessions related to vehicle fires.

14.0 JURMP REVISIONS

Since the submittal of the City's 2008 JURMP in March 2008 there have been no changes or revisions to the document. It is anticipated that there will be changes during the next reporting period, fiscal year 2008-09.

15.0 CONCLUSIONS AND RECOMMENDATIONS

15.1 Introduction

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the San Diego Copermittees. Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2007 – June 30, 2008).

15.2 Conclusions

This annual report presents the activities the City conducted from July 1, 2007 through June 30, 2008 to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The activities involved implementing, and improving where needed, existing programs and developing new programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. Improving the quality of the discharge from the MS4 should have beneficial effects on the local receiving water bodies.

As detailed in the Program Effectiveness Assessment Component, the City met all of the development planning targets and met or exceeded the municipal targets. While the City fell slightly short on the targeted number of households to utilize the Household Hazardous Waste Program in the residential component, the target for the amount of household hazardous waste collected was exceeded. Long-term effectiveness assessment is an ongoing and iterative process and the City will continue to use this process to further improve its storm water program.

15.3 Recommendations

15.3.1 Database Tracking System for various departments and divisions

Many components of the new 2007 Municipal Permit require detailed information from across departmental boundaries and, therefore, across various data collection systems within the City. As part of the March 2008 Integrated Water Utilities Master Plan, the Information Technology component provided several key strategies which will focus on integrating reporting requirements and, therefore, collection systems across businesses and operations. As the Urban Runoff Hotline is utilized more, the Clean Water Program will be integrating information from Hotline calls into the main Water Utilities database. This will ensure complaints and inquires are tracked as they are distributed through Water and Sewer Maintenance Divisions, Code Enforcement Division and the Clean Water Program and will provide more detailed information for reporting purposes.

As land use development continues in the City, challenges associated with data management, such as tracking of post-construction BMPs, maintenances agreements, and associated documents, as emerged. It is important to update available tools with up-to-date information. This will be an issue to address during the next reporting period. The Clean Water Program will

also be working with other City departments to ensure that the details of inspections, complaints, and follow-ups will be tracked appropriately to be included in future annual reports.

15.3.2 Assessment of Educational Outreach Materials

The Clean Water Program has developed several educational materials in the past that will be assessed, revised and re-printed where needed. The City will consider using Community Social Based Marketing tool to determine the effectiveness of disseminating these brochures or if another educational outreach toll may be more effective. Table 15-1 provides a list of brochures already produced, its description and whether the document is planned for revision and/or reprinting.

Table 15-1. Educational Materials Planned for Revision and Reprinting.

Education Material	Description
Urban Runoff Guidelines for Residents Brochure	This brochure will be reviewed and revised where necessary to address pollutants of concern and topics.
Pollution Prevention Tips for Gardening Activities Brochure	This brochure will be reviewed and revised, if necessary and re-ordered.
Urban Runoff Guidelines for Commercial Businesses Brochure	This brochure will be revised to better reflect the requirements of Permit Order 2007-0001.
Urban Runoff Guidelines for Powerwashers	The San Diego county co-permittees will be working on the development of education outreach materials for this target audience. While in development, the City of Oceanside will seriously consider revising this brochure to educate this target audience about the BMP requirements for power washing business operations.
Guide to Oceanside Water bodies Booklet	This brochure was reprinted during this reporting period. It will be revised and updated with current information, updated GIS maps and additional details.
Poop Pollutes Pet Waste Bag Dispensers	Pet waste bag dispensers will be re-ordered for an anticipated Pick up your Pet Waste Campaign to be impelemtend during Fiscal year 2008-09 along the San Luis Rey River Trail.
Click Message Pen	These click message pens will be re-ordered in Fiscal Year 2008-09. The six messages on the pens will be reviewed and possibly revised based on pollutants of concern relative to Oceanside watersheds.

15.3.3 Underserved Target Audience Outreach - Including Mobile Businesses and Spanish Speaking Population

Underserved target audiences will be targeted with revised information during reporting period 2008-09. The two main audiences in this category are mobile businesses and the Spanish speaking population.

ATTACHMENT 3-A

A Pollution Prevention Guide for the Construction Industry

Water Quality Regulations for Construction Sites

In 1972, the Environmental Protection Agency developed regulations to control water pollution. As a result, the National Pollutant Discharge Elimination System (NPDES) Permit was created. NPDES permits are issued to municipalities as well as construction sites. In addition to complying with local regulations, which are governed by our municipal NPDES permit, you may be required to obtain a permit through the State of California under the State General Construction Permit (99-08-DWQ). All construction sites over one acre are required to obtain coverage under this permit.

Construction sites can contribute pollutants, such as sediment, metals, and chemicals, to our local creeks, rivers, lakes, lagoons, and ocean. These pollutants make their way down our streets and into storm drains, eventually discharging to the nearest body of water.

All construction sites are required to implement Best Management Practices (BMP) to prevent storm water pollution. This brochure is intended to assist your construction site in understanding BMP requirements.

Each municipality has one or more persons dedicated to ensuring that all construction sites are in compliance with state and local storm water control regulations. Contact your local municipality for further information.

Right-of-Way Permitting

We understand that there are times when space on construction sites is limited. If at any point, you (as a contractor or subcontractor) need to use the public right-of-way in order to work or store materials, you must apply for a special permit. This permit allows you to use the City's right-of-way areas, and describes what is required to prevent illegal contaminants from entering local storm drains. For more information or to obtain a permit application contact your local jursidiction.

Inspection and Enforcement Program

Each jurisdiction has established an enforcement program to ensure that all businesses operate in compliance with all appropriate storm water laws and other City requirements. Contractors, site supervisors and property owners can be held responsible for violations, which may lead to a civil penalty of up to $10,000 per day and/or reimbursing the local jurisdiction for all expenses associated with clean up.

Best Management Practices

Construction materials such as paint, dirt and trash often find their way into our storm drains, polluting the environment and jeopardizing our creeks, rivers, lakes, lagoons, and ocean.

The NCSWP is working with contractors to implement what are known as Best Management Practices (BMPs) on all construction sites. That is, methods used to keep pollution out of our storm drains and off public property, such as sidewalks, streets, parkways and alleys. Carrying out and maintaining these BMPs on the construction site is critical to protecting our ocean and lagoons.

The following is a list of BMPs and pollution prevention measures that shall be implemented at all construction sites:

1. **Conduct daily site cleanings.**
2. **Develop spill response and containment procedures.**
3. **Educate employees and subcontractors about BMPs.**
4. **Develop an erosion control plan for wind and rain.**
5. **Regularly maintain all BMPs at project site.**

Water Quality Regulations for Construction Sites

Dear Contractor,

The North County Storm Water Program (NCSWP) is a collective of jurisdictions in northern San Diego County working together to protect our watersheds. We believe that reducing pollution is critical to maintaining our communities' way of life.

It is our hope that this brochure will help you identify activities that are recognized to cause water pollution and implement appropriate Best Management Practices (BMPs) to minimize their impact. By providing you with these tools, we hope to make your job easier while keeping our waterways clean.

Each jurisdiction will be inspecting their construction sites to ensure the protection of water quality. We look forward to seeing the BMPs presented in this brochure implemented at your sites.

Together we have the ability to preserve and improve the quality of life in our communities.

Sincerely,

The North County Storm Water Program

Only Rain in the Storm Drain

Materials Storage

All building materials and fuel stored on the site must be contained and covered. It is illegal for contractors to wash out paint brushes in the street or dump any residues in the storm drain. Paint brushes and spray guns must be contained and disposed of properly.

Perimeter controls

Gravel bags, silt fences, and straw wattles are acceptable perimeter controls, and must be used to surround the entire site to control run-on and run-off. Avoid running over perimeter controls with vehicles or heavy equipment, as they can damage the materials. Keep extra absorbent materials and/or a wet/dry vacuum on site to quickly pick up unintended spills. Sites must also be checked and maintained daily.

Building materials/staging areas

Construction materials must be stored on site at all times unless a right-of-way permit has been obtained. Building materials should always be covered when not in use to prevent run-off caused by wind or rain. To apply for a right-of-way permit, contact the appropriate department of your local jurisdiction.

Dumpsters/Port-a-Potty

Always cover dumpsters with a rollback tarp. Areas around dumpsters should be swept daily. Perimeter controls should also surround dumpsters and all Port-a-Potties. If dumpsters or Port-a-Potties are kept on the street, right-of-way permits are needed.

These guidelines are generalized. Please check specific requiren

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
2007-2008 ANNUAL REPORT
FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 2007 through June 30, 2008

An Annual Report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

Please circle or highlight any information contained in Items A, B, and C below that is new or revised so we can update our records. Please remember that a Notice of Termination and new Notice of Intent are required whenever a facility operation is relocated or changes ownership.

If you have any questions, please contact your Regional Board Industrial Storm Water Permit Contact. The names, telephone numbers, and e-mail addresses of the Regional Board contacts, as well as the Regional Board Offices addresses are indicated below.

ANNUAL REPORT

SPECIFIC INFORMATION

MONITORING AND REPORTING PROGRAM

D. SAMPLING AND ANALYSIS EXEMPTIONS AND REDUCTIONS

1. For the reporting period, was your facility exempt from collecting and analyzing samples from **two** storm events in accordance with sections B.12 or 15 of the General Permit?

   ☐ **YES** Go to Item D.2 ☒ **NO** Go to Section E

2. Indicate the reason your facility is exempt from collecting and analyzing samples from **two** storm events. Attach a copy of the first page of the appropriate certification if you check boxes ii, iii, iv, or v.

   i. ☐ Participating in an Approved Group Monitoring Plan **Group Name:** _____

   ii. ☐ Submitted **No Exposure Certification (NEC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy NEC conditions? ☐ YES ☐ NO

   iii. ☐ Submitted **Sampling Reduction Certification (SRC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy SRC conditions? ☐ YES ☐ NO

   iv. ☐ Received Regional Board Certification Certification Date: _____

   v. ☐ Received Local Agency Certification Cetification Date: _____

3. If you checked boxes i or iii above, were you scheduled to sample **one** storm event during the reporting year?

   ☐ **YES** Go to Section E ☐ **NO** Go to Section F

4. If you checked boxes ii, iv, or v, go to Section F.

E. SAMPLING AND ANALYSIS RESULTS

1. How many storm events did you sample? 0 If less than 2, **attach explanation** (if you checked item D.2.i or iii. above, only attach explanation if you answer "0").

2. Did you collect storm water samples from the first storm of the wet season that produced a discharge during scheduled facility operating hours? (Section B.5 of the General Permit)

   ☐ **YES** ☒ **NO, attach explanation** **(Please note that if you do not sample the first storm event, you are still required to sample 2 storm events)**

3. How many storm water discharge locations are at your facility? 1

4. For each storm event sampled, did you collect and analyze a sample from each of the facilitys' storm water discharge locations? ☐ YES, go to Item E.6 ☒ NO

5. Was sample collection or analysis reduced in accordance with Section B.7.d of the General Permit? ☐ YES ☒ NO, **attach explanation**

   If "YES", **attach documentation** supporting your determination that two or more drainage areas are substantially identical.

   Date facility's drainage areas were last evaluated _____

6. Were all samples collected during the first hour of discharge? ☐ YES ☒ NO, **attach explanation**

7. Was all storm water sampling preceded by three (3) working days without a storm water discharge? ☐ YES ☒ NO, **attach explanation**

8. Were there any discharges of stormwater that had been temporarily stored or contained? (such as from a pond) ☐ YES ☒ NO, go to Item E.10

9. Did you collect and analyze samples of temporarily stored or contained storm water discharges from two storm events? (or one storm event if you checked item D.2.i or iii. above) ☐ YES ☐ NO, **attach explanation**

10. Section B.5. of the General Permit requires you to analyze storm water samples for pH, Total Suspended Solids (TSS), Specific Conductance (SC), Total Organic Carbon (TOC) or Oil and Grease (O&G), other pollutants likely to be present in storm water discharges in significant quantities, and analytical parameters listed in Table D of the General Permit.

    a. Does Table D contain any additional parameters related to your facility's SIC code(s)? ☐ YES ☒ NO, Go to Item E.11

    b. Did you analyze all storm water samples for the applicable parameters listed in Table D? ☐ YES ☐ NO

    c. If you did not analyze all storm water samples for the applicable Table D parameters, check one of the following reasons:

       _____ In prior sampling years, the parameter(s) have not been detected in significant quantities from two consecutive sampling events. **Attach explanation**

       _____ The parameter(s) is not likely to be present in storm water discharges and authorized non-storm water discharges in significant quantities based upon the facility operator's evaluation. **Attach explanation**

       _____ Other. **Attach explanation**

11. For each storm event sampled, attach a copy of the laboratory analytical reports and report the sampling and analysis results using **Form 1** or its equivalent. The following must be provided for each sample collected:

- Date and time of sample collection
- Name and title of sampler.
- Parameters tested.
- Name of analytical testing laboratory.
- Discharge location identification.
- Testing results.
- Test methods used.
- Test detection limits.
- Date of testing.
- Copies of the laboratory analytical results.

F. QUARTERLY VISUAL OBSERVATIONS

1. **Authorized Non-Storm Water Discharges**
Section B.3.b of the General Permit requires quarterly visual observations of all authorized non-storm water discharges and their sources.

a. Do authorized non-storm water discharges occur at your facility?

☒ **YES** ☐ **NO** Go to Item F.2

b. Indicate whether you visually observed all authorized non-storm water discharges and their sources during the quarters when they were discharged. **Attach an explanation for any "NO" answers.** Indicate "N/A" for quarters without any authorized non-storm water discharges.

July -September	☒ **YES**	☐ **NO**	☐ **N/A**	October-December	☒ **YES**	☐ **NO**	☐ **N/A**
January-March	☒ **YES**	☐ **NO**	☐ **N/A**	April-June	☒ **YES**	☐ **NO**	☐ **N/A**

c. Use **Form 2** to report quarterly visual observations of authorized non-storm water discharges or provide the following information.

i. name of each authorized non-storm water discharge
ii. date and time of observation
iii. source and location of each authorized non-storm water discharge
iv. characteristics of the discharge at its source and impacted drainage area/discharge location
v. name, title, and signature of observer
vi. **any** new or revised BMPs necessary to reduce or prevent pollutants in authorized non-storm water discharges. Provide new or revised BMP implementation date.

2. **Unauthorized Non-Storm Water Discharges**
Section B.3.a of the General Permit requires quarterly visual observations of all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources.

a. Indicate whether you visually observed all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources. **Attach an explanation for any "NO" answers.**

July -September	☒ **YES**	☐ **NO**	October-December	☒ **YES**	☐ **NO**
January-March	☒ **YES**	☐ **NO**	April-June	☒ **YES**	☐ **NO**

b. Based upon the quarterly visual observations, were any unauthorized non-storm water discharges detected?

☒ **YES** ☐ **NO** Go to item F.2.d

c. Have each of the unauthorized non-storm water discharges been eliminated or permitted?

☐ **YES** ☒ **NO** **Attach explanation**

d. Use **Form 3** to report quarterly unauthorized non-storm water discharge visual observations or provide the following information.

i. name of each unauthorized non-storm water discharge.
ii. date and time of observation.
iii. source and location of each unauthorized non-storm water discharge.
iv. characteristics of the discharge at its source and impacted drainage area/discharge location.
v. name, title, and signature of observer.
vi. **any** corrective actions necessary to eliminate the source of each unauthorized non-storm water discharge and to clean impacted drainage areas. Provide date unauthorized non-storm water discharge(s) was eliminated or scheduled to be eliminated.

G. MONTHLY WET SEASON VISUAL OBSERVATIONS

Section B.4.a of the General Permit requires you to conduct monthly visual observations of storm water discharges at all storm water discharge locations during the wet season. These observations shall occur during the first hour of discharge or, in the case of temporarily stored or contained storm water, at the time of discharge.

1. Indicate below whether monthly visual observations of storm water discharges occurred at all discharge locations. **Attach an explanation for any "NO" answers.** Include in this explanation whether any eligible storm events occurred during scheduled facility operating hours that did not result in a storm water discharge, and provide the date, time, name and title of the person who observed that there was no storm water discharge.

	YES	NO		YES	NO
October	☒	☐	February	☒	☐
November	☒	☐	March	☒	☐
December	☒	☐	April	☒	☐
January	☒	☐	May	☒	☐

2. Report monthly wet season visual observations using **Form 4** or provide the following information.

   a. date, time, and location of observation
   b. name and title of observer
   c. characteristics of the discharge (i.e., odor, color, etc.) and source of any pollutants observed.
   d. **any** new or revised BMPs necessary to reduce or prevent pollutants in storm water discharges. Provide new or revised BMP implementation date.

ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION (ACSCE)

H. ACSCE CHECKLIST

Section A.9 of the General Permit requires the facility operator to conduct one ACSCE in each reporting period (July 1-June 30). Evaluations must be conducted within 8-16 months of each other. The SWPPP and monitoring program shall be revised and implemented, as necessary, within 90 days of the evaluation. The checklist below includes the minimum steps necessary to complete a ACSCE. Indicate whether you have performed each step below. **Attach an explanation for any "NO" answers.**

1. Have you inspected all potential pollutant sources and industrial activities areas? ☒ YES ☐ NO
   The following areas should be inspected:

   - areas where spills and leaks have occured during the last year.
   - outdoor wash and rinse areas.
   - process/manufacturing areas.
   - loading, unloading, and transfer areas.
   - waste storage/disposal areas.
   - dust/particulate generating areas.
   - erosion areas.
   - building repair, remodeling, and construction
   - material storage areas
   - vehicle/equipment storage areas
   - truck parking and access areas
   - rooftop equipment areas
   - vehicle fueling/maintenance areas
   - non-storm water discharge generating areas

2. Have you reviewed your SWPPP to assure that its BMPs address existing potential pollutant sources and industrial activities areas? ☒ YES ☐ NO

3. Have you inspected the entire facility to verify that the SWPPP's site map, is up-to-date? The following site map items should be verified: ☒ YES ☐ NO

   - facility boundaries
   - outline of all storm water drainage areas
   - areas impacted by run-on
   - storm water discharges locations
   - storm water collection and conveyance system
   - structural control measures such as catch basins, berms, containment areas, oil/water separators, etc.

4. Have you reviewed all General Permit compliance records generated since the last annual evaluation? ☒ YES ☐ NO

The following records should be reviewed:

- quarterly authorized non-storm water discharge visual observations
- monthly storm water discharge visual observation
- records of spills/leaks and associated clean-up/response activities
- quarterly unauthorized non-storm water discharge visual observations
- Sampling and Analysis records
- preventative maintenance inspection and maintenance records

5. Have you reviewed the major elements of the SWPPP to assure compliance with the General Permit? ☒ YES ☐ NO

The following SWPPP items should be reviewed:

- pollution prevention team
- list of significant materials
- description of potential pollutant sources
- assessment of potential pollutant sources
- identification and description of the BMPs to be implemented for each potential pollutant source

6. Have you reviewed your SWPPP to assure that a) the BMPs are adequate in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges, and b) the BMPs are being implemented? ☒ YES ☐ NO

The following BMP categories should be reviewed:

- good housekeeping practices
- spill response
- employee training
- erosion control
- quality assurance
- preventative maintenance
- material handling and storage practices
- waste handling/storage
- structural BMPs

7. Has all material handling equipment and equipment needed to implement the SWPPP been inspected? ☒ YES ☐ NO

I. ACSCE EVALUATION REPORT

The facility operator is required to provide an evaluation report that includes:

- identification of personnel performing the evaluation
- the date(s) of the evaluation
- necessary SWPPP revisions
- schedule for implementing SWPPP revisions
- any incidents of non-compliance and the corrective actions taken.

Use **Form 5** to report the results of your evaluation or develop an equivalent form.

J. ACSCE CERTIFICATION

The facility operator is required to certify compliance with the Industrial Activities Storm Water General Permit. To certify compliance, both the SWPPP and Monitoring Program must be up to date and be fully implemented.

Based upon your ACSCE, do you certify compliance with the Industrial Activities Storm Water General Permit? ☒ YES ☐ NO

If you answered "NO" **attach an explanation** to the ACSCE Evaluation Report why you are not in compliance with the Industrial Activities Storm Water General Permit.

STATE WATER RESOURCES CONTROL BOARD

E-2. SAMPLING AND ANALYSIS

FIRST STORM EVENT OF THE SEASON THAT PRODUCED A DISCHARGE OCCURRED DURING NON WORKING HOURS.

STATE WATER RESOURCES CONTROL BOARD

E-6. SAMPLING AND ANALYSIS

NO SAMPLES WERE COLLECTED DURING THE REPORTING PERIOD OF 07 – 08. ALL STORM WATER DISCHARGES OCCURRED BEFORE OR AFTER WORKING HOURS, AND WERE NOT PRECEEDED BY 3 WORKING DAYS.

STATE WATER RESOURCES CONTROL BOARD

E-7. SAMPLING AND ANALYSIS

NO SAMPLES WERE COLLECTED DURING THE REPORTING PERIOD OF 07 – 08. ALL STORM WATER DISCHARGES OCCURIED BEFORE OR AFTER WORKING HOURS, AND WERE NOT PROCEDED BY 3 WORKING DAYS.

ATTACHMENT SUMMARY

Answer the questions below to help you determine what should be attached to this annual report. Answer NA (Not Applicable) to questions 2-4 if you are not required to provide those attachments.

1. Have you attached Forms 1,2,3,4, and 5 or their equivalent?	☒ YES (Mandatory)		
2. If you conducted sampling and analysis, have you attached the laboratory analytical reports?	☒ YES	☐ NO	☐ NA
3. If you checked box II, III, IV, or V in item D.2 of this Annual Report, have you attached the first page of the appropriate certifications?	☐ YES	☐ NO	☒ NA
4. Have you attached an explanation for each "NO" answer in items E.1, E.2, E.5-E.7, E.9, E.10.c, F.1.b, F.2.a, F.2.c, G.1, H.1-H.7, or J?	☒ YES	☐ NO	☐ NA

ANNUAL REPORT CERTIFICATION

I am duly authorized to sign reports required by the INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (see Standard Provision C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those person directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Printed Name: BRYAN FORWARD

Signature: [illegible] Date: 6·26·08

Title: ORDINANCE ENFORCEMENT SUPERVISOR

DESCRIPTION OF BASIC ANALYTICAL PARAMETERS

The Industrial Activities Storm Water General Permit (General Permit) requires you to analyze storm water samples for at least four parameters. These are pH, Total Suspended Solids (TSS), Specific Conductance (SC),and Total Organic Carbon (TOC). Oil and Grease (O&G) may be substituted for TOC. In addition, you must monitor for any other pollutants which you believe to be present in your storm water discharge as a result of industrial activity and analytical parameters listed in Table D of the General Permit. There are no numeric limitations for the parameters you test for.

The four parameters which the General Permit requires to be tested are considered *indicator* parameters. In other words, regardless of what type of facility you operate, these parameters are nonspecific and general enough to usually provide some indication whether pollutants are present in your storm water discharge. The following briefly explains what each of these parameters mean:

pH is a numeric measure of the hydrogen-ion concentration. The neutral, or acceptable, range is within 6.5 to 8.5. At values less than 6.5, the water is considered acidic; above 8.5 it is considered alkaline or basic. An example of an acidic substance is vinegar, and a alkaline or basic substance is liquid antacid. Pure rainfall tends to have a pH of a little less than 7. There may be sources of materials or industrial activities which could increase or decrease the pH of your storm water discharge. If the pH levels of your storm water discharge are high or low, you should conduct a thorough evaluation of all potential pollutant sources at your site.

Total Suspended Solids (TSS) is a measure of the undissolved solids that are present in your storm water discharge. Sources of TSS include sediment from erosion of exposed land, and dirt from impervious (i.e. paved) areas. Sediment by itself can be very toxic to aquatic life because it covers feeding and breeding grounds, and can smother organisms living on the bottom of a water body. Toxic chemicals and other pollutants also adhere to sediment particles. This provides a medium by which toxic or other pollutants end up in our water ways and ultimately in human and aquatic life. TSS levels vary in runoff from undisturbed land. It has been shown that TSS levels increase significantly due to land development.

Specific Conductance (SC) is a numerical expression of the ability of the water to carry an electric current. SC can be used to assess the degree of mineralization, salinity, or estimate the total dissolved solids concentration of a water sample. Because of air pollution, most rain water has a SC a little above zero. A high SC could affect the usability of waters for drinking, irrigation, and other commercial or industrial use.

Total Organic Carbon (TOC) is a measure of the total organic matter present in water. (All organic matter contains carbon) This test is sensitive and able to detect small concentrations of organic matter. Organic matter is naturally occurring in animals, plants, and man. Organic matter may also be man made (so called synthetic organics). Synthetic organics include pesticides, fuels, solvents, and paints. Natural organic matter utilizes the oxygen in a receiving water to biodegrade. Too much organic matter could place a significant oxygen demand on the water, and possibly impact its quality. Synthetic organics either do not biodegrade or biodegrade very slowly. Synthetic organics are a source of toxic chemicals that can have adverse affects at very low concentrations. Some of these chemicals bioaccumulate in aquatic life. If your levels of TOC are high, you should evaluate all sources of natural or synthetic organics you may use at your site.

Oil and Grease (O&G) is a measure of the amount of oil and grease present in your storm water discharge. At very low concentrations, O&G can cause a sheen (that floating "rainbow") on the surface of water (1 qt. of oil can pollute 250,000 gallons of water). O&G can adversely affect aquatic life and create unsightly floating material and film on water, thus making it undrinkable. Sources of O&G include maintenance shops, vehicles, machines and roadways.

If you have any questions regarding whether or not your constituent concentrations are too high, please contact your local Regional Board office. The United States Environmental Protection Agency (USEPA) has published stormwater discharge benchmarks for a number of parameters. These benchmarks may be helpful when evaluating whether additional BMPs are appropriate. These benchmarks can be accessed at our website at http://www.swrcb.ca.gov. It is contained in the Sampling and Analysis Reduction Certification.

Section D (pages 5-6) of the General Permit.

- Quarterly visual observations are required to observe current and detect prior unauthorized NSWDs.
- Quarterly visual observations are required during dry weather and at all facility drainage areas.
- Each unauthorized NSWD source, impacted drainage area, and discharge location must be identified and observed.
- Unauthorized NSWDs that can not be eliminated within 90 days of observation must be reported to the Regional Board in accordanc with Section A.10.e of the General Permit.
- Make additional copies of this form as necessary.

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
2007-2008 ANNUAL REPORT
FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 2007 through June 30, 2008

An Annual Report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

Please circle or highlight any information contained in Items A, B, and C below that is new or revised so we can update our records. Please remember that a Notice of Termination and new Notice of Intent are required whenever a facility operation is relocated or changes ownership.

If you have any questions, please contact your Regional Board Industrial Storm Water Permit Contact. The names, telephone numbers, and e-mail addresses of the Regional Board contacts, as well as the Regional Board Offices addresses are indicated below.

REGIONAL BOARD INFORMATION:

2007-2008

ANNUAL REPORT

SPECIFIC INFORMATION

MONITORING AND REPORTING PROGRAM

D. SAMPLING AND ANALYSIS EXEMPTIONS AND REDUCTIONS

1. For the reporting period, was your facility exempt from collecting and analyzing samples from **two** storm events in accordance with sections B.12 or 15 of the General Permit?

   ☐ **YES** Go to Item D.2 ☒ **NO** Go to Section E

2. Indicate the reason your facility is exempt from collecting and analyzing samples from **two** storm events. Attach a copy of the first page of the appropriate certification if you check boxes ii, iii, iv, or v.

   i. ☐ Participating in an Approved Group Monitoring Plan **Group Name:** _____

   ii. ☐ Submitted **No Exposure Certification (NEC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy NEC conditions? ☐ YES ☐ NO

   iii. ☐ Submitted **Sampling Reduction Certification (SRC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy SRC conditions? ☐ YES ☐ NO

   iv. ☐ Received Regional Board Certification Certification Date: _____

   v. ☐ Received Local Agency Certification Cetification Date: _____

3. If you checked boxes i or iii above, were you scheduled to sample **one** storm event during the reporting year?

   ☐ **YES** Go to Section E ☐ **NO** Go to Section F

4. If you checked boxes ii, iv, or v, go to Section F.

E. SAMPLING AND ANALYSIS RESULTS

1. How many storm events did you sample? 0 If less than 2, **attach explanation** (if you checked item D.2.i or iii. above, only attach explanation if you answer "0").

2. Did you collect storm water samples from the first storm of the wet season that produced a discharge during scheduled facility operating hours? (Section B.5 of the General Permit)

   ☐ **YES** ☒ **NO, attach explanation** **(Please note that if you do not sample the first storm event, you are still required to sample 2 storm events)**

3. How many storm water discharge locations are at your facility? 1

4. For each storm event sampled, did you collect and analyze a sample from each of the facilitys' storm water discharge locations? ☐ YES, go to Item E.6 ☒ NO

5. Was sample collection or analysis reduced in accordance with Section B.7.d of the General Permit? ☐ YES ☐ NO, **attach explanation**

   If "YES", **attach documentation** supporting your determination that two or more drainage areas are substantially identical.

   Date facility's drainage areas were last evaluated _____

6. Were all samples collected during the first hour of discharge? ☐ YES ☒ NO, **attach explanation**

7. Was all storm water sampling preceded by three (3) working days without a storm water discharge? ☐ YES ☒ NO, **attach explanation**

8. Were there any discharges of stormwater that had been temporarily stored or contained? (such as from a pond) ☐ YES ☒ NO, go to Item E.10

9. Did you collect and analyze samples of temporarily stored or contained storm water discharges from two storm events? (or one storm event if you checked item D.2.i or iii. above) ☐ YES ☐ NO, **attach explanation**

10. Section B.5. of the General Permit requires you to analyze storm water samples for pH, Total Suspended Solids (TSS), Specific Conductance (SC), Total Organic Carbon (TOC) or Oil and Grease (O&G), other pollutants likely to be present in storm water discharges in significant quantities, and analytical parameters listed in Table D of the General Permit.

    a. Does Table D contain any additional parameters related to your facility's SIC code(s)? ☐ YES ☒ NO, Go to Item E.11

    b. Did you analyze all storm water samples for the applicable parameters listed in Table D? ☐ YES ☐ NO

    c. If you did not analyze all storm water samples for the applicable Table D parameters, check one of the following reasons:

    _____ In prior sampling years, the parameter(s) have not been detected in significant quantities from two consecutive sampling events. **Attach explanation**

    _____ The parameter(s) is not likely to be present in storm water discharges and authorized non-storm water discharges in significant quantities based upon the facility operator's evaluation. **Attach explanation**

    _____ Other. **Attach explanation**

11. For each storm event sampled, attach a copy of the laboratory analytical reports and report the sampling and analysis results using **Form 1** or its equivalent. The following must be provided for each sample collected:

- Date and time of sample collection
- Name and title of sampler.
- Parameters tested.
- Name of analytical testing laboratory.
- Discharge location identification.
- Testing results.
- Test methods used.
- Test detection limits.
- Date of testing.
- Copies of the laboratory analytical results.

F. QUARTERLY VISUAL OBSERVATIONS

1. **Authorized Non-Storm Water Discharges**
Section B.3.b of the General Permit requires quarterly visual observations of all authorized non-storm water discharges and their sources.

a. Do authorized non-storm water discharges occur at your facility?

☒ **YES** ☐ **NO** Go to Item F.2

b. Indicate whether you visually observed all authorized non-storm water discharges and their sources during the quarters when they were discharged. **Attach an explanation for any "NO" answers.** Indicate "N/A" for quarters without any authorized non-storm water discharges.

July -September	☒ **YES**	☐ **NO**	☐ **N/A**	October-December	☒ **YES**	☐ **NO**	☐ **N/A**
January-March	☒ **YES**	☐ **NO**	☐ **N/A**	April-June	☒ **YES**	☐ **NO**	☐ **N/A**

c. Use **Form 2** to report quarterly visual observations of authorized non-storm water discharges or provide the following information.

i. name of each authorized non-storm water discharge
ii. date and time of observation
iii. source and location of each authorized non-storm water discharge
iv. characteristics of the discharge at its source and impacted drainage area/discharge location
v. name, title, and signature of observer
vi. **any** new or revised BMPs necessary to reduce or prevent pollutants in authorized non-storm water discharges. Provide new or revised BMP implementation date.

2. **Unauthorized Non-Storm Water Discharges**
Section B.3.a of the General Permit requires quarterly visual observations of all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources.

a. Indicate whether you visually observed all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources. **Attach an explanation for any "NO" answers.**

July -September	☒ **YES**	☐ **NO**	October-December	☒ **YES**	☐ **NO**
January-March	☒ **YES**	☐ **NO**	April-June	☒ **YES**	☐ **NO**

b. Based upon the quarterly visual observations, were any unauthorized non-storm water discharges detected?

☐ **YES** ☒ **NO** Go to item F.2.d

c. Have each of the unauthorized non-storm water discharges been eliminated or permitted?

☐ **YES** ☐ **NO** **Attach explanation**

d. Use **Form 3** to report quarterly unauthorized non-storm water discharge visual observations or provide the following information.

i. name of each unauthorized non-storm water discharge.
ii. date and time of observation.
iii. source and location of each unauthorized non-storm water discharge.
iv. characteristics of the discharge at its source and impacted drainage area/discharge location.
v. name, title, and signature of observer.
vi. **any** corrective actions necessary to eliminate the source of each unauthorized non-storm water discharge and to clean impacted drainage areas. Provide date unauthorized non-storm water discharge(s) was eliminated or scheduled to be eliminated.

G. MONTHLY WET SEASON VISUAL OBSERVATIONS

Section B.4.a of the General Permit requires you to conduct monthly visual observations of storm water discharges at all storm water discharge locations during the wet season. These observations shall occur during the first hour of discharge or, in the case of temporarily stored or contained storm water, at the time of discharge.

1. Indicate below whether monthly visual observations of storm water discharges occurred at all discharge locations. **Attach an explanation for any "NO" answers**. Include in this explanation whether any eligible storm events occurred during scheduled facility operating hours that did not result in a storm water discharge, and provide the date, time, name and title of the person who observed that there was no storm water discharge.

	YES	NO		YES	NO
October	☒	☐	February	☒	☐
November	☒	☐	March	☒	☐
December	☒	☐	April	☒	☐
January	☒	☐	May	☒	☐

2. Report monthly wet season visual observations using **Form 4** or provide the following information.

   a. date, time, and location of observation
   b. name and title of observer
   c. characteristics of the discharge (i.e., odor, color, etc.) and source of any pollutants observed.
   d. **any** new or revised BMPs necessary to reduce or prevent pollutants in storm water discharges. Provide new or revised BMP implementation date.

ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION (ACSCE)

H. ACSCE CHECKLIST

Section A.9 of the General Permit requires the facility operator to conduct one ACSCE in each reporting period (July 1-June 30). Evaluations must be conducted within 8-16 months of each other. The SWPPP and monitoring program shall be revised and implemented, as necessary, within 90 days of the evaluation. The checklist below includes the minimum steps necessary to complete a ACSCE. Indicate whether you have performed each step below. **Attach an explanation for any "NO" answers.**

1. Have you inspected all potential pollutant sources and industrial activities areas? ☒ YES ☐ NO
   The following areas should be inspected:

   - areas where spills and leaks have occured during the last year.
   - outdoor wash and rinse areas.
   - process/manufacturing areas.
   - loading, unloading, and transfer areas.
   - waste storage/disposal areas.
   - dust/particulate generating areas.
   - erosion areas.
   - building repair, remodeling, and construction
   - material storage areas
   - vehicle/equipment storage areas
   - truck parking and access areas
   - rooftop equipment areas
   - vehicle fueling/maintenance areas
   - non-storm water discharge generating areas

2. Have you reviewed your SWPPP to assure that its BMPs address existing potential pollutant sources and industrial activities areas? ☒ YES ☐ NO

3. Have you inspected the entire facility to verify that the SWPPP's site map, is up-to-date? The following site map items should be verified: ☒ YES ☐ NO

   - facility boundaries
   - outline of all storm water drainage areas
   - areas impacted by run-on
   - storm water discharges locations
   - storm water collection and conveyance system
   - structural control measures such as catch basins, berms, containment areas, oil/water separators, etc.

4. Have you reviewed all General Permit compliance records generated since the last annual evaluation? ☒ YES ☐ NO

The following records should be reviewed:

- quarterly authorized non-storm water discharge visual observations
- monthly storm water discharge visual observation
- records of spills/leaks and associated clean-up/response activities
- quarterly unauthorized non-storm water discharge visual observations
- Sampling and Analysis records
- preventative maintenance inspection and maintenance records

5. Have you reviewed the major elements of the SWPPP to assure compliance with the General Permit? ☒ YES ☐ NO

The following SWPPP items should be reviewed:

- pollution prevention team
- list of significant materials
- description of potential pollutant sources
- assessment of potential pollutant sources
- identification and description of the BMPs to be implemented for each potential pollutant source

6. Have you reviewed your SWPPP to assure that a) the BMPs are adequate in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges, and b) the BMPs are being implemented? ☒ YES ☐ NO

The following BMP categories should be reviewed:

- good housekeeping practices
- spill response
- employee training
- erosion control
- quality assurance
- preventative maintenance
- material handling and storage practices
- waste handling/storage
- structural BMPs

7. Has all material handling equipment and equipment needed to implement the SWPPP been inspected? ☒ YES ☐ NO

I. ACSCE EVALUATION REPORT

The facility operator is required to provide an evaluation report that includes:

- identification of personnel performing the evaluation
- the date(s) of the evaluation
- necessary SWPPP revisions
- schedule for implementing SWPPP revisions
- any incidents of non-compliance and the corrective actions taken.

Use **Form 5** to report the results of your evaluation or develop an equivalent form.

J. ACSCE CERTIFICATION

The facility operator is required to certify compliance with the Industrial Activities Storm Water General Permit. To certify compliance, both the SWPPP and Monitoring Program must be up to date and be fully implemented.

Based upon your ACSCE, do you certify compliance with the Industrial Activities Storm Water General Permit? ☒ YES ☐ NO

If you answered "NO" **attach an explanation** to the ACSCE Evaluation Report why you are not in compliance with the Industrial Activities Storm Water General Permit.

STATE WATER RESOURCES CONTROL BOARD

E-2. SAMPLING AND ANALYSIS

FIRST STORM EVENT OF THE SEASON THAT PRODUCED A DISCHARGE OCCURRED DURING NON WORKING HOURS.

STATE WATER RESOURCES CONTROL BOARD

E-6. SAMPLING AND ANALYSIS

NO SAMPLES WERE COLLECTED DURING THE REPORTING PERIOD OF 07 – 08. ALL STORM WATER DISCHARGES OCCURRED BEFORE OR AFTER WORKING HOURS, AND WERE NOT PRECEEDED BY 3 WORKING DAYS.

STATE WATER RESOURCES CONTROL BOARD

E-7. SAMPLING AND ANALYSIS

NO SAMPLES WERE COLLECTED DURING THE REPORTING PERIOD OF 07 – 08. ALL STORM WATER DISCHARGES OCCURIED BEFORE OR AFTER WORKING HOURS, AND WERE NOT PROCEDED BY 3 WORKING DAYS.

ATTACHMENT SUMMARY

Answer the questions below to help you determine what should be attached to this annual report. Answer NA (Not Applicable) to questions 2-4 if you are not required to provide those attachments.

1. Have you attached Forms 1,2,3,4, and 5 or their equivalent?	☒ YES (Mandatory)		
2. If you conducted sampling and analysis, have you attached the laboratory analytical reports?	☒ YES	☐ NO	☐ NA
3. If you checked box II, III, IV, or V in item D.2 of this Annual Report, have you attached the first page of the appropriate certifications?	☐ YES	☐ NO	☒ NA
4. Have you attached an explanation for each "NO" answer in items E.1, E.2, E.5-E.7, E.9, E.10.c, F.1.b, F.2.a, F.2.c, G.1, H.1-H.7, or J?	☒ YES	☐ NO	☐ NA

ANNUAL REPORT CERTIFICATION

I am duly authorized to sign reports required by the INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (see Standard Provision C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those person directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Title: ORDINANCE ENFORCEMENT SUPERVISOR

DESCRIPTION OF BASIC ANALYTICAL PARAMETERS

The Industrial Activities Storm Water General Permit (General Permit) requires you to analyze storm water samples for at least four parameters. These are pH, Total Suspended Solids (TSS), Specific Conductance (SC),and Total Organic Carbon (TOC). Oil and Grease (O&G) may be substituted for TOC. In addition, you must monitor for any other pollutants which you believe to be present in your storm water discharge as a result of industrial activity and analytical parameters listed in Table D of the General Permit. There are no numeric limitations for the parameters you test for.

The four parameters which the General Permit requires to be tested are considered *indicator* parameters. In other words, regardless of what type of facility you operate, these parameters are nonspecific and general enough to usually provide some indication whether pollutants are present in your storm water discharge. The following briefly explains what each of these parameters mean:

pH is a numeric measure of the hydrogen-ion concentration. The neutral, or acceptable, range is within 6.5 to 8.5. At values less than 6.5, the water is considered acidic; above 8.5 it is considered alkaline or basic. An example of an acidic substance is vinegar, and a alkaline or basic substance is liquid antacid. Pure rainfall tends to have a pH of a little less than 7. There may be sources of materials or industrial activities which could increase or decrease the pH of your storm water discharge. If the pH levels of your storm water discharge are high or low, you should conduct a thorough evaluation of all potential pollutant sources at your site.

Total Suspended Solids (TSS) is a measure of the undissolved solids that are present in your storm water discharge. Sources of TSS include sediment from erosion of exposed land, and dirt from impervious (i.e. paved) areas. Sediment by itself can be very toxic to aquatic life because it covers feeding and breeding grounds, and can smother organisms living on the bottom of a water body. Toxic chemicals and other pollutants also adhere to sediment particles. This provides a medium by which toxic or other pollutants end up in our water ways and ultimately in human and aquatic life. TSS levels vary in runoff from undisturbed land. It has been shown that TSS levels increase significantly due to land development.

Specific Conductance (SC) is a numerical expression of the ability of the water to carry an electric current. SC can be used to assess the degree of mineralization, salinity, or estimate the total dissolved solids concentration of a water sample. Because of air pollution, most rain water has a SC a little above zero. A high SC could affect the usability of waters for drinking, irrigation, and other commercial or industrial use.

Total Organic Carbon (TOC) is a measure of the total organic matter present in water. (All organic matter contains carbon) This test is sensitive and able to detect small concentrations of organic matter. Organic matter is naturally occurring in animals, plants, and man. Organic matter may also be man made (so called synthetic organics). Synthetic organics include pesticides, fuels, solvents, and paints. Natural organic matter utilizes the oxygen in a receiving water to biodegrade. Too much organic matter could place a significant oxygen demand on the water, and possibly impact its quality. Synthetic organics either do not biodegrade or biodegrade very slowly. Synthetic organics are a source of toxic chemicals that can have adverse affects at very low concentrations. Some of these chemicals bioaccumulate in aquatic life. If your levels of TOC are high, you should evaluate all sources of natural or synthetic organics you may use at your site.

Oil and Grease (O&G) is a measure of the amount of oil and grease present in your storm water discharge. At very low concentrations, O&G can cause a sheen (that floating "rainbow") on the surface of water (1 qt. of oil can pollute 250,000 gallons of water). O&G can adversely affect aquatic life and create unsightly floating material and film on water, thus making it undrinkable. Sources of O&G include maintenance shops, vehicles, machines and roadways.

If you have any questions regarding whether or not your constituent concentrations are too high, please contact your local Regional Board office. The United States Environmental Protection Agency (USEPA) has published stormwater discharge benchmarks for a number of parameters. These benchmarks may be helpful when evaluating whether additional BMPs are appropriate. These benchmarks can be accessed at our website at http://www.swrcb.ca.gov. It is contained in the Sampling and Analysis Reduction Certification.

Section D (pages 5-6) of the General Permit.

- Quarterly visual observations are required to observe current and detect prior unauthorized NSWDs.
- Quarterly visual observations are required during dry weather and at all facility drainage areas.
- Each unauthorized NSWD source, impacted drainage area, and discharge location must be identified and observed.
- Unauthorized NSWDs that can not be eliminated within 90 days of observation must be reported to the Regional Board in accordanc with Section A.10.e of the General Permit.
- Make additional copies of this form as necessary.

WATER UTILITIES COMPLAINT FORM

TO: Teresa, Glenn, Robert, Tom

FROM: Judy

SUBJECT: water running down street

DATE/TIME: 1-ish 2/21/08

REPORTING PARTY NAME: Clark

REPORTING PARTY ADDRESS: None given

REPORTING PARTY PHONE NUMBER: 760-685-2615

REPORTING PARTY PHONE NUMBER 2:

SITE OF COMPLAINT ADDRESS: Cranberry St between Pacesetter & Edgewater

REFERRED TO: above

CONCERN/COMPLAINT: complaint was made once before and Water responded by turning off water. Landscapers turned water back on and said the problem would be too expensive to fix, so they are letting the water run down the street. HOA involved is Guajome Meadows. Caller contacted Board of HOA but doen't think anything was done with landscapers.

DISPATCHED VIA: this record only

WELCOME TO THE OCEANSIDE CLEAN WATER PROGRAM NEWSLETTER!

Due to the expanding programs and service opportunities our Oceanside Clean Water Program offers, we have designed a bi-yearly newsletter to keep you informed of the latest activities and water quality information. As an Oceanside resident, you will continue to receive fliers in your water utility bill about upcoming community cleanup events, as well as this newsletter. If you wish to be a part of the Oceanside Clean Water Program mailing list, or know others interested, please contact us and we will add the name(s) promptly. We hope you find this newsletter valuable.

The 20 Gallon challenge
Save Water Now

The City of Oceanside and the San Diego County Water Authority have a challenge for you - the 20 Gallon Challenge. Historic dry conditions in California, coupled with legal and regulatory constraints on water imported from northern California, make it essential for residents and businesses to increase water conservation immediately. It is more important than ever to conserve water during hot, dry summer months. If every person can save 20 gallons of water a day, that will significantly help the region by allowing more water to stay in storage to meet future demands.

Saving water is easier than you think. A few simple changes can make a big difference in your water usage. For ideas on how to meet the 20 Gallon Challenge look at the table on the 2nd page of this newsletter.

Keep in mind that 60 percent of urban water use in San Diego County is used for outside of the home. Outdoor landscaping alone in San Diego County takes up about half of all residential water use. That's more than 58 billion gallons of water every year. Unfortunately a lot of that water use is from overwatering landscaping, and much of it ends up running down the gutter and into our creeks to the ocean. Overwatering not only damages the vegetation that you are trying to keep healthy, but also allows pollutants, like fertilizers and pesticides, to enter storm drains which leads to our creeks, rivers, and coastline.

By practicing good water conservation strategies, you will not only ensure that there's enough water for everyone, but also help protect the quality of our creeks, rivers, lakes and beaches.

Buena Vista Creek and Oceanside Beach Cleanup

September 15, 2007
9:00 - Noon

Celebrate California Coastal Cleanup Day by participating in the seventh annual Buena Vista Creek Cleanup and Oceanside Pier Beach Cleanup. The City of Oceanside, together with I Love a Clean San Diego, Coastkeeper, and 1-800-GOT-JUNK will be hosting a cleanup along the banks of Buena Vista Creek, as well as a beach cleanup south of Oceanside Pier on September 15th, from 9 a.m. to 12:00 p.m. Volunteers will receive free refreshments, community service hours, and a free T-shirt. Call the Clean Water Program Event Information Line for more details at 760-435-5536.

Cleanup sites

- Behind Chicks Sporting Goods at Plaza Drive and College Boulevard (3514 College Boulevard)
- North of fire station #4 located at Thunder Drive and Lake Boulevard.
- Behind Kohl's store at College Boulevard and Marron Rd.
- South side of Oceanside Pier

Loma Alta Creek Cleanup
April 26, 2008
9 am - 12 pm

Celebrate Earth Day by participating in the Sixth Annual Creek to Bay Cleanup event on April 26, 2008. The City of Oceanside, together with I Love a Clean San Diego and 1-800-GOT-JUNK, will be hosting a cleanup along the banks of Loma Alta Creek and at two sites on the Pacific Ocean.

Volunteers can choose from five sites:

- Buccaneer Park at Pacific and Morse Streets (1500 South Pacific Street)
- Behind VONS on Oceanside Boulevard and I-5 (1737 Oceanside Boulevard)
- Mesa Drive between El Camino Real and Rancho Del Oro Drive
- Behind commercial buildings at 1629 Ord Way (Off Oceanside Boulevard between College Boulevard and Temple Heights Drive)
- South side of the Oceanside Pier

Join us while we remove unwanted materials from the creek and beach and help to improve Oceanside water quality. Volunteers will receive free parking, refreshments, community service hours, and a free T-shirt.

For more information about cleanup events call 760-435-5536 or 760-435-5807.

2008 River and Creek Cleanup Events

Please join the Clean Water Program staff and citizen volunteers to assist in removing trash and debris from our local beaches, rivers, and creeks.

Event Times: 9:00 a.m. - 12:00 p.m.
Event Details: 760-435-5536

- April 26, 2008: Loma Alta Creek Cleanup
- July 5, 2008: Morning After Mess - City Beaches
- September 20, 2008: California Coastal Cleanup Day - Buena Vista Creek Cleanup
- November 8, 2008: San Luis Rey River Cleanup

Grease Down the Drain Causes Sewer Blockages

Your help is needed!

It is very difficult to remove grease and oil from sewer pipes. The use of sewer clean-out snakes will only create a small hole through the grease that has built up on the inside of the pipe.

Remember these simple grease disposal tips:

- Never pour grease down sink drains or toilets.
- Pour grease into a non-flammable container, let harden, and place in trash.
- Wipe excess grease from pots and pans with a paper towel.
- Washing grease down the drain with warm water won't prevent clogs; grease will still harden in pipes.

Pool Water Draining Tips
to protect the environment

As the summer rapidly approaches, many Oceanside residents will turn to their swimming pools to beat the heat. Pool owners are preparing to remove the old pool water that has been sitting all winter. Draining pool water to the street is a common practice but it can be detrimental to the environment.

To most people, pool water does not seem environnmentally damaging. When pool water is drained into the street it picks up other pollutants and carries them down the storm drain to the nearest creek, river, lake or to the ocean. And, if not properly treated first, pool water can contain harmful additives and chemicals.

Follow these steps for proper pool water disposal and environmental protection:

- De-chlorinate your pool before emptying:
  - Allow water to sit for a few days in the sun to naturally de-chlorinate.
  - Purchase and use a de-chlorination kit.
- Drain pool water into your landscape or sanitary sewer.
- Rinse cartridge filters or diatomaceous earth (DE) filters onto a dirt, grassy or other pervious area. With DE, simply scoop up the residue and throw it in the trash.

With your help you can enjoy your pool and still protect the environment.

Urban Runoff Hotline

Help protect our local waterways

Call the Clean Water Program Urban Runoff Hotline if you see anyone dumping anything down a storm drain or anything other than rain water entering the storm drain. Remember...

"Only Rain in the Storm Drain".

760-435-5800

Did You Know That...

the City of Oceanside provides each residential home with a convenient wheeled cart for collection and disposal of green waste. When placed in this container, the green waste will be composted at the local composting facility in Oceanside.

Sweeping and blowing grass clippings, leaves and other landscape trimmings into the street causes water pollution

If residents sweep grass and leaves into the street the green waste can go down the storm drain and reach our local waterways. You might think, "What's wrong with that?" When the green waste starts to decompose in the water, it can cause the following problems:

- Ammonia levels increase, creating a hostile environment for the animals and creatures that use the waterways.
- If picked up by the street sweeper, the green waste goes to the landfill instead of to the composting facility.

Follow these tips to make sure your green waste is composted and doesn't go to the landfill or pollute our local waterways:

- Place only grass clippings, leaves, weeds, and other prunings out for collection.
- Prunings and branches must be tied into 4-foot sections and tied into bundles not to exceed 18 inches in diameter.
- Please do not use wire for bundles.
- Place green waste cart on the curb by 6 a.m. the same day as your regular trash collection.
- Do not place green waste in plastic bags. Green waste in plastic bags will not be collected.

For more information call the Solid Waste and Recycling Hotline at 760-435-5015.

Clean Water Program
Phone and Code Reference List

Regarding calls for dumping materials down storm drains, irrigation runoff, and other potential storm water violations

Urban Runoff Hotline (Working Hours) This is the Water Utilities Department	**760-435-5800**
Off Fridays/weekends - Emergencies only (water running into yard; hazardous material seen being dumped into storm drain, etc.)	**Reference emergency call out list:** Contact the person on duty for public works/water utilities/sewer/fire, etc.

There are some activities that generate runoff water into the storm drain. Some of these activities are legal for residents but illegal for commercial businesses.

Activity		Commercial	Residential
Power washing		Required to capture water and vacuum up or and./or drain it to landscape	Legal for residents to power wash or hose off driveways and sidewalks without hiring a commercial contractor.
Car Washing		Mobile car detailers are required to capture water and dispose of in landscape or sewer - not the gutter or storm drain.	Legal for residents to wash on their driveways; illegal to wash in the street; Ask if they will wash on the grass or at car wash.
Charity Car Washes		Required to capture water and dispose into sewer or landscape	Code: One charity car wash allowed per parcel per month.
Irrigation Runoff It is illegal to allow water other than rain to run off your property onto another.		Homeowners associations managing common areas are required to adjust system to avoid any runoff.	Homeowners can allow runoff but are educated about the problems associated with over irrigation runoff.

Oceanside City Codes Related to Storm Water/Urban Runoff

Animal Waste Removal

4.16.2 Animal waste removal – fail, refuse or neglect to clean up feces

Chapter 40: City of Oceanside Urban Runoff Management, and Discharge Ordinance

40.2.1 – Discharge Prohibitions (Illegal Discharges)

40.2.1 (a) *Illegal discharges* - Discharge of pollutants or non-storm water into storm water conveyance system or receiving water; see exemptions under 40.2.2.

40.2.1 (b) *Illegal connection* - Illegal connection to storm water conveyance system even if connection was pursuant to a city permit at time of construction.

Updated July 2008

40.2.1 – Discharge Prohibitions (Illegal Discharges), continued

40.2.1 (c) *Liability for illegal discharge* – liability is responsibility of person causing, contributing, or responsible for illegal discharge.

40.2.1 (c) *Litter, dumps, or stockpiles* – Deposition of materials on public or private lands that may result in illegal discharge.

40.2.1 (e) Violation of NPDES permit – Any discharge that would violate NPDES permit for Oceanside is prohibited.

40.2.2 – Discharges exempted from discharge prohibitions (Legal Discharges)

40.2.2 (a) Separately permitted discharges – Discharges permitted under a valid-specific NPDES permit or facility are exempt from discharge prohibitions.

40.2.2 (b) Categorically allowed discharges subject to section 40.2.3 – The following categories of non-storm water discharges are exempt from discharge prohibitions and are subject to Section 40.2.3.:

- Discharges from potable water sources other than water main breaks
- Diverted stream flows (with required permits)
- Flows from riparian habitats and wetlands
- Foundation drains
- Individual residential washing of vehicles in driveway (prohibited in street)
- Irrigation water including recycled water used for irrigation
- Landscape irrigation
- Lawn watering
- Rising ground water
- Swimming pool discharges (if dechlorinated to less than one PPM chlorine)
- Uncontaminated ground water infiltration to storm drains
- Uncontaminated pumped ground water
- Water from crawl space pumps
- Water from footing drains

40.2.2 (c) Categorically allowed discharges not subject to section 40.2.3 – The following categories of non-storm water discharges are exempt from discharge prohibitions and are not subject to Section 40.2.3.

- Air conditioning condensation
- Flows from emergency fire fighting activities
- Springs
- Water line flushing

40.2.3 – Best management practice requirements and general requirements applicable to all dischargers

40.2.3 (a) Applicable requirements – All dischargers must comply with applicable prohibitions in sections 40.1 through 40.2 and must comply with other pars oft his Chapter.

40.2.3 (b) Minimum best management practices for all dischargers – All dischargers in the city must install, implement and maintain the following minimum BMPs:

40.2.3 (b)(1) Eroded soils - Prior to rainy season, dischargers must remove or secure significant accumulations of eroded soils from slopes previously disturbed by clearing or grading, if those eroded soils could otherwise enter the storm water conveyance system or receiving waters during the rainy season.

40.2.3 (b)(2) Pollution prevention - Dischargers employing ten or more persons on a full-time basis shall implement those storm water pollution prevention practices that are generally recognized in that discharger's industry or business as being effective and economically advantageous.

40.2.3 (b (3) Prevention of illegal discharges - Illicit connections must be eliminated and illegal discharge practices eliminated.

40.2.3 (b)(4) Slopes - Completed slopes that are more than five (5) feet in height, more than two hundred fifty (250) square feet in total area, and steeper than 3:1 (run-to-rise) that have been disturbed, shall be protected from erosion prior to the first rainy season, and continuously thereafter.

40.2.3 (b)(5) Storage of materials and wastes. All materials and wastes with the potential to pollute urban runoff shall be stored in a manner that either prevents contact with rainfall and storm water, or contains contaminated runoff for treatment and disposal.

40.2.3 (b)(6) Use of materials - All materials with the potential to pollute urban runoff (including but not limited to cleaning and maintenance products used outdoors, fertilizers, pesticides and herbicides, etc.) shall be used in accordance with label directions. No such product may be disposed of or rinsed into receiving waters or the storm water conveyance system.

Volunteers pitch in for Coastal Cleanup Day

By Promise Yee

OCEANSIDE — In a countywide effort, more than 5,000 volunteers hit San Diego beaches and inland areas Sept. 15 for the 23rd annual Coastal Cleanup Day organized by I Love a Clean San Diego and San Diego Coast Keeper. Oceanside City Beach and Buccaneer Beach were two of the 60 sites that received a cleanup.

Volunteers came to Oceanside City Beach from as far away as Simi Valley to participate and families, high school students and Boy Scouts armed with trash bags and gloves pitched in during the cleanup. "Our pack does it twice a year," said Oceanside resident Michael Walls, who picked up trash with Cub Scouts and his 3-year-old son Benjamin Walls.

Michael Walls said the cleanup provides valuable lessons for scouts. "It's teaching them keep the environment clean."

Young volunteer Hailey Haynes of Oceanside knows some of the dangers of pollution. "The sea creatures could eat something and die and it could pollute the ocean," Hailey said.

According to Cynthia Mallott of the city of Oceanside Clean Water Program, a data card used to record trash pickup during the event helped volunteers realize that a lot of trash travels from shipping barges and sewer systems to the beach. "Our goal is to educate people on where the pollution comes from," she said.

For information on trash pickup and volunteer opportunities log on to www.cleanupday.org.

1. Kimberly Aguilar, her father Mike Martin and daughter Hailey Haynes carry their trash bags up the beach.
2. Hailey said she picks up trash to beautify our beaches and protect marine animals.
3. Oceanside City Beach was one of 60 sites in San Diego County for trash pickup on Coastal Cleanup Day. Benjamin Walls of Oceanside, 3, is learning early to do his part to keep beaches clean.

AROUND NORTH COUNTY

Saturday will be busy day in O'side

The San Luis Rey River flows through Oceanside, when it has enough water to flow.

J. STRYKER MEYER

Regardless of whether the water is flowing or not, hundreds of pounds of rubbish and trash get dumped in the riverbed throughout the year. On Saturday, the city of Oceanside is teaming with 1-800-GOT-JUNK to host the seventh annual cleanup from 9 a.m. until noon.

City officials said previous efforts have taken hundreds of pounds of trash and garbage from the river and they are hoping to exceed previous years collection totals.

"With the rainy season approaching, it is important to remove accumulated debris from the river bed which can be washed downstream to the ocean, creating possible public health risks and an awful mess," said **Cynthia Mallett**, an environmental specialist for the city.

The San Luis Rey River begins east of Palomar Mountain and collects water for more than 550 square miles of North County tributaries during its 50-mile travel to the ocean near Oceanside Harbor.

There will be four locations for litter removal on Saturday:

- Benet Road on the north side of Highway 76 and Airport Road;
- Fousatt Road on the north side of Highway 76 near the bike path;
- Douglas Drive and North River Road, near the bike path; and
- College and Vandegrift boulevards on the north side of the Maj. Gen. Ray Murray Bridge.

Mallett said the Fousatt Road site will need additional people this year because of the amount of debris in dumped in the area, including old barbecues and household trash. Call (760) 435-5536.

BUSY SATURDAY — At 7 a.m. Saturday, registration will begin for the postponed

Man pleads not guilty to pipe bomb

Discovery of explosives along I-5 led to road closures Frida

TERI FIGUEROA

ESCONDIDO — After a quarter-century running one of the few old-fashioned horse ranches in Escondido, Dixie Bernard is facing the prospect of becoming homeless and jobless at the age of 83.

Country Club Ranch, on the western outskirts of the city in Eden Valley, has been Bernard's home and livelihood since shortly after he moved from Kentucky to San Diego County 24 years ago.

But a new owner is slated to take over the 10-acre ranch this month, and she said Tuesday that she was planning some dramatic renovations and upgrades that don't include Bernard.

"I'm scared and worried," Bernard said during a Tuesday morning interview at the ranch. "I've been trying to make a living out of this place, but I won't be able to do that any more. I'll have nothing when I walk away from here."

Longtime custo lied around Bernar came aware of the about two weeks owner, Michell Kin open to the possibi continuing to live a Kimball explained no longer capable ranch or living alon

Volunteers Wanted!!!

The City of Oceanside Clean Water Program

wants to make our waters clean for all residents and visitors. We need your help in order to improve water quality. There are several cleanup events throughout the year that get people outdoors and in touch with our environment. A big Thank You goes out to all volunteers who take the time out of their busy schedules to help with these important cleanup events. The 2008 there are currently four events scheduled.

2008 Oceanside Cleanup Event Schedule

All events are held from 9:00 a.m. – Noon

April 26, 2008

Creek to Bay Cleanup Event along Loma Alta Creek

July 5, 2008 – Morning After Mess; Oceanside Harbor and beaches

September 20, 2008 – California Coastal Cleanup Day along Buena Vista Creek and Oceanside beaches

November 8, 2008 – San Luis Rey River Clean Up Event

All volunteers receive cleanup supplies, including bags and gloves, refreshments and a T-shirt. For more information on staging sites and event details call **760-435-3695.**

RE: STATEMENT OF CERTIFICATION
CITY OF OCEANSIDE JURISDICTIONAL URMP

I certify under penalty of law that the Illicit Discharge, Detection, and Elimination Section (Section 7) of the Jurisdictional Urban Runoff Management Program Annual Report for 2007-2008 was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for knowing violations.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

This section documents the activities conducted by the City of Oceanside during the 2007-2008 reporting period to manage illicit discharges and meet the requirements of Sections D.4 and J.3.a.(3)(f) of the 2007 Municipal Permit.

7.1 Introduction

Illicit connections and illicit discharges (IC/IDs) can result in unauthorized discharges of pollutants to MS4s. IC/IDs can be defined as the following:

- An ***illicit connection*** is a connection that conveys an illicit discharge to the MS4 (pipe, drain, channel, catch basin, grated inlet, junction box, etc.).
- An ***illicit discharge*** is the act of disposing of any pollutant that is prohibited by the City either intentionally or unintentionally to the MS4. This does not include non-storm water exemptions and discharges resulting from emergency fire fighting activities. A list of non-prohibited, non-storm water discharges is provided in Chapter 3 of the City's JURMP Update (2007).

The main objective of the illicit discharge, detection, and elimination (IDDE) component of the City's storm water program is to seek and eliminate IC/IDs into the MS4. Eliminating IC/IDs helps minimize potentially negative impacts of human activities on receiving water bodies.

The City uses its municipal personnel to assist in actively seeking, identifying, and reporting IC/IDs during their daily activities. Detection and prevention of IC/IDs is achieved by:

- Operating a public complaint hotline,
- Inspecting local businesses and municipal facilities,
- Conducting dry weather field screening and analytical monitoring,
- Maintaining municipal MS4 and sewer systems, and
- Educating the local community.

The City investigates, inspects, and follows-up on every IC/ID that is reported or detected, to identify the source or sources of the discharge. Voluntary compliance and escalating enforcement mechanisms are implemented to immediately eliminate the IC/ID once the source has been identified when appropriate. Educational materials are distributed to help prevent future IC/ID occurrences. In addition, the City is in the process of developing MS4 outfall and source identification monitoring programs as part of a regional and jurisdictional effort to aid in identifying IC/IDs.

7.2 Public Reporting of Illicit Discharges and Connections

To aid the process of identifying illicit discharges, the City encourages the public and City staff to report illicit discharges and connections. A public complaint hotline specifically for urban runoff has been developed, and is currently operated by the Water Utilities Department:

Oceanside Urban Runoff Hotline
(760) 435-5800

The hotline is answered during business hours by City staff. Bilingual staff is available to handle calls by Spanish speakers. For after hours, holidays and weekend calls, callers needing immediate assistance are referred to the Oceanside Police and/or Fire Departments and the remaining are prompted to leave a message. Maintenance and operations staff are also trained to promptly refer potential storm water violations observed in the field to the Hotline (details of municipal staff training are in Section 10.2). City staff is provided with their own incentive based reporting hotline called *Oceanside Eyes*, which allows them to earn credit towards certain awards for each report that they phone in.

In addition to the Urban Runoff Hotline, IDDE related public complaints are also reported to Code Enforcement:

Code Enforcement
(760) 435-3944

Once a complaint is received, it is logged into a database for documentation and tracking purposes. The complaint is then forwarded to either a Clean Water Program Inspector or a Code Enforcement Officer. City personnel investigate every complaint logged through the hotline to determine if pollutants are in fact being discharged to the MS4. If investigators find evidence of a violation or other IC/ID, every effort is made to find the responsible party and inform them of the complaint or issue a violation.

A total of 54 public complaints were received through the Urban Runoff Hotline during the 2007-2008 reporting period compared to 14 calls in the previous reporting period. Figure 7-1 is a summary of the nature of calls made to the Urban Runoff Hotline. The Code Enforcement Hotline reported 190 calls for storm water/Clean Water Program complaints compared to 279 calls in the previous reporting period. However, due to tracking procedures, the 279 reported complaints may have included additional code enforcement inspections related to urban runoff issues. A revised tracking policy is planned for upcoming years to glean detailed information from each call.

Figure 7-1. Summary of Urban Runoff Hotline Calls during the 2007-2008 Reporting Year.

The Urban Runoff Hotline is publicized in the *Oceanside Community Magazine*, the *North County Times* newspaper, the City's website, the Clean Water Program website, on a monthly locat TV program called KOCT Oceanside Update, informational literature for public distribution, and at local community events and meetings. In addition, education to the public stresses the importance of reporting discharges and describes the critical role that the public plays in the identification and elimination of Urban Runoff pollution related problems.

7.3 Spill Reporting, Response, and Prevention

The City implements spill reporting, spill response, and spill prevention mechanisms to prevent, respond to, contain, and clean up all sewage and other spills that discharge to its MS4 from any source.

7.3.1 Spill Prevention

7.3.1.1 Sanitary Sewers

The City's preventive and corrective sewer maintenance programs consist of a variety of components provided for the operation, maintenance, repair and replacement of sewer mains, manholes, and pump stations. The programs provide for the routine monitoring, inspection, cleaning, and related maintenance of all components of the collection system in order to reduce the potential of sanitary sewer overflows (SSO) and other structural failures. Potential problems are noted and maintenance schedules adjusted accordingly. If necessary, repairs are initiated by City maintenance crews. Larger more complex projects are referred for inclusion in the capitol improvement projects (CIP) process for planning, design, and construction.

When system malfunctions do occur, such as SSO main stoppages, electrical outages, and mechanical breakdowns, the cause of the problem is investigated and analyzed. Maintenance schedules are then adjusted accordingly. If appropriate, the infrastructure component is referred for repair or replacement by maintenance crews.

Cleaning schedules are analyzed and adjusted for proper scheduling. During the 2007-08 reporting year, 312 miles (1,649,702 feet) of sanitary sewer were cleaned.

Additionally, in June and July of 2008 (crossing two reporting periods), 7,252 feet of City sewer lines were slip lined and manholes pressure grouted and sealed in the Loma Alta watershed. The slip lining project cost approximately $700,000.

A large CIP in the planning stage during the 2007-08 reporting year, is the land outfall replacement project replacing 6,200 feet of sewer lines in the Loma Alta watershed. The existing land outfall was constructed in 1972 and consists of approximately 34,000 linear feet of 24-inch ductile iron pipe. Currently the land outfall transports around 10 MGD (million gallons per day) of flow. Several failures of the existing land outfall have occurred recently along Oceanside Boulevard, therefore a 6,200 linear foot segment is currently being replaced. This segment is parallel to the centerline of Oceanside Boulevard and the limits of the pipeline replacement are from approximately 1200 feet west of Vine Street to approximately 200 feet west of Hoover Street. This project should be completed in the spring of 2009 and is estimated to cost over $4,000,000.

Private Sewer Laterals and Septic Systems

The City requires that private sewer laterals and septic systems be designed and operated in accordance to industry standards. The City also requires the proper maintenance of these facilities in order to avoid spills, breakages, and failures.

7.3.1.2 Other Spills

The City prevents spills from private businesses and residents through required BMPs, education, and enforcement of relevant regulations for the storage and usage of hazardous materials.

The City also received funds from the California Integrated Waste Management Board to establish a permanent household hazardous waste (HHW) collection facility for its residents. The City's objective was to encourage a convenient, proper disposal and collection of HHW materials for its residents. This facility is currently open Monday through Friday for used oil, paint, and antifreeze disposal and every Saturday for collection of the following materials:

- Aerosols
- All purpose cleaners
- Ammonia
- Antifreeze
- Automobile cleaners
- Barbecue lighter fluid
- Batteries
- Brake fluid
- Chlorine bleach
- Detergents
- Disinfectants
- Drain opener
- Furniture polish
- Gasoline
- Glass cleaner
- Herbicides
- Mothballs
- Motor oil
- Oven cleaner
- Paint
- Paint thinner
- Pesticides
- Rubber cement
- Rug/upholstery cleaner
- Scouring powder
- Silver polish
- Toilet bowl cleaner
- Transmission fluid
- Tube and tile cleaner
- Turpentine varnish
- Water sealant
- Wood finish

The HHW collection facility is periodically promoted by the City through the *Oceanside Community Magazine*, the *North County Times* newspaper, on the Clean Water Program website and at local community events and meetings where literature is distributed. There is also literature available to the public at the City offices.

During the 2007-2008 reporting period, 3,430 Oceanside households utilized the household hazardous waste disposal facility, disposing or recycling 142.8 tons of hazardous materials (including universal waste) during the reporting period. An additional 119.9 tons of E-waste was recycled in the same reporting year. Compared to the 2006-07 reporting period, the number of households utilizing the program is down from 3,668, but more waste is being disposed of; up from 130.7 tons. The amount of E-waste dropped off for recycling has also increased from 115.2 tons.

The City provides information to the public on used motor oil recycling and identifies the local state certified collection centers in the City. Furthermore, as part of the City's collection program, a 1,500-gallon used oil collection receptacle is provided at the City's harbor for use by

harbor slip renters. During FY 2007-08, 600 gallons of oil were recycled along with one barrel of oil filters.

7.3.1.3 Prevention of Fugitive Trash

In addition to spills from sewer overflows or hazardous waste dumping activities, the City is also addressing the prevention of trash getting into our receiving waters.

As discussed in detail in Section 4 of the 2007-2008 Annual Report, 571 miles of public streets in the City of Oceanside are swept at least monthly. Double this length to accommodate for both east/west and north/south directions giving a total of 1,142 curb miles. In addition, a total of 3,252 structures (catch basins, manholes, inlets, outlets, etc.) were inspected and cleaned during the reporting period. A total of 2,972 structures were cleaned by United Storm Water and 280 structures were cleaned by City maintenance crews. A total of 65.5 tons of waste was removed. The waste generally consisted of trash, green waste, sediment, roots, solids, and rocks.

In addition, because cigarettes and their associated trash, including wrappers and cartons, are the most littered item in America and the world, during FY 2007-08 the Oceanside Harbor Maintenance Department purchased and began installation of cigarette butt collection boxes. Cigarette Pollution Solutions, a private company with its own special cigarette filter receptacle, called the Butts Only Box, was determined to be an ideal design for placement in the harbor and near the beach areas. The Box is designed to accept cigarette and cigar butts and keep them from being exposed to rain and irrigation water until they are collected for proper disposal. It features a stainless steel construction that resists the salt weather environment at the coast and has a removable inner basket for easy servicing.

During Fiscal Year 2007-08 the Department of Harbors and Beaches purchased 23 Butts Only Boxes at a cost of $375 each and installed 20 of them throughout the Harbor and along Oceanside beaches. Thirteen of these boxes were installed in the harbor area near restaurants, docks, and bathrooms. Seven Boxes were installed along the heavily walked road that parallels the beach called The Strand and at the top of the municipal pier (Figure 7-2).

Figure 7-2. Butts Only Boxes in Oceanside Harbor and along the Strand.

Cigarette Pollution Solutions also provides a disposal and tracking service with a monthly statement of the amount of cigarette filters collected from all of the Boxes. The boxes were phased in throughout the spring and summer of 2008. Table 7-1 provides a summary of the amount of cigarette butts collected from March through July of 2008.

Table 7-1. Number and Weight of Cigarette Butts Collected in FY 2007-08.

Date	Time period covered	Number of butts collected
3/14/2008	2/11-3/13/08	435
4/16/2008	3/14-4/16/08	577
5/17/2008	4/17-5/17/08	539
6/17/2008	5/18-6/17/08	1,753
7/26/2008	6/18-7/22/08	3,715
	Total butts collected	**7,019**
	Weight	**2.78 pounds**

Future instillations may include the sport fishing industry out of Oceanside Harbor. The sport fishing boats that launch from Oceanside Harbor have been approached about installing a version of the Butts Only Boxes on their boats. Two have expressed interest and the City will be receiving statements summarizing the installation and use of those boxes.

7.3.2 Spill Reporting

7.3.2.1 Public Reporting of Spills

Spills entering the MS4 may be discovered during routine maintenance activities, scheduled monitoring, or observed and reported to the City by citizens. Citizens may use the Urban Runoff Hotline, Code Enforcement, or Oceanside Police Department phone numbers to report spills. Any reports by the public or City staff are referred to the Wastewater Division of the Water Utilities Department.

7.3.2.2 City Spill Reporting

The City complies with the sewage spill reporting requirements outlined in Table 7-2 and detailed in Section 9 of the JURMP Update:

Table 7-2. Summary of Sewage Spill Reporting Requirements

Spill Volume	Criteria	Agency Receiving Report	Reporting Period
Any	Spills to waters of the State	SWRCB online RWQCB DEH	3 days (initial) 24 hours Immediate
Any	Municipal Permit non-compliance threatening human or environmental health	RWQCB SWRCB online	24 hours verbal and 5 days written 3 days (initial)
Any	Mitigated spills (absorbed, cleaned up, or captured)	DEH	24 hours

Spill Volume	Criteria	Agency Receiving Report	Reporting Period
Any	Unmitigated spills to areas with potential public contact	DEH	Immediate
Any	Unmitigated spills to areas without potential public contact	DEH	24 hours
>1000 gallons	Anywhere	OES RWQCB DEH SWRCB online	Immediate 24 hours Immediate 3 days (initial)

County of San Diego Department of Environmental Health (DEH)
State Office of Emergency Services (OES)
Regional Water Quality Control Board (RWQCB)
State Water Resources Control Board (SWRCB)

7.3.3 Spill Response

Responses to sewer spills are conducted in accordance to the City's Sewer Overflow Response Plan and the responsible agencies are summarized in Table 7-3.

Table 7-3. Responsible Agency for Sewage Spills

Source	Responsible Agency
Leaks and spills from publicly owned collection system	City of Oceanside
Private residence (failing septic systems)	County DEH
Any spill reaching MS4	City of Oceanside

During the 2007-2008 reporting period, the City responded to 15 sewer spills, four of which were privately owned. Only three spills reached the receiving water and only 20% of the total amount of total overflow volume for the year was released to the environment. Quick response times and the use of City vactor trucks and inlet protection devices assisted in the decrease in spill volume for the reporting year. Grease and roots were the most common causes of the blockages. The Clean Water Program and the Wastewater Division of the Water Utilities Department continued the public outreach effort initiated in the last reporting year for residential contribution of grease in the sanitary sewer. As a result, there were fewer spills this year with grease as the primary cause. Notifications of these spills are submitted to the RWQCB through quarterly reports. A summary of SSO overflows during 2007-2008 is presented in Table 7-4.

Responses to other spills are conducted by the Fire Department or qualified personnel in the Public Works Department, as appropriate to the situation. Both small and large spills are handled following HAZMAT Incident Response Team (HIRT) Policies and Procedures as issued by the Unified San Diego County Emergency Services Organization. The Oceanside Fire Department responded to all of the non-sewer related spills during the 2007-2008 permit year. A summary of the 21 spills is presented in Table 7-5. The majority of the spills were small fuel spills from leaking vehicles.

Table 7-4. Summary of SSO Overflows during the 2007-2008 Fiscal Year.

Overflow Start Date Time	Overflow End Date Time	Total Overflow Volume (gal)	Overflow Volume Released to Environment (gal)	Overflow Cause	Did the SSO Enter a Storm Drain?	Did the SSO Reach Other Surface Waters?	Initial Secondary Receiving Waters	Prevention Corrective Measures
7/18/07 10:20	7/18/07 10:40	100	100	Grease	No	No	N/A	Routine cleaning the following month.
8/21/07 7:50	8/21/07 8:11	420	420	Grease	Yes	Yes	Buena Vista Creek/Buena Vista Lagoon	Rodder broke stoppage and rodded the line.
8/28/07 19:59	8/28/07 21:00	61	61	Roots	Yes	No	N/A	Next day removal of roots.
9/23/07 12:40	9/23/07 13:40	30	30	Roots	Yes	No	N/A	TV to inspect root issue.
10/18/07 10:10	10/18/07 10:30	100	0	Roots	Yes	No	N/A	TV to inspect root issue.
10/23/07 11:37	10/23/07 11:48	550	0	Other - Dog hair/toys	No	No	N/A	TV to inspect. Talk with Humane Society about traps/screens for dog hair
11/4/07 11:40	11/4/07 12:47	335	230	Grease	Yes	Yes	San Luis Rey River	Rodder broke stoppage. Jet area and drop chlorine.
12/3/07 12:10	12/3/07 12:35	500	150	Grease, Roots, Rags	Yes	No	N/A	Extend maintenance schedule to include this line.
1/1/2008 Unknown	1/1/08 8:40	600	0	Unknown - Private	No	No	N/A	Code Enforcement citation.
1/8/08 11:45	1/8/08 13:15	720	160	Roots, Rags	Yes	No	N/A	TV line. Increase to monthly cleaning schedule.
2/2/08 7:00	2/2/08 9:20	105,000	21,000	Line Break	Yes	Yes	Loma Alta Creek/Pacific Ocean	City accelerated replacement of 6,200 feet of 36in PVC pipeline with emergency funds.
3/5/08 9:40	3/5/08 10:20	200	50	Unknown - Private	Yes	No	N/A	City crews remained onsite until stoppage was cleared by plumber.
3/26/08 19:10	3/26/08 20:00	450	0	Blockage - RV Dump hose	Yes	No	N/A	Entry to free hose from pipe.
5/9/08 10:40	5/9/08 10:50	100	100	Unknown - Private	Yes	No	N/A	City crews remained onsite until stoppage was cleared by plumber and grease trap cleaned.
6/12/08 8:00	6/12/08 8:20	300	50	Debris, Rags, Roots	Yes	No	N/A	TV line to identify source of rags.

Table 7-5. Summary of Non-SSO Spills during the 2007-2008 Fiscal Year.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
8/2/2007 12:20	8/2/2007 12:25	0009250	Gasoline	1 gallon	Hazardous materials leak control & containment	N/A	Interstate-5 SB gasoline or other flammable liquid spill. Plugged fuel line and contained spill.
9/21/2007 11:34	9/21/2007 12:00	0011449	Fuel	1/2 gallon	Hazardous materials spill control and confinement	Hazardous materials leak control & containment	Fuel leak on pavement below parked vehicle. Fuel leaked plugged.
9/25/2007 21:16	9/25/2007 21:35	0011661	Fuel	N/A	Investigate	Hazardous materials leak control & containment	Contain fuel leak from vehicle in parking area.
10/2/2007 15:18	10/2/2007 15:20	0011953	Fuel	N/A	Investigate	N/A	Possible fuel running down alley where subjects were working; liquid in alley was water.
10/6/2007 10:30	10/6/2007 10:40	0012119	Natural Gas	N/A	Investigate	N/A	Odor of natural gas. Referred to SDG&E. Lines being purged; utility investigated.
10/17/2007 15:20	10/17/2007 16:45	0012589	Gasoline	1 gallon	Hazardous materials leak control & containment	Remove hazard	Report of a strong gasoline odor from neighboring apartment. Gained entry found van leaking gas from rotten fuel line. Once the line was repaired, the gas dried on its own.
10/24/2007 20:22	10/24/2007 20:59	0012960	Fuel	0	Investigate	Establish safe area	Abandoned 5 gallon bucket of racing fuel approximately half full with the cap missing. No obvious spill or leak. Projects bagged, drummed and secured.
11/6/2007 18:45	11/6/2007 19:04	0013534	Diesel Fuel	5 gallons	Establish safe area	Hazardous materials spill control and confinement	Diesel fuel leak spread adjacent to fuel pump at gas station. Fuel covered with absorbent; owner to dispose. OPD present.
11/28/2007 12:59	11/28/2007 13:16	0014525	Formaldehyde	500cc	Investigate	Hazardous condition, other	Accidental spill of formaldehyde on floor of business. Spill was contained and cleaned up by on-site personnel previous to arrival of FD. County Health Dept was contacted relative to disposal of material and cloth used for absorption.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
12/10/2007 16:57	12/10/2007 17:32	0015141	Mercury	1cc	Remove hazard	N/A	Small amount of mercury found in parking lot and placed in an air tight container to dispose.
12/18/2007 16:13	12/18/2007 16:25	0015500	Oil	Undetermined	Cancelled enroute	N/A	Responded to a reported oil spill however upon arrival EMI Environmental was in the process of cleaning up the mess. There was no water runoff.
12/26/2007 11:22	12/26/2007 11:46	0015825	Gasoline	Undetermined small amount	Hazardous materials spill control and confinement	N/A	Small gasoline spill from leak in fuel tank - secured leak and had vehicle towed to repair facility.
2/1/2008 8:05	2/1/2008 8:12	0001342	Gasoline	Undetermined	Investigate	N/A	Found truck in parking lot dripping gasoline from underneath. The clamp to the fuel filter was loose. Fire Dept tightened clamp, put down Sorball and advised owner to call tow truck.
2/13/2008 17:39	2/13/2008 17:43	0001850	Transmission Fluid	Undetermined small amount	Investigate	Hazardous materials spill control and confinement	Small amount of transmission fluid was slowly running down gutter. Reporting party states that a tow truck recently picked up a car, shoveled some dirt on the fluid and left. Fire Department used absorbent on the remaining fluid and disposed it properly.
2/16/2008 13:14	2/16/2008 17:34	0001971	Water and gasoline mix	Undetermined	Establish safe area	Control traffic	Single vehicle accident with driver losing control. Vehicle damaged the gas meter, electrical meter, water line to the house and punctured the vehicle's gas tank. Flowing water mixed with gas was running down street as police approached. OPD began diking of flow and called Public Works to assist in diversion and cleanup. Water was then shut off.
2/27/2008 14:48	2/27/2008 15:08	0002459	Fuel	Undetermined	Investigate	N/A	Investigate fuel leak in a parking lot. Small amount of fuel leaked from a car that was being worked on. Leak stopped on it's own. Advised owner to get towed.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
3/2/2008 12:21	3/2/2008 12:30	0002589	Fuel	2 gallons	Investigate	Remove hazard	Two gallon fuel spill at gas pump. Used absorbent to clean up and disposed of properly per 7-11 policy.
3/7/2008 18:26	3/7/2008 18:55	0002820	Gasoline	1.2 gallon	Hazardous materials leak control & containment	N/A	Vehicle fuel leak after running over an object. Stopped leak; owner made arrangements to have vehicle towed.
3/11/2008 22:43	3/11/2008 22:59	0003006	Fuel	Unable to determine	Hazardous materials spill control and confinement	N/A	Upon arrival, found two small areas approx. 2x2 with fuel already absorbing into asphalt. Person who reported the incident found two individuals syphoning gas from his work truck. Spread small amount of cat litter on ground to absorb remaining fuel.
3/26/2008 16:49	3/26/2008 18:34	0003631	Fuel/seawater mix	15 gallons	Investigate	Establish safe area	28 foot fishing boat at the fuel dock had approx. 15 gallons of unleaded fuel and sea water mixture in bilge. Applied class B foam and the boat towed to hoist dock to be repaired.
4/16/2008 13:41	4/16/2008 14:22	0004491	Fuel	2 gallons	Establish safe area	N/A	Response to a report of gas leaking from vehicle. Stopped leak and absorbed the two gallons of spilled fuel with cat litter. Tow truck arrived to transport vehicle.
4/24/2008 9:41	4/24/2008 10:38	0004792	Diesel Fuel	8 gallons	Investigate	Provide manpower	Diesel fuel spill about eight gallons. Helped employee on scene clean up and contain.

7.4 Urban Runoff Monitoring

The Urban Runoff Monitoring Program includes MS4 Outfall Monitoring, Source Identification Monitoring, and the Dry Weather Field Screening and Analytical Monitoring Program.

7.4.1 MS4 Outfall Monitoring and Source Identification Monitoring

The new MS4 Outfall Monitoring Program and the Source Identification Monitoring Program workplans were submitted to the RWQCB on July 1, 2008 for review. The Copermittees developed the proposed regional guidance and will begin implementing both programs in the 2008-2009 reporting year. For permit compliance, the City and County of San Diego did begin sampling for the MS4 outfall monitoring program in 2007-2008 prior to program approval.

7.4.2 Dry Weather Field Screening and Analytical Monitoring

The updated requirements of the Dry Weather Monitoring Program component in the 2007 Municipal Permit (Order 2007-001) built upon the requirements of the previous Municipal Permit (Order 2001-01). The dry weather analytical and field screening monitoring components consist of 1) field observations (site description and qualitative observations), 2) field screening monitoring (testing of sample while at site and flow estimation), and 3) analytical monitoring on a subset of sites (performing further tests of sample later at a laboratory). The new Municipal Permit also added a trash assessment component and now requires follow-up investigations to be conducted within two business days of receipt of results.

The City's complete 2008 Dry Weather Monitoring Report is provided as Attachment 7-A to this submission. This report includes:

- Reporting of all dry weather field screening and analytical monitoring results.
- Dry weather field screening and analytical monitoring report.
- Corrections for the Dry Weather Monitoring stations.
- The number and brief description of any IC/IDs found and eliminated during Dry Weather Monitoring.
- Description of activities conducted to manage IC/IDs found during Dry Weather Monitoring.

Below is a summary of the findings.

Dry weather monitoring is conducted at each site at least once between May 1st and September 30th each year. During the 2008 monitoring season, 67 primary sites were visited. Five of those sites were inaccessible and an additional nine were dry. Eighteen alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (29%).

When field measurements and/or laboratory analysis showed an exceedance of established action levels, the site was revisited within two business days to confirm the initial results. When follow-up sampling confirms continued exceedance of action levels, the City conducted further investigations to identify the source of the exceedance.

Thirty three sites required confirmation for an initial field screening exceedance. Of those, 19 required an IC/ID investigation. The most common exceedance was for orthophosphate. Of the 19 sites chosen for laboratory analysis, only one site had an exceedance for chemistry results. A015 exceeded the action levels for dissolved zinc. There is an ongoing investigation into the source; groundwater is suspected. There were seven exceedances for total coliforms, two for fecal coliforms, and two for Enterococcus. None of the fecal coliform or Enterococcus confirmation samples exceeded the action levels and therefore did not required an IC/ID investigation. Five of the seven total coliform exceedances required an upstream investigation.

In an historical comparison of action level exceedances, orthophosphate exceedances have increased gradually over the past several years, however, ammonia exceedances have decreased. In addition, bacteria levels continue to decrease and fewer sites are exceeding action levels.

The prevailing source for exceedances of field screening analytes was ponded water. The prevailing source of ponded and flowing water was from residential over-irrigation. With the additional push for water conservation in light of changing water availability, several avenues are being implemented to reach the general public about water conservation which will in turn reduce dry season runoff and improve water quality. These efforts include more face-to-face outreach by two new Clean Water Program Compliance Inspectors hired in February of 2008 who have responded to reports of over-irrigation in residential neighborhoods and at commercial and industrial facilities. In addition to the two new inspectors, the Water Utilities Department has hired an outreach coordinator specifically for water conservation education. Outreach avenues include information inserts in water bills, presentations on the local public access channel, and sponsoring workshops for the agricultural community and HOAs. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

During the first year of the trash assessment, approximately 65% of the sites were either “optimal”, “suboptimal”, or “marginal” and did not require the detailed trash evaluation which identifies potential routes and sources. Twenty seven percent of the sites were “submarginal” and 7% of the sites were “poor”. The San Luis Rey Watershed had the highest percentage of “submarginal” and “poor” sites (46%). The majority of the trash found at the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common sources of the food packaging and household wastes were households and transients.

Follow-up investigations continue to be conducted at sites with ongoing exceedances. Water conservation and urban runoff education outreach, as well as beach and creek clean-up events are on-going year-round as the City continues the effort to detect and eliminate illicit discharges to the storm drain system.

The City did not make any changes to the MS4 map during the 2007-08 fiscal year. To address MS4 inaccuracies and update the GIS layer of the MS4 map in the future, the City began researching hand-held GIS data collection units to be used collaboratively between Public Works, Engineering, and the Water Utilities Departments. Between June and August of 2008, the City purchased two Trimble GeoXH units. One of the many uses of these units is to verify

the accuracy of the MS4 map and relay the information gathered in the field to the Engineering Department to update the GIS layer. During FY 08/09, the City will be creating the data dictionary needed to collect consistent and necessary data for the storm drain system update and will roll out the field effort in the Spring and Summer of 2009.

7.5 Follow-up and Enforcement

The City implements and enforces its ordinances, orders, or other legal authority to prevent illicit discharges and connections to its MS4. Enforcement mechanisms are implemented on an escalating scale to enforce compliance, and follow-up inspections are conducted to ensure compliance has been achieved.

The administrative and judicial tools listed below are used as necessary to eliminate IC/IDs:

- Written warnings
- Enforcement of contracts
- Stop work notices
- Public nuisance abatement
- Denial or revocation of permits
- Civil and/or Criminal Court Actions
- Additional penalties or fines

The nature of the City's enforcement approach is determined on a case-by-case basis and is based on factors such as the severity of the violation, the threat to human or environmental health, site-specific circumstances, and past compliance history.

Code Enforcement recorded 375 cases potentially related to the requirements of the Municipal Permit. A total of 66 of these cases were related to potential IC/IDs. Table 7-6 presents a summary of the IC/ID investigations by Code Enforcement officers initiated during the 2007-2008 reporting year. The summary includes a brief description and the number of follow-ups and enforcement actions taken to achieve compliance. More detailed information on select IC/ID investigations by the Clean Water Program that were not a part of the Dry Weather Program are presented in Attachment 7-B.

Table 7-6. Summary of 07/08 IC/ID Investigations by Code Enforcement Officers

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Citations	Criminal Citation	Case Closed?
07-2851	Residential	7/5/2007	OIL RUNNING DOWN DRIVEWAY	Site Visit, unable to validate complaint. Phone call to reporting party left message	7/10/2007	7/10/2007	1	0	1	0	0	0	0	0	Yes
07-3150	Residential	7/20/2007	ILLEGAL DISCHARGE - DIRT	Site visit. Spoke with property owner about tracking dirt into roadway. Met with contractor. Issuec Admin cite 9173 to contractor for illegal discharge and cleanup of road.	7/20/2007	7/21/2007	2	0	1	0	0	0	1	0	Yes
07-3209	Residential	7/25/2007	ININTIAL ODOR; WASHING ANIMAL FECES INTO GUTTERLINE	Several site visits and phone calls with nothing observed. 7/28/08 received another phone call. 7/30/08 Sive visit: Property owner (PO) has connected dog run into sewer clean out. We had PO run water thru surface drain in rear yard observed feces and strong smell of urine flowing into street. po states was unaware that these drains were the problem and thought they had corrected the problem by eliminating the dog run from the rear yard surface drains. Informed property owner to get the drains cleared and not to use for cleaning out around aviary area. Asked PO to call when drains are cleared. PC to RP. RP states will be in contact if not resultved. No further contact.	7/25/2007	12/20/2007	2	0	10	0	0	0	0	0	Yes
07-3214	Residential	7/25/2007	WASHING MACHINE WATER OUT INTO STREET	Sent out a NOAV to the property owner regular mail.	7/26/2007	8/28/2007	1	0	1	1	0	0	0	0	Yes
07-3281	Residential	7/24/2007	CONCRETE RESIDUE WASHING INTO STREET	Some evidence of concrete residue observed in gutter line; most has dried up. Spoke to reportin party onsite; advised of status. Letter sent. Follow up found street and curb clear.	7/31/2007	8/1/2007	2	0	0	0	1	0	0	0	Yes
07-3357	Commercial	8/7/2007	ILLEGAL DISCHARGE	Site visit. No discharge from property. Advised manager of Stormwater concern	8/7/2007	8/7/2007	1	0	0	0	0	0	0	0	Yes
07-3363	Residential	8/7/2007	ILLEGAL DISCHARGE	Site visit. Observed illegal discharge in gutterline. Issued Admin Cite 9176. Follow up found the area clean.	8/7/2007	8/16/2007	2	0	0	0	0	0	1	0	Yes
07-3402	Residential	8/13/2007	THROWING DOG FECES IN DRAINAGE CHANNEL	Admin warning 11812 sent to property owner and occupant. Phone call from occupant states is a city employee and aware of Storm Water regs and is not throwing the dog feces into drainage channel. Asked if they observe any body throwing waste into channel to please call our office.	8/13/2007	8/30/2007	0	0	1	0	0	0	1	0	Yes
07-3567	Residential	8/27/2007	ILLEGAL DRAINAGE	Site Visit, spoke w / contractor. States had a concrete pump on Friday washed out in the dirt anc irrigation and rain on Sunday washed material into street and gutter. No evidence of discharge visible at time of site visit	8/27/2007	8/28/2007	1	0	1	0	0	0	0	0	Yes
07-3615	Residential	8/30/2007	ILLEGAL DUMPING	Site Visit, Photos Taken, Admin warning 9178 posted on property.	8/30/2007	8/30/2007	2	0	0	0	0	0	0	0	Yes
07-3677	Residential	9/4/2007	POWERWASHING ROOF	Received complaint from Parking Enforcement via water dept. Follow up found area clear	9/4/2007	9/5/2007	2	0	0	0	0	0	0	0	Yes
07-4171	Residential	9/25/2007	IMPROPER DISPOSAL OF OIL WASTE	Site Visit, Photos Taken, spoke to occupant with interruption from S.Soto. Informed that materia needs to be swept up and properly disposed of today or citation will be issued.	9/25/2007	9/25/2007	1	0	1	0	0	0	0	0	Yes
07-4191	Commercial	9/10/2007	WASHING MATS IN ALLEY AND PARKING LOT	Site Visit, spoke w / manager informed of complaints and storm water regulations concerning restaurants and washing of mats. Manager states will talk to BO and will call if any questions.	9/10/2007	2/4/2008	1	0	0	0	0	0	0	0	Yes
07-4484	Residential	10/13/2007	POWER WASHING TRASH ENCLOSURE INTO PARKING LOT	Site Visit, as requested by CE manager. BO had washed out dumpster enclosure into parking lot creating a health and safety concern and storm water issue. Issued Admin warning 9180 to BO. Called Sewer Collections to clean up and informed BO there may be cost recovery.	10/13/2007	10/13/2007	1	0	1	0	0	0	1	0	Yes
07-4520	Residential	10/18/2007	PRESSURE WASHING AND WATER GOING INTO STORM DRAIN	Site visit. Educated business owner about proper tail water collection. No further issues.	10/18/2007	10/18/2007	1	0	1	0	0	0	0	0	Yes
07-4792	Residential	11/6/2007	ILLICIT DISCHARGE ONTO CITY PROPERTY	Site Visit, Photos Taken, spoke w / manager showed him pictures taken on 11-2-07 by parking Enforcement. Manager states a carpet cleaner for a resident dumped the water in a drain in the landscape area. Informed manager this has happened before and if they could try to inform residents about proper disposal of this type of material. Follow up found area clear.	11/6/2007	2/4/2008	2	0	0	0	0	0	0	0	Yes
07-4800	Commercial	11/7/2007	OIL IN THE PARKING LOT	Informed reporting party oil container placed on private property is property owner responsibility t take care of or remove. Suggested the container of oil be taken to any recycle center such as Kragen or Pep Boys. reporting party states will take care of it.	11/7/2007	1/18/2007	0	0	1	0	0	0	0	0	Yes
07-4834	Industrial	11/9/2007	CHEMICALS GOING INTO STORM DRAIN	Reporting party states used to work at this business and was concerned about their practices an how they disposed of the haz mat. Site Visit spoke business owner states he knows who filed complaint because the person he had recently laid off due to unfavorable workmanship has already called the EPA, OSHA, SD County Haz Mat and has already been visited by each of these agencies. I called T.Welch from County Haz Mat to verify and was informed this site has never bee an issue for his dept. We made a courtesy Storm Water inspection and was satisfied with the condition of this property.	11/12/2007	11/13/2007	1	0	1	0	0	0	0	0	Yes
07-4850	Commercial	11/13/2007	WASH WATER DISCHARGE	Site Visit, spoke w / BO informed of complaint. States the water may be coming from sprinklers along top of slope he is trying to get vegetated. Observed water from car wash is diverted into reclaim system which is a requirement from city. BO will turn off sprinklers and see if that eliminates problem. Follow up found no water.	11/13/2007	11/20/2007	2	0	0	0	0	0	0	0	Yes
07-4993	Residential	11/28/2007	ILLEGAL DISCHARGE	SV, Observed tenant degreasing engine in driveway. Issued Admin Warning Cite 9181 anc instructed on proper way of clean up. Follow up found party in compliance.	11/28/2007	11/28/2007	2	0	1	0	0	0	1	0	Yes
07-5004	Commercial	11/29/2007	PROHIBITED DISCHARGE INTO SEWER	Hydranautics discharging into sewer. Several citations increasing in fine over several months 4/18/08 corrections were made.	11/29/2007	4/10/2008	3	1	1	0	0	0	1	2	Yes
07-5019	Residential	11/29/2007	UNLAWFUL DISCHARGE INTO STORM DRAIN	Site visit: Photo(s) taken of sidewalk and French drain outlet; evidence of white substanc observed and documented. Letter sent. Follow up found no further evidence of discharge.	11/27/2007	1/22/2008	2	0	0	0	2	0	0	0	Yes
07-5077	Commercial	12/3/2007	ILLEGAL DISCHARGE INTO HARBOR	Camp Pendleton discharge into harbor. Site visits and meetings with reps, but discharge continued. Referred to RWQCB.	12/3/2007	2/5/2008	3	0	3	0	0	0	0	0	Yes

Table 7-6. Summary of 07/08 IC/ID Investigations by Code Enforcement Officers

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Citations	Criminal Citation	Case Closed?
07-5263	Residential	12/7/2007	STORM WATER ISSUES	Site Visit, observed trench dug around property. At time of Site Visit, did not observe any sign of mud leaving property but did notice small amount of dirt in street and was unable to determine the source. Letter sent. Discussion with property owner; new BMPs were put in place.	12/7/2007	1/18/2008	2	0	4	1	0	0	0	0	Yes
07-5366	Residential	12/22/2007	STORM DRAINAGE VIOLATION	Site visit met w / property owner showed rear yard no violations. Property owner stated this issue has been looked at by engineering dept approx 11 yrs ago with the same determination.	12/22/2007	2/4/2008	2	0	1	1	0	0	0	0	Yes
07-5395	Residential	12/31/2007	WASHING MUD & SILT INTO STREET	Allege letter sent, Phone call to reporting party left message informing of action being take	2/4/2008	2/5/2008	1	0	0	1	0	0	0	0	Yes
08-0199	Residential	1/15/2008	OIL SPILL IN GUTTERLINE REACHED STORMDRAIN	Site Visit, Photos Taken, Phone call to reporting party met in front of his residence. Observed oil in gutter line all the way to storm drain. Unable to determine source. Phone call to Public Works C.Brust placed absorbent material on oil and will be swept on a regular sweep on1-16-08.	1/15/2008	1/15/2008	1	0	3	0	0	0	0	0	Yes
08-0202	Commercial	1/16/2008	DISCHARGE OF MUD ONTO CITY STREET	Phone call from M.Sabelis states his crew has cleaned up Mission Ave and requested our dep make contact with apartment management to place BMP's to prevent further erosion problems. Site Visit, spoke w manager states will have BMP's put in place and will do maintain drainage courses as needed.	1/16/2008	1/24/2008	2	0	1	0	0	0	0	0	Yes
08-0249	Commercial	1/17/2008	ILEGAL DISCHARGE & MAINTENANCE ISSUE	Received complaint from Vista Storm Water insp. Phone call to mgr requesting a time to insp and address concerns. Site Visit, met w / BO gave copies of photos, educated her on storm water reg and ways to keep her business clean and still be in compliance. Email reply to reporting party	2/11/2008	2/11/2008	1	0	1	0	0	0	0	0	Yes
08-0505	Residential	2/11/2008	CEMENT WASHOUT DISCHARGE FROM CAMP PENDLETON	Camp Pendleton discharge to North Terrace elementary school. Received copies of email regarding cement washout discharge. Case opened for tracking purposes. Referred to RWQCB. See detailed IC/ID Sheet in Appendix.	2/12/2008	2/12/2008	0	1	0	0	0	0	0	0	Yes
08-0686	CS	2/15/2008	PUMPING WATER ONTO STRAND	Call from OPD, Site Visit, Admin cite 12512 issued to job super for draining elevator shaft afte rain onto The Strand.	2/15/2008	2/15/2008	1	0	0	0	0	0	1	0	Yes
08-0759	Residential	2/19/2008	ILLEGAL DISCHARGE AND MAJOR AUTO REPAIR	Site visit. Observed illegal oil discharge to conveyance system. Issued Warning Cite 12513 to discharger. Clean up in progress. Follow up found area clean.	2/19/2008	2/20/2008	2	0	0	0	0	0	1	0	Yes
08-0788	Residential	2/20/2008	MOTOR HOME DUMPING WATER ON STREET	Site Visit, Phone call to reporting party states motor home sometimes discharges water from the bottom. While on-site observed what appeared to be water coming from motor home. After looking closer observed irrigation water from up-hill hitting front tire that is turned toward the curb making water run out into the street.	2/18/2008	2/18/2008	1	0	2	0	0	0	0	0	Yes
08-0789	Commercial	2/19/2008	OIL BEING DUMPED IN STORMDRAIN	Site Visit, spoke with BO unable to validate complaint. Email response sent to M.Lahsaie to be forwarded to RWQCB.	2/19/2008	2/19/2008	1	0	0	0	0	0	0	0	Yes
08-0825	Residential	2/25/2008	WASHING PAINT BRUSHES INTO STORMDRAIN	Site Visit, spoke with 19 y/o daughter of the po states her brother had placed a paint can in the trash can and the driver took it out and placed it on the sidewalk. Someone kicked it over and it spilled on the sidewalk and her brother tried to wash it away with water. Informed resident of how to properly dispose of paint and explained how this residual paint needs to be cleaned up. They will comply	2/25/2008	2/25/2008	2	0	1	0	0	0	0	0	Yes
08-0986	Residential	3/4/2008	OIL ON THE STREET	site visit, Notice of Violation sent w / photos, Follow up found area clear	3/4/2008	4/11/2008	1	0	0	1	0	0	0	0	Yes
08-1001	Residential	3/4/2008	DISCHARGING GREY WATER FROM WATER HEATER	Allege letter sent, Site Visit, Photos Taken, no change in condition. The issues on this property have previously been addressed. A Certificate of Non Compliance has been recorded on this property. Refer to case 07-2070.	3/19/2008	4/11/2008	1	0	0	1	1	0	0	0	Yes
08-1040	Residential	3/10/2008	WASHING MUD INTO STREET AND STORMDRAIN	Site Visit, Photos Taken, Admin warning 11842 sent to residence. Phone call from property owne states due to other problems associated with this tenant he was served with an eviction notice and will be out by the end of this month.	3/12/2008	3/12/2008	1	0	3	0	0	0	1	0	Yes
08-1065	Commercial	3/11/2008	ILLEGAL DISCHARGE AND UNPERMITTED STORAGE	Site Visit, Photos Taken, spoke to Harbor Patrol and Harbor Maintenance about on-going issues. i illegal discharge, smell associated with dumping into storm-drain, storing of traps on city property, creating a trip hazard with hoses and electric cords, blocking public access by doing business on the sidewalk, unlicensed business. No business activity at this time. Admin cites given. Dock cleaned up and no further discharge.	3/11/2008	4/9/2008	3	2	1	0	0	0	0	0	Yes
08-1310	Residential	3/18/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Site visit. Observed contractor washing plaster into rear yard drain which flows out to gutterline. Issued Admin Warning for cleanup. Follow up - gutter clean	3/18/2008	3/19/2008	2	0	0	0	0	0	1	0	Yes
08-1323	Residential	3/19/2008	OIL ON THE STREET	Vehicle is leaking oil in the street at night when parked. Made site visit. Observed some staining i front of residence. Drafted and sent via mail notice to property owner. Follow up - no further problem.	3/19/2008	3/26/2008	2	0	1	0	1	0	0	0	Yes
08-1342	Residential	3/20/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Site visit. Issued Admin Warning 9186 to acting manager for improper washing of parking lot,drive thru,and dumpster enclosure. Several follow-ups and discussion with managers; no further problems.	3/20/2008	5/20/2008	4	0	1	0	0	0	1	0	Yes
08-1343	Residential	3/20/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Site visit. Issued Admin Warning to contractor for cleanup of spilled concrete. Advised of precautions to take in the future. Follow up found no further problems.	3/20/2008	3/24/2008	2	0	1	0	0	0	1	0	Yes
08-1345	Residential	3/18/2008	ILLEGAL DISCHARGE INTO STORMDRAIN	Site visit. Issued Admin Warning to contractor for cleanup of spilled concrete. Advised o precautions to take in the future. Follow up found business complying.	3/20/2008	7/23/2008	3	0	1	0	0	0	0	0	Yes

Table 7-6. Summary of 07/08 IC/ID Investigations by Code Enforcement Officers

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Citations	Criminal Citation	Case Closed?
08-1346	Residential	3/20/2008	ILLEGAL DISCHARGE INTO STORMDRAIN	Drafted and sent notice to property owner about washing yard waste into storm drain. Follow up found no further problem.	3/24/2008	4/21/2008	1	0	2	0	1	0	0	0	Yes
08-1379	Residential	3/25/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Site visit. Issued Admin Warning site for illegal discharge and clean up. Follow up found area clean.	3/25/2008	3/26/2008	2	0	1	0	0	0	1	0	Yes
08-1471	Residential	4/1/2008	STORM WATER VIOLATION AND GRAFFITI ON THE PROPERTY	reporting party complained of smell and discharge coming from back of business. Site visit. Spoke with manager. Observed illegal discharge coming from trash dumpster area. Issued Admin Warning 9187 to MGR for illegal discharge and poor maint of rear area. Concrete apron broken and seepa is creating its own septic system. Improvements completed; no further issues.	4/1/2008	4/21/2008	3	0	2	0	0	0	1	0	Yes
08-1631	Residential	4/2/2008	ILLEGAL DISCHARGE INTO STORM DRAIN	Received report from city personnel regarding a carpet cleaning business dumping waste water int the Stormwater conveyance system. Site visit. Vehicle GOA. Used info from reporting party to locate business in Oceanside. Sent admin cite to business owner.	4/2/2008	5/7/2008	1	0	2	0	1	0	1	0	Yes
08-1632	Commercial	4/1/2008	ILLEGAL DISCHARGE INTO STORM DRAIN	Site visit. Spoke with new manager about better upkeep of trash enclosure area. She stated it woul be cleaned up to standards immediately. Site visit later in day confirmed proper maint of dumpster area. Will monitor because of past history with business.	4/1/2008	7/29/2008	2	0	0	0	0	0	0	0	Yes
08-1748	Residential	4/14/2008	OIL IN ALLEY	Site visit photo taken of two oil pans in alley. Follow up found area clear	4/14/2008	4/22/2008	2	0	0	0	0	0	0	0	Yes
08-1776	Residential	4/16/2008	SEDIMENT DISCHARGE	Site visit. Observed sediment from off road dirt track on property impacting storm water conveyanc system. Drafted and sent letter to property owner. Compliance met.	4/21/2008	8/11/2008	2	0	1	0	1	0	1	0	No
08-1837	Residential	4/22/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Observed property discharging sediment laden water. Issued Admin Warning 9188 to Contracto cleaning out a stagnant swimming pool. Will return to check on proper cleanup of discharge. Follow up found property in compliance.	4/22/2008	4/24/2008	2	0	0	0	0	0	1	0	Yes
08-1878	Commercial	4/23/2008	ILLEGAL DISCHARGE	Site visit. Spoke with Maint about issue. Someone has been dumping paint and other construction materials into the dumpster on a regular basis. Maint is going to keep an eye out. Will monitor.	4/23/2008	5/6/2008	2	0	1	0	0	0	0	0	Yes
08-2030	Commercial	5/5/2008	POWERWASHING GREASE GRATE	Site visit. Spoke with Manager about proper cleaning techniques. Manager stated that he will tell hi manager of the situation and call back. Follow up found all employees properly trained.	5/5/2008	7/23/2008	2	0	1	0	0	0	0	0	Yes
08-2201	Commercial	5/8/2008	OIL, TRASH IN STORMDRAIN HASN T MET PROPERLY PLACED/ STORED	Site Visit, met w / BO walked site pointed out areas of concern. BO states will have issues addressed within a couple weeks. PC from BO asking for extension. BO planning complete remodel which will address issues. Plans in the works. Extension granted.	5/8/2008	6/4/2008	1	0	1	0	0	0	0	0	Yes
08-2220	Commercial	5/9/2008	ILLEGAL DISCHARGE INTO STORMWATER CONVEYANCE SYSTEM	Site visit. Observed overflowing grease trap because of block in lateral line. City vactor truck an crew on site monitoring spill. Spoke with regional manager about getting a pump truck and a plumber to rectify situation. Issued Admin Warning cite 9189 to acting manager on scene for discharge and cleanup. Several Follow up visits; now in compliance.	5/9/2008	5/20/2008	5	0	3	0	0	0	1	0	Yes
08-2269	Commercial	5/14/2008	ILLEGAL DISCHARGE	Site visit. Observed soapy water discharge from property. Spoke with general manager. Vehicles i rear of business being washed. Issued Admin Cite 9190 to business. Explained alternative methods of BMP usage. Business in compliance on Follow up.	5/14/2008	7/15/2008	4	0	1	0	0	0	1	0	Yes
08-2286	Industrial	5/15/2008	DISPOSING OF SPOILED LIQUIDS IN DUMPSTER	Site Visit, met with P.Yosuico and BO discussed different ways of disposing of spent material. BO will be contacting waste management to get green waste totes.	5/14/2008	5/15/2008	1	0	0	0	0	0	0	0	Yes
08-2364	Residential	5/22/2008	POWER WASHING STREET INTO L A C	Site Visit, Photos Taken, Admin warning 12517 issued to po. Stopped washing street while on-site. Informed po either hire a street sweeper or clean up by other means of dry sweep.	5/22/2008	5/22/2008	1	0	0	0	0	0	1	0	Yes
08-2365	Residential	5/22/2008	WATER RUNNING INTO STORMDRAIN	Site Visit, this area has a sump pump at the top of the hill towards Skyhaven at the retiremen community that keeps this water flowing continuously into the Right of Way. PC to RP to explain situation. RP appreciated info.	5/22/2008	5/26/2008	1	0	1	0	0	0	0	0	Yes
08-2479	Residential	6/4/2008	ILLEGAL STORMWATER DISCHARGE	Observed MA power washing roof of dwelling on the property; residue was observed to be runnin into gutter and street, and flowing west towards Elm Tree Dr. storm drain. Admin warning for discharge and expired business license. Discharge cleaned. Follow up on business license - no action; two admin cites. Compliance was achieved.	6/4/2008	7/29/2008	3	0	2	0	0	0	2	2	Yes
08-2495	Residential	6/6/2008	CEMENT DEBRIS, WASHING PAINT BRUSHES DOWN DRAIN	Site Visit, observed brick and sand stored in Right of Way to be placed in driveway. Informed worker this is normally not permitted but because it was to be placed in driveway and it is not a busy or thru street to hurry and get material placed and clean up all residual dirt in street and gutter line. Follow up - area clean.	6/6/2008	6/10/2008	2	0	0	0	0	0	0	0	Yes
08-2511	Residential	6/9/2008	DUMPING MOTOR OIL IN WATER MOTOR BOX EXCESSIVE OIL	Site visit, Notice of Violation sent w / photos.	6/5/2008	8/20/2008	1	0	0	1	0	0	0	0	No
08-2638	Residential	6/11/2008	HAZARDOUS WASTE	Phone call from Chip (public Works). Observed containers of spent oil and e waste along parkwa in front of residence. Issued Warning cite 9191 to property owner for proper disposal. Follow up showed compliance.	6/11/2008	6/12/2008	2	0	1	0	0	0	1	0	Yes
08-2705	CS	6/18/2008	ILLEGAL DISCHARGE INTO HARBOR	Camp Pendleton discharging mud. Referred to RWQCB. Went on base and noticed two workers ir a storm drain inlet installing filter systems. They had removed the BMP's that was holding back the residual mud creating the discharge. Hunt Corp. job superintendent stating the workers had mistakenly removed the BMP's in the inlets and has since replaced them to prevent any further discharge. They will be using a vactor to remove any sediment before removing BMP's	6/13/2008	6/16/2008	1	0	5	0	0	0	0	0	Yes

7.6 Illicit Discharge, Detection, and Elimination Component Effectiveness Assessment

Effectiveness assessment is an important component of the JURMP because it can assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The San Diego County Copermittees developed two guidance documents to assist in the assessment of the JURMP components as well as the jurisdictions overall JURMP program. These two documents are titled *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* and the *Baseline Long-term Effectiveness Assessment* (BLTEA). The City participated in regional efforts to develop these documents in anticipation of the requirement to assess their JURMP programs.

The effectiveness assessment approach developed by the Copermittees during the 2005-06 permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below:

- Level 1: Compliance with Activity-Based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

The establishment of measurable outcomes is necessary for both incremental program component improvements and as a basis for future establishment of relationships between implementation and water quality improvement outcomes.

This section discusses the effectiveness assessment of the IDDE components of the JURMP. Overall program effectiveness assessment is discussed in Section 11 of the 2007-2008 City of Oceanside JURMP Annual Report submitted September 30, 2008.

A large effort of the IDDE element is the City's Dry Weather Monitoring Program. The City revised the historical program to meet the 2007 Municipal Permit requirements and implemented the new program between May 1 and September 30, 2008. Table 7-7 provides a summary of the Level 1 activity-based compliance assessment of the program. This was the first year the City used a replacement program for dry or inaccessible sites. While there were 67 sites on the primary site list, fourteen were either dry or inaccessible. An additional 18 sites were visited to find ponded or flowing water. Although staff thought that all dry sites were replaced, the City fell one site short of the original number of sites, resulting in a 99% completion rate. This will be addressed in the next monitoring year. The City continued laboratory sampling at more sites than required which resulted in a 112% completion rate. All initial site exceedances of action levels were confirmed within two business days and all sites, even those without ponded or flowing water, that were accessible were assessed for trash extent and amount.

Table 7-7. Dry Weather Monitoring Component - Level 1: Compliance with Activity-Based Requirements.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
IDDE D.4	Site Visits	Primary Dry Weather Sites Listed	Primary & Alternate Dry Weather Sites Visited	Actual/Target	Percent ( ) Completion
		67	85	85/67	127
	Field Screening	Primary Dry Weather Sites Listed	Number of Sites Screened with Flowing/Ponded Water	Actual/Target	Percent ( ) Completion
		67	66	66/67	99
	Laboratory Analysis	Number of Sites Required for Lab Analysis	Number of Sites Sampled for Lab Analysis	Actual/Target	Percent ( ) Completion
		17	19	19/17	112
	Follow-Ups (Within Two Business Days)	Number of Sites Requiring Confirmation	Number of Site Follow-up within Two Business Days	Actual/Target	Percent ( ) Completion
		33	33	33/33	100
	Trash Assessment	Number of Dry Weather Sites Accessible	Number of Trash Assessments Conducted	Actual/Target	Percent ( ) Completion
		81	81	81/81	100

The City's Dry Weather Monitoring program was first implemented in 2002. Although the program has evolved and the number of sites and location of sites has varied, some assessment of discharge water quality can be made (Level 5 assessments). Figure 7-3 provides a summary of the percent of action level exceedances for select field screening parameters from 2002 through 2008. Nitrate action level exceedances have remained the same. Orthophosphate exceedances vary and do not show any trends, but have stayed under 25% since 2002. Ammonia exceedances for 2002, 2003, and 2004 occurred in over 80% of the sites. The 2005 Dry Weather Report indicates that these exceedances were likely due to false positives with the method being used. The methods were changed in 2005 and ammonia exceedances were increasing slightly until the 2008 monitoring year. In the 2008 dry weather season, ammonia exceedances were below 2006 levels.

Figure 7-4 provides a summary of the microbiology results from 2002 through 2008. Bacterial exceedances have been on a decreasing trend since 2005. Total coliform exceedances have fallen from 100% of the samples, to 37% of the samples analyzed. Fecal coliform exceedances comprised just over 20% of the samples in 2005, 2006, and 2007, and fell to 11% in 2008. Enterococcus results have remained stable at 11% over the last three years.

In 2004, nitrate was not analyzed in field screening samples. In 2002, the results for nitrate were likely reported as Nitrate (NO_3) as opposed to Nitrate as N (NO_3-N). Not converting the results to the appropriate action level format creates a larger number of exceedances, than should be. Reporting years 2003 through 2006 were corrected, but documentation was not available to definitively clain that this was the case for 2002. Therefore, the results were omitted from this assessment.

Figure 7-3. Dry Weather Monitoring – Level 5: Changes in Discharge Quality. Summary of Field Screening Action Level Exceedances from 2002 - 2008.

Figure 7-4. Dry Weather Monitoring – Level 5: Changes in Discharge Quality. Summary of Bacteriological Action Level Exceedances from 2002 - 2008.

7.7 Program Review and Modification

Two recommendations for the IDDE component of the Municipal Permit are suggested. As discussed in Section 15 of the JURMP Annual Report, a database tracking system has been recommended and is being researched to better track the inter-departmental effort to gather data related to the requirements of the 2007 Municipal Permit. Specific to the IDDE Component, the Clean Water Program is working with the Engineering Department and Public Works to update the MS4 map utilizing GIS technology.

7.7.1 Database Tracking System for various departments and divisions

Public reporting of potential IDDEs, in addition to staff investigations across the Water Department, Public Works, and Code Enforcement require detailed information from across departmental boundaries and, therefore, across various data collection systems within the City. As part of the March 2008 Integrated Water Utilities Master Plan, the Information Technology component provided several key strategies which will focus on integrating reporting requirements and, therefore, collection systems across businesses and operations. As the Urban Runoff Hotline is utilized more, the Clean Water Program will be integrating information from Hotline calls into the main Water Utilities database. This will ensure complaints and inquires are tracked as they are distributed through Water and Sewer Maintenance Divisions, Code Enforcement Division and the Clean Water Program and will more easily gather and provide detailed information for reporting purposes.

As land use development continues in the City, challenges associated with data management, such as tracking of post-construction BMPs, maintenances agreements, and associated documents, as emerged. It is important to update available tools with up-to-date information. This will be an issue to address during the next reporting period. The Clean Water Program will also be working with other City departments to ensure that the details of inspections, complaints, and follow-ups will be tracked appropriately to be included in future annual reports.

7.7.2 Maintenance of MS4 Maps using GIS Technology

To address MS4 inaccuracies and update the GIS layer of the MS4 map in the future, the City began researching hand-held GIS data collection units to be used collaboratively between Public Works, Engineering, and the Water Utilities Departments. Between June and August of 2008, the City purchased two Trimble GeoXH units. One of the many uses of these units is to verify the accuracy of the MS4 map and relay the information gathered in the field to the Engineering Department to update the GIS layer. During FY 08/09, the City will be creating the data dictionary needed to collect consistent and necessary data for the storm drain system update and will roll out the field effort in the Spring and Summer of 2009.

1 INTRODUCTION

1.1 Program Summary

In February 2001, the San Diego Regional Water Quality Control Board issued Order No. 2001-01 to the communities of San Diego County. As part of Order 2001-01, the City of Oceanside was required to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. The purpose of the program was to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. Information collected from dry weather monitoring is used to characterize dry weather discharges in the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations are conducted as necessary to detect and eliminate the sources of these pollutants.

In 2007 the San Diego Regional Water Quality Control Board issued a new five-year permit for Receiving Waters and Urban Runoff Monitoring and Reporting, Order No. 2007-0001. The Copermittees in San Diego County are required, as part of their Jurisdictional Urban Runoff Management Program (JURMP), to update their Dry Weather Program to meet or exceed the requirements of Order No. 2007-0001. The City of Oceanside's Dry Weather Program was reviewed and updated and the details of the new program are included in the City of Oceanside 2007 JURMP Update.

This report presents the results of the City of Oceanside's 2008 Dry Weather Field Screening and Analytical Monitoring Program which includes the revisions to the program required by Order No. 2007-0001. The key changes to the new Municipal Permit were adding a trash assessment component and requiring follow-up investigations to be conducted within two business days of receipt of results. Details of the program are presented in Section 3.

1.2 City of Oceanside Drainage Summary

The City of Oceanside lies on the northern coast of San Diego County, 35 miles north of the City of San Diego and 83 miles south of the City of Los Angeles. The City is bounded to the west by the Pacific Ocean, the north by Camp Pendleton Marine Corps Base, the east by unincorporated areas of the County of San Diego and the City of Vista, and the south by the City of Carlsbad. The City covers approximately 42 square miles with a population of just over 173,000 people. California's main highway, Interstate 5, runs through the City, as does Highway 78, which provides southeast access to Interstate 15. Highway 76, which runs northeast, also provides access to Interstate 15.

The City's boundaries include two major watersheds; the San Luis Rey Watershed, which includes the San Luis Rey River and the Carlsbad Hydrologic Unit, which includes Loma Alta Creek, Buena Vista Creek, and Agua Hedionda Creek.

1.2.1 San Luis Rey Watershed

1.2.1.1 San Luis Rey River

The San Luis Rey Watershed is the northernmost watershed within the City of Oceanside. It is approximately 558 square miles and extends inland to encompass a large portion of the northern unincorporated areas of the County of San Diego. The San Luis Rey River is the primary watercourse of the watershed and discharges to the Pacific Ocean near the northern border of the City of Oceanside. While the San Luis Rey Watershed is the largest hydrologic unit in the San Diego region, 92.5% of the watershed lies within the unincorporated part of the County, and not within the City of Oceanside. However, a wide floodplain is prominent through the City, including levees on either side of the river to protect the surrounding developments, adjacent to or within the historical floodplain, from future storm events. In 2007, the Pacific Street Bridge Project broke ground to restore the river mouth to its natural open state by creating a bridge over the river and removing the "Arizona crossing," a land berm and large culvert intended to wash out during large storm events. The new bridge was completed and opened in September of 2008 and the hardscape of the Arizona crossing was removed at the end of October 2008.

The one named tributary within the City's boundaries is Pilgrim Creek, which drains a relatively undeveloped portion of the City with some residential areas and a municipal golf course in addition to an undeveloped area of Camp Pendleton. The remaining drainage areas within the City include areas of agricultural, residential, and some industrial land uses.

1.2.2 Carlsbad Watershed

1.2.2.1 Loma Alta Creek

Loma Alta Creek is the northernmost watershed in the Carlsbad Hydrologic Unit. It flows alongside Oceanside Boulevard, beginning as a rising spring just west of Melrose Drive in the City of Vista and ending at Buccaneer Beach Park where it enters the Pacific Ocean. Approximately five percent of the Loma Alta Creek Watershed is in the City of Vista, and the remaining portion is entirely in the City of Oceanside. Loma Alta Creek is over seven miles long and encompasses nearly 6,300 acres of land, 70 percent of which is developed. Almost 90% of the land within the watershed is privately owned.

Several tributaries drain into Loma Alta Creek, however, the only named tributary is Garrison Creek, located along Garrison Street west of El Camino Real. Much of the creek has been modified throughout the years, with the use of fully or partially concrete-lined channels to stabilize the creek-bed slopes. Loma Alta winds through a highly industrial area towards the western portion of the creek. Other land uses include residential and commercial uses.

1.2.2.2 Buena Vista Creek

The Buena Vista Watershed extends approximately 10.6 miles inland from the coast, totaling 14,437 acres and draining 21 square miles. The Watershed begins on the western slopes of the San Marcos Mountains, flows through areas of the County of San Diego and the Cities of Vista, Carlsbad, and Oceanside, turns into a lagoon and then ends at the

Pacific Ocean. A weir was built in 1940 to stop tidal flow at the mouth and the lagoon now functions as a freshwater lagoon.

In the City of Oceanside, Buena Vista Creek parallels Highway 78. The lagoon is located south of Highway 78 and west of Jefferson Street. The upper and western basins of the Buena Vista Watershed are primarily in the City of Vista, the southeastern portions are primarily in the San Diego County jurisdiction, and the lower basin is straddled between the Cities of Carlsbad and Oceanside as the Creek weaves its way between the two cities. Approximately 80% of the Buena Vista Watershed is developed, primarily with commercial and residential land uses. Some agricultural activities also exist in the watershed. Because of the intense development in the watershed, large sections of Buena Vista Creek have been concrete-channelized to reduce the chance of flooding private property.

1.2.2.3 Agua Hedionda Creek

A small portion of the City of Oceanside lies within the watershed of a tributary of Agua Hedionda Creek, called Calavera Creek. Beginning in an undeveloped portion of land just west of Highway 78, Calavera Creek's headwaters start in Vista, proceed through a pocket of San Diego County unincorporated area, head into Oceanside, and then eventually drain to Lake Calavera. Lake Calavera was created by the building of a dam in the 1940s. While the creekbed downstream of the lake is typically dry, the creek reforms in wet weather to wind its way through Carlsbad and joins the major artery of Agua Hedionda Creek. Near the Pacific Ocean, Agua Hedionda Creek opens up into a lagoon. The entire Calavera Creek Basin is approximately 3,770 acres. The primary land use in the portion of the Agua Hedionda Watershed that lies within the City of Oceanside's boundaries is residential.

2 SAMPLING LOCATIONS

2.1 Site Selection

City monitoring staff worked with a consultant experienced in dry weather monitoring to update the City's Dry Weather Monitoring Program site locations during the 2008 JURMP Update process. This process involved preparing maps integrating the City's drainage system, watersheds, major water bodies, current dry weather monitoring locations, and land use. The sites were referenced against major drainage lines to see if any major lines were not being sampled, if any existing sites captured only very small drainage areas, or if any existing sites were redundant in that two or more neighboring sites provided data about essentially the same area. Historical data was also evaluated to determine which sites had routinely been dry in recent years and monitoring staff identified sites that had been found to be inaccessible. During this process it was determined that approximately 40 percent of the City's existing sites were routinely dry, were inaccessible, and/or assessed only very small drainage areas. Assessment of existing sites and prepared maps also found that the existing sites missed larger drainage areas or did not capture some of the recently developed areas. A list of potential new sites was drafted based on the following criteria:

- The site was downstream of any sources of suspected illicit discharge or illicit activity.
- The location took into account hydrological conditions, total drainage area, traffic density, age of the structures or buildings, history, and land use types.
- The site was located at the farthest downstream manhole or other accessible location in the drainage area being assessed.

A primary and an alternate site list were created after verification of accessibility was assessed. As a result of this process, a number of inaccessible or dry sites were removed, several sites with small drainage areas were redesignated as alternate sites, and several new sites were selected. The City's revised program now provides a more thorough, overall coverage of its MS4 while more efficiently allocating resources to sites that provide useful data. For a detailed list of site changes see the 2008 JURMP Update.

The updated list of 67 primary monitoring stations, their locations, land uses, and drainage areas is presented in Table 1. Alternate dry weather monitoring stations have been selected and are listed in Table 2. These stations are used as replacements for primary stations where no flowing or ponded water is observed. A map of the MS4 with primary and alternate sampling station locations is included as Figure 1.

2.2 Site Descriptions

Site visits were conducted at 67 of the primary monitoring stations. Five of the primary stations were inaccessible and nine were dry, so an additional 18 alternate stations were visited in search of flowing or ponded water within the City in 2008. This section includes a detailed description of each monitoring station.

The site identification numbers are not arranged by location (for example, from east to west) because over the course of the Dry Weather Program, sites have been eliminated

and added to best represent the City's MS4. The site identification numbers do either start with an A, B, L, or S which corresponds with the Agua Hedionda Creek (A), Buena Vista Creek (B), Loma Alta Creek (L), or the San Luis Rey River (S). For example, Site S112 would have been sampled from San Luis Rey River at location 112. The site locations are shown in Figure 1 and described below. The site identification numbers, descriptions, GPS coordinates, and conveyance structure types of the primary stations are listed in Table 1 and of the alternate stations in Table 2. Photos of each site visited are included as Appendix A.

Figure 1. 2008 City of Oceanside Dry Weather Monitoring Stations.

2.2.1 Agua Hedionda Site Descriptions

A002
Site A002 is a 74-inch RCP located at the end of Cannon Road. The outlet drains the residential areas along Cannon Road. Access to the site is from Cannon Road. Field screening and laboratory samples were collected from the flowing water.

A004a
Site A004a is a 48-inch RCP located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The outlet drains the residential areas south and east of the outlet. Access to the site is from Cannon Road to the pump station access road. Field screening and laboratory samples were collected from the flowing water.

A004b
Site A004b is a brow ditch located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The concrete drainage ditch drains the irrigated areas on the slope behind the residences on Spinnaker Ridge. Access to the site is via Cannon Road to the pump station access road. Field screening and laboratory samples were collected from the flowing water.

A013
Site A013 is a 36-inch RCP located at the intersection of Lake Boulevard and Alameda Drive, south of Agua Hedionda Creek. The outlet drains the residential areas south of the site. Access to the site is from Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A014
Site A014 is a 36-inch RCP located east of the intersection of Lake Boulevard and Alameda Drive, north of Agua Hedionda Creek. The outlet drains the school and residential areas north of Lake Boulevard. Access to the site is from Lake Boulevard. Field screening samples were collected from the flowing water.

A015
Site A015 is a 48-inch RCP located south of Lake Boulevard and south of the creek. The outlet drains the residential areas south and east along Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A016
Site A016 is a 36-inch RCP located southeast of the intersection of Amigos Court and Serena Lane, south of Lake Boulevard. The outlet drains the residential areas north across Lake Boulevard. Access to the site is through open space off of Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A019
Site A019 is a 36-RCP located in Oak Riparian Park off of Lake Boulevard, north of Agua Hedionda Creek. The outlet drains the residential and park areas north and south of

Lake Boulevard. Access to the site is from the parking lot off of Lake Boulevard. Field screening samples were collected from the ponded water.

A021
Site A021 is a 36-inch RCP located off of Sky Haven Lane, north of Agua Hedionda Creek. The outlet drains the residential areas to the north of the outfall. Access to the site is from a residential driveway and down a steep embankment in the middle of a densely vegetated area. Due to overgrowth of vegetation on the hill, the site was deemed too dangerous to access. It was replaced by A022.

A022
Site A022 is an alternate site. It is a concrete box outlet located at the southwest corner of Lake Boulevard and Southridge Road, north of Agua Hedionda Creek. The outlet drains the residential areas to the north of the outfall. Access to the site is from Southridge Road. Field screening samples were collected from the ponded water.

2.2.2 Buena Vista Creek Site Descriptions

B002
Site B002 is a 72-inch RCP located on Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial and residential areas north of SR-78. Access to the site is via Lagoon View Drive. Field screening and laboratory samples were collected from the ponded water.

B022
Site B022 is a 48-inch RCP constructed in the north side of the Buena Vista Creek channel wall, east of the Thunder Drive Bridge. The outlet drains the residential area north of Buena Vista Creek. Access to the site is from within the Buena Vista Creek channel. Field screening and laboratory samples were collected from the flowing water.

B023
Site B023 is a 36-inch RCP located west of 3524 Lake Boulevard south of Buena Vista Creek. The outlet drains the residential areas southeast of Lake Boulevard. Access to the site is from Lake Boulevard. Field screening samples were collected from the ponded water.

B024
Site B024 is a 36-inch RCP located on the southwest corner of College Boulevard Bridge on the south side of Buena Vista Creek. The outlet drains the residential areas east and west of College Boulevard south of the creek. Access to the site is from College Boulevard. Field screening samples were collected from the ponded water.

B026
Site B026 is a 48-inch RCP located south of the Tri-City Crossroads Plaza off of Plaza Drive on the north of Buena Vista Creek. The outlet drains the commercial areas around Plaza Drive. Access to the site is from Tri-City Crossroads Plaza or the open lot to the east of the plaza. Field screening samples were collected from the flowing water.

B027
Site B027 is located off of Haymar Drive at South Coast Material yard north of Buena Vista Creek. The outlet drains the residential and commercial areas north of SR-78. Access to the site is from Haymar Drive. Access to the site that was sampled in previous years was overgrown and near a dangerous bank. The sampling site was moved 50 yards downstream this year due to vegetation overgrowth on the steep bank accessing the sampling point. No additional inputs between the two sites were apparent. Field screening samples were collected from the flowing water.

B030
Site B030 is an alternate site. It is a 36-inch RCP located within a sewer easement south of SR-78, west of AAA and north of Buena Vista Creek. The outlet drains the residential areas north of SR-78. Access to the site is from the sewer easement road. Field screening samples were collected from the flowing water.

B031
Site B031 includes four 54-inch RCPs located between Haymar Drive and SR-78, across from Camino Real County Club, and north of Buena Vista Creek. The western-most outfall is sampled. This outlet drains the golf course, commercial, and residential areas north of SR-78. Access to the site is via Haymar Drive. Field screening samples were collected from the flowing water.

B032
Site B032 includes two 60-inch RCPs located between Haymar Drive and SR-78, across from Carlsbad Plaza, north of Buena Vista Creek. Both pipes are from the same source. The outlet drains the golf course and commercial areas north of SR-78. Access to the site is from Haymar Drive. Field screening samples were collected from the flowing water.

B033
Site B033 is a 42-inch RCP located north of SR-78 behind the Black Angus restaurant, north of Buena Vista Creek. The outlet drains the commercial areas north of SR-78 into a large catch basin with ponded water. The outfall that was sampled is the largest input to the basin. Access to the site is from SR-78. Field screening samples were collected from the flowing water.

B034
Site B034 is a 36-inch RCP located north of SR-78 behind Burger King at the Jefferson Street exit. The outlet drains the commercial areas north of SR-78. Access to the site is from SR-78. Overgrown vegetation and a steep slope made this site inaccessible this year.

B102
Site B102 is a 36-inch CMP located within a sewer easement south of SR-78 and north of Buena Vista Creek. The outlet drains the residential and commercial areas north of SR-78. Access to the site is from the sewer easement road. The sewer road was slightly

overgrown and the surrounding areas were very overgrown. The storm drain could not be found in the vegetation and the trail previously used was inaccessible.

B103
Site B103 is located at the end of Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial areas north of SR-78. Access to the site is via Lagoon View Drive. Field screening samples were collected from the ponded water.

B104
Site B104 is a manhole on the southeast corner of South Coast Highway and Eaton Street. The outlet drains the commercial and residential areas on the east side of South Coast Highway. This site replaced B001 by moving it upstream approximately 230 yards out of tidal influence. Access to the site is from South Coast Highway. Field screening samples were collected from the ponded water.

B105
Site B105 is a large manhole capped with an open grate on the El Camino Golf Course and the end of Nicklaus Way. The storm drain carries flows from the large residential area to the north east of the site and the golf course. Access to the site is from Nicklaus Way. Field screening samples were collected from the flowing water.

B106
Site B106 is a 72 inch RCP outlet just north of Buena Vista Creek off of College Boulevard. The storm drain system begins just under a mile upstream and drains a large commercial and residential area north of Buena Vista Creek along College. Access to the site is from Nicklaus Way. Field screening samples were collected from the flowing water.

2.2.3 Loma Alta Creek Site Descriptions

L001
Site L001 is a 48-inch RCP located at the intersection of North Avenue and Vista Pacific Drive, north of Loma Alta Creek. The outlet drains the industrial areas south of North Avenue. Access to the site is via North Avenue. Field screening samples and analytical lab samples were collected from the flowing water.

L002
Site L002 is a 66-inch RCP located northwest of the intersection of North Avenue and Vista Pacific Drive, north of Loma Alta Creek. The outlet drains the industrial areas east of the outlet. Access to the site is from a walking path off of North Avenue. Field screening samples were collected from the flowing water.

L003
Site L003 is a 48-inch RCP located off of North Avenue and east of Autumn Drive, south of Loma Alta Creek. The outlet drains the residential area southeast of North Avenue. Access to the site is via North Avenue. Field screening samples were collected from the flowing water.

L007
Site L007 is an alternate site. It is a 48-inch RCP located north of North Avenue west of Seasons Road, south of Loma Alta Creek. The outlet drains the residential areas on the hillside south of North Avenue. The outlet is partially submerged with ponded water. Access to the site is from North Avenue. Field screening samples were collected from the ponded water.

L008
Site L008 is an alternate site. It is a 40-inch RCP located on the corner of Westridge Drive and Quailridge Drive, north of Loma Alta Creek. The outlet drains the residential areas on the hillside north of Oceanside Boulevard. Access to the site is from Westridge Drive. Field screening samples were collected from the ponded water.

L009
Site L009 is under College Boulevard at the Loma Alta Creek crossing. Three box culverts are present and drain the residential and commercial areas east of College Boulevard. Access to the site is via College Boulevard. Field screening samples and analytical lab samples were collected from the flowing water.

L010
Site L010 are two 36-inch RCP located west of College Boulevard near the railroad tracks. The outlet drains the residential areas on the hillside south of Loma Alta Creek adjacent to College Boulevard. Access to the site is from College Boulevard. Field screening samples were collected from the flowing water.

L013
Site L013 is a manhole located south of the shopping center on the corner of Oceanside Boulevard and College Boulevard, north of Loma Alta Creek. The outlet is no longer accessible due to overgrown vegetation, but the manhole upstream of the outlet is now sampled. Access to the site is from parking lot behind ReMax. Field screening samples were collected from the flowing water.

L019
Site L019 is a 48-inch RCP, located south of the intersection of Corporate Centre Drive and Oceanside Boulevard, north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. Field screening and analytical samples were collected from the ponded water.

L020
Site L020 is a 36-inch RCP located east of the intersection of Corporate Centre and Oceanside Boulevard, north of Loma Alta Creek. The outlet drains the commercial areas located north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. Field screening samples were collected from the flowing water.

L024
Site L024 is a 36-inch RCP located south of Oceanside Boulevard at the west end of the Evergreen Nursery. The outlet drains the commercial and open space area located north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. This site was overgrown with cattails and the outfall was inaccessible.

L027
Site L027 has historically been sampled at the intersection of Garrison Street and Industry Way, north of Loma Alta Creek, where Garrison Creek flows in a concrete channel. That location was not accessible and L027 was sampled upstream of the intersection of Garrison Street and Oceanside Boulevard where the creek is flows through a box culvert to an earthen channel. The channel drains the residential and commercial areas located northeast of Oceanside Boulevard. Access to the site is from Garrison Street. Field screening and laboratory samples were collected from the flowing water.

L032
Site L032 is a 64-inch RCP located south of the intersection of Camelot Drive and Industry Way, north of Loma Alta Creek. The outlet drains the industrial and commercial area north of Industry Way. Access to the site is through a private business from Industry Way and was blocked and inaccessible in 2007. Access was available during the 2008 dry weather season, but the outlet was dry and therefore, no field screening samples were collected.

L034
Site L034 is an alternate site. It is a 24-inch RCP located between Waste Management and a self storage lot south of Oceanside Boulevard. Field screening samples were collected from the ponded water.

L036
Site L036 is located adjacent to the intersection of Skylark Drive and Downs Street, south of the Loma Alta Creek. The outlet is now in the Sprinter rail right of way, so the manhole upstream of the outlet was visited. The outlet drains the residential area north of Loma Alta Creek. Access to the site is via Skylark Drive. There was not enough ponded water to conduct field screening.

L037
Site L037 is an alternate site. It is an earthen channel south of Loma Alta Creek. The channel drains the commercial area south of Loma Alta Creek. The site is at the east end of South Oceanside Boulevard. Dry weather flows were not observed at this site.

L040
Site L40 is an open concrete trapezoidal channel north of Loma Alta Creek. The outlet drains the commercial and residential areas located adjacent and to the north of Oceanside Boulevard. Access to the site is through the Vons parking lot off of Oceanside Boulevard. Field screening and laboratory samples were collected from the channel.

L046
Site L046 is a 24-inch RCP constructed in the north wall of the Loma Alta Creek channel just east of the Coast Highway Bridge. This outfall conveys flow from commercial and residential area north of Loma Alta Creek. Access to the site is from Coast Highway. Field screening samples were collected from the ponded water.

L050
Site L050 is a 24-inch RCP constructed in the north wall of the Loma Alta Creek channel. The outlet drains the Casitas Trailer Park located north of the Loma Alta Creek. Access to the site requires going into Loma Alta Creek channel. Dry weather flows were not observed at this site.

L052
Site L052 is a 36-inch RCP located just west of the I-5 overpass on the south side of Loma Alta. The outlet drains Cavalier Trailer Park. Access to the site requires going into Loma Alta Creek channel. Dry weather flows were not observed at this site.

L054
Site L054 is a 24-inch RCP constructed in the south wall of Loma Alta Creek. The outlet is located southwest of the intersection of Hillside and Evergreen Lane. Site L054 drains the trailer park, Marshall Park, and the residential area to the south. Access to the site requires entering the Loma Alta Creek channel. Field screening and laboratory samples were collected from the channel.

L103
Site L103 is a 72-inch RCP located west of Corporate Centre, north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Boulevard off of Corporate Centre. Access to the site is from Corporate Centre. Field screening samples were collected from the flowing water.

L105
Site L105 is a manhole located on Industry Way, north of Loma Alta Creek. The outlet within the manhole drains the residential and commercial area located north of Industry Way. Access to the site is from Industry Way. Dry weather flows were not observed at this site.

L107
Site L107 has historically been a 36-inch RCP outlet located on the north side of Loma Alta Creek near the intersection of Crouch Street and Oceanside Boulevard. Due to Sprinter rail construction and other changes to the channel walls, the site was moved upstream to a manhole at the corner of Crouch and Oceanside Boulevard. The storm system drains the commercial and residential areas located north of Oceanside Boulevard. Ponded water was observed however there was insufficient volume to conduct field screening.

L108
Site L108 is a concrete channel that flows into Loma Alta Creek west of Interstate 5 from the north. This site replaced L050 because it is in the same general area, but has a larger watershed and has continuous flow. Access to the site is from Loma Alta Creek through Cavalier Trailer Park. Field screening samples were collected from the flowing water.

L109
Site L109 is a 24-inch RCP constructed in the south wall of the Loma Alta Creek channel. The outlet drains the trailer park and the residential area south of Loma Alta surrounding La Salina Street. Access to the site requires going into Loma Alta Creek channel. The outfall was wet and ponded water was observed however there was insufficient volume to conduct field screening.

L110
Site L110 is an outlet from Garrison Creek at Mesa Boulevard and Parsley. Access to the site is from Mesa Boulevard through a locked fence at an open field. Field screening samples were collected from the ponded water.

L111
Site L111 was added during the 2008 Dry Weather Monitoring season. This area is undergoing commercial and light industrial growth and was added to the alternate list to capture these land uses. The outlet is northeast of the intersection of Rancho del Oro and Oceanside Boulevard. Access is from Seagate Drive. Field screening samples were collected from the ponded water.

L114
Site L114 was added during the 2008 Dry Weather Monitoring season. This outfall is located under the Pacific Coast Highway Bridge on the northwest side. The drainage area has not been identified, but it is likely from the areas north along the Coast Highway. Access to the site requires going into Loma Alta Creek channel. Field screening samples were collected from the flowing water.

2.2.4 San Luis Rey Site Descriptions

S006
Site S006 is a 36-inch corrugated metal pipe (CMP) located under Interstate 5. Access to Site S006 is from Carmelo Drive. Site S006 conveys flows from the residential area south of Camp Pendleton and east of Interstate 5 to the north side of the trail under I-5. Field screening samples and analytical lab samples were collected from the flowing water.

S025
Site S025 is an alternate site. It is located on the north side of the San Luis Rey River on West Airport Road across from a junkyard. S025 is a 24-inch RCP in a headwall that drains the junkyard located just north of the outlet. No dry weather flows were observed.

S032
Site S032 is a 36-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River. The S032 outlet conveys flows from the residential, commercial, and open space areas located on the south side of SR-76. Access to the site is from Foussat Road to the access road that runs parallel to the River on the south side. Field screening samples were collected from the ponded water.

S035
Site S035 is located on the south side of the San Luis Rey River. Site S035 is a 42-inch RCP with a flap gate installed. Access to the site is from Douglas Drive to the access road south of the San Luis Rey River. Dry weather flows were not observed at this site.

S043
Site S043 is a 30-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River under the College Boulevard Bridge. The site collects dry weather flows from the residential area immediately south of the outlet. Access to the site is via College Boulevard to the access road on the south side of the River. No dry weather flows were observed.

S044
Site S044 is an open channel located on the south side of the San Luis Rey River. It conveys flows from residential and commercial areas. Access to the site is at northeast corner of Frazee Road and Oleander Drive. Field screening samples were collected.

S045
Site S045 is at the outfall of three 4-foot by 6-foot boxes on the south side of the San Luis Rey River. S045 conveys flows from the residential areas south of Frazee Road to the River. Access to the site is via Frazee Road. Field screening samples were collected from the flowing water.

S065
Site S065 is located within the open channel of Pilgrim Creek prior to confluence with the San Luis Rey River. Access to the site is from the San Luis Rey Wastewater Treatment Plant via North River Road to the access road located on the north side of San Luis Rey River. Site S065 conveys dry weather flows from a municipal golf course, residential, agricultural, parks, and open areas located to the north to the San Luis Rey River. Dry weather flows were not observed. This site was replaced by S118.

S072
Site S072 is a 60-inch RCP with a flap gate installed and is located on the north side of the San Luis Rey River. Access to the site is from River Tree Drive at Marlado Park. Site S072 conveys dry weather flows to the River from the park and residential community located north of the outlet. Dry weather flows were not observed.

S075
Site S075 is a 24-inch RCP in a headwall located on the north side of the San Luis Rey River. Access to the site is from the access road that runs parallel to the River between Benet and Foussat Roads. Site S075 conveys dry weather flows from the new residential developments north of the San Luis Rey River. Field screening samples from the flowing water were collected.

S077
Site S077 is an open channel south of SR-76 and upstream of Guajome Lake. Access to the site is from Hitching Post Drive. The runoff consists primarily of residential and commercial flows from east of the outlet. Samples are collected where the channel is concrete. Downstream of the sampling point, the channel is a natural swale that leads to Guajome Regional Park. Field screening samples were collected from the flowing water.

S085
Site S085 is an alternate site. It includes two 24-inch RCPs located at North Santa Fe Avenue and Champlain Street. The outlet drains into a concrete channel south of the San Luis Rey River. S085 conveys the dry weather flows from the residential area to the south of North Santa Fe Avenue. Access to the site is from North Santa Fe Avenue. Field screening samples were collected from the ponded water.

S088
Site S088 is a 36-inch RCP located at the intersection of Mesa Drive and North Santa Fe Avenue. The site is located west of the Guajome Regional Park and south of the San Luis Rey River. Site S088 conveys dry weather flows from the residential area to the west into Guajome Regional Park. Access to the site is via North Santa Fe Avenue. Field screening samples were collected of the ponded water.

S102
Site S102 is located north of SR-76 between North Santa Fe Road and Guajome Lake Road, south of the San Luis Rey River. It is a 24-inch RCP that drains a residential area immediately east. Access to the site is from SR-76 and requires entering private property; therefore, access is limited. Field screening samples were collected of the ponded water.

S103
Site S103 is located south of the San Luis Rey River. Access to the site is from the park east of 5396 Gooseberry Way. The outlet drains the residential and park areas in the neighborhood to the south. Field screening samples were collected of the ponded water.

S104
Site S104 in a 24-inch RCP located south of the San Luis Rey River. Access to the site is from park east of 5476 Gooseberry Way. The outlet drains the residential area south of the site. Field screening samples were collected of the ponded water.

S106
Site S106 includes four 36-inch plastic pipes at the intersection of North River Road and Sleeping Indian Road on the north side of the San Luis Rey River. The outlet drains the agricultural and residential area immediately north of the site. Access to the site is from North River Road. Field screening samples and analytical lab samples were collected from the flowing water.

S107
Site S107 is a natural channel that crosses under North River Road on the north side of the San Luis Rey River. The channel drains the agricultural area immediately north of the site. Access to the site is from North River Road. Field screening samples were collected from the flowing water.

S108
Site S108 is a natural channel that crosses under Via Puerta del Sol on the north side of the San Luis Rey River. The channel drains residential areas and agricultural areas in the immediate vicinity. Access to the site is at the intersection of Via Puerta del Sol and Big View Road. Dry weather flows were not observed. This site was replaced by S120.

S109
Site S109 is an 18-inch RCP located on the south side of the San Luis Rey River. The site conveys the runoff from the residential area immediately south of the outlet. Access to the site is from the access road to the east of College Boulevard. Field screening samples were collected from the ponded water.

S110
Site S110 is located on the north side of the San Luis Rey River. S110 is a 30-inch RCP with a flap gate installed. Access to Site 110 is from Rainier Way east of Douglas Drive. Field screening samples were collected from the ponded water.

S111
Site S111 is a concrete channel adjacent to Fireside Park, east of San Luis Rey River. The channel drains residential and commercial areas east of the site. Access to the site is from Fireside Street. Field screening samples were taken from the ponded water.

S113
Site S113 is located off of Capistrano Drive across from Capistrano Park. The site conveys flows from Camp Pendleton and from Capistrano Park south to the San Luis Rey River. The cliff appears to have eroded into the river and access to the outfall was not possible. Attempted to sample at next manhole up, but was also inaccessible. There was overland flow coming into drain that was further investigated.

S115
Site S115 is an open concrete channel between Mission Avenue and SR-76 west of El Camino Real. The site conveys flows from the commercial area to the east along Mission

Avenue towards Douglas Drive. Access to the site is from Mission Avenue. Field screening samples were collected from the flowing water.

S116
Site S116 is located off of North River Road across from Del Rio Elementary School. The outfall conveys flows from the school and the residential area north of North River Road. It consists of two six-foot by six-foot boxes. Access to the site is from North River Road. This site replaced the historically dry S052 sampling site. Field screening samples were collected from the flowing water.

S117
Site S117 is a 48-inch RCP located northwest of North Sante Fe Road and Champlain Road. The outfall conveys flows from the residential areas east and south along North Santa Fe Road. Access to the site is from North Santa Fe Road. Field screening samples were collected from the flowing water.

S118
Site S118 is an alternate site. It is located at the southwest corner of College and Silver Bluff. It consists of two pipes originating from the same source. The largest pipe, a 72-inch RCP, was sampled, which conveys flows from the residential area to the north and east along Silver Bluff and Mosaic. This site was added to the Dry Weather Monitoring Program as a replacement for S085. Access to the site is from Silver Bluff. Field screening samples were collected from the ponded water.

S119
Site S119 is an alternate site. It is an open concrete channel located off of Douglas Drive at the municipal golf course. The site conveys flows from the residential areas south and east, as well as the golf course. Access to the site is from Douglas Drive. Field screening samples were collected from the ponded water.

S120
Site S120 is an alternate site. It is a 36-inch RCP outfall at the east end of Jeffries Ranch Road. It conveys flows from the residential area west of the outfall. Access to the site is from Jeffries Ranch Road. Field screening samples were collected from the ponded water.

S121
Site S121 is an alternate site. It consists of two partially submerged 48-inch RCPs at the northwest intersection of College Boulevard and Frazee Road. It conveys flows from the residential area southeast of the intersection. Access to the site is from Frazee Road through a locked gate. Field screening samples were collected from the ponded water.

3 METHODS

Dry weather monitoring is conducted at least once at each primary station where flowing or ponded water is observed during the dry season (May 1 – September 30). If a primary site is visited and no flowing or ponded water is present, this information is documented on the field sheet (or electronically in the field tablet) and a station from the alternate list is then visited. Dry weather monitoring is only conducted when there has been at least 72 hours of dry weather prior to the time of the sampling. Grab samples are collected for laboratory analysis at a minimum of 25 percent of the stations where water is present.

The following describes the City of Oceanside's Dry Weather Program components including field site visits, laboratory analysis of water samples, and IC/ID investigations. The general site description and atmospheric conditions were recorded for each site visit whether or not runoff was observed. An example of the hard copy data sheet is provided in Appendix B. However, the 2008 dry weather season was the first program to begin collecting field data electronically on Panasonic Toughbooks using a database specifically created based on the field data sheet and the data sharing format approved by the Dry Weather Monitoring Workgroup. A photograph was also taken at each site (Appendix A). Monitoring was not conducted during any rain event or within 72 hours of the end of any rain event greater than one tenth of an inch.

3.1 Qualitative Observations

Qualitative field observations were made during each site visit where ponded or flowing water was observed and sampled. These observations were intended to provide a general assessment of the runoff and include parameters such as odor, water clarity, and the presence of floatables, visible deposits, stains and aquatic life. These descriptions were recorded on the field data sheet or electronically in the field tablet.

3.2 Flow Measurement

Flow measurements can be used to estimate pollutant mass loading, prioritize storm drains for future investigations, or to identify significant changes in flow that may be indicative of an illegal release upstream. Since all of the sample locations lack a permanent flow measurement installation, several field methods were employed to estimate flow rates for different flow types such as an open channel, outfall, or drainage pipe. These methods have been adapted from the County of San Diego's Dry Weather Monitoring Program Quality Assurance Project Plan[1].

Velocity-area method - This method requires the physical measurement of the velocity (V), depth (D), and width (W) of flowing water. Discharge is determined as follows:

$$\text{Discharge} = V \times D \times W \qquad \text{Eq. (1)}$$

[1] County of San Diego. 2004. Quality Assurance Project Plan for the County of San Diego's Dry Weather Monitoring Program. April 2004.

Where the water depth was adequate, a Global Flow Probe was used to get the average velocity in feet per second. Stream depth and width were recorded on the field data sheet and the discharge in cubic feet per second (cfs) was calculated using Eq. (1).

Where the flow was too slow or the water too shallow to measure the velocity using the probe, the velocity was estimated by timing the travel of a piece of floating debris (e.g., a leaf). The velocity was calculated by dividing the travel distance (feet) by the recorded travel time (seconds).

Fill a bottle method - If the flowing water was able to be captured, such as from a raised pipe, the fill-a-bottle method was used. The time it took to fill a known volume was recorded. Discharge was calculated by dividing the volume by the time and converting that value into cubic feet per second.

3.3 Field Screening

Water physicochemical properties (e.g., pH, conductivity, turbidity, dissolved oxygen (DO), and temperature) are important indicators of water quality. The Horiba U-10 6-parameter probe was used to measure:

- pH.
- Conductivity.
- Turbidity.
- Dissolved oxygen (DO).
- Water temperature.

If the water was deep enough, the probe was placed horizontally in the water column, facing upstream. If water was shallow, a syringe or cup was used to collect water and transfer into a container and then the properties were measured. Due to the sampling process involved, DO measurements in a beaker may be different from *in situ* measurements. The Horiba U-10 was calibrated daily prior to use in the field using the standard calibration solution as well as a three-point pH calibration.

At each site with ponded or flowing water, water samples were collected and analyzed in the field for:

- Ammonia (NH_3).
- Nitrate as N (NO_3-N).
- Orthophosphate (PO_4).
- MBAS (Surfactants).

Ammonia, nitrate, orthophosphate, and MBAS were measured in the field using CHEMetrics field test kits. Each test kit contained a sample mixing container, necessary reagent-filled ampoules, the appropriate color standards for colorimetric analysis, filters for photometric analysis, and instructions for each kit. The procedures instructed by CHEMetrics were followed.

3.4 Laboratory Water Quality Analyses

Laboratory samples were collected at a minimum of 25% of the sites with flowing or ponded water. Samples were submitted to EnviroMatrix Analytical, Inc. for chemistry analysis and Weston Solutions, Inc. for microbiology analysis. Below is the complete list of laboratory analytes:

- Oil and Grease
- Total Hardness
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Enterococcus Bacteria
- Total Coliform Bacteria
- Fecal Coliform Bacteria
- Chlorpyrifos
- Diazinon

All samples were analyzed using Standard Methods or EPA Methods by the laboratories.

3.5 IC/ID Investigations

Each station is visited at least once per dry weather season, if accessible and safe. When field measurements and/or laboratory analysis showed an exceedance of established action levels, the site was revisited within two business days to confirm the initial results. When follow-up sampling confirms continued exceedance of action levels, the City conducted further investigations to identify the source of the exceedance. Upstream investigations were not conducted when exceedances were not noted during the follow-up visit or when the exceedance is known not to be the result of IC/IDs, as without a high constituent level to track, the investigation is unlikely to identify any sources.

The action levels used for the 2008 dry weather monitoring period are presented in Table 3. If the initial results were confirmed and an exceedance continued, an upstream investigation was initiated. In addition, any potential IC/IDs found visually or with any other evidence of gross contamination, an IC/ID investigation was pursued immediately (e.g., substantial petroleum sheen, excessive turbidity, extremely high ammonia concentration, evidence of sewage release, etc.).

In general, IC/ID investigations include identifying pollution sources and correcting or eliminating them. Various methods can be used for source identification, for example, observation by following flows or discharges upstream, field measurements or laboratory analysis of water samples. The correction and elimination of identified sources may be achieved by outreach/education, best management practices (BMPs) implementation, and enforcement when necessary.

Table 3. 2008 Dry Weather Monitoring Action Levels

Analyte	Action Level
Field Measurements	
pH	6.5-9.0 pH units
Conductivity	N/A
Turbidity	N/A
Dissolved Oxygen	Not a required analyte
Temperature	N/A
Ammonia Nitrogen	1.0 mg/L
Nitrate as N	10.0 mg/L
Orthophosphate	2.0 mg/L
Surfactants (MBAS)	1.0 mg/L
Laboratory Measurements	
Oil and Grease	15 mg/L
Total Hardness	N/A
Cadmium (Dissolved)	California Toxics Rule (CTR)
Copper (Dissolved)	California Toxics Rule (CTR)
Lead (Dissolved)	California Toxics Rule (CTR)
Zinc (Dissolved)	California Toxics Rule (CTR)
Total Coliform Bacteria	50,000 MPN/100mL
Fecal Coliform Bacteria	20,000 MPN/100mL
Enterococcus	10,000 MPN/100mL
Chlorpyrifos	0.5 µg/L
Diazinon	0.5 µg/L

3.6 Trash Assessment

Section II.B.3.C (7) of the 2007 Municipal Permit requires Copermittees to assess the presence of trash in receiving water and urban runoff at each dry weather monitoring station. A work plan for trash assessment was finalized in August of 2007 which outlined procedures and created field assessment forms to be used by the Copermittees[2] . The field form is included in Appendix B.

The assessment is primarily a qualitative assessment. The assessment includes five categories with a narrative description and a range of number of pieces. The five categories are:

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.

[2] Weston Solutions and Brown and Caldwell. 2007. Final Monitoring Workplan for the Assessment of Trash in San Diego County Watersheds. Prepared for the County of San Diego. August 30, 2007.

- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human and/or aquatic health is assessed at each site by the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category.

If a site falls into the poor or submarginal category, then the type of trash is denoted and ranked and the potential routes and sources are identified. Options for types, routes and sources are listed below:

Types of Trash	*Potential Routes*	*Potential Sources*
Automotive	Dumping	Household
Biohazard Waste	Littering	Construction
Business Related	Upstream	Commercial
Ciagrette Butts	Unable to Determine	Industrial
Construction		School
Fabric/Clothing		Transient
Food Packaging		Unable to Determine
Food Waste		
Household		
Shopping Carts		
Toxic		
Yard Waste		

4 RESULTS

The dry weather monitoring program was conducted from May 1, 2008 through September 30, 2008. A site visit at all 67 of the primary sites was attempted, however five of those sites were inaccessible or deemed unsafe. An additional nine primary sites were dry. A total of 85 sites were visited, 66 were ponded or flowing and field screening was conducted, and of those, 19 were chosen for additional laboratory analysis (Table 4).

The results of the qualitative observations, flow measurements, field measurements and laboratory measurements are presented in the following sections.

Table 4. 2008 Summary of Dry Weather Monitoring Sites Visited.

Watershed	No. Primary Sites Listed	No. Primary Sites Inaccessible	No. Primary Sites Dry	No. Alternate Sites Visited	No. Sites Sampled for Lab Analysis	Total No. Sites Visited
Agua Hedionda	9	1	0	1	6	10
Buena Vista	14	2	0	2	3	16
Loma Alta	20	1	4	9	6	29
San Luis Rey	24	1	5	6	4	30
TOTAL	67	5	9	18	19	**85**

4.1 Qualitative Observations

Qualitative observations are a routine and important part of the field screening program. Weather conditions were recorded at each site and any evidence of dry weather flows were documented. Visual observations of the sample water and the vicinity of the sampling location such as odor, color, clarity, floatable materials, vegetation and biological organisms were also recorded. Observations are summarized below and presented in Table 5.

Light Conditions

Sixty six of the 85 sites visited had sunny conditions during site visits. Seven sites had overcast conditions, and 12 sites had partly cloudy conditions. No sites were visited during foggy conditions.

Odor

Forty nine of the sites with water had no distinguishable odor associated with the storm drain outlets. Sixteen sites had a musty odor, one site smelled of rotten eggs, no sites had a sewage odor, and no sites had a chemical odor.

Color

Forty four of the sites with water had no observed color. Eighteen sites had a yellow color and two sites had a brown color. One site had a green color. Another site had a white color.

NS – Not Sampled (dry)
NA – Not Accessible

Clarity
Sixty one of the sites with water were clear with negligible suspended particles observed. Four of the sites sampled were slightly cloudy and one of the samples was opaque.

Floatable Materials
The categories of floatable materials were trash, bubbles/foam, sheen, fecal matter, and other and each site had the potential to have multiple categories of floatable materials listed. Twenty two sites were observed to have no floatable materials. Thirty seven sites were observed to have trash in or near the sampling location. Nine sites were observed to have bubbles and/or foam. Eleven sites had a visible sheen. At one site, fecal matter was observed. Thirty nine sites observed also had floatable materials outside of the categories listed; those materials, were algae, leaf debris, or grass clippings.

Deposits
The categories of deposits were coarse particulates (sediment/gravel), fine particulates, stains, oily deposits, and other. Multiple types of deposits could have been identified at each site. Forty four sites did not have any deposits at the sampling site. Twenty one sites had fine particulate deposits. Five sites had course particulate deposits of sediment and/or gravel. One site had some type of stain at the sampling point. No sites had an oily deposit. Nine sites had deposits listed as other, which included algae and/or leaf debris.

Vegetation
The categories for amount of vegetation present at and around the sampling area were none, limited, normal, and excessive. Twenty four sites and no vegetation present. One site had limited vegetation growth signifying some type of eradication program. Fifty one sites observed had normal vegetation growth. Three sites had excessive vegetation growth around the sampling area.

Biology
The categories for types of life present at the sites were insects, algae, fish, snails, and mussels/barnacles. Multiple types of life could have been identified at each site. Thirty eight of the sites had algae present; eleven of those sites also having some other type of life present. One site had snails present. Thirty seven sites had insects present. Seven sites had fish present. Seven sites had some “other” type of life present; usually crawfish or tadpoles/frogs. Twenty four sites did not have any visible life present at the sampling site.

4.2 Field Water Quality Results

Field analyses were conducted at all sites with flowing or ponded water. The field analyses were conducted using a Horiba U-10 and CHEMetrics field test kits. A summary of the initial screening results from field analysis is presented in Table 6. If action levels were exceeded, the site was revisited to confirm the initial results and an IC/ID investigation was initiated. Follow-up investigations are presented in Section 4.4.

Table 6. 2008 Initial Screening Field Measurement Results for Sites with Ponded or Flowing Water.

Bold/Highlighted values indicate action level exceedances.
NS – Not sampled/Field Equipment Malfunction.
AE – Analyst Error/Data Entry Error. While the data was lost inexplicably in the database, the analytes that exceeded action levels were recorded in a hard copy format and follow-ups were completed.

Flow Rate
Twenty seven of the 66 sites with water were ponded. The flow rates at the sites with measurable flow ranged from 0.1 gpm at S075 to 225 gpm at L027.

Water Temperature
Water temperature was measured in the field immediately upon sample collection at each site with flowing or ponded water. Temperature readings ranged from 19.5˚C at S104 on June 23, 2008 to 33.4˚C at S115 on June 30, 2008. The average temperature during field screening was 23.5˚C with a standard deviation of 2.93˚C.

pH
pH is a term used to indicate the alkalinity or acidity of a substance as ranked on a scale from 1.0 to 14.0. Acidity increases as the pH gets lower. Figure 3 presents the pH of some common liquids.

Figure 2. pH of Selected Liquids.

pH affects many chemical and biological processes in the water. For example, different organisms flourish within different ranges of pH. The largest varieties of aquatic animals prefer a range of 6.5-8.0. pH outside this range reduces the diversity in the stream because it stresses the physiological systems of most organisms and can reduce reproduction. Low pH can also allow toxic elements and compounds to become mobile and "available" for uptake by aquatic plants and animals. This can produce conditions that are toxic to aquatic life. Changes in acidity can be caused by atmospheric deposition (acid rain), surrounding rock, and certain wastewater discharges. An unusually high pH reading could be an indicator of an industrial discharge in the sample area; therefore, pH is used as an indicator of illicit discharges.

The pH values taken from the ponded or flowing water ranged from 6.26 at A015 to 10.11 at S110. The average pH value observed during the field screening was 8.0 with a standard deviation of 0.6. The three sites that were outside of the acceptable range were A015, S115, and S110. A015 was the only site that had pH levels below the acceptable range. The area around A015 is known to have a high water table with geologic conditions that cause low pH, foam, and crystalline deposits on the soil. S115 and S110 are associated with concrete channels or pipes. Concrete is known to be basic and have high pH values associated with the cement components. This may be a cause of the high pH values.

Conductivity
Conductivity is a measure of the ability of water to pass an electrical current. Conductivity in water is affected by the presence of inorganic dissolved solids such as chloride, nitrate, sulfate, and phosphate anions (ions that carry a negative charge) or sodium, magnesium, calcium, iron, and aluminum cations (ions that carry a positive charge). Organic compounds like oil, phenol, alcohol, and sugar do not conduct electrical current very well and therefore have a low conductivity when in water. Conductivity is also affected by temperature: the warmer the water, the higher the conductivity. In addition, discharges to streams can also change the conductivity depending on their make-up. A failing sewage system would raise the conductivity because of the presence of chloride, phosphate, and nitrate; an oil spill would lower the conductivity. The conductivity values ranged from 0.98 mS/cm at S102 to 11.0 mS/cm at B023. The average conductivity value observed during field screening was 3.9 mS/cm.

Turbidity
Turbidity is a measure of water clarity, how much the material suspended in water decreases the passage of light through the water. Suspended materials include soil particles (clay, silt, and sand), algae, microbes and other substances. Turbidity can affect the color of the water.

Higher turbidity increases water temperatures because suspended particles absorb more heat. This, in turn, reduces the concentration of dissolved oxygen because warm water holds less dissolved oxygen than cold. Higher turbidity also reduces the amount of light penetrating the water, which reduces photosynthesis and the production of dissolved oxygen. Suspended materials can clog fish gills, reducing resistance to disease in fish, lowering growth rates, and affecting egg and larval development. As the particles settle, they can blanket the stream bottom, especially in slower waters, and smother fish eggs.

Turbidity can be useful as an indicator of the effects of runoff from construction, agricultural practices, logging activity, discharges, and other sources. Turbidity often increases sharply during a rainfall, especially in developed watersheds, which typically have relatively high percentages of impervious surfaces. The flow of storm water runoff from impervious surfaces rapidly increases stream velocity, which increases the erosion rates of stream banks and channels. Turbidity can also rise sharply during dry weather if earth-disturbing activities are occurring in or near a stream without erosion control practices in place. The turbidity values ranged from <1 at five sites to 100 NTU at A014. The average turbidity value observed during field screening was 15 NTU.

Dissolved Oxygen
Dissolved oxygen analysis measures the amount of gaseous oxygen dissolved in an aqueous solution. Oxygen gets into water by diffusion from the surrounding air, by aeration, and as a waste product of photosynthesis.

Adequate dissolved oxygen is necessary for good water quality. Oxygen is a necessary element to all forms of life. Natural stream purification processes require adequate oxygen levels in order to provide for aerobic life forms. As dissolved oxygen levels in the water

drop below 5.0 mg/L, aquatic life is put under stress. The lower the concentration, the greater the stress is on aquatic life. The dissolved oxygen values ranged from 0.43 mg/L at S032 to 18.13 mg/L at L019. The average dissolved oxygen value observed during field screening was 7.5 mg/L. All but one of the sites that had DO levels less than 4.0 mg/L were ponded and frequently had higher turbidity and nutrient levels, indicating nutrient breakdown.

Ammonia

Ammonia is a common indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment, however, in higher quantities it can become toxic to fish and other organisms. The ammonia values range from 0.1 to >10 mg/L. The average ammonia value observed during the field screening was 0.6 mg/L with a standard deviation of 0.4 mg/L. Six of the nine sites that exceeded the action level for ammonia were ponded and were likely caused by decaying organic matter in the ponded water.

Orthophosphate

Both phosphorus and nitrogen are essential nutrients for the plants and animals that make up the aquatic food web. Since phosphorus is the nutrient in short supply in most fresh waters, even a modest increase in phosphorus can, under the right conditions, set off a chain of undesirable events in a stream including accelerated plant growth, algae blooms, and low dissolved oxygen.

There are many sources of phosphorus, both natural and human. These include soil and rocks, wastewater treatment plants, runoff from fertilized lawns and cropland, failing septic systems, runoff from animal manure storage areas, disturbed land areas, drained wetlands, water treatment, and commercial cleaning preparations. The orthophosphate values ranged from <0.2 mg/L to >5 mg/L. The average orthophosphate value observed during field screening was 1.2 mg/L. Thirteen sites exceeded the action level.

Nitrate-N

Nitrate is the most readily available form of nitrogen for plant uptake and is a limiting factor in plant growth. Nitrates are naturally occurring in soil and rocks, but are also added to watersheds from anthropogenic sources such as fertilizers, failing septic systems, and animal waste. The nitrate-N values from the 2008 dry weather monitoring season ranged from 0.2 to 53 mg/L at S106. The average nitrate-N value was 2.3 mg/L with a standard deviation of 7.0 mg/L. The nitrate levels at S106 were over three times greater than the next highest levels of nitrate-N at L054 and B002. Three sites exceeded the nitrate action level.

Surfactants (MBAS)

Surfactants or MBAS were previously analyzed in the laboratory, but in the new permit are required as part of the field screening. Surfactants are analyzed to detect detergent pollution from residential, commercial, or industrial washing activities. MBAS results were greater than or equal to the action level of 1.0 mg/L at 11 of the initial screening sites. Over half of those sites had conductivity results greater that 5 mS/cm. Several Copermittees reported exceedances in the field screening data at sites with higher conductivity levels, but when the

samples were taken to the laboratory, there were no exceedances. In the City of Oceanside there were 11 exceedances of MBAS action levels, but upon confirmation, none of them required further investigation.

4.3 Laboratory Water Quality Results

Laboratory analysis was conducted at 19 sites, representing 29% of the sites with ponded or flowing water. Laboratory chemistry results are summarized and presented in Table 7 and microbiology results in Table 8. If action levels were exceeded, the site was revisited to confirm the initial results and an IC/ID investigation was initiated. Follow-up investigations are presented in Section 4.4 and Appendix C.

Oil and Grease

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities. Oil and grease was not detected at any of the dry weather sites.

Total Hardness

Total hardness measures the amount of polyvalent cations in water. It generally represents calcium and magnesium ions in a water sample because they are the most common cations. Results are expressed in mg/L of $CaCO_3$. The California Toxics Rule (CTR) applies hardness-based water quality objectives to dissolved metals. Increasing hardness has the effect of decreasing the toxicity of metals[3]. The hardness values ranged from 340 mg/L of $CaCO_3$ at A004a to 3120 mg/L of $CaCO_3$ at A015 with an average of 1261 mg/L of $CaCO_3$ and a standard deviation of 882 mg/L of Ca CO_3. Three of the four sites with hardness values over 2000 mg/L of $CaCO_3$ were in the Agua Hedionda watershed near the intersection of Lake and Cannon; an area with a high groundwater table and historical geologic crystalline formations.

Dissolved Metals

Metal concentrations in the environment can originate from a variety of sources including automobiles, automobile repair facilities, car washing, and industrial activities, as well as natural geologic processes. The laboratory samples collected during the 2008 Dry Weather Monitoring Program were analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Results were compared to the hardness-based CTR CMC (1-hour) criterion. Dissolved cadmium was detected at one site, A015, but was below the action level. Dissolved copper was detected at ten sites, but they were all below the CTR criterion. Dissolved lead results were below the laboratory detection limits at all sites. Dissolved zinc was detected at three of the sites and it also exceeded the CTR criterion at site A015.

Chlorpyrifos and Diazinon

Chlorpyrifos and diazinon are organophosphate pesticides used to control insects, fleas and ticks. As of December 31, 2004, it became unlawful to sell diazinon outdoor, non-agricultural products. Chlorpyrifos can now only be used for nursery production, golf courses and road medians. Neither chlorpyrifos nor diazinon was detected at any of the laboratory sampling sites.

Total Coliform Bacteria

Total coliform bacteria are mostly harmless bacteria that are ubiquitous in the environment living in soil, water, and mammalian digestive tracts. Water samples are analyzed for total coliform bacteria to indicate the presence of other more harmful pathogenic (disease causing) organisms that are associated with coliform but are difficult to test for because they are present in much smaller quantities. During the dry weather monitoring period total coliform results ranged from 3,000 MPN/100mL to 300,000 MPN/100 ml. Seven of the 19 sites sampled for laboratory analysis exceeded total coliform action levels.

Fecal Coliform and Enterococcus

Members of two bacteria sub-groups, fecal coliforms and enterococcus, are used as indicators of possible sewage contamination because they are specifically found in human and animal

digestive tracks. Although they are generally not harmful themselves, they indicate the possible presence of pathogenic bacteria, viruses, and protozoans that also live in human and animal digestive systems. Since it is difficult, time-consuming, and expensive to test directly for the presence of a large variety of pathogens, these fecal indicator bacteria are used. Sources of fecal contamination to surface waters include wastewater treatment plants, on-site septic systems, domestic and wild animal manure, and storm water runoff.

In addition to the possible health risk associated with the presence of elevated levels of fecal bacteria, they can also cause cloudy water, unpleasant odors, and an increased oxygen demand. Fecal coliform results ranged from 20 MPN/100mL to 23,000 MPN/100 ml. Two of the 19 sites sampled for laboratory analysis exceeded the fecal coliform action level. Enterococcus results ranged from <10 MPN/100mL to 17,239 MPN/100mL. Two of the 19 sites sampled exceeded the Enterococcus action level. Only one site, B022, exceeded all three microbiology action levels.

4.4 IC/ID Investigations

Sites that exceeded one or more action level were revisited and resampled to confirm the initial result. If the confirmation result also exceeded an action level, an IC/ID investigation was initiated. Thirty three sites had one or more action level exceedances that required confirmation. Nineteen of those sites, upon confirmation, required an IC/ID investigation

The most common exceedance was for orthophosphate; 13 sites had an initial exceedance. All but two of those sites were ponded or had very low flow. Eight of the 13 sites required an IC/ID investigation. Eleven sites had an initial exceedance for MBAS (surfactants) but none of the confirmation samples exceeded the action level. This may be due to either the fleeting use of surfactants, such as in car washing, or the amount of degradation in environment. Nine of the sites had an initial exceedance for ammonia; five of those required an IC/ID investigation. Figure 4 provides the number of sites by watershed exceeding the initial field screening action levels.

Only one of the 19 sites sampled for laboratory chemistry analysis required an upstream investigation. A015 continued to exceed action levels for dissolved zinc. There is an ongoing investigation attempting to identify the source of this exceedance. Microbiology exceedances were mostly for total coliforms. There were seven exceedances for total coliforms, two for fecal coliforms, and two for Enterococcus. None of the fecal coliform or Enterococcus confirmation samples required an IC/ID investigation. Five of the seven total coliform exceedances required an upstream investigation. Figure 5 provides the number of sites by watershed that exceeded the microbiology action levels.

Appendix C contains a detailed description of the confirmation and IC/ID investigations at each site and the actions that were taken to reduce contaminants.

Figure 3. Number of Initial Field Screening Exceedances by Analyte and Watershed.

Figure 4. Number of Microbiology Exceedances by Analyte and Watershed.

4.5 Trash Assessment

Eighty one sites were assessed for trash amount and extent. The majority of sites were in the mid-range of the assessment and were either suboptimal, marginal, or submarginal. Figure 6 and Table 9 present a summary of trash assessment throughout the City. Loma Alta and San Luis Rey Watersheds were the only watersheds to include sites with a "poor" rating. The distribution across watersheds is presented in four charts that make up Figure 7. In addition, Figures 7 and 8 provide an orthophoto of the San Luis Rey and Carlsbad Watersheds and the distribution of trash assessment ratings throughout each watershed.

Figure 6. Trash Assessment by Watershed.

4.5.1 Threat to Human or Aquatic Health

The threat to human and aquatic health was assessed at each site. A threat to human health includes trash and debris that have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria or have the potential for physical harm. A threat to aquatic health includes trash and debris such as small floatable material that is persistent and can be transported long distances that resemble food and may be ingested. The threat also includes debris that has the potential for entanglement or oil or chemicals that could harm aquatic life.

Three sites (4% of all sites) were deemed a threat to human health in the 2008 dry weather survey; sites B022, L001, S106. Site B022 was an assessment of both the storm drain and receiving water. Several dirty diapers were found at this site in the receiving water. It appeared as though residents of the neighboring apartment complex threw their trash into the channelized creek. A used syringe was found at L001. And, at Site S106, possible human feces was found at the storm drain outfall.

Nine sites (11% of all sites) were deemed a threat to aquatic health; Sites A002, B030, L032, S045, S072, S102, S104, S118, and S120. Sites L032, S104, and S120 all had small Styrofoam pieces that be mistaken for food by aquatic life. S102 had countless small, yellow, air gun pellets around the outfall that could also be mistaken for food. B030 had green netting present that has the potential to cause entanglement. Sites A002, S118, S072, and S045 all had spray paint cans present.

Figure 7. 2008 Trash Assessment for the San Luis Rey Watershed.

Figure 8. 2008 Trash Assessment for the Carlsbad Watersheds.

4.5.2 Submarginal and Poor Site Assessment

Twenty two of the 81 sites (27%) assessed were deemed submarginal and six of the 81 (7%) were deemed poor. Table 10 presents a summary of the sites that were submarginal and poor and identifies the ranking for the types of trash found. For example, a rank of "1" for Household and "2" for Food Packaging would mean that there was more household waste than food packaging waste. In addition, up to two potential routes and sources were identified and are listed in the Table 10.

Sixty seven percent of the trash found in submarginal and poor sites fell into the household or food packaging categories (Figure 8). There was no "automotive" or "toxic" waste found at any of the assessment locations. The two most common potential routes of trash entering the area were littering (46%) or upstream (40%). Household waste was the most common potential source of the trash (55%). Twenty seven percent of the trash also listed "transient" a potential source (Figure 9).

5 DISSCUSION

5.1 2008 Dry Weather Summary

The 2008 Dry Weather Monitoring season marked the first year for implementation of Order No. 2007-0001, the San Diego Region's Municipal Permit. In the City's 2007 JURMP Update, sites were reassessed and procedures were refined to fit the new requirements. The City now has a list of 67 primary sites and 24 alternate sites to visit between May 1 and October 30 of each year. If a primary site is inaccessible or dry, an alternate site, ideally from the same watershed, is screened. If samples from any site with ponded or flowing water exceed Dry Weather Monitoring action levels, those sites are resampled within two business days. If the site continues to exceed action levels then an IC/ID investigation is initiated. A trash assessment is completed at each site.

During the 2008 monitoring season, the 67 primary sites were visited. Five of those sites were inaccessible and an addition nine were dry. Eighteen alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (29%).

Thirty three sites required confirmation for an initial field screening exceedance. Of those, 19 required an IC/ID investigation. Figure 10 represents the percentage of sites in each watershed that exceeded an initial field screening analyte. The most common exceedance was for orthophosphate.

Figure 11. Percentage of Initial Exceedances in Each Watershed.

Of the 19 sites chosen for laboratory analysis, only one site had an exceedance for chemistry results. A015 exceeded the CTR for dissolved zinc. There is an ongoing investigation into the source; groundwater is suspected. For microbiology results, there were seven exceedances for total coliforms, two for fecal coliforms, and two for Enterococcus. None of the fecal coliform or Enterococcus confirmation samples required an IC/ID investigation. Five of the seven total coliform exceedances required an upstream investigation.

The prevailing source for exceedances of field screening analytes was ponded water. The prevailing source of ponded and flowing water was from residential over-irrigation. With the additional push for water conservation in light of changing water availability, several avenues are being implemented to reach the general public about water conservation which will in turn improve water quality. These efforts include more face-to-face outreach by two new Clean Water Program Compliance Inspectors responding to reports of over-irrigation in residential and commercial neighborhoods. On their daily work assignment the City Water Utilities Department water meter crew identifies and reports city-wide over-irrigation runoff cases to the Clean Water Program Compliance Inspectors for further follow-up investigations. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

In addition, informational inserts have been placed in each water bill almost every month of the past year. The inserts include information about water incentive programs, community workshops, water-wise landscape suggestions, and repeated information about reducing water consumption particularly on outside landscaping. Outreach is also being provided on the local public access channel, the Oceanside Magazine, public education to schools, scout troops, and having staff available at community events such as Harbor Days and the local farmer's market. Outreach efforts have also extended to homeowner's associations. The City in coordination with the Water Conservation Garden at Cuyamaca College and the San Diego County Water Authority sponsored a free workshop entitled, "Saving Water and Money for Your HOA." It was the highest attended workshop for HOAs in the county with 129 attendees.

5.2 Historical Data Comparison

In February 2001, the San Diego Regional Water Quality Control Board issued Order No. 2001-01 to the communities of San Diego County. As part of Order 2001-01, the City of Oceanside was required to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. The Dry Weather Program under this order was implemented in the 2002 Dry Weather season. This section provides a comparison of the last seven years of dry weather data.

The majority of exceedances from the last several years are nutrients (nitrate, orthophosphate, and ammonia) and bacterial indicators (total coliform, fecal coliform, and Enterococcus). Table 11 provides a summary of the previous seven years of dry weather monitoring data including the number of sites monitored and the number of exceedances of these specific field and laboratory analytes.

Table 11. 2002-2008 Dry Weather Monitoring Report Data Comparison.

Monitoring Year	2008	2007	2006	2005	2004	2003	2002
Total No. of Sites Visited	85	93	99	100	68	99	290
No. of Sites Sampled for Initial Field Screening	66	61	54	44	18	56	56
No. of Sites Exceeding Nitrate Action Level*	3	3	3	2	NS	3	11*
No. of Sites Exceeding Orthophosphate Action Level	13	12	6	8	2	14	11
No. of Sites Exceeding Ammonia Action Level	9	15	8	4	17	49	50
No. of Sites Exceeding MBAS Action Level	13	N/A	N/A	N/A	N/A	N/A	N/A
No. of Sites Sampled for Laboratory Analysis	19	18	19	17	19	16	11
No. of Sites Exceeding Total Coliform Action Level	7	9	12	17	11	0	4
No. of Sites Exceeding Fecal Coliform Action Level	2	4	5	4	2	0	1
No. of Sites Exceeding Enterococcus Action Level	2	2	2	4	3	2	0

*In the 2007 Dry Weather Monitoring Report, a discussion of the reporting of historical nitrate data was presented. Previous reports indicated that nitrate reported in monitoring years 2002, 2003, 2005 and 2006 may have been reported as NO_3, as opposed to NO_3-N. Without converting to the appropriate form of nitrate to compare to the set action levels, the number of exceedances was likely erroneously high. These numbers have been changed to reflect the conversion to NO_3-N, with the exception of the 2002 monitoring year. Without notes or written discussions to verify the lack of conversion, the data will continue to be reported as originally printed.

Orthophosphate exceedances have increase gradually over the past several years, however, ammonia exceedances have decreased. The majority of those sites in both cases were ponded water, where decaying plant debris may be a cause of spikes in the results. Bacteria levels continue to decrease and fewer sites are exceeding action levels.

5.3 Trash Assessment

The 2008 Dry Weather Monitoring Program is the first year for assessing the amount and extent of trash at each dry weather monitoring location. Approximately 65% of the sites were either “optimal”, “suboptimal”, or “marginal” and did not require the detailed trash evaluation. Twenty seven percent of the sites were “submarginal” and 7% of the sites were “poor”. The San Luis Rey Watershed had the highest percentage of “submarginal” and “poor” sites (46%).

The majority of the trash found in the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common source of the food packaging and household wastes are households and transients.

Three sites (4% of all sites) were deemed a threat to human health in the 2008 dry weather survey. One site had dirty diapers; at one site a syringe was found; and at the final site, possible human feces were observed. Nine sites (11% of all sites) were deemed a threat to aquatic health. Four sites had small Styrofoam or plastic pieces that be mistaken for food by aquatic life. One site had green netting present that had the potential to cause entanglement. And four sites had spray paint cans present.

6 CONCLUSIONS

The City of Oceanside's boundaries include two major watersheds; the San Luis Rey Watershed, which includes the San Luis Rey River, and the Carlsbad Hydrologic Unit, which consists of Loma Alta Creek, Buena Vista Creek, and Agua Hedionda Creek. As part of Order 2001-01, the San Diego Regional Water Quality Control Board required all Copermittees to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program beginning in 2002. The purpose of the program was to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain system, minimizing the negative impacts of human activities on these water bodies. In 2007 the San Diego Regional Water Quality Control Board issued a new five-year permit for Receiving Waters and Urban Runoff Monitoring and Reporting, Order No. 2007-0001. The Copermittees in San Diego County were required, as part of their Jurisdictional Urban Runoff Management Program (JURMP), to update their Dry Weather Program to meet or exceed the requirements of Order No. 2007-0001. The key changes to the new Municipal Permit were adding a trash assessment component and requiring follow-up investigations to be conducted within two business days of receipt of results.

This report presents the results of the City of Oceanside's 2008 Dry Weather Field Screening and Analytical Monitoring Program which includes the revisions to the program required by Order No. 2007-0001.

Prior to the new requirements outlined in Order No. 2007-001, the City's Dry Weather Monitoring Program consisted of approximately 100 sites that were visited every year. If a site was dry, all observations were noted, but it was not replaced. The City's new Dry Weather Monitoring Program, as outlined in the 2008 JURMP Update, includes 67 primary monitoring stations and 24 alternate monitoring stations. If one of the primary stations was dry, alternate stations were visited until a site with ponded or flowing water was found and field screening was completed. Trash assessments were completed at every accessible site, whether the site was dry or had water.

During the 2008 monitoring season, the 67 primary sites were visited. Five of those sites were inaccessible and an additional nine were dry. Eighteen alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (29%).

Thirty three sites required confirmation for an initial field screening exceedance. Of those, 19 required an IC/ID investigation. The most common exceedance was for orthophosphate. Of the 19 sites chosen for laboratory analysis, only one site had an exceedance for chemistry results. A015 exceeded the CTR for dissolved zinc. There is an ongoing investigation into the source; groundwater is suspected. For microbiology results, there were seven exceedances for total coliforms, two for fecal coliforms, and two for Enterococcus. None of the fecal coliform or Enterococcus confirmation samples required an IC/ID investigation. Five of the seven total coliform exceedances required an upstream investigation.

An historical comparison of action level exceedances shows that orthophosphate exceedances have increase gradually over the past several years, however, ammonia exceedances have decreased. In addition, bacteria levels continue to decrease and fewer sites are exceeding action levels.

The prevailing source for exceedances of field screening analytes was ponded water. The prevailing source of ponded and flowing water was from residential over-irrigation. With the additional push for water conservation in light of changing water availability, several avenues are being implemented to reach the general public about water conservation which will in turn reduce dry season runoff flow and improve water quality. These efforts include more face-to-face outreach by two new Clean Water Program Compliance Inspectors hired in February of 2008 who have responded to reports of over-irrigation in residential neighborhoods and at commercial and industrial facilities. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. Outreach avenues include information inserts in water bills, presentation on the local public access channel, and sponsoring workshops for the agricultural community and HOAs. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

During the first year of the trash assessment, approximately 65% of the sites were either "optimal", "suboptimal", or "marginal" and did not require the detailed trash evaluation which identified potential routes and sources. Twenty seven percent of the sites were "submarginal" and 7% of the sites were "poor". The San Luis Rey Watershed had the highest percentage of "submarginal" and "poor" sites (46%). The majority of the trash found at the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common source of the food packaging and household wastes are households and transients.

Follow-up investigations continue to be conducted at sites with ongoing exceedances. Water conservation and urban runoff outreach, as well as beach and creek clean-ups continues year-round as the City continues the effort to detect and eliminate illicit discharges to the storm drain system.

San Diego Stormwater Copermittees

Land Use Types for Dry Weather Monitoring

(Adopted by the Dry Weather Monitoring Workgroup, April 20, 2004)

1. **Residential**

   Residential (general)
   Single- and multi-family homes, mobile home parks, etc.

   Rural residential (For the County of San Diego and other appropriate Copermittees)
   Single family homes located in rural areas with lot sizes of approximately 1 to 10 acres. Rural residential estates may have small orchards, fields or small storage buildings associated with the residential dwelling unit, etc.

2. **Commercial**

   Offices, schools, shopping centers, auto dealerships, government/civic centers, cemeteries, churches, libraries, post offices, fire/police stations, military use, jails, prisons, border patrol holding stations, dormitories, hotels, motels, resorts, and casinos, etc.

3. **Agricultural**

   Orchards, vineyards, nurseries, greenhouses, flower fields, dairies, livestock, poultry, equine ranches, row crops and grains, pasture, fallow, etc.

4. **Industrial**

   Shipbuilding, airframe, aircraft manufacturing, industrial parks, manufacturing uses such as lumber, furniture, paper, rubber, stone, clay, and glass; auto repair services/recycling centers; warehousing, wholesale trade; mining, sand and gravel extraction, salt evaporation; junkyard, dumps/landfills; auto wrecking/dismantling and recycling centers, etc.

5. **Parks**

   Recreation areas and centers, neighborhood parks, wildlife and nature preserves, golf courses, accessible sandy areas along the coast or major water bodies allowing swimming and picnicking, etc.

6. **Open**

   Vacant and undeveloped lands, etc.

APPENDIX C

2008 IC/ID INVESTIGATIONS

A004a	Dry Weather 2008	8/18/2008

Site Summary:

Site A004a is 48-inch RCP located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The outlet drains the residential areas north and south of the outlet.

Investigatory Actions

Date	Action	Staff
8/18/2008	Initial investigation conducted. Field Screening showed exceedances for the following parameters: Orthophosphate: 2.70 mg/L Total Coliforms: 70,000 MPN/100mL Enterococcus: 17,239 MPN/100mL Flow was estimated at 29 gpm.	Witheridge
8/19/2008	Follow-up investigation conducted for field screening parameters. Orthophosphate results within acceptable parameters. Orthophosphate: 1.6 mg/L Flow was much less and estimated at 2 gpm.	Witheridge
8/27/2008	Follow-up laboratory samples collected at the outfall. Results showed an exceedance for total coliforms, but the Enterococcus result was below the action level. Total Coliforms: 240,000 MPN/100mL Enterococcus: 4,160 MPN/100mL Flow was back up and approximated at 35 gpm. An upstream investigation was initiated. The next upstream manhole in a brow ditch west of the homes on Nighthawk was sampled (A004a-1): Total Coliforms: 140,000 MPN/100mL Enterococcus: 6,488 MPN/100mL The manhole further upstream within the subdivision on Nighthawk was opened, but no flow was coming through the catch basin. However, flow could be heard elsewhere in the line. The flow was found coming from the brow ditch between Nighthawk and Viewridge and was	Witheridge/ Gremmels

<table>
<tr><td></td><td>sampled as it was going into a catch basin (A004a-2):
<table>
<tr><td>Total Coliforms</td><td>23,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>2,603 MPN/100mL</td></tr>
</table>
The flow was traced upstream to a broken irrigation system. The landscape company was onsite and repairing the problem.</td><td></td></tr>
</table>

Investigatory Status

The high flows were traced back to the broken irrigation system between Nighthawk and Viewridge. While, bacteria results were under the action levels at the most upstream location, the flows were likely affected by debris such as grass clippings, leaves, and trash, and the storm drain itself which are all reservoirs for bacteria growth. A code enforcement officer was present when the source was found, but repairs were already being made during the visit so no enforcement actions were taken.

Upstream Sampling Points

A004a-1

A004a-2

Source: Irrigation System

A013	Dry Weather 2008	8/25/2008

Site Summary:

Site A013 is a 36-inch RCP located at the intersection of Lake Boulevard and Alameda Drive, south of Agua Hedionda Creek. The outlet drains the residential areas immediately south of the site.

Follow-up Actions

Date	Action	Staff
8/25/2008	Initial investigation conducted. Laboratory screening showed exceedances for the total coliforms: Total Coliforms: 80,000 MPN/100mL Flow estimated at 12 gpm.	Witheridge
9/3/2008	Follow-up investigation conducted within two business days of receipt of results. Total coliforms again exceeded the action levels. Fecal coliforms, which did not exceed during initial screening, did exceed the action level (result = 23,000 MPN/100ml) Total Coliforms: 70,000 MPN/100mL An upstream investigation was also begun. The highest flows were tracked upstream to a manhole at the corner of Alameda and Amador. The orange deposits typical of A013 were found at this manhole. Total coliform and fecal coliform results were below the action levels (A013A): Total Coliforms: 30,000 MPN/100mL The flow was tracked further upstream to the next manhole without the orange deposits in front of 4920 Amador. Total coliform and fecal coliform results were below the action levels here, as well (A013B). Total Coliforms: 22,000 MPN/100mL	Witheridge/ Gremmels

Investigatory Status

This site was investigated in 2006 for the same tan foam, low pH, and total coliform exceedances. The same characteristic foam and lower pH were noted at neighboring Dry Weather site A015, as well. An investigation in the MS4 system and reports of similar

foam and unique geologic crystalline formations were noted in a natural channel along Shadow Ridge Road, as well as an open space area near Calaveras Lake.

At this time all investigations indicate that natural geologic and ground water phenomena in the Agua Hedionda region are responsible for the low pH and foam deposition seen at A013. The MS4 in this area commonly has groundwater seepage and mineral deposits throughout the system. The orange deposits are likely from this, but don't seem to correlate to bacterial exceedances. The bacterial exceedances also don't appear to be coming from urban runoff directly. Because fecal coliform and Enterococcus results remain well below their respective action levels, these bacteria exceedances don't appear to be a threat to human health. Causes are likely natural sources of bacteria attached to trash, leaf debris, or regrowth within the catch basin. This area will continue to be monitored.

Attachments

A013A

A013B

A014	Dry Weather 2008	8/20/08

Site Summary:

Site A014 is a 36-inch RCP located east of the intersection of Lake Boulevard and Alameda Drive, north of Agua Hedionda Creek. The outlet drains the school and residential areas north of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
8/20/08	Initial investigation conducted. Field screening showed the following exceedance for orthophosphate: Orthophosphate: 4.10 mg/L Ammonia: >10 mg/L Flow estimated at 7gpm.	Witheridge
8/21/08	Follow-up investigation conducted. Field screening results continued to exceed action levels for orthophosphate: Orthophosphate: 4.75 mg/L Ammonia: >10 mg/L Flow estimated at 25 gpm. Upstream Investigation was initiated. The manhole on the north side of Lake Boulevard was tested (A014A). Field observations noted the same flow as the outlet and similar field screening results: Orthophosphate: 3.65 mg/L Ammonia: >10 mg/L Investigation continued to a manhole up the hill north of Lake Blvd and under Madison Middle School's track (A014B). This manhole had two sources; one to the north and one to the east neither of which had comparable flows to the downstream site nor was the water the same brown turbid color. Results from the ponded water were: Orthophosphate: 0.25 mg/L Ammonia: 0.3 mg/L The only other inputs found between the two manholes were two field drains on the inside of the track. The ground was very wet and in some portions ponded.	Witheridge/ Gremmels

	Further investigation near three storage trailers found piles of mulch with weeds, plants, and algae growing in and around the piles. While there was no direct runoff to drains, groundwater seepage is suspected.	
9/11/08	Site visit conducted by Mo Lahsaie (Clean Water Program Coordinator) and Wil Perdomo (Clean Water Program Inspector). Observed recent application of manure to the school track. The school potentially could have irrigated the field to avoid body contact and to push the fertilizer through the root zone. Also observed a large manure pile at Madison Middle School track. Dr. Lahsaie contacted Vista School District to discuss alternate practices.	Lahsaie/ Perdomo

Investigatory Status

The flow and nutrient exceedances were tracked to the school's track and field area. The Clean Water Program Coordinator contacted Steve Presley at the Vista School District. Dr. Lahsaie also spoke with the Maintenance Supervisor, Mr. Jeff Gyer, who understood the potential for leaching manure/nutrients into the storm drain. Mr. Gyer contacted the Grounds Supervisor to coordinate more frequent irrigation practices with a shorter duration time to avoid potential runoff.

Attachments

A014A – Manhole on north side of Lake Blvd.

A014B – Manhole north of Madison Middle School track.

Mulch piles and wet ground around storage trailers.

Mulch piles on north side of trailers; wet ground with algae. Plants growing out of piles.

A015	Dry Weather 2008	8/25/2008

Site Summary:
Site A015 is a 48-inch RCP located south of Lake Park, off of Lake Boulevard, south of Agua Hedionda Creek. The outlet drains the residential areas east along Lake Boulevard Drive. Access to the site is from Lake Boulevard Drive.

Investigatory Actions

Date	Action	Staff
8/25/2008	Initial investigation conducted. Field and laboratory screening showed exceedances for the following parameters: pH: 6.26 pH Units MBAS: 1.0 mg/L Dissolved Zinc (Hardness): 0.498 mg/L (3120 mg/L as $CaCO_3$) Flow was estimated at 15 gpm, but appeared to also be coming from around the outlet directly from a groundwater source.	Witheridge
8/27/2008	Follow up investigation for field screening showed pH and MBAS levels to be under the action levels: pH: 6.62 pH Units MBAS: 0.65 mg/L During this visit, no flow could be found coming directly from the storm drain; it was ponded.	Witheridge
9/8/2008	Follow up investigation for dissolved zinc showed a continued exceedance of action levels: Dissolved Zinc (Hardness): 0.45 mg/L (2490 mg/L as $CaCO_3$) An upstream investigation was initiated. The majority of flow was tracked upstream to a manhole on the southwest corner of Lake and Cannon (A015A): Dissolved Zinc (Hardness): 0.62 mg/L (2550 mg/L as $CaCO_3$) The next manhole upstream was too deep and unsafe to sample (i.e. required confined-space entry permit).	Witheridge

<table>
<tr><td>10/23/2008</td><td>Further upstream investigation was performed for pH and dissolved zinc. See map below for exact locations.

</table></td><td></td></tr>
</table>

Investigatory Status

A015 has been subject to an ongoing investigation to locate the source of persistent white foam in runoff since 2004. Historically, total coliform exceedances and low pH also seem to be a common characteristic in this area. In 2006, the white foam was traced back through the MS4 system to a french drain from a hillside in a residential development. Other investigations show similar depositions of foam as well as unique geologic crystalline formations in the watershed. The visual upstream investigation in 2007 found groundwater seepage in the intersection of Lake and Canon with a similar white color which supports the hypothesis that the discharge and exceedances may be naturally occurring.

While coliform results during the 2008 monitoring year were below action levels, the low pH continued, as well as an exceedance of dissolved zinc were found. Dissolved metals had been investigated at this site in 2002. There were also exceedances of dissolved zinc in 2004 and 2006. The site was not sampled for laboratory analysis in 2003 or 2005. No source of dissolved zinc was ever found and so exceedances in groundwater were also assumed.

This year's investigation is ongoing. The flow with low pH and dissolved zinc exceedances was traced to a manhole with two French drains, one smaller green storm drain and one larger storm drain outfall. Ground water seepage was apparent from the larger storm drain and the associated French drain. The characteristic foam of that area and water trickling from the pipe seams were visible. The other two pipes are part of an ongoing investigation. When several subdivisions were engineered in this area, the ground was leveled and a large rubber mat with French drains was placed below the fill dirt and the buildings due to the high ground water table. The drainage from all of these

drains is likely from this construction, but research is being performed to confirm this hypothesis.

Four drains leading into manhole at A015G.

Map of A015 investigation on 10/23/2008.

A016	Dry Weather 2008	8/25/2008

Site Summary:

Site A016 is a 36-inch RCP located east of Amigos Court, south of Lake Boulevard, and north of Calavera Creek at the border of Oceanside and Carlsbad. The outlet drains the residential areas to the north and south of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
8/25/2008	Initial investigation conducted. Field Screening showed an exceedance for the following parameters: MBAS 1.0 mg/L Flow was estimated at 6gpm.	Witheridge
8/27/2008	Follow-up investigation conducted. Field screening results found MBAS to be within acceptable parameters: MBAS 0.75 mg/L Flow estimated at 1gpm.	Witheridge

Investigatory Status:
The follow-up investigation showed MBAS results were under the Dry Weather Monitoring Program action levels.

A019	Dry Weather 2008	8/14/2008

Site Summary:

Site A019 is a 24 inch RCP located in Oak Riparian Park off of Lake Boulevard, north of Agua Hedionda Creek. The outlet drains the residential and park areas north and south of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
8/14/2008	Initial investigation conducted. Field Screening from the ponded water showed exceedances for the following parameters: Orthophoshate 3.35 mg/L	Witheridge
8/15/2008	Follow up investigations from the ponded water continued to show exceedances for the following parameters: Orthophoshate 2.70 mg/L An upstream investigation was initiated. The next manhole upstream in the landscaped area of the parking lot was very deep (A019A). Although hard to see, it appeared there was either a small amount of ponded water or a slight trickle. No samples were collected. The next manhole upstream on the northeast corner of Ridge and Lake (A019B) had no flow, but the ground was wet. Leaves were observed in the bottom of the catch basin. A final manhole was investigated on the northwest corner of Ridge and Lake (A019C). This is a curb inlet that is piped directly to A109A. The ground was wet, but there was no flow.	Witheridge

Investigatory Status

Initial screening of ponded water at site A019 resulted in an action level exceedance of orthophosphate. The follow-up visit found a continued exceedance of orthophosphate. During the 2007 monitoring year, several areas of ponded water and excess runoff appeared to be coming from park landscaping. Clean Water Program staff met with Park

staff to discuss several options for water conservation and more efficient fertilization. In addition, beginning in October 2007, the Water Utilities Department requested that all City managed areas reduce their water use by 20%. Public Works achieved and surpassed this request by getting up to a 50% reduction in water use during the winter. These efforts have worked and during the 2008 monitoring year, there was no visible evidence of over-irrigation from the park. In addition, the Water Utilities Department is working with the Public Works Department to find grants to install smart controller irrigation systems on City property.

The ponded water is therefore likely from residential flow. With the additional push for water conservation in light of changing water availability, several other avenues are being implemented to reach the general public about water conservation which will in turn improve water quality. These efforts include more face-to-face outreach by Clean Water Program Inspectors responding to reports of over-irrigation in residential neighborhoods. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008. On a daily basis, the City Water Utilities Department Meter-Reader Crew reports any over-irrigation issues from residential dwelling and commercial facilities to the Clean Water Program Compliance Inspectors for follow-up investigations and public education outreach.

B002	Dry Weather 2008	8/5/2008

Site Summary:

Site B002 is a 72-inch RCP located on Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial and residential areas north of SR-78. Access to the site is via Lagoon View Drive.

Investigatory Actions

Date	Action	Staff
8/5/2008	Initial investigation conducted. Field Screening results showed an exceedance for the following parameter: Nitrate-N 12.6 mg/L	Witheridge
8/6/2008	Follow-up investigation conducted. Nitrate-N results were below the action level. Nitrate-N 5.8 mg/L	Witheridge

Investigatory Status
Nitrate-N results were below the action levels upon confirmation.

This site was also sampled four times during calendar year 2008 in coordination with Investigative Order R9-2006-076 to gain monitoring information for the upcoming nutrient TMDL associated with coastal lagoons. Detailed nutrient information about this site should be available in 2009.

B022	Dry Weather 2008	8/5/2008

Site Summary:

Site B022 is a 48-inch RCP built into the Buena Vista Creek channel wall east of the Thunder Drive Bridge. The outlet drains the residential areas north of Buena Vista Creek. Access to the site is from within Buena Vista Creek channel.

Investigatory Actions

<table>
<tr><th>Date</th><th>Action</th><th>Staff</th></tr>
<tr><td>8/5/2008</td><td>Initial investigation conducted. Field Screening and laboratory results showed exceedances for the following parameters:
<table>
<tr><td>Total Coliforms</td><td>300,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>23,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>14,136 MPN/100mL</td></tr>
</table>
Several diapers were found at around the outfall during sampling.</td><td>Witheridge</td></tr>
<tr><td>8/13/2007</td><td>Follow-up investigation conducted. Fecal coliform and Enterococcus results were below the action levels, but total coliform results were at the action level which does qualify it as an exceedance:
<table>
<tr><td>Total Coliforms</td><td>50,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>3,500 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>1,137 MPN/100mL</td></tr>
</table>
A thorough upstream investigation was conducted. The MS4 begins with overland flow north of the 78 at the intersection of Thunder Drive and Waring Road. This area was ponded. The main line manholes were opened, although technically lie within the City of Vista, but were too deep to sample. It appeared they contained ponded water with a lot of leaf debris. The first upstream sample was collected from a manhole northeast of the intersection of Vista Way and Thunder Drive (B022A):
<table>
<tr><td>Total Coliforms</td><td>22,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>13,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>798 MPN/100mL</td></tr>
</table></td><td>Witheridge/ Sabelis</td></tr>
</table>

<table>
<tr>
<td></td>
<td>The next downstream manhole is located within the City of Oceanside at a tire store off of Plaza south of the 78 (B022C):
<table>
<tr><td>Total Coliforms</td><td>13,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>1,300 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>323 MPN/100mL</td></tr>
</table>
Further downstream, and the next manhole upstream of the outfall, samples were collected from a manhole inside the condominium complex near the intersection of Thunder Drive and Tiburon (B022B):
<table>
<tr><td>Total Coliforms</td><td>7,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>700 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>2,014 MPN/100mL</td></tr>
</table>
</td>
<td></td>
</tr>
</table>

Investigatory Status

Follow-up investigations did not find any point sources for bacterial exceedances. Only total coliform continued to exceed upon confirmation and all IC/ID results were below action levels. The runoff appears to be coming from commercial and residential flow north of the 78 in the area of Thunder Drive and Waring Road, however no excessive runoff was observed from point sources. Over-irrigation is likely the source as the ground near storm drains were wet.

Residential behavior in the condominium complex closest to the outfall may be the source of bacterial contamination, although no runoff was found. A trash can is located in the parking lot directly above the outfall, but plastic bags with diapers were found thrown into the concrete channel. Code enforcement officers have discussed the trash issue with the manager of the complex. They have recommended management move the trash bins. No littering has been witnessed by staff.

B023	Dry Weather 2008	8/14/2008

Site Summary:

Site B023 is a 36-inch RCP located west of the intersection of Lake Boulevard and Thunder Drive south at 3524 Lake Blvd. The outlet drains the residential areas south of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
8/14/2008	Initial investigation conducted. Field screening results showed conductivity levels to be high: Orthophosphate: 2.05 mg/L MBAS: 1.0 mg/L	Witheridge
7/23/2007	Follow-up investigation conducted. Field screening showed orthophosphate and MBAS levels to be lower than the action level: Orthophosphate: 1.85 mg/L MBAS: 0.8 mg/L	Witheridge

Investigatory Status

Confirmation of initial results proved to be below action levels.

Previous investigations during the 2007 monitoring year showed that this runoff is from groundwater seepage upstream off of Mira Monte Drive.

B024	Dry Weather 2008	8/25/2008

Site Summary:

Site B024 is a 36-inch RCP located on the southwest corner of College Boulevard Bridge over Buena Vista Creek. The outlet drains the commercial and residential areas south on College Boulevard. Access to the site is from College Boulevard.

Investigatory Actions

Date	Action	Staff
8/25/2008	Initial investigation conducted. Field showed exceedances for the following parameters: Ammonia-N 1.0 mg/L	Witheridge
8/27/2008	Follow-up investigation showed that the field screening results were below the action level for ammonia: Ammonia-N 0.8 mg/L	Witheridge

Investigatory Status

Follow-up investigation showed ammonia levels to decrease below action level upon confirmation.

B030	Dry Weather 2008	9/3/2008

Site Summary:

Site B030 is an alternate site. It is a 36-inch RCP located within a sewer easement south of SR-78, west of AAA and north of Buena Vista Creek. The outlet drains the residential areas north of SR-78. Access to the site is from the sewer easement road.

Investigatory Actions

Date	Action	Staff
9/3/2008	Initial investigation conducted. Field showed exceedances for the following parameters: Ammonia-N: 1.0 mg/L Flow was estimated at 1gpm.	Witheridge
9/8/2008	Follow-up investigation was completed within two business days ("dark" Friday and weekend). Results showed that the field screening results continued to exceed the action level for ammonia: Ammonia-N: 1.0 mg/L Flow had decreased to approximately 0.25 gpm. An upstream investigation was initiated. The next manhole upstream was north of the 78 at the bus stop in front of AAA. The catch basin had a small amount of flow, but not enough to sample.	Witheridge

Investigatory Status

Follow-up investigation showed ammonia levels to continue above the action level but at a very low flow. The next upstream manhole did not have enough water to sample. There were leaves and trash in the catch basin that may contribute to the ammonia exceedance.

B033	Dry Weather 2008	8/21/2008

Site Summary:

Site B033 is a 42-inch RCP located north of SR-78 behind the Black Angus restaurant, north of Buena Vista Creek. The outlet drains the commercial areas north of SR-78 into a large catch basin with ponded water. The outfall that was sampled is the largest input to the basin. Access to the site is from SR-78.

Investigatory Actions

Date	Action	Staff
8/21/2008	Initial investigation conducted. Field screening showed an exceedance for the following parameter: Orthophosphate 2.25 mg/L	Witheridge
8/25/2008	Follow-up investigation was completed within two business days ("dark" Friday and weekend). Results showed that the field screening results continued to exceed the action level for orthophosphate: Orthophosphate 1.10 mg/L	Witheridge

Investigatory Status

Upon confirmation, orthophosphate levels were below the Dry Weather Monitoring action levels.

B104	Dry Weather 2008	8/18/2008

Site Summary:

Site B104 is a manhole on the southeast corner of South Coast Highway and Eaton Street. The outlet drains the commercial and residential areas on the east side of South Coast Highway. This site replaced B001 by moving it upstream approximately 230 yards out of tidal influence. Access to the site is from South Coast Highway.

Investigatory Actions

Date	Action	Staff
8/18/2008	Initial investigation conducted. The ponded water in the catch basin was sampled. Field screening showed an exceedance for the following parameter: Orthophosphate — 2.35 mg/L	Witheridge
8/19/2008	Follow-up investigation was completed within two business days. Results showed that the field screening results continued to exceed the action level for orthophosphate: Orthophosphate — 2.60 mg/L An upstream investigation was initiated; however there was only a trickle of water coming from the upstream box. There was not enough water to sample. An upstream manhole on Eaton street was investigated. The catch basin was wet, but no flowing water. Historical flows seem to be from landscaped areas and overland flow from homes. The next upstream manhole on the Coast Highway was investigated. There was evidence of overland flow from the commercial area, but there was not enough to track upstream.	Witheridge

Investigatory Status

Upon confirmation, orthophosphate levels from the ponded water in the catch basin continued to exceed action levels. There was no upstream flow to follow, however. The ponded water seems to be most likely from residential irrigation on Eaton Street. This is

being addressed by water conservation efforts throughout the City. These efforts include more face-to-face outreach by Clean Water Program Inspectors responding to reports of over-irrigation in residential neighborhoods. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

Ponded water at B104 looking upstream.

L001	Dry Weather 2008	7/21/2008

Site Summary:

Site L001 is a 48-inch RCP located at the intersection of North Avenue and Vista Pacific Drive, north of Loma Alta Creek. The outlet drains the industrial areas south of North Avenue. Access to the site is via North Avenue.

Investigatory Actions

Date	Action	Staff
7/21/2008	Initial investigation conducted. Laboratory screening showed an exceedance for the following parameter: Total Coliforms: 280,000 MPN/100mL	Witheridge
7/29/2008	Follow-up investigation was completed within two business days of receipt of results. Results showed that the laboratory screening results were below the action level for total coliforms: Total Coliforms: 23,000 MPN/100mL An upstream investigation was initiated while the sampling team was onsite. Flow was coming from two directions; one from North Avenue and one from Vista Pacific. Both manholes were too deep to sample (greater than 25 feet).	Witheridge

Investigatory Status

Upon confirmation, total coliform results were below the action level.

L002	Dry Weather 2008	7/23/2008

Site Summary:

Site L002 is a 66-inch RCP located near North Avenue and Vista Pacific Drive, north of Loma Alta. It drains the industrial and commercial area to the north of the creek and east of North Avenue.

Follow-up Actions

Date	Action	Staff
7/23/2008	Initial investigation conducted. Field screening showed exceedances for the following parameters: Ammonia — Data Entry Error MBAS — Data Entry Error During the initial field screening, the flow rate increased while the sampling team was present. The increased flow pushed more turbid flow into the receiving water. The flow sampled was likely a mixture of ponded water from the catch basin and the runoff coming from upstream. Although ammonia and MBAS were recorded on paper as an exceedance, the true results were lost from the computer database either through user or computer error. An upstream investigation was initiated immediately to find the source of the heavier flow. Brown, turbid water was traced to a drainage ditch next to the Sprinter train tracks. Access to the drainage ditch was through the North County Transit District right-of-way, and therefore was not able to be followed. A Code Enforcement Officer was called to assist in the investigation. The flow was determined to be from somewhere between Temple Heights Road to the west to east of the City Operations Center. The area was thoroughly searched, but as the flow dried up, no evidence of discharge was found. Hobie Company, a manufacturer of kayaks and sailboats, operates on next to the City Operations Center. Code Enforcement completed an inspection of their operation, but no runoff was found. The flow stopped while the investigation continued and made finding the source difficult.	Witheridge/ Gremmels

7/24/08	A follow-up investigation for ammonia and MBAS at L002 showed results below the action levels: Ammonia: 0.60 mg/L MBAS: 0.75 mg/L	Witheridge

Investigatory Status
It appears that this was an illicit discharge, but the source was not identified. In addition to the other commercial buildings in the area, it appears that the street sweeper washout area within the City Operations Center may be the culprit. The area is bermed and drains to the sewer, but there is a possibility that the area may have clogged and/or overflowed. A municipal inspection of this site was performed on April 29, 2008 and this area was not identified as a problem. Although this was not specifically identified as the source, to be certain that this is not a problem in the future, municipal trainings will cover the potential for a discharge at this area and ensure that City staff know how to avoid it.

Attachments

7/23/2008 - Flow at Temple Heights and the Sprinter tracks.

7/24/2008 - Example of street sweeper washout discharge into the City sewer system. This was taken the next day and no water was overflowing to the storm drain.

L010	Dry Weather 2008	7/28/2008

Site Summary:

Site L010 are two 36-inch RCP located west of College Boulevard near the railroad tracks. The outlet drains the residential areas on the hillside south of Loma Alta Creek adjacent to College Boulevard. Access to the site is from College Boulevard.

Follow-up Actions

Date	Action		Staff
7/28/2008	Initial investigation conducted. Field screening showed exceedances for the following parameters:		Witheridge
	MBAS	1.00 mg/L	
7/29/08	A follow-up investigation for MBAS resulted in levels below the action levels:		Witheridge
	MBAS	0.75 mg/L	

Investigatory Status

Upon confirmation, MBAS levels were below the Dry Weather Monitoring action levels.

L019	Dry Weather 2008	7/21/2008

Site Summary:

Site L19 is a 48-inch RCP, located south of the Corporate Centre and Oceanside Boulevard intersection, north of Loma Alta Creek. The outlet drains the commercial and open space areas located on the hill north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard

Investigatory Actions

Date	Action	Staff
7/21/2008	Initial investigation conducted. Field and laboratory results of the ponded water showed exceedances for the following parameters: pH: 9.32 pH units Total Coliforms: 50,000 MPN/100mL	Witheridge
7/23/2008	Follow-up investigation conducted. Field screening result for pH continued to exceed the action level: pH: 9.07 pH units An upstream investigation was initiated. The manhole on the northeast side of Oceanside Blvd and Corporate Center way was visited (L019A). The catch basin was wet, but there was no flow or ponded water. The manhole on the northwest side of Oceanside Blvd and Corporate Center Way was visited (L019B). There was ponded water approximately five inches deep. The field screening result for pH was below the action level: pH: 8.25 pH units	Witheridge
7/29/2008	Follow-up investigation for bacteria was conducted. Laboratory results were below the bacteria action levels: Total Coliforms: 8,000 MPN/100mL An upstream sample was also collected on the northwest corner at the intersection of Corporate Center and Oceanside Blvd (L019B). The bacteria levels here exceeded the action levels: Total Coliforms: >1,600,000 MPN/100mL Fecal Coliforms: 1,400 MPN/100mL The catch basin was also observed to have grass clippings,	Witheridge

	trash and sediment in it. These floatables likely provided the reservoir for total coliforms to grow.	

Investigation Status

The ponded water at this site was collected and sampled. Generally, the water has a slight trickle over the banks to the receiving water of Loma Alta. The pH level continued to exceed the action level upon confirmation but was in the acceptable range upstream. The source remains unknown at this time.

Total coliforms were below the action level upon confirmation. However, an upstream sample was taken from the ponded water which did exceed the action levels. Grass clippings, trash and sediment were observed in the ponded water and bacteria growing on these substances may have caused the IC/ID exceedance, as well as the initial exceedance.

Attachments

L019B – ponded water in catch basin.

L034	Dry Weather 2008	8/11/2008

Site Summary:

Site L034 is an alternate site. It is a 24-inch RCP located between Waste Management and a self storage lot south of Oceanside Boulevard.

Investigatory Actions

Date	Action	Staff
8/11/2008	Initial investigation conducted. Field and laboratory results of the ponded water showed exceedances for the following parameters: Ammonia: 1.0 mg/L MBAS: 1.75 mg/L	Witheridge
8/13/2008	Follow-up investigation conducted. Field screening result for ammonia continued to exceed the action level, while MBAS was below the action level: Ammonia: 3.0 mg/L MBAS: 0.85 mg/L An upstream investigation was initiated. The grate upstream had approximately a half inch of water in it, but was unable to be sampled. The next manhole upstream, across Oceanside Blvd, was dry. The investigation continued up Canyon toward several apartment complexes and single family homes, but no runoff was visible.	Witheridge

Investigation Status

The ponded water at this site was collected and sampled. Upstream samples were unable to be collected and no runoff was apparent. The likely source of flow is residential irrigation. This small flow then ponds and when leaves and grass clippings decay, ammonia may rise. With the additional push for water conservation in light of changing water availability, several new avenues are being implemented to reach the general public about water conservation which will in turn improve water quality. These efforts include more face-to-face outreach by Clean Water Program Inspectors responding to reports of over-irrigation in residential neighborhoods. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

L054	Dry Weather 2008	8/5/2008

Site Summary:

Site L054 is a 16-inch RCP outlet on the south side of Loma Alta Creek west of I-5. Access to the outfall is from Cavalier Mobile Estates through the channel. The outlet drains the residential area to the south and Marshall Park.

Investigatory Actions

Date	Action	Staff
8/5/2008	Initial investigation conducted. Field and laboratory screening of the flowing water showed the following exceedances: Nitrate-N: 16.6 mg/L Fecal Coliforms: 23,000 MPN/100mL	Witheridge
8/6/2008	Follow-up investigation conducted for nitrate. Field screening was conducted and showed nitrate levels continued to exceed the acceptable limits: Nitrate-N: 12.9 mg/L An upstream investigation was conducted and the flow tracked to an upstream inlet at the northwest corner of Port Marshall Park. Two main flows were found; one from a small PVC pipe coming from the east (L054A) and the other from an outlet of the MS4 system upstream (L054B). L054A is connected to a groundwater pump on the Cavalier Mobile Home Park property. This area had historical flooding problems, so the pump was installed approximately nine years ago. Field screening for nitrate was conducted here: Nitrate-N at L054A: 9.14 mg/L L054B is an outfall from the MS4 from the neighboring community of Marshall and California Streets. Upon closer inspection, the outfall was ponded, but flow was coming from a crack in the concrete to the left of the outfall pipe. This flow was sampled, however the nitrate data was not saved in the database. While the result did not exceed the action level, the specific level is not available.	Witheridge
8/13/2008	Follow-up investigation conducted for fecal coliforms. Laboratory screening showed the fecal coliform result to	Witheridge

	be below the action level: Fecal Coliforms: 5,000 MPN/100mL Upstream samples were collected from the two main flows and analyzed on the same day. Both fecal coliform results were well below the action level: Fecal Coliforms at L054A: <20 MPN/100mL Fecal Coliforms at L054B: 80 MPN/100mL	

Investigatory Status

Flow was tracked upstream from Loma Alta Creek to an inlet in the northwestern corner of Marshall Park. Flow from a sump pump in Cavalier Mobile Estate was found to the main source of flow and nitrate. This pump was investigated during the 2007 monitoring year. Cavalier Mobile Estates constructed a set of three sump pumps to continuously pump groundwater to the storm drain system in approximately 1999 to avoid flooding. It was hypothesized that a combination of natural seepage (from being built on a wetland) and over-irrigation from the residential area and park to the south caused continuous flooding of the mobile home park. Further sampling of the groundwater pump flow was conducted through May 2007. The park was not fertilized after October to see if a reduction in nitrate levels occurred. Watering of the park was also decreased. Results of the field testing are shown below in Table 1 in Attachments below.

Results did not seem to be affected by the lack of fertilizer or decrease of irrigation. Flows seemed to increase with rain events. However, Public Works will continue to conserve water for irrigation purposes. Beginning in October 2007, the Water Utilities Department requested that all City managed areas reduce their water use by 20%. Public Works achieved and surpassed this request by getting up to a 50% reduction in water use during the winter. In addition, the Water Utilities Department is working with the Public Works Department to find grants to install smart controller irrigation systems on City property.

This site was also sampled four times during calendar year 2008 in coordination with Investigative Order R9-2006-076 to gain monitoring information for the upcoming nutrient TMDL associated with coastal lagoons. Detailed nutrient information about this site should be available in 2009.

Attachments

L054B – Main flow coming from opening to the left of the outlet.

L054A - Pump outfall is small white PVC pipe which flows to drain.

S006	Dry Weather 2008	7/1/08

Site Summary:

Site S006 is a 36-inch corrugated metal pipe (CMP) located under I-5. S006 drains the interstate and the residential community to the northeast of the San Luis Rey River and I-5. The site was moved down stream because the original outfall pipe was inaccessible.

Investigatory Actions

Date	Action	Staff
7/1/2008	Initial investigation conducted. Field screening showed the following exceedance for orthophosphate: Orthophosphate-P: 2.00 mg/L	Witheridge
7/2/2008	Follow-up investigation conducted. Field screening results continued to exceed action levels for orthophosphate: Orthophosphate-P: 2.00 mg/L Upstream investigation was initiated. The next upstream inlet was at the west end of San Luis Rey Drive. There was evidence of overland run off into the Caltrans drain, but no flow.	Witheridge
7/21/2008	Initial laboratory bacteria sample was collected. Results showed the following exceedance for total coliform: Total Coliform: 50,000 MPN/100mL	Witheridge
7/29/2008	Follow-up investigation conducted. Laboratory results continued to exceed the action level for total coliforms: Total Coliform: 130,000 MPN/100mL Fecal coliform results were well below their respective action level at 230 MPN/100mL. An upstream investigation was initiated. Again, the inlet at the west end of San Luis Rey Drive was dry.	Witheridge

Investigatory Status

Both orthophosphate and total coliform results exceeded their respective action levels upon confirmation. An upstream investigation was initiated on two separate events. Both follow-up events showed very low flows (less than one gpm). Residential runoff is likely the source from the Capistrano neighborhood which drains through a CalTrans drain.

Residential over-irrigation is being addressed through several avenues being implemented to reach the general public about water conservation which will in turn improve water quality. These efforts include more face-to-face outreach by Clean Water Program Inspectors responding to reports of over-irrigation in residential neighborhoods. In addition to two new inspectors, the Water Utility Department has hired an outreach coordinator specifically for water conservation education. And, as mandated by the State, the City is preparing for the impending drought and has adopted a revised drought ordinance as of July 9, 2008.

S032	Dry Weather 2008	7/15/08

Site Summary:

Site S032 is a 36-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River. S032 outlet conveys flows from the residential, commercial, and open space areas located on the south side of SR-76.

Investigatory Actions

Date	Action	Staff
7/15/2008	Initial investigation conducted. Field and laboratory screening of the ponded water showed the following exceedances for ammonia and orthophosphate: Ammonia-N: 1.0 mg/L Orthophosphate-P: >8.0 mg/L	Witheridge
7/17/2008	Follow-up investigation conducted. Field screening was conducted and ammonia and orthophosphate results continued to be above the action levels: Ammonia-N: 1.0 mg/L Orthophosphate-P: 5.95 mg/L Upstream investigation initiated. Dry up stream at inlet.	Witheridge

Investigatory Status

Initial screening of S032 resulted in an action level exceedance of ammonia and orthophosphate. The investigation continued upstream to the other side of the bike path. The area was dry with no evidence of the source of the flow.

S075	Dry Weather 2008	7/15/2008

Site Summary:

Site S075 is a 24-inch RCP in a headwall located on the north side of the San Luis Rey River. Site S075 conveys dry weather flows from the newer residential developments north of the San Luis Rey River.

Investigatory Actions

Date	Action	Staff
7/15/2008	Initial investigation conducted. Field and laboratory screening showed the following exceedance for orthophosphate: Orthophosphate-P: 2..05 mg/L	Witheridge
7/17/2008	Follow-up investigation conducted. Field screening was conducted and orthophosphate results continued to be above the action level: Orthophosphate-P: 2.00 mg/L	Witheridge
7/17/2008	Upstream investigation was initiated. Two catch basins were identified at the intersection of Toopal and Big Sky. Three overland flows were investigated. S075A was the flow coming from the west corner of the northern catch basin at Toopal and Big Sky. Orthophosphate-P at S075A: 0.80 mg/L S075B was the flow coming from the east corner of the southern catch basin at Toopal and Big Sky. Orthophosphate-P at S075B: 0.70 mg/L S075C was the flow coming from the west corner of the southern catch basin at Toopal and Big Sky. Orthophosphate-P at S075C: 0.75 mg/L	Witheridge

Investigatory Status

Upon confirmation, orthophosphate results continued to exceed the action level. An upstream investigation was performed in the residential area to the north of the outfall. All of the flows were coming from area drains from private residences. These area drains capture the water from backyards which then drain to the curbs on the street. Clean Water Program inspectors went through the neighborhood on July 18, 2008 and spoke with homeowners and left door hangers identifying the problem and giving them recommendations on how to reduce their discharge. Not unusual, one home was found vacant and was owned by the bank. Contractors are being used to manage the landscapes of these homes.

S085	Dry Weather 2008	7/23/2008

Site Summary:

Site S085 is an alternate site. It includes two 24-inch RCPs located at North Santa Fe Avenue and Champlain Street. The outlet drains into a concrete channel south of the San Luis Rey River. S085 conveys the dry weather flows from the residential area to the south of North Santa Fe Avenue. Access to the site is from North Santa Fe Avenue.

Investigatory Actions

Date	Action	Staff
7/23/2008	Initial investigation conducted. Field screening showed the following exceedances: Ammonia 3.0 mg/L Orthophosphate 4.65 mg/L MBAS 1.0 mg/L	Witheridge
7/24/2008	Follow-up investigation conducted. Field screening was conducted and ammonia and orthophosphate results continued to be above the action level, while MBAS results were below the action level: Ammonia 1.0 mg/L Orthophosphate 2.70 mg/L MBAS 0.65 mg/L There was more ponded water on 7/24/08 than the day prior. An upstream investigation was initiated. A small flow of water was found coming from a broken sprinkler at 1322 Henshaw. Clean Water Program staff left a door hanger that requested the resident fix the broken sprinkler.	Witheridge

Investigatory Status

Upon confirmation, ammonia and orthophosphate results continued to exceed the action levels. An upstream investigation was performed and a broken sprinkler system was found at a private residence. Clean Water Program staff left a door hanger informing the resident of the problem. A phone call was received the same day that indicated the resident had fixed the irrigation system.

S102	Dry Weather 2008	6/23/2008

Site Summary:

Site S102 is located north of SR-76 and south of the San Luis Rey River. It is a 24-inch RCP that drains a residential area immediately east.

Investigatory Actions

Date	Action	Staff
6/23/2008	Initial investigation conducted. Field screening showed the following exceedance for ammonia: Ammonia-N: 1.0 mg/L	Witheridge
6/25/2008	Follow-up investigation conducted. Field screening was conducted and ammonia results were below the action level: Ammonia-N: 0.6 mg/L	Witheridge

Investigatory Status

Initial screening of S102 resulted in an action level exceedance of ammonia. The follow-up visit found decreased ammonia results below the action level.

S103	Dry Weather 2008	6/23/2008

Site Summary:

Site S103 is a concrete outfall located south of the San Luis Rey River. The outlet drains the residential and park areas south of the site outlet in the neighborhood to the south of the site.

Investigatory Actions

Date	Action	Staff
6/23/2008	Initial investigation conducted. Field screening showed the following exceedance for pH: pH 9.17	Witheridge
6/25/2008	Follow-up investigation conducted. Field screening was conducted and pH was below the action level: pH 7.7	Witheridge

Investigatory Status

Initial screening of S103 resulted in an action level exceedance of pH. The follow-up visit found that the pH had decreased below the action level.

S106	Dry Weather 2008	7/1/08

Site Summary:

Site S106 includes four 36-inch plastic pipes at the intersection of North River Road and Sleeping Indian Road on the north side of the San Luis Rey River. The outlet drains an agricultural area immediately north of the site. Access to the site is from North River Road.

Investigatory Actions

Date	Action	Staff
7/1/2008	Initial investigation conducted. Field Screening and laboratory results showed an exceedance for nitrate and MBAS: MBAS: 1.25 mg/L Nitrate-N: 53.0 mg/L	Witheridge
7/2/2008	Follow-up investigation conducted. Results show that MBAS was below the action levels but nitrate continued to exceed: MBAS: 0.85 mg/L Nitrate-N: >68.0 mg/L	Witheridge

Investigation Status

Nitrate loading from the agricultural area around Sleeping Indian has been an on-going issue. Clean Water Program staff began special investigations in the summer of 2006 to assess agricultural contribution to nitrate exceedance and began working with the contributing agricultural parties to voluntarily implement appropriate BMP's.

An investigation was completed during the 2008 monitoring year on May 21 specifically investigating the Sleeping Indian Road drainage area for nitrate exceedances and sources. The investigation identified that the most upstream source of the flow is a groundwater spring north of Grove View (SI5) that has a nitrate result below the dry weather monitoring action level. On the downstream side of the property at the corner of Las Tunas and Sleeping Indian (SI6), the flow is higher and the nitrate levels exceed the action level, but no point source was found. It seems that groundwater seepage is the source of this water high in nitrates and therefore the real source of the nitrate will be difficult to pinpoint. The table and map below provide the results of the investigation.

Table 1. Sleeping Indian Road Nitrate Investigation May 21, 2008.

Downstream→

SiteID	Description	Lat	Long	Date	Time	Nitrate as N (mg/L)
SI7	S106	33.26000	-117.26432	05/21/08	8:55	>81
SI1	Upstream of Nursery	33.26335	-117.26355	05/21/08	7:40	>81

SI6	Flow crosses Sleeping Indian	33.26910	-117.26317	05/21/08	8:45	23
SI5	Flow crosses Las Tunas/Grove View	33.27106	-117.26333	05/21/08	8:23	<2

While the majority of the agriculture and nursery facilities in the area are open to City inspections and recommendations, during the dry season, there is little surface water runoff to manage. The majority of water in this particular drainage area is groundwater seepage. Water conservation efforts may assist as well as assistance through the U.S. Department of Agriculture – Natural Resource Conservation District. A mandatory 30% decrease in water usage at agriculture facilities was enacted. The City will continue to maintain a good working relationship with these facilities and complete inspections and provide education on BMPs and water conservation.

Sleeping Indian Road Nitrate Study May 21, 2008

S109	Dry Weather 2008	8/7/2008

Site Summary:

Site S109 is an 18-inch RCP located on the south side of the San Luis Rey River. The site conveys the runoff from the residential area immediately south of the outlet.

Investigatory Actions

Date	Action	Staff
8/7/2008	Initial investigation conducted from the ponded water. Field Screening results showed exceedances for the following parameters: Ammonia-N: 1.5 mg/L Orthophosphate: 3.70 mg/L	Witheridge
8/11/2008	Follow-up investigation conducted. The outfall was dry with no water to be sampled.	Witheridge

Investigation Status

Upon confirmation, the outfall at S109 was dry. While a formal investigation was not required, a drive through the upstream was area completed. The upstream investigation indicated the original ponded water was likely runoff from residential over irrigation.

S110	Dry Weather 2008	6/16/2008

Site Summary:

Site S110 is located on the north side of the San Luis Rey River. S110 is a 30-inch RCP with a flap gate installed. Access to Site S110 is from Douglas Drive to the access road on the north side of the River

Investigatory Actions

Date	Action	Staff
6/16/2008	Initial investigation conducted. Field Screening results showed exceedances for pH: pH: 10.11 The sample was taken at 2:00pm on a very hot day (water temperature = 32.09 C)	Witheridge
6/18/2008	Follow up investigation conducted; field screening results showed pH within acceptable parameters. pH: 9.0	Witheridge

Investigatory Status

Upon confirmation, the pH result at S110 was within an acceptable range for pH. Historically, this site has repeatedly experienced high pH readings. The cause is unknown, but may be affected by biological processes of algae during the day or perhaps leaching from the basic components of the concrete.

S111	Dry Weather 2008	7/15/2008

Site Summary:

Site S111 is a concrete channel adjacent to Fireside Park, east of the San Luis Rey River. The channel drains the residential area east of the site.

Investigatory Actions

Date	Action	Staff
7/15/2008	Initial investigation conducted. Field Screening results showed an exceedance for MBAS: MBAS: 1.5 mg/L	Witheridge
7/17/2008	Follow-up investigation conducted. MBAS was under the action level: MBAS: 0.75 mg/L	Witheridge

Investigation Status

Upon confirmation, the MBAS result was below the Dry Weather Monitoring action level.

S115	Dry Weather 2008	6/30/2008

Site Summary:
Site S115 is an open concrete channel between Mission Avenue and SR-76 west of El Camino Real. The site conveys flows from the commercial area to the east along Mission Avenue towards Douglas Drive. Access to the site is from Mission Avenue.

Investigatory Actions

Date	Action	Staff
6/30/2008	Initial investigation conducted. Field screening showed the following exceedance for pH: pH 9.79	Witheridge
7/2/2008	Follow-up investigation conducted. Field screening was conducted and pH results were below the action level: pH 8.47	Witheridge

Investigatory Status

Upon confirmation, the pH result was within an acceptable range for the Dry Weather Monitoring action levels.

S116	Dry Weather 2008	6/16/2008

Site Summary:
Site S116 is located off of North River Road across from Del Rio Elementary School. The outfall conveys flows from the school and the residential area north of North River Road. It consists of two six-foot by six-foot boxes. Access to the site is from North River Road. This site replaced the historically dry S052 sampling site.

Investigatory Actions

Date	Action	Staff
6/16/2008	Initial investigation conducted. Field screening showed the following exceedance for orthophosphate and MBAS: Orthophosphate: 2.45 mg/L MBAS: 1.0 mg/L	Witheridge
6/18/2008	Follow-up investigation conducted. No water was present.	Witheridge

Investigatory Status

On June 16, 2008, S116 was visited and field screening results exceeded the action levels for orthophosphate and MBAS. There was very low flow estimated at 0.4 gpm during the initial screening. The site was again visited on June 18, 2008 for confirmation sampling. There was no water present.

S119	Dry Weather 2008	6/19/2008

Site Summary:
Site S119 is an alternate site. It is an open concrete channel located off of Douglas Drive at the municipal golf course. The site conveys flows from the residential areas south and east, as well as the golf course. Access to the site is from Douglas Drive.

Investigatory Actions

Date	Action	Staff
6/19/2008	Initial investigation conducted. Field screening showed the following exceedance for MBAS: MBAS: 1.0 mg/L	Witheridge
6/23/2008	Follow-up investigation conducted within two business days (weekend). MBAS result was below the action level: MBAS: 0.75 mg/L	Witheridge

Investigatory Status

Upon confirmation, the MBAS result was below the action level. Of note, there was considerably less water present the second day visited. The initial flow appeared to be from irrigation of the municipal golf course. The driving range area just underwent a remodel and the sprinklers were running longer to get grass growing. Clean Water Program staff spoke with the grounds crew on June 19, 2008 and requested a thorough check of the irrigation system with respect to broken sprinkler heads and timer settings.

Attachments

S119 on 6/23/2008.

S120	Dry Weather 2008	8/18/2008

Site Summary:
Site S120 is an alternate site. It is a 36-inch RCP outfall at the east end of Jeffries Ranch Road. It conveys flows from the residential area west of the outfall. Access to the site is from Jeffries Ranch Road.

Investigatory Actions

Date	Action	Staff
8/18/2008	Initial investigation conducted. Field screening showed the following exceedance for orthophosphate: Orthophosphate: 2.10 mg/L Laboratory samples were also collected, however, to ensure proper bacteria holding times, the site was revisited in the afternoon to collect the microbiology samples. The site was dry upon arrival, so the bacteria samples were collected on 8/25/2008.	Witheridge
8/19/2008	Follow-up investigation conducted. The orthophosphate result continued to exceed the action level: Orthophosphate: 2.20 mg/L An upstream investigation was initiated. Catch basins were wet, but had very little flow. A small amount of overland flow was identified at the southwest corner of Jefferies Ranch Road and Del Mar Drive (S120B): Orthophosphate: >8 mg/L This flow was traced upstream to two residential area drains with flowing water and visible algae. The first drain at 1617 Del Mar Drive (S120C) appeared to be contributing the most orthophosphate: Orthophosphate: >8 mg/L The next residential area drain from 1627 Del Mar Drive (S120D) was also exceeding action levels: Orthophosphate: 4.30 mg/L	Witheridge
8/25/2008	Initial investigation conducted for bacteria. Laboratory screening showed the following exceedance for total coliforms: Total Coliforms: 240,000 MPN/100mL	Witheridge
9/3/2008	A follow-up investigation was conducted. Total coliform	Witheridge

	results continued to exceed action levels: Total Coliforms: 110,000 MPN/100mL An upstream investigation was initiated. Flow was again coming from the southwest corner of Jeffries Ranch Road and Del Mar Drive. A sample was taken of overland flow entering the catch basin (S120A): Total Coliforms: 70,000 MPN/100mL The overland flow was coming from the same two residential area drains but was not individually sampled.	

Investigatory Status

Upon confirmation, the orthophosphate and total coliforms continued to exceed Dry Weather Monitoring action levels. The flow was traced upstream to two residential area drains. On the first investigation, door hangers were placed on the door with an explanation of findings and more facts about water conservation. In addition, Clean Water Program Inspectors were asked to attempt to speak with the residents and provide further suggestions. These visits were made on July 18, 2008.

Camp Pendleton	Non-Dry Weather IC/ID 2007-2008	Ongoing

Site Summary:

Investigatory Actions

Date	Action	Staff
11/30/2007 12/3/2007 12/4/2007 12/7/2007 12/27/2007 1/5/2008- 1/7/2008 1/28/2008 1/29/2008 2/22/2008 2/25/2008	Discharge from Camp Pendleton into Oceanside Harbor at two outfalls: 1) In front of Harbor Administration Building and 2) at the corner of A and Z docks. All releases were photo documented. Contact with Camp Pendleton was made, but the releases continued. Referred to Regional Board.	Quan/ Balch/ Lahsaie/ Ericson
12/4/2007	Contact from Regional Water Quality Control Board to Camp Pendleton representatives.	Clemente
2/7/2008	Release of a few 1000 gallons of liquid with a pH of 11 to North Terrace Elementary School from Camp Pendleton. A large containment basin had been breached at a construction site adjacent to the school and the wash water was flowing into school property at 5 gpm. The flow was contained and Camp Pendleton's contractor hired NRC to clean up the spill.	Lahsaie/ Ericson
2/12/2008	Referred to Regional Water Quality Control Board.	

Investigatory Status

Camp Pendleton received a Notice of Violation for construction related BMP failures at the Del Mar North-Del Mar Housing project.

North Coast Village	Non-Dry Weather IC/ID 2007-2008	October 2007

Site Summary:

North Coast Village is a condominium complex located on the beach on the south side of the San Luis Rey River.

Investigatory Actions

Date	Action	Staff
10/2008	Drain on north east corner of property discharging water. Aegea HOA management company to resolve issue.	Lahsaie
10/3/2008	Letter to Clean Water Program Coordinator describing action. A plumbing company was hired to clear drains.	Lahsaie

Investigatory Status

Additional investigation completed and discharge was likely coming from construction on the roof remodel. The discharge was stopped.

Vista Unified School District	Non-Dry Weather IC/ID 2007-2008	11/21/2007

Site Summary:

Vista Unified School District is building a new magnet school near the intersection of Melrose and SR 76.

Investigatory Actions

Date	Action	Staff
11/21/2007	It was brought to Clean Water Program staff attention that the construction site of the Vista Magnet High School had large amount of rock and dirt on the property. With the impending storm season, the Clean Water Program Coordinator and two Engineering Inspectors conducted a site visit.	Lahsaie/ S. Kemp/ K. Kaimuloa
11/26/2007	Clean Water Program Coordinator, the Lead Engineering Inspector, and two Code Enforcement Officers met with School District Representatives and their contractor at the construction site.	Lahsaie/ Kemp/ Ericson/ Gremmels
11/28/2008	Clean Water Program Coordinator sent summary site visit and list of action items to School District Representative.	Lahsaie
12/14/2008	Response from School District Representative listing measures that had already been taken.	

Investigatory Status

While the City does not have direct enforcement authority of the school district, the City is required to inspect all construction activities in its jurisdiction that could have a potential to impact the city's surface and groundwater quality. The City continued to work with Vista Unified School District to eliminate the potential for discharges during construction.

Monterey Bay Canners	Non-Dry Weather IC/ID 2007-2008	2/11/08

Site Summary:

Monterey Bay Canners Restaurant is located in Oceanside Harbor between K and Y Dock. There are two storm drain outlets near the restaurant.

Investigatory Actions

Date	Action	Staff
2/11/2008	During Coastal Storm Drain Monitoring, runoff and wet pavement noticed at Monterey Bay Canners trash area. Evidence of runoff going into the storm drain, although at the time of the visit, runoff was ponded just before the storm drain. City staff talked to Assistant Manager on duty and discussed improved practices for trash area.	Witheridge
4/1/2008	During Coastal Storm Drain Monitoring, runoff seen coming from trash area and again ponded at storm drain. Referred to Code Enforcement.	Witheridge
4/2/2008	Code Enforcement talked with Manager of Monterey Bay Canners Restaurant. Found leaking water pipe on roof. Problem was fixed immediately.	Gremmels

Investigatory Status

Code Enforcement officer spoke with manager and problem was fixed. This site is monitored regularly as part of the Coastal Storm Drain Program and no problems have occurred since.

Falling Leaf	Non-Dry Weather IC/ID 2007-2008	2/13/2008

Site Summary:

2338 Falling Leaf. Private residence with backyard backing up to a residential property located in the County unincorporated area with a septic system. Retaining wall on back side of slope constantly wet.

Investigatory Actions

Date	Action	Staff
2/12/2008	Initial investigation conducted in response to resident complaint. Possible septic failure at the top of the hill on County property.	Witheridge/ Lahsaie
2/13/2008	Follow-up investigation conducted. Samples collected for microbiology analysis and field test kit used for ammonia and nitrate measurements. See results below.	Witheridge/ Lahsaie

Investigatory Status

Investigation was conducted, but bacteria levels did not indicate a bacterial release:

Date	Time	Site ID	Location	Flow (gpm)	NO3-N[1] (mg/L)	NH4[2] (mg/L)	Total Coliform[3] (MPN/ 100mL)	E.coli[3] (MPN/ 100mL)	Entero[3] (MPN/ 100mL)
2/13/08	1405	FL1	Outlet onto street at 2336	0.7	17.3	0.6	1730	10	41
2/13/08	1420	FL2	Front yard of 2336	0.18	18	0.6	364	<10	10
2/13/08	1425	FL3	West side of backyard 2336	Ponded	N/S	N/S	5490	10	63

[1] CHEMetrics Field Test Kit for Nitrate as N - Cadmium Reduction Method

[2] CHEMetrics Field Test Kit for Ammonia as N - Direct Nesslerization Method

[3] Analyzed by City of Oceanside Water Utilities Laboratory

This property was also investigated in 2003 for similar concerns. Results were inconclusive then, as well. Results were sent to the resident and it was recommended that they contact the County for further issues, since the City of Oceanside does not have jurisdiction over the properties located in the County unincorporated areas.

Genentech	Non-Dry Weather IC/ID 2007-2008	2/17/2008

Site Summary:

Genentech is a large biotech company located in the Loma Alta watershed.

Investigatory Actions

Date	Action	Staff
2/17/2008	Release of an estimated 5,000 gallons of process water was discharged to the storm drain on Genentech property due to equipment malfunction. The water consisted of softened city water and a blowdown from Genentech's high purity water-distillation process. The water was free of pollutants. The release was stopped in approximately 50 minutes.	
2/20/2008	Release reported to Clean Water Program.	Lahsaie
2/22/2008	Genentech took a proactive approach and sent a letter to the Regional Water Quality Control Board and the City of Oceanside detailing the events of the release and correction action they had taken.	

Investigatory Status

No further contact.

Eastview Court	Non-Dry Weather IC/ID 2007-2008	2/27/2008

Site Summary:

Road buckling and water discharge coming from 1400 block of Eastview Court.

Investigatory Actions

Date	Action	Staff
2/27/2008	Clean Water Program Coordinator received detailed report of water runoff causing road cracking in the 1400 block of Eastview Court. Several City Departments were involved including Roads, Water, and the Clean Water Program.	Mallett/ Lahsaie
2/28/2008	Issue was forwarded to City Engineer and City consultant for geotechnical work. Chlorine tests of runoff indicated groundwater. Solution will require capital improvements project to put drain pipe in.	Smith/ Knowlton

Investigatory Status

No further contact.

Desmond Circle	Non-Dry Weather IC/ID 2007-2008	3/17/2008

Site Summary:

Resident complaint of runoff from neighbor's yard caused by over-irrigation and possible leak. Runoff is also entering storm drain.

Investigatory Actions

Date	Action	Staff
3/17/2008	Complaint received. On going problem that Code Enforcement has been a part of.	Lahsaie/ Crawford
3/18/2008	Water Utilities checked water meter records. Records indicate water use within reason currently, but historical high segments.	Lahsaie/ Ludlow
3/20/2008	Clean Water Program Coordinator spoke with resident. A broken irrigation line was fixed. Swimming pool in backyard may also be leaking. Suggested that resident hire an expert to determine if the source is groundwater or irrigation. Offered to take water sample for chlorine.	Lahsaie

Investigatory Status

No further contact.

CITY OF OCEANSIDE
WATER UTILITIES DEPARTMENT

DATE: **September 25, 2009**

RE: **STATEMENT OF CERTIFICATION**
CITY OF OCEANSIDE JURISDICTIONAL URMP

I certify under penalty of law that the Jurisdictional Urban Runoff Management Program Annual Report for 2008-2009 was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for knowing violations.

SIGNATURE: M. A. Lahsaiezadeh

NAME: Mo Lahsaiezadeh
TITLE: Clean Water Program Coordinator
JURISDICTION: City of Oceanside

THIS PAGE INTENTIONALLY LEFT BLANK

ES EXECUTIVE SUMMARY

Introduction

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the San Diego Copermittees. Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2008 – June 30, 2009).

Report Organization

Section J of Municipal Permit 2007-0001 defines the requirements for the Jurisdictional Urban Runoff Management Program (JURMP) Annual Report and states that each JURMP Annual Report shall, at a minimum, contain a comprehensive description of all activities conducted by the Copermittee for each required component. Table ES-1 presents these components and the section in which they are discussed.

Table ES-1. Municipal Permit 2007-0001 Reference Table.

Municipal Permit 2007-0001 Components	Annual Report Section
Development Planning Component	Section 2.0
Land-Use Planning	Section 2.2
Environmental Review Process	Section 2.3
Development Project Approval and Verification Process	Section 2.4
Construction Component	Section 3.0
Municipal Component	Section 4.0
Industrial and Commercial Component	Section 5.0
Residential Component	Section 6.0
Illicit Discharge Detection and Elimination Component	Section 7.0
Education Component	Section 8.0
Public Participation	Sections 9.0
Fiscal Analysis Component	Section 10.0
Effectiveness Assessment Component	Section 11.0
Special Investigations	Section 12.0
Non-Emergency Fire Fighting	Section 13.0
JURMP Revisions	Section 14.0
Conclusions and Recommendations	Section 15.0

Pursuant with the Municipal Permit this document contains all of the required information.

Program Highlights

Below is a summary of each section which describes the Clean Water Program activities appearing in this Annual Report. Please refer to the individual section for more detailed information.

Section 2.0 Development Planning Component

All new development and redevelopment projects are subject to the priority project or standard project provisions in the City's Interim SUSMP. During this reporting period the City adopted an Interim SUSMP which includes revisions that conform to the requirements of the Municipal Permit. Minimum storm water BMP requirements are part of the City's standard conditions of approval and are required of all projects receiving discretionary permits. The City will not support the entitlement of a project or issue development permits until the appropriate documents are reviewed by City staff and approved by the City Engineer. During the 2008-09 reporting period document reviews for each SWPPP and SWMP submitted by project applicants were performed. The City evaluated its established environmental review process for all development projects to determine compliance with the new Municipal Permit and determined that the current environmental review process adequately addresses the requirements of the Municipal Permit.

Section 3.0 Construction Component

The City of Oceanside Clean Water Program provided an updated inventory of construction sites with the 2008 JURMP and has revised that inventory during this reporting period. During the reporting period, the Clean Water Program inspected 55 construction sites to ensure they were in compliance with the City Code.

Section 4.0 Municipal Component

The City of Oceanside Clean Water Program utilized its 2008-09 municipally owned inventory and inspected 181 municipal areas to ensure these facilities are in compliance with the City Code. A total of 2,062 tons of waste was removed as a result of street sweeping and a total of 65.89 tons of waste was removed from the storm drain system (MS4) as part of the annual cleaning. Four-thousand and fifty two (4,052) feet of City sewer pipes were slip lined and 47 manholes rehabilitated.

Section 5.0 Industrial and Commercial Component

During this reporting period the staff of the Clean Water Program conducted a comprehensive update of its Industrial and Commercial business inventory. Working in conjunction with the Businesses Licensing division, the city updated its inventory based on commercial and industrial classifications, watershed location, and assignment of high, medium and low priorities. The inventory now includes 2,373 Industrial and Commercial businesses. Thirty three (33) industrial businesses and 539 commercial businesses were inspected during this reporting period, to ensure these facilities are in compliance with City Code.

Section 6.0 Residential Component

The City of Oceanside has developed an extensive program that aims to reduce pollutant runoff from residential areas and activities to the maximum extent practical (MEP). The City of Oceanside Clean Water Program received 124 calls on the Urban Runoff Hotline and Code Enforcement Program received 109 complaints from residents regarding potential urban runoff violations from residential areas and activities. Extensive educational efforts were made to help

Oceanside residents understand watersheds, water quality and urban runoff impacts through presentations on a local television channel, Clean Water Program newsletters mailed to each household, and through information available on the Clean Water Program Website.

Section 7.0 Illicit Discharges Detection and Elimination Component

This section is intended to document the activities conducted by the City of Oceanside during the 2008-2009 reporting period to manage illicit discharges. In accordance with the September 10, 2008 Regional Water Quality Control Board adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the entire FY 2008-09 Illicit Discharge Detection and Elimination Component, including the 2009 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2009.

Section 8.0 Education Component

The City of Oceanside Clean Water Program continued to use a variety of avenues to educate various internal and external groups about the Clean Water Program and the requirements of Municipal Permit Order 2007-0001. These outreach activities included municipal staff training, CWP newsletters, staffing community booths, conducted watershed education presentations, continued implementation of a 5th grade curriculum titled Project SWELL and targeting under-served audiences with educational materials.

Section 9.0 Public Participation Component

The Clean Water Program continued to sponsor beach and creek cleanup events and supported private groups who wanted to coordinate their own cleanup events. During this reporting period a total of 2,426 volunteers participated in these events, removing more than nine tons of trash, and debris, from the local waterways. In addition the City participated in regional education events including staffing a stormwater booth at the San Diego County Fair's EnviroFair Day.

Section 10.0 Fiscal Component

The City of Oceanside Clean Water Program continued to acquire funding from various sources to implement programs to meet Municipal Permit Order 2007-0001. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge that is delineated on the utility bills for each household and is based on the customer's water consumption. Approximate expenditures for the 2008-09 fiscal year is provided as well as the budget for the 2009-10 reporting period.

Section 11.0 Effectiveness Component

The City implemented an effectiveness assessment program to assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The City gathered and evaluated data for some of the program components for assessment during this reporting period. This data will be valuable for incorporation into long-term effectiveness evaluation on a jurisdictional level.

Section 12.0 Special Investigations

The City of Oceanside received funding from two sources to implement two water quality related projects: the San Luis Rey Bacteria Source Tracking Study and the Loma Alta Creek Ultraviolet Treatment Facility.

Lower San Luis Rey Bacteria Source Tracking
As part of the Proposition 50 Clean Beaches Initiative, the City of Oceanside was awarded $554,375 to track the sources of bacteria in the Lower San Luis Rey River. This study project has a goal to identify the sources and quantify the loading of bacterial contamination in the lower San Luis Rey River using a tiered approach. This approach will permit prioritization for mitigation of microbial contaminants and appropriate actions will be recommended to eliminate sources of bacterial contamination. Unfortunately, on December 19, 2008, the State Water Resource Control Board issued a Budget Letter that suspended all projects including the Lower San Luis Rey Source Identification Project, due to State budgetary constraints.

The Loma Alta Creek Ultraviolet Treatment Facility
The City was awarded a $5,000,000 Proposition 40 Clean Beaches Initiative (CBI) grant by the State Water Resources Control Board to construct an ultraviolet (UV) light treatment facility at the existing La Salina Wastewater Treatment Facility. The anticipated project goal is to eliminate beach closures during the dry season at Buccaneer Beach in Oceanside, California. This will be achieved by diverting the flow from the Loma Alta Lagoon through a UV treatment facility prior to discharging the flow onto the shoreline.

The Loma Alta Creek Ultraviolet Light Treatment Facility started treatment in June 2009 and continued September 2009. Water samples were taken weekly from Buccaneer Beach directly in front of the discharge pipe and seventy-five feet north and south of the discharge pipe. The samples were tested for total and fecal coliform and Enterococcus. All samples taken during summer 2009 met California Department of Health Services AB411 Objectives and there were no postings due to bacterial levels exceeding standards set by the County Department of Environmental Health.

Section 13.0 Non-Emergency Fire Fighting
Non-emergency fire fighting BMPs and educational methods for reducing the discharge of pollutants from non-emergency flows to the MEP are described in Section 13.

Section 14.0 JURMP Revisions
During this reporting period there were several revisions made to the City's 2008 JURMP. See Section 14 for more details.

Section 15.0 Conclusions and Recommendations
This section presents the conclusions from the 2008-2009 reporting year and provides recommendations for future activities and management actions for JURMP program components. To facilitate more streamlined JURMP reporting and aide in the effectiveness assessment period several departments within the City moved forward with implementation of various data tracking systems toward the end of the reporting period. It is anticipated that these data tracking systems will be fully functional in the 2009-10 reporting period.

1.0 INTRODUCTION

This annual report document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) (referred to in this document as the Municipal Permit) draining the Watersheds of the County of San Diego, which include agencies with land use authority including the incorporated Cities of San Diego County, the County of San Diego, the San Diego Unified Port District, and the San Diego County Regional Airport Authority (collectively called Copermittees). Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2008-2009 annual reporting period (July 1, 2008 – June 30, 2009).

This Municipal Permit is based on the Federal Clean Water Act (CWA), the Porter–Cologne Water Quality Control Act, applicable state and federal regulations, all applicable provision of statewide Water Quality Control Plans and Polices adopted by the State Water Resources Control Board (SWRCB), the Water Quality Control Plan for the San Diego Basin adopted by the Regional Water Quality Control Board (RWCQB), the California Toxics Rule, and the California Toxics Rule Implementation Plan. This Annual Report addresses the renewed NPDES Permit No. CAS0108758, which was first issued on July 16, 1990 (Order No. 90-42), renewed on February 21, 2001 (Order No. 2001-01), and renewed again on January 24, 2007

In the interests of communicating consistent messages to the community regarding the most efficient and effective means of reducing storm water and urban runoff pollution, and as directed under Part J.5 of the Municipal Permit, this document was developed following the standardized format developed and agreed upon by the Copermittees. For the most part, compliance with the Municipal Permit was undertaken by the Copermittees through the development and implementation of the JURMP; therefore this Annual Report is organized in a similar format as the 2008 JURMP.

1.1 Background

Urban development typically involves conversion of natural space to developed areas that include impervious surfaces such as streets, buildings, and parking lots. With the increase in human population and impervious surfaces associated with developed areas there tends to be higher runoff volume and velocity due to the impervious area's incapacity to absorb and hold rainwater. Also, human use of developed areas is associated with a number of pollutants that can be conveyed to the municipal separate storm sewer system (MS4) by a rain event or non-storm water discharges. This is called non-point source pollution. Non-point source pollution, such as urban runoff discharges to the MS4, is a large source of pollutants to receiving water bodies in the San Diego region and throughout the United States. Pollutants commonly associated with urban runoff include sediments, pesticides, fertilizers, herbicides, trash, oil and grease, and heavy metals. Such pollutants are generated by everyday activities such as construction, landscaping and vehicle use and maintenance.

Pollutants that reach receiving water bodies, such as streams, lakes, bays, lagoons, and the ocean, have the potential to significantly impact human and environmental health as well as wildlife that utilize these water bodies and surrounding habitat for survival. Notably, environmentally sensitive areas (ESA) are especially threatened by urban development because such areas tend to have lower capacities to withstand pollutants entering the area.

1.2 Purpose and Objectives

The purpose of this annual report is to present the activities the City conducted during the Fiscal reporting period of July 1, 2008 through June 30, 2009 to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The activities involved implementing, and improving where needed, existing programs and developing new programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. Improving the quality of the discharge from the MS4 should have beneficial effects on the local receiving water bodies.

Table 1-1 presents the organization of the City's JURMP Annual Report and a summary of the corresponding permit requirement in Order No. 2007-0001. Some Report sections and permit requirements overlap and will be found in multiple locations throughout the document.

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

The development of urban areas has the potential to negatively impact the surrounding environment. The addition of impervious surfaces can alter the natural drainage patterns of the area, and development can facilitate the introduction of pollutants to the environment resulting from human activities. Accordingly, the City has developed measures to limit the potential for urban development to negatively impact the environment through careful land use planning and thoughtful design of development projects. Development projects are defined by the Municipal Permit as new development or redevelopment with land disturbing activities, structural development including construction or installation of a building or structure, the creation of impervious surfaces, public agency projects, and land subdivision. Through the implementation of the City's development planning component the City will reduce the discharge of pollutants from development projects to the Maximum Extent Practicable (MEP), protect receiving water bodies while managing increases in runoff that have the potential to increase erosion in streams or rivers.

This section documents the City Jurisdictional Urban Runoff Management Program (JURMP) Development Planning activities performed by the City of Oceanside during the reporting period of July 1, 2008 to June 30, 2009. The City has continued to implement the comprehensive Land-Use Planning component of the JURMP in order to satisfy the provisions of Section D.1 of the San Diego RWQCB Order No. R9-2007-0001; also referred to as the Municipal Permit. A directory of the subsections within the Municipal Permit Section J.3.a and corresponding Annual Report compliance sections are listed in Table 2-1, below.

Table 2-1. Order No. R9-2007-0001 Compliance Summary.

J.3.a.(3)(a).i Amendments to General Plan	See Section 2.2.1 of this Annual Report
J.3.a.(3)(a).ii Projects underwent urban runoff approval process	See Section 2.4.3 of this Annual Report
J.3.a.(3)(a).iii Project with SUSMP Requirements	See Section 2.4.4.8 of this Annual Report
J.3.a.(3)(a).iv SUSMP BMP requirements were applied	See Section 2.4.4.2 of this Annual Report
J.3.a.(3)(a).v Example of priority development project	See Section 2.4.4.4 of this Annual Report
J.3.a.(3)(a).vi Projects allowed to implement low removal efficiency BMPs	See Section 2.2.3 of this Annual Report
J.3.a.(3)(a).vii Treatment Control Inventory	See Section 2.4.4.7 of this Annual Report
J.3.a.(3)(a).viii Number of treatment control BMPs inspected	See Section 2.4.4.7 of this Annual Report
J.3.a.(3)(a).ix	See Section 2.4.4.7 of this Annual Report

Description of verification of O&M for treatment control BMPs	
J.3.a.(3)(a).x Confirmation that BMP verification was conducted for all priority development projects	See Section 2.4.3 of this Annual Report
J.3.a.(3)(a).xi Projects with SUSMP waivers	See Section 2.4.4.8 of this Annual Report

J.3.a.(3)(a).xv Development projects not required to meet HMP requirements	See Section 2.2.3 of this Annual Report
J.3.a.(3)(a).xvi Development projects disturbing 50 acres or more	See Section 2.2.3 of this Annual Report
J.3.a.(3)(a).xvii Violations and enforcement actions for development projects	See Section 3 Attachment 3-C of this Annual Report
J.3.a.(3)(a).xviii Notable activities	See Section 2.2.1 of this Annual Report

2.2 Land Use Planning

2.2.1 Background

The development planning component focuses on efforts to mitigate erosion and reduce pollutant discharges in urban runoff resulting from new development and redevelopment projects to the MEP through land use planning and development process that includes project review, approval, and verification.

The Land Use Element of the General Plan was amended in 2003 to include a number of water quality and watershed protection measures. The primary focus of the measures was to provide a more balanced relationship between the needs of the community and development interests, while managing finite natural resources. There were no water quality related amendments adopted into the General plan during this reporting period. The specific policies are detailed in Section 4.2.3 of the 2008 Jurisdictional Urban Runoff Management Plan.

2.2.1.1 Notable Activities

The City engaged in two notable activities to promote the management of urban runoff from development projects including participation in regional workgroups related to development projects and the decisions to move forward with the implementation of a new data tracking system.

The City of Oceanside, including staff from the CWP and the Engineering Division, regularly participated in the HMP-TAC and the Copermittee Development and Construction workgroups. City staff attended meetings and provided comments on the development of regional work products including the County-wide Model SUSMP.

During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water, Sewer, and the Clean Water Program, continued rolling out the GBA Masters Series software. Water and Sewer continued to utilize the product and the Clean Water Program gained approval to purchase additional licenses and hire a consultant to help modify the software to their needs. Complete roll-out for the Clean Water Program is expected in reporting year 2009/2010. The Development Services Department, which includes Code Enforcement, Building, and Engineering, choose CRW Systems, Inc. and will begin roll-out in the 2009/2010 reporting year. These systems will allow for tracking and reporting of needed information, including stormwater data, across the departments.

2.2.2 Source Characterization

Source characterization is an important component of any urban runoff program. Various land use types and activities are known to generate different combinations of pollutants that have the potential to negatively affect the surrounding environment, including the receiving waters.

The Interim SUSMP identifies twelve (12) separate "Project Categories", which are cited as anticipated or potential sources of storm water pollution based upon a particular land use and specific site conditions. By identifying pollutant sources and the impairments to the receiving waters; a project may effectively mitigate storm water impacts, to the Maximum Extent Practicable (MEP) through the implementation of Low Impact Development (LID) practices and the appropriate application of a combination of Source Control, Site Design, and Treatment Control BMPs. Project Categories and General Pollutant Categories appear in Table 3 of the Interim SUSMP.

2.2.3 Best Management Practice Requirements

There are established minimum design requirements for all development projects, which are discussed in Section 4.4.3 of the 2008 JURMP. In addition, the Land Use Planning Element of the General Plan contains policies to protect water quality that are reflected in Section 4.2.3 of the 2008 JURMP. During the latter part of this reporting period (i.e. March 2008), the City adopted an Interim SUSMP which contains several new storm water requirements. The BMP requirements were influenced by the inclusion of the LID practices and the phased introduction of the Hydromodification Plan (HMP) as part of the Municipal Permit.

LID practices are included in the Site Design BMP discussion of the Interim SUSMP. The addition of LID practices lends direct support to the HMP component by providing a broad spectrum of design concepts aimed at minimizing the introduction of pollutants and offsetting the conditions of concern associated with impacts to the hydrologic regime. During this reporting period, there were no projects subject to the "Interim Hydromodification Criteria for Projects Disturbing 50 Acres or More".

The Interim SUSMP also includes Treatment Control BMP discussion which provides a direct correlation to pollutant types and physical characteristics that enable transport. This information assists the design professional in developing an effective BMP "treatment train" and facilitates the pursuit of the MEP standard. Treatment Control BMPs are required to meet the medium removal efficiency standard for the identified Primary Pollutants of Concern associated with a specific site development. The implementation of a Treatment Control BMPs with low removal efficiency is not permissible. The Interim SUSMP is available at the City of Oceanside – Engineering Division counter or may be downloaded from the City website at http://www.oceansidecleanwaterprogram.org/dev_susmp.asp.

2.2.4 Program Implementation

The General Plan has been adopted by the City Council and is a legally binding document; the City of Oceanside is required to abide by its policies. In addition to the General Plan, the City addresses water pollution through implementation of its Municipal Code. Chapter 40 of the Municipal Code is the Urban Runoff Management and Discharge Control Ordinance and is commonly referred to as the Storm Water Ordinance. The Ordinance contains multiple references to the SUSMP. The City first adopted the SUSMP in 2002 as a condition of the governing Municipal Permit. The document was based on a regionally developed Model SUSMP. More recently, the SUSMP was revised to conform to the 2007 Municipal Permit and was adopted in March 2008 as the Interim SUSMP.

All new development and redevelopment projects are subject to the priority project or standard project provisions in this Interim Local SUSMP, subject to the lawful prior approval provisions of the Municipal Permit. Development projects deemed not to be a threat to storm water quality, per the City's Urban Runoff Assessment form and on a case-by-case basis, may be exempt from SUSMP requirements. The Interim SUSMP was developed to address post-construction urban runoff pollution from various types of development projects. Certain categories of development projects were deemed more likely to discharge pollutants and are defined as Priority Development Projects (Priority Project) and are subject to additional storm water requirements. As part of the design process, Priority Projects must submit post-construction BMP plans, known as Storm Water Mitigation Plans (SWMPs). These SWMPs must list the BMPs proposed to address the potential pollutants likely to be generated by the development and conditions of concern typically associated with the type of development.

Details on the completed and planned SUSMP updates may be found in Section 4.4.4.4 of the 2008 JURMP. In addition, information pertaining to the legal authority to implement a storm water program is located in Section 2 of the 2008 JURMP.

2.3 Environmental Review Process

The City has evaluated its established environmental review process for all development projects to determine compliance with the new Municipal Permit. The City guides the developers through the filing necessary documents and identifies which reports are required to be submitted and approved before development may begin. The current environmental review process places emphasis on the evaluation of water quality impacts and related issues that may result from the project development.

The Planning Division and Engineering Division of the Development Services Department are responsible for reviewing development projects for conformance with storm water requirements. The City will continue to assess all development and redevelopment projects for compliance with the California Environmental Quality Act (CEQA) by reviewing the Environmental Initial Study checklist completed by each project applicant. A copy of this checklist is included in Appendix D of the 2008 JURMP. The checklist contains questions to evaluate potential negative impacts on receiving water bodies. Projects which are determined to have "potentially significant impacts" to the surrounding environment and receiving waters are required to prepare Environmental Impact Reports (EIRs) for City review. Development projects that are not required to prepare EIRs proceed to the next phase of the approval process.

During the development of the 2008 JURMP, the City evaluated its current established environmental review process for all new development and redevelopment projects to determine compliance with the new Municipal Permit. The City determined that the current environmental review process adequately addresses the requirements of the Municipal Permit. While the specific requirements evaluated during the environmental review process are expected to change periodically, the basic review structure did not require revision during this reporting period. Details of the current environmental review process are provided in Section 4.3 of the 2008 JURMP.

2.4 Development Project Approval and Verification Process

2.4.1 Background

The City has an established administrative and discretionary approval processes that provides multiple reviews by the Planning and Engineering Divisions. The Planning Division is responsible for determining acceptable land uses, development constraints, and identifying environmental issues. The Engineering Division is composed of various disciplines (i.e., Engineering Improvements, Grading and Drainage, Water and Sewer Utilities, Hydrology, Geotechnical, Storm Water, Traffic, and Landscape), which perform a coordinated review of all project applications. In addition, the Building Division coordinates with Storm Water Review to ensure that new development, remodeling projects, additions, or demolitions are reviewed for compliance with storm water regulations. The Fire Department also performs multiple reviews and notifies the appropriate division in the event of a discrepancy or nonconformance. The coordinated involvement of all Divisions and disciplines provides an elevated degree of assurance that all projects are subjected to thorough scrutiny as part of the normal review process. Particulars surrounding the project approval and process verification are discussed in the following sections.

2.4.2 Source Characterization

Understanding and identifying pollutant sources is a basic component in developing a comprehensive storm water mitigation program. Sufficient data exists to support the claim that a particular land use will generate, or potentially generate, certain types of pollutants.

Table 3 of the Interim SUSMP identifies twelve (12) individual "Project Categories" that have been determined to contribute pollutants based upon land use type and proximity to

environmentally sensitive areas. The pollutants associated with various land uses are categorized as being anticipated or potential; depending on site specific conditions. All projects, i.e. Priority Development and Standard Development Projects, are required to identify "Pollutants of Concern from the Project Area" as part of the SWMP or Runoff Assessment Report (RAR). Once identified, the project shall implement appropriate BMPs to mitigate the pollutants generated by the project area. The Project Categories and General Pollutant Categories appear in Table 3 of the Interim SUSMP.

2.4.3 Best Management Practice Requirements

The Municipal Permit dictates minimum BMP requirements for all new development and redevelopment projects. The requirements are included in the City Storm Water Ordinance and Interim SUSMP and shall include, but not be limited to, the implementation of the following BMPs and LID practices by the project proponent:

- Source control BMPs that reduce storm water pollutants of concern in urban runoff, including storm drain stenciling and signage, properly designed outdoor material storage areas, properly designed trash storage areas, the implementation of Integrated Pest Management Principles (IPM) and the inclusion of efficient irrigation system, and drought tolerant/native species landscape design.

- Low Impact Development (LID) BMPs implemented where feasible to maximize infiltration, provide retention, slow runoff, minimize impervious footprint, direct runoff from impervious areas into landscaping, utilization of natural drainage systems, and constructing impervious surfaces to minimum widths necessary;

- Buffer zones for natural water bodies, where feasible. Require the project proponent to implement other types of buffers such as trees or access restrictions where conventional setbacks are not feasible;

- Measures to mitigate discharges of pollutants that result during grading or construction activities as specified in the Section D.2 of the Municipal Permit; and

- Submittal of a mechanism under which ongoing long-term maintenance of all structural post-construction BMPs will be conducted.

These minimum storm water BMP requirements are an integral part of the City standard conditions of approval and are required of all projects receiving discretionary permits. The City will not support the entitlement of a project or issue development permits until the appropriate Interim SUSMP documents are reviewed by City staff and approved by the City Engineer. Any subsequent changes that affect the approved BMPs will be subject to an amendment process that includes review by City staff and approval by the City Engineer.

2.4.4 Program Implementation

2.4.4.1 SUSMP Revision

During this reporting period the City continued to implement requirements and practices cited in the Interim SUSMP. A permanent, full-time staff member was added to the Water Utilities

Department, Clean Water Program to continue the storm water review program that was previously initiated in the Engineering Division; i.e. reviewing SUSMP documents for conformance with the Interim SUSMP and to ensure that related final engineering plans are consistent with the approved SUSMP documents. There were no revisions to the City Interim SUSMP during this reporting period.

The City has continued working toward the adoption of a final HMP by participating in shareholder and Copermittee meetings, and sessions of the HMP TAC. The final HMP is expected to be submitted to the RWQCB by late December 2009. For the time being, the City will continue to implement Interim Hydromodification Criteria until the final HMP is approved.

2.4.4.2 SUSMP Document Review

Each new development and redevelopment project is required to complete the Urban Runoff Threat Assessment Form – Attachment D of the Interim SUSMP. The form and associated development plans provide staff with information to perform a SUSMP determination. SUSMP determinations are performed on a case-by-case basis. A SUSMP determination typically places the vast majority of projects into a Priority Development or Standard Development category.

A very limited number of projects are not required to submit a SUSMP document and are noted as SUSMP exemptions. A SUSMP exemption differs from a SUSMP wavier of infeasibility. The City has never granted a waiver of infeasibility to a Priority Project and does not anticipate granting waivers in the future; however, if waivers are necessary, the City may elect to develop a waiver mitigation program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the project watershed.

A project with a SUSMP exemption is not categorized as a Priority or Standard Project; is not subject to permanent storm water requirements, and does not have a greater than “low” threat to water quality construction prioritization, pursuant to Section 1, Part A and Part B of the Urban Runoff Threat Assessment Form. Projects which are granted a SUSMP exemption typically involve incidental construction with negligible ground disturbance. Examples include the addition of an antenna to an existing cellular tower or interior tenant improvements to an existing building.

The overwhelming majority of new development and redevelopment projects are subject to the provisions of the Interim SUSMP. Projects are identified as Priority Development or Standard Development projects based upon land use categories and applicability of permanent storm water BMPs pursuant to Section 1 of the Urban Runoff Threat Assessment Form.

2.4.4.3 Priority Projects

Priority Projects are required to obtain an approved SWMP as part of the entitlement process. The items required in a SWMP are described in Section 2.2.2 of the Interim SUSMP. In summary, Priority Projects must determine the Primary Pollutants of Concern based upon source characterization and impacts to the 303(d) impaired receiving waters. This category of development is required to provide Source Control BMPs while implementing LID practices and Site Design BMPs. The project must incorporate Structural Treatment Control BMPs into the

site development. The selected Treatment Control BMPs must have a medium to high removal efficiency for the identified Primary Pollutants of Concern. The Treatment Control BMPs with low pollutant removal efficiencies are not permissible in the City of Oceanside.

Priority Projects must also have an approved Operation and Maintenance Plan (O&M Plan) and enter into a Storm Water Facilities Maintenance Agreement (SWFMA) to ensure the long-term maintenance and operation of the Treatment Control BMPs. The City Engineer will not consider Priority Project structural Treatment Control BMPs "effective," and therefore will not accept storm water BMPs as meeting the MEP standard, unless a mechanism is in place that will ensure ongoing long-term maintenance of all structural BMPs. This mechanism shall be proposed by the project proponent as part of the SWMP and will be refined though the City's review process until satisfactory verification of maintenance is provided to the City Engineer. Such verification may include but is limited to covenants, legal agreements, maintenance agreements, and/or conditional use permits. A security may be required.

2.4.4.4 Priority Project Example

The Elfens Children's School (ADP-6-07) is an example of an infill Priority Development Project. The project is located on a 1.36-acre pre-graded site. The surrounding subdivision and adjacent Arrowood Golf Course were constructed in 2003. The development includes the following Priority Project categories; Commercial Development > 1 acre, restaurant, and parking lot. The project has integrated LID practices, Site Design, Source Control, and Treatment Control BMPs into a comprehensive storm water mitigation plan.

The project LID and Site Design BMPs include minimizing impervious drive aisles and parking, maximizing rainfall interception by incorporating drought tolerant groundcover and canopy intercepting landscape, and minimizing directly connected impervious areas by discharging roof drains to stabilized landscape areas. Source Control BMPs implemented onsite include properly designed trash storage areas, utilizing an efficient irrigation system, prohibiting outdoor material and processing areas, installing prohibitive dumping signage and stenciling, and providing public education to the occupants.

The project is divided into three watershed management areas (WMAs) for the purpose of mitigating storm water runoff and offsetting potential changes to the hydrologic regime. Two of the WMAs will be developed, while the third will remain a pre-graded pad. The pre-graded pad will be stabilized by a combination of erosion control and treatment control BMPs, which include but are not limited to the placement of straw wattles and gravel bags, the application of hydroseed, and the installation of a proprietary filter. Future development considerations will be addressed by amending the approved SWMP.

The remaining portion of the site consists of building, parking, and landscape area, which form two separate WMAs. Approximately two-thirds of the school building and the majority of landscape area form the southern watershed. Roof drains are directed to the stabilized outfall locations within the landscape area. There they form a confluence with landscape runoff. The combined flows receive treatment in a vegetated swale that conveys the runoff to a grated inlet. The remaining portion of the site is comprised on parking and roof area. Runoff from this WMA

is conveyed by sheet and gutter flow to a sand media filter. The treated flows are collected in a subdrain prior to discharge to the MS4.

2.4.4.5 Standard Projects

Standard Projects are required to obtain an approved RAR. The items required in a RAR are listed in Section 2.2.2 of the Interim SUSMP. Standard Projects must also identify the anticipated and potential pollutants based upon land use. The projects are required to implement Source Control and Site Design BMPs, and LID practices. Standard Projects are not required include Treatment Control BMPs. As such, the projects are not required to provide an O&M Plan or enter into a SWFMA.

2.4.4.6 Adequacy of Proposed Plans

The City Engineer will review submitted SUSMP documents and other relevant plans for compliance with the applicable SUSMP requirements. The City Engineer may approve proposed alternatives to the BMP requirements in the City's SUSMP if they are determined to be applicable and equally or more effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs and will be requested as part of a staff review cycle. The SWMP or RAR will be deemed complete when the City Engineer determines that the project complies with the Interim SUSMP. Project status is tracked by database and confirmed by hardcopy records.

2.4.4.7 Inspection

The City has compiled an inventory a Treatment Control BMP inventory with information for all approved Priority Projects. See Attachment 2-A for this inventory list. All installed Treatment Control BMPs are regularly inspected by City inspectors to ensure intended function and proper maintenance. Inspection frequencies are based on the project's assigned Threat to Water Quality (TTWQ) as determined by Interim SUSMP Attachment D, the Urban Runoff Threat Assessment form. The Municipal Permit dictates that high priority sites shall be inspected annually and medium priority sites are to be inspected every two years. Low priority site are inspected as needed. In addition, the Municipal Permit requires a minimum of 20% of the total number of projects with approved Treatment Controls and a maximum of twice the average number of projects with Treatment Control BMPs approved per year will be inspected annually. The Municipal Permit dictates 50% of all medium priority sites with drainage inserts will be inspected annually. City Inspection staff performed a total of 40 SUSMP inspections during this reporting period.

It is the responsibility of the inspection staff to ensure that all BMPs proposed for the project have been built according to the construction plans before signing off on each stage of construction. The inspectors will use the project's plans to identify any missing or incorrectly installed structural BMPs and deny approval for sites with observed problems. City Staff inspected all Priority Projects subject to SUSMP requirements prior to occupancy to ensure that all LID, Source Control, and Treatment Control BMPs proposed for the project have been constructed in compliance with all approved plans and City permits and ordinances. Inspections of Priority Project sites prior to occupancy allows the City to verify that all BMPs are in place before any anticipated pollutants associated with the occupied use of the site are generated.

The current plan check process includes steps to enforce the implementation of development requirements during construction. Since all Treatment Control BMPs are required to be shown on the project's plans, inspectors check to make sure these BMPs have been correctly installed during their routine inspections. Errors in BMP installation are noted during plan checks. Projects are required to promptly correct errors until BMP installation is consistent with the approved plan.

Inspections will include examination of all Treatment Control BMPs at the site to verify that each Treatment Control BMP is in working order, being maintained properly, and is in compliance with all applicable City ordinances and permits. Inspection findings will be documented by the inspector using the City of Oceanside Treatment Control BMP Inspection form in Appendix D of the 2008 JURMP. Deficiencies in Treatment Control operation and maintenance are noted during the inspection, the responsible party is notified and appropriate enforcement actions take place as described in Section 4.4.4.9 of the 2008 JURMP, in order to achieve compliance.

The City will require annual verification of proper maintenance of all treatment control BMPs by the responsible party for maintenance prior to the start of the rainy season. The City requires all Priority Projects to include Operation and Maintenance checklists and a self-inspection log for the site's Treatment Control BMPs found in the project SWMP. The City will require these forms to be completed by the site's responsible party and be submitted to the City annually. The annual maintenance verification of Treatment Controls by the party responsible for maintenance is unlike any current program within the City. Due to this circumstance, the City anticipates re-evaluation of its annual maintenance verification procedure to conform to current Municipal Permit requirements. See Attachment 2-A for sites that were inspected and/or have BMP maintenance verification on file for this reporting period

The City will use a variety of enforcement methods to ensure storm water requirements for all development projects within the City's jurisdiction are implemented. Enforcement measures will escalate with continued violations as necessary. A detailed description of the different enforcement measures used by the City of Oceanside to enforce its storm water regulations can be found in Section 2 of the 2008 JURMP.

Since installation of structural BMPs will be closely inspected and signed off during regular grading and building inspections, the City does not expect major deficiencies in BMP installation to be found once construction is completed. However, some Treatment Control BMPs, such as filter inserts, are usually installed post-construction and thus may not be checked during grading and building inspections. To address this, correct BMP installation is also examined during the final project inspection, and building inspectors sign off on the final "red line" drawings that include any approved changes that were made to the plans during the course of construction. This provides City personnel with the ability to check the constructed project against the approved storm water documents. If any BMP, including filter inserts, is noted to be missing or incorrectly installed by City inspectors during or upon completion of construction, the City will require project to correct BMP deficiencies.

Enforcement of post-construction BMP maintenance after occupancy will include verbal and written warnings and monetary penalties. All enforcement actions will be documented appropriately in the development project's database file. If a development site receives frequent citations or is not responsive to previously issued enforcement actions, more severe actions, such as court actions, will be used as necessary. Details surrounding the City Treatment Control BMP inspection program may be found in Section 4.4.4.7 of the 2008 JURMP.

2.4.4.8 2008-2009 SUSMP Document Submittal and Review Summary

A number of SUSMP document reviews were performed during the 2008-2009 reporting period. There were 53 Priority Project SWMP submittals which prompted 145 reviews with a total 24 of projects receiving approval. During the same period there were 7 Priority Projects that submitted Amendments to a previously approved SWMP that prompted 10 reviews and yielded 3 approvals. In addition, there were 10 Standard Projects that submitted an RAR which prompted 20 reviews. During the 2008-2009 reporting period a total of 5 Standard Projects received an RAR approval.

During the reporting period there were 17 Priority Projects that submitted O&M plans as part of the final engineering process. There were a total of 34 reviews performed with a total of 9 O&M Plans receiving approval. The SWMFA is typically submitted with O&M Plan. Some projects elect to "trail" the SWFMA submittal. During this reporting period 16 SWFMAs were submitted, prompting 43 reviews, resulting in 9 approved agreements.

All projects are subject to a SUSMP Determination. The determination process places the majority of developments into Priority Project or Standard Project categories. A small number of projects were found to be exempt from SUSMP requirements. Projects which are granted a SUSMP exemption typically involve minor construction with minimal ground disturbance. Examples of projects that are eligible to receive an exemption include interior tenant improvements to an existing structure or the addition of an antenna to an existing cellular tower. During this reporting period there were 81 reviews linked to the evaluation of 64 Urban Runoff Threat Assessments; submitted as part of the SUSMP Determination process. At total of 45 projects were not categorized as a Priority or Standard Project and therefore were not required to submit a SWMP or RAR.

A SUSMP exemption differs from a SUSMP wavier of infeasibility. The City has never granted a waiver of treatment control BMP infeasibility to a Priority Project and does not anticipate granting waivers in the future. However, if a waiver is deemed necessary, the City may elect to develop a waiver mitigation program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the project watershed. There were no SUSMP waivers of infeasibility granted during this reporting period. See Table 2-2 for more detail on project submittals and review results.

2.4.4.9 Outreach and Staff Training

City officials involved in planning and review of development projects received a comprehensive training on storm water requirements during this reporting period. See Table 2-3 for the departments and city officials that were provided training. Training topics during this reporting period focused on general water quality concepts, specific SUMSP requirements, LID components that can be recommended for specific projects, implementation procedures and minimal information about future HMP components.

Table 2-3. Staff Training during the 2008-2009 Reporting Period.

Department Division	Training Date	Number in Attendance
Building Division	July 30, 2008	12
Engineering Inspectors	October 23, 2008	10
Engineering-Capital Improvement staff	April 9, 2009	6
Planning Division	May 5, 2009	10

2.5 Development Planning Component Effectiveness Assessment

See Section 11.0 for an assessment of the development planning component of the City's JURMP.

2.6 Program Review and Modification

The Development Planning components of this Report, the City JURMP, and the SUSMP will be revised as necessary to conform to the future requirements of the Municipal Permit. Major revisions to the Development Planning component will be cited in Section 14 of the City JURMP.

3.0 CONSTRUCTION COMPONENT

3.1 Introduction

Construction and grading activities have the potential to impact neighboring water bodies due to the presence of disturbed soils and building materials. It is important that construction sites take appropriate measures to prevent potential pollutants from entering the storm drain system.

The purpose of the construction component section of the City's JURMP is to provide guidance in order to limit the negative impact that construction and grading activities can have on receiving water bodies. The information in this section of the annual report describes how the City of Oceanside met the minimum requirements outlined in Section D.2 of the Municipal Permit Order 2007-0001 to reduce the release of pollutants into the storm drain system to the Maximum Extent Practicable (MEP) (Table 3-1).

Table 3-1. Order 2007-0001 Compliance Summary

J.3.a.(3)(d).iv Updated construction site inventory	See Section 3.2.1 of this Annual Report
J.3.a.(3)(d).i Ordinance update and approval process modifications	See Section 3.3 of this Annual Report
J.3.a.(3)(d).vi BMP Implementation	See Sections 3.4 and 3.5 of this Annual Report
J.3.a.(3)(d).ix Confirmation that sites went through urban runoff approval process	See Section 2.4.3 of this Annual Report
J.3.a.(3)(d).x and xi Inspection of construction sites	See Section 3.5.2 of this Annual Report
J.3.a.(3)(d).xiii and xiv Enforcement of construction sites	See Section 3.5.3 of this Annual Report
J.3.a.(3)(d).xii Inspection frequency and totals during dry and wet seasons	See Section 3.5.2.3 of this Annual Report
J.3.a.(3)(d).vii Requirements for application of erosion and sediment control BMPs	See Section 3.5 of this Annual Report
J.3.a.(3)(d).viii Construction sites requiring Advanced Treatment	See Section 3.5 of this Annual Report

A large portion of the Construction Component of the City's JURMP is described in three documents:

- Chapter 40 of the City Code or Ordinances
- City's Grading Regulations Manual
- City's *Construction Urban Runoff Requirements Manual* (Construction Manual).

All of these documents are available on-line via the City's website.

The Construction Manual was developed by the City to provide construction projects with guidance in order to comply with the City Code and its ordinances. The Construction Manual is a living document and will change with time to ensure an effectively implemented program. Updated versions of the manual will be made available whenever modifications have been proposed and approved by the City. During this reporting period no changes were made to the Construction Manual. The City's full Construction Manual can be found in Appendix C of the 2008 JURMP Update. It is anticipated that this manual will change during this permit cycle once a new Construction Permit is adopted by the State Water Resources Control Board.

3.2 Source Characterization

3.2.1 Site Inventory

The City has compiled a watershed-based inventory of all active construction sites within its jurisdiction. The inventory includes details on each construction site, including project name, location, and threat to water quality (TTWQ) as determined by the process described in Section 5.2.1.1 of the 2008 JURMP.

The inventory process for construction sites is based on information collected from construction projects when they are applying for a grading or building permit. When the permit is approved, this information is then entered into a database developed by the City. If a permit was previously issued for a project, then the database is updated to reflect the most up-to-date information. A spreadsheet of active construction projects in the City's jurisdiction as of June 30, 2009 can be found in Attachment 3-A.

3.2.2 Construction Site Prioritization

All construction sites within the City's jurisdiction are assigned a priority of high, medium, or low TTWQ. Following are criteria used to determine the level of TTWQ.

Construction sites that meet any of the following criteria are considered a **High** TTWQ:

- A site 50 acres or more in size where grading will occur during the wet season.
- A site one acre or more and tributary to a CWA section 303(d) water body segment impaired for sediment or within, directly adjacent to, or discharging directly to a receiving water within an ESA.
- A site that has been determined by the City or the RWQCB to pose a significant threat to water quality.

Sites that are greater than one acre but do not meet any of the above criteria are considered a **Medium** TTWQ.

Sites less than one acre and are not determined to be a significant threat to water quality are considered a **Low** TTWQ. See Table 3-2 at the end of this section for a list of active construction sites and their assigned TTWQ.

Construction projects determine their TTWQ priority by completing the City's Urban Runoff Threat Assessment Form (Appendix D of the 2008 JURMP Update). This form contains information from the City's Construction Urban Runoff Requirements Manual (Construction

Manual) on how to evaluate a construction site's TTWQ. The Urban Runoff Threat Assessment form requires all construction sites to respond to the following questions when assigning priority:

- Item 1 – Project Size: Are you grading or otherwise disturbing soil of one acre or more?
- Item 2 – Planned period of grading: Will the project involve grading or soil disturbance?
- Item 3 – Vicinity of the Project to Environmentally Sensitive areas: Is the project tributary or adjacent to environmentally sensitive water bodies within the City?
- Item 4 – Presence of significant erodible slopes: Does the project include significant erodible slopes?
- Item 5 – Potential to produce significant non-storm water discharges or pollutants: Does the project have the potential to produce non-storm water discharges or pollutants?
- Item 6 – Project type: Will the project result in more than 5,000 square feet of impervious surface area?

All project proponents are directed to reference a prioritization matrix to determine the priority of the project. An example of the matrix is provided as Table 3-2 below. The matrix is used by first locating the appropriate row in the matrix according to the size of the project, then moving across the row. The proponent should refer to the answers given to the five questions above. If "Yes" was responded to a question, the corresponding box in the matrix provides the priority for the project. The use of this matrix was developed consistent with the requirements of the Permit Order 2007-0001. Under this process, construction sites that meet either of the following conditions must be classified as High Priority.

Table 3-2. Construction Project TTWQ Prioritization Matrix.

Project Size	Item 2	Item 3	Item 4	Item 5	Item 6	Default Priority
Greater than 50 acres	High	High	High	High	High	Medium
5□50 acres	□	High	High	High	High	Medium
1□5 acres	□	High	Medium	Medium	Medium	Medium
Less than 1 acre	□	Medium	Medium	Medium	Medium	Low

3.3 Updates to Ordinances and Approval Processes

During this reporting period there were no updates to the City's ordinances or approval process. Storm water compliance requirements for construction activities are included in the City's Construction Manual found in Appendix C of its 2008 JURMP.

The City made one revision to its SUSMP during this reporting period by exchanging an older isopoluvial map with a more recent version. Also, the City will be responsible for the adoption and implementation of a revised SUSMP by March 2010 which is based on a model SUSMP developed by the San Diego County copermittees. Once the City revises its SUSMP, the Construction Manual will again be reviewed and changes will be made appropriately. In addition, ordinances will be reviewed to make sure they reflect the information in the SUSMP and allow for LID components to be implemented into development projects. City of Oceanside Clean Water Program staff has been regularly attending and participating in meetings with San Diego County copermittees for the development of the model SUSMP.

3.4 Best Management Practice Requirements

The City has a set of minimum Best Management Practices (BMPs) that must be implemented at all construction sites regardless of TTWQ priority including implementing and maintaining general site management BMPs and erosion and sediment control BMPs to reduce, retain, and manage pollutant discharges to the MEP. Table 5-2 of the City's 2008 JURMP (pp. 5-4 and 5-5) outlines the minimum construction BMPs required by the City along with the reference to corresponding current fact sheets obtained from the Caltrans Storm Water Quality BMP Handbook and California Stormwater Quality Association (CASQA) for Construction Sites.

A Construction BMP brochure titled "A Pollution Prevention Guide for the Construction Industry" is provided to the developer during pre-development meetings. This brochure provides a sample drawing that illustrates the minimum BMPs that must be used at all construction sites to protect storm drains and minimize pollution. See Attachment 3-B for a copy of this brochure. This brochure is also available at both the Engineering and Building Department counters of the City. Approximately 250 brochures were distributed to the public by building division staff during this reporting period.

3.5 Program Implementation

All construction sites are required to select, install, and maintain BMPs that meet or exceed the minimum BMP requirements described in the City Construction Manual and in Section 5.4.1 of the 2008 JURMP. There in no minimum threshold of disturbed area that relieves a project of the responsibility to implement erosion and sediment control BMPs. Moreover, all sites requiring a grading permit are obligated to implement an Erosion Control Plan as part of the Grading Plan review and permit process. Construction activities that result in a land disturbance equal to or greater than one acre are subject to the requirements of the National Pollutant Discharge Elimination System (NPDES) Construction General Permit (CGP). Projects that are subject to the CGP are required to file a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB), obtain a Waste Discharge Identification Number (WDID#), and develop and implement a site specific Storm Water Pollution Plan (SWPPP) prior to the commencement of any grading activities. SWPPPs are required to include a list of BMPs that will be implemented during each phase of construction to reduce pollution discharges to the MEP. In addition, selected projects governed by the CGP may be required to employ advanced treatment as part of their SWPPP. Each project will perform a site assessment that includes the determination of a Sediment Risk Factor and a Receiving Water Risk Factor to ascertain a Combined Risk Level. Projects with Risk Levels associated with (Numeric Effluent Limits) NELs may find it necessary to implement an Advanced Treatment System (ATS) to achieve effluent standards. Projects faced with physical constraints that "inhibit the ability to construct a correctly sized sediment basin" may also elect to implement an ATS to comply with the MEP standard.

3.5.1 Education and Staff Training

Site owner/developer education and training

The City provides all appropriate parties involved with construction activities with training and informational materials regarding storm water quality, as applicable. These parties include but are not limited to City employees and project proponents, which can include contractors, subcontractors, developers, property owners, and superintendents. Education and training of the

development community in Oceanside is typically done on a project-by-project basis during a mandatory pre-construction meeting with the City and during construction site inspections.

Prior to the issuance of permits, construction site owners and developers meet during a pre-construction meeting with City staff and developer staff and/or contractors, subcontractors and superintendents. During these meetings City staff from various departments review what is expected of the project proponent in order to develop the project. At least one Clean Water Program staff person attends these meetings. Topics covered during these meetings specific to storm water pollution prevention include:

- Grading - Reference to the City of Oceanside Grading Regulations manual and the BMP Construction manual (both available on the City's website).
- Site Plan review for storm water inlets and associated BMPs
- Review of site-specific BMPs more applicable to the site and associated with the potential pollutants that could be generated from the proposed business operations
- Inspection Requirements and Frequency – Unannounced and upon call-outs from the public
- Expectations of BMPs during dry and wet seasons
- Construction BMP Brochure is provided

Prior to wet season, all currently permitted construction sites were contacted to remind site owners and developers to assess, repair and update their sites BMPs to reduce erosion potential and prevent storm water pollution. Site owners and developers are also advised to update their erosion control plans and SWPPPs that are applicable to the site.

Municipal Staff Training

City staff directly involved with development and construction sites are provided training on a departmental basis. For further details on topics covered during the City's construction educational program, please refer to Sections 10.2.2 and 10.3.1 of the City's 2008 JURMP. During this reporting period three groups were provided training in regards to erosion control and BMP installation and maintenance for construction sites. See Table 3-3 below for those who received training.

Table 3-3. Municipal Staff Training.

Department Commission	Training Date	Number in Attendance
Engineering Inspectors	October 23, 2008	6
Capital Improvement Project (CIP) Staff	April 9, 2009	8
Planning Division	May 5, 2009	10

3.5.2 Inspection of Construction Sites

Permit Order 2007-0001 requires that the City develop and implement an inspection program to ensure that each construction site properly complies with the City's relevant ordinances, permits, and the Permit Order 2007-0001. This section describes the City's inspection program for 2008-09 of construction sites developed in accordance with Part F.2.g of the Permit Order 2007-0001.

Each project was assigned an engineering and storm water inspector who was tasked with conducting inspections at the site throughout the construction phase of the project. All inspectors have been educated in the requirements of the Permit Order 2007-0001 and through in-house training and seminars, and/or construction-specific certificate training seminars.

3.5.2.1 Initial Site Inspections

Upon commencement of work at a construction site, a City inspector will visit the site and perform the following:

- Where applicable, a check for proof of coverage under the General Construction Permit.
- A review of the SWPPP (where applicable) and erosion control plans with the appropriate project proponent on site.
- A check for proper implementation of the BMPs outlined in the projects plans.
- A review of the maintenance schedule and procedures for each BMP.

All construction sites in the City's construction site inventory receive initial site inspections regardless of TTWQ priority. If any required documents or BMPs are found to be missing or deficient, the City may issue a stop work notice until the deficiencies are corrected.

3.5.2.2 Routine and Follow-Up Inspections

Once an initial site inspection is performed, additional routine inspections will be performed. The frequency of these routine inspections depends on the site's assigned TTWQ. The criteria used to determine a construction site's TTWQ presented in Section 5.2.1.1 were developed to correspond to the routine inspection frequencies required by the new Municipal Permit. Table 3-4 presents the different TTWQ categories and their corresponding minimum inspection frequencies for the wet (October 1 through April 30) and dry (May 1 through September 30) seasons.

Table 3-4. Construction Site Inspection Frequency

Construction Site TTWQ	Wet Season Inspection Frequency	Dry Season Inspection Frequency
High	Every two weeks	As needed
Medium	Monthly	
Low	As Needed	

3.5.2.3 Construction Site Inspection Frequencies

Attachment 3-A provides the number of inspections conducted during both rainy and dry seasons for active construction sites during the reporting period. This table provides inspection numbers from both engineering and building department staff.

It was determined that there were 55 active construction sites with grading permits during the reporting period. As required by the Permit, these construction sites were assigned high, medium and low priority ratings based on the Permit requirements. Table 3-5 below provides the ratings of the priority construction sites and the minimum number of inspections required per the Permit for both rainy and dry seasons.

Table 3-5. Prioritized Construction Site Inventory Summary and Required Inspection Frequency.

Prioritized Construction Sites		Minimum Required Inspection Frequency		
Threat Priority		**Wet Season**	**Minimum number of required inspections**	**Dry Season - As Needed**
High	20	Bi-weekly over 32 weeks	320	As Needed
Medium	17	Monthly over 5 months	85	As Needed
Low	18		90	As Needed
Total	**55**		**495**	As Needed

The City conducted 1,016 wet season and 250 dry season storm water related inspections of prioritized construction sites.

During the reporting period the City conducted inspections of construction sites in accordance with the requirements of the Permit. See table 3-6 below for a summary of the construction site inspections completed during wet and dry seasons.

Table 3-6. Inspection Frequency Verification Table.

Wet Season Inspections		Dry Season Inspections		Total Number of Prioritized Construction Site Inspections
Engineering Dept.	**Building Dept.**	**Engineering Dept.**	**Building Dept.**	
884	132	168	82	
1,016		250		1,266

Based on tables 3-5 and 3-6 above, the City conducted the minimum required inspections.

3.5.3 Enforcement Measures for Construction Sites

The City will be responsible for enforcement of applicable local ordinances and permits at all construction sites in its jurisdiction. When violations are observed and documented during a site inspection, the City will implement appropriate enforcement measures based on the severity of the violation. Enforcement can range from written warnings to more severe enforcement such as stop work notices. Stronger enforcement measures will be used as necessary if proper corrective actions are not implemented during the allotted time frame or if the severity of the violation warrants stricter enforcement.

The typical progressive enforcement steps that the City will implement include the following:

- Written warnings
- Enforcement of contracts (Municipal projects)
- Stop work notices
- Administrative citations
- Denial or revocation of permits
- Civil and/or criminal court actions

Enforcement actions by Code Enforcement Officers for construction sites begin with a referral from another department, a site visit, or by a complaint lodged via phone. Depending on the severity of the violation, follow up activities may include phone calls, site visits, written correction notices with specified compliance timeframes, or administrative warnings. If these actions do not produce the required improvements, administrative citations (starting at $100 with a $1,000 maximum fine) and/or stop-work notices are given.

Enforcement actions conducted for construction sites by Code Enforcement and Engineering Divisions, including enforcement action dates, administrative abatement costs, and compliance status, are included as Attachment 3-C. More details about enforcement actions during this reporting period are available on file at the City.

3.5.4 Reporting of Noncompliant Sites

The City is required to provide notification to the RWQCB of non-compliant sites in the City that are determined to pose a threat to human or environmental health. Verbal notification is required within 24 hours of the discovery of non-compliance and a written report should be submitted to the RWQCB within 5 days of the incident. The criteria established for determining when a site is not compliant and poses a threat to human or environmental health is described in Section 5.5.5 of the 2008 JURMP. See Table 3-7 below for the sites issued high enforcement correction notices during this reporting period: See Attachment 3-A for the status of these sites during this reporting period.

Table 3-7. Construction Sites issued Stop Work Notices

Project Name	WDID	Watershed	Address Location	Stop Work Notice Issue Date
Hi Hope Ranch	937C22214	San Luis Rey	Highway 76 and Melrose	12/29/08
Darwin Glen	937C325609	San Luis Rey	Darwin and Sagewood Drive	3/30/09
Darwin Knolls	937C325610	San Luis Rey	Darwin and Ocean Ridge Ct.	3/30/09
Ocean Heights	937C330740	San Luis Rey	Mission Avenue & Valley Heights Drive	
Bellon Residence	937C341136	San Luis Rey		11/04/08
Fire Mountain Estates	937C341032	Carlsbad – Loma Alta	Fire Mountain	12/18/08

3.6 Construction Activities Effectiveness Assessment (Optional)

See Section 11.0 for an assessment of the Construction Component of the City's JURMP.

3.7 Program Review and Modification

The Clean Water Program will continue to review and modify the construction component as needed. Clarifications and updates were made to FY 2007-08 Annual Report inspections, enforcement actions, and the reporting of non-compliant sites in response to the meeting and follow-up written request from RWQCB staff in December 2007 and January 2008. In addition, the Development Services Department, which includes Planning, Building, Engineering, and Code Enforcement, will be rolling out new tracking software, CRW Systems, Inc., which will assist in tracking and reporting of stormwater data. Training and official roll-out will begin in the 2009-10 reporting year.

THIS PAGE INTENTIONALLY LEFT BLANK

4.0 MUNICIPAL COMPONENT

4.1 Introduction

This section documents the activities conducted by the City of Oceanside at its municipally owned, leased and/or managed facilities during the 2008-2009 reporting period to meet the requirements of Section D.3 of Municipal Permit Order 2007-0001 (Table 4-1). The City of Oceanside owns and/or maintains a variety of municipal facilities including operation centers/facilities, public parks, administration buildings, fire stations, a fire training facility, industrial facilities, potable reservoirs, sewage pump stations, wastewater treatment facilities, public roads, streets and parking facilities and other miscellaneous facilities. Additionally, the City conducts activities that have a high threat to water quality such as power washing, street and sidewalk repair, painting, graffiti removal, parking meter maintenance, MS4 maintenance, and regular upkeep of the sanitary sewer system to prevent overflows and leaking.

Table 4-1. Order 2007-0001 Compliance Summary

D.3.a Municipal (Existing Development)	Section 4 of this Annual Report
J.3.a.(3)(c).i Updates to Municipal Inventory	See Section 4.1.1 of this Annual Report
J.3.a.(3)(c).ii BMP Implementation	See Section 4.2.3, 4.3.3, 4.4.3,4.5.3, 4.6.3, and 4.8.3 of this Annual Report
J.3.a.(3)(c).iii Inspection and maintenance of municipal treatment controls	See Sections 4.4.3 of this annual report
J.3.a.(3)(c).iv Number of catch basins and inlets, inspections, and cleaning	See Section 4.4.3 of this annual report
J.3.a.(3)(c).v Distance of MS4 inspected and cleaned	See Section 4.4.2 of this annual report
J.3.a.(3)(c).vi Distance of open channels inspected and cleaned	See Section 4.4.2 of this annual report
J.3.a.(3)(c).vi Amount of waste removed from MS4 and open channels	See Section 4.4.3 of this annual report
J.3.a.(3)(c).viii MS4 inspected less than annually	See Section 4.4.1 of this annual report
J.3.a.(3)(c).ix Implementation of BMPs for pesticides, herbicides, and fertilizers	See Section 4.3.3 of this Annual Report
J.3.a.(3)(c).x, xi, xii, xiii Curb miles	See Section 4.2.2 and 4.2.4, of this Annual Report
J.3.a.(3)(c).xiv Municipal parking lots	See Section 4.2.2, 4.2.4., and 4.2.5.1 of this Annual Report
J.3.a.(3)(c).xv Tonnage of debris removed from streets and parking lots	See Section 4.2.5.2of this Annual Report
J.3.a.(3)(c).xvi	See Section 4.5 of this Annual Report

Prevention of infiltration from sanitary sewer	
J.3.a.(3)(c).xvii Sites inspected and frequency	See Attachment 4-A of this Annual Report
J.3.a.(3)(c).xviii Inspection results	See Attachment 4-A of this Annual Report
J.3.a.(3)(c).xix Inspections steps determined full compliance	See Attachment 4-A of this Annual Report
J.3.a.(3)(c).xx Violations and enforcement actions	See Attachment 4-A of this Annual Report
J.3.a.(3)(c).xxi Notable activities	See Section 4.1 and 4.5 of this Annual Report

To comply with the Municipal Permit, the City of Oceanside has developed a comprehensive program designed to reduce the amount of pollutants that are transported in urban runoff from municipal areas and municipal activities. Some of the significant activities include street sweeping, inspections of municipal facilities, and educational efforts geared toward municipal personnel.

The City continues to use its Municipal Urban Runoff Procedures Manual (Municipal Manual) as a useful reference document for training staff and developing and implementing educational programs. The Municipal Manual contains BMP requirements and related guidance for City facilities and employees and was circulated to relevant City staff directly involved with the Municipal NPDES Permit. This manual was first prepared as part of the JURMP in 2002 and updated and provided with the 2008 JURMP. See Appendix C.3 of the 2008 JURMP for this manual. No changes were made to this manual during this reporting period.

Notable Activities

During this reporting period there was one notable activity for the municipal component. An outfall replacement project was conducted which replaced 6020 linear feet of 36” HDPE and PVC pipe that runs parallel to Oceanside Blvd. See Section 4.5.3 for more information.

4.1.1 Source Identification

As required in Section D.3.a(1) of Permit Order 2007-0001, the City of Oceanside has developed a prioritized, watershed-based inventory of municipal properties and activities. The City of Oceanside maintains a number of municipal facilities, including parks, administrative buildings, fire stations, and public works yards. The inventory of municipal facilities, including areas and activities, is updated annually. The inventory used for fiscal year 2008-09 is Attachment 4-A to this report. Table 4-2 provides a summary of the facility categories within the City’s inventory.

Table 4-2. Summary of Municipal Facilities by Category.

Facility Category	Number of Facilities
Park and Recreation Facilities	46
Public Works Operations Facilities	3
Municipal Landfills	2
Marinas	3
Municipal Airport	1
Potable Water Treatment Facilities	13
Wastewater Treatment Facilities and Lift Stations	36
Police and Fire Facilities	14
Other Fixed and Leased Facilities	26
Roads, Streets, Highways and Parking Facilities	37
Total Facilities	**181**

4.2 Roads, Streets, Highways, and Parking Facilities

4.2.1 Background

Roads, streets, highways, and parking facilities are an integral part of any functional City. These facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control the level of pollutants, such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities. Other City activities include building new roads, resurfacing existing roads, and similar construction-related activities. All construction-related activities conducted by the City will continue to be conducted under the requirements of the construction component, which is described in detail in Section 3 of this document.

4.2.2 Source Characterization

The City of Oceanside maintains approximately 571 miles of public roads and streets throughout the City. During this reporting period, 28,954 curb miles were calculated. This number is the actual miles when the brooms on the street sweepers were down - not the total mileage for the City's street sweeping vehicles.

A parking facility is defined as a stand-alone parking facility, which is a parking facility that is not associated and/or adjacent to other inventoried municipal facilities. Parking facilities that are associated and/or adjacent to municipal facilities will continue to be included in regular maintenance activities of the associated municipal facility. Roads, streets, highways, and parking facilities are included in the City's municipal inventory, which is included as Attachment 4-A of this annual report. There are 36 parking facilities within the City.

4.2.3 Best Management Practice Requirements

Similar to municipal fixed facilities, the City will continue to utilize the City-developed Municipal BMP Manual to choose applicable BMPs to implement for public roads, streets, parking facilities and operational facilities within the City.

Street sweeping and cleaning continues to be the main BMP that is implemented for roads, streets, and parking facilities. The frequency of cleaning takes into account the following:

variations in climate conditions, surrounding land use, design of existing structures, traffic volume, frequency and quantity of accidental spills and leaks, and areas with historical trash and/or debris problems. Treatment control BMPs will be used for road sections subject to SUSMP.

The City will continue to implement an aggressive street sweeping program to reduce the amount of pollutants discharged from roads, streets, and parking facilities in the City with a particular focus on facilities that drain to environmentally sensitive areas (ESAs). If in the future negative impacts to ESAs associated with runoff from roads, streets, highways, or parking facilities are noted, the City will take the measures necessary to mitigate the negative impacts.

4.2.4 Program Implementation

As an effort to reduce the pollutant load entering local receiving water bodies, the City continued to implement a sweeping schedule for roads, streets, highways, and parking facilities to meet the requirements of the Municipal Permit. There have been no significant changes to the existing programs during the reporting period.

Roads, streets, and highways that have been observed as generating relatively high volumes of trash, sediment, and debris are included as high priority and will continue to be swept at least twice per month; medium priority streets are streets in the City that generate moderate volumes of trash, sediment, and debris and will continue to be swept at least monthly. Low priority streets have been observed as generating relatively low volumes of trash, sediment, and debris and will continue to be swept as needed, but not less than once per year. In the event of a National Holiday, sweeping is made up in a timely manner, usually by the next working day. Due to the City's proximity to the Pacific Ocean and as a means to target watershed constituents of concern, the City typically sweeps all streets within the City above baseline jurisdictional activity standards. Additional program details can be found in Section 6.3 of the 2008 JURMP.

All public streets in the City of Oceanside are swept at least monthly. There is a total of 571 miles of public streets that are swept regularly per the frequency outlined below. There were 28,954 curb miles swept during this reporting period. Some streets are swept more frequently than others.

- Every Monday, Wednesday, and Friday, the downtown commercial areas and other high use areas are swept using regenerative air vacuum street sweepers. These areas include the medians on Mission Avenue, Canyon Drive, and the Civic Center Drive Bridge, Wisconsin Avenue to Pacific Street to Ditmar Street, the Strand, and all downtown parking lots.
- The majority of all other public streets, not included in the areas listed above, are swept every other week. In some low use residential areas, the streets may be swept monthly.
- As necessary, sweepers or other clean up crews will respond to public or municipal staff reports to collect debris and/or sweep.
- Inspection of streets and curbs for cleaning is continuous. City employees are encouraged to identify areas that should be cleaned and to call the municipal employee reporting line, Oceanside Eyes. Residents are encouraged to call the Public Works Maintenance Hotline.

4.2.5 Inspection and Maintenance Results

4.2.5.1 Inspections

Inspections and maintenance activities were conducted throughout the reporting period as described in the previous section. Following is a review of the results form inspection and maintenance.

There are 37 facilities in the Roads, Streets, Highway and Parking Facilities categories which include 36 parking lots and 571 miles of public road. During this reporting period all 37 of these facilities were inspected by CWP staff. Some corrections were noted but were addressed by appropriate staff in a timely manner. Due to the fact that many of these parking facilities are swept at least once per week, debris and sediment are removed on a very frequent basis.

4.2.5.2 Maintenance

Street sweeping activities resulted in the collection of over 2,062 tons of waste from public streets and parking lots during the reporting period. These results are comparable with tonnage amounts from previous reporting years. See Table 4-3 for a summary of debris collected during this reporting period and in previous reporting periods.

Table 4-3. Summary of amount of street sweeping debris collected.

Reporting year	Tons
2003-2004	2,604
2004-2005	2,538
2005-2006	2,283
2006-2007	2,480
2007-2008	2,358
2008-2009	2,062

4.2.6 Roads, Streets, Highways, and Parking Facilities Element Effectiveness Assessment

See Section 11.0 for an assessment of the Municipal component of the City's JURMP.

4.3 Parks and Recreational Facilities

4.3.1 Background

The City of Oceanside is committed to providing the highest quality of service to its residents by providing the opportunity for them to enjoy a variety of recreational activities at both outdoor parks and indoor recreational facilities. Operating and maintaining 46 community attractions from public pools, beaches, parks and community centers, the City of Oceanside works hard every day to maintain the high level of service. The inspection and maintenance of these facilities in regards to storm water is important because of the number of facilities throughout the city and the public exposure that these facilities receive.

One park was added to the inventory during this reporting period: Mance Buchanon Park. Construction of this 29-acre park was completed during this reporting period. The park is located

on College Boulevard just south of the San Luis Rey River crossing and is slated to be an active recreational park that includes ball and soccer fields.

4.3.2 Source Characterization

The City regularly inspects, cleans and maintains 46 Parks and Recreational Facilities. Because of high public use these facilities have the potential to generate a variety of pollutants including trash and debris, organic material and sediment. See Attachment 4-A of is annual report for the updated Parks and Recreational Facilities inventory.

4.3.3 Program Implementation

The City has selected BMPs to implement at Parks and Recreational Facilities to reduce the contribution of pollutants associated with the application, storage, and disposal of pesticides, herbicides and fertilizers. These BMPs are detailed in the Municipal Manual. All 46 facilities were inspected during this reporting period with only minor corrections noted. See Attachment 4-A for inspection information for these facilities.

Pesticides, herbicides and fertilizers are seldom used directly by the City, as it contracts out the majority of work involving these substances. To facilitate compliance with this Section of the Municipal Permit, the City has reviewed its landscaping contract and has integrated BMP requirements into the conditions of the contract.

4.4 Municipal Separate Storm Sewer System

4.4.1 Background

As required by Section D.3.a.(3) of the Municipal Permit, the City has implemented a schedule of maintenance activities for the City's entire Municipal Separate Storm Sewer System (MS4), including any structural controls designed to reduce pollutant discharges to or from its MS4s and related drainage structures. The City has determined, through historical knowledge and records, the locations within the MS4 that require regular waste removal and those areas that are less likely to require any waste removal. The City has developed a comprehensive Flood Control Annual Maintenance Program which includes a list of the high priority areas, divided into zones, which are to be inspected annually using an inspection checklist. Approximately 110 sites are inspected and maintained annually. No sites are inspected and cleaned less than annually.

4.4.2 Source Characterization

The Public Works, Street Division, performs ongoing inspection and cleaning of storm drains and flood control facilities, as well as annual maintenance of all major facilities such as creeks, desilting basins, detention basins and rock and concrete lined channels. There are approximately 104 concrete and earthen channels that are inspected and maintained throughout the city. Over 49,000 linear feet of storm drains, catch basins, and concrete and earthen channels are maintained on at least an annual basis. In addition, the Street Division performs annual maintenance/cleaning in September, October, and November for all major MS4 facilities. The results of this work are recorded on an Annual Maintenance List that is available at the City Operations Center.

4.4.3 Best Management Practices

In order to inspect and clean storm drains as described above, during the May through September period, the City contracted with United Storm Water Inc. A total of 3,354 structures (catch basins, manholes, inlets, outlets, etc.) were inspected and cleaned during the reporting period by the City contractors and City maintenance crews. A total of 65.89 tons of waste was removed. The waste generally consisted of trash, green waste, dirt, sand, roots, solids, rocks, and silt. During the inspections if a storm drain was not labeled with a marker, one was installed. During this reporting period 779 were labeled with a placard stating: "No Dumping – Drains to Creek" in both English and Spanish. See the photo below for a copy of the storm drain placard installed. See Table 4-4 for a summary of the amount of waste removed from catch basins, inlets, the MS4 and open channels by category.

Table 4-4. Waste removed from catch basins, inlets, the MS4 and open channels by category.

Structure	Number Inspected	Contractor or City Crew	Drain Markers Installed	Cleaned	Amount of Material Removed
Catch Basin/Inlet	3,074	Contractor	779	3,074	65.89 tons
Catch Basin/Inlet	280	City Staff		280	
Total Catch Basin/Inlet	3,354			3,354	
Open Channels	104	City Staff	N/A	49,455 ft.	1,536 tons
Drain Pipe		City Staff	N/A	2,545	

Trash Trap at the Oceanside Municipal Golf Course

In addition to standard maintenance, staff at the City of Oceanside Municipal Golf Course had noted that trash and debris was collecting in Pilgrim Creek, which runs in the middle of the course, after storm events. The source of the trash and debris was identified as a residential area just south of the golf course across Douglas Drive. City staff installed a trash trap downstream of this priority residential area and upstream of Pilgrim Creek in the open channel that parallels the driving range at the municipal golf course. The goal of this trap was to capture trash and organic debris coming from the residential neighborhood before it enters the golf course and Pilgrim Creek. This trash trap was installed in March 2009.

After installation there was one rain event that captured 40 pounds of trash and organic debris. During future reporting years, the volume or weight of trash will be tracked. See the photos

below of the newly installed trash trap and a photo of the effectiveness of the trash trap in stopping debris from reaching the waterway.

Trash trap immediately after installation

Trash trap with debris

4.5 Sanitary Sewer

4.5.1 Background

The City of Oceanside Sewer Division maintains the sanitary sewer system within the jurisdictional boundaries which includes sewer lines, lift stations, sewage treatment plants. This sanitary sewer system uses pipes to remove human waste from homes and businesses and transport that waste to one of two waste water treatment plants in the City. The two treatment plants are operated by city crews.

4.5.2 Source Characterization

The City regularly inspects, cleans and maintains thousands of feet of sanitary sewer pipe, 34 sewer lift stations and two sewage treatment plants. See Attachment 4-A for the 2008-09 wastewater Facilities inventory.

4.5.3 Best Management Practices

Since the City owns and operates the sewage system, these facilities are regularly inspected and maintained for proper operation and maintenance, and to ensure that BMPs are in place for the protection of receiving waters that may be impacted from the system. The City's preventive and corrective sewer maintenance programs consist of a variety of components provided for the operation, maintenance, repair and replacement of sewer mains, manholes, and pump stations.

In order to ensure that the sanitary sewer lines do not leak, the city has a long term plan to slip line the sewer pipes throughout the City. During this reporting period 4,054 feet of City sewer lines were slip lined. In addition 47 manholes were rehabilitated. Since the 2005-06 reporting period the City has slip-lined a total of 17,285 feet of sewer. The City also inspected and cleaned 312 miles (1,649,702 feet) of sanitary sewer.

Notable Activity

Land Outfall Sewer Replacement

During this reporting period 6020 liner feet of pipe of the Land outfall were replaced. The existing land outfall was constructed in 1972 and consists of approximately 34,000 linear-feet of 24-inch ductile iron pipe. Several failures of the existing land outfall have occurred recently and

one segment (approx. 6,000 linear-feet) was identified for immediate replacement. The segment targeted for replacement, runs parallel to the centerline of Oceanside Boulevard, and begins approximately 600 feet west of Vine Street and terminates approximately 1200 feet east of Crouch Street. This project consisted of the installation of 6020 linear feet of 36" HDPE and PVC pipe in this segment.

A formal bid process was used to select the contractor. A Notice to Proceed was issued on June 19, 2008. The project was completed on June 4, 2009 with a project budget of $4,059,486.60.

4.6 City Operations Center

4.6.1 Background

The City Operations Center (COC) is a municipally owned and operated facility that houses several departments or divisions for the City including Public Works, fleet maintenance, road maintenance, parks and recreation maintenance and others. Because of the diverse activities of these departments and divisions, the City developed a Storm Water Pollution Prevention Plan (SWPPP) for the COC in the fall of 2002.

The COC includes the following areas: employee parking lot, COC main building (offices, storage and fleet maintenance), traffic control lot, back lot, city vehicle parking lot, large vehicle equipment lot, fueling area, waste disposal area, wash facilities, general use yard and west corner lot. The SWPPP has the following objectives:

- Identify and evaluate sources of pollutants from the facility that may affect the quality of urban runoff discharge and to identify and
- Implement site-specific best management practices to reduce or prevent pollutants in urban runoff discharges.

The SWPPP outlines BMPs to be implemented at each of the respective areas. A comprehensive training program was also developed and has been implemented in concert with the COC SWPPP.

4.6.2 Source Characterization

Due to the nature of the various activities from the departments and divisions it was determined that there are various activities that generate pollutants and have the potential to reach storm water conveyance systems. Some of these activities include vehicle washing, disposal of street sweeping debris, temporary storage of wrecked vehicles, and storage of various materials, including paints, solvents, metal piping and infrastructure materials. In addition steep hillside landscaped areas can be a potential pollutant source if BMPs are not managed properly.

4.6.3 Best Management Practices

Since the implementation of the SWPPP at the COC some permanent BMPs have been installed and continue to be used for protection of receiving waters. Following is a brief description of the BMPs in place at the COC and any new BMPs installed during this reporting period.

4.6.3.1 Wash Facility

The main wash facility is used for washing large vehicles and equipment, and collection of street sweeper and vactor truck contents. The main wash facility is a completely contained area,

surrounded on all sides by berms and curbs. The entire area drains to the eastern corner of the pad where it enters a grated inlet that leads to a clarifier and then the sewer. An overflow is available if the drain to the sewer is clogged or the volume of water exceeds its capacity, however, this is not anticipated to happen frequently because the drain is maintained daily.

4.6.3.2 Storm Drain Filters and other inlet BMPs

BMPs in place before reporting period

During previous reporting periods the Public Works Department installed two BioClean filters at the only two outlets which drain runoff from the City Operations Center: one on the south side of the COC where a 36” box outlet discharges directly into Loma Alta Creek, and one at the 12” pipe which discharges onto Oceanside Blvd. These filters were inspected and repaired as necessary during the late summer/early fall, spring and prior to forecast storms. Also a brushless filter was added to the 36” box outlet during prior reporting periods.

During fiscal year 2007-08 three broom gate were installed at the COC. The outlets where these broom gates were installed at the COC are located at the southern property line next to the SDGE easement, Loma Alta Creek and Sprinter RXR. See the photo below for an example of the broom gate installed. During the next reporting period the effectiveness of the debris removal and the maintenance of these broom gates will be assessed.

During fiscal year 2007-08 the BioClean filter that was installed on the 12” pipe that discharges to Oceanside Blvd was removed due to constant clogging and replaced with fiber rolls around the inlet. This drainage area will be checked regularly to remove debris collected around the fiber rolls and to ensure that the fiber rolls in proper working order.

BMPs installed or changed during Fiscal Year 2008-09

There were no new inlet BMPs installed at this facility during the reporting period.

4.6.3.3 Structural BMPs

BMPs in place before reporting period

BMPs installed in FY 2005-2006 included a garage cover built to cover drums in the storage area, and an area was designated to hold all wrecked vehicles from police department with secondary containment installed around wrecked vehicles contain any fluid runoff from the vehicles.

During Fiscal Year 2007-08 the water utilities department installed two structural covers to prevent rain from reaching these metal materials and causing rusting and deterioration. Metal materials that are subject to rusting and deterioration when exposed to the elements, including scrap metal are contained and covered until used or disposed of through a licensed commercial metal recycling company.

BMPs installed or changed during Fiscal Year 2008-09

There were no new structural BMPs installed at this facility during the reporting period.

4.6.3.4 Pollution Prevention and Recycling

BMPs in place before reporting period

The COC continues to implement an aggressive pollution prevention/recycling program including: purchasing re-refined oils, recycling used oils, oil filters, fuel filters, antifreeze, used tires, and batteries. In addition solid waste recycling bins are located throughout the facility for collection of bottles, cans, glass and mixed paper.

Additional solid waste recycling bins were installed throughout the COC including ones outside of the facility so field crews can easily deposit their recyclable when cleaning the interior of their vehicles. Also, each vehicle driver was provided with a convenient recycling basket to use in their vehicle for easy collection of their recyclables.

BMPs installed or changed during Fiscal Year 2008-09

There were no new pollution prevention BMPs installed at this facility during the reporting period.

4.6.4 Program Implementation

4.6.4.1 Facility Inspection

A thorough walk through inspection of the COC Facility was conducted by the operation manager of the facility and Clean Water Program inspectors on February 27, 2009. See Attachment 4-A for a list of minor corrections needed for this facility. A second inspection conducted on April 14, 2009 verified that the corrections needed had been addressed.

4.7 Other Facilities

4.7.1 Background

The City of Oceanside owns and operates two closed landfills (Maxson Street Landfill, WDID 9375005695 and Mission Avenue Landfill, WDID 9375005696). The City also operates and maintains eight fire fighting facilities including one fire fighting training facility.

4.7.2 Source Characterization

The two closed landfills maintained by the City have the potential to generate pollutants that can negatively impact receiving waters. If potential storm water discharges are identified, appropriate BMPs are implemented to prevent pollutants from entering MS4.

Also fire fighting stations have the potential to generate pollutants such as trash and debris, organic materials and fluids and wash water from fire fighting vehicles. The two closed landfills and the fire fighting facilities are included in the City's municipal inventory, which is included as Attachment 4-A of this annual report.

4.7.3 Program Implementation

Closed Landfills

Both closed landfills are inspected quarterly per permit requirements and an annual report is prepared each for submittal to the Regional Water Quality Control Board. See Attachment 4-B for copies of the 2008-09 Annual Report for Storm Water Discharges Associated with Industrial Activities for these two landfills.

Fire Stations

All fire stations were inspected during the reporting period. During the station inspections no violations or potential violations were noted.

4.8 Special Events

The City of Oceanside hosts a variety of Special Events in the City. These events include major sporting events and community fairs and festivals. A Special Events Permit is required for any organized activity involving the use of, or having impact upon, public property, public facilities, parks, beaches, sidewalks street areas or the temporary use of private property in a manner that varies from its current land use. The permit process includes a BMP implementation plan. The City has a Special Events Committee comprised of various City Department representatives who review permit applications to insure events are held safely and do not adversely impact the community.

4.8.1 Source Characterization

The City issues Special Event permits for both internal city sponsored events and event organizations that coordinate events that may include vendors or various event related elements.

- Antiques on Mission
- Dia de los Muertos
- Turkey Trot 5k Run
- Ironman Triathlon
- Race Across America
- Freedom Day Parade

Typically, special events have a high density use of people per square foot raising the potential for pollutant types at special events, such as:

- Setup and teardown of equipment booths
- Booth operation generating trash
- Food and drink preparation and consumption – illicit discharges and organic material
- Hydraulic rides – oil and grease
- Temporary portable restroom – chemicals and bacteria
- Hydration stations – water cups and other trash material

4.8.2 Best Management Practices

All special events are required to implement designated BMPs and comply with all applicable regulations outlined in the Oceanside Municipal Code. During pre-event application meetings for large events, event organizers are provided with an event permit packet that includes storm water related information including a copy of the Storm Water Compliance Guidelines for Special Events brochure and the Special Events Inspection Form. Copies of the brochure and inspection form are attached. It is explicitly stated that the company coordinating the event is required to leave the site as clean as the pre-event condition and shall not allow any materials or liquid to enter the storm drain system.

4.8.3 Program Implementation

4.8.3.1 Event Inspections

A storm water inspection report form has been developed for use before and after large special events. Storm water compliance inspection reports will be completed prior to the start of the event to ensure that appropriate BMPs are in place. A post-event inspection will ensure that the site is properly cleaned. A special events office representative will conduct pre- and post-inspections. This office may designate another city department representative to conduct the pre- or post-event inspections, when needed.

During this reporting period two of the event locations that were listed in the updated revision to the 2008 JURMP were moved out of City jurisdiction and were held on private property. These two events are Antiques on Mission and Dia de los Muertos. The Race Across America event was determined to be a low priority event because bicycle riders start in Oceanside, in small groups and leave the city in phases to travel across the United States.

The Freedom Day parade was held on Saturday June 27, 2009. Because this event attracts thousands of people who gather along the sidewalks of Coast Highway, the City first ensures that there is no debris or material that can cause liability to the citizens attending the event. After the event street sweeping crews are on-site within one hour to remove any debris left behind by event attendees.

During this reporting period one event was inspected which was the Ironman Triathlon which was held between the dates of April 2- 4, 2009 with staging starting in the harbor and beaches area. No stormwater relate violations were noted during the event and during the post-event inspection it determined that the site was clean and did not pose any potential storm water violations. See Attachment 4-C for copy of the inspection form for this event.

4.8.3.2 Street Sweeping

Most special events occur in the downtown area which is swept 5 days a week, with sweeping vehicles generally onsite within 12 hours from the end of the event.

For special events that cause an added impact to the community street sweeping is conducted immediately after the end of the event. On an annual basis, the City holds one parade in the downtown area after which street sweeping is immediately conducted.

4.8.3.3 Harbor and Beaches Maintenance

Large events held in the Harbor and Beaches area can have the potential to generate large quantities of trash. In addition to the above information, the Harbor and Beaches Maintenance Division conducts the following activities after large events and holidays held in the Harbor and Beaches area:

- A litter abatement contractor provides staff to walk beach and hand pick up litter.
- City staff uses trucks and/or utility carts to follow and pick up items that are too large for the litter abatement contractor such as logs, furniture, etc.
- City staff further screens the beach using Cherrington beach sweeping machines.
- A pressure-washing contractor or City staff washes the hardscapes with all wash water being recovered and disposed of properly.

4.9 Power Washing

4.9.1 Background

The City conducts a number of activities which are not designated and/or confined to a specific location. Because such activities are not confined to a fixed facility, where BMPs may be permanently implemented, BMPs must actively be implemented during all mobile municipal activities.

4.9.2 Source Characterization

Mobile activities that City employees may use during their day-to-day operations that have a potential to create polluted runoff include:

- Power Washing
- Infrastructure Maintenance
- Street and sidewalk repair
- Street striping
- Waste removal
- Traffic light maintenance
- Parking meter maintenance
- Landscape/Right-of-Way Maintenance

4.9.3 Best Management Practice Requirements

As previously mentioned, the City will continue to implement good housekeeping and general pollution prevention measures during municipal activities including the mobile activities listed above. City personnel will continue to be trained to collect all water generated by power washing activities. City personnel continue to use the City's Municipal BMP Manual to choose applicable BMPs to implement for municipal areas and activities. Pesticide, herbicide, and fertilizer management BMPs similar to those discussed in Section 6.2.3.1 of the City's 2008 JURMP will continue to be implemented during landscaping of City right of way such as medians.

4.9.4 Program Implementation

City field crews will continue to be actively trained to implement BMPs during all mobile activities including how to properly contain, control, and capture any discharge generated by power washing (or any other discharge-generating activities). The City uses fiber rolls, geo logs,

silt fencing, check dams, gravel bags, and filter inserts during mobile activities, where applicable. City personnel involved in mobile activities are trained to be aware of Illicit Connections/Illicit Discharges and report them to the appropriate City staff promptly. More information about the City's education program, including municipal training activities, is included in Section 10 of this document.

4.10 Municipal Component Effectiveness Assessment

See Section 11.0 for an assessment of the municipal component of the City's JURMP.

4.11 Program Modification and Review

The Clean Water Program will continue to implement its SWPPP at the City Operations Center and continue its ongoing inspection and maintenance program for the facilities listed in the Municipal Inventory. Any changes to the program will be reported in the next annual report.

THIS PAGE INTENTIONALLY LEFT BLANK

5.0 INDUSTRIAL AND COMMERCIAL COMPONENT

5.1 Introduction

The City of Oceanside continues to implement a comprehensive program that aims to reduce and prevent industrial and commercial pollution discharges to and from the MS4 to the maximum extent practicable (MEP) to protect local receiving water bodies and to comply with the Municipal Permit. This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to meet the reporting requirements of Section J.1.a(3)(f) of Order 2007-0001 Municipal Permit (Table 5-1).

Table 5-1. Order 2007-0001 Reporting Summary.

Permit Section	Annual Report Section Reference
J.3.a.(3)(d).i -Any updates to the industrial and commercial inventory.	See Section 5.2.2 of this Annual Report
J.3.a.(3)(d).ii - Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources.	See Section 5.2.4.1 and 5.2.4.4 of this Annual Report
J.3.a.(3)(d).iii - A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses.	See Section 5.2.1 and 5.3.3 of this Annual Report
J.3.a.(3)(d).iv - Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected.	See Section 5.2.2 of this Annual Report
J.3.a.(3)(d).v - Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection.	See Section 5.2.2, 5.2.4.1 and 5.2.4.4 of this Annual Report
J.3.a.(3)(d).vi - Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance.	See Section 5.2.4.1 and 5.2.4.4 of this Annual Report
J.3.a.(3)(d).vii - Identification of the number of third party inspections conducted.	See Section 5.2.4.1 of this Annual Report
J.3.a.(3)(d).viii - Identification of efforts conducted to verify third party inspection effectiveness.	See Section 5.2.4.3 of this Annual Report
J.3.a.(3)(d).ix - A description of efforts implemented to address mobile businesses.	See Section 5.3 of this Annual Report
J.3.a.(3)(d).x - The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	See Section 5.2.4.2 and 5.2.4.4 of this Annual Report
J.3.a.(3)(d).xi - A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees.	See Section 5.2.4.1 and 5.2.4.2 of this Annual Report
J.3.a.(3)(d).xii - A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources.	See Section 5.1.1 of this Annual Report

The City has compiled a list of industrial and commercial sources and developed BMP requirements, including pollution prevention measures, for each source and activity. Implementation of these requirements will be accomplished through education, inspection, and enforcement.

5.1.1 Notable Activities

The City of Oceanside Clean Water Program conducted several notable activities during this reporting period including a comprehensive update of its Industrial and Commercial business inventory, updating the 2008 JURMP with narrative to check for coverage under the General Industrial Permit while conducting inspections and developing a protocol for non-filers, and the attendance of CWP staff at a BMP training for concrete mix trucks:

- Working in conjunction with the Businesses Licensing division, the city updated its inventory based on commercial and industrial classifications, watershed location, and assignment of high, medium and low priorities. See Section 5.2.2 for more information about the updated inventory.
- Updated JURMP. Added check for coverage under the General Industrial Permit (Notice of Intent (NOI) and/or Waste Discharge Identification No.). See Section 14.2.
- Added section on Identification of Industrial Non-filers; Created a Non-filer checklist and flow chart for reference by inspectors to convey to industrial businesses what qualifies as a non-filer and how to submit to the SWRCB non-filer applications. See Section 14.2.
- Employee presentation by local business: Palomar Transit Mix, a subsidiary of Vulcan Materials Company, conducted an informational presentation for city Clean Water Program (CWP) staff outlining the Best Management Practices for the concrete trucks used by their company. See Section 5.3.4.3 for more information about this training.

5.2 Stationary Industrial and Commercial Sites Sources Element

5.2.1 Background

Section 7 of the City's 2008 JURMP, titled Industrial and Commercial Component, requires the implementation and maintenance of applicable pollution prevention Best Management Practices (BMPs) by industrial owners and/or operators pursuant to City Code to minimize or eliminate the impacts of industrial and commercial activities on receiving waters and other sensitive environmental resources. The City uses a variety of ways to educate and ensure that BMPs are implemented at industrial and commercial facilities including dissemination of the City's industrial and commercial BMP manuals, site inspections and enforcement.

5.2.2 Source Characterization

The City annually updates its watershed-based industrial/commercial inventory which contains the name, address, and description of all industrial sites within its jurisdiction, regardless of site ownership. During this reporting period the staff of the Clean Water Program conducted a comprehensive update of its Industrial and Commercial business inventory. Working in conjunction with the Businesses Licensing division, the city updated its inventory based on commercial and industrial classifications, watershed location, and assignment of high, medium and low priorities.

Attachment 5-A provides this comprehensive list and serves as an updated inventory to the inventory submitted with the 2008 JURMP. The attached inventory was used to conduct FY 2008-09 inspections and will be updated where needed during the FY 2009-10 inspections. This table does not include mobile businesses that have City of Oceanside business licenses. See section 5.3 of this report for mobile business information.

In the City there are a total of 2,373 Industrial and Commercial businesses. See Tables 5-2 and 5-3 below for a summary of the number of industrial and commercial businesses inventoried in the City according to watershed location.

Table 5-2. Industrial Businesses in the City by Watershed.

Watershed	Number of Industrial Business	
	2007-08 Inventory	2008-09 Inventory
San Luis Rey	95	13
Loma Alta	141	49
Buena Vista	5	0
Agua Hedionda	0	0
Total	**241**	**62**

Table 5-3. Commercial Businesses in the City by Watershed.

Watershed	Number of Commercial Businesses	
	2007-08 Inventory	2008-09 Inventory
San Luis Rey & Harbor	331	859
Loma Alta	338	966
Buena Vista	151	463
Agua Hedionda	6	23
Not Verified	10	0
Total	**836**	**2311**

Based on this updated inventory, the City contains approximately 62 industrial businesses. Each of these businesses was prioritized on their threat to water quality. Table 5-4 provides a summary of the prioritization for industrial businesses.

Table 5-4. Industrial Businesses in the City by Priority.

Priority	Number of Industrial Business
High	20
Medium	14
Low	28
Total	**62**

Based on the 2008 inventory, the City contains approximately 2311 commercial businesses. Each of these businesses was prioritized on their threat to water quality. Table 5-5 provides a summary of the prioritization for industrial businesses.

Table 5-5. Commercial Businesses in the City by Priority.

Priority	Number of Commercial Business
High	496
Medium	98
Low	1717
Total	**2311**

5.2.3 Best Management Practice Requirements

BMP Manuals

Two manuals originally developed in 2001, *Industrial Urban Runoff Requirements Manual* and *Commercial Urban Runoff Requirements Manual,* detail requirements of industrial and commercial businesses to comply with the City's Urban Runoff Management and Discharge Control Regulations. In order to ensure industrial and commercial owners and operators are informed and understand the applicable pollution prevention BMPs to be implemented and/or maintained, site-specific pollution prevention methods for industrial and commercial areas and activities located within the City, are specified in these two manuals.

The manuals were first produced in FY 2001-02 as a result of requirements under Municipal Permit Order No. 2001-01 and were revised in 2004 to include additional state requirements. These manuals were again reviewed and revised during the 2007-08 reporting period to ensure compliance with the new Municipal Permit Order No. R9-2007-0001. The main changes were the additional of categories and a list of specific BMPs for those industrial and commercial activities. Inspections, enforcement, and reporting and the definitions have not been changed. See this section of the 2007-08 report for a list of changes to both the industrial and commercial manuals.

The City conducted efforts to ensure industrial and commercial business owners and/or operators have received a copy of the Industrial Manual either through an annual inspection or a response to a complaint or concern reported through the Urban Runoff Hotline. In addition, copies of the Industrial Manual are available on the Clean Water Program website.

5.2.4 Program Implementation

Annual inspections of commercial and industrial businesses are conducted by Clean Water Program inspectors, Code Enforcement officers and a private contractor to ensure that applicable pollution prevention activities are implemented by industrial and commercial business owners and/or operators. In addition, inspections are conducted based on calls received on the Urban Runoff Hotline. All industrial and commercial businesses visited, through the annual inspection program or by complaint call acknowledged on the Hotline, receive follow-up visits until the industrial business is deemed in-compliance with City Code. All documentation pertaining to site visits are on file at the City. City staff conducted a total of 588 inspections during the 2008-2009 reporting year: 33 of industrial businesses, 539 of commercial businesses, including eating and drinking establishments, and 16 nursery or greenhouse businesses.

5.2.4.1 Inspections of Industrial Businesses

During this reporting period the Clean Water Program updated its 2008 JURMP with the following information in regards to inspection of industrial businesses. This program was updated in order to comply with part D.3.b.(3) of Permit Order 2007-0001. See Section 14.2 for the specific areas updated for the Industrial business inspections. Inspections of industrial businesses by third parties were not conducted during this reporting period.

Inspections of industrial businesses will typically be conducted by designated Clean Water Program Inspectors and Code Enforcement personnel. Inspections will be tracked using the City's Urban Runoff Business database. Inspectors will utilize a Commercial and Industrial businesses Inspection Form provided in Appendix D of the 2008 JURMP. The major activities and accomplishments undertaken by the City for this requirement during the reporting period included:

- Completion of 33 site inspections of industrial businesses during the reporting period.
- Completion of 20 required annual inspections of high priority industrial businesses during the reporting period.
- Completion of 13 required annual inspections of medium and low priority industrial businesses during the reporting period.
- Completion of eleven follow-up visits either in response to the initial inspection or response to a complaint.
- Dissemination of the Industrial Manual to help industrial owners and/or operators become aware of the City Code requirements for BMP implementation, and information on applicable BMPs for specific industrial businesses and activities.
- Ensuring proper and continued training of the Code Enforcement officers and Clean Water Program compliance inspectors dedicated to the Clean Water Program.

See Attachment 5-B for inspection dates, corrective items needed and compliance dates for industrial businesses.

5.2.4.2 Enforcement of Industrial Businesses

Section 7.2.4.3 of the City's 2008 JURMP describes the City's program for enforcement of ordinances at an industrial site. This program was designed in accordance with part D.3.b.(3) of Municipal Permit Order 2007-0001. There were no enforcement actions required for Industrial businesses during this reporting period.

5.2.4.3 Inspections of Commercial businesses

Section 7.2.4.3 of the City's 2008 JURMP describes the City's program for conducting inspections of commercial businesses. This program was developed and implemented in accordance with part D.3.b.(3) of the Municipal Permit Order 2007-0001. As detailed in the JURMP, inspections of High and Low Priority Commercial Businesses are conducted as deemed necessary by the Code Enforcement personnel and CWP inspectors. Some inspections are initiated in response to a public or municipal staff report, an illicit discharge source investigation, or as a follow up to a previous inspection.

The major activities and accomplishments undertaken by the City for this requirement during the reporting period included:

- Three hundred twenty (320) eating and drinking establishments were inspected at least once for the proper implementation and maintenance of storm water BMPs and grease control devices. The inspector forwarded all facilities that were not in-compliance with storm water regulations to Code Enforcement Officers.
- One hundred sixty four (164) inspections of high priority commercial businesses were inspected, excluding restaurants and agricultural operations
- Thirty nine (39) inspections of medium and low priority commercial businesses were inspected, excluding restaurants and agricultural operations
- Sixteen (16) inspections of nursery and greenhouse operations within the City of Oceanside was conducted for compliance to urban runoff regulation City Code Chapter 40.
- Ensuring proper and continuing training of the Code Enforcement Officers and Clean Water Program inspectors dedicated to the Clean Water Program.

See Attachment 5-B for inspection dates, corrective items needed and compliance dates for commercial businesses

During the 2008-09 reporting periods, all eating and drinking establishments were inspected for compliance with the City's urban runoff regulations and adequate implementation and maintenance of BMPs. These 320 inspections were conducted by a city-hired private contractor. Throughout the year Clean Water Program Inspectors would randomly ride along with the private contractor to verify the inspection effectiveness.

When CWP Inspectors and Code Enforcement Officers conduct inspections at high priority areas, they target the entire commercial/industrial complex, because these areas often contain a mix of industrial and commercial operations. Rather than just focus on the High Priority businesses located in these areas, CWP Inspectors and Code Enforcement officers inspect all businesses in the complex to ensure owners and/or operators understand their BMP requirements and can work collaboratively with their neighbors to implement BMPs or solve drainage problems.

Code Enforcement officers inspected 16 nursery and greenhouse operations according to the City's Business Licensing Department. These sites, along with the larger agricultural facilities that are annually inspected by the County Weights and Measures Department, are visited several times a year by City staff due to the evolving nature of their business. With constant plowing and crop rotation, CWP staff not only complete annual inspections, but also complete a pre-rain event inspection and visit the agricultural areas frequently during the rainy season as well as during rain events. The City maintains a cooperative relationship with the U.S. Department of Agriculture NRCS for assisting the agricultural community in Oceanside in design and implementation of BMPs.

5.2.4.4 Enforcement of Commercial Businesses

All other commercial businesses, except for two, were in compliance after the second visit. These two commercial businesses were refereed to the Code Enforcement Division for lack of

proper storage of hazardous materials under cover and on secondary containment. Code Enforcement (CE) conducted an inspection upon the referral date upon which the owner/operator completed with requests. No additional code enforcement action was taken against these businesses. See Table 5-6 below for inspection information on these two businesses.

Table 5-6. Code Enforcement action for Commercial Businesses.

Businesses Name	Principal Products Services	1st Inspec. Date	Corrective Action Needed	2nd Inspec. Date	Corrective Action Needed	Referred to CE Date	Code Enforcement Inspection Date	Compliance Status
Mohsen Oil	Gasoline Station w/Convenience Store	11/19/08	Properly store Haz Mat.	12/18/08	Same	1/28/09	1/28/09	IC
Thrifty Gasoline	Gasoline Station w/Convenience Store	11/20/08	Properly store Haz Mat.	12/18/08	Same	1/28/09	1/28/09	IC

IC In Compliance

5.2.4.5 Reporting of Noncompliant Sites

The City is required to provide notification to the RWQCB of noncompliant sites in the City that are determined to pose a threat to human or environmental health. Oral notification is required within 24 hours of the discovery of noncompliance and a written report should be submitted to the RWQCB within five days of the incident.

The Regional Water Quality Control Board was notified of businesses or operations that were not compliant after follow-up visits and despite issuance of the City code from CWP staff and/or Code Enforcement officers, or for operations that were not under the City's regulatory jurisdiction (Camp Pendleton). Following is a list of these businesses and operations.

- Camp Pendleton housing development sediment discharge to Oceanside Harbor.
- Camp Pendleton housing development sediment discharge to Capistrano Park.
- Private owner placing graded soil and rock material within flood plain of San Luis Rey River

5.2.5 Stationary Industrial and Commercial Sites Sources Effectiveness Assessment

See Section 11.0 for an assessment of the Industrial and Commercial Component of the City's JURMP.

5.3 Mobile Sources Element

5.3.1 Background

Due to the lack of a stationary location for proper disposal of potentially hazardous liquids and materials, there is a major area of concern about where mobile businesses discharge water used in their line of work. Due to the nature of their activities, mobile businesses will continue to be regulated differently than other businesses. Mobile businesses can be difficult to identify because they may not have a City business license, they go out of business on a relatively regular basis and, though they may have a home base, they can cross jurisdictional lines to operate their business. For the reasons regular inspections of mobile businesses will be challenging and time consuming in the future.

5.3.2 Source Characterization

The mobile businesses known to operate within the City's jurisdiction are noted on the City's commercial inventory. The following business types are addressed by the mobile sources element of the City's industrial and commercial program.

- Mobile automobile or other vehicle washing
- Pest control services
- Mobile carpet, drape or furniture cleaning
- Mobile construction trades
  - Painting and coating
  - Cement mixing or cutting
  - Masonry
  - Other contractors
- Landscaping
- Pool and fountain cleaning
- Power washing services

Because not all mobile businesses have obtained business licenses in the City or have a base of operations in the City, the City expects that a continual process of refining and updating its inventory will be needed. Sources for such inventory updates will include reported incidents, general observations by City staff, and available business licenses. The City intends to participate in an education outreach program through the Industrial Commercial Sources Workgroup to educate Mobile Businesses of their minimum BMPs. The regional workgroup requested Mobile Business inventories from each Copermittee, of which Oceanside complied, which will be compiled into one list. It is anticipated that this education piece will be sent to the inventory list during the next reporting period. The inventory of Mobile Commercial Businesses is available in Appendix B.5 of the City's 2008 JURMP as part of the Commercial Inventory.

5.3.3 Best Management Practice Requirements

The City updated its Commercial Urban Runoff Requirements Manual during the 2007-08 reporting period with information on the required BMPs for both mobile and stationary sources. This updated manual can be referenced in Appendix C of the City's 2008 JURMP. One example of a BMP included in the updated manual is for outdoor vehicle detailing by a mobile business and the BMP explains how to capture and contain the rinse water so that it does not enter the storm drain system. Regardless of where the activity occurs, the City categorically prohibits illegal discharges from mobile businesses.

5.3.4 Program Implementation

5.3.4.1 Education Outreach

Because a specific element of the industrial and commercial program for mobile businesses is being newly developed, it is anticipated that some mobile businesses are not aware of storm water requirements and that education will need to be a significant portion of the program. The City of Oceanside will notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the City's 2008 JURMP.

5.3.4.2 Inter-Jurisdictional Cooperation

The City of Oceanside is participating in the Regional Industrial Commercial Sources workgroup which is developing a plan to educate mobile businesses about proper BMPs and protection of water quality. A complete report on these activities of this workgroup will be included in the Regional Urban Runoff Management Program report due to the RWQCB in January 2010.

5.3.4.3 Staff Training

Code Enforcement Division Officers and Clean Water Program Compliance Inspectors are responsible for conducting storm water compliance inspections and enforcement of mobile sources. Officers and inspectors are trained annually on inspection and enforcement procedures and BMP implementation as they relate to mobile businesses. City staff is encouraged to report potential illegal discharges from mobile businesses when working in the City to the storm water hotline.

Palomar Transit Mix BMP Presentation
Also during this reporting period Palomar Transit Mix a subsidiary of Vulcan Materials Company conducted a presentation for CWP staff outlining the Best Management Practices for the concrete trucks used by their company. This training, held on June 9, 2008 demonstrated the use of a new technology that limits jobsite waste and protects concrete from getting on the ground which can have a potential to reach the MS4.

There were three City staff in attendance at this workshop including two Code Enforcement Officers and one Clean Water Program staff person. Although this training was held in the previous reporting period the information presented was very useful for dissemination to other concrete truck drives during this reporting period.

5.3.4.4 Inspections

During this reporting period, inspection of mobile businesses was conducted on an as needed basis. The most common triggers for these inspections were from incident reports received over the Urban Runoff Hotline and direct visual observations by City staff.

5.3.4.5 Enforcement

During this reporting period Code Enforcement officers responded to complaint calls regarding mobile businesses that were allowing water to enter the storm drain system. During the site visit, depending on the nature of the complaint, Code Enforcement officers issued notices to comply and/or educated the operator on the proper BMPs that should be in place during their operation and provided them with the power washing brochure.

5.4 Industrial and Commercial Component Effectiveness Assessment

See Section 11.0 for an assessment of the Industrial and Commercial Component of the City's JURMP.

5.5 Program Review and Modification

During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water, Sewer, and the Clean Water Program, continued rolling out the GBA Masters

Series software. Water and Sewer continued to utilize the product and the Clean Water Program gained approval to purchase additional licenses and hire a consultant to help modify the software to their needs. Complete roll-out for the Clean Water Program is expected in reporting year 2009/2010. The Development Services Department, which includes Code Enforcement, Building, and Engineering, choose CRW Systems, Inc. and will begin roll-out in the 2009/2010 reporting year. These systems will allow for tracking and reporting of needed information, including stormwater data, across the departments.

6.0 RESIDENTIAL COMPONENT

6.1 Introduction

A total of 39 percent of the City's 26,983 acres is designated as either multi- or single-family residential according to the San Diego Association of Governments (SANDAG). Since residential land use comprises such a large area of the City, residential activities can have a considerable effect on the quality of receiving waters in and around the City. The City of Oceanside has developed an extensive program that aims to reduce pollutant runoff from residential areas and activities to the MEP.

This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to meet the requirements of Section D.3.c of the Municipal Permit (Table 6-1). The City continued the implementation of an enforcement program that responds to and monitors potential violation calls received on the Oceanside Urban Runoff Hotline (Hotline).

Table 6-1. Order 2007-0001 Compliance Summary.

D.3.c Residential Program	See Section 6 of this Annual Report
J.3.a.(3)(e).i High threat residential areas	See Section 6.2 of this Annual Report
J.3.a.(3)(e).ii Designated BMPs were implemented	See Section 6.3 of this Annual Report
J.3.a.(3)(e).iii Proper disposal of used oil and HHW	See Section 6.4.2 of this Annual Report
J.3.a.(3)(e).iv Amounts of HHW collected	See Section 6.4.2 of this Annual Report
J.3.a.(3)(e).v Evaluation of methods used for oversight of residential areas	See Section 6.2.1 of this Annual Report
J.3.a.(3)(e).vi Violations and enforcement actions	See Section 6.4.7 of this Annual Report
J.3.a.(3)(e).vii Collaboration on implementation of Regional Residential Education Program	See Section 6.5 of this Annual Report
J.3.a.(3)(e).viii Notable Activities	See Section 6.3.1 and 6.4.1 of this Annual Report

The City also utilizes its revised Urban Runoff Requirements Manual for Residents (Residential Manual) that contains BMP requirements and related guidance information for residents of the City. This manual has been made available to residents through the City's Clean Water Program Website. Changes to the Residential Manual were made during the 2007-08 reporting period.

6.1.1 Notable Activities

- Trash trap BMP installed in priority residential area. See section 6.3.1 for more information.

- Development of email distribution list for newsletters and event notifications to replace the traditional US Postal Service mailings. See section 6.4.1 for more information.

6.2 Source Characterization

Residential neighborhoods can be the source of a variety of pollutants depending on the activities conducted in residentially developed areas. Pursuant to Section D.3.c.(1) of the Permit Order 2007-0001, the City identified High Priority Residential Areas and Activities in the JURMP. The following residential activities have been identified by the City to be High Priority Activities:

- Automobile or boat repair and maintenance.
- Automobile washing.
- Automobile parking.
- Home and garden care activities and product use.
- Disposal of household hazardous waste.
- Disposal of pet waste.
- Disposal of green waste.
- Any other residential activity that contributes a significant pollutant load to the MS4.
- Power washing activity (both do-it-yourself and contracting services).

The City has also identified residential areas of High Priority. These areas include the following:

- Any residential area tributary to a CWA section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential area within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within an ESA

6.2.1 Evaluation of methods for oversight of residential areas and activities.

The Public Works storm drain maintenance staff has the best opportunity to inform the Clean Water Program staff about drainage areas that have a lot of trash and debris. On a regular basis the CWP staff request from public works maintenance staff areas within the city that are generating for two reasons:

1. To identify areas within the City where the public can become involved to assist in removing trash and debris from the specific areas where debris ahs collected, and
2. To target the residential areas for future outreach.

During this reporting period two residential areas were identified as contributing excessive trash to the MS4 and potentially the receiving waters. The first was a neighborhood that drains to Pilgrim Creek and eventually the San Luis Rey River. The second was a portion of MS4 that drains to Garrison Creek and then Loma Alta Creek near El Camino High School. See section 6.3.1 below for more specific information on these areas and the BMPs chosen.

6.3 Best Management Practice Requirements

The City's JURMP Residential Component requires the implementation and maintenance of applicable pollution prevention Best Management Practices (BMPs) by residents pursuant to City Code. In order to ensure residents are informed and understand the applicable pollution prevention BMPs to be implemented and/or maintained, site-specific pollution prevention

methods for residential areas and activities, located within the City, are specified in the Residential Manual. This manual is found in Appendix C of the City's 2008 JURMP.

Education and outreach aimed at residents helps facilitate the implementation of BMPs, including pollution prevention methods. A detailed discussion of the City's education program can be found later in Section 10 of the 2008 JURMP. Details on education outreach to the residential community can be found in Sections 8 and 9 of this annual report.

6.3.1 BMP Implementation

Trash Trap at the Oceanside Municipal Golf Course

Staff at the City of Oceanside Municipal Golf Course had noted that trash and debris was collecting in Pilgrim Creek, which runs in the middle of the course, after storm events. The source of the trash and debris was identified as a residential area just south of the golf course across Douglas Drive. City staff installed a trash trap downstream of this priority residential area and upstream of the municipal golf course in the open channel that parallels the driving range. The goal of this trap was to capture trash and organic debris coming from the residential neighborhood before it enters the golf course and Pilgrim Creek. This trash trap was installed in March 2009.

After installation there was one rain event that captured 40 pounds of trash and organic debris. During future reporting years, the volume or weight of trash will be tracked. See the photos below of the newly installed trash trap and a photo of the effectiveness of the trash trap in stopping debris from reaching the waterway.

Trash trap immediately after installation

Trash trap with debris

Non-Structural, Administrative BMP for Trash from Oceanside Unified School District

Public Works staff identified a section of MS4 that had a large amount of tennis balls and other trash, such as plastic bottles, after storm events where Garrison Creek daylights off of Mesa Boulevard. It appeared that a large amount of the trash, including tennis balls, softballs, plastic drink bottles, and food wrappers, was likely coming from El Camino High School and Martin Luther King, Jr. Middle School. The Clean Water Program Coordinator notified the Maintenance and Operations Director of the Oceanside Unified School District of the problem. On January 22, 2009, the Director notified all area principals about the accumulation of trash and asked the principals to share the photos with staff and students using school newspapers, assemblies, and brochures.

Trash accumulation at Garrison Creek.

6.4 Program Implementation

6.4.1 Outreach

The most efficient way to encourage pollution prevention and BMP implementation and to restrict polluting practices is to educate residents on how to carry out their daily activities in ways that have the smallest potentials to discharge pollutants to the MS4. During this reporting period the Clean Water Program provided educational information and training to residents, in the following ways:

- Cleanup events
- Booths at public events
- Public television notices
- Presentations
- Website
- Email notifications
- Residential BMP Manual

During this reporting period the Clean Water Program discontinued mailing upcoming event notices to interested parties through the US Postal Service. In order to save time and money an email distribution list was created. This will allow for people to receive notifications by email which eliminates postage costs. Also, receivers of the information can easily forward the fliers to other people who may be interested in the specific information.

The City will also consider conducting an outreach program upstream of this trash trap mentioned in 6.3.1 above in future reporting periods. The goal will be to educate residents in this targeted neighborhood about proper disposal of trash and the negative effects of fugitive trash that enters local waterways.

Further outreach program details for this reporting period can be found in the Education and Public Participation, Section 8 and Section 9, of this document.

6.4.2 Household Hazardous Waste

The City continued to facilitate the proper management and disposal of used oil, toxic materials, and all other HHW to the residential audience. Residents have the opportunity to take used oil to approximately 12 private auto parts stores within the jurisdiction. In addition Waste Management, Inc., the City's franchise trash hauler, accepts HHW at its Oceanside facility. Residents may bring up to five gallons per day of used motor oil, used oil filters, and anti-freeze, Tuesday through Saturday from 8 a.m. to 4 p.m. without an appointment. HHW may be brought on Saturdays by appointment only. Details of the locations mentioned above can be found in Section 8.4.2 of the City's 2008 JURMP.

During the 2008-2009 reporting period, 3,430 Oceanside households utilized the household hazardous waste disposal facility, disposing or recycling 146.59 tons of hazardous materials (including universal waste) during the reporting period. An additional 127.56 tons of E-waste was recycled in the same reporting year.

Furthermore, as part of the City's collection program, a 1,500-gallon used oil collection receptacle is provided at the City's harbor. This receptacle is available for residents who live on the boats in the Marina as well as for those boat owners and operators who rent a harbor slip to conveniently recycle the used motor oil and oil filters generated from the boats. During the reporting period 832 gallons of used oil were collected and recycled. In addition one 55-gallon barrel of used oil filters were collected from Harbor residents.

6.4.3 Clean Water Program Newsletters

Twice per year, educational newsletters are mailed with the utility to over 42,000 homes in the City. Topics in the newsletters explain storm water pollution, effects on water quality, pollutants of concern, illegal discharges, BMP implementation, and special events.

During this reporting period two Clean Water Program Newsletters were distributed to over 42,000 households. An overview of topics in these two newsletters is listed below. A copy of these two newsletters is included in Attachment 6-A this annual report.

Fall 2008

- Bacteria Source Tracking Project on the San Luis Rey River
- Coastal Cleanup Day, Buena Vista Creek and Oceanside Beach Cleanup
- Water conservation tips to eliminate water runoff
- West Nile virus and over watering connection

Spring 2009

- Loma Alta Creek Cleanup event
- Cleanup events calendar for 2009
- Green Week 2009
- Storm Drains vs. Sewer
- Water Conservation Landscaping Workshops

6.4.4 Oceanside Update

In addition to printed media, the City's community television station, KOCT, airs thirty-minute public service announcements with three-minute presentations from various City departments. Those households in the City who have access to the KOCT local channel are able to view this show. During this reporting period the Clean Water Program provided ten three-minute presentations. Table 6-2 provides an overview of the topics covered during each taping.

Table 6-2. Summary of 2008-09 Oceanside Update Topics by Month

Date	Topic Discussed
July 2008	Pick up pet waste
August 2008	State drought situation, water conservation tips, and Coastal Cleanup Day
September 2008	Coastal Cleanup Day, Buena Vista Creek and Oceanside Beach Cleanup
October 2008	Water rebate programs
December 2008	How to protect water quality during the rainy season
January 2009	2009 Cleanup event schedule and storm drains vs. sewers.
March 2009	Storm drains and sewer difference and Loma Alta Creek Cleanup
April 2009	Oceanside watersheds and Loma Alta Creek and Oceanside Beach Cleanup
May 2009	Water awareness month, water conservation & irrigation runoff
June 2009	Pool draining tips to protect water quality

6.4.5 Website

The Clean Water Program maintains its own Website providing convenient electronic access to program information for residents and the general public. The address for this website is www.oceansidecleanwaterprogram.org. This Website provides the opportunity to learn about storm water pollution, the sources of this pollution, and what can be done to eliminate these pollutants from entering the storm drain system, thereby improving water quality in receiving waters. During this reporting period there were 35,647 hits to the Clean Water Program website. This number does not account for traffic from within the Oceanside network.

Specific web pages available on the Clean Water Program Website are as follows:

- Commercial Business
- Development
- Events
- Industrial Business
- Just for Kids
- Water Quality Laws
- Other Websites
- Landslide Prevention
- Clean Water Projects
- Report Violations
- Residential/General
- Just for Educators
- Waterbodies

The residential web page offers the following information:

- An overview of pollutants in receiving waters and how those pollutants get there
- The difference between the storm drain system and the sewer system
- Links to pollutant factsheets in PDF format
- Links to brochures in PDF format, including the Storm Water Pollution prevention Tips for Residents
- Links to past Clean Water Program Newsletters in PDF format
- Link to the Residential Urban Runoff Requirements Manual

The Website address is disseminated to the public in a variety of ways:

- Listed in all Clean Water Program Newsletters
- Mentioned during each Oceanside Update Taping and shown at the bottom of the screen
- Listed on promotional items
- Listed on Clean Water Program staff business cards

6.4.6 Hotline

The City will continue to encourage public reporting of illicit discharges and illegal dumping through the City's Urban Runoff Hotline, which is run by the Water Utilities Department. The Hotline phone number is (760) 435-5800. All calls related to potential urban runoff violations were documented and forwarded to Code Enforcement.

The Urban Runoff Hotline was promoted through a variety of media during this reporting period, including announcements on local television stations, placement on brochures, click-message pens, pencils, and other promotional "give-aways", advertisement on the City's Clean Water Program webpage and in Clean Water Program newsletters. During the reporting period, 124 calls were received on the Urban Runoff Hotline by residents concerning potential urban runoff violations. This is a significant increase from the 55 calls received in the 2007-08 Reporting period and the 14 calls received during the 2006-07 reporting period. The majority of the urban runoff calls were related to over-irrigation runoff. There was significant outreach to the public about the importance of conserving water. As a result, there was a significant increase in the number of calls related to over-irrigation, homes irrigating on other than their assigned day, and hosing down of hardscapes.

6.4.7 Enforcement

Section 8.4.4 of the JURMP describes the City's program for enforcement of ordinances in residential areas. The major activities and accomplishments undertaken by the City during this reporting period included:

- Code Enforcement responded to 109 urban runoff related cases, related to residential areas and activities, during the reporting period.
- An accounting of all residential enforcement actions, taken by Code Enforcement Officers, is shown in the following table.

See Table 6-3 for an accounting of Code Enforcement Actions during 2008-09.

Table 6-3. Accounting of Residential Code Enforcement Actions for the 2008-2009 Reporting Year.

Action Type	Follow-up Phone Call	Follow-up Site Visit	Follow-up Office Visit	Written Notice	Letter Sent	Inspection Report	Admin. Warning	Administrative Monetary Citation	Referral to Other Dept	Stop Work Notice
of Actions	113	178	4	4	32	13	26	1	2	0

6.5 Collaboration to implement Regional Residential Education Program

During this reporting period the City of Oceanside elected to serve as Co-chair for the Education and Residential Sources Workgroup (ERS Workgroup) which is tasked with implementing the Regional Residential Education Program. The ERS workgroup was established as one of several workgroups under the Memorandum of Understanding amongst the San Diego County Copermittees (Copermittees). The chair of each of these workgroups presides over and provides leadership and direction to the workgroup. This includes serving as the point of contact to external entities, soliciting group input, developing meeting content, facilitating meetings, and coordinating with the Secretary to finalize work products for distribution to the workgroup. The City of Oceanside Co-chaired this workgroup with staff from the City of Imperial Beach. The City of Oceanside plans to continue serving as the co-chair for the ERS Workgroup.

Details of the activities of the ERS Workgroup will be provided in the submittal of the annual report of the Regional Urban Runoff Management Program due to the RWQCB in January 2010.

6.6 Residential Component Effectiveness Assessment

See Section 11.0 for an assessment of the education component of the City's JURMP.

6.7 Program Review and Modification

During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water, Sewer, and the Clean Water Program, continued rolling out the GBA Masters Series software. Water and Sewer continued to utilize the product and the Clean Water Program gained approval to purchase additional licenses and hire a consultant to help modify the software to their needs. Complete roll-out for the Clean Water Program is expected in reporting year 2009/2010. The Development Services Department, which includes Code Enforcement, Building, and Engineering, choose CRW Systems, Inc. and will begin roll-out in the 2009/2010 reporting year. These systems will allow for tracking and reporting of needed information, including stormwater data, across the departments.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

This section is intended to document the activities conducted by the City of Oceanside during the 2008-2009 reporting period to manage illicit discharges and meet the requirements of Sections D.4 and J.3.a.(3)(f) of the 2007 Municipal Permit.

In accordance with the September 10, 2008 Regional Water Quality Control Board adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the entire FY 2008-09 Illicit Discharge Detection and Elimination Component, including the 2009 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2009.

THIS PAGE INTENTIONALLY LEFT BLANK

8.0 EDUCATION COMPONENT

8.1 Introduction

Education is an important step in working towards improving receiving water quality both locally and regionally. By increasing public awareness and encouraging a change in both the attitude and the behavior of the general public and the regulated community, the City may reduce or eliminate storm water pollution caused by common daily activities.

This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to meet the requirements of Section D.3.g of the Municipal Permit. The City continued the implementation of an education outreach program for municipal staff, industrial and commercial businesses, and the general public.

Table 8-1. Order 2007-0001 Compliance Summary.

J.3.a.(3)(g).i Description of education efforts	See Section 8.0 of this Annual Report
J.3.a.(3)(g).ii Underserved target audiences	See Section 8.3.1 of this Annual Report
J.3.a.(3)(g).iii Education of municipal employees	See Section 8.2 of this Annual Report
J.3.a.(3)(g).iv Education of construction community	See Section 8.4 of this Annual Report
J.3.a.(3)(g).v City education efforts for residents, general public and school children	See Section 8.3 of this Annual Report

The City of Oceanside continued to provide a comprehensive storm water education program to achieve the following objectives:

- Measurably increase the knowledge of target communities regarding MS4s, impacts of urban runoff on receiving waters, and BMP solutions for the target audience.
- Measurably change the behavior of target communities, and thereby reduce pollutant releases to MS4s and the environment.

Educational programs and activities are tailored to meet the needs of the following target audiences:

- Municipal departments and personnel.
- Construction site owners and developers.
- Industrial and commercial owners and operators.
- Residential community, general public, and school children.
- “Underserved” target audiences, where applicable.

Many education outreach efforts are conducted on an ongoing basis, such as direct interaction during inspections, pre-construction meetings, or when taking calls from the City’s Urban Runoff Hotline. Educational materials are also available throughout the year at special events and at the City’s Water Utilities Department counter. Targeted mailings, focused training

sessions, and other educational efforts are provided when found to be necessary through monitoring programs, records of complaints, and other similar factors.

8.2 Staff Training Element

City personnel are the eyes and ears of the City, and can provide valuable information on storm water related discharges and potential violations that may be occurring within the City. The City presents general storm water educational content, which is described in Section 10.3 of the 2008 JURMP, to all City departments. The City primarily educates its municipal personnel through classroom training, on-the-job training sessions, and the Municipal BMP Manual (Appendix C of the 2008 JURMP). Customized training programs are designed for personnel targeting fieldwork-related departments such as storm water compliance inspectors, building/engineering inspectors, public works, planning department staff, and park and recreation personnel. General informational storm water training sessions are provided for municipal personnel in other departments to review storm water regulations in the City, impacts of urban runoff and BMPs to be implemented to reduce or eliminate runoff.

During this reporting period twenty (20) departments or divisions were provided a training on storm water related issues. In addition one division from the solid waste and recycling trash hauler for the City was provided with storm water training. A total of 195 City staff and 64 staff from the trash hauler attended storm water trainings.

During this reporting period one of two Storm Water Pollution Prevention Education Programs developed by a private company, EXCAL Visual, were used for municipal staff trainings. These programs include a 15-20 minute video and a quiz specific to the video. Also, during this reporting period, a specific quiz was developed for Engineering staff who work on Capital Improvement Projects.

Prior to the start of these training sessions using the programs mentioned above a multiple choice quiz was given to each participant to establish a baseline of knowledge for that individual. The quiz also served as the sign-in sheet for the individual attending each training session. After the completion of the video additional storm water related details were provided depending on the department or division being trained. Time was allotted for questions and answers toward the end of the training session. Prior to the end of the training session the same multiple choice quiz was given to each participant. One hundred sixteen (116) municipal employees took both a pre and post-quiz during a municipal training session. For more information on the effectiveness of these training programs based on the pre- and post-quiz scores see Section 11.0 of this report.

One program titled “Storm Water Pollution Prevention - Strom Warnings” covers Everyday Best Management Practices for Industrial Facilities. Specific BMPs are covered to address the following issues related to industrial facilities:

- Good Housekeeping
- Materials Management
- Spill Response
- Equipment Fueling & Repair
- Outdoor Manufacturing
- Preventive Maintenance

- Waste Management
- Dust Producing Processes

Departments or Divisions that received this training were:

- Water Distribution - Reverse Osmosis Plant
- Water Distribution – Operations
- Water Distribution – Maintenance
- Sewer Collections – La Salina Waste Water Treatment Plant
- Sewer Collections – Field Staff
- Water Distribution – Weese Plant (Drinking Water Treatment Plant)

The other program titled "Municipal Storm Water Pollution Prevention – Storm Watch" covers everyday BMPs for other municipal staff activities such as Parks and Recreation and Fleet Maintenance. Specific BMPs covered in this course are as follows:

- Good Housekeeping and Spill Prevention
- Vehicle and Equipment Washing
- Vehicle and Equipment maintenance
- Spill Reporting and Response
- Street Maintenance
- Outdoor Storage of Materials and Wastes
- Landscaping and Lawn Care

Departments or Divisions that received this training were:

- Streets Division – Street Repair and Maintenance
- Streets Division – Street Sweepers
- Parks and Recreation Maintenance
- Fleet Maintenance
- Water Meter Services
- Harbor Division – Maintenance Staff
- Harbor Division - Harbor Police
- Harbor Division - Lifeguards

Other Departmental staff received customized training because of their need for specific education that was not covered in these two programs or information covered in these programs was not needed to convey to these groups due to the nature of their work as municipal employees. The following departments were trained using a customized Power Point Presentation and an interactive format to allow for questions and answers throughout the training program:

- Planning Division
- Engineering Division – Engineering Inspectors
- Engineering Division- Capital Improvement Project Staff
- Building Maintenance
- Business Licensing, Revenue and Utility Billing
- Water Utilities Administration

Waste Management is the solid waste and recycling company that services residential and commercial/industrial businesses in the City of Oceanside. Though they are not a department or division of the City, they are an important entity to target with storm water related education programs due to the nature of their business. During this reporting period the trash haulers with Waste Management were targeted for storm water education. A customized power point presentation was used to emphasize the importance of proper handling of solid waste during servicing of trash cans and dumpsters and how to report potential storm water violations to Oceanside's Clean Water Program staff. The targeted audience was:

- Waste Management – Trash, Recycling and Green Waste Truck Drivers

In addition to the above training, Palomar Transit Mix a subsidiary of Vulcan Materials Company conducted a training session for local municipal employees outlining the Best Management Practices for the concrete trucks used by their company. This training, held on June 9, 2008 demonstrated the use of a new technology that limits jobsite waste and protects concrete from getting on the ground which can have a potential to reach the MS4.

There was three City staff in attendance at this workshop including two Code Enforcement Officers and one Clean Water Program staff person. Although this training was held in the previous reporting period the information presented was very useful for dissemination to other concrete truck drives during this reporting period.

8.3 Educational Outreach Element

Residential areas make up a large portion of the land use in the City, and therefore even small pollutant discharges can be magnified significantly and have the potential to affect the quality of the receiving waters. Activities such as residential car washing and over irrigation are harmful to receiving water bodies by contributing pollutants such as heavy metals, detergents, and nutrients. Providing residents with appropriate educational materials may help to increase overall awareness, and encourage residents to change harmful behaviors and subsequently reduce the potential for pollutants to enter the storm drain system and reach receiving water bodies.

Media

Twice per year, educational newsletters are mailed to all homes in the City with water utility bills. Topics in the newsletters explain storm water pollution, effects on water quality, pollutants of concern, illegal discharges, BMP implementation, and special events.

During this reporting period two Clean Water Program Newsletters were distributed to over 42,000 households. An overview of topics in these two newsletters are as follows:

Fall 2008

- Bacteria Source Tracking Project on the San Luis Rey River
- Coastal Cleanup Day, Buena Vista Creek and Oceanside Beach Cleanup
- Water conservation tips to eliminate water runoff
- West Nile virus and over watering connection

Spring 2009

- Loma Alta Creek Cleanup event

- Cleanup events calendar for 2009
- Green Week 2009
- Storm Drains vs. Sewer
- Water Conservation Landscaping Workshops

A copy of these two newsletters is included as Attachment 6-A to this annual report.

Website

The City's Clean Water Program website also offers electronic copies of a variety of storm water fact sheets covering topics such as proper pesticide and fertilizer use, trash disposal, pet waste and lawn waste disposal, proper chlorine and other swimming pool chemical disposal, sedimentation, effects of soaps and detergents on receiving waters, and other storm water-related topics. During this reporting period there were 35,647 hits to the Clean Water Program website. This number does not account for traffic from within the Oceanside network.

Oceanside Update

In addition to printed media, the City's community television station, KOCT, airs thirty-minute public service announcements with three-minute presentations from various City departments. During this reporting period the Clean Water Program will provided ten three-minute presentations. Table 8-2 provides an overview of the topics covered during each taping.

Table 8-2. Summary of 2008-09 Oceanside Update Topics by Month

Date	Topic Discussed
July 2008	Pick up pet waste
August 2008	State drought situation, water conservation tips, and Coastal Cleanup Day
September 2008	Coastal Cleanup Day, Buena Vista Creek and Oceanside Beach Cleanup
October 2008	Water rebate programs
December 2008	How to protect water quality during the rainy season
January 2009	2009 Cleanup event schedule and storm drains vs. sewers.
March 2009	Storm drains and sewer difference and Loma Alta Creek Cleanup
April 2009	Oceanside watersheds and Loma Alta Creek and Oceanside Beach Cleanup
May 2009	Water awareness month, water conservation & irrigation runoff
June 2009	Pool draining tips to protect water quality

Community Events – Booths and Outreach Activities

The Clean Water Program staff participated independently and in conjunction with other cities in the North County Storm Water Program by staffing nine booths at several community events in Oceanside and north San Diego County. The Clean Water Program staff talked to residents, handed out educational materials, and responded to questions and concerns.

Table 8-3 lists community events attended between July 2008 and June 2009 to encourage community participation and education of the effects of polluted urban runoff:

Table 8-3. 2008-09 Community Events.

Date	Event	Participants (Estimated)
07/19/08	Grand Opening of Fire Station 7	2,500
09/19/08	Harbor Days	30,000
10/11/08	Pride the Beach - Oceanside	500
10/26/08	North County Human Society Paws Fiesta	200
10/29/09	Genentech ECO Fair	500
03/21/09	Green Fair Oceanside	500
04/19/2009	Fallbrook Avocado Festival	50,000
4/26/09	Earth Day at Mission San Luis Rey	5,000
05/16/09	Operation Appreciation - Oceanside	2,500

School Education

Educating the City's youngest residents is important in two ways: ideally the good habits/behaviors learned will be carried into adulthood, and secondly, children may educate their families and friends around them with the information they have learned. Children are impressionable at a young age, and are therefore more likely to act upon the knowledge given to them now and throughout their life.

The City continued its outreach to school age children through the use of the watershed model during presentations. A total of ten presentations were conducted reaching 248 school-age children and 13 adults. Table 8-4 provides a list of groups and classrooms that were educated about storm water pollution via these presentations.

Table 8-4. 2008-09 School Age Children Watershed Presentations.

Date	Group	Children	Adults
11/20/2008	Libby Elementary (3rd Grade)	24	1
11/20/2008	Libby Elementary (3rd Grade)	27	1

Splash Lab

The San Diego County Office of Education Splash Science Lab is a completely self-contained mobile laboratory brought to local schools to provide students with hands-on experience with the following resources:

- Watershed/storm drain model presentations
- GIS computer stations
- Water Conservation Station
- San Diego Estuary Station

- Microscopes - with live specimens!
- Chemistry experiments
- State of the art computers
- Cooperative learning skills

The curriculum is designed for grade levels 4-6 and is aligned with California Science Content Standards.

During this reporting period three schools received the Science Splash Lab with the costs covered by the City Water Utilities Department. See Table 8-5 below for information on the schools and number of students who participated in the program

Table 8-5. Schools using Science Splash Lab during the 2008/2009 Reporting Year.

Project SWELL (SWELL = Stewardship: Water Education for Lifelong Leadership)

The City continues to collaborate with San Diego CoastKeeper and the San Diego Unified School District (SDUSD) to customize and implement Project SWELL, a water-based science curriculum, for different grade levels in the Oceanside Unified School District (OUSD). The Project SWELL curriculum will foster a sense of stewardship for our natural environment and help to empower and educate these future leaders of America to understand and improve the condition of San Diego's coast and waterways. Project SWELL balances environmental and scientific studies as a comprehensive and hands-on K-12 water quality and pollution prevention curricula. More information about this curriculum can be found at http://www.projectswell.org/. This curriculum provides students with knowledge of water resources in San Diego County and Oceanside, watershed functions, water conservation, the effects of polluted urban runoff, and how students can help prevent water pollution. The City of Oceanside is currently implementing the 5th grade curriculum and is considering implementing the 6th grade and 4th grade curricula in the future.

5th Grade

During this reporting period the 5th grade level curriculum continued to be implemented. The OUSD adopted a slightly revised version of the FOSS science kits used for K-5th grade levels for the 2009-10 school year. FOSS (Full Option Science Systems) is a research-based science curriculum for grades K–8 developed at the Lawrence Hall of Science, University of California at Berkeley. During the next reporting period, the curriculum will be revised to reflect the use of the revised FOSS kits.

6th Grade

For 6th grade the OUSD and the SDUSD adopted different science kits for implementation during the 2008-09 school year. The SDUSD will need to change the 6th grade curriculum to reflect the materials that will be used in the new science kit. Once the SDUSD curriculum is

revised the City of Oceanside will move forward with customizing the curriculum for Oceanside and hopefully piloting the curriculum during the 2009-10 school year.

In preparation for the 6th grade curriculum, the City of Oceanside developed a table that had specific information related to the various watersheds and water bodies in the northern watersheds of San Diego County. (See Table 8-4 of Oceanside's 2007-08 JURMP Annual report.) There is a possibility that this table will need to be updated once the new 303(d) list of impaired water bodies is finalized which will be done before implementation of the curriculum.

Other Education Outreach opportunities

Communities Alive in Nature, a local non-profit organization, implements education outreach programs to local school districts in San Diego County. One component of their education outreach program is to educate high school age students about water quality and how to assess water quality based on water chemistry and the biological community of benthic macroinvertebrates living within the streams. The Clean Water Program was invited to participate in a hands-on field training for these students to demonstrate how to properly use field test kits for water quality analysis and the proper protocols for collection of benthic macroinvertebrates. Clean Water Program staff participated in two training sessions for 9th grade students who attend Pacific Ridge School, a local private school located in the Carlsbad Hydrologic Unit. These two events were held on March 19 and March 26, 2009 at Dawson Reserve and Green Oaks Ranch respectively, both located in Vista along Agua Hedionda Creek. 47 students and 12 adults participated in the training.

Over-Irrigation

Clean Water Inspectors responded and documented over irrigation issues after receiving complaints from the general public or city staff. Inspectors investigated water sources and contacted property owners in person if possible or provided informational door hangers indicating the need to curtail overwatering or fix broken irrigation system if applicable, as well as provided information to educate the public to conserve water. After responding to complaints, inspector's maintained electronic files of all complaints and revisited locations to make sure over irrigation had stopped. In problematic areas where overwatering was caused by many property owners, the entire area was notified by door hangers and/or letters informing the property owners the need to conserve water and avoid polluting the storm drain systems. After the institution of Stage II Drought ordinance, inspectors also enforced the new requirements for the time and duration of irrigation through out the City per the requirements of the new ordinance. If the property owners did not curtail overwatering, the information was submitted to Code Enforcement for further processing of the violations.

Water meter reader personnel are trained to document and respond to urban runoff and over-irrigation issues as they come across such activities during their normal activities. While in the field these personnel will enter the address location into a hand-held meter of a site that may have an urban runoff violation. These addresses are then compiled and given to the Clean Water Inspectors for follow-up. When possible, the water meter reader personnel will also leave door hangers and report incidents of urban runoff. Depending on the situation a meter shop personnel will visit the site or the Clean Water Inspector will follow-up.

Residential Car Washing

Residents continued to be encouraged to use professional car washes or to implement BMPs at their homes to prevent water produced by residential car washing from entering the storm water conveyance system.

Pick Up Your Pet Waste Campaign

During the previous reporting period a relationship between the Clean Water Program and Girl Scout Troop 1215 was established. Troop 1215 agreed to participate in an education outreach campaign encouraging dog owners and dog walkers to pick up after their pets. This project is included as a Watershed Activity under the San Luis Rey Watershed Management Program.

Pet waste left on grass, sidewalks, and along trails is not only a leading cause of bacterial contamination in waterways, but it is also an issue that concerns Oceanside residents. In the spring of 2009, the City of Oceanside Clean Water Program launched a Pick Up Your Pet Waste Campaign to encourage dog owners to clean up after their pets. The project focused on the San Luis Rey River Trail which is used for a variety of recreational purposes including walking, running, and biking. Many people also bring their dogs with them to the Trail. Although most dog owners who use the trail clean up after their pets, some pet waste still accumulates along the trail.

To kick off the campaign, an intercept survey was conducted by members of Girl Scout Troop 1215. While walking along the trail, the Girl Scouts asked people the location of where they accessed the trail, the street name they lived on and if they walk a dog along the trail. The results of this intercept survey allowed for the next component of the program, a mail survey, to target the neighborhoods where most people come from to use the trail.

The next component was a brief survey that was mailed to 300 Oceanside households located in neighborhoods near the trail. The goal of the survey was to identify the reasons why people do or do not pick up after their pets on the trail and in other public areas. Sixty-five percent of the households completed the survey and returned it to the City. Of those residents who completed the survey, 70 percent had visited the trail in the past and 48 percent reported that they had a dog in their household. Following are the overall results of the survey.

Reasons for Picking Up Dog Waste

Both dog owners and non-dog-owners agree that it is important to pick up dog waste, rating the importance of the issue as 9.6 out of 10. The top-rated reasons for picking up dog waste and throwing it in the trash were because: “It is the right thing to do” and “It pollutes parks, rivers, and beaches.”

Barriers to Picking up Dog Waste

The vast majority of Oceanside dog owners who walk their dogs reported that they always pick up after their pet, but 17 percent stated that they sometimes leave their dog’s waste behind without picking it up. Among dog owners, the most common reasons cited for why someone might leave dog waste behind while walking the Trail were:

- Forgot to bring a bag
- Nowhere to throw it away

- No one else around to see them

Survey Recommendations

The results of the survey provided clear recommendations for the Pick Up Your Pet Waste Campaign at the Trail including the installation of additional trash cans and pet waste bag dispensers as well as modifying signage to emphasize pet owner responsibility. Ninety-three percent of survey respondents agreed that more pet waste dispensers are needed in the community. As a result, the City will consider installing additional signage, trash cans, and pet waste bag dispensers along the trail during the next reporting period.

8.3.1 Targeting Underserved Communities

Underserved communities are communities the City has determined may require increased educational efforts. The City targeted the following underserved communities and high-risk behaviors.

Mobile Businesses

Due to their nature, mobile businesses are typically not inspected during the routine industrial and commercial inspection program; therefore they may not be receiving the same educational material as other industrial and commercial businesses. As part of the regional outreach efforts, the City submitted their inventory to the Industrial Commercial Workgroup which plans to develop a regional inventory and provide a list of minimum BMPs to these types of businesses. The City continues to use Code Enforcement to respond to complaint calls related to mobile businesses.

Also, the City of Oceanside was involved in the Industrial Commercial Business workgroup which was formed under the Memorandum of Understanding amongst the Copermittees. During this reporting period the City of Oceanside submitted their inventory of mobile businesses to this workgroup. This comprehensive inventory list will be compiled from all Copermittees that have such an inventory, to eventually develop an education outreach piece for this underserved target audience.

Spanish-speaking population

The City will continue to target the large Spanish-speaking population in the City by offering a number of educational brochures and handouts, including the Green Wrench Guide and Integrated Pest Management tip cards in both English and Spanish. Additional Spanish language education outreach materials will be developed in future years. In addition there are posters available in Spanish for restaurants and automotive related businesses.

Nursery and Greenhouse Operations

Due to the amount of agricultural land use in the City, the City distributed a number of printed educational materials to agricultural/nursery/greenhouse site owners and operators. The City continues to provide educational materials, when needed, to nursery and greenhouse operations during annual inspections and on unannounced visits throughout the year.

Education Materials Distributed

Materials are regularly developed and updated to provide residents, the general public, and students with information about urban runoff, water quality, BMPs, Clean Water Program projects, and the Urban Runoff Hotline number. These materials include brochures and promotional items that are distributed upon request and during community events where the Clean Water Program staff a booth. No significant changes were made to any of the brochures during this reporting period. Copies of these brochures were submitted with previous annual reports. Table 8-6 lists the educational materials distributed during the 2008-2009 reporting period and Figure 8-1 provides a photo of the educational materials.

Table 8-6. Educational Brochures and Promotional Items Developed and/or Distributed.

Education Material	Description	Number Distributed
	Educational Brochures	
Urban Runoff Guidelines for Residents Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from residential activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	250
Pollution Prevention Tips for Gardening Activities Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from gardening activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	100
Urban Runoff Guidelines for Commercial Businesses Brochure	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from commercial and industrial business activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	100
Urban Runoff BMPs for Construction Projects handout	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from home-improvement activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	250
Urban Runoff Guidelines for Powerwashers	Provides information about urban runoff and the connection to water quality, as well as typical impacts resulting from powerwashing activities, BMPs to prevent urban runoff pollution, hotline for potential violations, and website address for more information.	50
Guide to Oceanside Waterbodies Booklet	A colorful introduction to the waterbodies in Oceanside. The Guide is intended to help residents develop a sense of stewardship, as well as provide information about local creeks, rivers, lakes, wetlands, and lagoons, the history behind each waterbody, and stakeholder information. In addition, the Guide includes a description of a watershed and current monitoring programs implemented to test recreational water quality.	150
	Total number of educational brochures distributed during this reporting period.	**900**

Promotional Items		
Poop Pollutes Pet Waste Bag Dispensers	Pet waste bag dispensers were distributed at community events.	100
Click Message Pen	Each pen has Oceanside's Urban Runoff Hotline phone number as well as the following text, "Protect our Waterways: sweep sidewalks, all storm drains led to the ocean, recycle motor oil and filters, eliminate irrigation runoff, pick up pet waste, litter pollutes our waterways and conserve water."	2,000
Pencils	Each pencil has Oceanside's Urban Runoff Hotline phone number and is made from recycled newsprint	500
Decals	These static cling decals have Oceanside's Urban Runoff Hotline phone number and can be placed on the windshield for quick reference to report potential storm water violations.	200
Gel Pen	These gel pens have Oceanside's Urban Runoff Hotline phone number and were distributed to City employees only during municipal training sessions.	150
Goodie Bags	These vinyl bags have ten ways to protect our water and Oceanside's Urban Runoff Hotline and were distributed to school and scout troops (filled with other promotional items) and handed out at community event booths.	500
T-shirts	T-shirts are offered as a give-away option for beach and creek cleanup volunteers.	900
Tote Bags	These reusable tote bags are made from recycled cotton and have the words "One Less Plastic Bag" and the Green Oceanside logo. They were distributed to employees and as a give-away option for beach and creek cleanup volunteers.	400
Water bottles	These reusable aluminum water bottles were distributed to employees and as a give-away option for beach and creek cleanup volunteers.	300
Rally Towels	These 11"x15" rally towels have ht slogan "Only Rain in the Strom Drain and were offered to beach and creek cleanup volunteers.	200
Bracelets	These translucent blue bracelets state "I Love Clean Water City of Oceanside Clean Water Program" and were distributed to children during community events and in goodie bags for classroom presentations.	250
Flashlights	These flashlights have the Clean Water Program name on them and were provided as a raffle item during municipal training sessions.	20
Scratch Note Pads	These 4.25 x 5.5 inch note pads provided stormwater pollution prevention tips and were distributed to municipal employees and to the public at community events.	750
Dog Poop Calendars	The Monthly Doos Calendar, which displays dog poop piles in unique venues, was distributed at special events to people completing a pet waste survey.	50
	Total number of promotional items distributed during this reporting period.	**6,320**

Figure 8-1. Promotional Items Distributed During Reporting Year 2008-09.

8.4 Education of Construction Community

The City provides all appropriate parties involved with construction activities with training and informational materials regarding storm water quality, as applicable. These parties include but are not limited to City employees and project proponents, which can include contractors, subcontractors, developers, property owners, and superintendents.

Education and training of the development community in Oceanside is typically done on a project-by-project basis during a mandatory pre-construction meeting with the City and during construction site inspections.

Prior to the issuance of any permits, construction site owners and developers are either given printed educational material or referred to the Clean water Program website for information that includes the municipal permitting process, as well as the state and local storm water permit requirements for construction sites. Prior to the wet season, all currently permitted construction sites are contacted reminding site owners and developers to update their sites' BMPs to reduce erosion and prevent storm water pollution, as well as update erosion control plans and SWPPPs.

The Building Division counter in City Hall references websites that have the following documents for construction site owners and developers to reference:

- Clean Water Program Website to for a link to the General Construction Storm Water Permit
- The City's Construction Manual
- Construction related sections of the Municipal Storm Water Permit Order R9-2007-0001
- Standard Urban Storm Water Mitigation Plan, when applicable

In addition to referring the construction community to the documents mentioned above, a copy of the Urban Runoff BMPs for Construction Projects brochure is stapled on to the storm water

related development plans for the project. This ensures that the construction community has received BMP information and is required to follow the minimum BMPs listed and shown in the brochure. Additional BMPs may be required by the City based on a review of the Storm Water Pollution Prevention Plan prepared by the project applicant. Storm water information is also disseminated to the construction community through storm water compliance inspections of construction sites.

Training of City staff is done continually using a variety of methods such as workshops and memorandums. For further detail regarding the City's construction educational program, please refer to Sections 10.2.2 and 10.3.1 of this document.

8.5 Outreach Component Effectiveness Assessment (Optional)

See Section 11.0 for an assessment of the education component of the City's JURMP.

8.6 Program Review and Modification (Optional)

Staff Training

The Clean Water Program will continue to implement its comprehensive municipal staff training program, including the implementation of pre- and post-test quizzes. The scores from the pre- and post-quizzes will continue to be assessed to determine the effectiveness of the training programs. If specific divisions or departments are in need of educational materials or reference materials related to storm water, the Clean Water Program staff will assist in the development of these materials to provide to those departments or divisions for dissemination or reference.

9.0 PUBLIC PARTICIPATION COMPONENT

In order to ensure success with any City-wide program, the public must be involved. Stewardship and participation by the general public will increase the acceptance and willingness to comply with new regulations. The City of Oceanside has actively pursued public involvement in the Clean Water Program through the implementation of various programs and feedback mechanisms. This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to meet the requirements of Section D.6 of the Municipal Permit (Table 9-1).

Table 9-1. Order 2007-0001 Compliance Summary.

J.3.a.(3)(h).i Public Participation Efforts	See Entire Section 9 of this Annual Report

9.1 Local Public Participation Opportunities

The City of Oceanside encourages its residents to become involved in the Clean Water Program in various ways. The variety of ways the public can participate in the Clean Water Program include reporting potential violations to the Urban Runoff Hotline, beach and creek cleanup events, and community events.

9.1.1 Urban Runoff Hotline

With the establishment of the Urban Runoff Hotline, (760) 435-5800, the public can report potential violations that could pollute the City's receiving waters. The Urban Runoff Hotline was promoted through a variety of media during this reporting period, including announcements on local television stations, placement on brochures, click-message pens, pencils, and other promotional "give-aways", and advertisement on the City's Clean Water Program webpage.

- During the reporting period, one hundred twenty four (124) calls were received on the Urban Runoff Hotline by residents concerning potential urban runoff violations. This is a significant increase from the 55 calls received in the 2007-08 Reporting period and the 14 calls received during the 2006-07 reporting period.
- In addition, Code Enforcement responded to 109 urban runoff related cases, related to residential areas and activities, during the reporting period.

9.1.2 Oceanside Eyes

In addition to the Urban Runoff Hotline City Staff is encouraged to participate in the Clean Water Program through the use of a special City Enhancement Hotline specifically for Oceanside employees called "Oceanside Eyes." This hotline is call incentive driven and promoted internally. During storm water classes for municipal staff, this hotline is mentioned as an alternative for calling the Urban Runoff Hotline.

9.1.3 Cleanup Events

City Sponsored events

To increase Oceanside residents' stewardship toward our local waterways, the Clean Water Program hosts annual cleanup events at every major waterway in Oceanside including Buena

Vista Creek, Loma Alta Creek, San Luis Rey River and City beaches. Each cleanup averages between 100 to 300 participants. During the 2009-09 reporting period, approximately 1,561 volunteers removed approximately 8.98 tons of trash, debris, appliances, furniture, shopping carts and other unwanted material from Oceanside waterways.

Private group sponsored events

Also, private groups regularly approach the city to coordinate their own beach cleanup. The city of Oceanside including the Clean Water Program, Lifeguard division and the harbor maintenance staff support these groups by providing them guidance on what areas to target for cleanup, supplies for their event (bags and gloves) and safety instructions for the group. During this reporting period six private groups coordinated their own beach cleanup event in Oceanside. A total of 1,904 volunteers removed 485 pounds form Oceanside beaches.

Between the City sponsored and private group sponsored events, 1,561 volunteers removed 17,968 pounds of trash and debris from Oceanside City beaches and the three waterways that traverse the City of Oceanside. Table 9-2 lists cleanup events held between July 2008 and June 2009 to encourage community participation and education of the effects of urban runoff:

Table 9-2. Cleanup Events Held during the 2008-09 Reporting Year.

Date	Event	Number of Participants	Pounds Tonnage of Waste Removed
City Sponsored Cleanup Events			
7/5/2008	Morning After Mess	305	175 pounds
9/20/2008	Buena Vista Creek Cleanup	128	9,000 pounds
9/20/2008	Oceanside Beach Cleanup	307	215 pounds
11/08/2008	San Luis Rey River Cleanup	315	5,000 pounds
4/25/2009	Loma Alta Creek Cleanup	99	2,000 pounds
4/25/2009	Oceanside Beach Cleanup - Pier	204	127 pounds
4/25/2009	Oceanside Beach Cleanup Buccaneer Beach	203	451 pounds
	Total City Sponsored Events	**1,561**	**17,968 pounds**
Private Group Sponsored Events			
01/10/2008	Oceanside High School Environmental Club	10	10 pounds
02/23/2008	Oceanside High School Baseball Players	52	260 pounds
4/05/2008	Pacific Kiwanis High School Students	25	50 pounds
4/07/2008	Vista High School Key Club	5	10 pounds
4/19/2008	Black Student Union Cal State San Marcos	33	55 pounds
6/06/2008	Kid's Oceanside Beach Cleanup	800	100 pounds

Date	Event	Number of Participants	Pounds Tonnage of Waste Removed
	Total Private Group Events	**865**	**485 pounds**
	Grand Totals	**2,426**	**18,453 pounds**

Cleanup event mailing lists

During this reporting period and in previous years all volunteers were placed on a mailing list and were periodically mailed fliers with event information allowing them a sense of ownership and responsibility toward the Program. See Attachment 9-A for 2008-09 reporting year fliers mailed to past participants. In order to become more environmentally conscious and use less paper, during the next reporting period, the Clean Water Program will create an email distribution list as a way to inform interested parties about upcoming cleanup events. This will save time for staff to update mailing labels and eliminate the postage and printing costs for mailing these fliers.

9.1.4 Oceanside Update Show

Clean Water Program staff appears regularly on the Oceanside Update Show broadcast through Oceanside Channel KOCT. Each spot allows staff to spend three to five minutes discussing specific storm water pollution programs, pollution prevention, and BMPs to reduce impacts. The show is broadcast twice daily at 7:00 a.m. and 7:00 p.m. Topics are varied with every taping of Oceanside Update, therefore the viewing audience learns about a multitude of BMPs. While KOCT is unable to determine the actual number of residents who watch Channels 17 and 18 regularly or for any length of time, both channels broadcast to approximately 50,000 Oceanside households. Table 9-3 summarizes topics discussed each month in which the Clean Water Program aired a spot:

Table 9-3. Summary of Oceanside Update Topics by Month.

Date	Topic Discussed
July 2008	Pick up pet waste
August 2008	State drought situation, water conservation tips, and Coastal Cleanup Day
September 2008	Coastal Cleanup Day, Buena Vista Creek and Oceanside Beach Cleanup
October 2008	Water rebate programs
December 2008	How to protect water quality during the rainy season
January 2009	2009 Cleanup event schedule and storm drains vs. sewers.
March 2009	Storm drains and sewer difference and Loma Alta Creek Cleanup
April 2009	Oceanside watersheds and Loma Alta Creek and Oceanside Beach Cleanup
May 2009	Water awareness month, water conservation & irrigation runoff
June 2009	Pool draining tips to protect water quality

9.1.5 Additional Public Participation Opportunities

Other opportunities for local public participation during this reporting period are discussed in this section.

Pick Up Your Pet Waste Campaign

During the previous reporting period a relationship between the Clean Water Program and Girl Scout Troop 1215 was established. Troop 1215 agreed to participate in an education outreach campaign encouraging dog owners and dog walkers to pick up after their pets. This project is included as a Watershed Activity under the San Luis Rey Watershed Management Program.

Pet waste left on grass, sidewalks, and along trails is not only a leading cause of bacterial contamination in waterways, but it is also an issue that concerns Oceanside residents. In the spring of 2009, the City of Oceanside Clean Water Program launched a Pick Up Your Pet Waste Campaign to encourage dog owners to clean up after their pets. The project focused on the San Luis Rey River Trail which is used for a variety of recreational purposes including walking, running, and biking. Many people also bring their dogs with them to the Trail. Although most dog owners who use the trail clean up after their pets, some pet waste still accumulates along the trail.

To kick off the campaign, an intercept survey was conducted by members of Girl Scout Troop 1215. While walking along the trail, the Girl Scouts asked people the location of where they accessed the trail, the street name they lived on and if they walk a dog along the trail. The results of this intercept survey allowed for the next component of the program, a mail survey, to target the neighborhoods where most people come from to use the trail.

The next component was a brief survey that was mailed to 300 Oceanside households located in neighborhoods near the trail. The goal of the survey was to identify the reasons why people do or do not pick up after their pets on the trail and in other public areas. Sixty-five percent of the households completed the survey and returned it to the City. Of those residents who completed the survey, 70 percent had visited the trail in the past and 48 percent reported that they had a dog in their household. Following are the overall results of the survey.

Reasons for Picking Up Dog Waste

Both dog owners and non-dog-owners agree that it is important to pick up dog waste, rating the importance of the issue as 9.6 out of 10. The top-rated reasons for picking up dog waste and throwing it in the trash were because: “It is the right thing to do” and “It pollutes parks, rivers, and beaches.”

Barriers to Picking up Dog Waste

The vast majority of Oceanside dog owners who walk their dogs reported that they always pick up after their pet, but 17 percent stated that they sometimes leave their dog’s waste behind without picking it up. Among dog owners, the most common reasons cited for why someone might leave dog waste behind while walking the Trail were:

- Forgot to bring a bag
- Nowhere to throw it away
- No one else around to see them

Survey Recommendations

The results of the survey provided clear recommendations for the Pick Up Your Pet Waste Campaign at the Trail including the installation of additional trash cans and pet waste bag

dispensers as well as modifying signage to emphasize pet owner responsibility. Ninety-three percent of survey respondents agreed that more pet waste dispensers are needed in the community. As a result, the City will consider installing additional signage, trash cans, and pet waste bag dispensers along the trail during the next reporting period.

Interpublic Education. The City has developed programs to educate the public and various target communities of the JURMP and the numerous ways the public can contribute to reducing pollution of the City's waterways and Receiving Waters. However, the City recognizes that no matter how many educational programs it implements, there will always be a need for ongoing outreach to various audiences. Therefore, "spreading the word" is another significant effort that the public will be encouraged to participate in that will substantially contribute to the success of the JURMP. When speaking with the public about urban runoff issues, they are encouraged to speak with neighbors about how everyday activities can potentially pollute local waterways.

During this reporting period the Clean Water Program was contacted by a city resident living in a neighborhood with a Homeowners Association. This resident requested informational brochures that could be distributed to households in the neighborhood that address urban runoff and water conservation information. Brochures and information provided to the resident for distribution were as follows:

- Urban Runoff Guidelines for Residents – 125 each
- Pollution Prevention Tips for Gardening Activities - 125
- Pollution Prevention Tips for Landscape Contractors – 5
- Miscellaneous promotional items

The City will continue to provide homeowners associations with informational brochures for distribution throughout their communities.

City Staff Activities. City staff is the public at work. Staff is encouraged to report violations and provide feedback on the implementation of the JURMP. City staff is the eyes and ears of the City, and can provide valuable information on which components and programs are working and provide suggestions or recommendations on improving the programs. The City staff is provided an incentive based hotline called Oceanside Eyes for reporting potential runoff violations as well as other problems that require remediation, such as road repair or infrastructure maintenance needs. In addition, City staff provides feedback during municipal training sessions, information meetings, and by direct contact with the Clean Water Program Manager and staff. Comments are discussed and if changes can be made to better improve the program, then they are planned and implemented.

9.2 Regional Public Participation Opportunities

This section describes those mechanisms available, at the regional level, for the public to participate in to assist in the implementation of regional JURMP related programs and to provide feedback to the Copermittees and contribute to the continuing development of the numerous JURMPs in effect around the County:

9.2.1 Media

Outreach to the public through the media serves as a widespread public education BMP and is an important element of public participation and keeps communication open between government

staff and the public. During Fiscal year 2008-09 all cleanup events were covered in the Oceanside Magazine:

- 2008 Oceanside Beach and River Cleanup Events – Article in summer 2008 *Oceanside Magazine*
- 2009 Oceanside Beach and River Cleanup Events – Article in spring 2009 *Oceanside Magazine*

Copies of the media coverage are located in Attachment 9-B.

9.2.2 Regional Events

San Diego County Fair

The San Diego Regional Storm Water Copermittees sponsored the San Diego County Fair (Fair) in 2008 as an education and outreach activity. The sponsorship was a joint effort between the City of San Diego's Think Blue program and the regional Copermittees. The Fair was selected as a regional event due to its unique ability to potentially reach more than one million San Diegans and convey a strong environmental message. The Residential Sources and Outreach Workgroup (Outreach Workgroup) was responsible for overseeing sponsorship activities with the City of San Diego leading the coordination and implementation efforts.

The 2008 Fair was held June 14th through July 6th, spanning two fiscal years and will be included in both the FY 07/08 and FY 08/09 annual reports. The attendance for the fair was estimated at 1,235,698 persons for the 21 days the event occurred. Sponsorship for the Fair included staffing an outreach booth for 11 days, in which the majority of the jurisdictions provided staffing support. Two staff people from the City of Oceanside's Clean Water Program staffed the booth on June 21, 2008.

The outreach booth served as the primary method for educating the public about watershed protection and pollution prevention. The Outreach Workgroup elected to promote Integrated Pest Management (IPM) as the primary theme and collaborated on the distribution of IPM materials in both English and Spanish. Individual jurisdictions were invited to distribute their own materials in addition to the IPM materials. The Copermittees received credit as both a Flower & Garden Show sponsor and an Enviro-Fair sponsor.

Think Blue was designated as the brand for the Copermittees' during the event and signage demarking the symbol included banners, planter box displays and recycle bin stickers, which were visible at over 500 locations throughout the Fair. Media exposure included TV, radio and press releases. The sponsorship was printed in both the Fair program and included on the Fair map. Other promotions included newspaper advertisements, electronic messaging over the Jumbo Tron, website logos and links, and PA system announcements in both English and Spanish.

Think Blue, City of San Diego developed an event survey for the purposes of assessment. Over 1,200 survey cards were completed during the 11 days the booth was staffed. The questions focused on general storm water knowledge and awareness. The results are being tabulated and will be reported in the 2008-09 RURMP.

Independence Jam

The Independence jam was a concert event held at the Oceanside Amphitheatre attracting 4,000 people from throughout the region. At this event the organizers had and Eco-village where environmentally conscious businesses and organizations were able to a staff a table. Copermittees staffed a table in the Eco-Village to educate event participants about storm water pollution. At this event promotional give-away items distributed were rally towels, tattoos, and displayed the watershed map of the San Diego region. Participants were able to ask questions of staff about which watershed they lived in and were provided with stormwater education information.

Copermittee Working Bodies

The Copermittees collectively developed ten (10) Working body groups to coordinate the implementation of regional programs required by the Municipal Permit. Each Copermittee is required to provide at least one representative to each working body. These working bodies meet at least four times per year unless a different meeting frequency is established through unanimous approval of all Copermittees.

During this reporting period the City of Oceanside participated in each working body. In addition The City of Oceanside Co-chaired the Educational and Residential Sources Workgroup. Activities related to each of these ten working bodies during FY 2008-09 will be provided in the Regional Urban Runoff Management Program (RURMP) annual report scheduled to be submitted to the RWQCB in January 2010.

Regional Hotlines

The regional hotlines provide a direct connection for public participation. Historically, the hotlines have worked well and should continue to increase in use as more people are educated of the hotline and the types of issues to report. The City will encourage reporting through its local hotlines, however, the regional hotlines will serve as an alternative to the local hotlines and also provide an opportunity for reporting by visitors to the City, from other areas in the County, who are not familiar with the local hotlines.

THIS PAGE INTENTIONALLY LEFT BLANK

10.0 FISCAL ANALYSIS COMPONENT

The City of Oceanside acquires the funds necessary to facilitate the City's storm water program through four departments or divisions in the City: Water Utilities, Public Works, Engineering and Code Enforcement. Much of City's storm water program falls under the responsibility of these four departments/divisions. Funds obtained for use in implementing the City's storm water program are utilized for a number of different programs, including jurisdictional, watershed, and regional programs. This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to meet the requirements of Section G of the Municipal Permit Order 2007-0001 (Table 10-1).

Table 10-1. Order 2007-0001 Compliance Summary.

G: Fiscal Analysis Component	See Entire Section 10 of this Annual Report
J.3.a.(3)(j).i Fiscal analysis of City urban runoff management program	See Entire Section 10 of this Annual Report

Effective programs require adequate funding to implement planned activities. The first step in securing adequate funding for the JURMP is to provide a strategy for effectively conducting a fiscal analysis of the JURMP in its entirety. This year's fiscal analysis included an evaluation of the expenditures (such as capital, operation and maintenance, education, and administrative expenditures) necessary to accomplish the activities described in the JURMP and required under investigation orders and Total Maximum Daily Loads (TMDLs).

10.1 Fiscal Analysis Methods

10.1.1 Program Funding

As previously mentioned, the City secures funding for the implementation of the storm water program through the Water Utilities, Public Works, and Engineering departments/divisions in the City. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge. The surcharge is based on the customer's water consumption, so the surcharge is also designed as an incentive for individuals to conserve water. This amount is equal to $0.07 per unit of water used.

The Development Services Department secures funding from development-related programs. The Engineering Division receives funding through fees assessed on developers for grading plan checks and inspections. Funding for Public Works departments is obtained through general allocations to the department.

10.1.2 Urban Runoff Management Programs

The City's storm water budget is used to support the following departments/divisions:

- Water Utilities Department - Administration of the City's Clean Water Program
- Development Service Department, Engineering Division – Storm water plan review, SUSMP and HMP
- Development Service Department, Engineering Division - Capital Improvement Projects

- Public Works Department - Storm Drain Maintenance
- Public Works department - Solid Waste
- Public Works Department - Flood Control
- Public Works Department - Street and Median Maintenance

Personnel from various City departments and divisions are involved in the implementation of the City's storm water program. Refer to Section 2 and the City's certification letter in Appendix A, pages 2 and 3, of the City's 2008 JURMP for further detail regarding the responsibilities of various departments. Other program expenditures include watershed and regional storm water activities.

10.1.3 Expenditure and Budget Reporting

Following are the expenditures for fiscal year 2008-09 as well as a proposed budget for the next fiscal year. The fiscal year expenditures are presented in tabular format with separate rows for different expenditure categories and the associated budget. The budget for the next fiscal year is presented in the same table.

The JURMP budgeting for the Water Clean Water Program which includes various departments is described in the following sections and summarized in Table 10-2 at the end of this section. Currently there is eight staff people dedicated to the City's Clean Water Program.

- One full-time Clean Water Program/JURMP Coordinator
- Two full-time Environmental Specialists (focusing on water quality monitoring, education outreach, and program administration)
- Two full-time CWP inspectors
- One full-time Engineering Assistant (focusing on SUSMP and HMP)
- Two full-time Code Enforcement Officers

10.1.3.1 Water Utilities Department

The surcharge rate described above under Program Funding is listed as a separate line item on Oceanside customers' utility bills. This allows for the clear delineation of the revenue being secured for the Clean Water Program in the Water Utilities section of the utility bill. The costs to administer the Clean Water Program during Fiscal Year 2008-09 totaled 1,020,583. It is anticipated that the Water Utilities Department will expend $1,253,458 during Fiscal year 2009-10.

10.1.3.2 Public Works

The City calculated the curb miles swept for the reporting period and they totaled 28,954 miles. The overall cost of the City's street sweeping program during FY 2008-09 was estimated to cost $944,000 during this reporting period. This includes $460,000 for equipment costs and $484,000 for staff costs. With a total of 28,954 curb miles swept in the City at a cost of $944,000, this averages out to $32.60 per curb mile.

The cost for inspection and maintenance of the MS4 was $360,580 during this reporting period. These costs are expected to increase to $369,597 during fiscal year 2009-10. During fiscal year

2008-09 the Public Works Department spent approximately $1,369,580. It is anticipated that the Public Works Department will expend $1,415,597 during Fiscal year 2009-10.

10.1.3.3 Engineering

Municipal Permit Order 2007-001 requires an increased focus and effort in development-related review and inspection, development of a Hydromodification Plan and revisions to the Standard Urban Storm Water Mitigation Plan. The approximate costs to implement this program during Fiscal year 2008-09 totaled $275,006. It is anticipated that Engineering Department will expend $195,000 during Fiscal year 2008-09.

10.1.3.4 Overall Clean Water Program Costs

During Fiscal Year 2008-09 approximately $2,665,169 was expended amongst four departments for the implementation of the Clean Water Program. It is anticipated that the total program costs for Fiscal Year 2009-10 will total $2,864,055.

Table 10-2. JURMP Budgeting for Water Utilities, Public Works and Engineering Departments/Divisions.

Department	Item	Fiscal Year 2007-2008	Fiscal Year 2008-2009	Projected Fiscal Year 2009-2010
Water Utilities	Personnel (including Code Enforcement)	410,330	557,023	686,260
	Misc. office supplies, postage, uniforms	2,000	424	4,700
	Print Materials	0	10,229	34,500
	Monitoring Programs including lab materials, supplies and services	17,191	41,733	89,000
	Other Misc Cleanups and booths	73,000	24,027	2,000
	Consultant Fees Investigation Order, TMDL	730,440	202,876	250,800
	Independent Contractors	0	39,000	0
	Permits	135,000	27,178	25,000
	Dues, Travel, Advertising	9,400	934	8,950
	Equipment	2,000	0	5,000
	Regional Copermittee Cost-share Monitoring, RURMP, WURMP	71,618	117,159	147,248
Water Utilities	**Total**	**1,450,979**	**1,020,583**	**1,253,458**
Public Works	Street Sweeping (Equipment)	442,000	460,000	478,000
	Street Sweeping (staffing and /or contract costs)	465,000	484,000	503,000
	Conveyance System Cleaning (Contracted Work and City Staff	351,910	360,580	369,597
	Personnel for CWP Monitoring	65,000	65,000	65,000
Public Works	**Total**	**1,323,910**	**1,369,580**	**1,415,597**
Engineering	Personnel	250,000	260,000	165,000
	Hydromodification Plan	22,510	15,006	30,000
Engineering	**Total**	**272,510**	**275,006**	**195,000**
	Grand Total	**3,047,399**	**2,665,169**	**2,864,055**

11.0 EFFECTIVENESS ASSESSMENT COMPONENT

11.1 Introduction

Effectiveness assessment is an important component of the JURMP because it can assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The San Diego County Copermittees developed two guidance documents to assist in the assessment of the JURMP components as well as the jurisdictions overall JURMP program. These two documents are titled *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* and the *Baseline Long-term Effectiveness Assessment* (BLTEA). The City participated in regional efforts to develop these documents in anticipation of the requirement to assess their JURMP programs.

The City gathered and evaluated data for some of the program components for assessment during this reporting period. This data will be valuable for incorporation into long-term effectiveness evaluation on a jurisdictional level. In future reporting years, the issue of standardized assessment metrics and procedures will be addressed by the Copermittees. The City anticipates participation in the further development of these work products.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes.

Next the program developed during the planning step is implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique. The effectiveness assessment approach developed by the Copermittees during the 2005-06 permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

- Level 1: Compliance with Activity-Based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation

- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

The establishment of measurable outcomes is necessary for both incremental program component improvements and as a basis for future establishment of relationships between implementation and water quality improvement outcomes.

11.2 Effectiveness Assessment Results

The Municipal Permit Order 2007-0001 requires the City to assess the effectiveness of each significant activity specific to each program component, for each program component as a whole, and for the storm water program as a whole. Levels 1, 2, 3, 4, 5, and 6 outcomes are discussed in the text below. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome level assessments

Level 1 – Compliance with Activity-Based Permit Requirements: Documenting Activities

Compliance with Activity-based permit requirements is intended to provide a quantitative assessment that reflects the regional long-term effectiveness assessment framework through targeted outcomes for the City based on various components of the Municipal Permit. Level 1 outcomes take the form of a simple yes or no answer basically answering "Was the control measure completed?" or it may provide feedback that may be quantified, counted, or tracked over time to demonstrate effort or progress.

Level 2 – Changes in Knowledge/Awareness: Raising Awareness

An important goal of stormwater programs is to increase the level of knowledge and awareness among target audiences such as residents, businesses, and municipal employees. Level 2 outcomes provide program managers feedback on how effective the various control measures have been in raising awareness and changing attitudes of the target audience.

Level 3 – Behavioral Change/BMP Implementation: Changing Behavior

A key focus of the stormwater management program is to affect changes in behavior. By building increases in knowledge and awareness (Level 2), Level 3 outcomes provide program managers with feedback on how effective the program elements and control measures have been in motivating target audiences to change their behaviors and implement appropriate BMPs.

Level 4 – Load Reductions: Reducing Loads from Sources

Many control measures are intended to reduce the loading of pollutants from targeted sources. Load reductions should, in turn, result in improvements to discharge and receiving water quality. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning.

Level 5 – Changes in Discharge Quality: Improving Runoff Quality

A primary focus of stormwater management programs is to reduce pollutants in stormwater to the maximum extent practicable, and to ensure that these discharges do not cause or contribute to violations of water quality standards in receiving waters. At this level baseline measurements of runoff quality are measured to allow comparison. Multi-year data sets are needed in order to have any confidence in the measured change.

Level 6 – Changes in Receiving Water Quality: Protecting Receiving Water Quality

The ultimate objective of stormwater management programs is the protection of water bodies. At level 6, program mangers will focus on outcomes such as compliance with water quality standards, protection of biological integrity, and beneficial use attainment.

Summary

Program elements and control measures will typically have outcomes at more than one of the levels described above and not all outcome levels will necessarily be applicable to all activities. The information submitted with this report will address levels 1, 2, 3 and 4. Section 7 of this report, IDDE, will be submitted prior to December 15 and will address level 5.

11.2.2 Overall Component Assessments

11.2.2.1 Development Planning

The City's review process for development projects is effectively requiring higher removal efficiency BMPs. Based on some interaction with responsible parties during the reporting period and the results of the treatment control inspections, it appears that there is a consistent desire by developers to include just structural BMPs instead of a combination of LID, site design, and source control and treatment controls BMPs. The City will work with the parties responsible for maintenance of treatment control BMPs to address this issue during FY 2009-10. The following information highlights the Development Component of the City's JURMP. Table 11-1 presents the level 1 effectiveness assessment.

Revised SUSMP Manual

The City of Oceanside Interim Local SUSMP is based on the Interim Model SUSMP developed collectively by the Copermittees to address post-construction urban runoff pollution from new development and redevelopment projects that fall under both "priority project" and "standard project" categories. The general goal of the SUSMP is to develop and implement practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from a project site and urban runoff flow rates, volumes, velocities, and durations. This goal may be achieved through site-specific controls and/or drainage area-based structural treatment controls. The City's Interim Local SUSMP identifies appropriate BMPs for certain designated project types to achieve this goal. Projects that are identified as priority projects are required to prepare a Stormwater Mitigation Plan (SWMP). Development projects not qualifying as priority projects will be required to prepare a Runoff Assessment Report (RAR) as specified in this SUSMP. The RAR will require the applicant to incorporate LID concepts, site design

BMPs, and source control BMPs in the project design, but no structural treatment control BMPs will be required. The manual is available on the Clean Water Program website.

Interdepartmental Coordination
The City's SUSMP and development review process includes multiple departments and divisions throughout the City. The City has taken necessary steps to maintain compliance with SUSMP requirements through the coordination of these multiple departments and divisions.

Dedicated Storm Water Management Program
The City established the Clean Water Program (CWP) in 2001 under the Water Utilities Department. During this reporting period the CWP program in conjunction with the Engineering Department provided the necessary oversight for all management components of the SUSMP.

Table 11-1. Development Planning – Level 1: Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Development Planning D.1.e	Development Projects	Projects needing SWMP	Projects completing SWMP	Actual/Target	Percent ( ) Completion
	Priority Projects (Required SWMP)	53	24	24/53	45
		Sites needing RAR	Sites completing RAR	Actual/Target	
	Standard Projects (Require RAR)	10	5	5/10	50
	SUSMP Inspections	Sites targeted for Inspection	Sites Inspected	Actual/Target	
	High, Medium and Low Priority Sites (Total 41)	41	40	40/41	97

The 45% and 50% completion rates for Development Projects reflect the fact that several projects are continuing to move through the approval process for SWMP or RAR. Some projects may take one or two reviews before approval, while other project can take significant more plan reviews before receiving approval.

As the City continues to grow and evolve, challenges associated with data management emerges such as tracking of post-construction BMPs, maintenances agreements, and associated documents. It is important to update available tools with up-to-date information. The Development Services Department, which includes Code Enforcement,

Building, and Engineering, have chosen CRW Systems, Inc. as a data tracking system and will begin roll-out in the FY 2009-10 reporting year.

11.2.2.2 Construction

The construction component of the City's JURMP continues to be effectively implemented through inspection and enforcement, education and training and BMP maintenance (Table 11-2). As construction activities continue, the City will maintain the level of performance established from past years, and continue to meet the regulatory standards mandated in the Municipal permit.

Table 11-2. Construction – Level 1: Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Development Planning D.2.d	Construction Projects	sites targeted for Inspection	sites inspected	Actual/Target	Percent (%) Completion
	High Priority Sites	20	20	20/20	100
	Medium Priority	17	17	17/17	100
	Low Priority Sites	18	18	18/18	100

11.2.2.3 Municipal

The municipal component of the City's JURMP continues to provide a well-rounded approach and will continue to implement a comprehensive education program along with inspections of municipal facilities, MS4 maintenance, sanitary sewer slip-lining and street sweeping (Table 11-3).

In addition the City implemented a training program that provided pre- and post-quizzes to assess the effectiveness of the training course specific to each department or division. During the 2008-09 reporting year, 195 City staff were trained on the City's storm water program requirements. Pre- and post- tests were given to assess the level of knowledge before and after each training session. Depending on the nature of the employee's department, the employee's were given an eight, a 15, or a 20 questions test. The eight question test was designed specifically for the engineering inspectors. The 15-question test targeted City staff that worked in various departments including fleet maintenance, parks and recreation and street maintenance. The 20-question test targeted staff who work at and maintain industrial facilities. The average City pre-test score was 68% percent of the questions correct. The average City post-test score was 98% percent of the questions correct. Figure 11-1 presents the pre- and post-test scores by City department.

Table 11-3. Municipal – Level 1: Compliance with Activity-Based Requirements; Level 4 - Load Reductions: Reducing Loads from Sources.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.a	Municipal Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent (□) Completion
	(High, Medium and Low priority facilities)	181	181	181/181	100
	MS4	of catch Basins to be cleaned	of catch Basins actually cleaned	Actual/Target	Percent (□) Completion
	Catch basins cleaned	3,350	3,354	3,354/3,350	100
	Sanitary Sewer	of feet to be slip-lined	of feet actually slip-lined	Actual/Target	Percent (□) Completion
	Feet of sewer slip-lined	4,000	4,054	4,054/4,000	101
	Street Sweeping	of miles of streets to be swept	of miles of streets actually swept	Actual/Target	Percent (□) Completion
	Curb miles of street swept	28,954	28,954	28,954/28,954	100

Figure 11-1. Municipal – Level 2: Changes in Knowledge/Awareness: Raising Awareness.

11.2.2.4 Industrial and Commercial

The City implements a comprehensive inspection program for industrial and commercial facilities including all restaurants and nursery and greenhouse operations. Table 11-4 provides an assessment for the inspections.

Table 11-4. Industrial and Commercial Component - Level 1: Compliance with Activity-Based Requirements.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.b	Industrial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High, priority facilities)	21	20	20/21	95
	Industrial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	Medium and Low priority facilities	As Needed	13	N/A	N/A

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High priority facilities - Restaurants	320	320	320/320	100
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	High priority facilities Other than restaurants	165	164	164/165	99
	Commercial Facilities	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	Medium and Low priority facilities	As needed	39	N/A	N/A
	Nursery and Greenhouses	of sites to be inspected	of sites actually inspected	Actual/Target	Percent ( ) Completion
	All High Priority	16	16	16/16	100

During this reporting period one facility assigned a high rating under the industrial facilities, Hobie Cat, was down-graded form high to medium, and was not inspected. The majority of the work for this facility is conducted inside and under cover. Also, this facility is surrounded by the City Operations Center and the Clean Water Program staff views this facility on a daily basis during regular day-to-day operations.

11.2.2.5 Residential

The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. The City is also conducting additional monitoring studies to help identify and mitigate residential sources of pollution more effectively. Although fewer households participated in dropping off household hazardous waste during this reporting period, more quantity of household hazardous waste was collected for proper disposal (Table 11-5).

Table 11-5. Residential Component - Behavioral Change/BMP Implementation Changing Behavior.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Residential D.3.e	Household Hazardous Material	Quantity of waste targeted	Quantity of waste collected	Actual/Target	Percent ( ) Completion
		130 tons	274.46 tons	274.46/130	211
	Households Participating in Program	of households targeted	of households participating	Actual/Target	Percent ( ) Completion
		3,500	3,430	3,430/3,500	98

11.2.2.6 IDDE

An assessment of this component will be provided in Section 7 when the City submits the entire FY 2007-08 Illicit Discharge Detection and Elimination Component, including the 2008 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2009.

11.2.2.7 Education and Public Participation

The City implements a comprehensive education outreach program for both municipal staff and the public as well as a comprehensive public participation program (Table 11-6). See 11.2.2.3 above for an assessment of the Municipal training program. The City prides itself on educating children within its jurisdiction through the use of a watershed model and the Project SWELL curriculum incorporated into the 5th grade science curriculum.

Table 11-6. Education and Public Participation Component - Compliance with Activity-Based Permit Requirements: Documenting Activities.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
Municipal D.3.g	Student Presentations	of presentations targeted	of presentations completed	Actual/Target	Percent ( ) Completion
		10	13	10/13	130
	CWP Newsletters	of newsletters targeted for completion	of newsletters completed	Actual/Target	Percent ( ) Completion
		2	2	2/2	100
	Oceanside Update Tapings	of tapings planned	of tapings completed	Actual/Target	Percent ( ) Completion
		6	10	10/6	166
	CWP Website	of targeted hits	of actual hits	Actual/Target	Percent ( ) Completion
		45,000	35,647	35,647/45,000	79.2

11.3 Program Review and Modification

No changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

12.0 SPECIAL INVESTIGATIONS

12.1 Lower San Luis Rey Bacteria Source Identification Project

12.1.1 Overview

As part of the Proposition 50 Clean Beaches Initiative, the City of Oceanside has been awarded a grant to track the sources of bacteria in the Lower San Luis Rey River. The shoreline at the outlet of the San Luis Rey (SLR) River mouth in Oceanside, California is visited by thousands of people each year. Elevated levels of fecal indicator bacteria (FIB) have affected water quality in the river mouth and the adjacent shoreline. In 2007, this beach was posted due to bacterial exceedances for 54 days; in 2006, it was posted for 71 days; in 2005, this beach was posted for 209 days and 186 of those days were during one consecutive stretch. As a result of the exceedances, the river mouth and one-half mile of shoreline is listed as an impaired water body under section 303(d) of the Clean Water Act for exceedances of indicator bacterial standards. The beach is also listed as a Clean Beach Task Force priority beach.

A major objective of the San Luis Rey Watershed Urban Runoff Management Program (WURMP) lead by the City of Oceanside is to identify sources of the FIB at the river mouth. As directed by the WURMP, the City of Oceanside and the County of San Diego have jointly sampled the San Luis Rey River since March of 2004 to determine if the river is the source of the high concentrations of FIB at the river mouth. Thus far, the results are inconclusive and indicate the need for focused sampling in the lower river and at the river mouth.

To address this issue, the City received $554,375 from the SWQCB and, with the assistance of other stakeholders, will match $141,750 to implement the source identification project in the lower river and river mouth. The City awarded MACTEC Engineering and Consulting, Inc. (MACTEC) and their team of leading scientist in the field the lead contract for the organization and completion of the two-year study.

The overall goal of the proposed study is to identify the sources and quantify the loading of bacterial contamination using a tiered approach. The project will analyze for FIB to identify "hot spots" and to assess bacterial flux. Based on these results, genetic microbial and viral analyses on selected samples will be conducted to pinpoint potential sources and identify potential public health risks. The suite of analyses include *Bacteroides spp,* ESP gene quantification, enterovirus analyses using quantitative PCR (QPCR), sequencing of the enterovirus from the field samples, community based bacterial analyses, and *Enterococcus* speciation. In addition, the joint monthly monitoring program between the City of Oceanside and the County of San Diego will continue and the bacteria monitoring data will be collected and utilized throughout the duration of the project.

This approach will permit prioritization for mitigation of microbial contaminants and appropriate actions will be recommended to eliminate sources of fecal contamination. The three following objectives will be accomplished to achieve the overall goal set forward above:

- Identify point and non-point sources of bacteria contamination in the Lower San Luis Rey River and at the river mouth during the dry and wet season,
- Estimate the bacterial loading from tributaries and along the main stem of the San Luis Rey River during the dry and wet season, and
- Recommend Best Management Practices (BMPs) to reduce and/or eliminate bacterial sources.

12.1.2 Activities completed during previous reporting period

Establishment of a TAC

The first TAC meeting was held on November 1, 2007 from 9:30 to noon. Members included six representatives from the Regional Water Quality Control Board, County of San Diego, City of Vista, and San Diego CoastKeeper in addition to three representatives from the City of Oceanside. An overview of the project and historical data was presented for the benefit of the stakeholders. The role of the TAC was discussed. The TAC will be involved in all aspects of the project, including final approval of the project approach and oversight of the monitoring and reporting. The meeting was concluded with a tour of the mouth of the San Luis Rey to orient members with the complexity of the river. A final list of the TAC was submitted to the SWRCB on January 10, 2008.

A second TAC meeting was held on February 4, 2008 with six representatives from the Regional Water Quality Control Board, County of San Diego, City of Vista, and San Diego CoastKeeper in addition to two representatives from the City of Oceanside. The MACTEC project team presented the proposed project approach to the TAC. The approach was discussed and the TAC made recommendations to be included in the Monitoring Plan and QAPP.

Consultant Selection

A Request for Proposals (RFP) was sent out on November 8, 2007 to solicit proposals from interested and experienced consultants to perform a bacteria source tracking project on the San Luis Rey River. Proposals were due to the City of Oceanside by December 4, 2007 and a subcommittee of the TAC reviewed the proposals on December 7, 2007. MACTEC Engineering and Consulting, Inc. was officially awarded and given a notice to proceed by City Council on February 20, 2008.

Monitoring Plan and Quality Assurance Project Plan Approval

Other important work included the development and approval by the SWRCB of the Monitoring Plan and Quality Assurance Project Plan (QAPP) by the MACTEC project team with input from the TAC. The consultants and members of the TAC and City staff participated in a conference call to discuss the draft Monitoring Plan and QAPP on March 28, 2008. These documents were reviewed by the SWRCB and revised based upon their comments. The SWRCB approved the Monitoring Plan and QAPP on June 19, 2008.

First Monitoring Event

The first dry season monitoring event took place on June 18 and 19, 2008. Dr. Rachel Noble traveled to San Diego to prepare for the first event with the project team and participate both days of monitoring. The project team collected bacteria samples and flow measurements at six

monitoring locations in the Lower San Luis Rey River. The bacteria samples were analyzed for fecal indicator bacteria and the remaining sample volume was filtered and frozen for molecular analysis. The river mouth was not sampled, as planned, due to construction of the Pacific Street Bridge.

The City of Oceanside and the County of San Diego implemented the changes to the joint monthly monitoring program during the June 2008 monitoring event. The program will continue using SWAMP protocols throughout the remainder of the source identification project allowing the bacteria data from monthly monitoring to supplement the dry and wet weather event data.

12.1.3 Activities completed during current reporting period

Second Monitoring Event

The second dry season event took place on July 23 and 24, 2008. The project team collected bacteria samples and flow measurements at five of six monitoring locations in the Lower San Luis Rey River. As part of the Visual Observation Program, observations were conducted July 23 and 24, 2008 within the Lower San Luis Rey River and upstream in the drainage basin to identify possible sources of bacteria. The river mouth was again not sampled, due to construction of the Pacific Street Bridge.

The City of Oceanside and the County of San Diego continued to use SWAMP protocols to allow for use of the monthly monitoring data to supplement the project monitoring event data.

Genetic Molecular Analysis

Based on the fecal indicator bacteria (FIB) results of the first two dry weather monitoring events, four of six project sampling sites (Murray Bridge, Douglas Bridge, Pilgrim Creek, and Sleeping Indian) were selected for additional genetic molecular analysis. Two were river sites and two were tributaries. Genetic molecular analysis was conducted on samples collected at these sites during days 1 and 2 of the June 2008 event. There were no FIB exceedances of standards during the July 2008 event and, therefore, none of those sites were chosen for additional analysis per the QAPP and Monitoring Plan.

Visual Observation Program

The City of Oceanside and the project team continued to develop the visual observation program based on the results from the July event, including modifications to the field forms, prioritization of the observation zones, and coordination of volunteer support with San Diego CoastKeeper.

Suspension of Funds from State Water Resource Control Board, Dept. of Finance

On December 19, 2008, the State Water Resource Control Board issued a Budget Letter that suspended all projects including the Lower San Luis Rey Source Identification Project. All work on the Visual Observation Program and all planned wet and dry weather events were stopped. The work completed after this notice was primarily to assess the status of various elements of the project, including laboratory work and the effect of the stop work notice on genetic analysis. In addition, the potential for American Relief and Recovery Act (ARRA) funds was assessed and answers to the survey were researched and submitted on March 13, 2009. On April 6, 2009, The City of Oceanside received a conditional approval letter that the project was eligible for funding

from the ARRA. Unfortunately on April 7, 2009 the City of Oceanside received a letter saying that new guidance from the EPA regarding "shovel ready" projects indicated our project was no longer eligible for the ARRA funding.

With more time passing, the City of Oceanside requested an assessment from MACTEC of the molecular sample holding times for samples not yet analyzed and a summary from our contractors of what and where data that had been analyzed is located. Unfortunately, samples for two of the three types of genetic analyses had expired and are therefore no longer available for use to the program. Samples were analyzed for *Enterovirus A* by Dr. Jed Furman's laboratory at the University of Southern California. *Enterovirus A* was not detected in any of the samples.

The monthly joint monitoring program conducted by the City of Oceanside and the County of San Diego continued as modified for the Grant project until June of 2009. In June 2009, the City and County agreed to continue the monitoring program, but the City brought the monitoring in-house to the San Luis Rey Wastewater Treatment Plan Laboratory. The same field procedures were followed, but the reporting limits changed to above SWAMP recommendations. This change is not expected to effect results, as bacteria levels are usually at or above these reporting limits.

The City and MACTEC are prepared to restart the project as soon as approval is received from the State Board.

12.2 Loma Alta Creek Ultraviolet Light Treatment Facility

12.2.1 Overview

Loma Alta Creek Lagoon and Buccaneer Beach, located in the City of Oceanside, are currently impacted by high levels of bacteria. This is a family beach adjacent to a park with a large parking area, showers and an eating establishment that sees large crowds during the dry months. The City has determined that a key source of bacteria and nutrients in Loma Alta Creek is urban runoff that discharges into the creek. The source of water for Loma Alta Creek is from storm drain flows and hillside seepage from the Loma Alta watershed, which drains approximately 6,400 acres, and flows through densely developed residential, commercial, and industrial land uses.

Just over eight acres of the Loma Alta Slough are included on Section 303(d) of the federal Clean Water Act list of impaired water bodies for bacterial indicators and eutrophication within the and for 1.1 miles of coastline at the opening. The increased presence of bacteria and pathogens in the watershed poses a threat to REC-1 and REC-2 beneficial uses and directly impacts the ocean water quality at Buccaneer Beach. The bacteria that are present in Loma Alta Creek have resulted in numerous beach closures and postings at Buccaneer Beach. Historically, Buccaneer Beach was subject to closures that last the entire summer season. To

reduce the bacterial loading on Buccaneer Beach, the City will allow the lagoon opening to sand closed as the south swell arrives in May and divert 100% of the dry weather flow through an ultraviolet light treatment facility then discharge the treated water at the high tide line into the ocean. The project, once completed, will capture up to 1,000,000 gallons per day of urban runoff Loma Alta Creek Ultraviolet Light Treatment Facility

12.2.2 Project Scope

The City was awarded a $5,000,000 Proposition 40 Clean Beaches Initiative (CBI) grant by the State Water Resources Control Board to construct an ultraviolet (UV) light treatment facility at the existing La Salina Wastewater Treatment Facility. One hundred percent of the dry weather creek flows (averaging 300 to 700 gallons per minute) will be intercepted in the lagoon and diverted to the UV treatment facility, located on the northern bank of the creek. The treatment facility consists of piping flows from an exiting diversion structure by gravity from the lagoon through a 2 micron fine screen to a wet well where the flow is pumped into two large sand filters followed by two UV disinfection units housed in a reinforced concrete building. The treated water is discharged through a pipe extended along the existing section of rip-rap that runs along the north side of the Loma Alta creek outlet at Buccaneer Beach. During wet weather months (November through April), the lagoon would be opened to allow free flow to the ocean and the UV system would be bypassed.

12.2.3 Progress Milestones Achieved Schedule

The California Coastal Commission approved Permit No. 6-06-152 for construction of the outfall pipe associated with the UV treatment facility on June 14, 2007. Loma Alta Creek UV Treatment Facility project entered into the construction phase on August 13, 2007 when the official Notice to Proceed was issued to Orion Construction Corporation.

Fiscal year 2008-09 Update

The Loma Alta Creek Ultraviolet Light Treatment Facility started treatment in June 2009 and continued throughout the summer. The plant typically ran three to four days a week with average flows of 300 gallons per minute. No water was discharged onto the beach when the UV Facility was offline. Flows were lower than expected due to drought conditions and conservation efforts of Oceanside residents.

Water samples were taken weekly from Buccaneer Beach directly in front of the discharge pipe and seventy-five feet north and south of the discharge pipe. The samples were tested for total and fecal coliform and Enterococcus. All samples taken during summer 2009 met California Department of Health Services AB411 Objectives and there were no postings due to bacterial levels exceeding standards set by the County Department of Environmental Health. The UV Facility will run through September 2009 unless heavy rains arrive earlier than expected.

Oceanside Loma Alta Creek UV Outfall pipe releasing treated water

12.2.4 Project Outcomes Effectiveness Benefits

The anticipated project goal is to eliminate beach closures during the dry months at Buccaneer Beach in Oceanside, California. This will be achieved by diverting the flow from the Loma Alta Lagoon through a UV treatment facility prior to discharging the flow onto the shoreline. The City will monitor the UV treated storm drain outlet and the surf zone for bacteria for the 2009 AB411 period. The approved Monitoring Plan and Quality Assurance Project Plan developed for this project was implemented.

13.0 NON-EMERGENCY FIRE FIGHTING

Emergency fire fighting flows (flows necessary for the protection of life or property) are allowed by the Municipal Permit and do not require implementation of BMPs. Non-emergency fire fighting BMPs and educational methods for reducing the discharge of pollutants from non-emergency flows to the MEP are described below.

Order 2007-0001 Compliance Summary

J.3.a(3)(1)iv Non-Emergency Fire Fighting	See Entire Section 13 of this Annual Report

13.1 Best Management Practices

The City developed and implemented a program to reduce pollutants from non-emergency fire fighting flows, in accordance with Section B.3 of Permit Order 2007-0001. BMPs were implemented when the following activities were conducted:

- Regular Maintenance of Fire and Emergency Vehicles and Equipment
- Training Exercises
- Facilities Maintenance
- Post-Emergency Rehabilitation of Response Equipment

These activities were conducted in a way to either minimize or eliminate the discharge of pollutants to the MS4. Detailed descriptions of BMPs are given for each activity below:

Regular Maintenance of Fire and Emergency Vehicles and Equipment

- Vehicles and equipment were cleaned where runoff was directed to either the sanitary sewer system or to a drain with an oil/water separator system.
- Vehicles and equipment were cleaned where runoff would pond and evaporate and/or where runoff would filter through landscaped areas.
- Sewer drains in a vehicle cleaning area were outfitted with a hydro screen fabric barrier to collect debris.
- Spill kits were available to promptly cleanup and contain leaking or spilled vehicle fluids.
- Use of soaps, cleaners, and detergents were minimized, and general cleaning solutions were disposed of into the sanitary sewer system.

Training Exercises

- Water used in training exercises was directed to landscaped areas whenever possible, and runoff from the training exercises was not allowed to discharge to the MS4.
- Live fire training activities were pre-planned to allow integration of barriers to off-site runoff that could contribute to non-storm water discharges.

Facilities Maintenance

- Impervious areas such as apparatus floors, maintenance bays, driveways, patios, and walkways were swept to remove debris. Debris was placed in the trash.
- Landscaped areas were maintained as required to reduce the introduction of leaves and other landscape waste into the MS4.
- Irrigation systems were monitored and maintained as required to reduce irrigation water from going off-site.

- Spills were cleaned up using spill kits provided at the work site, and disposal of spilled material was in accordance with applicable regulations.
- Spills that required a cleanup beyond the ability of the on-site employees were reported to the City's Public Works Department for assistance with appropriate resources.
- Maintenance and repair of structures were conducted using methods that do not contribute pollutants to the MS4.

Post-Emergency Rehabilitation of Response Equipment
Tools, fire hoses, ladders, and other equipment utilized at the scene of an emergency were restored to a response-ready state in a manner that does not delay the ability of the apparatus to be available for another emergency response. The use of water that could contribute to storm water discharges was used unless another practical and immediately available method was identified, and was performed in a manner that minimized discharges to the MEP.

13.2 Educational Methods

During live fire fighting training exercises all fire fighters were educated about the requirement to not allow water flows to enter the MS4. Fire fighters in attendance for training sessions about how to use high pressure fire fighting hoses were educated on how to direct the water to percolation basins that are permanently in place at the training grounds. Water that is directed to these basins was allowed to infiltrate into the soil and/or evaporate.

Prior to building structures at the training grounds being set on fire, perimeter controls were put in place to ensure that water from the non-emergency training session did not reach the MS4. Fire fighters in attendance were educated on the proper type and installation protocol of perimeter controls. These perimeter controls were also used for training sessions related to vehicle fires.

14.0 JURMP REVISIONS

On December 19, 2008, Regional Water Quality Control Board (RWQCB) and City of Oceanside staff met to review the City's 2008 JURMP and 2007/2008 JURMP Annual Report. Based on that meeting, the RWQCB sent a letter with requested revisions and updates to the JURMP and JURMP Annual Report. The revisions made to the City's JURMP are provided in the sections below. Updates to the JURMP 2007/2008 that were applicable and made this reporting year are discussed throughout this Annual Report in the appropriate section.

14.1 Section 6.0 (Municipal)

The following update will replace Section 6.7 in its entirety of the City of Oceanside's 2008 JURMP.

6.7 Special Events

The City of Oceanside hosts a variety of Special Events in the City. These events include major sporting events and community fairs and festivals. A Special Events Permit is required for any organized activity involving the use of, or having impact upon, public property, public facilities, parks, beaches, sidewalks street areas or the temporary use of private property in a manner that varies from its current land use. The permit process includes a BMP implementation plan. The City has a Special Events Committee comprised of various City Department representatives who review permit applications to insure events are held safely and do not adversely impact the community.

6.7.1 Source Characterization

The City issues Special Event permits for both internal city sponsored events and event organizations that coordinate events that may include vendors or various event related elements. Samples of these events include:

- Antiques on Mission
- Dia de los Muertos
- Turkey Trot 5k Run
- Ironman Triathlon
- Race Across America
- Freedom Day Parade

Typically, special events have a high density use of people per square foot raising the potential for pollutant types at special events, such as:

- Setup and teardown of equipment booths
- Booth operation generating trash
- Food and drink preparation and consumption – illicit discharges and organic material
- Hydraulic rides – oil and grease
- Temporary portable restroom – chemicals and bacteria
- Hydration stations – water cups and other trash material

6.7.2 Best Management Practices

All special evens are required to implement designated BMPs and comply with all applicable regulations outlined in the Oceanside Municipal Code. During pre-event application meetings for large events, event organizers are provided with an event permit packet that includes storm water related information including a copy of the Storm Water Compliance Guidelines for Special Events brochure and the Special Events Inspection Form. Copies of the brochure and inspection form are provided in Attachment 14-A. It is explicitly stated that the company coordinating the event is required to leave the site as clean as the pre-event condition and shall not allow any materials or liquid to enter the storm drain system.

6.7.3 Program Implementation

6.7.4.1 Event Inspections

A storm water inspection report form has been developed for use before and after large special events. Storm water compliance inspection reports will be completed prior to the start of the event to ensure that appropriate BMPs are in place. A post-event inspection will ensure that the site is properly cleaned. A special events office representative will conduct pre- and post-inspections. This office may designate another city department representative to conduct the pre- or post-event inspections, when needed.

6.7.4.2 Street Sweeping

Most special events occur in the downtown area which is swept 5 days a week, with sweeping vehicles generally onsite within 12 hours from the end of the event.

For special events that cause an added impact to the community street sweeping is conducted immediately after the end of the event. On an annual basis, the City holds one parade in the downtown area after which street sweeping is immediately conducted.

6.7.4.3 Harbor and Beaches Maintenance

Large events held in the Harbor and Beaches area can have the potential to generate large quantities of trash. In addition to the above information, the Harbor and Beaches Maintenance Division conducts the following activities after large events and holidays held in the Harbor and Beaches area:

- A litter abatement contractor provides staff to walk beach and hand pick up litter.
- City staff uses trucks and/or utility carts to follow and pick up items that are too large for the litter abatement contractor such as logs, furniture, etc.
- City staff further screens the beach using Cherrington beach sweeping machines.
- A pressure-washing contractor or City staff washes the hardscapes with all wash water being recovered and disposed of properly.

14.2 Section 7.0 (Industrial)

The following information highlighted in red shall amend the City of Oceanside's 2008 JURMP. The additional language provides further detail on the City's process to determine and report non-filers. The notification process has not been amended and will continue as written in Section 7.2.4.4 of Oceanside's 2008 JURMP. A list of any identified non-filers will be provided in future annual reports.

7.2.4.3 Facility Inspections

Inspections of industrial businesses will typically be conducted by designated Clean Water Program compliance inspectors and/or Code Enforcement personnel. Inspections will be tracked using the City's Urban Runoff Business Database or another similar database. Inspectors will utilize a Commercial and Industrial businesses Inspection Form, an example of which is provided in Appendix D. City inspectors will use a restaurant-specific form and grease control report for inspections at food service establishments in the City. These forms are included in Appendix D. The following describes the procedures that inspectors will follow to conduct inspections.

Step 1: Initiation

An inspection is initiated as a result of one of the following:

- A report by the public or a municipal staff member
- An illicit discharge investigation
- As a follow up to a previous inspection, violation, or citation
- An inspector identifying that the business is due for a routine inspection

The inspectors will always conduct a complete inspection of the business regardless of the initiating circumstances. However, the inspectors may choose to focus on specific issues that were previously identified for noncompliance or which were the initial reason for an inspection.

Step 2: Pre-Inspection Preparation

Prior to visiting a business, the inspector will access the Urban Runoff Business Database and complete the general information portion of the Commercial and Industrial businesses Inspection Form. An option to print out an inspection form may become available with further development of the Urban Runoff Business Database. The inspector will review the sheet to determine the business's primary activity, general location, proximity to water bodies, applicable BMPs, and other relevant information. The inspector will also note incomplete portions of the business's general description so as to attempt to complete the information during the inspection.

Step 3: The Site Visit

Approach to the Site

Prior to entering onto the business facility, the inspector will document the following:

- Adjacent conveyances or water bodies

- Visible discharge points along perimeter of the site
- Outdoor areas of intensive industrial activity
- Signs of recent additions or remodels.

The Management Office

After introductions, the inspector will obtain information from the business operator or other responsible individual. At this time the inspector will conduct the following:

- Obtain updated information for the Urban Runoff Business Database, including changes in ownership or operations.
- Verify the SIC Code and other descriptions of the business.
- Clarify observations made before entering the facility (i.e., any changes in activities, materials, or physical structures).
- Check for coverage under the General Industrial Permit.
- Review the SWPPP if available.
- Identify which general BMP requirements apply to the businesses.
- Interview the responsible individual about which non-structural BMPs are implemented and how the various BMP requirements are met, since a majority of these BMPs may be incorporated into operations and may not be evident in a walkthrough.
- Review other relevant items such as existing pollution prevention plans or an environmental management system.

Facility Walkthrough with Management and Supervisor

The site map, if available, will be used to orient the inspector while conducting a walkthrough of the facility. Areas in which industrial activities are exposed to precipitation, thereby increasing the risk of pollutants entering storm water will be noted. Attention will also be given to run-on of storm water and runoff in these areas, as well as pollution prevention measures. From the walkthrough, an inspector can assess the following:

- Accuracy of site map, descriptions of the business, materials list, and SWPPP.
- Confirmation of additions or changes observed while approaching the facility.
- Evidence of illegal discharges (i.e., ongoing leaks or recent spills, or connections not authorized under an NPDES permit).
- Effectiveness of BMP implementation in each area of the business.

The Inspection Form

The inspector will fill out the inspection form during the interview of the responsible party and the walkthrough of the business. Once the inspection is completed, while still onsite, the inspector will complete the inspection form and revise information as necessary. A signature on the form will be obtained by the responsible person, or designated responsible person, at the business site.

Identification of Industrial Non-filers

During the site visit, if the inspector suspects the facility to be a covered facility under the General Industrial Permit (GIP) and/or Waste Discharge Requirements, the inspector will notify the business owner and/or operator of the reporting requirements. The inspector will review the

General Industrial Permit requirements and coverage and then provide the owner/operator with a fact sheet that provides resources for further information. A copy of the fact sheet is located in Attachment 14-B. Upon determination of the facility's Permit requirements, Clean Water Program staff will notify the RWQCB in the City's JURMP Annual Report as described in Section 7.2.4.4.

THIS PAGE INTENTIONALLY LEFT BLANK

15.0 CONCLUSIONS AND RECOMMENDATIONS

15.1 Introduction

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the San Diego Copermittees. Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2008 – June 30, 2009).

15.2 Conclusions

This annual report presents the activities the City conducted from July 1, 2008 through June 30, 2009 to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The activities involved implementing, and improving where needed, existing programs and developing new programs intended to minimize or eliminate the effects of urban runoff within the City's jurisdiction on receiving water bodies. Improving water quality of the discharge from the MS4 should have beneficial effects on the local receiving water bodies.

As detailed in the Program Effectiveness Assessment Component, the City met all of the development planning targets and met the municipal targets. Long-term effectiveness assessment is an ongoing and iterative process and the City will continue to use this process to further improve its storm water program.

15.3 Recommendations

15.3.1 Database Tracking System for various departments and divisions

During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water, Sewer, and the Clean Water Program, continued rolling out the GBA Masters Series software. Water and Sewer continued to utilize the product and the Clean Water Program gained approval to purchase additional licenses and hire a consultant to help modify the software to their needs. Complete roll-out for the Clean Water Program is expected in reporting year 2009/2010. The Development Services Department, which includes Code Enforcement, Building, and Engineering, choose CRW Data Tracking Systems and will begin roll-out in the 2009/2010 reporting year. These systems will allow for tracking and reporting of needed information, including stormwater data, across the departments.

15.3.2 Assessment of Education Program

During this reporting period the City of Oceanside conduct a comprehensive education outreach program along the San Luis Rey River Trail titled the Pick Up Your Pet Waste Campaign. During the next reporting period an assessment of this program will be conducted.

15.3.3 Underserved Target Audience Outreach - Including Mobile Businesses and Spanish Speaking Population

Underserved target audiences will be targeted with educational information during reporting period 2009-10. The City intends to participate in an education outreach program through the Industrial Commercial Sources Workgroup to educate Mobile Businesses of their minimum BMPs. The regional workgroup requested Mobile Business inventories from each Copermittee, of which Oceanside complied, which will be compiled into one list. It is anticipated that this education piece will be sent to the inventory list during the next reporting period. The inventory of Mobile Commercial Businesses is available in Appendix B.5 of the City's 2008 JURMP as part of the Commercial Inventory.

Water Quality Regulations for Construction Sites

Dear Contractor,

The North County Storm Water Program (NCSWP) is a collective of jurisdictions in northern San Diego County working together to protect our watersheds. We believe that reducing pollution is critical to maintaining our communities' way of life.

It is our hope that this brochure will help you identify activities that are recognized to cause water pollution and implement appropriate Best Management Practices (BMPs) to minimize their impact. By providing you with these tools, we hope to make your job easier while keeping our waterways clean.

Each jurisdiction will be inspecting their construction sites to ensure the protection of water quality. We look forward to seeing the BMPs presented in this brochure implemented at your sites.

Together we have the ability to preserve and improve the quality of life in our communities.

Sincerely,

The North County Storm Water Program

Contact Phone Numbers:

City of Carlsbad 760-602-2719

City of San Marcos 760-744-1050

City of Encinitas 760-633-2787

City of Del Mar 858-755-9313

City of Oceanside 760-435-5800

City of Solana Beach 858-720-2470

City of Vista 760-726-1340

Best Management Practices

Construction materials such as paint, dirt and trash often find their way into our storm drains, polluting the environment and jeopardizing our creeks, rivers, lakes, lagoons, and ocean.

The NCSWP is working with contractors to implement what are known as Best Management Practices (BMPs) on all construction sites. That is, methods used to keep pollution out of our storm drains and off public property, such as sidewalks, streets, parkways and alleys. Carrying out and maintaining these BMPs on the construction site is critical to protecting our ocean and lagoons.

The following is a list of BMPs and pollution prevention measures that shall be implemented at all construction sites:

1. **Conduct daily site cleanings.**
2. **Develop spill response and containment procedures.**
3. **Educate employees and subcontractors about BMPs.**
4. **Develop an erosion control plan for wind and rain.**
5. **Regularly maintain all BMPs at project site.**

Right-of-Way Permitting

We understand that there are times when space on construction sites is limited. If at any point, you (as a contractor or subcontractor) need to use the public right-of-way in order to work or store materials, you must apply for a special permit. This permit allows you to use the City's right-of-way areas, and describes what is required to prevent illegal contaminants from entering local storm drains. For more information or to obtain a permit application contact your local jurisdiction.

Inspection and Enforcement Program

Each jurisdiction has established an enforcement program to ensure that all businesses operate in compliance with all appropriate storm water laws and other City requirements. Contractors, site supervisors and property owners can be held responsible for violations, which may lead to a civil penalty of up to $10,000 per day and/or reimbursing the local jurisdiction for all expenses associated with clean up.

Water Quality Regulations for Construction Sites

In 1972, the Environmental Protection Agency developed regulations to control water pollution. As a result, the National Pollutant Discharge Elimination System (NPDES) Permit was created. NPDES permits are issued to municipalities as well as construction sites. In addition to complying with local regulations, which are governed by our municipal NPDES permit, you may be required to obtain a permit through the State of California under the State General Construction Permit (99-08-DWQ). All construction sites over one acre are required to obtain coverage under this permit.

Construction sites can contribute pollutants, such as sediment, metals, and chemicals, to our local creeks, rivers, lakes, lagoons, and ocean. These pollutants make their way down our streets and into storm drains, eventually discharging to the nearest body of water.

All construction sites are required to implement Best Management Practices (BMP) to prevent storm water pollution. This brochure is intended to assist your construction site in understanding BMP requirements.

Each municipality has one or more persons dedicated to ensuring that all construction sites are in compliance with state and local storm water control regulations. Contact your local municipality for further information.

A Pollution Prevention Guide for the Construction Industry

North County Storm Water Program

Carlsbad • Del Mar • Encinitas • Oceanside • San Marcos • Solana Beach • Vista

Only Rain in the Storm Drain

Materials Storage

All building materials and fuel stored on the site must be contained and covered. It is illegal for contractors to wash out paint brushes in the street or dump any residues in the storm drain. Paint brushes and spray guns must be contained and disposed of properly.

Perimeter controls

Gravel bags, silt fences, and straw wattles are acceptable perimeter controls, and must be used to surround the entire site to control run-on and run-off. Avoid running over perimeter controls with vehicles or heavy equipment, as they can damage the materials. Keep extra absorbent materials and/or a wet/dry vacuum on site to quickly pick up unintended spills. Sites must also be checked and maintained daily.

Building materials/staging areas

Construction materials must be stored on site at all times unless a right-of-way permit has been obtained. Building materials should always be covered when not in use to prevent run-off caused by wind or rain. To apply for a right-of-way permit, contact the appropriate department of your local jurisdiction.

Dumpsters/Port-a-Potty

Always cover dumpsters with a rollback tarp. Areas around dumpsters should be swept daily. Perimeter controls should also surround dumpsters and all Port-a-Potties. If dumpsters or Port-a-Potties are kept on the street, right-of-way permits are needed.

These guidelines are generalized. Please check specific requiren

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
2008-2009 ANNUAL REPORT
FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 2008 through June 30, 2009

An Annual Report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

Please circle or highlight any information contained in Items A, B, and C below that is new or revised so we can update our records. Please remember that a Notice of Termination and new Notice of Intent are required whenever a facility operation is relocated or changes ownership.

If you have any questions, please contact your Regional Board Industrial Storm Water Permit Contact. The names, telephone numbers, and e-mail addresses of the Regional Board contacts, as well as the Regional Board Offices addresses are indicated below.

REGIONAL BOARD INFORMATION:

San Diego Region
9174 Sky Park Court, Suite 100
San Diego, CA 92123

Contact: Tony Felix
Tel: (858) 636-3134
Email: Tfelix@waterboards.ca.gov

GENERAL INFORMATION

A. Facility Information:

Oceanside City Maxson Landfill
Brooks St And Maxson St
Oceanside, CA 92054
WDID No: 9 37I005695

Facility Contact: Forward Bryan
Email: bforward@ci.oceanside.ca.us
Phone: 760-435-519~~3~~4

SIC Code(s):
4953 Refuse Systems

B. Facility Operator Information:

Oceanside PWD
300 N Coast Hwy
Oceanside, CA 92054

Operator Contact: Bryan Forward
Email: bforward@ci.oceanside.ca.us
Phone: 760-435-~~5111~~ 5194

C. Facility Billing Information:

Oceanside PWD
300 N Coast Hwy
Oceanside, CA 92054

Billing Contact: Bryan Forward
Email: bforward@ci.oceanside.ca.us
Phone: 760-435-~~5111~~ 5194

2008-2009

ANNUAL REPORT

SPECIFIC INFORMATION

MONITORING AND REPORTING PROGRAM

D. SAMPLING AND ANALYSIS EXEMPTIONS AND REDUCTIONS

1. For the reporting period, was your facility exempt from collecting and analyzing samples from **two** storm events in accordance with sections B.12 or 15 of the General Permit?

   ☐ **YES** Go to Item D.2 ☒ **NO** Go to Section E

2. Indicate the reason your facility is exempt from collecting and analyzing samples from **two** storm events. Attach a copy of the first page of the appropriate certification if you check boxes ii, iii, iv, or v.

   i. ☐ Participating in an Approved Group Monitoring Plan **Group Name:** _____

   ii. ☐ Submitted **No Exposure Certification (NEC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy NEC conditions? ☐ YES ☐ NO

   iii. ☐ Submitted **Sampling Reduction Certification (SRC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy SRC conditions? ☐ YES ☐ NO

   iv. ☐ Received Regional Board Certification Certification Date: _____

   v. ☐ Received Local Agency Certification Cetification Date: _____

3. If you checked boxes i or iii above, were you scheduled to sample **one** storm event during the reporting year?

   ☐ **YES** Go to Section E ☐ **NO** Go to Section F

4. If you checked boxes ii, iv, or v, go to Section F.

E. SAMPLING AND ANALYSIS RESULTS

1. How many storm events did you sample? 0 If less than 2, **attach explanation** (if you checked item D.2.i or iii. above, only attach explanation if you answer "0").

2. Did you collect storm water samples from the first storm of the wet season that produced a discharge during scheduled facility operating hours? (Section B.5 of the General Permit)

   ☐ **YES** ☐ **NO, attach explanation** **(Please note that if you do not sample the first storm event, you are still required to sample 2 storm events)**

3. How many storm water discharge locations are at your facility? 1

4. For each storm event sampled, did you collect and analyze a sample from each of the facilitys' storm water discharge locations? ☒ YES, go to Item E.6 ☐ NO

5. Was sample collection or analysis reduced in accordance with Section B.7.d of the General Permit? ☐ YES ☐ NO, **attach explanation**

   If "YES", **attach documentation** supporting your determination that two or more drainage areas are substantially identical.

   Date facility's drainage areas were last evaluated _____

6. Were all samples collected during the first hour of discharge? ☐ YES ☒ NO, **attach explanation**

7. Was all storm water sampling preceded by three (3) working days without a storm water discharge? ☐ YES ☒ NO, **attach explanation**

8. Were there any discharges of stormwater that had been temporarily stored or contained? (such as from a pond) ☐ YES ☒ NO, go to Item E.10

9. Did you collect and analyze samples of temporarily stored or contained storm water discharges from two storm events? (or one storm event if you checked item D.2.i or iii. above) ☐ YES ☐ NO, **attach explanation**

10. Section B.5. of the General Permit requires you to analyze storm water samples for pH, Total Suspended Solids (TSS), Specific Conductance (SC), Total Organic Carbon (TOC) or Oil and Grease (O&G), other pollutants likely to be present in storm water discharges in significant quantities, and analytical parameters listed in Table D of the General Permit.

    a. Does Table D contain any additional parameters related to your facility's SIC code(s)? ☐ YES ☒ NO, Go to Item E.11

    b. Did you analyze all storm water samples for the applicable parameters listed in Table D? ☐ YES ☐ NO

    c. If you did not analyze all storm water samples for the applicable Table D parameters, check one of the following reasons:

       _____ In prior sampling years, the parameter(s) have not been detected in significant quantities from two consecutive sampling events. **Attach explanation**

       _____ The parameter(s) is not likely to be present in storm water discharges and authorized non-storm water discharges in significant quantities based upon the facility operator's evaluation. **Attach explanation**

       _____ Other. **Attach explanation**

11. For each storm event sampled, attach a copy of the laboratory analytical reports and report the sampling and analysis results using **Form 1** or its equivalent. The following must be provided for each sample collected:

- Date and time of sample collection
- Name and title of sampler.
- Parameters tested.
- Name of analytical testing laboratory.
- Discharge location identification.
- Testing results.
- Test methods used.
- Test detection limits.
- Date of testing.
- Copies of the laboratory analytical results.

F. QUARTERLY VISUAL OBSERVATIONS

1. **Authorized Non-Storm Water Discharges**
Section B.3.b of the General Permit requires quarterly visual observations of all authorized non-storm water discharges and their sources.

a. Do authorized non-storm water discharges occur at your facility?

☒ **YES** ☐ **NO** Go to Item F.2

b. Indicate whether you visually observed all authorized non-storm water discharges and their sources during the quarters when they were discharged. **Attach an explanation for any "NO" answers**. Indicate "N/A" for quarters without any authorized non-storm water discharges.

July -September	☒ **YES**	☐ **NO**	☐ **N/A**	October-December	☒ **YES**	☐ **NO**	☐ **N/A**
January-March	☒ **YES**	☐ **NO**	☐ **N/A**	April-June	☒ **YES**	☐ **NO**	☐ **N/A**

c. Use **Form 2** to report quarterly visual observations of authorized non-storm water discharges or provide the following information.

i. name of each authorized non-storm water discharge
ii. date and time of observation
iii. source and location of each authorized non-storm water discharge
iv. characteristics of the discharge at its source and impacted drainage area/discharge location
v. name, title, and signature of observer
vi. **any** new or revised BMPs necessary to reduce or prevent pollutants in authorized non-storm water discharges. Provide new or revised BMP implementation date.

2. **Unauthorized Non-Storm Water Discharges**
Section B.3.a of the General Permit requires quarterly visual observations of all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources.

a. Indicate whether you visually observed all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources. **Attach an explanation for any "NO" answers**.

July -September	☒ **YES**	☐ **NO**	October-December	☒ **YES**	☐ **NO**
January-March	☒ **YES**	☐ **NO**	April-June	☒ **YES**	☐ **NO**

b. Based upon the quarterly visual observations, were any unauthorized non-storm water discharges detected?

☒ **YES** ☐ **NO** Go to item F.2.d

c. Have each of the unauthorized non-storm water discharges been eliminated or permitted?

☐ **YES** ☒ **NO** **Attach explanation**

d. Use **Form 3** to report quarterly unauthorized non-storm water discharge visual observations or provide the following information.

i. name of each unauthorized non-storm water discharge.
ii. date and time of observation.
iii. source and location of each unauthorized non-storm water discharge.
iv. characteristics of the discharge at its source and impacted drainage area/discharge location.
v. name, title, and signature of observer.
vi. **any** corrective actions necessary to eliminate the source of each unauthorized non-storm water discharge and to clean impacted drainage areas. Provide date unauthorized non-storm water discharge(s) was eliminated or scheduled to be eliminated.

G. MONTHLY WET SEASON VISUAL OBSERVATIONS

Section B.4.a of the General Permit requires you to conduct monthly visual observations of storm water discharges at all storm water discharge locations during the wet season. These observations shall occur during the first hour of discharge or, in the case of temporarily stored or contained storm water, at the time of discharge.

1. Indicate below whether monthly visual observations of storm water discharges occurred at all discharge locations. **Attach an explanation for any "NO" answers**. Include in this explanation whether any eligible storm events occurred during scheduled facility operating hours that did not result in a storm water discharge, and provide the date, time, name and title of the person who observed that there was no storm water discharge.

	YES	NO		YES	NO
October	☒	☐	February	☒	☐
November	☒	☐	March	☒	☐
December	☒	☐	April	☒	☐
January	☒	☐	May	☒	☐

2. Report monthly wet season visual observations using **Form 4** or provide the following information.

   a. date, time, and location of observation
   b. name and title of observer
   c. characteristics of the discharge (i.e., odor, color, etc.) and source of any pollutants observed.
   d. **any** new or revised BMPs necessary to reduce or prevent pollutants in storm water discharges. Provide new or revised BMP implementation date.

ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION (ACSCE)

H. ACSCE CHECKLIST

Section A.9 of the General Permit requires the facility operator to conduct one ACSCE in each reporting period (July 1-June 30). Evaluations must be conducted within 8-16 months of each other. The SWPPP and monitoring program shall be revised and implemented, as necessary, within 90 days of the evaluation. The checklist below includes the minimum steps necessary to complete a ACSCE. Indicate whether you have performed each step below. **Attach an explanation for any "NO" answers.**

1. Have you inspected all potential pollutant sources and industrial activities areas? ☒ YES ☐ NO
   The following areas should be inspected:

   - areas where spills and leaks have occured during the last year.
   - outdoor wash and rinse areas.
   - process/manufacturing areas.
   - loading, unloading, and transfer areas.
   - waste storage/disposal areas.
   - dust/particulate generating areas.
   - erosion areas.
   - building repair, remodeling, and construction
   - material storage areas
   - vehicle/equipment storage areas
   - truck parking and access areas
   - rooftop equipment areas
   - vehicle fueling/maintenance areas
   - non-storm water discharge generating areas

2. Have you reviewed your SWPPP to assure that its BMPs address existing potential pollutant sources and industrial activities areas? ☒ YES ☐ NO

3. Have you inspected the entire facility to verify that the SWPPP's site map, is up-to-date? The following site map items should be verified: ☒ YES ☐ NO

   - facility boundaries
   - outline of all storm water drainage areas
   - areas impacted by run-on
   - storm water discharges locations
   - storm water collection and conveyance system
   - structural control measures such as catch basins, berms, containment areas, oil/water separators, etc.

4. Have you reviewed all General Permit compliance records generated since the last annual evaluation? ☒ YES ☐ NO

The following records should be reviewed:

- quarterly authorized non-storm water discharge visual observations
- monthly storm water discharge visual observation
- records of spills/leaks and associated clean-up/response activities
- quarterly unauthorized non-storm water discharge visual observations
- Sampling and Analysis records
- preventative maintenance inspection and maintenance records

5. Have you reviewed the major elements of the SWPPP to assure compliance with the General Permit? ☒ YES ☐ NO

The following SWPPP items should be reviewed:

- pollution prevention team
- list of significant materials
- description of potential pollutant sources
- assessment of potential pollutant sources
- identification and description of the BMPs to be implemented for each potential pollutant source

6. Have you reviewed your SWPPP to assure that a) the BMPs are adequate in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges, and b) the BMPs are being implemented? ☒ YES ☐ NO

The following BMP categories should be reviewed:

- good housekeeping practices
- spill response
- employee training
- erosion control
- quality assurance
- preventative maintenance
- material handling and storage practices
- waste handling/storage
- structural BMPs

7. Has all material handling equipment and equipment needed to implement the SWPPP been inspected? ☒ YES ☐ NO

I. ACSCE EVALUATION REPORT

The facility operator is required to provide an evaluation report that includes:

- identification of personnel performing the evaluation
- the date(s) of the evaluation
- necessary SWPPP revisions
- schedule for implementing SWPPP revisions
- any incidents of non-compliance and the corrective actions taken.

Use **Form 5** to report the results of your evaluation or develop an equivalent form.

J. ACSCE CERTIFICATION

The facility operator is required to certify compliance with the Industrial Activities Storm Water General Permit. To certify compliance, both the SWPPP and Monitoring Program must be up to date and be fully implemented.

Based upon your ACSCE, do you certify compliance with the Industrial Activities Storm Water General Permit? ☒ YES ☐ NO

If you answered "NO" **attach an explanation** to the ACSCE Evaluation Report why you are not in compliance with the Industrial Activities Storm Water General Permit.

ATTACHMENT SUMMARY

Answer the questions below to help you determine what should be attached to this annual report. Answer NA (Not Applicable) to questions 2-4 if you are not required to provide those attachments.

1. Have you attached Forms 1,2,3,4, and 5 or their equivalent?	☒ YES (Mandatory)		
2. If you conducted sampling and analysis, have you attached the laboratory analytical reports?	☐ YES	☒ NO	☐ NA
3. If you checked box II, III, IV, or V in item D.2 of this Annual Report, have you attached the first page of the appropriate certifications?	☐ YES	☐ NO	☐ NA
4. Have you attached an explanation for each "NO" answer in items E.1, E.2, E.5-E.7, E.9, E.10.c, F.1.b, F.2.a, F.2.c, G.1, H.1-H.7, or J?	☒ YES	☐ NO	☐ NA

ANNUAL REPORT CERTIFICATION

I am duly authorized to sign reports required by the INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (see Standard Provision C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those person directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

STATE OF CALIFORNIA
STATE WATER RESOURCES CONTROL BOARD
2008-2009 ANNUAL REPORT
FOR STORM WATER DISCHARGES ASSOCIATED
WITH INDUSTRIAL ACTIVITIES

Reporting Period July 1, 2008 through June 30, 2009

An Annual Report is required to be submitted to your local Regional Water Quality Control Board (Regional Board) by July 1 of each year. This document must be certified and signed, under penalty of perjury, by the appropriate official of your company. Many of the Annual Report questions require an explanation. Please provide explanations on a separate sheet as an attachment. **Retain a copy of the completed Annual Report for your records.**

Please circle or highlight any information contained in Items A, B, and C below that is new or revised so we can update our records. Please remember that a Notice of Termination and new Notice of Intent are required whenever a facility operation is relocated or changes ownership.

If you have any questions, please contact your Regional Board Industrial Storm Water Permit Contact. The names, telephone numbers, and e-mail addresses of the Regional Board contacts, as well as the Regional Board Offices addresses are indicated below.

REGIONAL BOARD INFORMATION:

San Diego Region
9174 Sky Park Court, Suite 100
San Diego, CA 92123

Contact: Tony Felix
Tel: (858) 636-3134
Email: Tfelix@waterboards.ca.gov

GENERAL INFORMATION

2008-2009

ANNUAL REPORT

SPECIFIC INFORMATION

MONITORING AND REPORTING PROGRAM

D. SAMPLING AND ANALYSIS EXEMPTIONS AND REDUCTIONS

1. For the reporting period, was your facility exempt from collecting and analyzing samples from **two** storm events in accordance with sections B.12 or 15 of the General Permit?

   ☐ **YES** Go to Item D.2 ☒ **NO** Go to Section E

2. Indicate the reason your facility is exempt from collecting and analyzing samples from **two** storm events. Attach a copy of the first page of the appropriate certification if you check boxes ii, iii, iv, or v.

   i. ☐ Participating in an Approved Group Monitoring Plan **Group Name:** _____

   ii. ☐ Submitted **No Exposure Certification (NEC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy NEC conditions? ☐ YES ☐ NO

   iii. ☐ Submitted **Sampling Reduction Certification (SRC)** Date Submitted: _____

   Re-evaluation Date: _____

   Does facility continue to satisfy SRC conditions? ☐ YES ☐ NO

   iv. ☐ Received Regional Board Certification Certification Date: _____

   v. ☐ Received Local Agency Certification Cetification Date: _____

3. If you checked boxes i or iii above, were you scheduled to sample **one** storm event during the reporting year?

   ☐ **YES** Go to Section E ☐ **NO** Go to Section F

4. If you checked boxes ii, iv, or v, go to Section F.

E. SAMPLING AND ANALYSIS RESULTS

1. How many storm events did you sample? 0 If less than 2, **attach explanation** (if you checked item D.2.i or iii. above, only attach explanation if you answer "0").

2. Did you collect storm water samples from the first storm of the wet season that produced a discharge during scheduled facility operating hours? (Section B.5 of the General Permit)

   ☐ **YES** ☒ **NO, attach explanation** **(Please note that if you do not sample the first storm event, you are still required to sample 2 storm events)**

3. How many storm water discharge locations are at your facility? 1

E-2. Sampling and Analysis

First storm event of the season that produced a discharge occurred during non working hours.

4. For each storm event sampled, did you collect and analyze a sample from each of the facilitys' storm water discharge locations? ☒ YES, go to Item E.6 ☐ NO

5. Was sample collection or analysis reduced in accordance with Section B.7.d of the General Permit? ☐ YES ☐ NO, **attach explanation**

   If "YES", **attach documentation** supporting your determination that two or more drainage areas are substantially identical.

   Date facility's drainage areas were last evaluated _____

6. Were all samples collected during the first hour of discharge? ☐ YES ☒ NO, **attach explanation**

7. Was all storm water sampling preceded by three (3) working days without a storm water discharge? ☐ YES ☒ NO, **attach explanation**

8. Were there any discharges of stormwater that had been temporarily stored or contained? (such as from a pond) ☐ YES ☒ NO, go to Item E.10

9. Did you collect and analyze samples of temporarily stored or contained storm water discharges from two storm events? (or one storm event if you checked item D.2.i or iii. above) ☐ YES ☐ NO, **attach explanation**

10. Section B.5. of the General Permit requires you to analyze storm water samples for pH, Total Suspended Solids (TSS), Specific Conductance (SC), Total Organic Carbon (TOC) or Oil and Grease (O&G), other pollutants likely to be present in storm water discharges in significant quantities, and analytical parameters listed in Table D of the General Permit.

    a. Does Table D contain any additional parameters related to your facility's SIC code(s)? ☐ YES ☒ NO, Go to Item E.11

    b. Did you analyze all storm water samples for the applicable parameters listed in Table D? ☐ YES ☐ NO

    c. If you did not analyze all storm water samples for the applicable Table D parameters, check one of the following reasons:

       _____ In prior sampling years, the parameter(s) have not been detected in significant quantities from two consecutive sampling events. **Attach explanation**

       _____ The parameter(s) is not likely to be present in storm water discharges and authorized non-storm water discharges in significant quantities based upon the facility operator's evaluation. **Attach explanation**

       _____ Other. **Attach explanation**

11. For each storm event sampled, attach a copy of the laboratory analytical reports and report the sampling and analysis results using **Form 1** or its equivalent. The following must be provided for each sample collected:

- Date and time of sample collection
- Name and title of sampler.
- Parameters tested.
- Name of analytical testing laboratory.
- Discharge location identification.
- Testing results.
- Test methods used.
- Test detection limits.
- Date of testing.
- Copies of the laboratory analytical results.

E-6. Sampling and Analysis

No samples were collected during the reporting period of 08-09. All storm water discharges occurred before or after working hours, and were not preceded by 3 working days.

E-7. Sampling and Analysis

No samples were collected during the reporting period of 08-09. All storm water discharges occurred before or after working hours, and were not preceded by 3 working days.

F. QUARTERLY VISUAL OBSERVATIONS

1. **Authorized Non-Storm Water Discharges**
Section B.3.b of the General Permit requires quarterly visual observations of all authorized non-storm water discharges and their sources.

a. Do authorized non-storm water discharges occur at your facility?

[x] **YES** [ ] **NO** Go to Item F.2

b. Indicate whether you visually observed all authorized non-storm water discharges and their sources during the quarters when they were discharged. **Attach an explanation for any "NO" answers**. Indicate "N/A" for quarters without any authorized non-storm water discharges.

July -September	[x] **YES**	[ ] **NO**	[ ] **N/A**	October-December	[x] **YES**	[ ] **NO**	[ ] **N/A**
January-March	[x] **YES**	[ ] **NO**	[ ] **N/A**	April-June	[x] **YES**	[ ] **NO**	[ ] **N/A**

c. Use **Form 2** to report quarterly visual observations of authorized non-storm water discharges or provide the following information.

i. name of each authorized non-storm water discharge
ii. date and time of observation
iii. source and location of each authorized non-storm water discharge
iv. characteristics of the discharge at its source and impacted drainage area/discharge location
v. name, title, and signature of observer
vi. **any** new or revised BMPs necessary to reduce or prevent pollutants in authorized non-storm water discharges. Provide new or revised BMP implementation date.

2. **Unauthorized Non-Storm Water Discharges**
Section B.3.a of the General Permit requires quarterly visual observations of all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources.

a. Indicate whether you visually observed all drainage areas to detect the presence of unauthorized non-storm water discharges and their sources. **Attach an explanation for any "NO" answers**.

July -September	[x] **YES**	[ ] **NO**	October-December	[x] **YES**	[ ] **NO**
January-March	[x] **YES**	[ ] **NO**	April-June	[x] **YES**	[ ] **NO**

b. Based upon the quarterly visual observations, were any unauthorized non-storm water discharges detected?

[x] **YES** [ ] **NO** Go to item F.2.d

c. Have each of the unauthorized non-storm water discharges been eliminated or permitted?

[ ] **YES** [x] **NO** **Attach explanation**

d. Use **Form 3** to report quarterly unauthorized non-storm water discharge visual observations or provide the following information.

i. name of each unauthorized non-storm water discharge.
ii. date and time of observation.
iii. source and location of each unauthorized non-storm water discharge.
iv. characteristics of the discharge at its source and impacted drainage area/discharge location.
v. name, title, and signature of observer.
vi. **any** corrective actions necessary to eliminate the source of each unauthorized non-storm water discharge and to clean impacted drainage areas. Provide date unauthorized non-storm water discharge(s) was eliminated or scheduled to be eliminated.

G. MONTHLY WET SEASON VISUAL OBSERVATIONS

Section B.4.a of the General Permit requires you to conduct monthly visual observations of storm water discharges at all storm water discharge locations during the wet season. These observations shall occur during the first hour of discharge or, in the case of temporarily stored or contained storm water, at the time of discharge.

1. Indicate below whether monthly visual observations of storm water discharges occurred at all discharge locations. **Attach an explanation for any "NO" answers**. Include in this explanation whether any eligible storm events occurred during scheduled facility operating hours that did not result in a storm water discharge, and provide the date, time, name and title of the person who observed that there was no storm water discharge.

	YES	NO		YES	NO
October	☒	☐	February	☒	☐
November	☒	☐	March	☒	☐
December	☒	☐	April	☒	☐
January	☒	☐	May	☒	☐

2. Report monthly wet season visual observations using **Form 4** or provide the following information.

   a. date, time, and location of observation
   b. name and title of observer
   c. characteristics of the discharge (i.e., odor, color, etc.) and source of any pollutants observed.
   d. **any** new or revised BMPs necessary to reduce or prevent pollutants in storm water discharges. Provide new or revised BMP implementation date.

ANNUAL COMPREHENSIVE SITE COMPLIANCE EVALUATION (ACSCE)

H. ACSCE CHECKLIST

Section A.9 of the General Permit requires the facility operator to conduct one ACSCE in each reporting period (July 1-June 30). Evaluations must be conducted within 8-16 months of each other. The SWPPP and monitoring program shall be revised and implemented, as necessary, within 90 days of the evaluation. The checklist below includes the minimum steps necessary to complete a ACSCE. Indicate whether you have performed each step below. **Attach an explanation for any "NO" answers.**

1. Have you inspected all potential pollutant sources and industrial activities areas? ☒ YES ☐ NO
   The following areas should be inspected:

   - areas where spills and leaks have occured during the last year.
   - outdoor wash and rinse areas.
   - process/manufacturing areas.
   - loading, unloading, and transfer areas.
   - waste storage/disposal areas.
   - dust/particulate generating areas.
   - erosion areas.
   - building repair, remodeling, and construction
   - material storage areas
   - vehicle/equipment storage areas
   - truck parking and access areas
   - rooftop equipment areas
   - vehicle fueling/maintenance areas
   - non-storm water discharge generating areas

2. Have you reviewed your SWPPP to assure that its BMPs address existing potential pollutant sources and industrial activities areas? ☒ YES ☐ NO

3. Have you inspected the entire facility to verify that the SWPPP's site map, is up-to-date? The following site map items should be verified: ☒ YES ☐ NO

   - facility boundaries
   - outline of all storm water drainage areas
   - areas impacted by run-on
   - storm water discharges locations
   - storm water collection and conveyance system
   - structural control measures such as catch basins, berms, containment areas, oil/water separators, etc.

4. Have you reviewed all General Permit compliance records generated since the last annual evaluation? ☒ YES ☐ NO

The following records should be reviewed:

- quarterly authorized non-storm water discharge visual observations
- monthly storm water discharge visual observation
- records of spills/leaks and associated clean-up/response activities
- quarterly unauthorized non-storm water discharge visual observations
- Sampling and Analysis records
- preventative maintenance inspection and maintenance records

5. Have you reviewed the major elements of the SWPPP to assure compliance with the General Permit? ☒ YES ☐ NO

The following SWPPP items should be reviewed:

- pollution prevention team
- list of significant materials
- description of potential pollutant sources
- assessment of potential pollutant sources
- identification and description of the BMPs to be implemented for each potential pollutant source

6. Have you reviewed your SWPPP to assure that a) the BMPs are adequate in reducing or preventing pollutants in storm water discharges and authorized non-storm water discharges, and b) the BMPs are being implemented? ☒ YES ☐ NO

The following BMP categories should be reviewed:

- good housekeeping practices
- spill response
- employee training
- erosion control
- quality assurance
- preventative maintenance
- material handling and storage practices
- waste handling/storage
- structural BMPs

7. Has all material handling equipment and equipment needed to implement the SWPPP been inspected? ☒ YES ☐ NO

I. ACSCE EVALUATION REPORT

The facility operator is required to provide an evaluation report that includes:

- identification of personnel performing the evaluation
- the date(s) of the evaluation
- necessary SWPPP revisions
- schedule for implementing SWPPP revisions
- any incidents of non-compliance and the corrective actions taken.

Use **Form 5** to report the results of your evaluation or develop an equivalent form.

J. ACSCE CERTIFICATION

The facility operator is required to certify compliance with the Industrial Activities Storm Water General Permit. To certify compliance, both the SWPPP and Monitoring Program must be up to date and be fully implemented.

Based upon your ACSCE, do you certify compliance with the Industrial Activities Storm Water General Permit? ☒ YES ☐ NO

If you answered "NO" **attach an explanation** to the ACSCE Evaluation Report why you are not in compliance with the Industrial Activities Storm Water General Permit.

ATTACHMENT SUMMARY

Answer the questions below to help you determine what should be attached to this annual report. Answer NA (Not Applicable) to questions 2-4 if you are not required to provide those attachments.

1. Have you attached Forms 1,2,3,4, and 5 or their equivalent?	☒ YES (Mandatory)		
2. If you conducted sampling and analysis, have you attached the laboratory analytical reports?	☐ YES	☒ NO	☐ NA
3. If you checked box II, III, IV, or V in item D.2 of this Annual Report, have you attached the first page of the appropriate certifications?	☐ YES	☐ NO	☐ NA
4. Have you attached an explanation for each "NO" answer in items E.1, E.2, E.5-E.7, E.9, E.10.c, F.1.b, F.2.a, F.2.c, G.1, H.1-H.7, or J?	☒ YES	☐ NO	☐ NA

ANNUAL REPORT CERTIFICATION

I am duly authorized to sign reports required by the INDUSTRIAL ACTIVITIES STORM WATER GENERAL PERMIT (see Standard Provision C.9) and I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those person directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Section D (pages 5-6) of the General Permit.

- Quarterly visual observations are required to observe current and detect prior unauthorized NSWDs.
- Quarterly visual observations are required during dry weather and at all facility drainage areas.
- Each unauthorized NSWD source, impacted drainage area, and discharge location must be identified and observed.
- Unauthorized NSWDs that can not be eliminated within 90 days of observation must be reported to the Regional Board in accord with Section A.10.e of the General Permit.
- Make additional copies of this form as necessary.

OBSERVATIONS

PRE-EVENT (1)	POST-EVENT (2)
☒ No violations observed during the inspection.	☒ No violations observed during the inspection.
☐ Violations observed during the inspection	☐ Violations observed during the inspection
☐ Implement Corrective Actions As Required Below	☐ Implement Corrective Actions As Required Below

CORRECTIVE ACTION REQUIRED: ☐ Photos Taken

1	2	
☐	☐	Prevent trash/recycling from overflowing.
☐	☐	**Immediately** clean up oil/grease spills and leaks.
☐	☐	Post-event street sweeping required.
☐	☐	Provide immediate protection for storm drain inlets.
☐	☐	Clean in and around storm drains.
☐	☐	Train staff, vendors, and participants on pollution prevention.

1	2	
☐	☐	Sweep up trash and debris.
☐	☐	**Immediately** discontinue outdoor washing or hosing.
☐	☐	Dumpsters & trash receptacles must be covered during rain events
☐	☐	Provide spill kit(s) in required areas.
☐	☐	Provide secondary containment for portable restroom(s).

O _____

Implement corrective actions by_____. A City staff person will return to verify that corrective actions implemented as required. If you have any questions or comments, please contact the Special Events office at 760-435-5540.

CITY OF OCEANSIDE
clean water program

Volume 6, Issue 2 - Fall 2008

Coastal Cleanup Day September 20, 2008 9 am - 12 pm

Celebrate California Coastal Cleanup Day by participating in the eigth annual Buena Vista Creek Cleanup and Oceanside Pier Beach Cleanup. The City of Oceanside, together with I Love a Clean San Diego, Coastkeeper, and 1-800-GOT-JUNK will be hosting a cleanup along the banks of Buena Vista Creek, as well as a beach cleanup south of Oceanside Pier on September 20th, from 9 a.m. to 12:00 p.m. Volunteers will receive cleanup supplies, refreshments, community service hours, and a free T-shirt. Call the Clean Water Program Event Information Line for more details at 760-435-5536.

Cleanup sites

- Behind Chicks Sporting Goods at Plaza Drive and College Boulevard (3514 College Boulevard)
- North of fire station #4 located at Thunder Drive and Lake Boulevard.
- Behind Kohl's store at College Boulevard and Marron Rd.
- South side of Oceanside Pier

Join us while we remove unwanted materials from the creek and beach and help to improve Oceanside water quality. For more information about cleanup events and how you can prevent water pollution visit ourWebsite at

www.oceansidecleanwaterprogram.org.

Bacteria source tracking project on the San Luis Rey River

The shoreline at the outlet of the San Luis Rey River mouth in Oceanside, California is visited by thousands of people each year to enjoy a variety of recreational activities. However, for a number of years, elevated levels of indicator bacteria (total coliform, fecal coliform, and Enterococcus) have affected water quality in the river mouth and the adjacent shoreline. The beach has had significantly more beach postings and closures as a result of elevated bacterial levels than other beaches in the City. Public health is a priority for the City of Oceanside who is striving to improve water quality through its Clean Water Program.

To address this issue, the City of Oceanside Clean Water Program was awarded $554,375 from the Clean Beaches Initiative (CBI) Proposition 50 grant. The objective of this study is to identify the source or sources of bacteria that are causing the high bacteria levels. The sources could be from humans, pet waste, coyotes, dogs, raccoons, birds who land at the river mouth, or other wildlife. More in-depth bacterial analysis will better determine the exact source. After the data is analyzed a list of potential activities to eliminate the input of those sources will be developed.

Water quality sampling along the river has been ongoing since 2004. Scheduled smapling for this grant will be done in June 2008, August 2008, winter 2008/09 and summer 2009. The final report for the project is scheduled for completion in January 2010 with release to the public shortly thereafter. For more information about this project, call the Clean Water Program staff at 760-435-5800.

DID YOU KNOW...

Over Watering

↓

Urban Runoff

↓

West Nile Virus

...ARE CONNECTED?

Our imported water supplies have ben cut, so we need to reduce water use immediately. You can help by not over watering your yard. Eliminate one day a week from your watering schedule, or cut your watering times by two minutes. To learn other water saving tips visit www.20gallonchallenge.com.

Underground backyard french drains that reach the curb can contribute to runoff and ponded water in your street. Ponded water is the perfect breeding ground for mosquitos that can carry the West Nile virus.

Tips to eliminate water runoff

Check your landscape for any water runoff both during the water cycle and after the cycle is complete.

If water runs onto the driveway, sidewalk, or street:

- ❑ Adjust sprinklers so they spray only landscape.
- ❑ Reduce the irrigation cycle 1-3 minutes.
- ❑ Check for and repair leaks and broken sprinkler heads.
- ❑ Water after 8:00 p.m. and before 6:00 a.m.

If water comes out of the curb drain in front of your house

- ❑ You may be over watering or have a leak.
- ❑ Reveiw the above tips and make any appropriate changes.

Urban Runoff Hotline

760-435-5800

Call the Urban Runoff Hotline if you see water runoff in in your street or anything other than rainwater going down the storm drain.

CITY OF OCEANSIDE
clean water program
Volume 7, Issue 1 - Winter 2009

Loma Alta Creek Cleanup
April 25, 2009
9 a.m. - 12 p.m.

Celebrate Earth Day by participating in the 10th Annual Creek to Bay Cleanup event on April 25, 2009. The City of Oceanside, together with I Love a Clean San Diego and 1-800-GOT-JUNK, will be hosting a cleanup along the banks of Loma Alta Creek and at two sites on the Pacific Ocean.

Choose from five sites

- Buccaneer Park at Pacific and Morse Streets (1500 South Pacific Street)
- Behind McDonald's on Oceanside Boulevard and I-5 (1701 Oceanside Boulevard)
- Mesa Drive between El Camino Real and Rancho Del Oro Drive
- Behind commercial buildings at 1629 Ord Way (Off Oceanside Boulevard between College Boulevard and Temple Heights Drive)
- South side of the Oceanside Pier

Join us while we remove unwanted materials from the creek and beach and help to improve Oceanside water quality. Volunteers will receive cleanup supplies, refreshments, community service hours, and a free T-shirt or other giveaway item. For more information call 760-435-5536 or 760-435-5807.

Receive event notices by email

To receive event announcements by email, send your email address to cleanwaterprogramevents@ci.oceanside.ca.us, or log on to the events tab at www.oceansidecleanwaterprogram.org to register. While visiting the Web site, learn how you can protect water quality.

Together we can prevent water pollution.

In This Issue

- 2009 river, creek, and beach cleanup events
- Green Week at Oceanside Library: March 16 - 21, 2009
- Water Conservation Landcaping Workshops for residents
- Storm drains are not connected to the sanitary sewer

Green Week: March 16 - 21, 2009
At the Oceanside Public Library
Learn how your family can be better stewards of the planet

Each day during Green Week there will be fun children's activities to teach them how to be better stewards of the planet including recycling, water conservation, and preventing water pollution. Students can also participate in two contests:

- Bookmark Contest - Winning designs will be printed for distribution.
- Recycling Challenge - Classrooms compete to collect the most cans and plastic bottles during the week. The winning class earns a lunch party for their entire classroom. Details at any OUSD school.

Don't miss these fun and educational events. For more information visit www.oceansidecleanwaterprogram.org or call the Oceanside Library at 760-435-5590.

- Monday, March 16 - 6 p.m.: Our Blue Planet
- Tuesday, March 17 - 6 p.m.: Reduce, Reuse, Recycle
- Wednesday, March 18 - 6 p.m.: Stories & author visit
- Thursday, March 19 - All Day: Children Eco-crafts
- Friday, March 20 - Bookmark Contest Deadline
- Saturday, March 21 - 9 a.m. to 12 p.m.: The Green Fair

Come to the downtown Civic Center Plaza and enjoy games, food, and information booths. An awards ceremony will be held for contest winners. For event fliers and contest details visit your local library or visit www.oceansidecleanwaterprogram.org.

Green Week is sponsored by the Friends of the Oceanside Public Library, the City of Oceanside's Solid Waste and Recycling Division, and the Water Utilities Department's Water Conservation and Clean Water Programs.

Urban Runoff Hotline - Help protect our local waterways

Please report if you see anything other than rain water entering the storm drain.

760-435-5800 "Only Rain in the Storm Drain!"

FREE Water Conservation Landscaping Workshops

Space is limited! Call 760-435-5800 to reserve a seat.

Did you know that 60% of our urban water is used for landscape irrigation and other outdoor purposes? In an effort to help the community conserve water outdoors, the City of Oceanside's Water Utilities Department is offering a series of free landscaping workshops to help homeowners save water (and money) while making their gardens colorful, healthy, and attractive. Homeowners will learn about efficient irrigation and landscape management. These workshops have been created specifically for landscaping in California with a focus on water conservation landscaping techniques.

Residential Landscaping Workshop
Date: Saturday, May 23, 2009
Time: 9 a.m. to 12 p.m.
Mira Costa College @ One Barnard Dr.
Horticulture Building 7000
Oceanside, CA 92056

This one-day workshop will cover:

- Garden design for homeowners
- Use of California-friendly plants
- Sprinkler system basics
- Introduction to irrigation scheduling

Bye Bye Grass Workshop (Two-day workshop)
Dates: June 23 AND June 25, 2009
Time: 6:30 - 8:30 p.m.
Oceanside City Hall
Civic Center Library Community Rooms
330 N. Coast Highway
Oceanside, CA 92054

This two-day workshop will focus on:

- Fast, effective, and inexpensive methods to remove your lawn (day one), and
- Irrigation systems demonstration, kinds of spaces you need in your garden, and creative ideas for installing beautiful low-water-use plants (day two).

For more information call 760-435-5800 or log on to www.ci.oceanside.ca.us and click on water saving opportunities. Space is limited. To reserve a seat at any of these workshops call the Water Utilities Department at 760-435-5800.

Did You Know That...

Storm Drains Lead to the Nearest Waterway

Rain water (also called storm water) that flows off buildings, walkways and streets into storm drains ultimately flows to the Pacific Ocean. Unlike water that goes to the sanitary sewer system (like your sink, shower, and toilet water), storm water is not treated or filtered before it is discharged to the ocean. Storm water runoff can pick up pollutants from yards and streets that can have harmful effects on wildlife and the recreational uses of rivers, creeks and beaches. Sometimes area beaches are posted or closed due to pollution. It is important to keep storm water runoff clean.

What can I do?

- Don't dump anything down the storm drain - remember "Only Rain in the Storm Drain!"
- Pick up pet waste promptly- it transmits disease
- Place landscape clippings in curbside carts - don't sweep into streets or down storm drains
- Wait three days after rain to apply fertilizers and pesticides
- Visit www.oceansidecleanwaterprogram.org for more tips

2009 River, Creek, and Beach Cleanup Events

Please join the Clean Water Program staff and citizen volunteers to assist in removing trash and debris from our local rivers, creeks and beaches.

Event Times: 9:00 a.m. - 12:00 p.m.
Event Details: 760-435-5536

- April 25, 2009: Loma Alta Creek Cleanup
- July 5, 2009: Morning After Mess - City Beaches
- September 19, 2009: Buena Vista Creek Cleanup and California Coastal Cleanup Day
- November 7, 2009: San Luis Rey River Cleanup

iDesign Impact

Join us at any of the following sites:

- Oceanside Harbor - Parking Lot #10
- Highway 76 & Benet Road
- Highway 76 & Foussat Road at bike path
- Douglas Drive at the bike path on south side of SLR River north of Pala Road
- Mance Buchanon Park on College Blvd. just north of Adams Ave.

Do You Know Your Watershed?

The San Luis Rey Watershed is located along the northern border of San Diego County, California. It originates in the Palomar and Hot Springs Mountains and extends over 55 miles across northern San Diego County. This forms a watershed* with an area of approximately 360,000 acres or 562 square miles making it the third largest in the San Diego region (SANDAG 1998). The river ultimately discharges to the Pacific Ocean at the western boundary of the City of Oceanside.

The San Luis Rey Watershed is comprised of three Hydrologic Areas (HAs), which have been delineated based on drainage patterns: Lower San Luis, Monserate, and Warner Valley. Over 54% of the land in the watershed is vacant or undeveloped. The next largest land uses in the watershed are residential (15%) and agriculture (14%). The highest concentration of population is located in the Lower San Luis HA. There are six federally recognized Tribal Indian Reservations with land in the watershed. The highest point in the San Luis Rey watershed and in San Diego County is Hot Springs Mountain with an elevation of 6,533 feet (1,991 meters).

A watershed defines where any litter, debris, oil, grease, fertilizers, or other pollutants will travel when it rains. During the rainy season or when over watering occurs, these pollutants are carried down the curb, into a storm drain, and are released into a "receiving water". Receiving waters can be any body of water including creeks, rivers (like the San Luis Rey), lakes, and the ocean. You can help protect the receiving waters where you live by disposing of trash properly, washing your car on the grass or at a car wash (not on your driveway), and not applying fertilizer before it rains. Report anything but rain water traveling down the gutter or storm drain to the Oceanside Urban Runoff Hotline (760-435-5800). Remember "Only Rain in the Storm Drain".

To learn more about Oceanside watersheds log onto www.oceansidecleanwaterprogram.org and click on waterbodies. And for more information about the watersheds in San Diego County, log onto www.projectcleanwater.org.

*wa·ter·shed – noun
1. the ridge or crest line dividing two drainage areas; water parting; divide;
2. the region or area drained by a river, stream, etc.; drainage area.

News Briefs

Early Start to Trash Collection on July 5th

Trash and recycling collection for residential, multifamily and commercial customers who would normally be serviced on Friday, July 4th, will be serviced on Saturday, July 5th. Because of the expected crowds in the beach and harbor areas, Waste Management will begin collection at 4:00 am, beginning in the areas that are located west of Coast Highway, between Oceanside Blvd. and the harbor. This early start time is expected to minimize the difficulties associated with holiday crowds. Waste Management and the City would like to thank customers in advance for their patience and cooperation.

Recycling at Harbor and Beaches

The City of Oceanside is proud to announce that we have more than doubled the amount of recycling containers at our Harbor and Beaches. This summer, while you are out enjoying our Harbor and Beaches, please remember to recycle your empty beverage bottles and cans. Be on the look out for our brand new recycling containers and remember to place your empty bottles and cans in one of these containers, and NOT in a trash can. These new recycling containers will be available along The Strand and Harbor for your convenience, so let's save our landfills.

OCEANSIDE RECYCLES, Recycling Hotline: 435-5015.

Beach and River Cleanup Events

Please join the Clean Water Program staff and citizen volunteers to assist in removing trash and debris from our local beaches, rivers, and creeks. All volunteers receive cleanup supplies, refreshments, community service hours and a free T-shirt. All events are held from 9:00 am to 12:00 pm. For more information about cleanup events call 435-5536 or log onto www.oceansidecleanwaterprogram.org.

- July 5: Morning After Mess – City Beaches
- September 20: California Coastal Cleanup Day – Buena Vista Creek Cleanup
- November 8: San Luis Rey River Cleanup

Sushi Spurs Oceanside Redevelopment

Located in the heart of downtown at 301 Mission Avenue in the recently completed Oceanside Terraces development, Harney Sushi, of San Diego fame, is set to unveil its new Oceanside location June 27 with a private preview event and silent auction benefiting the California Surf Museum. To celebrate the opening and help support its new neighbors, Harney Sushi Oceanside will also be donating 5% of its first week sales to the California Surf Museum. With a 600-gallon fish tank, cascading wall of water, fireplace, comfortable indoor and outdoor seating, sushi and sake bars, private VIP room and DJs six nights a week, Harney Sushi provides a distinct dining experience and aesthetic that sets it apart as truly progressive. Harney Sushi will serve lunch Monday through Friday and dinner daily until midnight. Visit Harney Sushi online at www.harneysushi.com.

Health and Wellness Fair

Tri-City Medical Center will host the Inaugural Mid-Summer's Health and Wellness Fair Thursday, July 10, from 4:00-7:00 pm, on the Medical Center campus located at 4002 Vista Way, Oceanside. It will take place in the northwest Parking lot.

Tri-City professionals will provide free health screenings, information about disease prevention and explain how to access services offered by the hospital, including the new Health and Wellness Complex scheduled to open November 2008. The fair will also feature entertainment, food, drinks and guest appearances by sports celebrities. For additional information call 450-4785 or 908-6458.

Kids IV Golf Tournament

North County Health Services will be holding their fourth annual Fore For Kids IV Golf Tournament on August 22 at Lake San Marcos Resort and Country Club. Shotgun time will start promptly at 12:30 pm. Please come join us for 18 holes of golf, feasting, auctions and an amazing day of fun. Sign up soon as the event sells out rapidly. One hundred percent of the proceeds aid comprehensive pediatric programs. To participate or get information about sponsorship opportunities, call Victor Botello at 736-6710 or Michelle Davis at 736-8705.

In Search of...Volunteers

The City has expanded its Volunteer program and is looking for additional volunteers to fill interesting and rewarding opportunities Citywide. These opportunities range from working on various recreational, sports and literacy programs, to providing office support. Presently, the City has 500+ active volunteers working with various City projects and programs. These volunteers supplement existing services.

In effort to expand the program, Human Resources created a Volunteer Web site which may be reached at the following link: http://www.ci.oceanside.ca.us/datarelation.aspx?Content=286.

Once on the Web site, download application forms, view the procedures manual, the policy that governs this program and the different City departments that are participating. Volunteers are placed by matching interests with work needed.

For additional information please visit the volunteer Web site or call Armando Fernandez at 435-3508.

Earth Day: April 22, 2009

This year you can contribute to the environment on Earth Day by reducing or permanently eliminating your use of plastic bags!

Get Rid of Plastic Bags... And Plastic!

The raw material of plastic bags is oil. Therefore, the more we use plastic bags, the more we waste oil — a non-renewable energy source.

The petroleum-based plastic bags take hundreds of years to break down, so if they are not recycled they become litter.

It creates visual pollution: in the streets, on the beaches, etc. Also, they can clog roadside drains, which could cause street flooding during heavy rainfall.

Plastic bags can be recycled but it rarely happens: according to the United States Environmental Protection Agency, only 1% of plastic bags were recycled in 2000, against twenty percent for paper bags.

They endanger wildlife and particularly sea life such as sea turtles and dolphins, which can die of entanglement, suffocation, and ingestion because they assume that these bags are jellyfish.

Plastic: A Not-So-Safe Material

Bisphenol-A, a common chemical used to make certain plastics has been linked to potentially deadly diseases like diabetes, heart disease, and cancer.

Studies have shown that 90% of American people have Bisphenol-A in their bodies.

Exposure to Bisphenol comes from many different sources such as the foods we eat, the water and beverages we drink, electronics, and even our dentists.

Even babies come in contact with Bisphenol at an early age, as many baby bottles are made from the plastic.

What YOU Can Do!

Use reusable grocery bags, which always have a lower environmental impact.

Reuse your plastic shopping bags: use them for trash so as not to buy others that are more energy wasting; use them for storage.

Use paper bags rather than plastic bags when you are given the choice, but keep in mind that paper bags generate 70 percent more air and 50 times more water pollutants than plastic bags, and it takes more than four times as much energy to manufacture a paper bag as it does to manufacture a plastic bag.

Heritage Park Village & Museum

Heritage Park centers around an idyllic main street lined with many of Oceanside's original buildings and period furnishings. This two-acre site is a perfect setting for picnics, reunions, company barbecues, wedding receptions, and other special events.

Park grounds are open daily 9:00 AM – 4:00 PM, with the historic buildings open on Sundays 1:00 PM – 4:00 PM. For a personal tour, please call 433-8297 to make an appointment.

have been prioritized according to type of event, number in attendance, proximity to the nearest water body, and potential threat to water quality. Based on this prioritization, the City of Oceanside will be conducting storm water compliance inspections of most special events within the City. These compliance inspections will include a pre-event inspection where storm water BMPs are evaluated. An event inspection is required to determine the effectiveness of BMPs, and a post-event inspection to ensure the site is properly cleaned. Compliance inspections may also include recommendations for additional measures that may be required to comply with the storm water regulations.

Please note that all special events in the City of Oceanside are required to implement all of the minimum special event BMPs and comply with all applicable regulations outlined in the Oceanside Municipal Code

Remember "Only Rain in the Storm Drain"

wastewater treatment plant discharged to the ocean. The storm drain system, on the other hand, is designed to carry rainwater away from streets, parking lots, and driveways to help prevent flooding during rain events. Water entering the storm drain system does not receive any treatment and flows directly to our creeks, lagoons, and ocean.

ONLY RAIN IN THE STORM DRAIN!

Preventing Pollution is Up to Us!

Did you know that storm drains are NOT connected to sanitary sewer systems or other treatment plants? As rainfall flows over the ground, it picks up a variety of pollutants that flow directly to our creeks, lagoons, and ocean.

Special Event Pollutants

Special event activities can generate a variety of pollutants that can pollute our waterways.

- Trash and Debris
- Oil and Grease
- Metals
- Detergents
- Bacteria and Viruses
- Sediment

Best Management Practices Work!

Best Management Practices (BMPs) are procedures and practices that all special event organizers **are required** to implement to prevent pollutants from entering our storm drains. Once sources of pollution have been identified, the next step is to select BMPs that eliminate or reduce storm water pollution. Storm Water Compliance staff can work with you to develop BMPs for your specific event.

Protection for All Seasons

Even when rain is not expected, event organizers are required to implement BMPs. Depending on the size, location, number of participants, and other relevant factors, a Storm Water Pollution Prevention Plan (SWPPP) may need to be developed and must be approved by the City prior to Special Event Permit issuance. The SWPPP is intended to demonstrate that appropriate measures are being implemented before, during, and after the event to reduce and prevent pollutants from leaving the event venue.

Good Housekeeping

- **Use dry clean-up methods first!** Never use a water hose or pressure washing system to clean up spills. Use mops, brooms, or wire brushes to clean sidewalks, pavements, and other impervious surfaces. Wash water must be disposed of to the sanitary sewer and never the storm drain.
- Minimize the use of cleaning solutions and chemical agents. Dispose of waste properly.
- Keep site free of litter. Place trash and recycling receptacles around the site to minimize litter.

Preventive Maintenance

- Inspect equipment and vehicles frequently and clean up leaks and spills immediately.
- Prior to the event, locate and protect all drainage points using storm drain protection devices such as sand bags, fabric filters, berms, containment booms, etc.
- Label or place signs at, around, or adjacent to storm drains with the following wording: "No Dumping" or other pollution preventative message.
- Regularly inspect storm drains during the event to prevent pollutants from accumulating.

Waste Maintenance

- Reduce, Reuse, Recycle.
- Frequently inspect trash and recycling receptacles to ensure they do not overflow. Place trash inside dumpsters or plastic bags until it can be removed.
- Dumpsters must be kept closed when not in use.
- Never place liquid waste, leaky bags, or hazardous waste in dumpsters or trash bins.

Materials Storage and Handling

- Store materials in covered areas not exposed to rain.
- Keep outdoor storage areas clean.

Food Preparation

- Food vendors must have spill kits in or adjacent to their work area. Spill kits include: towels, kitty litter, and/or clean-up materials. All spilled materials must be promptly cleaned up and disposed of properly.

Temporary Relief Stations

- Relief stations must be placed away from locations that have the potential to impact the storm drain systems.
- All relief stations are required to have a secondary containment or additional BMPs to contain possible overflows or debris from rechign storm drian inlets.

Staff and Vendor Training

- Discuss and distribute information about storm water pollution prevention during staff (including contractor) training and vendor registration.

Post Event Clean Up

- All streets, sidewalks, and public areas must be cleaned (sweeping, litter pickup, etc.) and returned to the pre-event condition.
- Remove temporary public art (chalk, paint, charcoal, clay, etc) using dry-clean up methods only.
- If a street sweeper will be used, ensure they are onsite promptly after the event.
- Assign an appropriate number of staff to promptly and adequately clean-up after the event.
- After the site has been cleaned, storm drain containment and protection devices must be removed.

For more information or assistance, please call 760-435-5540 or 760-435-5800.

General Industrial Permit Fact Sheet

WHAT IS THE GENERAL INDUSTRIAL PERMIT?

The California State Water Resources Control Board (SWRCB) adopted the current National Pollutant Discharge Elimination System (NPDES) General Industrial Permit in 1997. It requires certain industrial businesses to obtain a storm water permit in order to discharge runoff into a city's storm drain system or a local waterbody. The storm water permit mandates that regulated industrial businesses must develop and implement various programs to prevent the contamination of storm water runoff draining off their site. An update of this Permit was drafted in 2005, but has not yet been adopted.

HOW DO I KNOW IF I NEED THIS PERMIT?

If the Standard Industrial Classification (SIC) Code of your business is between 0211 and 5171, you may be subject to regulation under the Permit, unless conditionally excluded. If subject, you are required to submit a Notice of Intent (NOI) to the San Diego Regional Water Quality Control Board (RWQCB) and be in compliance with the other planning, monitoring, and training requirements of the permit. Below is a list of general facility descriptions that are subject to the Permit:

- Facilities with effluent limitations, new source performance standards, or toxic pollutant effluent standards
- Manufacturing
- Oil and Gas/Mining
- Hazardous Waste Treatment, Storage, or Disposal
- Landfills, Land Application Sites, and Open Dumps
- Recycling Facilities
- Steam Electric Power Plants
- Transportation Facilities
- Sewage or Wastewater Treatment Works
- Manufacturing facilities where industrial materials, equipment, or activities are exposed to storm water (Light Industrial)

A complete list of SIC Codes regulated under the General Industrial Permit is available on the SWRCB website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/sicnum.shtml

CAN A FACILITY BE EXEMPT FROM PERMITTING?

There is an exemption from storm water permitting for industrial facilities which have no exposure of industrial materials and activities to storm water. The intent is to provide all regulated industrial facilities whose activities are completely indoors (with no potential to discharge to a storm drain) with a simplified method of complying with the Permit. You still must file with the RWQCB, but you only need to submit a No Exposure Certification Form:

http://www.epa.gov/npdes/pubs/msgp2008_appendixk.pdf

WHO DO I CONTACT FOR MORE INFORMATION?

For answers to frequently asked questions and links to the Permit:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/indusfaq.shtml

For additional information about the No Exposure Exclusion:

http://cfpub.epa.gov/npdes/stormwater/exposure.cfm

For additional information on local regulations versus state regulations:

http://www.oceansidecleanwaterprogram.org/industrial.asp

For all other questions, contact:

- San Diego RWQCB General Number: (858) 467-2952
- SWRCB Industrial General Number: (916) 341-5538

CITY OF OCEANSIDE
WATER UTILITIES DEPARTMENT

DATE: December 10, 2009

RE: STATEMENT OF CERTIFICATION
CITY OF OCEANSIDE JURISDICTIONAL URMP

I certify under penalty of law that the Illicit Discharge, Detection, and Elimination Section (Section 7) of the Jurisdictional Urban Runoff Management Program Annual Report for 2008-2009 was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for knowing violations.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

This section documents the activities conducted by the City of Oceanside during the 2008-2009 reporting period to manage illicit discharges and meet the requirements of Sections D.4 and J.3.a.(3)(f) of the 2007 Municipal Permit. A directory of the subsections within the Municipal Permit Section J.3.a. and corresponding Annual Report compliance sections are listed in Table 7-1.

Table 7-1. Order No. R9-2007-0001 Compliance Summary.

J.3.a(3)(f)i. MS4 corrections and the Dry Weather Field Screening Map	See Section 7.7.3 and Appendix 7-A of this Annual Report
J.3.a(3)(f)ii. Reporting of all dry weather field screening and analytical monitoring results	See Section 7.4.3 and Appendix 7-A of this Annual Report
J.3.a(3)(f)iii. Dry weather consultant reports	N/A
J.3.a(3)(f)iv. Brief description of any other investigations and follow-up activities	See Section 7.5 and Appendix 7-B of this Annual Report
J.3.a(3)(f)v. and vi. Number and descriptions of IC/IDs identified and eliminated	See Section 7.4.3 and Appendix 7.5 of this Annual Report
J.3.a(3)(f)vii. Spills to the MS4	See Section 7.3.3 of this Annual Report
J.3.a(3)(f)viii. Activities to prevent spills from entering the MS4	See Section 7.3.1 of this Annual Report
J.3.a(3)(f)ix. Notification of sewage spills	See Section 7.3.2 of this Annual Report
J.3.a(3)(f)x. Hotline calls	See Section 7.2 of this Annual Report
J.3.a(3)(f)xi. Public reporting of illicit discharges	See Section 7.2 and Section 8 of this Annual Report
J.3.a(3)(f)xii. Violations and enforcement actions	See Section 7.5 of this Annual Report
J.3.a(3)(f)xiii. Description of notable activities	See Section 7.1 of this Annual Report

7.1 Introduction

Illicit connections and illicit discharges (IC/IDs) can result in unauthorized discharges of pollutants to MS4s. IC/IDs can be defined as the following:

- An ***illicit connection*** is a connection that conveys an illicit discharge to the MS4 (pipe, drain, channel, catch basin, grated inlet, junction box, etc.).
- An ***illicit discharge*** is the act of disposing of any pollutant that is prohibited by the City either intentionally or unintentionally to the MS4. This does not include non-storm water exemptions and discharges resulting from emergency fire fighting activities. A list of non-prohibited, non-storm water discharges is provided in Chapter 3 of the City's JURMP Update (2007).

The main objective of the illicit discharge, detection, and elimination (IDDE) component of the City's storm water program is to seek and eliminate IC/IDs into the MS4. Eliminating IC/IDs helps minimize potentially negative impacts of human activities on receiving water bodies.

The City uses its municipal personnel to assist in actively seeking, identifying, and reporting IC/IDs during their daily activities. Detection and prevention of IC/IDs is achieved by:

- Operating a public complaint hotline,
- Inspecting local businesses and municipal facilities,
- Conducting dry weather field screening and analytical monitoring,
- Maintaining municipal MS4 and sewer systems, and
- Educating the local community.

The City investigates, inspects, and follows-up on every IC/ID that is reported or detected, to identify the source or sources of the discharge. Voluntary compliance and escalating enforcement mechanisms are implemented to immediately eliminate the IC/ID once the source has been identified when appropriate. Educational materials are distributed to help prevent future IC/ID occurrences. In addition, the City is in the process of developing MS4 outfall and source identification monitoring programs as part of a regional and jurisdictional effort to aid in identifying IC/IDs.

Notable Activities

To reduce the risk of sanitary sewer overflows, the City Sewer Department installed sewer monitoring alarm systems in several high priority areas. In addition, the land outfall replacement project was completed which replaced 6020 linear feet of 36" HDPE and PVC sewer pipe in the Loma Alta Creek watershed. See Section 7.3.1.1 for more information.

7.2 Public Reporting of Illicit Discharges and Connections

To aid the process of identifying illicit discharges, the City encourages the public and City staff to report illicit discharges and connections. A public complaint hotline specifically for urban runoff has been developed, and is currently operated by the Water Utilities Department:

Oceanside Urban Runoff Hotline
(760) 435-5800

The hotline is answered during business hours by City staff. Bilingual staff is available to handle calls by Spanish speakers. For after hours, holidays and weekend calls, callers needing immediate assistance are referred to the Oceanside Police and/or Fire Departments and the remaining are prompted to leave a message. Maintenance and operations staff are also trained to promptly refer potential storm water violations observed in the field to the Hotline (details of municipal staff training are in Section 10.2). City staff is provided with their own incentive based reporting hotline called *Oceanside Eyes*, which allows them to earn credit towards certain awards for each report that they phone in.

In addition to the Urban Runoff Hotline, IDDE related public complaints are also reported to Code Enforcement:

Code Enforcement
(760) 435-3944

Once a complaint is received, it is logged into a database for documentation and tracking purposes. The complaint is then forwarded to either a Clean Water Program Inspector or a Code Enforcement Officer. City personnel investigate every complaint logged through the hotline to

determine if pollutants are in fact being discharged to the MS4. If investigators find evidence of a violation or other IC/ID, every effort is made to find the responsible party and inform them of the complaint or issue a violation.

A total of 98 public complaints were received through the Urban Runoff Hotline during the 2008-2009 reporting period compared to 54 calls in the previous reporting period. Figure 7-1 is a summary of the nature of calls made to the Urban Runoff Hotline. The Code Enforcement Hotline reported 112 calls for storm water/Clean Water Program complaints compared to 190 calls in the previous reporting period. However, due to tracking procedures, the 190 reported complaints may have included additional code enforcement inspections related to urban runoff issues. A revised tracking policy is planned for upcoming years to better manage the information.

Figure 7-1. Summary of Urban Runoff Hotline Calls during the 2008-2009 Reporting Year.

The Urban Runoff Hotline is publicized in the *Oceanside Community Magazine*, the *North County Times* newspaper, the City's website, the Clean Water Program website, on a monthly local TV program called KOCT Oceanside Update, informational literature for public distribution, and at local community events and meetings. In addition, education to the public stresses the importance of reporting discharges and describes the critical role that the public plays in the identification and elimination of Urban Runoff pollution related problems.

7.3 Spill Reporting, Response, and Prevention

The City implements spill reporting, spill response, and spill prevention mechanisms to prevent, respond to, contain, and clean up all sewage and other spills that discharge to its MS4 from any source.

7.3.1 Spill Prevention

7.3.1.1 Sanitary Sewers

The City's preventive and corrective sewer maintenance programs consist of a variety of components provided for the operation, maintenance, repair and replacement of sewer mains, manholes, and pump stations. The programs provide for the routine monitoring, inspection, cleaning, and related maintenance of all components of the collection system in order to reduce the potential of sanitary sewer overflows (SSO) and other structural failures. Potential problems are noted and maintenance schedules adjusted accordingly. If necessary, repairs are initiated by City maintenance crews. Larger more complex projects are referred for inclusion in the capitol improvement projects (CIP) process for planning, design, and construction.

When system malfunctions do occur, such as SSO main stoppages, electrical outages, and mechanical breakdowns, the cause of the problem is investigated and analyzed. Maintenance schedules are then adjusted accordingly. If appropriate, the infrastructure component is referred for repair or replacement by maintenance crews.

Cleaning schedules are analyzed and adjusted for proper scheduling. During the 2008-09 reporting year, 312 miles (1,649,702 feet) of sanitary sewer were cleaned.

In order to ensure that the sanitary sewer lines do not leak, the city has a long term plan to slip line the sewer pipes through the City. During this reporting period 4,054 feed of City sewer lines were slip lines and an additional 47 manholes were rehabilitated.

In high priority areas, five SmartCover sewer monitoring and alarm systems were in use during the 2008-09 reporting year. These systems continuously monitor water level and at a pre-determined high water marks an alarm is sent to on-duty personnel to inspect the line to prevent a spill.

The land outfall replacement project, a large CIP project, was completed during the 2008-2009 reporting year. 6,020 linear feet of pipe of the land outfall were replaced in the Loma Alta Watershed. The previous land outfall was constructed in 1972 and consisted of approximately 34,000 linear feet of 24-inch ductile iron pipe. Several failures of the existing land outfall had occurred along Oceanside Boulevard, therefore a 6,000 linear foot segment was identified for immediate replacement. This project consisted of the installation of 6,020 linear feet of 36-inch HDPE and PVC pipe in this segment. The project was completed on June 4, 2009 with a budget of over $4,000,000.

In addition, the almost mile and a half segment of ocean outfall pipe was inspected by cctv for preventative maintenance.

Private Sewer Laterals and Septic Systems

The City requires that private sewer laterals and septic systems be designed and operated in accordance to industry standards. The City also requires the proper maintenance of these facilities in order to avoid spills, breakages, and failures.

7.3.1.2 Other Spills

The City prevents spills from private businesses and residents through required BMPs, education, and enforcement of relevant regulations for the storage and usage of hazardous materials.

The City also received funds from the California Integrated Waste Management Board to establish a permanent household hazardous waste (HHW) collection facility for its residents. The City's objective was to encourage a convenient, proper disposal and collection of HHW materials for its residents. This facility is currently open Monday through Friday for used oil, paint, and antifreeze disposal and every Saturday for collection of the following materials:

- Aerosols
- All purpose cleaners
- Ammonia
- Antifreeze
- Automobile cleaners
- Barbecue lighter fluid
- Batteries
- Brake fluid
- Chlorine bleach
- Detergents
- Disinfectants
- Drain opener
- Furniture polish
- Gasoline
- Glass cleaner
- Herbicides
- Mothballs
- Motor oil
- Oven cleaner
- Paint
- Paint thinner
- Pesticides
- Rubber cement
- Rug/upholstery cleaner
- Scouring powder
- Silver polish
- Toilet bowl cleaner
- Transmission fluid
- Tube and tile cleaner
- Turpentine varnish
- Water sealant
- Wood finish

The HHW collection facility is periodically promoted by the City through the *Oceanside Community Magazine*, the *North County Times* newspaper, on the Clean Water Program website and at local community events and meetings where literature is distributed. There is also literature available to the public at the City offices.

During the 2008-2009 reporting period, 3,430 Oceanside households utilized the household hazardous waste disposal facility, disposing or recycling 146.59 tons of hazardous materials (including universal waste) during the reporting period. An additional 127.56 tons of E-waste was recycled in the same reporting year.

The City provides information to the public on used motor oil recycling and identifies the local state certified collection centers in the City. Furthermore, as part of the City's collection program, a 1,500-gallon used oil collection receptacle is provided at the City's harbor for use by harbor slip renters. During FY 2008-09, 832 gallons of oil were recycled along with one 55-gallon barrel of used oil filters.

7.3.1.3 Prevention of Fugitive Trash

In addition to spills from sewer overflows or hazardous waste dumping activities, the City is also addressing the prevention of trash getting into our receiving waters.

As discussed in detail in Section 4 of the 2008-2009 Annual Report, 571 miles of public streets in the City of Oceanside are swept at least monthly. During this reporting year, 28,954 curb

miles were swept. Last year's estimate of 1,142 curb miles (length of total street miles in the City doubled) was an underestimation compared to the actual tracked amount during the 2008-2009 reporting period by the City's Public Works Department. Street sweeping activities resulted in the collection of over 2,062 tons of waste from public streets and parking lots during this reporting year. In addition, a total of 3,354 structures (catch basins, manholes, inlets, outlets, etc.) were inspected and cleaned during the reporting period. A total of 65.89 tons of waste was removed. The waste generally consisted of trash, green waste, dirt, sand, roots, solids, rocks, and silt.

Trash Trap at the Oceanside Municipal Golf Course

In addition to standard maintenance, staff at the City of Oceanside Municipal Golf Course had noted that trash and debris was collecting in Pilgrim Creek, which runs in the middle of the course, after storm events. The source of the trash and debris was identified as a residential area just south of the golf course across Douglas Drive. City staff installed a trash trap downstream of this priority residential area and upstream of Pilgrim Creek in the open channel that parallels the driving range at the municipal golf course. The goal of this trap was to capture trash and organic debris coming from the residential neighborhood before it enters the golf course and Pilgrim Creek. This trash trap was installed in March 2009 (Figure 7-2).

After installation there was one rain event that captured 40 pounds of trash and organic debris. During future reporting years, the volume or weight of trash will be tracked. See the photos below of the newly installed trash trap and a photo of the effectiveness of the trash trap in stopping debris from reaching the waterway.

Trash trap immediately after installation

Trash trap with debris

Figure 7-2. Trash BMP installed at the Oceanside Municipal Golf Course.

Cigarette Butt Boxes in the Harbor and at the Beach

Cigarettes and their associated trash, including wrappers and cartons, are the most littered item in America. During FY 2007-08 the Department of Harbors and Beaches purchased and began installation of cigarette butt collection boxes to mitigate this litter in Oceanside Harbor and along Oceanside's beaches. Cigarette Pollution Solutions, a private company with its own special cigarette filter receptacle, called the Butts Only Box, was determined to be an ideal design for placement in the harbor and near the beach areas. The Box is designed to accept cigarette and cigar butts and keep them from being exposed to rain and irrigation water until they are collected for proper disposal. It features a stainless steel construction that resists the salt weather environment at the coast and has a removable inner basket for easy servicing.

During that first year, the Department of Harbors and Beaches purchased 23 Butts Only Boxes at a cost of $375 each and installed 20 of them throughout the Harbor and along Oceanside beach parks. Thirteen of these boxes were installed in the harbor area near restaurants, docks, and bathrooms. Seven Boxes were installed along the heavily walked road that parallels the beach called The Strand and at the top of the municipal pier (Figure 7-3).

Figure 7-3. Butts Only Boxes in Oceanside Harbor and along the Strand.

Cigarette Pollution Solutions also provides a disposal and tracking service with a monthly statement of the amount of cigarette filters collected from all of the Boxes. The boxes were phased in throughout the spring and summer of 2008 and continued to be maintained throughout FY 2008-09. In September 2008, Cigarette Pollution Solutions also installed a Butts Only Box on one of the sport fishing boats that runs out of Oceanside Harbor. Table 7-2 provides a summary of the amount of cigarette butts collected during this reporting year from the Harbor and Strand and Table 7-3 provides a summary of the butts collected on the sport fishing boat.

Table 7-2. Cigarette Butts Collected from Harbor and Strand in FY 2008-09.

Date	Time period covered	Number of butts collected
8/26/2008	7/23-8/22/08	3,418
9/23/2008	8/23-9/22/08	3,456
10/23/2008	9/23-10/22/08	2,397
11/23/2008	10/23-11/22/08	2,259
12/23/2008	11/23-12/22/08	3,606

5/23/2009	4/23-5/22/09	0
6/23/2009	5/23-6/22/09	356
	Total butts collected	**1,697**
	Weight	**1.27 pounds**

7.3.2 Spill Reporting

7.3.2.1 Public Reporting of Spills

Spills entering the MS4 may be discovered during routine maintenance activities, scheduled monitoring, or observed and reported to the City by citizens. Citizens may use the Urban Runoff Hotline, Code Enforcement, or Oceanside Police Department phone numbers to report spills. Any reports by the public or City staff are referred to the Wastewater Division of the Water Utilities Department.

7.3.2.2 City Spill Reporting

The City complies with the sewage spill reporting requirements outlined in Table 7-4 and detailed in Section 9 of the JURMP Update:

Table 7-4. Summary of Sewage Spill Reporting Requirements

Spill Volume	Criteria	Agency Receiving Report	Reporting Period
Any	Spills to waters of the State	SWRCB online RWQCB DEH	3 days (initial) 24 hours Immediate
Any	Municipal Permit non-compliance threatening human or environmental health	RWQCB SWRCB online	24 hours verbal and 5 days written 3 days (initial)
Any	Mitigated spills (absorbed, cleaned up, or captured)	DEH	24 hours
Any	Unmitigated spills to areas with potential public contact	DEH	Immediate
Any	Unmitigated spills to areas without potential public contact	DEH	24 hours

Spill Volume	Criteria	Agency Receiving Report	Reporting Period
>1000 gallons	Anywhere	OES RWQCB DEH SWRCB online	Immediate 24 hours Immediate 3 days (initial)

County of San Diego Department of Environmental Health (DEH)
State Office of Emergency Services (OES)
Regional Water Quality Control Board (RWQCB)
State Water Resources Control Board (SWRCB)

7.3.3 Spill Response

Responses to sewer spills are conducted in accordance to the City's Sewer Overflow Response Plan and the responsible agencies are summarized in Table 7-5.

Table 7-5. Responsible Agency for Sewage Spills

Source	Responsible Agency
Leaks and spills from publicly owned collection system	City of Oceanside
Private residence (failing septic systems)	County DEH
Any spill reaching MS4	City of Oceanside

During the 2008-2009 reporting period, the City responded to eight sewer spills, one of which was privately owned. Only one spill reached the receiving water and only 7% of the total overflow volume for the year was released to the environment (down from 20% the previous year). Quick response times and the use of City vactor trucks assisted in the decrease in spill volume for the reporting year. In addition, the Clean Water Program and the Wastewater Division of the Water Utilities Department continued the public outreach effort initiated in the last reporting year for residential contribution of grease in the sanitary sewer. As a result, there were fewer spills this year with grease as the primary cause. The remaining causes of spills were primarily because of debris or roots and half of them were due to unique situations like a plane crash or asphalt from a contractor. Notifications of these spills are submitted to the Regional Water Quality Control Board (RWQCB) through quarterly reports. A summary of SSO overflows during 2008-2009 is presented in Table 7-6.

Responses to other spills are conducted by the Fire Department or qualified personnel in the Public Works Department, as appropriate to the situation. Both small and large spills are handled following HAZMAT Incident Response Team (HIRT) Policies and Procedures as issued by the Unified San Diego County Emergency Services Organization. The Oceanside Fire Department responded to all of the non-sewer related spills during the 2008-2009 permit year. A summary of the 26 spills is presented in Table 7-7. The majority of the spills were small fuel spills from leaking vehicles.

Table 7-6. Summary of SSO Overflows during the 2008-2009 Fiscal Year.

Overflow Start Date Time	Overflow End Date Time	Total Overflow Volume (gal)	Overflow Volume Released to Environment (gal)	Overflow Cause	Did the SSO Enter a Storm Drain?	Did the SSO Reach Other Surface Waters?	Initial Secondary Receiving Waters	Prevention Corrective Measures
8/6/08 13:30	8/6/08 13:55	135	0	Asphalt from contractor street overlay job	Yes	No	N/A	Made entry into manholes to remove all asphalt from channel and decks
10/16/08 12:30	10/16/08 12:55	375	325	Unknown	Yes	No	N/A	Will inspect in future to make sure College is on a maintenance program to avoid future spills
10/26/08 6:00	10/26/08 6:20	200	200	Debris	Yes	No	N/A	Line will be placed on semi-annual maintenance program
1/24/09 10:45	1/24/09 11:35	25,000	0	Plane Crash	No	No	N/A	None (single accident/valve repaired)
2/1/09 8:00	2/1/09 9:16	532	132	Roots, Debris, Grease, Manhole Failure	Yes	No	N/A	City crews are going to clean out, repair and raise manhole
2/25/09 6:34	2/25/09 8:14	1000	600	Grease & Blockage	Yes	Yes	Oceanside Harbor	Line was jetted and televised. Industrial Waste Inspector on site to deal with restaurant FOG issues.
4/6/09 7:42	4/6/09 8:10	280	280	Large amount of rags and debris	Yes	No	N/A	Add section of sewer to vactor annual cleaning
6/15/09 9:28	6/15/09 10:10	440	440	Roots	Yes	No	N/A	Televise line to determine maintenance schedule.

Table 7-7. Summary of Non-SSO Spills during the 2008-2009 Fiscal Year.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
7/7/2008 11:13	7/7/2008 11:47	0007844	Gasoline	Several	Investigate	Hazardous materials leak control & containment	SUV struck object in road per driver. Found leaking fuel from underside of vehicle on arrival, most of which absorbed in to shoulder or roadway. Leak controlled. CalTrans handle rest of collection.
7/17/2008 23:24	7/17/2008 23:38	0008299	Gasoline	Unknown	Investigate	N/A	Evidence of someone trying to, or succeeding in stealing fuel from van owned by the hotel. Fuel had evaporated.
7/20/2008 15:14	7/20/2008 15:30	0008421	Oil	Unknown	Hazardous condition	N/A	Clean up small oil spill from previous MVA
7/27/2008 13:19	7/27/2008 13:38	0008718	Gasoline	5 gallons	Hazardous materials spill control and confinement	N/A	Gasoline spilled on the service station s ground from a leaking rental truck gas tank. The spill was absorbed and allowed to evaporate. Spent absorbent was bagged and discarded
8/22/2008 15:12	8/22/2008 15:19	0009806	Gasoline	Unknown	Hazardous condition	N/A	Gasoline leak from a vehicle reported. Tank was emptied.
9/7/2008 9:49	9/7/2008 9:56	0010473	Gasoline	Unknown	Hazardous materials spill control and confinement	N/A	Car in parking lot found to be leaking fuel, leak contained and stopped, parking enforcement contacted
9/23/2008 3:12	9/23/2008 7:33	0011193	Diesel Fuel	20 Gallons	Refer to proper authority	Hazardous materials spill control and confinement	Tractor trailer accident. Fuel leak temporarily stopped by driver with hand over the leak. Hole sealed, area diked at entrance to storm drain. Contacted DEH and SDCO HRT. DEH contacted OES. Public works contacted to determine storm drain locations and spill removal option.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
9/26/2008 17:03	9/26/2008 17:10	0011367	Gasoline	Unknown	Investigate	N/A	Fuel leak reported at residence. No fuel leaking upon OFD arrival. Owner was contacted and told to fix problem before driving. No fuel on ground and none appeared to have entered gutter.
10/11/2008 23:35	10/11/2008 23:42	0012072	Gasoline	2 Gallons	Investigate	Establish safe area	Man stated fuel was siphoned from his car, causing spill on the side of the roadway. No fuel appeared to reach the storm drain. Absorbent material placed over run of spill.
10/19/2008 9:37	10/19/2008 9:47	0012425	Gasoline	Unknown	Investigate	Hazardous materials spill control and confinement	Found small leak coming from RP car. Put absorbent on the ground to help with containing the small amounts of leaking gas.
11/10/2008 15:43	11/10/2008 17:17	0013439	Motor Oil and Petroleum	gallon and 8 Gallons	Refer to proper authority	Hazardous materials spill control and confinement	Motor vehicle accident in water way; Primary jurisdiction: Vista. Referred to DFG and Coast Guard.
11/18/2008 18:27	11/18/2008 18:39	0013806	Gasoline	1 Quart	Hazardous materials spill control and confinement	N/A	Vehicle owner reported small fuel leak. On arrival, there was no active fuel leak. Absorbent was spread to control spill
12/17/2008 12:21	12/17/2008 18:20	0015070	Petroleum	55 Gallons	Hazardous materials spill control and confinement	N/A	Petroleum found leaking into the Loma Alta creek from unknown underground source by code enforcement. Found to be leaking from unknown source in excavation area into storm drain. No spill to ocean.

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
1/15/2009 7:36	1/15/2009 7:48	0000654	Diesel Fuel	1 Gallon	Investigate	N/A	Diesel fuel reported in the water near C dock in Oceanside harbor.
3/17/2009 20:55	3/17/2009 21:09	0003275	Gasoline	Small amount	Investigate	N/A	A gas tank was being removed from a car in the street and a small amount spilled on the asphalt. Absorbent put down
3/21/2009 20:18	3/21/2009 21:07	0003485	Gasoline	Unknown	Hazardous materials spill control and confinement	Establish safe area	Minor leak to inline fuel filter caused by debris on HWY 78. Fuel leak stopped. Vehicle towed to owners residence
3/25/2009 18:38	3/25/2009 18:43	0003639	Gasoline	Unknown	Hazardous materials spill control and confinement	N/A	Fuel leak found in a fuel/vent line, and was plugged with a golf tee. Vehicle owner contacted a towing service
3/25/2009 20:39	3/25/2009 21:04	0003646	Oil	4 Quarts	Remove Hazard	N/A	Remove approximately 4 quarts of oil from roadway after traffic collision
4/15/2009 13:24	4/15/2009 14:50	0004572	Mercury	1 thermometer	Establish safe area	Decontaminate Persons or equipment	Mercury thermometer broke inside county health office. Notification to HIRT and DEH.
4/18/2009 12:12	4/18/2009 12:15	0004715	Gasoline	Unknown	Investigate	N/A	Vehicle owner reported that her car leaked when she attempted to pour gasoline into the tank. Called for tow. Station attendant cleaned up spill.
4/26/2009 16:37	4/26/2009 17:36	0005108	Gasoline	5 Gallons	Hazardous materials spill control and confinement	N/A	Responded to no detail MVA. Leak in the gas tank, contained spill, vehicle gas tank near empty, spill stopped. OPD and tow on scene

Fire Dept. Arrival Date Time	Last Unit Cleared Date Time	Incident Number	Substance reported spilled	Amount of spilled substance	Primary Action Taken	Secondary Action Taken	Description
6/3/2009 14:54	6/3/2009 17:51	0006665	Muriatic Acid	1 Gallon	Investigate	Establish safe area	Chemical leak reported. Approximately 1 gallon of yellow liquid found seeping from under pump room floor. Substance was identified as muriatic acid for the pool. The leak was stopped. Spill was removed by a private contractor
6/13/2009 21:11	6/13/2009 21:51	0007151	Gasoline	Unknown	Hazardous materials spill control and confinement	N/A	Control gasoline leak from vehicle in garage. Secured leak and removed vehicle from garage outside. Owner of vehicle requested not to return vehicle to garage until fuel leak was fully repaired.
6/14/2009 7:14	6/14/2009 7:21	0007170	Oil	2 quarts	Investigate	Determine is materials were non-hazardous	OPD on scene with a vehicle that was leaking motor oil. 2 qts. on asphalt. Spread Sorball.
6/14/2009 20:45	6/14/2009 21:24	0007198	Motor Oil	Unknown	Hazardous materials spill control and confinement	N/A	Responded to motor oil leak from vehicle. Isolated spill area and applied absorbent, notified OPD and Streets Div for traffic control and clean up
6/29/2009 17:19	6/29/2009 17:30	0007846	Hydraulic fluid	20 gallons	Hazardous condition, other		Heavy equipment leaking hydraulic fluid, contained with absorbent. OPD controlled traffic, public works finished cleanup and removal.

7.4 Urban Runoff Monitoring

The Urban Runoff Monitoring Program includes MS4 Outfall Monitoring, Source Identification Monitoring, and the Dry Weather Field Screening and Analytical Monitoring Program.

7.4.1 MS4 Outfall Monitoring

In accordance with RWQCB Order R9-2007-0001, the Copermittees developed the MS4 Outfall Monitoring Program Work Plan through a collaborative effort in 2007–2008 and submitted the final Work Plan on June 25, 2008 (County of San Diego Copermittees, 2008). The MS4 Outfall Monitoring Work Plan is the framework for random dry and random wet monitoring and the targeted dry and targeted wet monitoring. The collection and analysis of water samples discharging from MS4 outfalls to receiving waters during all four types of sampling will be used to address Core Management Question 3:

> What is the relative urban runoff contribution to the receiving water problem(s)?

Random sampling was conducted to address the following subquestions identified in the MS4 Outfall Work Plan:

1. What are the characteristics of the discharges from MS4 outfalls in regard to high-priority pollutants?

2. Are constituent loadings changing over time?

Targeted sampling was conducted to address the following subquestions:

1. Which of the targeted MS4 outfalls have the greatest pollutant loading?

2. Are the pollutant loadings decreasing over time from these MS4 outfalls?

The City of Oceanside is responsible for targeted dry weather sampling at 13 sites throughout Oceanside. A regional water quality monitoring contractor is hired by the Copermittees for the collection the random dry, random wet and targeted wet weather samples throughout San Diego County.

In FY 2008-09, the City of Oceanside visited the 13 targeted dry weather monitoring sites. All five sites in the Buena Vista or Loma Alta HAs were flowing. Four of the eight sites in the San Luis Rey River Watershed were dry. Table 7-8 presents the targeted dry weather monitoring sites visited during the 2008-09 fiscal year. A contractor for the Copermittees conducted the random dry and random wet weather sampling through San Diego County as the first phase of the program. The targeted wet weather monitoring will be implemented in FY 2009-10.

Table 7-8. FY 2008-09 City of Oceanside Targeted Dry Weather Monitoring Sites.

StationID	Sample Date	WaterFlow	FlowRate (gpm)	Analytes Monitored
Carlsbad Watersheds				
B002	6/8/2009	Flowing	6	Bacteria, TDS, TSS, Total Nitrogen-N, Total Phosphorus-P
L009	6/8/2009	Flowing	103	Bacteria, TDS, Total Nitrogen-N, Total Phosphorus-P
L027	6/8/2009	Flowing	94	
L054	6/8/2009	Flowing	8	
L111	5/20/2009	Flowing	3	
San Luis Rey River Watershed				
S006	5/27/2009	Flowing	□1	Bacteria, Chlorides, TDS, Total Nitrogen-N, Total Phosphorus-P
S075	5/27/2009	Flowing	□1	
S106	5/27/2009	Flowing	53	
S107	5/27/2009	Dry	0	
S116	5/27/2009	Dry	0	
S119	5/20/2009	Dry	0	
S122	5/20/2009	Flowing	1	
S123	5/20/2009	Dry	0	

The results of all three types of monitoring are presented in detail in Section 12 and each WMA Section of the 2008-09 Regional Urban Runoff Monitoring Report. At this time, additional data is still needed to properly characterize the pollutant discharges from MS4 outfalls in each WMA. It is anticipated that more meaningful spatial comparisons can be made as a more robust data set is developed in subsequent years for the MS4 Outfall Monitoring Program.

7.4.2 Source Identification Monitoring

The Source Identification Program is a requirement of San Diego RWQCB Order R9-2007-0001 (Section B.2 of the Receiving Waters and Urban Runoff Monitoring and Reporting Program). The Copermittees provided a framework for source identification studies entitled "Urban Runoff Source Identification Program in San Diego County Watersheds" (County of San Diego Copermittees, 2008). This framework described the conceptual monitoring to be conducted over the course of the Permit. The original framework stated two sites would be monitored: one from the City of Carlsbad and one from the City of La Mesa. The City of Carlsbad study area was changed to the City of Del Mar. The Copermittees subsequently developed a workplan for implementation during the 2008–2009 Permit Year. The workplan, "2008-2009 Source Identification Monitoring, Residential Area Runoff Assessment was designed to assess dry weather runoff from single family residences.

The primary goal of this study was to collect dry weather residential land use discharge data for application to regional assessments since residential land uses comprise the most common land uses in urban areas. A secondary goal of collecting the data was to compare data collected in San Diego County to data collected from an intensive residential land use runoff study under a Proposition 50 Grant in Orange and Sacramento Counties (Haver, 2007[1]).

[1] The results of the Proposition 50 Nonpoint Source Pollution Control Program Grant entitled "Evaluating Best Management Practices (BMPs) Effectiveness to Reduce Volumes of Runoff and Improve the Quality of Runoff

To address the study questions the following information is presented. More detailed information about the 2008-09 Source Identification Monitoring is presented in Section 12 of the 2008-09 Regional Urban Runoff Monitoring Report:

1. **When are the dry weather or nuisance flows detected from single-family residences (during what part of the day/week)?**

In general, peak discharge times varied amongst all sites. It is likely that individual residences water use activities occur at different times and at different schedules. Based on a review of the data, residential flow in La Mesa was highest during the week, specifically on Tuesdays. However, flows at the downstream site in La Mesa were indicative of groundwater influences and may be associated with a lag time from residential water uses over the weekend. In Del Mar, flow was highest on the weekend, specifically on Saturday.

2. **What is the water quality and load of constituents of dry weather or nuisance flows from single-family residences?**

Overall, concentrations from the general chemistry constituents were below the WQOs, with the exceptions of total nitrate and total phosphorus, which were above their respective WQOs for all samples measured. The highest loads for the general chemistry constituents were measured at the La Mesa study area. The highest loads were from TDS and chloride. Based on the levels of the general chemistry constituents, it is possible that Site LM-SID-1 has a groundwater influence, explaining the continuous flow at this location and the high TDS, chloride, and nitrate levels.

Organophosphorus pesticides were not detected in either of the drainage areas monitored. Synthetic pyrethroids were detected in 6 of the 7 samples collected. Of the samples which did have detectable pyrethroid results, Bifenthrin was above the LC_{50} in the Del Mar study area and Permethrin was above the LC_{50} in the La Mesa study area. The Permethrin result was recorded at Site LM-SID-2, during the second sampling event. But, of the pyrethroid load per acre results for the entire monitoring season, Site DM-SID-1 had the higher results. This also suggests that single-family residences present a likely source of synthetic pyrethroids in urban runoff. The results are also consistent with the findings from the *Characterization and Assessment of Storm Drain Sediments from Switzer Creek* (WESTON, 2009). Synthetic pyrethroids were most commonly detected in the sediments in storm drains which drained residential areas, and specifically in the upper reaches of the drainage areas studied.

Dissolved metals (i.e., cadmium, copper, lead, and zinc) were not detected above the California Toxics Rule benchmark values from any of the residential runoff samples collected. The loads per acre were slightly higher in the La Mesa study area, but loads for these constituents were generally very low. These low load results, especially in the Chollas Creek subwatershed, where dissolved metals are constituents of concern, may be reflective of the small commercial and industrial land use in the upper drainage areas included in the study.

---

from Urban Environments" is being conducted by Dr. Darren Haver of the UC Davis. Dr. Haver is coordinating the collection of wet and dry samples from four residential communities in Sacramento and four residential communities in Orange County. Work currently is suspended at the request of the State of California.

Indicator bacteria (i.e., total coliforms, fecal coliforms, *E.coli*, and enterococci) were highest in the smaller drainage areas monitored in La Mesa study area (i.e., LM-SID-2 and LM-SID-3) and also in the Del Mar site. Between the two residential sites, DM-SID-1 had the greater bacterial concentrations. Site DM-SID-1 also was above the benchmark for fecal coliforms whereas the Site LM-SID-1 was not. However, due to the larger flow volume, greater bacterial loads were observed for the LM-SID-1 residential runoff site.

3. What are the potential sources of dry weather flows from single-family residences?

Flows from single-family residences occur from various activities. In general, it was evident that dry weather flows from the upper sites in La Mesa and the Del Mar site likely occurred from residential lawn watering which were observed periodically during the sampling events or from random discharges associated with urban areas. However, flows from the downstream site at La Mesa appear to be from groundwater sources, which may be associated with residential over-irrigation and low permeability soils.

This study was also designed to be comparable to the Proposition 50 Non-Point Source Grant Study being conducted by Dr. Darrin Haver from U.C. Davis. However, due to the current State of California economic conditions, the State has withheld funding for this study. Therefore, at this time, the results of Dr. Haver's study are not available for comparison.

The San Diego County Water Authority and most water districts in the County of San Diego, including the City of Oceanside, have implemented water use restrictions due to the current drought conditions. The outreach and enforcement programs sponsored by these agencies aim to reduce water consumption and water waste through several different means, though better management of irrigation runoff is most applicable to storm water management. As discussed in the next section and in Attachment 7-A, the 2009 Dry Weather Monitoring Report, these restrictions, outreach, and enforcement programs do seem to be making a difference in Oceanside shown by more dry sampling sites in the City.

7.4.3 Dry Weather Field Screening and Analytical Monitoring

The requirements of the current Dry Weather Monitoring Program component in the 2007 Municipal Permit (Order 2007-001) built upon the requirements of the previous Municipal Permit (Order 2001-01). The dry weather analytical and field screening monitoring components consist of 1) field observations (site description and qualitative observations), 2) field screening monitoring (testing of sample while at site and flow estimation), and 3) analytical monitoring on a subset of sites (performing further tests of sample later at a laboratory). The new Municipal Permit also added a trash assessment component and now requires follow-up investigations to be conducted within two business days of receipt of results.

The City's complete 2009 Dry Weather Monitoring Report is provided as Attachment 7-A to this submission. This report includes:

- Reporting of all dry weather field screening and analytical monitoring results.
- Dry weather field screening and analytical monitoring report.
- Corrections for the Dry Weather Monitoring stations.

- The number and brief description of any IC/IDs found and eliminated during Dry Weather Monitoring.
- Description of activities conducted to manage IC/IDs found during Dry Weather Monitoring.

Below is a summary of the findings.

Dry weather monitoring is conducted at each site at least once between May 1st and September 30th each year. During the 2009 monitoring season, 67 primary sites were visited. Three of those sites were inaccessible and an additional fourteen were dry. All 28 alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (28%).

When field measurements and/or laboratory analysis showed an exceedance of established action levels, the site was revisited within two business days to confirm the initial results. When follow-up sampling confirms continued exceedance of action levels, the City conducted further investigations to identify the source of the exceedance.

Twenty four sites required confirmation for an initial field screening exceedance. Of those, 18 required an IC/ID investigation. The most common exceedance was for orthophosphate. Of the 19 sites chosen for laboratory analysis, two sites had an exceedance for chemistry results. A013 exceeded the CTR for dissolved cadmium and B002 for dissolved zinc. There was an upstream investigation at A013 and groundwater is the suspected source as no discharges were found. Confirmation samples at B002 found results for dissolved zinc under the action level. For microbiology results, there were seven exceedances for total coliforms, four for fecal coliforms, and two for Enterococcus. Six of the seven total coliform exceedances required an upstream investigation. Two of the four fecal coliform confirmation samples and both of the Enterococcus confirmation samples required an IC/ID investigation.

An historical comparison of action level exceedances shows that while orthophosphate exceedances are the predominant field analyte exceedance, there were fewer in 2009 than the previous two years. Ammonia exceedances have decreased. This may be due, in part, to a change in the analytical field test kit method. In practice and in discussion with other Copermittees, the 2009 method seems more accurate for environmental samples (as opposed to drinking water samples). Bacteria exceedances were similar to the previous year and continue to have fewer sites exceeding action levels.

Similar to the 2008 dry weather results, in 2009 a little less than half of the sites that were sampled were ponded. Many of these did not have a flowing source upstream. Exceedances at these sites may be attributed to periodic upstream flow and/or the decay of organic material in the ponded water to cause Dry Weather exceedances. More sites were dry this year as compared to the 2008 season; 19 as opposed to ten the previous year. This may be due to drought conditions and the Drought Level 2 Water Restrictions that became effective July 1, 2009.

The most common source of flowing water was residential and commercial landscape over-irrigation. In addition to the restrictions, the City of Oceanside Water Utilities Department

increased public outreach and awareness of water conservation needs and measures between the summer of 2008 and the summer of 2009. This outreach included hiring a part-time Water Conservation Specialist to assist in presentations to HOAs and community groups, and on the local public access channel and written outreach for inserts in water bills and press releases. The education effort is described in detail in Section 8 of the Oceanside JURMP Annual Report, but it did include a newsletter topic in the Fall of 2008 addressing water conservation tips to eliminate water runoff and three minute public service announcements including a topic addressing irrigation runoff. Staff outreach to respond to complaints, violations, and Dry Weather Monitoring exceedances included face-to-face outreach by two Clean Water Program Compliance Inspectors. Historical mail-outs have yielded little response. New door-hangers that can be personalized were created and utilized by the Inspectors when residents were not home.

The 2009 Dry Weather Monitoring Program is the second year for assessing the amount and extent of trash at each dry weather monitoring location. Approximately 73% of the sites were either "optimal", "suboptimal", or "marginal" and did not require the detailed trash evaluation. Twenty four percent of the sites were "submarginal" and 3% of the sites were "poor". The San Luis Rey Watershed continued to have the highest percentage of "submarginal" and "poor" sites (32%), but that percentage was down from last year (46%). The majority of the trash found in the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common source of the food packaging and household wastes are households and transients. These are consistent results with the previous trash assessment year.

Follow-up investigations continue to be conducted at sites with ongoing exceedances. Water conservation and urban runoff education outreach, as well as beach and creek clean-up events are on-going year-round as the City continues the effort to detect and eliminate illicit discharges to the storm drain system. The Dry Weather Monitoring program during 2009, detected seven potential IC/IDs, of which four were eliminated. It should be noted that several of the IC/IDs were from residential and commercial over-irrigation which was not a violation until July1, 2009 when the Stage 2 Drought Ordinance became effective. Details for each follow-up is provided in Appendix 7-A.

To address MS4 inaccuracies and update the GIS layer of the MS4 map, the City purchased two Trimble GeoXH units in FY 2008-09 to be used collaboratively between Public Works, Engineering, and the Water Utilities Departments. One of the many uses of these units is to verify the accuracy of the MS4 map and relay the information gathered in the field to the Engineering Department to update the GIS layer. The City continued the effort to create the data dictionary needed to collect consistent and necessary data for the storm drain system update. Although he City did not make any changes to the MS4 map during the 2008-09 fiscal year, the Trimble units were field tested and used for upstream investigations and mapping small segments of the MS4, but a full roll out the field effort is anticipated during FY 2009-10.

7.5 Follow-up and Enforcement

The City implements and enforces its ordinances, orders, or other legal authority to prevent illicit discharges and connections to its MS4. Enforcement mechanisms are implemented on an

escalating scale to enforce compliance, and follow-up inspections are conducted to ensure compliance has been achieved.

The administrative and judicial tools listed below are used as necessary to eliminate IC/IDs:

- Written administrative warnings and citations
- Stop work notices
- Public nuisance abatement
- Denial or revocation of permits
- Civil and/or Criminal Court Actions
- Additional penalties or fines

The nature of the City's enforcement approach is determined on a case-by-case basis and is based on factors such as the severity of the violation, the threat to human or environmental health, site-specific circumstances, and past compliance history.

Code Enforcement recorded 308 cases potentially related to the requirements of the Municipal Permit. A total of 112 of these cases were related to potential IC/IDs, almost three times the number of cases in the previous reporting year. Of these, 75 cases did detect an IC/ID and 74 of those were eliminated. The one case that is still open without resolution includes ongoing discussions with Camp Pendleton and is presented in Appendix 7-B in greater detail. Table 7-9 presents a summary of the IC/ID investigations by Code Enforcement officers initiated during the 2008-2009 reporting year. The summary includes a brief description and the number of follow-ups and enforcement actions taken to achieve compliance. More detailed information on IC/ID investigations by the Clean Water Program that were not a part of the Dry Weather Program are presented in Attachment 7-B.

THIS PAGE LEFT INTENTIONALLY BLANK

Table 7-6. Summary of 08/09 IC/ID Investigations by Code Enforcement Officers

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Warning	Administrative Citations	Criminal Citation	Case Closed?
08-4900	Residential	12/12/2008	ABANDONED CAR LEAKING OIL IN FRONT OF THIS HOUSE	Site visit. No vehicle observed on street. Note: street sweeping occurs at this location on this day. No further action.	1/13/2009	1/13/2009	1	0	0	0	0	0	0	0	0	Yes
08-4105	Residential	10/2/2008	ALLEGED STORM WATER VIOLATION	Investigated a complaint that a man was degreasing his engine in the street. No violation could be determined at the scene, and accused man denied the charge.	10/2/2008	10/3/2008	1	0	0	0	0	0	0	0	0	Yes
09-0331	Commercial Construction Site	2/5/2009	BMP FAILURE	Site visit. Cursory inspection of outfall coming from the base onto Capistrano Park. Severe failure of BMP structure and sediment discharge resulting from failure noted.Documented BMP failure with photos. Met with Camp Pendleton rep. Work delayed due to funding. Will monitor.	2/4/2009	5/13/2009	5	0	0	0	0	0	0	0	0	Yes
09-1632	Residential	5/8/2009	BROKEN SPRINKLERS - WATER RUNNING DOWN STREET	Attempted contact with reporting party. Drafted and sent notice to property owner to repair/adjust irrigation or broken pipe. Phone call from property owner stating that issue will be looked into by her gardener. Site visit in AM on 5/19. Area dry. No further issues.	5/11/2009	5/19/2009	1	0	0	1	0	0	0	0	0	Yes
08-3683	Commercial	8/25/2008	CAR WASHING OPERATION ON PUBLIC STREET	Phone call to reporting party requesting if he observes this activity to call my cell.Site visit, Observed a male in Black Ford Explorer washing a pick up truck in street. This male was very stand offish almost confrontational states he has only washed vehicles here a couple of times and knows who is complaining. Informed this person doesn t matter who complained, he still needs a business license, can t conduct business on city streets and needs to comply with storm water regs. Person states will cease doing work in street and will not be doing business in this city any longer. Informed if we observe this activity again he will be cited for all three violations. Phone call to reporting party. Happy with response.	8/25/2008	8/27/2008	1	0	0	0	0	0	0	0	0	Yes
08-4341	Residential	10/22/2008	CARPET VAN DUMPING INTO STORM DRAIN	Phone call to reporting party. Area visit. Unable to locate violation. Will monitor. Area visits 11/5 and 12/2. Still unable to locate violation. Case closed until violation occurs again.	10/22/2008	12/2/2008	3	0	0	0	0	0	0	0	0	Yes
09-2229	Residential	6/29/2009	CHANGING OIL IN THE STREET	Site visit. No evidence of violation. Attempted contact with reporting party. No further issues.	6/30/2009	6/30/2009	1	0	0	0	0	0	0	0	0	Yes
08-4712	Residential	12/4/2009	CHANGING THE OIL OF A BLCK VW IN GUEST PARKING LOT	Site visit; no vehicle observed in general location. Observed multiple locations where oil has dripped onto parking spaces. Phone call to property manager; left voicemail. 12/15 Noted return call back from property manager regarding complaint issues. No further action.	12/5/2008	12/10/2008	1	0	0	0	0	0	0	0	0	Yes
08-3104	Residential	7/14/2008	CHEVY WITH TRAILER ATTACHED IS LEAKING OIL	Phone call to reporting party. Site visit. Spoke with property owner. Property owner stated that power steering hose developed a leak. Property owner is now storing vehicle on driveway with proper protection until repairs can be made. No further issues.	7/15/2008	7/15/2008	1	0	0	0	0	0	0	0	0	Yes
08-4808	Residential	12/10/2008	CROSS-LOT DRAINAGE	Site Visit, met with property owner and reporting party on-site. Explained to both parties that since the drainage pattern on both of their properties has been altered this problem is a civil matter.	12/10/2008	1/6/2009	1	0	0	0	0	0	0	0	0	Yes
08-4018	Residential	9/24/2008	DIRT ON THE STREE AND GOING INTO STORM DRAIN	Phone call to reporting party. No answer. 9/30 Reattempted phone call to reporting party. No answer. Site visit on 10/8. Observed a small amount of dirt in driveway. No issues.	9/25/2008	10/8/2008	1	0	0	0	0	0	0	0	0	Yes
08-4705	Residential	12/4/2008	DISCHARGING GRAY WATER INTO STREET	Site Visit, Photos Taken. Admin warning 14003 mailed to property owner on 12/5 with photos. Site Visit. No discharge of grey water observed at this time. Will monitor. Amin warning returned to sender.1/13 Admin warning 14003 resent to occupant.	12/2/2008	1/13/2008	2	0	0	0	0	0	1	0	0	Yes
08-4349	Residential	10/23/2008	DRAINAGE BACKING UP BEHIND HIS PROPERTY	Site Visit. Area referred to County.	10/23/2008	10/23/2008	1	0	0	0	0	0	0	0	0	Yes
08-4651	Commercial	8/18/2008	DRAINAGE CHANNEL MAINTENANCE	Public works complaint received regarding stagnating waterand vector control problem in wetland area / creek along Oside blvd. County vector contacted; treated area. Three administrative warnings issued for channel maintenance.	8/4/2008	10/21/2009	1	0	2	0	0	0	3	0	0	No
09-1168	Residential	4/9/2009	DRAINAGE COURSE MAINTENANCE	Site visit, located area of concern. Notice sent w / photo. Property owner says management supposed to maintain. Contact property management asked to be notified when problem is fixed (within two weeks). Site visit. Drainage channel cleared.	4/6/2009	6/11/2009	2	0	1	0	0	0	0	0	0	Yes
08-3809	Residential	9/9/2008	DRAINAGE COURSE MAINTENANCE	Site visit. Clarified drain area of responsibility for property management.	9/9/2008	10/3/2008	1	0	0	0	0	0	0	0	0	Yes
08-3284	Residential	7/30/2008	DRAINAGE DITCH HAS WEEDS AND WATER THAT STINKS	Letter sent 8/21. Site Visit, Photos Taken, drainage course remains blocked. Administrative warning 11850 mailed to property owner.Site Visit 10/24, ditch cleared.	8/21/2008	10/24/2008	2	0	0	0	1	0	1	0	0	Yes
08-3147	Residential	7/15/2008	DRAINING WASHING MACHINE INTO STREET	Site visit. No wash water or any unlawful discharge observed.	7/15/2008	8/13/2008	1	0	0	0	0	0	0	0	0	Yes
09-0555	Residential	2/24/2009	DUMPING OIL INTO STORM DRAIN	Phone call to reporting party. Site visit. Observed stain in gutter from property. Absorbent had been placed to soak up fluid. Drafted and sent notice to property owner for cleanup and prevention of future spills. Phone from reporting party. Area cleaned . No further issues at this time.	2/26/2009	3/4/2009	1	0	0	1	0	0	0	0	0	Yes
08-3556	Residential	8/12/2008	EMPTYING KOI POND INTO LOMA ALTA CREEK	Letter sent.	8/21/2008	8/21/2008	0	0	0	0	1	0	0	0	0	Yes
09-0534	Residential	2/23/2009	EROSION ON ACCESS ROAD/ EASEMENT	Site visit, Photos Taken. Phone call to property management and emailed photos of area of concern. Site visit. Met w/Sewer collections and Landscape/Maintenance supervisors for both properties. Walked areas of concern. Supervisors stated they would be in contact with HOA s and will start work when given the OK by property management. Site visit, Photo taken, property being maintained by GRG management have not cleared drainage courses. Phone call to property management states they will have landscaper clear drainage courses immediately.Phone call from landscaper states drainage course cleared.	3/2/2009	8/25/2009	3	0	2	0	0	0	0	0	0	Yes
08-3961	Commercial	9/17/2008	EXCESSIVE WATER INTO STORMDRAIN - FUNDRAISER CAR WASHES	Site visit. Spoke to manager, explained storm water regulations.	11/5/2008	11/5/2008	1	0	0	0	0	0	0	0	0	Yes
09-0100	Commercial Construction Site	1/14/2009	FAILURE TO COMPLY W/ SWPPP	Site visit, met w /developer and SWIM Erosion Control Contractor. Explained the entire site needs to be brought into compliance with SWPPP along with all documentation. Also explained the City will not be in the position to point out or instruct what the erosion control contractor needs to do or how he chooses to do it. Administrative warning 14012 emailed to developer.Site visit 1/21, Photos Taken, no change in condition. Administraven citation 14013 sent. Phone call to Montage Holdings confirms receipt of citation; states contract with SWIM erosion control has been signed for 4 phases of work pertaining to SWPPP. Site visit with Erosion control contractor (2/2). Site not completely in compliance at this time. Site Visit 4/23, no change in condition. Site is inactive site due to downturn in economy.	1/8/2009	5/27/2009	4	`0	1	0	0	0	1	1	0	Yes

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Warning	Administrative Citations	Criminal Citation	Case Closed?
08-4565	Commercial Construction Site	11/7/2008	FAILURE TO COMPLY W/ SWPPP	Site visit. Met with foreman, city inspectors, and construction management. Site visit. Administrative warning 14002 issued. Site visit 11/8. Area looks OK. 11/17 - Stop work issued for failure to keep street clean and need to provide a plan for maintaining and cleaning street for rest of project. Stop work lifted 11/18. Three more site visits to monitor street cleaning measures.	11/7/2008	1/27/2009	6	0	1	0	0	1	1	0	0	Yes
08-4721	Commercial Construction Site	12/5/2008	FAILURE TO INSTALL AND MAINTAIN BMP'S	Received complaint from Engineering. Site visit with property owner. Explained Best Management Practices requirements and erosion control. Issued Administrative citation 14007 to property owner. Site visit 12/15 during rain. Property is under manageable control concerning BMPs. Will monitor.Site visit 1/15. Property in compliance at this time. Closed. Case reopened by request of engineering department.PO has been using generator for power, tapped into construction meter for water into the house, has not complied with SWPPP or notice of intent. Spoke to property owner. Informed would be posting property with a Notice and Order for Public Nuisance.	12/5/2008	10/21/2009	4	0	0	0	0	0	0	1	0	No
09-2262	Commercial	6/30/2009	HOSING OFF AROUND FUEL PUMPS	Site visit. Spoke to manager about proper BMP's for this type of work. Informed manager that as of 7/1 stage 2 drought ordinance goes into effect. Manager states he will comply.	6/30/2009	6/30/2009	1	0	0	0	0	0	0	0	0	Yes
08-4036	Residential	9/25/2008	ILLEGAL CROSS LOT DRAINAGE - PIPE INSTALLED	Reporting party reports that neighboring home has installed a drainage pipe to the rear of the property impacting surrounding properties.Drafted and sent notice to property owner for removal of pipe. Property owner states that drainage from rear of property has historically drained to the brow ditch also located to the rear of the property. Made site visit. The rear yard drainage pipe installed properly dumps any runoff into the concrete brow ditch. Installation of this pipe will help alleviate impact to the storm drain.Reporting party states that pipe is going to cause erosion on his property. Made site visit. Explained to reporting party that installed pipe will help reduce sediment discharge and erosion.	9/25/2008	1/5/2009	2	0	0	0	0	0	0	0	0	Yes
08-4099	Residential	10/2/2008	ILLEGAL DISCHARDE	Site visit 10/2. Issued Administrative citation 12364 to contractor for illegal discharge (tile saw).Site visit 10/3. Area clean.	10/2/2008	10/3/2008	2	0	0	0	0	0	0	1	0	Yes
08-4338	Residential	10/21/2008	ILLEGAL DISCHARGE	Site visit. Notice of Violation issued and assigned case numbers VA08-0346 & 0347. 11/6 One of the vehicles in compliance and 2nd in process. Phone call from owner stated that intent is to show operability. Site visit, vehicles are in compliance at this time with one gone on arrival from location.	10/22/2008	11/6/2008	3	0	0	0	0	0	0	0	0	Yes
08-4640	Residential	11/19/2008	ILLEGAL DISCHARGE	Drafted and sent notice to property owner, drafted and sent notice to occupant. Phone call received from occupant- explained violation. 12/2 - No further issues.	11/20/2008	11/21/2008	1	0	0	0	2	0	0	0	0	Yes
09-1505	Residential	5/4/2008	ILLEGAL DISCHARGE	Reporting party states that property owner s tenants are allowing vehicle fluids to drain into the storm drain. Drafted and sent notice to property owner.Phone call from tenant stated that smell was from special fuel used in off-road vehicles and that it was not being discharged into the gutter line.Explained storm water requirements. Tenant agreed to take proper steps to avoid any impact to the storm water system.	5/5/2009	5/13/2009	0	0	0	0	1	0	0	0	0	Yes
09-1659	Commercial	5/12/2008	ILLEGAL DISCHARGE	Site visit, spoke to business owner. Unable to validate complaint. Business owner aware of stormwater regulations and not to clean mats in gutter line.	5/12/2009	5/14/2009	1	0	0	0	0	0	0	0	0	Yes
08-4860	Residential	12/18/2008	ILLEGAL DISCHARGE	Administrative warning 12524 issued to job superintendent. Multiple site visits showed site to be in compliance.	12/17/2008	2/26/2009	8	0	0	0	0	0	1	0	0	Yes
09-1662	Residential	5/12/2008	ILLEGAL DISCHARGE	Site Visit, spoke to RP pointed out clean out cap removed.Phone call to property owner. Left message concerning necessary repairs. Site visit- repairs made.	5/12/2009	5/18/2009	2	0	1	0	0	0	0	0	0	Yes
08-3305	Commercial Construction Site	7/31/2008	ILLEGAL DISCHARGE	Phone call from Harbor Maintenance. Site visit. Observed contractor Pumping ground water into storm drain. Project in need of best management practices maintenance. Spoke with project manager.Drafted and delivered Warning 12356 to Project manager with understanding that project will properly monitor and maintain all best management practices. Monitored. Project in compliance. Project completed.	7/31/2008	11/5/2008	5	0	0	0	0	0	1	0	0	Yes
09-1853	Commercial	5/29/2009	ILLEGAL DISCHARGE	Phone call to reporting party.Phone call to corporate office left detailed message for operations manager.Phone call to operations manager. States she met with store manager and employees educating them on proper methods of cleaning surrounding property, grease and dumpster enclosure.	5/29/2009	6/17/2009	2	0	0	0	0	0	0	0	0	Yes
09-1899	Residential	6/3/2009	ILLEGAL DISCHARGE	Received a call about reddish water in the gutter. Site visit found a painting contractor power washing the hallways in the complex. I had workers stop work and capture all the water in the gutters. Phone call to contractor advised him of the situation. Stated he would immediately resolve all the issues. Two hours later all the water had been removed from the gutters. Met with the contractor who had already begun installing the best management practices. Site visit, all best management practices in place. No water was entering the storm drains.	6/3/2009	6/4/2009	3	0	0	0	0	0	0	0	0	Yes
08-2952	Residential	7/8/2008	ILLEGAL DISCHARGE	Spoke with homeowner. Explained storm water requirements. Owner stated that they will comply. Drafted and sent letter reiterating conversation. Monitored. No further issues.	7/8/2008	8/25/2008	2	0	0	0	1	0	0	0	0	Yes
08-4886	Commercial	12/23/2008	ILLEGAL DISCHARGE	Site visit. Sediment discharge off property. Issued Administrative citation 12368 to Manager for cleanup and prevention. Monitored. Business in compliance.	12/23/2008	2/25/2009	2	0	0	0	0	0	0	1	0	Yes
08-4679	Commercial	12/1/2008	ILLEGAL DISCHARGE	Property has discharged sediment from recent rain. Site visit. Nursery in process of cleanup. 12/3 Site visit. Nursery in compliance.	12/1/2008	12/3/2008	2	0	0	0	0	0	0	0	0	Yes
08-3041	Commercial	7/9/2008	ILLEGAL DISCHARGE (TRASH AND DEBRIS)	Site visit. Observed loading dock full of grey water. Spoke with manager. Made site inspection. Discussed areas of concern, proper maintenance and cleanup with manager. Issued Admin Warning 9193 to Mgr. Sump pump had ceased working due to improper maint. Site visit. Business in compliance at this time.	7/9/2008	8/11/2008	2	0	0	0	0	0	1	0	0	Yes
09-0556	Residential	2/24/2009	ILLEGAL DISCHARGE / ZONING - CUP FOR NEW LOCATION	Site visit. Spoke with manager about possible illegal discharge. He pointed to the neighboring business. They have a drain that undergrounds the entrance of Ben s Recycling. Spoke with neighboring business (Harvest Foods). A condensation line was hit by a vehicle causing the discharge. The smell was due to a slow drain causing backup in the line. This was being repaired today to avoid any future problems. A CUP is on file and they have installed a filtering system on property.No further issues.	2/25/2009	2/25/2009	1	0	0	0	0	0	0	0	0	Yes
09-0155	Residential	1/21/2009	ILLEGAL DISCHARGE INTO STORM DRAIN	Property has been given prior notice to maintain property so it does not affect the storm water conveyance system. Site visit. Discussed issues with manager. Issued Administrative Citation 12370. Business in compliance at this time.	1/21/2009	2/12/2009	2	0	0	0	0	0	0	1	0	Yes

Table 7-6. Summary of 08/09 IC/ID Investigations by Code Enforcement Officers

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Warning	Administrative Citations	Criminal Citation	Case Closed?
08-4634	Residential	11/5/2008	ILLEGAL DISCHARGE INTO STORM DRAIN/ MAJOR AUTO REPAIR	Site visit. Issued Admin cite 14223 to PO via mail. 6/30 Site visit. No further issues at this time. PC to RP for follow up.	6/25/2009	7/1/2009	2	0	0	0	0	0	0	1	0	Yes
08-3724	Residential	9/2/2008	VEHICLE LEAKS OIL IN THE STREET	Site visit. Spoke with RO of leaking vehicle. RO stated that he would park vehicle on own property until repairs can be made(valve cover gasket). Will monitor. Site visit. Vehicle GOA	9/2/2008	11/21/2008	2	0	0	0	0	0	0	0	0	Yes
08-3482	Residential	8/6/2008	VEHICLE REPAIR ON PUBLIC STREET	Site visit. Observed automotive work being done on street in front of residence. Issued Admin. Warning to mechanic. Site visit. No further issues.	8/6/2008	8/7/2008	2	0	0	0	0	0	1	0	0	Yes
08-3557	Residential	8/12/2008	VEHICLES LEAKING OIL ON STREET	Letter sent to PO. SV, unable to verify driveway condition due to vehicle on location. Continue to monitor. SV, area has no visible copious oil staining. No further action at this time.	8/12/2008	9/2/2008	2	0	0	0	1	0	0	0	0	Yes
08-3558	Residential	8/12/2008	VEHICLES LEAKING OIL ON STREET	Letter sent to PO. SV, oil staining on driveway resolved w/ absorbent placed on driveway.	8/12/2008	8/14/2008	1	0	0	0	1	0	0	0	0	Yes
09-0966	Residential	3/23/2009	WASHES TOW TRUCK AND VEHICLE MAINTENANCE EQUIPMENT	Site visit. Attempted contact with PO. Drafted notice to cease discharge. 3/25 Sent Notice to PO. Site visit. No further issues. Contacted RP with results.	3/24/2009	4/13/2009	2	0	0	1	0	0	0	0	0	Yes
08-4396	Residential	10/29/2008	WASHING BOAT AND FISH BLOOD GOING INTO DRAIN	Site Visit, spoke with boat owner explained storm water regs. Boat owner states neighbors have already spoke to him. He states he does his washing of his boat at the harbor wash out and he is only lobster fishing so he does not clean fish out in the street. PC to RP.	11/5/2008	11/5/2008	1	0	0	0	0	0	0	0	0	Yes
08-4653	Residential	11/18/2008	WASHING DOG FECES INTO STORM DRAIN	Per CEO management will be holding off on enforcement action due to neighborhood dispute. 12/5 No further complaints. Closing case	11/21/2008	12/5/2008	0	1	0	0	0	0	0	0	0	Yes
09-1126	Residential	4/6/2009	WASHING DOG FECES INTO STREET	Allege letter sent. PC from PO states he doesn t wash feces into street and this complaint is prompted by other issues. Informed PO was aware of some other issues and that is why only allege letter was sent. PO states he understands appreciate the way this was handled. PC to RP left message I am closing case and to call back if issue is not resolved.	4/9/2009	4/23/2009	0	0	2	0	1	0	0	0	0	Yes
08-3542	Commercial	8/13/2008	WASHING MOTOR OIL DOWN THE STREET	PC to RP. Site visit. Issued Admin Warning Cite 9196 to BO to maintain property. Site visit. Business in compliance.	8/13/2008	10/7/2008	2	0	1	0	0	0	1	0	0	Yes
08-3562	Residential	8/14/2008	WASHING PAINT DOWN THE GUTTER - MEN WORKING AT THIS SITE	PC to RP. Site visit. Spoke with contractor. Contractor stated that the cleaning crew was responsible for the discharge. PC to PO. PO stated that cleanup will begin immediately. 8/25 Site visit. No further issues.	8/14/2008	8/25/2008	1	0	1	0	0	0	0	0	0	Yes
09-1039	Residential	2/24/2009	WASHING RED TILE DUST INTO STREET	PC to RP. Site visit. Observed stain in gutter from property. Absorbent had been placed to soak up fluid. Drafted and sent notice to PO for cleanup and prevention of future spills. PC from RP. Area cleaned .	3/31/2009	4/13/2009	1	0	1	0	0	0	0	0	0	Yes
08-3128	Residential	7/9/2008	WATER GOING DOWN FOUSSAT RD TOWARDS OCEANSIDE BLVD	Site visit w/M.Sabelis. Determined that runoff caused by upper neighborhood irrigation and groundwater infiltration. No Stormwater issues at his time. PC to RP with results.	7/15/2008	7/15/2008	1	0	1	0	0	0	0	0	0	Yes
08-4606	Residential	11/17/2008	WATER IS RUNNING INTO NEIGHBORS PROPERTY	Two site visits revealed no obvious water drainage onto adjacent property. Prior case history reveals RP was advised of potential civil issue regarding water leakage onto adjacent property. PC to RP: VM left requesting details of complaint. Second site visit: Photos taken of water draining off property onto sidewalk, potential trip hazard. Administrative Warning 13788 issued and sent to PO with photos. 1/5 water leak appears to have been fixed, eliminating trip hazard on sidewalk.	11/17/2008	1/5/2009	4	0	0	0	0	0	1	0	0	Yes
08-3772	Residential	9/4/2008	WATER LEAK	PC to RP. Site visit. Observed a small amount of flow coming from French drain. Drafted and sent notice to PO. 9/16 Site visit. Extension to repair. 1/5 Site visit. No discharge from pipe drain. No other issues at this time.	9/10/2008	1/5/2009	3	0	3	0	0	0	0	0	0	Yes
09-0104	Commercial	1/8/2009	WATER LINE REPAIR ON NCTD R.O.W	Site Visit, by request of M.Lahsaie to look at project. Made suggestions as to placement of BMP s Site Visit, met w / K.Thomas from NCTD she expressed their conditions and concerns. M.Lahsaie contacted RWQCB. 1/9 pointed out areas of concern and placement of BMP s. BMP maintenance prior to storm. 3/26 Site Visit, Photos Taken, project near completion.	1/7/2009	3/26/2009	14	0	0	0	0	0	0	0	0	Yes

Case Number	Occupancy Status	Date Received	Nature of Complaint	Actions Taken	First Contact	Last Contact	Site Visits	Office Visits	Phone Contacts	Written Notices	Letters Sent	Stop Work Notices	Administrative Warning	Administrative Citations	Criminal Citation	Case Closed?
08-3493	Residential	8/7/2008	WATER RUNNING 24/7 FORM CURB ENTRANCE TO COMPLEX	Site Visit, PC to RP left message was on-site. Contacted a Plumber from ACT Plumbing on-site trying to locate source of leak. Will call when source is located. 8/21 PC from Plumber has determined the source to be ground water. PC to RP left message with findings.	8/7/2008	8/20/2008	1	0	2	0	0	0	0	0	0	Yes
08-3499	Residential	8/6/2008	WATER RUNNING DOWN THE STREET DUE TO BROKEN PIPE	Site Visit, Photos Taken, spoke with maintenance person who showed me inside utility shed has almost 2 of standing water. Went to property next door where management believes water is coming from. Unable to verify the source. Spoke to manager states will contact corporate office and inform them of city involvement. I suggested they get a leak detection service to try to figure the source of water. Site Visit, manager states had leak detection service on-site and unable to determine source. Water located problem. Fixed.	8/6/2008	8/14/2008	2	0	2	0	0	0	0	0	0	Yes

7.6 Illicit Discharge, Detection, and Elimination Component Effectiveness Assessment

Effectiveness assessment is an important component of the JURMP because it can assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The San Diego County Copermittees developed two guidance documents to assist in the assessment of the JURMP components as well as the jurisdictions overall JURMP program. These two documents are titled *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* and the *Baseline Long-term Effectiveness Assessment* (BLTEA). The City participated in regional efforts to develop these documents in anticipation of the requirement to assess their JURMP programs.

The effectiveness assessment approach developed by the Copermittees during the 2005-06 permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below:

- Level 1: Compliance with Activity-Based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

The establishment of measurable outcomes is necessary for both incremental program component improvements and as a basis for future establishment of relationships between implementation and water quality improvement outcomes.

This section discusses the effectiveness assessment of the IDDE components of the JURMP. Overall program effectiveness assessment is discussed in Section 11 of the 2007-2008 City of Oceanside JURMP Annual Report submitted September 30, 2008.

A large effort of the IDDE element is the City's Dry Weather Monitoring Program. Table 7-10 provides a summary of the Level 1 activity-based compliance assessment of the program. This was the second year the City used a replacement program for dry or inaccessible sites. While there were 67 sites on the primary site list, fourteen were either dry or inaccessible. An additional 30 sites were visited to find ponded or flowing water. The City continued laboratory sampling at more sites than required which resulted in a 112% completion rate. All but one initial site exceedances of action levels were confirmed within two business days resulting in a 96% completion rate. Confirmation at L029 was missed, but the error was corrected and the site was revisited within five business days. Eighty eight sites, even those without ponded or flowing water, were assessed for trash extent and amount which resulted in a 131% completion rate.

Table 7-10. Dry Weather Monitoring Component - Level 1: Compliance with Activity-Based Requirements.

Permit Section	Activity Source Type	Targeted Outcome	Actual	Measures of Success	
IDDE D.4	Site Visits	Primary Dry Weather Sites Listed	Primary & Alternate Dry Weather Sites Visited	Actual/Target	Percent ( ) Completion
		67	97	97/67	145
	Field Screening	Primary Dry Weather Sites Listed	Number of Sites Screened with Flowing/Ponded Water	Actual/Target	Percent ( ) Completion
		67	67	67/67	100
	Laboratory Analysis	Number of Sites Required for Lab Analysis	Number of Sites Sampled for Lab Analysis	Actual/Target	Percent ( ) Completion
		17	19	19/17	112
	Follow-Ups (Within Two Business Days)	Number of Sites Requiring Confirmation	Number of Site Follow-up within Two Business Days	Actual/Target	Percent ( ) Completion
		24	23	23/24	96
	Trash Assessment	Number of Field Screening or Analytical Monitoring Stations	Number of Trash Assessments Conducted	Actual/Target	Percent ( ) Completion
		67	88	88/67	131

The City's Dry Weather Monitoring program was first implemented in 2002. Although the program has evolved and the number of sites and location of sites has varied, some assessment of discharge water quality can be made (Level 5 assessments). Figure 7-4 provides a summary of the percent of action level exceedances for selected field screening parameters from 2002 through 2009. Nitrate action level exceedances have been stable but decreased this year with only one site exceedance (1%). Orthophosphate exceedances vary and do not show any trends, but have stayed under 25% since 2002 and are equal to the 2004 and 2006 monitoring season at the lowest exceedance percentage of 11%. Ammonia exceedances for 2002, 2003, and 2004 occurred in over 80% of the sites. The 2005 Dry Weather Report indicates that these exceedances were likely due to false positives with the method being used. The methods were changed in 2005 and once again this dry weather season and ammonia exceedances are the lowest they have been in 2009 at 5%.

Figure 7-5 provides a summary of the microbiology results from 2002 through 2009. Bacterial exceedances have been on a decreasing trend since 2005. Total coliform and Enterococcus

exceedances are the same as the last reporting year. Fecal coliform exceedances in 2009 increased from the previous years from 11% to 21%.

In 2004, nitrate was not analyzed in field screening samples. In 2002, the results for nitrate were likely reported as Nitrate (NO_3) as opposed to Nitrate as N (NO_3-N). Not converting the results to the appropriate action level format creates a larger number of exceedances, than should be. Reporting years 2003 through 2006 were corrected, but documentation was not available to definitively clain that this was the case for 2002. Therefore, the results were omitted from this assessment.

Figure 7-4. Dry Weather Monitoring – Level 5: Changes in Discharge Quality. Summary of Field Screening Action Level Exceedances from 2002 - 2009.

Figure 7-5. Dry Weather Monitoring – Level 5: Changes in Discharge Quality. Summary of Bacteriological Action Level Exceedances from 2002 - 2009.

7.7 Program Review and Modification

Three recommendations for the IDDE component of the Municipal Permit are suggested: 1) The Regional Monitoring Workgroup re-evaluated the dry-weather action levels and are providing a recommended change. 2) As discussed in Section 15 of the JURMP Annual Report, a database tracking system was needed both for the Clean Water Program and other departments within the City. These systems were created and some implemented within the 2008-09 reporting year. 3) Specific to the IDDE Component, the Clean Water Program is working with the Engineering Department and Public Works to update the MS4 map utilizing GIS technology.

7.7.1 Bacterial Action Levels for Dry Weather Monitoring

The Regional Monitoring Workgroup in November 2009 requested the Dry Weather Monitoring Sub-workgroup to evaluate dry weather action levels that were submitted in April 2003 by the County of San Diego on behalf of the Copermittees. The Dry Weather Sub-workgroup determined that the bacterial indicators action levels required additional analysis. All other action levels were deemed appropriate and will not change. The Dry Weather Sub-workgroup contracted the services of D-Max Engineering through the City of La Mesa to conduct the evaluation of historical bacterial data collected from dry weather monitoring from 2002 through 2007. Details of their evaluation are posted on the Project Clean Water Website at http://www.projectcleanwater.org/pdf/science_mon/dry_weather_2009bacteria_action_level_report_draft.pdf. The Regional Monitoring Workgroup on May 19, 2009 evaluated the recommendations of the Dry Weather Sub-workgroup and selected the 80th percentile values to be proposed as the dry weather action levels for bacterial indicators beginning on May 1, 2010. The current levels and the levels proposed to effective as of May 1, 2010 are presented in Table 7-11.

Table 7-11. Bacterial Indicators Action Levels for Dry Weather Monitoring Program

	Total Coliform (MPN/100 mL)	Fecal Coliform (MPN/100 mL)	Enterococcus (MPN/100mL)
2003-2009 Action Levels	50,000	20,000	10,000
Proposed 2010 -2012 Action Levels	130,000	13,000	7,000

7.7.2 Database Tracking System for various departments and divisions

During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water, Sewer, and the Clean Water Program, continued rolling out the GBA Masters Series software. Water and Sewer continued to utilize the product and the Clean Water Program gained approval to purchase additional licenses and hire a consultant to help modify the software to their needs. Complete roll-out for the Clean Water Program is expected in reporting year 2009-10. The Development Services Department, which includes Code Enforcement, Building, Planning and Engineering, choose CRW Data Tracking Systems and will begin roll-out in the 2009-10 reporting year. These systems will allow for tracking and reporting of needed information, including storm water data, across the departments. The Clean Water Program has been working closely with other City departments to ensure that the details of inspections, complaints, follow-ups, post-construction BMPs, maintenance agreements, and other associated documents will be tracked appropriately to be included in future annual reports.

7.7.3 Maintenance of MS4 Maps using GIS Technology

One of the many uses of these units is to verify the accuracy of the MS4 map and relay the information gathered in the field to the Engineering Department to update the GIS layer. The City continued the effort to create the data dictionary needed to collect consistent and necessary data for the storm drain system update. Although he City did not make any changes to the MS4 map during the 2008-09 fiscal year, the Trimble units were field tested used for upstream investigations and mapping small segments of the MS4, but a full roll out the field effort is anticipated during FY 2009-10.

1 INTRODUCTION

1.1 Program Summary

In February 2001, the San Diego Regional Water Quality Control Board issued Order No. 2001-01 to the communities of San Diego County. As part of Order 2001-01, the City of Oceanside was required to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. In 2007, the San Diego Regional Water Quality Control Board issued a new five-year permit for Receiving Waters and Urban Runoff Monitoring and Reporting, Order No. 2007-0001. The Copermittees in San Diego County were required, as part of their Jurisdictional Urban Runoff Management Program (JURMP), to update their Dry Weather Program to meet or exceed the requirements of Order No. 2007-0001. The City of Oceanside's Dry Weather Program was reviewed and updated and the details of the current program are included in the City of Oceanside 2008 JURMP Update.

The purpose of the dry weather program is to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. Information collected from dry weather monitoring is used to characterize dry weather discharges in the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations are conducted as necessary to detect and eliminate the sources of these pollutants.

This report presents the results of the City of Oceanside's 2009 Dry Weather Field Screening and Analytical Monitoring Program.

1.2 City of Oceanside Drainage Summary

The City of Oceanside lies on the northern coast of San Diego County, 35 miles north of the City of San Diego and 83 miles south of the City of Los Angeles. The City is bounded to the west by the Pacific Ocean, the north by Camp Pendleton Marine Corps Base, the east by unincorporated areas of the County of San Diego and the City of Vista, and the south by the City of Carlsbad. The City covers approximately 42 square miles with a population of just over 173,000 people. California's main highway, Interstate 5, runs through the City, as does Highway 78, which provides southeast access to Interstate 15. Highway 76, which runs northeast, also provides access to Interstate 15.

The City's boundaries include two major watersheds; the San Luis Rey Watershed, which includes the San Luis Rey River and the Carlsbad Hydrologic Unit, which includes Loma Alta Creek, Buena Vista Creek, and Calavera Creek a tributary to Agua Hedionda Creek.

1.2.1 San Luis Rey Watershed

1.2.1.1 San Luis Rey River

The San Luis Rey Watershed is the northernmost watershed within the City of Oceanside. It is approximately 558 square miles and extends inland to encompass a large portion of

the northern unincorporated areas of the County of San Diego. The San Luis Rey River is the primary watercourse of the watershed and discharges to the Pacific Ocean near the northern border of the City of Oceanside. While the San Luis Rey Watershed is the largest hydrologic unit in the San Diego region, 92.5% of the watershed lies within the unincorporated part of the County, and not within the City of Oceanside. However, a wide floodplain is prominent through the City, including levees on either side of the river to protect the surrounding developments, adjacent to or within the historical floodplain, from future storm events. In 2007, the Pacific Street Bridge Project broke ground to restore the river mouth to its natural open state by creating a bridge over the river and removing the "Arizona crossing," a land berm and large culvert intended to wash out during large storm events. The new bridge was completed and opened in September of 2008 and the hardscape of the Arizona crossing was removed at the end of October 2008.

The one named tributary within the City's boundaries is Pilgrim Creek, which drains a relatively undeveloped portion of the City with some residential areas and a municipal golf course in addition to an undeveloped area of Camp Pendleton. The remaining drainage areas within the City include areas of agricultural, residential, and some industrial land uses.

1.2.2 Carlsbad Watershed

1.2.2.1 Loma Alta Creek

Loma Alta Creek is the northernmost watershed in the Carlsbad Hydrologic Unit. It flows alongside Oceanside Boulevard, beginning as a rising spring just west of Melrose Drive in the City of Vista and ending at Buccaneer Beach Park where it enters the Pacific Ocean. Approximately five percent of the Loma Alta Creek Watershed is in the City of Vista, and the remaining portion is entirely in the City of Oceanside. Loma Alta Creek is over seven miles long and encompasses nearly 6,300 acres of land, 70 percent of which is developed. Almost 90% of the land within the watershed is privately owned.

Several tributaries drain into Loma Alta Creek, however, the only named tributary is Garrison Creek, located along Garrison Street west of El Camino Real. Much of the creek has been modified throughout the years, with the use of fully or partially concrete-lined channels to stabilize the creek-bed slopes. Loma Alta winds through a highly industrial area towards the western portion of the creek. Other land uses include residential and commercial uses.

1.2.2.2 Buena Vista Creek

The Buena Vista Watershed extends approximately 10.6 miles inland from the coast, totaling 14,437 acres and draining 21 square miles. The Watershed begins on the western slopes of the San Marcos Mountains, flows through areas of the County of San Diego and the Cities of Vista, Carlsbad, and Oceanside, turns into a lagoon and then ends at the Pacific Ocean. A weir was built in 1940 to stop tidal flow at the mouth and the lagoon now functions as a freshwater lagoon.

In the City of Oceanside, Buena Vista Creek parallels Highway 78. The lagoon is located south of Highway 78 and west of Jefferson Street. The upper and western basins of the

Buena Vista Watershed are primarily in the City of Vista, the southeastern portions are primarily in the San Diego County jurisdiction, and the lower basin is straddled between the Cities of Carlsbad and Oceanside as the Creek weaves its way between the two cities. Approximately 80% of the Buena Vista Watershed is developed, primarily with commercial and residential land uses. Some agricultural activities also exist in the watershed. Because of the intense development in the watershed, large sections of Buena Vista Creek have been concrete-channelized to reduce the chance of flooding private property.

1.2.2.3 Agua Hedionda Creek

A small portion of the City of Oceanside lies within the watershed of a tributary of Agua Hedionda Creek, called Calavera Creek. Beginning in an undeveloped portion of land just west of Highway 78, Calavera Creek's headwaters start in Vista, proceed through a pocket of San Diego County unincorporated area, head into Oceanside, and then eventually drain to Lake Calavera. Lake Calavera was created by the building of a dam in the 1940s. While the creekbed downstream of the lake is typically dry, the creek reforms in wet weather to wind its way through Carlsbad and joins the major artery of Agua Hedionda Creek. Near the Pacific Ocean, Agua Hedionda Creek opens up into a lagoon. The entire Calavera Creek Basin is approximately 3,770 acres. The primary land use in the portion of the Agua Hedionda Watershed that lies within the City of Oceanside's boundaries is residential.

2 SAMPLING LOCATIONS

2.1 Site Selection

City monitoring staff worked with a consultant experienced in dry weather monitoring to update the City's Dry Weather Monitoring Program site locations during the 2008 JURMP Update process. This process involved preparing maps integrating the City's drainage system, watersheds, major water bodies, current dry weather monitoring locations, and land use. The sites were referenced against major drainage lines to see if any major lines were not being sampled, if any existing sites captured only very small drainage areas, or if any existing sites were redundant in that two or more neighboring sites provided data about essentially the same area. Historical data was also evaluated to determine which sites had routinely been dry in recent years and monitoring staff identified sites that had been found to be inaccessible. During this process it was determined that approximately 40 percent of the City's existing sites were routinely dry, were inaccessible, and/or assessed only very small drainage areas. Assessment of existing sites and prepared maps also found that the existing sites missed larger drainage areas or did not capture some of the recently developed areas. A list of potential new sites was drafted based on the following criteria:

- The site was downstream of any sources of suspected illicit discharge or illicit activity.
- The location took into account hydrological conditions, total drainage area, traffic density, age of the structures or buildings, history, and land use types.
- The site was located at the farthest downstream manhole or other accessible location in the drainage area being assessed.

A primary and an alternate site list were created after verification of accessibility was assessed. As a result of this process, a number of inaccessible or dry sites were removed, several sites with small drainage areas were redesignated as alternate sites, and several new sites were selected. The City's revised program now provides a more thorough, overall coverage of its MS4 while more efficiently allocating resources to sites that provide useful data. For a detailed list of site changes see the 2008 JURMP Update.

The updated list of 67 primary monitoring stations, their locations, land uses, and drainage areas is presented in Table 1. Alternate dry weather monitoring stations have been selected and are listed in Table 2. These stations are used as replacements for primary stations where no flowing or ponded water is observed. A map of the MS4 with primary and alternate sampling station locations is included as Figure 1.

2.2 Site Descriptions

Site visits were attempted at the 67 primary monitoring stations. Three of the primary stations were inaccessible and fourteen were dry, so the additional 28 alternate stations were visited in addition to creating two new stations in search of flowing or ponded water within the City in 2009. This section includes a detailed description of each monitoring station.

The site identification numbers are not arranged by location (for example, from east to west) because over the course of the Dry Weather Program, sites have been eliminated and added to best represent the City's MS4. The site identification numbers do either start with an A, B, L, or S which corresponds with the Agua Hedionda Creek (A), Buena Vista Creek (B), Loma Alta Creek (L), or the San Luis Rey River (S). For example, Site S112 would have been sampled from San Luis Rey River at location 112. The site locations are shown in Figure 1 and described below. The site identification numbers, descriptions, GPS coordinates, and conveyance structure types of the primary stations are listed in Table 1 and of the alternate stations in Table 2. Photos of each site visited are included as Appendix A.

Table 1. 2009 Primary Dry Weather Monitoring Site Locations.

StationID	Location	HSA	Latitude	Longitude	TBPage	TBGrid	LandUse□1	LandUse□2	Convey□Type
A002	South end Cannon Road	904.3	33.16125	-117.27073	1107	E5	Residential	None	Outlet

Figure 1. 2009 City of Oceanside Dry Weather Monitoring Stations.

2.2.1 Agua Hedionda Site Descriptions

A002
Site A002 is a 74-inch RCP located at the end of Cannon Road. The outlet drains the residential areas along Cannon Road. Access to the site is from Cannon Road. Field screening and laboratory samples were collected from the flowing water.

A004a
Site A004a is a 48-inch RCP located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The outlet drains the residential areas south and east of the outlet. Access to the site is from Cannon Road to the pump station access road. Field screening and laboratory samples were collected from the flowing water.

A004b
Site A004b is a brow ditch located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The concrete drainage ditch drains the irrigated areas on the slope behind the residences on Spinnaker Ridge. Access to the site is via Cannon Road to the pump station access road. Field screening and laboratory samples were collected from the flowing water.

A013
Site A013 is a 36-inch RCP located at the intersection of Lake Boulevard and Alameda Drive, south of Agua Hedionda Creek. The outlet drains the residential areas south of the site. Access to the site is from Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A014
Site A014 is a 36-inch RCP located east of the intersection of Lake Boulevard and Alameda Drive, north of Agua Hedionda Creek. The outlet drains the school and residential areas north of Lake Boulevard. Access to the site is from Lake Boulevard. Field screening samples were collected from the flowing water.

A015
Site A015 is a 48-inch RCP located south of Lake Boulevard and south of the creek. The outlet drains the residential areas south and east along Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A016
Site A016 is a 36-inch RCP located southeast of the intersection of Amigos Court and Serena Lane, south of Lake Boulevard. The outlet drains the residential areas north across Lake Boulevard. Access to the site is through open space off of Lake Boulevard. Field screening and laboratory samples were collected from the flowing water.

A019
Site A019 is a 36-RCP located in Oak Riparian Park off of Lake Boulevard, north of Agua Hedionda Creek. The outlet drains the residential and park areas north and south of

Lake Boulevard. Access to the site is from the parking lot off of Lake Boulevard. Field screening samples were collected from the ponded water.

A021
Site A021 is a 36-inch RCP located off of Sky Haven Lane, north of Agua Hedionda Creek. The outlet drains the residential areas to the north of the outfall. Access to the site is from a residential driveway and down a steep embankment in the middle of a densely vegetated area. Field screening samples were collected from the ponded water.

A022
Site A022 is an alternate site. It is a concrete box outlet located at the southwest corner of Lake Boulevard and Southridge Road, north of Agua Hedionda Creek. The outlet drains the residential areas to the north of the outfall. Access to the site is from Southridge Road. Field screening samples were collected from the ponded water.

A023
Site A023 is an alternate site. It is a RCP outlet located on the south side of Lake Boulevard west of Evening Canyon Road. Access to the site is from Lake Boulevard. Field screening samples were collected from the ponded water.

A024
Site A024 is an alternate site. It is a RCP outlet located on the south side of Lake Boulevard east of Emerald Drive. Access to the site is from Lake Boulevard. Field screening samples were collected from the ponded water.

2.2.2 Buena Vista Creek Site Descriptions

B002
Site B002 is a 72-inch RCP located on Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial and residential areas north of SR-78. Access to the site is via Lagoon View Drive. Field screening and laboratory samples were collected from the flowing water.

B022
Site B022 is a 48-inch RCP constructed in the north side of the Buena Vista Creek channel wall, east of the Thunder Drive Bridge. The outlet drains the residential area north of Buena Vista Creek. Access to the site is from within the Buena Vista Creek channel. Field screening and laboratory samples were collected from the flowing water.

B023
Site B023 is a 36-inch RCP located west of 3524 Lake Boulevard south of Buena Vista Creek. The outlet drains the residential areas southeast of Lake Boulevard. Access to the site is from Lake Boulevard. Field screening samples were collected from the ponded water.

B024
Site B024 is a 36-inch RCP located on the southwest corner of College Boulevard Bridge on the south side of Buena Vista Creek. The outlet drains the residential areas east and west of College Boulevard south of the creek. Access to the site is from College Boulevard. Field screening samples were collected from the ponded water.

B026
Site B026 is a 48-inch RCP located south of the Tri-City Crossroads Plaza off of Plaza Drive on the north of Buena Vista Creek. The outlet drains the commercial areas around Plaza Drive. Access to the site is from Tri-City Crossroads Plaza or the open lot to the east of the plaza. Field screening samples were collected from the flowing water.

B027
Site B027 is located off of Haymar Drive at South Coast Material yard north of Buena Vista Creek. The outlet drains the residential and commercial areas north of SR-78. Access to the site is from Haymar Drive. Access to the site is located in South Coast Material yard at the first right hand turn. Field screening samples were collected from the flowing water.

B030
Site B030 is an alternate site. It is a 36-inch RCP located within a sewer easement south of SR-78, west of AAA and north of Buena Vista Creek. The outlet drains the residential areas north of SR-78. Access to the site is from the sewer easement road, however, the area around the site was overgrown and the outlet inaccessible.

B031
Site B031 is an alternate site. It includes four 54-inch RCPs located between Haymar Drive and SR-78, across from Camino Real County Club, and north of Buena Vista Creek. The western-most outfall is sampled. This outlet drains the golf course, commercial, and residential areas north of SR-78. Access to the site is off of Haymar Drive on the sewer easement road. Field screening samples were collected from the ponded water, which was likely a mixture of outfall and creek water.

B032
Site B032 includes two 60-inch RCPs located between Haymar Drive and SR-78, across from Carlsbad Plaza, north of Buena Vista Creek. Both pipes are from the same source. The outlet drains the golf course and commercial areas north of SR-78. Access to the site is from Haymar Drive. Field screening samples were collected from the flowing water.

B033
Site B033 is a 42-inch RCP located north of SR-78 behind the Black Angus restaurant, north of Buena Vista Creek. The outlet drains the commercial areas north of SR-78 into a large catch basin with ponded water. The outfall that was sampled is the largest input to the basin. Access to the site is from SR-78. Field screening samples were collected from the flowing water.

B034
Site B034 is a 36-inch RCP located north of SR-78 behind Burger King at the Jefferson Street exit. The outlet drains the commercial areas north of SR-78. Access to the site is from SR-78. Overgrown vegetation and a steep slope made this site inaccessible.

B102
Site B102 is a 36-inch CMP located within a sewer easement south of SR-78 and north of Buena Vista Creek. The outlet drains the residential and commercial areas north of SR-78. Access to the site is from the sewer easement road. The sewer road was slightly overgrown and the surrounding areas were very overgrown. The storm drain could not be found in the vegetation and the trail previously used was inaccessible.

B103
Site B103 is located at the end of Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial areas north of SR-78. Access to the site is via Lagoon View Drive. Field screening samples were collected from the ponded water.

B104
Site B104 is a manhole on the southeast corner of South Coast Highway and Eaton Street. The outlet drains the commercial and residential areas on the east side of South Coast Highway. This site replaced B001 by moving it upstream approximately 230 yards out of tidal influence. Access to the site is from South Coast Highway. Field screening samples were collected from the ponded water.

B105
Site B105 is a large manhole capped with an open grate on the El Camino Golf Course and the end of Nicklaus Way. The storm drain carries flows from the large residential area to the north east of the site and the golf course. Access to the site is from Nicklaus Way. The sampling team was unable to remove the grate on top of the manhole and the bars were too narrow to sample through. Therefore, this site was inaccessible, but a site further upstream was created on the same MS4 line, B108.`

B106
Site B106 is a 72 inch RCP outlet just north of Buena Vista Creek off of College Boulevard. The storm drain system begins just under a mile upstream and drains a large commercial and residential area north of Buena Vista Creek along College. Access to the site is from Nicklaus Way. Field screening samples were collected from the flowing water.

B108
Site B108 is a manhole on the El Camino Country Club golf course. The storm drain system drains a large residential area north and east of the manhole. Access to the site is from Viscaya Way. Field screening samples were collected from the flowing water.

2.2.3 Loma Alta Creek Site Descriptions

L001
Site L001 is a 48-inch RCP located at the intersection of North Avenue and Vista Pacific Drive, north of Loma Alta Creek. The outlet drains the industrial areas south of North Avenue. Access to the site is via North Avenue. Field screening samples and analytical lab samples were collected from the flowing water.

L002
Site L002 is a 66-inch RCP located northwest of the intersection of North Avenue and Vista Pacific Drive, north of Loma Alta Creek. The outlet drains the industrial areas east of the outlet. Access to the site is from a walking path off of North Avenue. Field screening samples were collected from the flowing water.

L003
Site L003 is a 48-inch RCP located off of North Avenue and east of Autumn Drive, south of Loma Alta Creek. The outlet drains the residential area southeast of North Avenue. Access to the site is via North Avenue. Field screening samples were collected from the flowing water.

L004
Site L004 is an alternate site. It includes three 24" RCPs on North Avenue east of Autumn. The south eastern outfall was sampled. It drains a small residential area. Access to the site is via North Avenue. Field screening samples were collected from the ponded water.

L005
Site L005 is an alternate site. It includes two 24" and one 36" RCP at North Avenue & Autumn. It drains a small residential area. Access to the site is via North Avenue. No dry weather flows were observed.

L006
Site L006 is an alternate site. It is an RCP outfall at the intersection of North Ave. and Season Road south of Loma Alta Creek. It drains a small residential area. Access to the site is via North Avenue. Field screening samples were collected from the ponded water that was likely a mix of outfall and creek water.

L007
Site L007 is an alternate site. It is a 48-inch RCP located north of North Avenue west of Seasons Road, south of Loma Alta Creek. The outlet drains the residential areas on the hillside south of North Avenue. The outlet is partially submerged with ponded water. Access to the site is from North Avenue. Field screening samples were collected from the ponded water.

L008
Site L008 is an alternate site. It is a 40-inch RCP located on the corner of Westridge Drive and Quailridge Drive, north of Loma Alta Creek. The outlet drains the residential areas on the hillside north of Oceanside Boulevard. Access to the site is from Westridge Drive. Field screening samples were collected from the ponded water.

L009
Site L009 is under College Boulevard at the Loma Alta Creek crossing. Three box culverts are present and drain the residential and commercial areas east of College Boulevard. Access to the site is via College Boulevard. Field screening samples and analytical lab samples were collected from the flowing water.

L010
Site L010 are two 36-inch RCP located west of College Boulevard near the railroad tracks. The outlet drains the residential areas on the hillside south of Loma Alta Creek adjacent to College Boulevard. Access to the site is from College Boulevard. Field screening samples were collected from the flowing water.

L013
Site L013 is a manhole located south of the shopping center on the corner of Oceanside Boulevard and College Boulevard, north of Loma Alta Creek. The outlet is no longer accessible due to overgrown vegetation, but the manhole upstream of the outlet is now sampled. Access to the site is from the parking lot behind ReMax. Field screening samples were collected from the flowing water.

L016
Site L016 is an alternate site. It is a 36-inch RCP inside a manhole on Rancho Del Oro. This site has been altered by North County Transit District with the Sprinter Railway and is not accessible.

L019
Site L019 is a 48-inch RCP, located south of the intersection of Corporate Centre Drive and Oceanside Boulevard, north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. Field screening and analytical samples were collected from the ponded water.

L020
Site L020 is a 36-inch RCP located east of the intersection of Corporate Centre and Oceanside Boulevard, north of Loma Alta Creek. The outlet drains the commercial areas located north of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. Field screening samples were collected from the flowing water.

L024
Site L024 is a 36-inch RCP located south of Oceanside Boulevard at the west end of the Evergreen Nursery. The outlet drains the commercial and open space area located north

of Oceanside Boulevard. Access to the site is from Oceanside Boulevard. No dry weather flows were observed.

L027
Site L027 is located on Garrison Creek upstream of Oceanside Boulevard. The site is sampled where the creek is a natural channel. The channel drains the residential and commercial areas located northeast of Oceanside Boulevard. Access to the site is from Garrison Street. Field screening and laboratory samples were collected from the flowing water.

L029
Site L029 is an alternate site. It is a manhole at 3060 Industry Way. This site is the beginning of the short storm drain line that drains the surrounding commercial and industrial area. Access to the site is from Industry Way. Field screening samples were collected from the ponded water.

L032
Site L032 is a 64-inch RCP located south of the intersection of Camelot Drive and Industry Way, north of Loma Alta Creek. The outlet drains the industrial and commercial area north of Industry Way. Access to the site is through a private business from Industry Way. Dry weather flows were not observed at this site.

L034
Site L034 is an alternate site. It is a 24-inch RCP located between Waste Management and a self storage lot south of Oceanside Boulevard. Field screening samples were collected from the ponded water.

L036
Site L036 is located adjacent to the intersection of Skylark Drive and Downs Street, south of the Loma Alta Creek. The outlet is now in the Sprinter rail right of way, so the manhole upstream of the outlet was visited. The outlet drains the residential area north of Loma Alta Creek. Access to the site is via Skylark Drive. Dry weather flows were not observed at this site.

L037
Site L037 is an alternate site. It is an earthen channel south of Loma Alta Creek. The channel drains the commercial area south of Loma Alta Creek. The site is at the east end of South Oceanside Boulevard. Dry weather flows were not observed at this site.

L040
Site L40 is an open concrete trapezoidal channel north of Loma Alta Creek. The outlet drains the commercial and residential areas located adjacent and to the north of Oceanside Boulevard. Access to the site is through the Vons parking lot off of Oceanside Boulevard. Field screening and laboratory samples were collected from the ponded water in the channel.

L046
Site L046 is a 24-inch RCP constructed in the north wall of the Loma Alta Creek channel just east of the Coast Highway Bridge. This outfall conveys flow from commercial and residential area north of Loma Alta Creek. Access to the site is from Coast Highway. Field screening samples were collected from the ponded water.

L050
Site L050 is a 24-inch RCP constructed in the north wall of the Loma Alta Creek channel. The outlet drains the Casitas Trailer Park located north of the Loma Alta Creek. Access to the site requires going into Loma Alta Creek channel. Dry weather flows were not observed at this site.

L052
Site L052 is a 36-inch RCP located just west of the I-5 overpass on the south side of Loma Alta. The outlet drains Cavalier Trailer Park. Access to the site requires going into Loma Alta Creek channel. Dry weather flows were not observed at this site.

L054
Site L054 is a 24-inch RCP constructed in the south wall of Loma Alta Creek. The outlet is located southwest of the intersection of Hillside and Evergreen Lane. Site L054 drains the trailer park, Marshall Park, and the residential area to the south. Access to the site requires entering the Loma Alta Creek channel. Field screening and laboratory samples were collected from the flowing water.

L102
Site L102 is a 36-inch RCP inside a manhole on Esperanza Way. The site drains a residential area on the south side of Loma Alta. The site was flowing, but it was not enough to sample. A new site upstream, L115, was created to capture the flows in this storm drain system.

L103
Site L103 is a 72-inch RCP located west of Corporate Centre, north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Boulevard off of Corporate Centre. Access to the site is from Corporate Centre. Field screening samples were collected from the flowing water.

L105
Site L105 is a manhole located on Industry Way, north of Loma Alta Creek. The outlet within the manhole drains the residential and commercial area located north of Industry Way. Access to the site is from Industry Way. Dry weather flows were not observed at this site.

L107
Site L107 has historically been a 36-inch RCP outlet located on the north side of Loma Alta Creek near the intersection of Crouch Street and Oceanside Boulevard. Due to Sprinter rail construction and other changes to the channel walls, the site was moved

upstream to a manhole at the corner of Crouch and Oceanside Boulevard. The storm system drains the commercial and residential areas located north of Oceanside Boulevard. Dry weather flows were not observed at this site.

L108
Site L108 is a concrete channel that flows into Loma Alta Creek west of Interstate 5 from the north. This site replaced L050 because it is in the same general area, but has a larger watershed and has continuous flow. Access to the site is from Loma Alta Creek through Cavalier Trailer Park. Field screening samples were collected from the flowing water.

L109
Site L109 is a 24-inch RCP constructed in the south wall of the Loma Alta Creek channel. The outlet drains the trailer park and the residential area south of Loma Alta surrounding La Salina Street. Access to the site requires going into Loma Alta Creek channel. Dry weather flows were not observed at this site.

L110
Site L110 is an outlet from Garrison Creek at Mesa Boulevard and Parsley. Access to the site is from Mesa Boulevard through a locked fence at an open field. Field screening samples were collected from the ponded water.

L111
Site L111 was added as an alternate site during the 2008 Dry Weather Monitoring season. This area is undergoing commercial and light industrial growth and was added to the alternate list to capture these land uses. The outlet is northeast of the intersection of Rancho del Oro and Oceanside Boulevard. Access is from Seagate Drive. Field screening samples were collected from the ponded water.

L114
Site L114 was added as an alternate site during the 2008 Dry Weather Monitoring season. This outfall is located under the Pacific Coast Highway Bridge on the northwest side. The drainage area has not been identified, but it is likely from the areas north along the Coast Highway. Access to the site requires going into Loma Alta Creek channel. This site was visited towards the end of the summer when the UV Treatment System at the mouth of Loma Alta Creek was being tested. Loma Alta Slough water levels were raised with the operation of the UV System and this outfall became submerged and inaccessible.

L115
Site L115 was added as an alternate site during the 2009 Dry Weather Monitoring season. The site is a pipe inside a manhole at the end of Gem View Drive and replaced site L102. The land use in the drainage area is residential. The eastern outfall in the box was sampled. Field screening samples were collected from the flowing water.

2.2.4 San Luis Rey Site Descriptions

S006

Site S006 is a 36-inch corrugated metal pipe (CMP) located under Interstate 5. Access to Site S006 is from Carmelo Drive. Site S006 conveys flows from the residential area south of Camp Pendleton and east of Interstate 5 to the north side of the trail under I-5. Field screening samples and analytical lab samples were collected from the ponded water.

S025

Site S025 is an alternate site. It is located on the north side of the San Luis Rey River on West Airport Road across from a junkyard. S025 is a 24-inch RCP in a headwall that drains the junkyard located just north of the outlet. No dry weather flows were observed.

S032

Site S032 is a 36-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River. The S032 outlet conveys flows from the residential, commercial, and open space areas located on the south side of SR-76. Access to the site is from Foussat Road to the access road that runs parallel to the River on the south side. Field screening samples were collected from the ponded water.

S035

Site S035 is located on the south side of the San Luis Rey River. Site S035 is a 42-inch RCP with a flap gate installed. Access to the site is from Douglas Drive to the access road south of the San Luis Rey River. Dry weather flows were not observed at this site.

S043

Site S043 is a 30-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River under the College Boulevard Bridge. The site collects dry weather flows from the residential area immediately south of the outlet. Access to the site is via College Boulevard to the access road on the south side of the River. No dry weather flows were observed.

S044

Site S044 is an open channel located on the south side of the San Luis Rey River. It conveys flows from residential and commercial areas. Access to the site is at northeast corner of Frazee Road and Oleander Drive. Field screening and analytical laboratory samples were collected.

S045

Site S045 is at the outfall of three 4-foot by 6-foot boxes on the south side of the San Luis Rey River. S045 conveys flows from the residential areas south of Frazee Road to the River. Access to the site is via Frazee Road. Field screening samples were collected from the flowing water.

S065
Site S065 is located within the open channel of Pilgrim Creek prior to confluence with the San Luis Rey River. Access to the site is from the San Luis Rey Wastewater Treatment Plant via North River Road to the access road located on the north side of San Luis Rey River. Site S065 conveys dry weather flows from a municipal golf course, residential, agricultural, parks, and open areas located to the north to the San Luis Rey River. Dry weather flows were not observed.

S072
Site S072 is a 60-inch RCP with a flap gate installed and is located on the north side of the San Luis Rey River. Access to the site is from River Tree Drive at Marlado Park. Site S072 conveys dry weather flows to the River from the park and residential community located north of the outlet. Dry weather flows were not observed.

S075
Site S075 is a 24-inch RCP in a headwall located on the north side of the San Luis Rey River. Access to the site is from the access road that runs parallel to the River between Benet and Foussat Roads. Site S075 conveys dry weather flows from the new residential developments north of the San Luis Rey River. Field screening samples from the flowing water were collected.

S077
Site S077 is an open channel south of SR-76 and upstream of Guajome Lake. Access to the site is from Hitching Post Drive. The runoff consists primarily of residential and commercial flows from east of the outlet. Samples are collected where the channel is concrete. Downstream of the sampling point, the channel is a natural swale that leads to Guajome Regional Park. Field screening samples were collected from the flowing water.

S085
Site S085 is an alternate site. It includes two 24-inch RCPs located at North Santa Fe Avenue and Champlain Street. The outlet drains into a concrete channel south of the San Luis Rey River. S085 conveys the dry weather flows from the residential area to the south of North Santa Fe Avenue. Access to the site is from North Santa Fe Avenue. Field screening samples were collected from the ponded water.

S088
Site S088 is a 36-inch RCP located at the intersection of Mesa Drive and North Santa Fe Avenue. The site is located west of the Guajome Regional Park and south of the San Luis Rey River. Site S088 conveys dry weather flows from the residential area to the west into Guajome Regional Park. Access to the site is via North Santa Fe Avenue. Field screening samples were collected of the ponded water.

S102
Site S102 is located north of SR-76 between North Santa Fe Road and Guajome Lake Road, south of the San Luis Rey River. It is a 24-inch RCP that drains a residential area immediately east. Access to the site is from SR-76 and requires entering private

property; therefore, access is limited. Field screening samples were collected of the ponded water.

S103
Site S103 is located south of the San Luis Rey River. Access to the site is from the park east of 5396 Gooseberry Way. The outlet drains the residential and park areas in the neighborhood to the south. Field screening samples were collected of the ponded water.

S104
Site S104 in a 24-inch RCP located south of the San Luis Rey River. Access to the site is from the sewer easement and tomato fields northwest of the site. The outlet drains the residential area south of the site. Field screening samples were collected of the ponded water.

S106
Site S106 includes four 36-inch plastic pipes at the intersection of North River Road and Sleeping Indian Road on the north side of the San Luis Rey River. The outlet drains the agricultural and residential area immediately north of the site. Access to the site is from North River Road. Field screening samples and analytical lab samples were collected from the flowing water.

S107
Site S107 is a natural channel that crosses under North River Road on the north side of the San Luis Rey River. The channel drains the agricultural area immediately north of the site. Access to the site is from North River Road. Dry weather flows were not observed.

S108
Site S108 is a natural channel that crosses under Via Puerta del Sol on the north side of the San Luis Rey River. The channel drains residential areas and agricultural areas in the immediate vicinity. Access to the site is at the intersection of Via Puerta del Sol and Big View Road. Dry weather flows were not observed.

S109
Site S109 is an 18-inch RCP located on the south side of the San Luis Rey River. The site conveys the runoff from the residential area immediately south of the outlet. Access to the site is from the access road to the east of College Boulevard. Dry weather flows were not observed.

S110
Site S110 is located on the north side of the San Luis Rey River. S110 is a 30-inch RCP with a flap gate installed. Access to Site 110 is from Rainier Way east of Douglas Drive. Field screening samples were collected from the flowing water.

S111
Site S111 is a concrete channel adjacent to Fireside Park, east of San Luis Rey River. The channel drains residential and commercial areas east of the site. Access to the site is from Fireside Street. Field screening samples were taken from the ponded water.

S113
Site S113 is located off of Capistrano Drive across from Capistrano Park. The site conveys flows from Camp Pendleton and from Capistrano Park south to the San Luis Rey River. The cliff appears to have eroded into the river and access to the outfall was not possible. The next manhole up was visited, but the site was dry and no samples were collected.

S115
Site S115 is an open concrete channel between Mission Avenue and SR-76 west of El Camino Real. The site conveys flows from the commercial area to the east along Mission Avenue towards Douglas Drive. Access to the site is from Mission Avenue. Field screening samples were collected from the flowing water.

S116
Site S116 is located off of North River Road across from Del Rio Elementary School. The outfall conveys flows from the school and the residential area north of North River Road. It consists of two six-foot by six-foot boxes. Access to the site is from North River Road. This site replaced the historically dry S052 sampling site. Dry weather flows were not observed.

S117
Site S117 is a 48-inch RCP located northwest of North Sante Fe Road and Champlain Road. The outfall conveys flows from the residential areas east and south along North Santa Fe Road. Access to the site is from North Santa Fe Road. Field screening samples were collected from the flowing water.

S118
Site S118 is an alternate site. It is located at the southwest corner of College and Silver Bluff. It consists of two pipes originating from the same source. The largest pipe, a 72-inch RCP, was sampled, which conveys flows from the residential area to the north and east along Silver Bluff and Mosaic. This site was added to the Dry Weather Monitoring Program as a replacement for S085. Access to the site is from Silver Bluff. Field screening samples were collected from the ponded water.

S119
Site S119 is an alternate site. It is an open concrete channel located off of Douglas Drive at the municipal golf course. The site conveys flows from the residential areas south and east, as well as the golf course. Access to the site is from Douglas Drive. Dry weather flows were not observed.

S120
Site S120 is an alternate site. It is a 36-inch RCP outfall at the east end of Jeffries Ranch Road. It conveys flows from the residential area west of the outfall. Access to the site is from Jeffries Ranch Road. Dry weather flows were not observed.

S121
Site S121 is an alternate site. It consists of two partially submerged 48-inch RCPs at the northwest intersection of College Boulevard and Frazee Road. It conveys flows from the residential area southeast of the intersection. Access to the site is from Frazee Road through a locked gate. Field screening samples were collected from the ponded water.

S122
Site S122 is an alternate site. It is a RCP with a flap gate at the end of Tishmal Court. It conveys flows from the residential area north of the river. Access to the site is from the sewer easement path and pedestrian path on the north side of the river. Field screening and analytical screening samples were collected from the flowing water.

S123
Site S123 is an alternate site. It is a concrete channel from the Fireside Road drainage basin. It conveys flows from the residential area to the east and the commercial area to the south. Access to the site is from the easement/foot path on the southeast side of the river. Dry weather flows were not observed.

3 METHODS

Dry weather monitoring is conducted at least once at each primary station where flowing or ponded water is observed during the dry season (May 1 – September 30). If a primary site is visited and no flowing or ponded water is present, this information is documented on the field sheet (or electronically in the field tablet) and a station from the alternate list is then visited. Dry weather monitoring is only conducted when there has been at least 72 hours of dry weather prior to the time of the sampling. Grab samples are collected for laboratory analysis at a minimum of 25% of the stations where water is present.

The following describes the City of Oceanside's Dry Weather Program components including field site visits, laboratory analysis of water samples, and IC/ID investigations. The general site description and atmospheric conditions were recorded for each site visit whether or not runoff was observed. An example of the hard copy data sheet is provided in Appendix B. However, the 2008 dry weather season was the first program to begin collecting field data electronically on Panasonic Toughbooks using a database specifically created based on the field data sheet and the data sharing format approved by the Dry Weather Monitoring Workgroup. In 2009, the same Access-based database was used for electronic data entry in the field using a Dell Rugged Laptop. A photograph was also taken at each site (Appendix A). Monitoring was not conducted during any rain event or within 72 hours of the end of any rain event greater than one tenth of an inch.

3.1 Qualitative Observations

Qualitative field observations were made during each site visit where ponded or flowing water was observed and sampled. These observations were intended to provide a general assessment of the runoff and include parameters such as odor, water clarity, and the presence of floatables, visible deposits, stains and aquatic life. These descriptions were recorded on the field data sheet or electronically in the field tablet.

3.2 Flow Measurement

Flow measurements can be used to estimate pollutant mass loading, prioritize storm drains for future investigations, or to identify significant changes in flow that may be indicative of an illegal release upstream. Since all of the sample locations lack a permanent flow measurement installation, several field methods were employed to estimate flow rates for different flow types such as an open channel, outfall, or drainage pipe. These methods have been adapted from the County of San Diego's Dry Weather Monitoring Program Quality Assurance Project Plan[1].

Velocity-area method - This method requires the physical measurement of the velocity (V), depth (D), and width (W) of flowing water. Discharge is determined as follows:

$$\text{Discharge} = V \times D \times W \qquad \text{Eq. (1)}$$

[1] County of San Diego. 2004. Quality Assurance Project Plan for the County of San Diego's Dry Weather Monitoring Program. April 2004.

Where the water depth was adequate, a Global Flow Probe was used to get the average velocity in feet per second. Stream depth and width were recorded on the field data sheet and the discharge in cubic feet per second (cfs) was calculated using Eq. (1).

Where the flow was too slow or the water too shallow to measure the velocity using the probe, the velocity was estimated by timing the travel of a piece of floating debris (e.g., a leaf). The velocity was calculated by dividing the travel distance (feet) by the recorded travel time (seconds).

Fill a bottle method - If the flowing water was able to be captured, such as from a raised pipe, the fill-a-bottle method was used. The time it took to fill a known volume was recorded. Discharge was calculated by dividing the volume by the time and converting that value into cubic feet per second.

3.3 Field Screening

Water physicochemical properties (e.g., pH, conductivity, turbidity, dissolved oxygen (DO), and temperature) are important indicators of water quality. The Hydrolab Quanta 5-parameter probe was used to measure:

- pH.
- Conductivity.
- Turbidity.
- Dissolved oxygen.
- Water temperature.

If the water was deep enough, the probe was placed horizontally in the water column. If water was shallow, a syringe was used to collect water and transfer into a sampling cup and then the properties were measured. The Hydrolab Quanta has a built-in circulator to more accurately assess *in situ* measurements. The Quanta was calibrated daily prior to use in the field using the standard calibration solutions or secondary standards as well as a three-point pH calibration.

At each site with ponded or flowing water, water samples were collected and analyzed in the field for:

- Ammonia (NH_3) using CHEMetrics K-1403.
- Nitrate as N (NO_3-N) using CHEMetrics K-6923 or K-6933.
- Orthophosphate (PO_4) using CHEMetrics K-8513.
- MBAS (Surfactants) using CHEMetrics K-9400.

Ammonia, nitrate, orthophosphate, and MBAS were measured in the field using CHEMetrics field test kits. Each test kit contained a sample mixing container, necessary reagent-filled ampoules, the appropriate color standards for colorimetric analysis, filters for photometric analysis, and instructions for each kit. The test kits for ammonia, nitrate, and orthophosphate used the V-2000 photometer. The test kit for MBAS uses a visual color comparator. The procedures instructed by CHEMetrics were followed.

There were two major method changes for the 2009 Dry Weather Monitoring season. The City upgraded to the V-2000 photometer and a new method of analysis was used for ammonia. The V-2000 photometer was used with the same analysis methods for nitrate and orthophosphate from pervious years, but CHEMetrics changed the upper and lower detection limits. The ammonia test kit used for the 2009 Dry Weather Monitoring season did change methods and added the use of the photometer. Historically, the City used a CHEMetrics test kit that used the Direct Nesslerization Method. This method utilizes mercury in the analysis and therefore creates hazardous waste as a by-product of the test kit. During the 2009 monitoring season, the City switched to the CHEMetrics test kit that uses the Salicylate Method which does not create hazardous waste, and was later discovered to be more accurate for surface water samples.

3.4 Laboratory Water Quality Analyses

Laboratory samples were collected at a minimum of 25% of the sites with flowing or ponded water. Samples were submitted to the City of Oceanside San Luis Rey Wastewater Treatment Plant Laboratory, EnviroMatrix Analytical, Inc., or Weston Solutions for chemistry and microbiology analysis. Below is the complete list of laboratory analytes:

- Oil and Grease
- Total Hardness
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Enterococcus Bacteria
- Total Coliform Bacteria
- Fecal Coliform Bacteria
- Chlorpyrifos
- Diazinon

All samples were analyzed using Standard Methods or EPA Methods by the laboratories.

3.5 IC/ID Investigations

Each station is visited at least once per dry weather season, if accessible and safe. When field measurements and/or laboratory analysis showed an exceedance of established action levels, the site was revisited within two business days to confirm the initial results. When follow-up sampling confirms continued exceedance of action levels, the City conducted further investigations to identify the source of the exceedance. Upstream investigations were not conducted when exceedances were not noted during the follow-up visit, as without a high constituent level to track, the investigation is unlikely to identify any sources.

The action levels used for the 2009 dry weather monitoring period are presented in Table 3. If the initial results were confirmed and an exceedance continued, an upstream investigation was initiated. In addition, any potential IC/IDs found visually or with any

other evidence of gross contamination, an IC/ID investigation was pursued immediately (e.g., substantial petroleum sheen, excessive turbidity, extremely high ammonia concentration, evidence of sewage release, etc.).

Table 3. 2009 Dry Weather Monitoring Action Levels

Analyte	Action Level
Field Measurements	
pH	6.5-9.0 pH units
Conductivity	N/A
Turbidity	N/A
Dissolved Oxygen	Not a required analyte
Temperature	N/A
Ammonia Nitrogen	1.0 mg/L
Nitrate as N	10.0 mg/L
Orthophosphate	2.0 mg/L
Surfactants (MBAS)	1.0 mg/L
Laboratory Measurements	
Oil and Grease	15 mg/L
Total Hardness	N/A
Cadmium (Dissolved)	California Toxics Rule (CTR)
Copper (Dissolved)	California Toxics Rule (CTR)
Lead (Dissolved)	California Toxics Rule (CTR)
Zinc (Dissolved)	California Toxics Rule (CTR)
Total Coliform Bacteria	50,000 MPN/100mL
Fecal Coliform Bacteria	20,000 MPN/100mL
Enterococcus	10,000 MPN/100mL
Chlorpyrifos	0.5 µg/L
Diazinon	0.5 µg/L

In general, IC/ID investigations include identifying pollution sources and correcting or eliminating them. Various methods can be used for source identification, for example, observation by following flows or discharges upstream, field measurements or laboratory analysis of water samples. The correction and elimination of identified sources may be achieved by outreach/education, best management practices (BMPs) implementation, and enforcement when necessary.

3.6 Trash Assessment

Section II.B.3.C (7) of the 2007 Municipal Permit requires Copermittees to assess the presence of trash in receiving water and urban runoff at each dry weather field screening or analytical monitoring station. A work plan for trash assessment was finalized in August of 2007 which outlined procedures and created field assessment forms to be used by the Copermittees[2]. The field form is included in Appendix B.

[2] Weston Solutions and Brown and Caldwell. 2007. Final Monitoring Workplan for the Assessment of Trash in San Diego County Watersheds. Prepared for the County of San Diego. August 30, 2007.

The assessment is primarily a qualitative assessment. The assessment includes five categories with a narrative description and a range of number of pieces. The five categories are:

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human and/or aquatic health is assessed at each site. The definitions for these threats were amended to clarify and streamline the designations in this reporting year. The following definitions are also found on the 2009 Trash Assessment Form:

- *Potential Threat to Human Health* – Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form.
- *Potential Threat to Aquatic Health* – Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic item such as vehicle batteries, or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more.

If a site falls into the poor or submarginal category, then the type of trash is denoted and ranked and the potential routes and sources are identified. Options for types, routes and sources are listed below:

Types of Trash	*Potential Routes*	*Potential Sources*
Automotive	Dumping	Household
Biohazard Waste	Littering	Construction
Business Related	Upstream	Commercial
Cigarette Butts	Unable to Determine	Industrial
Construction		School
Fabric/Clothing		Transient
Food Packaging		Unable to Determine
Food Waste		
Household		
Shopping Carts		
Toxic		
Yard Waste		

4 RESULTS

The dry weather monitoring program was conducted between May 1, 2009 and September 30, 2009. A site visit at all 67 of the primary sites was attempted, however three of those sites were inaccessible or deemed unsafe. An additional fourteen primary sites were dry. A total of 97 sites were visited, 67 were ponded or flowing and field screening was conducted, and of those, 19 were chosen for additional laboratory analysis (Table 4).

The results of the qualitative observations, flow measurements, field measurements and laboratory measurements are presented in the following sections.

Table 4. 2009 Summary of Dry Weather Monitoring Sites Visited.

Loma Alta	20	0	5	16	6	36
San Luis Rey	24	0	9	8	4	32
TOTAL	67	3	14	30	19	**97**

4.1 Qualitative Observations

Qualitative observations are a routine and important part of the field screening program. Weather conditions were recorded at each site and any evidence of dry weather flows were documented. Visual observations of the sample water and the vicinity of the sampling location such as odor, color, clarity, floatable materials, vegetation and biological organisms were also recorded. Observations from the 90 accessible sites are summarized below and presented in Table 5.

Light Conditions

Seventy three of the 90 accessible sites had sunny conditions during site visits. Five sites had overcast conditions, and 12 sites had partly cloudy conditions.

Odor

Forty seven of the sites with water had no distinguishable odor associated with the storm drain outlets. Ten sites had a musty odor, two sites smelled of rotten eggs, one site had a sewage odor, one site had a chemical odor, and six sites had an odor designated as other.

Color

Forty seven of the sites with water had no observed color. Fifteen sites had a yellow color and three sites had a brown color. One site had a green color. Another site had a grey color.

NS – Not Sampled (dry)
NA – Not Accessible

Clarity
Sixty three of the sites with water were clear with negligible suspended particles observed. Three of the sites sampled were slightly cloudy and one of the samples was opaque.

Floatable Materials
The categories of floatable materials were trash, bubbles/foam, sheen, fecal matter, and other and each site had the potential to have multiple categories of floatable materials listed. Thirty nine sites were observed to have no floatable materials. Thirty eight sites were observed to have trash in or near the sampling location. Seven sites were observed to have bubbles and/or foam. Eight sites had a visible sheen. Thirty sites observed also had floatable materials outside of the categories listed; those materials, were algae, leaf debris, grass clippings, and/or duckweed.

Deposits
The categories of deposits were coarse particulates (sediment/gravel), fine particulates, stains, oily deposits, and other. Multiple types of deposits could have been identified at each site. Fifty seven sites did not have any deposits at the sampling site. Twenty one sites had fine particulate deposits. Thirteen sites had course particulate deposits of sediment and/or gravel. One site had some type of stain at the sampling point. Two sites had an oily deposit. Three sites had deposits listed as other, which included algae, leaf debris, or grass clippings.

Vegetation
The categories for amount of vegetation present at and around the sampling area were none, limited, normal, and excessive. Thirty four sites had no vegetation present. One site had limited vegetation growth signifying some type of eradication program. Forty two sites observed had normal vegetation growth. Thirteen sites had excessive vegetation growth around the sampling area.

Biology
The categories for types of life present at the sites were insects, algae, fish, snails, and mussels/barnacles. Multiple types of life could have been identified at each site. Thirty eight of the sites had algae present; twenty four of those sites also having some other type of life present. Twenty seven sites had snails present. Fourteen sites had insects present. Three sites had fish present. Eight sites had some “other” type of life present; usually crawfish or tadpoles/frogs. Forty sites did not have any visible life present at the sampling site.

4.2 Field Water Quality Results

Field analyses were conducted at all sites with flowing or ponded water. The field analyses were conducted using a Hydrolab Quanta and CHEMetrics field test kits. A summary of the initial screening results from field analysis is presented in Table 6. If action levels were exceeded, the site was revisited to confirm the initial results and an IC/ID investigation was initiated. Follow-up investigations are presented in Section 4.4.

Bold/Highlighted values indicate action level exceedances.
NS – Not sampled/Field Equipment Malfunction.
AE – Analyst Error/Data Entry Error. While the data was lost inexplicably in the database, the analytes that exceeded action levels were recorded in a hard copy format and follow-ups were completed.

Flow Rate
Thirty two of the 67 sites with water were ponded. The flow rates at the sites with measurable flow ranged from 0.2gpm at S075 to 103gpm at L027.

Water Temperature
Water temperature was measured in the field immediately upon sample collection at each site with flowing or ponded water. Temperature readings ranged from 18.35˚C at S118 on July 1, 2009 to 32.01˚C at S115 on June 2, 2009. The median temperature was 22.60; the average temperature was 22.96˚C with a standard deviation of 3.11˚C.

pH
pH is a term used to indicate the alkalinity or acidity of a substance as ranked on a scale from 1.0 to 14.0. Acidity increases as the pH gets lower. Figure 2 presents the pH of some common liquids.

Figure 2. pH of Selected Liquids.

pH affects many chemical and biological processes in the water. For example, different organisms flourish within different ranges of pH. The largest varieties of aquatic animals prefer a range of 6.5-8.0. pH outside this range reduces the diversity in the stream because it stresses the physiological systems of most organisms and can reduce reproduction. Low pH can also allow toxic elements and compounds to become mobile and "available" for uptake by aquatic plants and animals. This can produce conditions that are toxic to aquatic life. Changes in acidity can be caused by atmospheric deposition (acid rain), surrounding rock, and certain wastewater discharges. An unusually high pH reading could be an indicator of an industrial discharge in the sample area; therefore, pH is used as an indicator of illicit discharges.

The pH values taken from the ponded or flowing water ranged from 6.33 at A013 to 10.03 at S115. The median pH value observed during field screening was 7.80; the average pH value was 7.72 with a standard deviation of 0.6. The three sites that were outside of the acceptable range were A013, S115, and S111. A013 was the only site that had pH levels below the acceptable range. The area around A013 is known to have a high water table with geologic conditions that cause low pH, foam, and orange deposits. S111 and S115 are associated with concrete channels or pipes. Concrete is known to be basic and have high pH values associated with the cement components. This may be a cause of the high pH values. In

addition the temperature of the sample in both cases was greater than 30˚C which may also play a role in the pH value

Conductivity

Conductivity is a measure of the ability of water to pass an electrical current. Conductivity in water is affected by the presence of inorganic dissolved solids such as chloride, nitrate, sulfate, and phosphate anions (ions that carry a negative charge) or sodium, magnesium, calcium, iron, and aluminum cations (ions that carry a positive charge). Organic compounds like oil, phenol, alcohol, and sugar do not conduct electrical current very well and therefore have a low conductivity when in water. Conductivity is also affected by temperature: the warmer the water, the higher the conductivity. In addition, discharges to streams can also change the conductivity depending on their make-up. A failing sewage system would raise the conductivity because of the presence of chloride, phosphate, and nitrate; an oil spill would lower the conductivity. The conductivity values ranged from 0.17 mS/cm at B022 to 13.08 mS/cm at B023. The median conductivity value observed during field screening was 3.03. The average conductivity value was 3.84 mS/cm with a standard deviation of 2.78.

Turbidity

Turbidity is a measure of water clarity, how much of the material suspended in water decreases the passage of light through the water. Suspended materials include soil particles (clay, silt, and sand), algae, microbes and other substances. Turbidity can affect the color of the water.

Higher turbidity increases water temperatures because suspended particles absorb more heat. This, in turn, reduces the concentration of dissolved oxygen because warm water holds less dissolved oxygen than cold. Higher turbidity also reduces the amount of light penetrating the water, which reduces photosynthesis and the production of dissolved oxygen. Suspended materials can clog fish gills, reducing resistance to disease in fish, lowering growth rates, and affecting egg and larval development. As the particles settle, they can blanket the stream bottom, especially in slower waters, and smother fish eggs.

Turbidity can be useful as an indicator of the effects of runoff from construction, agricultural practices, logging activity, discharges, and other sources. Turbidity often increases sharply during a rainfall, especially in developed watersheds, which typically have relatively high percentages of impervious surfaces. The flow of storm water runoff from impervious surfaces rapidly increases stream velocity, which increases the erosion rates of stream banks and channels. Turbidity can also rise sharply during dry weather if earth-disturbing activities are occurring in or near a stream without erosion control practices in place. The turbidity values ranged from <1 at ten sites to 100 NTU at L004. The median turbidity value observed during field screening was 4.6 NTU. High turbidity values were usually caused by the nature of low flow sampling with a syringe. This was the case at L004, a clean sample was not possible due to the decaying organic matter on the bottom of the channel that had less than half an inch of water.

Dissolved Oxygen
Dissolved oxygen analysis measures the amount of gaseous oxygen dissolved in an aqueous solution. Oxygen gets into water by diffusion from the surrounding air, by aeration, and as a waste product of photosynthesis.

Adequate dissolved oxygen is necessary for good water quality. Oxygen is a necessary element to all forms of life. Natural stream purification processes require adequate oxygen levels in order to provide for aerobic life forms. As dissolved oxygen levels in the water drop below 5.0 mg/L, aquatic life is put under stress. The lower the concentration, the greater the stress is on aquatic life. The dissolved oxygen values ranged from 0.93 mg/L at L029 to 19.29 mg/L at S111. The median dissolved oxygen value observed during field screening was 6.84 mg/L. All but one of the sites that had DO levels less than 4.0 mg/L were ponded and frequently had higher turbidity and nutrient levels, indicating nutrient breakdown.

Ammonia
Ammonia is a common indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment, however, in higher quantities it can become toxic to fish and other organisms. The ammonia values range from <0.1 to >10 mg/L. The median ammonia value observed during the field screening was 0.36 mg/L. Four of the five sites that exceeded the action level for ammonia were ponded and were likely caused by decaying organic matter in the ponded water.

Orthophosphate
Both phosphorus and nitrogen are essential nutrients for the plants and animals that make up the aquatic food web. Since phosphorus is the nutrient in short supply in most fresh waters, even a modest increase in phosphorus can, under the right conditions, set off a chain of undesirable events in a stream including accelerated plant growth, algae blooms, and low dissolved oxygen. Locally, in San Diego County, however, the pH of soils here is higher than 8.0, which creates an unavailable to plantlife.

There are many sources of phosphorus, both natural and human. These include soil and rocks, wastewater treatment plants, runoff from fertilized lawns and cropland, failing septic systems, runoff from animal manure storage areas, disturbed land areas, drained wetlands, water treatment, and commercial cleaning preparations. The orthophosphate values ranged from <0.3 mg/L to 6.58 mg/L. The median orthophosphate value observed during field screening was 0.82 mg/L.

Nitrate-N
Nitrate is the most readily available form of nitrogen for plant uptake and is a limiting factor in plant growth. Nitrates are naturally occurring in soil and rocks, but are also added to watersheds from anthropogenic sources such as fertilizers, failing septic systems, and animal waste. The nitrate-N values from the 2009 dry weather monitoring season ranged from 0.2 to >68 mg/L at S106. The median nitrate-N value was 1.03 mg/L. Only site S106 exceeded the

nitrate action level. This site has historic nitrate exceedances primarily from groundwater seepage.

Surfactants (MBAS)

Surfactants or MBAS were previously analyzed in the laboratory, but in the current permit are required as part of the field screening. Surfactants are analyzed to detect detergent pollution from residential, commercial, or industrial washing activities. MBAS results were greater than or equal to the action level of 1.0 mg/L at eight of the initial screening sites. Half of those sites had conductivity results greater that 5 mS/cm. Several Copermittees reported exceedances in the field screening data at sites with higher conductivity levels, but when the samples were taken to the laboratory, there were no exceedances. In the City of Oceanside there were eight exceedances of MBAS action levels. Four of those exceedances were followed up with a laboratory sample where all results were below the detection limit. Three others were below the field test kit detection limit upon confirmation. One site continued to exceed, but was from ponded water with no upstream influence.

4.3 Laboratory Water Quality Results

Laboratory analysis was conducted at 19 sites, representing 28% of the sites with ponded or flowing water. Laboratory chemistry results are summarized and presented in Table 7 and microbiology results in Table 8. If action levels were exceeded, the site was revisited to confirm the initial results and an IC/ID investigation was initiated. Follow-up investigations are presented in Section 4.4 and Appendix C.

Oil and Grease

Oil and grease analysis is used to detect hydrocarbon pollution from a variety of sources including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities. Oil and grease was detected at two sites, but both were well below the action level of 15 mg/L.

Total Hardness

Total hardness measures the amount of polyvalent cations in water. It generally represents calcium and magnesium ions in a water sample because they are the most common cations. Results are expressed in mg/L of $CaCO_3$. The California Toxics Rule (CTR) applies hardness-based water quality objectives to dissolved metals. Increasing hardness has the effect of decreasing the toxicity of metals[3]. The hardness values ranged from 340 mg/L of $CaCO_3$ at B104 to 3160 mg/L of $CaCO_3$ at A016 with a median value of 1090 mg/L of Ca CO_3. The average hardness value was 1139 mg/L of $CaCO_3$ and a standard deviation of 699 mg/L of Ca CO_3. The two sites with hardness values over 2000 mg/L of $CaCO_3$ were in the Agua Hedionda watershed near the intersection of Lake and Cannon; an area with a high groundwater table and historical geologic crystalline formations.

Dissolved Metals

Metal concentrations in the environment can originate from a variety of sources including automobiles, automobile repair facilities, car washing, and industrial activities, as well as natural geologic processes. The laboratory samples collected during the 2009 Dry Weather Monitoring Program were analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Results were compared to the hardness-based CTR CMC (1-hour) criterion. Dissolved cadmium equaled the action level at one site, A013, and an upstream investigation was initiated. There were no exceedances of dissolved copper or lead. Dissolved zinc exceeded the CTR criterion at site B002, but was below the action level upon confirmation.

Chlorpyrifos and Diazinon

Chlorpyrifos and diazinon are organophosphate pesticides used to control insects, fleas and ticks. As of December 31, 2004, it became unlawful to sell diazinon outdoor, non-agricultural products. Chlorpyrifos can now only be used for nursery production, golf courses and road medians. Neither chlorpyrifos nor diazinon were detected at any of the laboratory sampling sites.

Total Coliform Bacteria
Total coliform bacteria are mostly harmless bacteria that are ubiquitous in the environment living in soil, water, and mammalian digestive tracts. Water samples are analyzed for total coliform bacteria to indicate the presence of other more harmful pathogenic (disease causing) organisms that are associated with coliform but are difficult to test for because they are present in much smaller quantities. During the dry weather monitoring period total coliform results ranged from 800 MPN/100mL to 300,000 MPN/100 ml. Seven of the 19 sites sampled for laboratory analysis exceeded total coliform action levels.

Fecal Coliform and Enterococcus
Members of two bacteria sub-groups, fecal coliforms and enterococcus, are used as indicators of possible sewage contamination because they are specifically found in human and animal digestive tracks. Although they are generally not harmful themselves, they indicate the possible presence of pathogenic bacteria, viruses, and protozoans that also live in human and animal digestive systems. Since it is difficult, time-consuming, and expensive to test directly for the presence of a large variety of pathogens, these fecal indicator bacteria are used. Sources of fecal contamination to surface waters include wastewater treatment plants, on-site septic systems, domestic and wild animal manure, and storm water runoff.

In addition to the possible health risk associated with the presence of elevated levels of fecal bacteria, they can also cause cloudy water, unpleasant odors, and an increased oxygen demand. Fecal coliform results ranged from 20 MPN/100mL to 80,000 MPN/100 ml. Four of the 19 sites sampled for laboratory analysis exceeded the fecal coliform action level. Enterococcus results ranged from 82 MPN/100mL to 72,700 MPN/100mL. Two of the 19 sites sampled exceeded the Enterococcus action level. Two sites, B022 and S122, exceeded all three microbiology action levels.

4.4 IC/ID Investigations

Sites that exceeded one or more action level were revisited and resampled to confirm the initial result. If the confirmation result also exceeded an action level, an IC/ID investigation was initiated. Twenty four sites had one or more action level exceedances that required confirmation. Eighteen of those sites, upon confirmation, required an IC/ID investigation

The most common exceedance was for orthophosphate; 11 sites had an initial exceedance. Seven of those sites were ponded and the remaining four had a flow of 3gpm or less. Eight of the 11 sites required an IC/ID investigation. Eight sites had an initial exceedance for MBAS (surfactants). Four of those sites were followed up with laboratory MBAS analysis. All four were below the detection limit. Three of the remaining sites were below the action level upon confirmation and just one remained exceeding; this one had ponded water with no upstream influence. Five of the sites had an initial exceedance for ammonia; four of those sites were ponded and three of those required an IC/ID investigation. Figure 3 provides the number of sites by watershed exceeding the initial field screening action levels.

Figure 3. Number of Initial Field Screening Exceedances by Analyte and Watershed.

Two of the 19 sites sampled for laboratory chemistry analysis required an upstream investigation. B002 had an initial exceedance for dissolved zinc, but upon confirmation, the results were below the action level. A013 exceeded the action level for dissolved cadmium. Groundwater is the suspected source after completion of the upstream investigation. Seven of the 19 sites chosen for laboratory analysis had at least one indicator bacteria exceedance. There were seven exceedances for total coliforms, four for fecal coliforms, and two for Enterococcus. Six of the seven total coliform exceedances required an upstream investigation. Two of the four fecal coliform confirmation samples and both of the Enterococcus confirmation samples required an IC/ID investigation. Figure 4 provides the number of sites by watershed that exceeded the microbiology action levels.

Appendix C contains a detailed description of the confirmation and IC/ID investigations at each site and the actions that were taken to reduce contaminants.

Figure 4. Number of Microbiology Exceedances by Analyte and Watershed.

4.5 Trash Assessment

Eighty one sites were assessed for trash amount and extent. The majority of sites was in the mid-range of the assessment and was either suboptimal, marginal, or submarginal. Table 9 and Figure 5 present a summary of trash assessment throughout the City. Loma Alta and San Luis Rey Watersheds were again the only watersheds to include sites with a “poor” rating. The distribution across watersheds is presented in four charts that make up Figure 6. In addition, Figures 7 and 8 provide an orthophotograph of the San Luis Rey and Carlsbad Watersheds and the distribution of trash assessment ratings throughout each watershed.

Figure 8. 2009 Trash Assessment for the Carlsbad Watersheds.

4.5.1 Threat to Human or Aquatic Health

The threat to human and aquatic health was assessed at each site. Detailed definitions for these threats are found in Section 2.8. In general, a threat to human health includes trash and debris that have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria or have the potential for physical harm. This year, the presence of mosquito larvae was specifically added as cause for a threat to human health if the water was ponded due to trash. A threat to aquatic health includes trash and debris such as small floatable material that is persistent and can be transported long distances that resemble food and may be ingested. The threat also includes debris that has the potential for entanglement or oil or chemicals that could harm aquatic life.

Two sites (2% of all sites) were deemed a threat to human health in the 2009 dry weather survey; sites B022 and L037. Site B022 was an assessment of both the storm drain and receiving water. Several dirty diapers were found at this site in the receiving water. An ongoing problem at this site appears to be residents of the condominium complex throwing trash into the channelized creek. A used diaper was also found at site L037.

Three sites (3% of all sites) were deemed a threat to aquatic health; Sites L008, L110, and S118. Sites L008 and L110 had small Styrofoam pieces that can be mistaken for food by aquatic life. Site S118 had spray paint cans present.

4.5.2 Submarginal and Poor Site Assessment

Twenty one of the 88 sites (24%) assessed were deemed submarginal and three of the 88 (3%) were deemed poor. Table 10 presents a summary of the sites that were submarginal and poor and identifies the ranking for the types of trash found. For example, a rank of “1” for Household and “2” for Food Packaging would mean that there was more household waste than food packaging waste. In addition, up to two potential routes and sources were identified and are listed in the Table 10.

Sixty nine percent of the trash found in submarginal and poor sites fell into the household or food packaging categories (Figure 9). There was no “automotive,” “biohazard,” “food waste,” or “toxic” waste found at any of the assessment locations. The two most common potential routes of trash entering the area were littering (49%) or upstream (42%). Household waste was the most common potential source of the trash (56%). Eighteen percent of the trash also listed “transient” as a potential source and 16% listed “commercial” as a potential source (Figure 10).

Table 10. Summary of Trash Type and Potential Routes and Sources for Submarginal and Poor Sites During the 2008 Dry Weather Monitoring Program.

5 DISSCUSION

5.1 2009 Dry Weather Summary

The 2009 Dry Weather Monitoring season marked the second year for implementation of Order No. 2007-0001, the San Diego Region's Municipal Permit. In the City's 2007 JURMP Update, sites were reassessed and procedures were refined to fit the new requirements. The City has a list of 67 primary sites and 28 alternate sites to visit between May 1 and October 30 of each year. If a primary site is inaccessible or dry, an alternate site, ideally from the same watershed, is screened. If samples from any site with ponded or flowing water exceed Dry Weather Monitoring action levels, those sites are resampled within two business days. If the site continues to exceed action levels then an IC/ID investigation is initiated. A trash assessment is completed at each site.

During the 2009 monitoring season, the 67 primary sites were visited. Three of those sites were inaccessible and an addition fourteen were dry. All 28 alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (28%).

Twenty four sites required confirmation for an initial field screening exceedance. Of those, 18 required an IC/ID investigation. Figure 11 represents the percentage of sites in each watershed that exceeded an initial field screening analyte. The most common exceedance was for orthophosphate.

Figure 11. Percentage of Initial Exceedances in Each Watershed.

Of the 19 sites chosen for laboratory analysis, two sites had an exceedance for chemistry results. A013 exceeded the CTR for dissolved cadmium and B002 for dissolved zinc. There was an upstream investigation at A013 and groundwater is the suspected source as no discharges were found. Confirmation samples at B002 found results for dissolved zinc under the action level. For microbiology results, there were seven exceedances for total coliforms, four for fecal coliforms, and two for Enterococcus. Six of the seven total coliform exceedances required an upstream investigation. Two of the four fecal coliform confirmation samples and both of the Enterococcus confirmation samples required an IC/ID investigation.

The majority of exceedances were from ponded water. The prevailing source of ponded and flowing water was from residential and commercial over-irrigation. With the continual push for water conservation in light of changing water availability, several avenues are being implemented to reach the general public about water conservation which will in turn improve water quality. On May 9, 2009, the Oceanside City Council voted to declare a Drought Level 2 with new water use restrictions for residents and businesses taking effect on July 1, 2009. Level 2 restrictions include:

- No washing down of paved surfaces.
- Stop water waste from inefficient landscape irrigation.
- Water before 10:00am and after 6:00pm.
- Wash vehicles using a bucket and hand-held hose equipped with a positive shut-off nozzle.
- Serve and refill water in restaurants only upon request.
- Offer hotel guests the option of not laundering towels and linens daily.
- Limit residential and commercial landscape irrigation to no more than 3 assigned days per week.
- Water landscaped areas, including trees and shrubs not irrigated by a landscape irrigation system, no more than 3 assigned days per week using a bucket, hand held hose with positive shut-off nozzle, or low-volume non-spray irrigation.
- Limit lawn watering and landscape irrigation using sprinklers to no more than 10 minutes per water station per assigned day.
- Sop operating ornamental fountains unless re-circulated water is used.
- Repair all leaks within 72 hours of notification by the City of Oceanside.

These efforts may be a reason for the increase in Dry Weather Monitoring sites without any ponded or flowing water. Staff outreach to respond to complaints, violations, and Dry Weather Monitoring exceedances include face-to-face outreach by two Clean Water Program Compliance Inspectors. Historical mail-outs have yielded little response. New door-hangers that can be personalized were created and utilized by the Inspectors when inhabitants were not home. In addition, on their daily work assignment the City Water Utilities Department water meter crew identifies and reports city-wide over-irrigation runoff cases to the Clean Water Program Compliance Inspectors for further follow-up investigations. In addition to two new inspectors, the Water Utility Department hired an outreach coordinator specifically for water conservation education in November of 2008.

The Water Conservation Specialist and Clean Water Program Environmental Specialists conducted water conservation and water quality outreach in many forms. Informational inserts, press releases, and fliers have been placed in water bills and distributed throughout the reporting year. The inserts include information about water saving incentive programs, community workshops, water-wise landscape suggestions, and repeated information about reducing water consumption particularly on outside landscaping. Outreach is also being provided on the local public access channel, the Oceanside Magazine, public education to schools, scout troops, and having staff available at community events such as Harbor Days and the local farmer's market. Table 11 provides a summary of the types and number of outreach provided to the community to reduce water waste and improve water quality.

Table 11. Summary of Water Conservation and Water Quality Outreach for Fiscal Year 2008/09.

Type of Outreach	Number of Events in 2008/09	Approximate Attendance for Reporting Year
Booths at Community Events	9	2,700
Speaker's Bureau to Community Groups	16	680
Youth Education in Schools	9	787
Landscape Workshops	4	254
Local Public Television PSAs	6	N/A
Utility Bill Stuffers	2	N/A
Press Releases/Flyers	14	N/A

5.2 Historical Data Comparison

In February 2001, the San Diego Regional Water Quality Control Board issued Order No. 2001-01 to the communities of San Diego County. As part of Order 2001-01, the City of Oceanside was required to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program. The Dry Weather Program under this order was implemented in the 2002 Dry Weather season. This section provides a comparison of the last seven years of dry weather data.

The majority of exceedances from the last several years are nutrients (nitrate, orthophosphate, and ammonia) and bacterial indicators (total coliform, fecal coliform, and Enterococcus). Table 12 provides a summary of the previous seven years of dry weather monitoring data including the number of sites monitored and the number of exceedances of these specific field and laboratory analytes.

Orthophosphate exceedances have increased gradually over the past several years, however, ammonia exceedances have decreased. The majority of those sites in both cases were ponded water, where decaying plant debris may be a cause of spikes in the results. Bacteria levels have decreased and fewer sites are exceeding action levels.

Table 12. 2002-2009 Dry Weather Monitoring Report Data Comparison.

Monitoring Year	2009	2008	2007	2006	2005	2004	2003	2002
Total No. of Sites Visited	97	85	93	99	100	68	99	290
No. of Sites Sampled for Initial Field Screening	67	66	61	54	44	18	56	56
No. of Sites Exceeding Nitrate Action Level*	1	3	3	3	2	NS	3	11[1]
No. of Sites Exceeding Orthophosphate Action Level	11	13	12	6	8	2	14	11
No. of Sites Exceeding Ammonia Action Level	5	9	15	8	4	17	49	50
No. of Sites Exceeding MBAS Action Level	8	13	N/A	N/A	N/A	N/A	N/A	N/A
No. of Sites Sampled for Laboratory Analysis	19	19	18	19	17	19	16	11
No. of Sites Exceeding Total Coliform Action Level	7	7	9	12	17	11	0	4
No. of Sites Exceeding Fecal Coliform Action Level	4	2	4	5	4	2	0	1
No. of Sites Exceeding Enterococcus Action Level	2	2	2	2	4	3	2	0

1-In the 2007 Dry Weather Monitoring Report, a discussion of the reporting of historical nitrate data was presented. Previous reports indicated that nitrate reported in monitoring years 2002, 2003, 2005 and 2006 may have been reported as NO_3, as opposed to NO_3-N. Without converting to the appropriate form of nitrate to compare to the set action levels, the number of exceedances was likely erroneously high. These numbers have been changed to reflect the conversion to NO_3-N, with the exception of the 2002 monitoring year. Without notes or written discussions to verify the lack of conversion, the data will continue to be reported as originally printed.

5.3 Trash Assessment

The 2009 Dry Weather Monitoring Program is the second year for assessing the amount and extent of trash at each dry weather monitoring location. Approximately 73% of the sites were either "optimal", "suboptimal", or "marginal" and did not require the detailed trash evaluation. Twenty four percent of the sites were "submarginal" and 3% of the sites were "poor". The San Luis Rey Watershed continued to have the highest percentage of "submarginal" and "poor" sites (32%), but that percentage was down from last year (46%). Comparison statistics for the trash assessment are presented in Table 13.

The majority of the trash found in the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common source of the food packaging and household wastes are households and transients. These are consistent results with the previous trash assessment year.

Two sites (2% of all sites) were deemed a threat to human health in the 2009 dry weather survey. At both sites, dirty diapers were observed. Three sites (3% of all sites) were deemed a threat to aquatic health. Two sites had small Styrofoam or plastic pieces that be mistaken for food by aquatic life. One site had spray paint cans present.

Table 13. 2008 – 2009 Trash Assessment Comparison.

Monitoring Year	2009	2008
Total No. of Sites Visited	88	81
No. of Sites Considered Optimal, Suboptimal, or Marginal	64	53
No. of Sites Considered Submarginal or Poor	24	28
No. of Sites With Better Rating than Previous Year	23	N/A
No. of Sites With Worse Rating than Previous Year	13	N/A
Two Most Common Types of Trash	Food Packaging (38%), Household (31%)	Food Packaging (36%), Household (31%)
Two Most Common Potential Routes	Littering (49%), Upstream (42%)	Littering (46%), Upstream (40%)
Two Most Common Potential Sources	Household (56%), Transient (18%)	Household (55%), Transient (27%)
No. of Sites with a Threat to Human Health	2	3
No. of Sites with a Threat to Aquatic Health	3	9

The 2008 trash assessment was used to identify sites that would be good candidates for City-sponsored and private clean-up events. The City of Oceanside coordinates four clean-up events per year. These four clean-up events include multiple sites throughout the watershed at each event. In addition to the City coordinated events, 12 times on average throughout the year, private citizen groups conduct beach and watershed clean-ups with City supplies and council. Both of these types of clean-ups utilized the 2008 trash assessment to identify high priority sites which were then included as a location for a clean-up.

In addition to clean-up events, the City identified two key sites where a structural and non-structural BMP was needed. The historic and future trash assessments will help in identifying these high priority areas for future BMP placement. The two BMPS are discussed below.

Trash Trap at the Oceanside Municipal Golf Course (Dry Weather Site S119)

Staff at the City of Oceanside Municipal Golf Course had noted that trash and debris was collecting in Pilgrim Creek, which runs in the middle of the course, after storm events. The source of the trash and debris was identified as a residential area just south of the golf course across Douglas Drive. City staff installed a trash trap downstream of this priority residential area and upstream of the municipal golf course in the open channel that parallels the driving range. The goal of this trap was to capture trash and organic debris coming from the residential neighborhood before it enters the golf course and Pilgrim Creek. This trash trap was installed in March 2009.

After installation there was one rain event that captured 40 pounds of trash and organic debris. During future reporting years, the volume or weight of trash will be tracked. See the photos below of the newly installed trash trap and a photo of the effectiveness of the trash trap in stopping debris from reaching the waterway.

Trash trap immediately after installation

Trash trap with debris

Non-Structural, Administrative BMP for Trash from Oceanside Unified School District (Dry Weather Site L110)

Public Works staff identified a section of MS4 that had a large amount of tennis balls and other trash, such as plastic bottles, after storm events where Garrison Creek daylights off of Mesa Boulevard. It appeared that a large amount of the trash, including tennis balls, softballs, plastic drink bottles, and food wrappers, was likely coming from El Camino High School and Martin Luther King, Jr. Middle School. The Clean Water Program Coordinator notified the Maintenance and Operations Director of the Oceanside Unified School District of the problem. On January 22, 2009, the Director notified all area principals about the accumulation of trash and asked the principals to share the photos with staff and students using school newspapers, assemblies, and brochures.

Trash accumulation at Garrison Creek.

6 CONCLUSIONS

The City of Oceanside's boundaries include two major watersheds; the San Luis Rey Watershed, which includes the San Luis Rey River, and the Carlsbad Hydrologic Unit, which consists of Loma Alta Creek, Buena Vista Creek, and Agua Hedionda Creek. As part of Order 2001-01, the San Diego Regional Water Quality Control Board required all Copermittees to develop and implement a Dry Weather Field Screening and Analytical Monitoring Program beginning in 2002. The purpose of the program was to detect and eliminate illicit connections and illegal discharges (IC/IDs) to the storm drain system, minimizing the negative impacts of human activities on these water bodies. In 2007 the San Diego Regional Water Quality Control Board issued a new five-year permit for Receiving Waters and Urban Runoff Monitoring and Reporting, Order No. 2007-0001. The Copermittees in San Diego County were required, as part of their Jurisdictional Urban Runoff Management Program (JURMP), to update their Dry Weather Program to meet or exceed the requirements of Order No. 2007-0001. The key changes to the 2007 Municipal Permit were adding a trash assessment component and requiring follow-up investigations to be conducted within two business days of receipt of results.

This report presents the results of the City of Oceanside's 2009 Dry Weather Field Screening and Analytical Monitoring Program which includes the revisions to the program required by Order No. 2007-0001.

The City's Dry Weather Monitoring Program, as outlined in the 2008 JURMP Update with site updates from 2008, includes 67 primary monitoring stations and 28 alternate monitoring stations. If one of the primary stations was dry, alternate stations were visited until a site with ponded or flowing water was found and field screening was completed. Trash assessments were completed at every accessible site, whether the site was dry or had water.

During the 2009 monitoring season, the 67 primary sites were visited. Three of those sites were inaccessible and an additional fourteen were dry. Twenty eight alternate sites were visited and two new sites with flowing or ponded water were added to the alternate list inventory. Nineteen of the ponded or flowing sites had additional analysis completed in the lab for chemistry and microbiology (28%).

Twenty four sites required confirmation for an initial field screening exceedance. Of those, 18 required an IC/ID investigation. The most common exceedance was for orthophosphate. Of the 19 sites chosen for laboratory analysis, two sites had an exceedance for chemistry results. A013 exceeded the CTR for dissolved cadmium and B002 exceeded the CTR for dissolved zinc. There was upstream investigation conducted at A013 and groundwater is suspected. Confirmation results at B002 did not show a continued exceedance for zinc. For microbiology results, there were seven exceedances for total coliforms, four for fecal coliforms, and two for Enterococcus. Six of the seven total coliform exceedances required an upstream investigation. Two of the four fecal coliform confirmation samples and both of the Enterococcus confirmation samples required an IC/ID investigation.

A historical comparison of action level exceedances shows that while orthophosphate exceedances are the predominant field analyte exceedance, there were fewer in 2009 than the previous two years. Ammonia exceedances have decreased. This may be due, in part, to a change in the analytical field test kit method. In practice and in discussion with with other Copermittees the 2009 method seems more accurate for environmental samples (as opposed to drinking water samples). Bacteria exceedances were similar to the previous year and continue to have fewer sites exceeding action levels.

Similar to the 2008 dry weather results, in 2009 a little less than half of the sites that were sampled were ponded. Many of these did not have a flowing source upstream. Exceedances at these sites may be attributed to periodic upstream flow and/or the decay of organic material in the ponded water to cause Dry Weather exceedances. More sites were dry this year as compared to the 2008 season; 19 as opposed to ten the previous year.

The most common source of flowing water was residential and commercial landscape over-irrigation. In addition to the restrictions, the City of Oceanside Water Utilities Department increased public outreach and awareness of water conservation needs and measures between the summer of 2008 and the summer of 2009. This outreach included hiring a part-time Water Conservation Specialist to assist in presentations to HOAs and community groups, and on the local public access channel and written outreach for inserts in water bills and press releases. The education effort is described in detail in Section 8 of the Oceanside JURMP Annual Report, but it did include a newsletter topic in the fall of 2008 addressing water conservation tips to eliminate water runoff and three minute public service announcements including a topic addressing irrigation runoff. Staff outreach to respond to complaints, violations, and Dry Weather Monitoring exceedances included face-to-face outreach by two Clean Water Program Compliance Inspectors. Historical mail-outs have yielded little response. New door-hangers that can be personalized were created and utilized by the Inspectors when residents were not home.

The 2009 Dry Weather Monitoring Program is the second year for assessing the amount and extent of trash at each dry weather monitoring location. Approximately 73% of the sites were either “optimal”, “suboptimal”, or “marginal” and did not require the detailed trash evaluation. Twenty four percent of the sites were “submarginal” and 3% of the sites were “poor”. The San Luis Rey Watershed continued to have the highest percentage of “submarginal” and “poor” sites (32%), but that percentage was down from last year (46%). The majority of the trash found in the sites that required further trash evaluation was either food packaging or household waste. These items were most commonly at the sites via littering or from upstream. And, the most common source of the food packaging and household wastes are households and transients. These are consistent results with the previous trash assessment year.

Follow-up investigations continue to be conducted at sites with ongoing exceedances. Water conservation and urban runoff outreach, as well as beach and creek clean-ups continues year-round as the City continues the effort to detect and eliminate illicit discharges to the storm drain system.

San Diego Stormwater Copermittees

Land Use Types for Dry Weather Monitoring

(Adopted by the Dry Weather Monitoring Workgroup, April 20, 2004)

1. **Residential**

   Residential (general)
   Single- and multi-family homes, mobile home parks, etc.

   Rural residential (For the County of San Diego and other appropriate Copermittees)
   Single family homes located in rural areas with lot sizes of approximately 1 to 10 acres. Rural residential estates may have small orchards, fields or small storage buildings associated with the residential dwelling unit, etc.

2. **Commercial**

   Offices, schools, shopping centers, auto dealerships, government/civic centers, cemeteries, churches, libraries, post offices, fire/police stations, military use, jails, prisons, border patrol holding stations, dormitories, hotels, motels, resorts, and casinos, etc.

3. **Agricultural**

   Orchards, vineyards, nurseries, greenhouses, flower fields, dairies, livestock, poultry, equine ranches, row crops and grains, pasture, fallow, etc.

4. **Industrial**

   Shipbuilding, airframe, aircraft manufacturing, industrial parks, manufacturing uses such as lumber, furniture, paper, rubber, stone, clay, and glass; auto repair services/recycling centers; warehousing, wholesale trade; mining, sand and gravel extraction, salt evaporation; junkyard, dumps/landfills; auto wrecking/dismantling and recycling centers, etc.

5. **Parks**

   Recreation areas and centers, neighborhood parks, wildlife and nature preserves, golf courses, accessible sandy areas along the coast or major water bodies allowing swimming and picnicking, etc.

6. **Open**

   Vacant and undeveloped lands, etc.

2009 Trash Assessment Form

SITE ID: _____ **DATE:** _____

LOCATION: _____ **TIME:** _____

OBSERVER: _____

PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE): _____

ESTIMATED AREA OF ASSESSMENT L X W (FT): _____

Amount and Extent of Trash	
EVALUATION OF TRASH INCLUDES: ☐ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH**	
☐ **Optimal**	On first glance, no trash visible. Little or no trash (10 pieces) evident when evaluated area is closely examined for litter and debris.
☐ **Suboptimal**	On first glance, little or no trash visible. After close inspection small levels of trash (10-50 pieces) evident in evaluated area.
☐ **Marginal**	Trash is evident in low to medium levels (51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present.
☐ **Submarginal**	Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present.
☐ **Poor**	Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (400 pieces).

In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

Site Evaluation for Potential Threat to Human Health and or Aquatic Health (applies to area of assessment)	
☐ **Potential Threat to Human Health**	Presence of more than one of, or a combination of the following items: hypodermic needles or other medical waste; used diapers, animal waste, or human feces; any toxic substance such as chemical containers, vehicle batteries, or fluorescent light bulbs. Alternatively high prevalence of any one item (e.g. Greater than 50 items that present a puncture or laceration hazard); or observations of mosquito larvae directly observed in water ponded due to trash. All subject to best professional judgment. Describe potential threat on back of form.
☐ **Potential Threat to Aquatic Health**	Large amount* of persistent, buoyant litter such as: hard or soft plastics, balloons, Styrofoam (equivalent to a cup), or large amount of settleable, degradable and nontoxic debris; cigarette butts. Presence of more than one of, or a combination of the following items: toxic items such as vehicle batteries, or spray cans; any evidence large clumps of yard waste from landscape maintenance such as yard waste or dumped leaf litter (not naturally occurring). All subject to best professional judgment. Describe potential threat on back of form. *Large amount is defined as 50 pieces or more.

- **Complete the following section for Submarginal, and Poor Evaluations ONLY**

TYPE	Ranking or Count by Type	POTENTIAL ROUTE (CHECK UP TO 2)				POTENTIAL SOURCE (CHECK UP TO 2)						
		Dumping	Littering	Upstream	Unable to determine	Household	Construction	Commercial	Industrial	School	Transient	Unable to determine

APPENDIX C

2009 IC/ID INVESTIGATIONS

THIS PAGE INTENTIONALLY LEFT BLANK

A004a	Dry Weather 2009	7/27/2009

Site Summary:

Site A004a is 48-inch RCP located below Spinnaker Ridge adjacent to the pump station off of Cannon Road. The outlet drains the residential areas north and south of the outlet.

Investigatory Actions

Date	Action	Staff
7/27/2009	Initial investigation conducted. Analytical Screening showed exceedances for the following parameters: Total Coliforms: 130,000 MPN/100mL Fecal Coliforms: 22,000 MPN/100mL Flow was estimated at 1.7 gpm.	Witheridge
8/5/2009	Follow-up investigation conducted for bacteria (official results were sent on 8/17/2009, but preliminary results were used to initiate the follow-up): Total Coliforms: 900,000 MPN/100mL Fecal Coliforms: 80,000 MPN/100mL Flow was less and estimated at 0.4 gpm. An upstream investigation was initiated. The MS4 system diverges. One line flows from the south and the other from the east. The line from the south had a trickle of water, but was not able to be sampled (A004a-A). The line from the east was sampled (A004a-B): Total Coliforms: >1,600,000 MPN/100mL Fecal Coliforms: 220,000 MPN/100mL Flow from this manhole increased while sampling. Samples were collected after the flow increased.	Witheridge
9/30/2009	The investigation continued upstream on the MS4 line to the east. The same manhole was resampled (A004a-B): Total Coliforms: 110,000 MPN/100mL Fecal Coliforms: 11,000 MPN/100mL Flow was approximated at 0.5 gpm. The next manhole upstream, on Nighthawk Way was	Witheridge/ Gremmels

<table>
<tr>
<td></td>
<td>visited. There was overland flow that was identified as over-irrigation from a home. The flow, estimated at 0.25 gpm, was sampled prior to entering the gutter (A004a-C):
<table>
<tr><td>Total Coliforms</td><td>80,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>1,400 MPN/100mL</td></tr>
</table>

However flow was also coming from the MS4 further east. A sample was not possible from this manhole due to depth and low flow.

This flow was traced upstream to Viewridge and was identified as overland flow coming primarily from area drains of two homes. The overland flow, estimated at 0.25 gpm, entering the MS4 was sampled (A004a-G):
<table>
<tr><td>Total Coliforms</td><td>80,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>23,000 MPN/100mL</td></tr>
</table>
</td>
<td></td>
</tr>
</table>

Investigatory Status

The source of the flow was identified as likely over-irrigation from the area drains of the residential community to the northeast of the outfall. This is a gated-community with single-family homes. Three homes were identified as the major contributors. On October 7, 2009, contact with the homeowners was attempted by Clean Water Program Inspectors, however no homeowners were present. Educational materials were left at the residences in the form of residential brochures.

Attachments

A004a-C

A004a-G

A013	Dry Weather 2009	7/29/2009

Site Summary:

Site A013 is a 36-inch RCP located at the intersection of Lake Boulevard and Alameda Drive, south of Agua Hedionda Creek. The outlet drains the residential areas immediately south of the site.

Follow-up Actions

Date	Action	Staff
7/29/2009	Initial investigation conducted. Field screening showed an exceedance for pH. The lab results showed an exceedance for Total Coliform: pH: 6.33 Total Coliforms: 70,000 MPN/100mL Dissolved Cadmium: 0.008 mg/L	Witheridge
7/30/2009	Follow up was conducted and pH was within the acceptable range: pH: 6.65	Witheridge
8/5/2009	Follow-up investigation conducted (official receipt of laboratory results was on August 17th, but preliminary results were used for bacteria follow-up). Total coliforms again exceeded the action levels: Total Coliforms: 170,000 MPN/100mL An upstream investigation was initiated. The highest flows were tracked upstream to a manhole at the corner of Amador and Alameda Drive. Total coliform and fecal coliform results were above the action levels (A013A): Total Coliforms: 170,000 MPN/100mL The flow was tracked further upstream to the next manhole without the orange deposits in front of 4920 Amador. Total coliform, fecal coliform, and Enterococcus results were above the action levels here (A013B). Total Coliforms: 900,000 MPN/100mL	Witheridge
8/13/2009	Confirmation sampling was conducted for dissolved cadmium (official receipt of results were on August 17th,	Witheridge

<table>
<tr><td></td><td>however preliminary results were used for metals follow-up). The confirmation result continued to exceed the action level:
<table><tr><td>Dissolved Cadmium</td><td>0.0091 mg/L</td></tr></table></td><td></td></tr>
<tr><td>9/30/2009</td><td>ICID investigation continued for both cadmium and bacteria.
At A013 (original site), a sample was collected for cadmium. Flow was estimated at 3pgm:
<table><tr><td>Dissolved Cadmium</td><td>0.0124 mg/L</td></tr><tr><td>Total Hardness</td><td>2400 mg/L as CaCO3</td></tr></table>
At the next upstream manhole, A013A, a sample was collected for cadmium. Orange deposits were noted in the MS4. Flow was estimated at 3 gpm :
<table><tr><td>Dissolved Cadmium</td><td>0.0179 mg/L</td></tr><tr><td>Total Hardness</td><td>2760 mg/L as CaCO3</td></tr></table>
At the next upstream manhole, A013B, samples were collected for bacteria and cadmium. No orange deposits were seen at this manhole. Flow was estimated at 3 gpm:
<table><tr><td>Dissolved Cadmium</td><td>0.0242 mg/L</td></tr><tr><td>Total Hardness</td><td>1760 mg/L as CaCO3</td></tr><tr><td>Total Coliforms</td><td>300,000 MPN/100ml</td></tr></table>
The next three manholes were visited, but samples were not collected. Flow was consistent in the pipe. Overland flow was observed from two locations above the 3rd manhole location (A013E) from over-irrigation. In this 1000 foot section of the MS4, the elevation does increase approximately 90 to 100 feet.

The next upstream manhole, A013F, was sampled for cadmium and bacteria. Flow was estimated at 1.5 gpm:
<table><tr><td>Dissolved Cadmium</td><td><0.0006 mg/L</td></tr><tr><td>Total Hardness</td><td>226 mg/L as CaCO3</td></tr><tr><td>Total Coliforms</td><td>900,000 MPN/100ml</td></tr></table>
Three more manholes were located on the MS4 upstream of this site, but all were sealed and not accessible. There was evidence of overland flow, but a source could not be identified as the curbs and gutter quickly dried.</td><td>Witheridge/ Gremmels</td></tr>
</table>

Investigatory Status

This area has been investigated for several years. Surrounding open space areas have been investigated along with the MS4 system each year. This area has a shallow groundwater table, along with a unique geologic make-up. White and orange crystalline

deposits are found in storm drains and in open space areas alike. The storm drain lines have been inspected using closed circuit television (CCTV) and groundwater can be seen coming into the joints of the MS4. Water quality action level exceedances this year include bacteria, pH, and dissolved cadmium.

This year, the SWRCB GeoTracker database was used to verify the highest depth of the groundwater table. A monitoring well less than a mile away at a similar elevation (380 feet) used for a Leaking Underground Storage Tank (LUST) Cleanup site, T0607391311, indicated the highest groundwater depth below ground surface was 11 feet. As stated in the above table, the downstream sites (A013 through A013E) begin at an elevation of 300 feet and increase in elevation by approximately 90 feet with manholes that are between 8 and 12 feet deep. This is another indication that groundwater infiltration is the primary cause of the flow.

The out of range pH reading was within an acceptable range upon confirmation, but the results historically are low and have been attributed to the natural geologic processes.

For this year's investigations for dissolved cadmium, samples within the 300 to 380 feet elevation had a total hardness 1760 and 2760 mg/L as CaCO3. The dissolved cadmium values were between 0.0124 and 0.0242 mg/L. The hardness levels, along with a flow of water that was not observed from overland flow, and the historical knowledge from CCTVing this line, indicate groundwater infiltration as the source of the cadmium.

However, bacteria levels seem to vary and were still exceeding the action levels at site A013F, upstream of what appeared to be the majority of the groundwater infiltration. The flow was half of what the downstream flows were, but observations of overland flow were scarce. Two area drains from single family homes were identified with significant flow, one that was green with algae. These were addressed by a Clean Water Program Inspector on October 7, 2009. Educational materials were provided to the residences. In addition, ongoing education and outreach programs are being conducted in conjunction with the drought restrictions and discussed in the Discussion Section of the Dry Weather Monitoring Report.

Attachments

A013A

A013B

A015	Dry Weather 2009	7/29/2009

Site Summary:
Site A015 is a 48-inch RCP located south of Lake Park, off of Lake Boulevard, south of Agua Hedionda Creek. The outlet drains the residential areas east along Lake Boulevard Drive. Access to the site is from Lake Boulevard Drive.

Investigatory Actions

Date	Action	Staff
7/29/2009	Initial investigation conducted. Field and laboratory screening showed exceedances for the following parameters: Orthophosphate-P: 2.04 mg/L Total Coliforms: 90,000 MPN/100 mL Fecal Coliforms: 30,000 MPN/100 mL	Witheridge
7/30/2009	A follow up investigation for orthophosphate showed levels to be under the action levels: Orthophosphate-P: 0.32 mg/L	Witheridge
8/5/2009	A follow up investigation for bacteria was initiated. Results were received on 8/17/09, but preliminary results were used to begin the investigation. The follow-up showed bacteria levels to be under the action levels: Total Coliforms: 22,000 MPN/100 mL Fecal Coliforms: 230 MPN/100 mL	Witheridge

Investigatory Status
A015 has been subject to an ongoing investigation to locate the source of persistent white foam in runoff since 2004. Historically, total coliform exceedances and low pH also seem to be a common characteristic in this area. This monitoring year, upon confirmation, all field and laboratory results were under the action levels and no further action was required.

A016	Dry Weather 2009	7/29/2009

Site Summary:

Site A016 is a 36-inch RCP located east of Amigos Court, south of Lake Boulevard, and north of Calavera Creek at the border of Oceanside and Carlsbad. The outlet drains the residential areas to the north and south of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
7/29/2009	Initial investigation conducted. Field and laboratory screening showed an exceedance for the following parameters: MBAS: 1.5 mg/L Total Coliforms: 300,000 MPN/100ml Flow was measured at 13.76gpm. Because the MBAS field test kit resulted in an exceedance, a sample for laboratory processing was collected later in the day. The laboratory results were below the action level: MBAS: <0.5 mg/L	Witheridge
7/30/2009	Prior to the MBAS results being reported, a follow-up investigation was conducted for the MBAS field test kit result. Field screening results found MBAS to be within acceptable parameters: MBAS: 0.85 mg/L Flow was estimated at 1gpm.	Witheridge
8/5/2009	A confirmation sample for total coliforms was collected. Official receipt of results was on 8/17/2009, however preliminary results were used to initiate the sampling: Total Coliforms: 130,000 MPN/100ml	Witheridge
9/30/2009	An upstream investigation was conducted for total coliform. Flow was identified in the next upstream manhole, but it could not be sampled due to the depth of the manhole. Flow was traced up to the Rancho Calevero Mobile Home Park. White irrigation pipe was found with flow dumping into the storm drain. This flow, a little over 3 gpm, was sampled: Total Coliforms: 130,000 MPN/100ml	Witheridge/ Gremmels

	The pipe was followed back to a pump, pumping out a decorative concrete lined pond in the middle of the park. Photos and documentation were turned over to Code Enforcement.	

Investigatory Status:
The follow-up investigation showed MBAS results were under the Dry Weather Monitoring Program action levels. Total coliform results continued to exceed the action levels and were attributed to Rancho Calevero Mobile Home Park pond maintenance. The mobile home park had a similar violation with another one of their ponds in 2007. In 2007, the Clean Water Program Coordinator visited and educated park management about storm water regulations and the options of using their drained un-chlorinated pond water on landscape. An administration warning citation was given on October 10, 2009 after Code Enforcement officers met with the Clean Water Program Coordinator. On October 13, 2009 a Code Enforcement officer met with management at the mobile home park and discussed the citation. On October 15, 2009, a site visit was made and the flow had ceased although the piping was still present.

Attachments

A016A

Upstream pond pump

A019	Dry Weather 2009	8/25/2009

Site Summary:

Site A019 is a 24 inch RCP located in Oak Riparian Park off of Lake Boulevard, north of Agua Hedionda Creek. The outlet drains the residential and park areas north and south of Lake Boulevard.

Investigatory Actions

Date	Action	Staff
8/24/2009	Initial investigation conducted. Field Screening from the ponded water showed exceedances for the following parameters: Orthophosphate-P: 2.16 mg/L	Witheridge
8/26/2009	Follow up investigations from the ponded water continued to show exceedances for the following parameters: Orthophosphate-P: 2.62 mg/L An upstream investigation was initiated. Two upstream manholes were investigated on Ridge Rd. However, while they were wet, no flow was seen and there was not enough water to sample. Both inlets contained a significant amount of leaf debris.	Witheridge

Investigatory Status

Initial screening of the ponded water at site A019 resulted in an action level exceedance of orthophosphate. The follow-up visit found a continued exceedance of orthophosphate. It appears that the ponded water is likely from the upstream residential neighbor, as there was no evidence of erosion or over-irrigation from the park. The storm drain collection boxes at the base of the neighborhood showed evidence of overland flow such as water stains and wet leaf debris, but not flows were occurring. Ongoing education and outreach programs are being conducted in conjunction with the drought restrictions and discussed in the Discussion Section of the Dry Weather Monitoring Report. In addition, mosquito larvae were present upon the routine investigation and the County Vector Control was notified. The ponded water was treated on August 25, 2009 and is now on the County's regular maintenance schedule.

A021	Dry Weather 2009	8/24/2009

Site Summary:

Site A021 is a 36 inch RCP located off of Sky Haven Lane, north of Calaveras Creek. The outlet drains the residential areas to the north of the outfall. Access to the site is from a residential driveway and down an embankment.

Investigatory Actions

Date	Action	Staff
8/24/2009	Initial investigation conducted. Field Screening from the ponded water showed exceedances for the following parameters: Orthophosphate — 2.88 mg/L	Witheridge
8/26/2009	Follow up investigations from the ponded water continued to show exceedances for the following parameters: Orthophosphate — 3.64 mg/L An upstream investigation was initiated. The next upstream manhole has 3 RCP inlets. One had a trickle of water, but it was not enough flow to sample. The other two were stained with water, but were not flowing. Since there was no significant flow to track, overland flow was investigated. There were puddles of water in the curb, but no source was identified, nor were they in places where over-irrigation or car washing seemed to occur.	Witheridge

Investigatory Status

Initial screening of the ponded water at site A021 resulted in an action level exceedance of orthophosphate. The follow-up visit found a continued exceedance of orthophosphate. There was not enough flow found in the upstream manhole to sample or track. Overland flow was evident in the surrounding neighborhood, but was ponded so sources were not identifiable. From the stains on the asphalt and previous dry weather investigations

(2007) in the area, groundwater seepage is the likely culprit of the water and the nutrient exceedance.

Investigatory Status

Overland ponding southwest of A021 manhole and curb inlet.

B002	Dry Weather 2009	6/8/2009

Site Summary:

Site B002 is a 72-inch RCP located on Lagoon View Drive, north of the Buena Vista Lagoon. The outlet drains the commercial and residential areas north of SR-78. Access to the site is via Lagoon View Drive.

Investigatory Actions

Date	Action	Staff
6/8/2009	Initial investigation conducted. Laboratory results showed an exceedance for dissolved zinc: Dissolved Zinc: 0.607 mg/L Total Hardness: 1510 mg/L as CaCO3	Witheridge
6/17/2009	Follow-up investigation conducted; receipt of results was on the same day. Dissolved zinc results were below Dry Weather action levels. Dissolved Zinc: 0.00957 mg/L Total Hardness: 866 mg/L as CaCO3 An upstream investigation was conducted on the day of the confirmation visit. The next accessible upstream manhole is north of Interstate 78 in a lane of traffic on Vista Way in the shopping center. This manhole was opened, but was too deep to sample. The next upstream manhole is in the parking lot/alley of the shopping center just west of Stater Bros. Market. The manhole was accessible and was sampled (B002B). Dissolved zinc was below the action levels: Dissolved Zinc: 0.004 mg/L Total Hardness: 947 mg/L as CaCO3 The line was followed further north into the residential area off of Ivy. The first manhole on the eastern side of the connection was dry. The next manhole west of the connection to the outfall was flowing and samples were collected (B002D). Dissolved zinc was below the action levels: Dissolved Zinc: <0 .002 mg/L Total Hardness: 970 mg/L as CaCO3	Witheridge

Investigatory Status

A follow up investigation was conducted and two upstream samples were taken. However, all samples submitted to the laboratory showed dissolved zinc results that were below the dry weather action level.

B022	Dry Weather 2009	7/27/2009

Site Summary:

Site B022 is a 48-inch RCP built into the Buena Vista Creek channel wall east of the Thunder Drive Bridge. The outlet drains the residential areas north of Buena Vista Creek. Access to the site is from within Buena Vista Creek channel.

Investigatory Actions

Date	Action	Staff
7/27/2009	Initial investigation conducted. Field Screening and laboratory results showed exceedances for the following parameters: Total Coliforms: 300,000 MPN/100mL Fecal Coliforms: 50,000 MPN/100mL Enterococcus: 22,200 MPN/100mL One diaper was found near the outfall but in the receiving water during sampling.	Witheridge
8/5/2009	Confirmation conducted. Laboratory results were received on 8/17/2009, however preliminary results were used to initiate confirmation. Total Coliform, Fecal Coliform and Enterococcus were all above exceedance levels during resample as well. Total Coliforms: 240,000 MPN/100mL Fecal Coliforms: 130,000 MPN/100mL Enterococcus: >24,196 MPN/100mL	Witheridge
10/7/2009	A follow-up investigation was conducted. The outfall was resampled and continued to exceed action levels for all indicator bacteria. Flow was estimated at approximately 1gpm. There were grass clippings deposits in the drain. Total Coliforms: 130,000 MPN/100mL Fecal Coliforms: 130,000 MPN/100mL Enterococcus: 72,700 MPN/100mL The next upstream manhole, located at Tiburon near Thunder Drive, B022A was sampled. Visual observations reported grass clippings and leaf debris just downstream of the sampling point in the storm drain creating ponded water. Some overland ponded water with birds bathing was observed. Total Coliforms: 56,000 MPN/100mL Fecal Coliforms: 36,000 MPN/100mL Enterococcus: 60,200 MPN/100mL	Witheridge/ Gremmels

	The next upstream manhole, B022B, a small amount of flow was observed, but there was not enough flow to sample. No grass clippings or leaf debris was observed in the storm drain. The next upstream manhole, B022C, is in the middle of Plaza Drive and was not accessible due to safety precautions for lack of traffic control.	

Investigatory Status
All indicator bacteria at this site continued to exceed action levels during the follow-up investigation. During the previous reporting year, action levels were exceeded initially, but upon a thorough investigation, no exceedances were found. Based on last year's results, it was estimated that the source of bacteria was between the outfall and the next upstream manhole. The outfall and accessible manholes south of the 76 and the City of Vista were visited, but only two sites were sampled. These two sites indicated that grass clippings, leaf debris, and irrigation runoff (with birds bathing) are likely the source of the bacteria exceedances.

The area was referred to a Clean Water Program Inspector to provide in-person education regarding appropriate irrigating and landscaping techniques. In addition, ongoing bilingual education and outreach will be provided to the condominium residents regarding the apparent improper disposal of trash into the receiving water.

B022A

Upstream → Downstream
Grass clippings in drain causing ponding.

B023	Dry Weather 2009	8/3/2009

Site Summary:

Site B023 is a 36-inch RCP located west of the intersection of Lake Boulevard and Thunder Drive south at 3524 Lake Blvd. The outlet drains the residential areas south of Lake Boulevard.

Investigatory Actions

Date	Action		Staff
8/3/2009	Initial investigation conducted. Field screening results showed conductivity levels to be exceed the action level:		Witheridge
	MBAS	1.25 mg/L	
8/4/2009	Follow-up investigation conducted. Field screening showed MBAS levels to be at the action level:		Witheridge
	MBAS	1.0 mg/L	
8/11/09	A laboratory sample was collected for MBAS. The result was non-detect:		Witheridge
	MBAS	< 0.5 mg/L	

Investigatory Status

Conductivity at this site ranged between 13 and 16 mg/L. Previous investigations have shown this to be a result of groundwater seepage. Because elevated conductivity is suspected to interfere with the MBAS field test kit, a laboratory sample was taken for measurement of MBAS. Laboratory analysis resulted in a non-detect for MBAS at B023.

B024	Dry Weather 2008	8/4/2009

Site Summary:

Site B024 is a 36-inch RCP located on the southwest corner of College Boulevard Bridge over Buena Vista Creek. The outlet drains the commercial and residential areas south on College Boulevard. Access to the site is from College Boulevard.

Investigatory Actions

Date	Action	Staff
8/4/2009	An initial investigation was conducted on the ponded water. Field investigations showed exceedances for the following parameters: Orthophosphate: 5.49 mg/L MBAS: 1.5 mg/L	Witheridge
8/5/2009	Follow-up investigation showed that the field screening results were below the action level for MBAS, but continued to exceed for orthophosphate: Orthophosphate: 3.98 mg/L MBAS: 0.5 mg/L	Witheridge

Investigatory Status

Follow up investigation showed that MBAS was no longer exceeding. However, orthophosphate still exceeded, and an upstream investigation was conducted. The storm drain line runs under a lane of traffic on a major thoroughfare, College Boulevard. The next safely accessible manhole is in the bike lane of southbound College Boulevard, south of Lake Boulevard. The manhole was wet, but there was not enough flow to sample. Previous year's upstream investigations have pointed to irrigation run-off from the residential neighborhoods within the City of Carlsbad. No source could be found for the ponded water or orthophosphate exceedance.

B104	Dry Weather 2009	7/15/2009

Site Summary:

Site B104 is a manhole on the southeast corner of South Coast Highway and Eaton Street. The outlet drains the commercial and residential areas on the east side of South Coast Highway. This site replaced B001 by moving it upstream approximately 230 yards out of tidal influence. Access to the site is from South Coast Highway.

Investigatory Actions

Date	Action	Staff
7/15/2009	Initial investigation conducted. The ponded water in the catch basin was sampled. Field screening and laboratory analysis showed exceedances for the following parameter: Orthophosphate: 2.25 mg/L Total Coliform: 50,000 MPN/100mL	Witheridge
7/16/2009	Follow-up investigation was completed within two business days. Results showed that the field screening no longer exceeded the action level for orthophosphate: Orthophosphate: 1.74mg/L	Witheridge
7/21/2009	A confirmation sample was collected for bacteria. Laboratory results were received on 8/12/2009, however preliminary results were used to initiate the investigation. Total coliforms continued to exceed the action level, however there was no flow from upstream. Total Coliform: 300,000 MPN/100mL	Witheridge

Investigatory Status

Upon confirmation, orthophosphate levels from the ponded water in the catch basin no longer exceeded action levels. A follow up was conducted for total coliforms. However, there was not flow coming in from upstream so a source could not be identified.

L013	Dry Weather 2009	7/20/2009

Site Summary:

Site L013 is a manhole located south of the shopping center on the corner of Oceanside Blvd., north of Loma Alta Creek. The outlet is no longer accessible due to overgrown vegetation. The manhole upstream is now sampled. Access to the site is from parking lot behind ReMax.

Follow-up Actions

Date	Action	Staff
7/20/2009	Initial investigation conducted. Field screening showed exceedances for the following parameters: MBAS 2.0 mg/L Orthophosphate-P 2.91 mg/L Ammonia-N 2.4 mg/L An initial sample was taken and the flow was estimated at approximately 1 gpm. A few minutes later, the flow increased to approximately 3 gpm and a new sample was collected and processed (which is shown above). The source of the flow was followed upstream to a manhole with flow coming from the east. The area was canvassed, however, no source was found.	Witheridge
7/21/2009	A confirmation investigation for MBAS and ammonia resulted in levels below the action levels. Orthophosphate continued to exceed: MBAS 0.25 mg/L Orthophosphate-P 3.39 mg/L Ammonia-N 0.25 mg/L The flow was estimated at 1 gpm. The flow was traced upstream and was coming from the west (unlike the previous day). The area was canvassed, but no source was found.	Witheridge
10/7/2009	Another follow-up investigation was conducted. There was a small amount of ponded water, but no flow and not enough ponded water to sample.	Witheridge/ Gremmels

Investigatory Status

The two visits to the site that warranted upstream investigations were from two different directions. The first exceedance on July 20th, was likely from McDonalds. This location

has a history of washwater dumping and sewer overflows, however, no definitive violation was found on that day. On August 11, 2009 the grease trap was observed overflowing into the storm drain and the business was shut down by County Health Department and City Code Enforcement issued an Administrative Citation. Clean Water Program, Sewer, and Code Enforcement officers met with the McDonalds management on August 17th to review proper procedures, requiring increased cleanouts, and increased training and record keeping.

The exceedance on July 21st, was unidentified. The flow at the next upstream manhole was coming from the west. The line was walked, but no further accessible (without inserts) manholes were found. Armstrong Nursery is a possible source, but no overland flow was identified.

Regular inspections of both facilities are continuous and both facilities are marked as high priority. Code Enforcement officers are aware of potential threats to water quality at both locations and continue ongoing education and inspection efforts.

L020	Dry Weather 2009	7/21/2009

Site Summary:

Site L020 is a 36-inch RCP, located east of the intersection of Corporate Centre and Oceanside Blvd., north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Blvd. Access to the site is from Oceanside Blvd.

Follow-up Actions

Date	Action	Staff
7/21/2009	Initial investigation conducted. Field screening showed exceedances for the following parameters: MBAS 1.5 mg/L	Witheridge
7/22/2009	A follow-up investigation for MBAS resulted in levels below the action levels: MBAS 0.75 mg/L	Witheridge

Investigatory Status

Upon confirmation, MBAS levels were below the Dry Weather Monitoring action levels.

L029	3060 Industry Way	8/24/2009

Site Summary:

Site L029 is a manhole on the north side of Loma Alta Creek. Access to the outfall is not available. The first accessible sampling point is at a curb inlet that begins the storm drain system in front of 3060 Industry Way. The outlet drains the commercial and industrial area south of Oceanside Boulevard.

Investigatory Actions

Date	Action	Staff
8/24/2009	Initial investigation conducted. Field screening of the ponded water showed the following exceedances: Ammonia: 3.8 mg/L Orthophosphate: 2.02 mg/L	Witheridge
8/31/2009	Follow-up investigation conducted. Field screening was conducted and showed ammonia and orthophosphate levels continued to exceed the action limits: Ammonia: 4.5 mg/L Orthophosphate: 2.22 mg/L	Witheridge

Investigatory Status

This site was taken off of the primary list during the 2008 JURMP Update because it is a small watershed and the only accessible sampling point is at the most upstream manhole/gurb inlet. The outfall is blocked by tree roots and so the sampling point is ponded. This site was selected this year because the lack of flowing and ponded sites. The initial visit results exceeded ammonia and orthophosphate action levels. A follow-up was conducted, but outside of the required five days. This site was overlooked on the follow-up list the following day, but when the mistake was realized, was immediately revisited one week later. This year and the investigation in 2007 indicated the ammonia and orthophosphate exceedances are most likely caused by leaf debris in the ponded water in the manhole. The sources of water are most likely over-irrigation and storm runoff.

L046	Dry Weather 2009	7/15/2009

Site Summary:

Site L046 is a 24-inch RCP constructed in the north wall of the Loma Alta Creek channel just east of the Coast Highway Bridge. This outfall conveys flow from commercial and residential area north of Loma Alta Creek. Access to the site is from Coast Highway.

Follow-up Actions

Date	Action		Staff
7/15/2009	Initial investigation conducted. Field screening showed exceedances for the following parameters:		Witheridge
	MBAS	1.0 mg/L	
7/16/2009	A follow-up investigation for MBAS resulted in levels that continued to exceed action levels:		Witheridge
	MBAS	2.0 mg/L	
7/29/2009	A sample was sent to the lab and MBAS resulted in levels below the action levels.		Witheridge
	MBAS	<0.5 mg/L	

Investigatory Status

Field results for this site exceeded the MBAS action level initially and upon confirmation. It is suspected that there is interference with the test kit when a sample has an elevated conductivity result. Conductivity was between 11 and 14 mS/cm this monitoring period. This site is influenced by Loma Alta Slough and subject to creek backflow. It was inaccessible during three attempted follow-up visits. It was finally accessible on July 29th and a laboratory sample was collected. The laboratory result indicated that there was no exceedance at this site.

L103	Dry Weather 2009	8/10/2009

Site Summary:

Site L103 is a 72-inch RCP located west of Corporate Centre, north of Loma Alta Creek. The outlet drains the industrial and commercial areas located north of Oceanside Blvd. off of Corporate Centre. Access to this site is from Corporate Centre.

Follow-up Actions

Date	Action	Staff
8/10/2009	Initial investigation conducted. Field screening showed exceedances for the following parameters: Orthophosphate-P: 3.05 mg/L	Witheridge
8/11/2009	A follow-up investigation for orthophosphate continued to exceed action levels: Orthophosphate-P: 2.73 mg/L An upstream investigation was conducted. The flows were tracked upstream to a manhole at the intersection of Avenida de la Plata and Corporate Center Drive (L103A). Orthophosphate continued to exceed: Orthophosphate-P: 2.22 mg/L The main flow of this line continues up Avenida de la Plata. There is a small tributary to this line that connects from the north west of Avenida del Oro. A manhole on this smaller line, in front of the post office, was opened, but there was no flow. The flow was tracked further upstream on Avenida de la Plata west of Avenida del Oro, but east of the small tributary split (L103B). Orthophosphate continued to exceed: Orthophosphate-P: 2.29 mg/L The investigation continued to a manhole in front of 4128 Avenida de la Plata, east of Avenida del Oro (L103C). There was no flow from this storm drain, but there was evidence of over-irrigation in the form of water stains in the curb.	Witheridge

	The next downstream manhole, in front of 4112 Avenida de la Plata was opened. There was a small amount of flow from a 6-inch plastic pipe (0.08 gpm) coming from the commercial area. The plastic pipe was sampled and the orthophosphate levels continued to exceed at this manhole: Orthophosphate-P: 2.34 mg/L	

Investigatory Status
Initial investigation and confirmation sample at L103 resulted in a continued orthophosphate exceedance. The flow was followed upstream to a storm drain junction outside of 4112 Avenida De La Plata. A small amount of water was coming from a six inch plastic pipe likely draining the landscaped areas in the business park. The flow was very low, 0.08 gpm. There were other observations of historical overland flow from water stains in the curb. There was also leaf debris in the storm drains and the curbs and gutters. Therefore, the flow is likely from over-irrigation and/or small drains from landscaped areas throughout the industrial/commercial business park area.

The business at 4112 Avenida De La Plata does maintain the small grassy area in front of property. Another property management company maintains the remaining curb areas. Follow-up conducted by Clean Water Inspector, but no runoff was apparent. The business was educated about reducing irrigation timers and was turning off timers for wet season.

S032	Dry Weather 2009	6/2/2009

Site Summary:

Site S032 is a 36-inch RCP with a flap gate installed and is located on the south side of the San Luis Rey River. S032 outlet conveys flows from the residential, commercial, and open space areas located on the south side of SR-76.

Investigatory Actions

Date	Action	Staff
6/2/2009	Initial investigation conducted. Field and laboratory screening of the ponded water showed the following exceedances for orthophosphate and MBAS: Orthophosphate-P: 6.58 mg/L MBAS: >3.0 mg/L Ammonia-N: 0.29 mg/L	Witheridge
6/3/2009	Follow-up investigation conducted. Field screening was conducted and ammonia and orthophosphate results continued to be above the action levels: Orthophosphate-P: 6.11 mg/L MBAS: >3.0 mg/L Ammonia-N: >15 mg/L The ammonia test kit may show a false negative if there is a high amount of ammonia. The sample was diluted in the follow up sampling and showed that the ammonia exceeded. An upstream investigation was initiated, but no flow was found. The other side of the levee is a large, dry basin.	Witheridge

Investigatory Status

Initial screening of S032 resulted in an action level exceedance of ammonia, orthophosphate, and MBAS. The investigation continued upstream to the other side of the bike path. The area was dry with no evidence of the source of the flow.

This was one of the first sites using a new CHEMetrics ammonia test kit. The possibility for false negatives was found and was documented for future use.

S104	Dry Weather 2009	8/31/2009

Site Summary:

Site S104 is a 24-inch RCP located south of the San Luis Rey River. Access to the site is through the tomato fields. The outlet drains the residential area south of the site.

Investigatory Actions

Date	Action	Staff
8/31/2009	Initial investigation conducted on the ponded water. Field Screening and laboratory results showed an exceedance for ammonia and orthophosphate: Ammonia: 1.05 mg/L Orthophosphate: 2.58 mg/L	Witheridge
9/2/2009	Follow-up investigation conducted. Results show that ammonia was below the action levels but orthophosphate continued to exceed: Ammonia: 0.15 mg/L Orthophosphate: 2.19 mg/L An upstream investigation was conducted. The next upstream manhole was at the end of the easement on the east side of Gooseberry (S104A): Ammonia: 0.47 mg/L Orthophosphate: 2.28 mg/L The next upstream manhole sampled was on the west side of Cranberry Drive (S104B). There were three influences, but only one drain from the northeast on Cranberry Drive was flowing. The flow was estimated at 0.5 gpm. Orthophosphate: 2.78 mg/L The next upstream site sampled was a from an area drain in front of 638 Creekside (S104C). There were other area drains that were wet, but this was the most upstream trickle (0.1gpm): Orthophosphate: 4.92 mg/L A visitor to the homeowner was spoken with. Educational material such as drought information and a suggestion to check the irrigation system and timers were left.	Witheridge

Investigation Status

Site S104 had an initial exceedance for ammonia and orthophosphate. Ammonia results on the confirmation visit were below action level exceedances. Orthophosphate continued to exceed action levels. The drainage area is single-family residential community with a home owner's association. The ponded water is most likely from over-irrigation within the neighborhood. One home was identified as a source this year. In previous years, blanket mail-outs have been sent to this neighborhood with little effect. When a broken irrigation or improperly run irrigation system is spotted, we now have a Clean Water Program Inspector to personally go to the home to provide information.

Attachments

S104A

S104B

S104C

S106	Dry Weather 2009	6/22/2009

Site Summary:

Site S106 includes four 36-inch plastic pipes at the intersection of North River Road and Sleeping Indian Road on the north side of the San Luis Rey River. The outlet drains an agricultural area immediately north of the site. Access to the site is from North River Road.

Investigatory Actions

Date	Action	Staff
6/22/2009	Initial investigation conducted. Field Screening and laboratory results showed an exceedance for nitrate and MBAS: MBAS: 1.25 mg/L Nitrate-N: >68.0 mg/L	Witheridge
6/23/2009	Follow-up investigation conducted. Results show that both analytes continued to exceed action levels: MBAS: 1.0 mg/L Nitrate-N: 49.11 mg/L An analytical sample for MBAS was collected at the time of sampling as well, and laboratory results showed that the level of MBAS is below the action level: MBAS: <0.5 mg/L	Witheridge

Investigation Status

Nitrate loading from the agricultural area around Sleeping Indian has been an on-going issue. Up-stream investigations have been conducted and were reported in the 2008 Dry Weather Report. Groundwater seepage has been identified as the main source of flow from up-stream. The site is also monitored under the WURMP San Luis Rey River Watershed joint monitoring program between the City and the County of San Diego. During the summer of 2009, between August 10th and September 22nd, the outlet stopped flowing. As of November 2009, there is still no flow from the Sleeping Indian drainage area.

S111	Dry Weather 2009	7/1/2009

Site Summary:

Site S111 is a concrete channel adjacent to Fireside Park, east of the San Luis Rey River. The channel drains the residential area east of the site.

Investigatory Actions

Date	Action	Staff
7/1/2009	Initial investigation conducted. Field Screening results showed an exceedance for pH: pH 9.72	Witheridge
7/2/2009	Follow-up investigation conducted earlier in the day. pH was under the action level: pH 8.30 High pH levels could be due to leaching of the concrete at high temperatures.	Witheridge

Investigation Status

Upon confirmation, the pH result was below the Dry Weather Monitoring action level.

S115	Dry Weather 2009	6/2/2009

Site Summary:
Site S115 is an open concrete channel between Mission Avenue and SR-76 west of El Camino Real. The site conveys flows from the commercial area to the east along Mission Avenue towards Douglas Drive. Access to the site is from Mission Avenue.

Investigatory Actions

Date	Action	Staff
6/2/2009	Initial investigation conducted. Field screening showed the following exceedance for pH: pH: 10.03 pH units	Witheridge
6/3/2009	Follow-up investigation conducted. Field screening was conducted and pH results continued to exceed the action level: pH: 9.08 pH units An upstream investigation was conducted. The flow was sampled approximately 100 feet upstream at the outflow of the box culvert. The pH results were below the action level: pH: 8.35 High pH levels may be due to high temperatures or leaching of the concrete.	Witheridge

Investigatory Status

Upon confirmation, the pH result continued to exceed action levels in the concrete channel. A sample was taken approximately 100 feet upstream where the flow day-lighted from a covered box culvert. The pH results were in the acceptable pH range. There were no other influences between the original site and the upstream sample. The cause is likely the high temperatures and/or the leaching of the concrete at high temperatures.

S118	Dry Weather 2009	7/1/2009

Site Summary:
Site S118 is an alternative site located at the southwest corner of College and Silver Bluff. It consists of two pipes originating from the same source. The largest pipe, a 72-inch RCP, conveys flows from the residential area to the north and east along Silver Bluff and Mosaic. Access is from Silver Bluff.

Investigatory Actions

Date	Action	Staff
7/1/2009	Initial investigation conducted of the ponded water. Field screening showed the following exceedance for Ammonia: Ammonia-N: 1.28 mg/L	Witheridge
7/2/2009	Follow-up investigation conducted on the ponded water. Ammonia continued to exceed action levels: Ammonia-N: 4.4 mg/L An upstream investigation was conducted. The flow was followed east. Water coming from a curb outlet on Silver Bluff and Masters was sampled (S118A). The flow was approximated at 2 gpm. Ammonia levels did not continue to exceed: Ammonia-N: 0.42 mg/L From the original site the MS4 was followed northeast to a manhole on Mosaic Circle (S118B). The box was wet with some ponded water, but no water could be sampled. The next manhole upstream on the MS4 is in front of 749 Mosaic Circle. No flow was observed.	Witheridge

Investigatory Status

Ammonia continued to exceed Dry Weather Monitoring action levels upon confirmation. An upstream investigation was conducted. A source of water was found, but historical knowledge from Public Works indicates it is groundwater and it was not exceeding the ammonia action level. A source for the exceedance could be from homeless encampments or from decaying organic matter in the ponded water. Code Enforcement was notified of the presence of the homeless encampments and they were removed.

S121	Dry Weather 2009	7/1/2009

Site Summary:
Site S121 is an alternative site. It consists of two partially submerged 48-inch RCP's at the northwest intersection of College Boulevard and Frazee Road. It conveys flows from the residential area southeast of the intersection. Access to the site is from Frazee Road through a locked gate.

Investigatory Actions

Date	Action	Staff
7/1/2009	Initial investigation conducted. Field screening showed the following exceedance for ammonia: Ammonia-N: >9.0 mg/L	Witheridge
7/2/2009	Follow-up investigation conducted. Ammonia was below the action level. Ammonia-N: 0.92 mg/L The ammonia test kit will result in a false positive if there are too many dilutions performed.	Witheridge

Investigatory Status
The exceedance during the routine investigation for ammonia was likely a false positive caused by over-dilution of the sample. The 2009 Dry Weather Monitoring season was the first season to use a non-mercury CHEMetrics kit for ammonia. Upon discussion with CHEMetrics and other municipalities, it appears that the previous kit being used over-estimated the amount of ammonia. Therefore, the field team during 2009 diluted samples that seemed low, only to create false-positives. For example, at this site, the initial sample was diluted by 2. Upon a dark yellow color, the dilution was then increased to a 3-times dilution. On the follow-up investigation, no dilution was used, and the result was within the detection range of the kit and a reasonably expected result for the site.

S122	Dry Weather 2009	7/15/2009

Site Summary:

S122 is a RCP with a flap gate at the end of Tishmal Court. It conveys flows from the residential area north of the river. Access to the site is from the sewer easement path and pedestrian path on the north side of the river.

Investigatory Actions

Date	Action	Staff
7/15/2009	Initial investigation conducted. Field screening showed exceedances for the following parameters: Orthophosphate-P: 2.06 mg/L Total Coliform: 300,000 MPN/100mL Fecal Coliforms: 80,000 MPN/100mL Enterococcus: 72,700 MPN/100mL	Witheridge
7/16/2009	Follow-up investigation conducted. Orthophosphate was below the action level: Orthophosphate-P: 1.11 mg/L	Witheridge
7/21/2009	Confirmation laboratory samples were collected. Total coliform and Enterococcus continued to exceed action levels: Total Coliform: 500,000 MPN/100mL Fecal Coliforms: 5,000 MPN/100mL Enterococcus: 50,000 MPN/100mL Although the confirmation sample results were unknown, overland flow from 3168 Toopal was identified as the only overland source and sampled (S122A). Total coliform exceeded at this location: Total Coliform: 1,600,000 MPN/100mL Fecal Coliforms: 50,000 MPN/100mL Enterococcus: 160,000 MPN/100mL This flow was identified as coming from a broken irrigation head at a residence and was visited by Clean Water Program Inspectors on July 18, 2009. The resident was personally spoken to and the leak was fixed upon a follow-up.	Witheridge

<table>
<tr><td>10/15/2009</td><td>The outfall was once again visited. Total coliforms exceeded action levels upon the second confirmation visit:
<table>
<tr><td>Total Coliform</td><td>220,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>5,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>5,340 MPN/100mL</td></tr>
</table>

An upstream investigation of the MS4 was initiated. The next upstream manhole contained water, but was too deep to sample. The next manhole upstream that was able to be sampled was on the north side of Benet in the City easement (S122B). Approximately 2 inches of ponded water was at the bottom of the manhole:
<table>
<tr><td>Total Coliform</td><td>80,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>11,000 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>13,000 MPN/100mL</td></tr>
</table>

The next upstream manhole was dry. There was overland flow entering the storm drain which was sampled (S122D), but did not exceed any of the action levels:
<table>
<tr><td>Total Coliform</td><td>8,000 MPN/100mL</td></tr>
<tr><td>Fecal Coliforms</td><td>1,300 MPN/100mL</td></tr>
<tr><td>Enterococcus</td><td>1,900 MPN/100mL</td></tr>
</table></td><td>Witheridge/ Gremmels</td></tr>
</table>

Investigatory Status

The orthophosphate result was below the Dry Weather action levels upon confirmation, but total coliform and Enterococcus continued to exceed. An upstream investigation was conducted but no manholes contained enough water to sample or were too deep. However, overland flow was found coming from the west along Toopal Drive. Water flooding a meter box at 3168 Toopal Dr. was sampled. The house was referred to a Clean Water Inspector and the problem was fixed upon the follow-up visit.

The site was revisited on October 15, 2009 with an improved manhole cover lifter and a longer sampling pole. The outfall exceeded for total coliforms, but not for fecal coliforms or Enterococcus. One overland flow was identified and sampled, but did not exceed the dry weather action levels. The manhole off of Benet Road in the easement was sampled with a long sampling pool. Total coliforms and Enterococcus did exceed the Dry Weather Program action levels. More information from an Engineering Inspector familiar with this site was gained. The storm drain system in the neighborhood provides an overflow from the Lake to the north, through the MS4 system to the San Luis Rey River. It is suspected that the deep manhole (S122B) is standing water from rain, the lake, and irrigation. Bacteria is likely regrowing in this low point and may be causing the exceedances.

Overland flows that were identified on October 15, 2009 were reported to Clean Water Program Inspectors and were visited on October 20, 2009 and education materials were provided. The effort to make personal visits will continue.

APPENDIX 7-B

2009 NON-DRY WEATHER MONITORING IC/IDS

THIS PAGE INTENTIONALLY LEFT BLANK

King of Kings Lutheran Church	Non-Dry Weather IC/ID 2008-2009	7/28/2008

Site Summary:

King of Kings Lutheran Church is located at 2993 McDonald Street in the Loma Alta Watershed.

Investigatory Actions

Date	Action	Staff
7/28/2008	While conducting Dry Weather Monitoring at several sites on Industry Street in the Loma Alta Watershed, overland flow (visually approximated at a little about 1gpm) was identified flowing down Industry Street. No samples were taken, but an upstream investigation was conducted. The investigation lead across Oceanside Boulevard to King of Kings Lutheran Church. While no water was currently running, the ground was very wet in a newly planted section of the embankment. AT&T had put new lines through the property and on the hill and had recently put down grass and new plants, along with BMPs in the area. The area was being heavily watered to get the plants to grow to avoid erosion. Clean Water staff spoke with the landscaper over the telephone and he agreed to reduce the sprinkler timers and conduct an irrigation system check during his next visit.	Witheridge

Investigatory Status

The flow found on Industry Street was tracked up to King of Kings Lutheran Church. New grass and other ground cover had been planted to prevent erosion on the sloop. The area was being over-watered. The landscaper was contacted and asked to reduce irrigation times.

Attachments

Flow on Industry Street

Irrigation of New Grass

AgriChemical and Supply, Inc.	Non-Dry Weather IC/ID 2008-2009	9/11/08

Site Summary:

AgriChemical and Supply, Inc. is a business located at 2002 Oceanside Boulevard. They provide non-native plant species control in the area, primarily using Round-Up herbicide.

Investigatory Actions

Date	Action	Staff
9/11/2008	A complaint of smelly water in a storm drain was received. Code Enforcement and Clean Water Program personnel investigated the complaint. There was ponded water in the storm drain at the bottom of their facility. The water was gray, opaque, and smelled of chemicals. A portion of the ponded water was in the sunlight. The sample was taken from the darkened, manhole portion of the ponded water and tested for glyphosate, the main chemical in Round-Up. Results were non-detect: Glyphosate: < 5 µg/L	Witheridge/ Erickson/ Lahsaie

Investigatory Status

Ponded water was found in the storm drain but there was no upstream flow at the time of the visit. Code Enforcement and the Clean Water Program Coordinator spoke with the business and instructed them on their wash-out procedures.

Camp Pendleton	Non-Dry Weather IC/ID 2008-2009	9/29/2008

Site Summary:
Camp Pendleton is located north and east of Oceanside Harbor. There are several storm drains that carry flow from the construction site of a residential area of the base and discharge to the Harbor.

Investigatory Actions

Date	Action	Staff
9/28/2008	Harbor Maintenance reported sediment discharge from Camp Pendleton to Oceanside Harbor during a rain event. The Clean Water Program Coordinator contacted the base and requested action/BMPs to prevent future sediment discharge.	Balch/ Lahsaie

Site Summary:
Capistrano Park is located just east of I-5 on the northern border of the City.

Investigatory Actions

Date	Action	Staff
2/4/2009	A stormwater inspector for the City conducted a cursory inspection of the outfall coming from the base into Capistrano Park and reported a severe failure of the BMPs installed in Camp Pendleton. There was erosion undermining the gabions downstream and a partial collapse of the east side of the hillside and undermining of the BMP structure.	
2/5/2009	Camp Pendleton notified by email with photos of the erosion and failures.	Lahsaie
2/10/2009	Four City employees met with four Camp Pendleton employees to discuss the sediment discharge and failure of erosion and sediment control BMPs on Camp Pendleton. Camp Pendleton agreed to include the BMP repair in their maintenance plan but due to budgetary constraints were unable to take immediate corrective action. Will put temporary BMPs in place (such as cleaning upstream detention basins in the housing development). The City Public Works' Department will repair the eroded area on the City side after Camp Pendleton has completed the repair on their side and will remove sediment as soon as is dry to bring the equipment.	Lahsaie, Sabelis, Tanner Kellison

Investigatory Status
The Regional Water Quality Control Board was notified in writing with photos on both issues and efforts are ongoing.

RE: **STATEMENT OF CERTIFICATION**
CITY OF OCEANSIDE JURISDICTIONAL URMP

I certify under penalty of law that the Jurisdictional Urban Runoff Management Program Annual Report for 2009-2010 was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for knowingly submitting false information, including the possibility of fine and imprisonment for knowing violations.

M.A. Lahsaiezadeh

THIS PAGE INTENTIONALLY LEFT BLANK

ES EXECUTIVE SUMMARY

Introduction

This document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, NPDES No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) Draining the Watersheds of the San Diego Copermittees. Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2007-2008 annual reporting period (July 1, 2009 – June 30, 2010).

Report Organization

Section J of Municipal Permit 2007-0001 defines the requirements for the Jurisdictional Urban Runoff Management Program (JURMP) Annual Report and states that each JURMP Annual Report shall, at a minimum, contain a comprehensive description of all activities conducted by the Copermittee for each required component. Table ES-1 presents these components and the section in which they are discussed.

Table ES-1. Municipal Permit 2007-0001 Reference Table.

Municipal Permit 2007-0001 Components	Annual Report Section
Development Planning Component	Section 2.0
Land-Use Planning	Section 2.2
Environmental Review Process	Section 2.3
Development Project Approval and Verification Process	Section 2.4
Construction Component	Section 3.0
Municipal Component	Section 4.0
Industrial and Commercial Component	Section 5.0
Residential Component	Section 6.0
Illicit Discharge Detection and Elimination Component	Section 7.0
Education Component	Section 8.0
Public Participation	Sections 9.0
Fiscal Analysis Component	Section 10.0
Effectiveness Assessment Component	Section 11.0
Special Investigations	Section 12.0
Non-Emergency Fire Fighting	Section 13.0
JURMP Revisions	Section 14.0
Conclusions and Recommendations	Section 15.0

Pursuant with the Municipal Permit this document contains all of the required information.

Program Highlights

Below is a summary of each section which describes the Clean Water Program activities appearing in this Annual Report. Please refer to the individual section for more detailed information.

Section 2.0 Development Planning Component

The development planning component focuses on the collective effort to mitigate impacts which may result from new development and redevelopment projects. The process of verifying compliance with the Municipal Permit is accomplished through the consistent application of storm water principles and regulations during all phases of development.

During this reporting period, the City continued to actively participate in the Copermittee Workgroups, Sub-workgroups, and HMP-TAC. The combined Copermittee effort resulted in the release of the Countywide Model SUSMP in February 2010, adoption of the Hydromodification Management Plan by the RWQCB in June 2010, and completion of the Regional Construction BMP Guidelines in June 2010.

During this same period the City released an update SUSMP in March 2010; consistent with the Countywide Model SUSMP and the Municipal Permit. Subsequent to the updated SUSMP, the City released a draft Storm Water Mitigation Plan (SWMP) template. The purpose of the template is to provide the design professional with a standardized presentation format while facilitating plan review. The SWMP template will become finalized upon complete implementation of the HMP.

Other notable activities that took place during this reporting period included the continued implementation of data tracking systems by multiple divisions within the City Water Utilities and Development Services Departments.

Section 3.0 Construction Component

The City of Oceanside Clean Water Program provided an updated inventory of construction sites with the 2008 JURMP and has revised that inventory during this reporting period. During the reporting period, the Clean Water Program inspected 54 construction sites to ensure they were in compliance with the City Code.

Section 4.0 Municipal Component

The City of Oceanside Clean Water Program utilized its end of fiscal year 2008-09 municipally owned inventory and inspected 176 municipal areas to ensure these facilities are in compliance with the City Code. A total of 2,093 tons of waste was removed as a result of street sweeping and a total of 894.52 tons of waste was removed from the storm drain system (MS4) as part of the annual cleaning. Three thousand four hundred and eight one (3,481) feet of City sewer pipes were slip lined and 53 manholes rehabilitated.

Section 5.0 Industrial and Commercial Component

The City annually updates its watershed-based industrial/commercial inventory which contains the name, address, and description of all industrial sites within its jurisdiction, regardless of site ownership. During this reporting period a new asset management software tool was implemented. The inventory existing at the beginning of the reporting period, with commercial

and industrial classifications, watershed location, and assigned priority was pulled into the new software. However, throughout the year, duplicate records, inadvertently changed priority levels, and missing, new, or out of business facilities were found. The inventory now includes 2,412 Industrial and Commercial businesses. Seventeen (17) industrial businesses and 597 commercial businesses were inspected during this reporting period, to ensure these facilities are in compliance with City Code.

The Water and Sewer Divisions of the Water Utilities Department have been using GBA Master Series Software, a maintenance management tool to track NPDES facility inspections, incoming hotline storm water complaint calls, and use with the jurisdictional monitoring program. This annual report is the first report utilizing the new technology. The Clean Water Program will be reviewing the effectiveness of the new tracking tool and will continue to implement improvements in the use or the system in the coming years.

Section 6.0 Residential Component

The City of Oceanside has developed an extensive program that aims to reduce pollutant runoff from residential areas and activities to the maximum extent practical (MEP). The City of Oceanside Clean Water Program received 251 calls on the Urban Runoff Hotline plus 136 referrals from City Staff. Code Enforcement responded to 84 urban runoff cases related to residential areas and activities, during the reporting period. Extensive educational efforts were made to help Oceanside residents understand watersheds, water quality and urban runoff impacts through presentations on a local television channel, Clean Water Program newsletters mailed to each household, and through information available on the Clean Water Program Website.

Section 7.0 Illicit Discharges Detection and Elimination Component

This section is intended to document the activities conducted by the City of Oceanside during the 2009-2010 reporting period to manage illicit discharges. In accordance with the September 10, 2008 Regional Water Quality Control Board adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the entire FY 2009-10 Illicit Discharge Detection and Elimination Component, including the 2010 Dry Weather Field Screening and Analytical Monitoring, no later than December 15, 2010.

Section 8.0 Education Component

The City of Oceanside Clean Water Program continued to use a variety of avenues to educate various internal and external groups about the Clean Water Program and the requirements of Municipal Permit Order 2007-0001. These outreach activities included municipal staff training, CWP newsletters, staffing community booths, conducted watershed education presentations, continued implementation of a 5th grade curriculum titled Project SWELL and targeting under-served audiences with educational materials.

Section 9.0 Public Participation Component

The Clean Water Program continued to sponsor beach and creek cleanup events and supported private groups who wanted to coordinate their own cleanup events. During this reporting period a total of 2,565 volunteers participated in these events, removing more than seven tons of trash, and debris, from the local waterways. In addition the City participated in regional education events including staffing a stormwater booth at the San Diego County Fair's EnviroFair Day.

Section 10.0 Fiscal Component

The City of Oceanside Clean Water Program continued to acquire funding from various sources to implement programs to meet Municipal Permit Order 2007-0001. To secure adequate funding, the Water Utilities Department collects a Clean Water Program surcharge that is delineated on the utility bills for each household and is based on the customer's water consumption. Approximate expenditures for the 2009-10 fiscal year is provided as well as the budget for the 2010-11 reporting period.

Section 11.0 Effectiveness Component

The City implemented an effectiveness assessment program to assist the City in determining which programs, and program components, are effectively improving water quality or leading to water quality improvement. The City gathered and evaluated data for some of the program components for assessment during this reporting period. This data will be valuable for incorporation into long-term effectiveness evaluation on a jurisdictional level.

Section 12.0 Special Investigations

The City of Oceanside received funding from two sources to implement two water quality related projects: the San Luis Rey Bacteria Source Tracking Study and the Loma Alta Creek Ultraviolet Treatment Facility.

Lower San Luis Rey Bacteria Source Tracking

As part of the Proposition 50 Clean Beaches Initiative, the City of Oceanside was awarded $554,375 to track the sources of bacteria in the Lower San Luis Rey River. This study project has a goal to identify the sources and quantify the loading of bacterial contamination in the lower San Luis Rey River using a tiered approach. This approach will permit prioritization for mitigation of microbial contaminants and appropriate actions will be recommended to eliminate sources of bacterial contamination.

On December 19, 2008, the State Water Resource Control Board issued a Budget Letter that suspended all projects including the Lower San Luis Rey Source Identification Project, due to State budgetary constraints. On December 17, 2009, the State Water Resources Control Board gave the City of Oceanside notice that the Lower San Luis Rey Source Identification Project grant had been selected to restart. Tasks implemented during this reporting period are detailed in Section 12.1.3.

The Loma Alta Creek Ultraviolet Treatment Facility

The City was awarded a $5,000,000 Proposition 40 Clean Beaches Initiative (CBI) grant by the State Water Resources Control Board to construct an ultraviolet (UV) light treatment facility at the existing La Salina Wastewater Treatment Facility. The anticipated project goal is to eliminate beach closures during the dry season at Buccaneer Beach in Oceanside, California. This will be achieved by diverting the flow from the Loma Alta Lagoon through a UV treatment facility prior to discharging the flow onto the shoreline.

The Loma Alta Creek Ultraviolet Light Treatment Facility first started treatment in June 2009 and continued through September 2009. The system was restarted after the 2009-10 wet season in May 2010. Water samples were taken weekly from Buccaneer Beach directly in front of the discharge pipe and seventy-five feet north and south of the discharge pipe. The samples were

tested for total and fecal coliform and Enterococcus. All samples taken during this reporting period met California Department of Health Services AB411 Objectives and there were no postings due to bacterial levels exceeding standards set by the County Department of Environmental Health.

Section 13.0 Non-Emergency Fire Fighting

Non-emergency fire fighting BMPs and educational methods for reducing the discharge of pollutants from non-emergency flows to the MEP are described in Section 13.

Section 14.0 JURMP Revisions

During this reporting period no revisions were made to the 2008 JURMP.

Section 15.0 Conclusions and Recommendations

This section presents the conclusions from the 2009-2010 reporting year and provides recommendations for future activities and management actions for JURMP program components. During this reporting period several departments within the City moved forward with implementation of various data tracking systems. The Water Utilities Department, which includes Water and Sewer divisions, and the Clean Water Program, continued rolling out the GBA Masters Series software. The Development Services Department, which includes Code Enforcement, Building, and Engineering, chose TRAKiT, permitting software by CRW Systems, Inc and began roll-out in this reporting year. Since both of these systems were fully launched in this reporting period, the Clean Water Program will be reviewing the effectiveness of the new tracking tool and will continue to implement improvements in the use of the system in the coming years.

1.0 INTRODUCTION

This annual report document was prepared by the City of Oceanside (City) pursuant to the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), Order No. 2007-0001, National Pollutant Discharge Elimination System (NPDES) Permit No. CAS0108758, Waste Discharge Requirements for Discharges of Urban Runoff from the Municipal Separate Storm Sewer Systems (MS4s) (referred to in this document as the Municipal Permit) draining the Watersheds of the County of San Diego, which include agencies with land use authority including the incorporated Cities of San Diego County, the County of San Diego, the San Diego Unified Port District, and the San Diego County Regional Airport Authority (collectively called Copermittees). Pursuant to Part J.3.a.of the Municipal Permit, this Jurisdictional Urban Runoff Management Program (JURMP) Annual Report provides a comprehensive description of the activities conducted by the City to meet the requirements of Section D of the Permit during the 2009-2010 annual reporting period (July 1, 2009 – June 30, 2010).

This Municipal Permit is based on the Federal Clean Water Act (CWA), the Porter–Cologne Water Quality Control Act, applicable state and federal regulations, all applicable provision of statewide Water Quality Control Plans and Polices adopted by the State Water Resources Control Board (SWRCB), the Water Quality Control Plan for the San Diego Basin adopted by the Regional Water Quality Control Board (RWCQB), the California Toxics Rule, and the California Toxics Rule Implementation Plan. This Annual Report addresses the renewed NPDES Permit No. CAS0108758, which was first issued on July 16, 1990 (Order No. 90-42), renewed on February 21, 2001 (Order No. 2001-01), and renewed again on January 24, 2007

In the interests of communicating consistent messages to the community regarding the most efficient and effective means of reducing storm water and urban runoff pollution, and as directed under Part J.5 of the Municipal Permit, this document was developed following the standardized format developed and agreed upon by the Copermittees. For the most part, compliance with the Municipal Permit was undertaken by the Copermittees through the development and implementation of the JURMP; therefore this Annual Report is organized in a similar format as the 2008 JURMP.

1.1 Background

Urban development typically involves conversion of natural space to developed areas that include impervious surfaces such as streets, buildings, and parking lots. With the increase in human population and impervious surfaces associated with developed areas there tends to be higher runoff volume and velocity due to the impervious area's incapacity to absorb and hold rainwater. Also, human use of developed areas is associated with a number of pollutants that can be conveyed to the municipal separate storm sewer system (MS4) by a rain event or non-storm water discharges. This is called non-point source pollution. Non-point source pollution, such as urban runoff discharges to the MS4, is a large source of pollutants to receiving water bodies in the San Diego region and throughout the United States. Pollutants commonly associated with urban runoff include sediments, pesticides, fertilizers, herbicides, trash, oil and grease, and heavy metals. Such pollutants are generated by everyday activities such as construction, landscaping and vehicle use and maintenance.

Pollutants that reach receiving water bodies, such as streams, lakes, bays, lagoons, and the ocean, have the potential to significantly impact human and environmental health as well as wildlife that utilize these water bodies and surrounding habitat for survival. Notably, environmentally sensitive areas (ESA) are especially threatened by urban development because such areas tend to have lower capacities to withstand pollutants entering the area.

1.2 Purpose and Objectives

The purpose of this annual report is to present the activities the City conducted during the Fiscal reporting period of July 1, 2009 through June 30, 2010 to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The activities involved implementing, and improving where needed, existing programs and developing new programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. Improving the quality of the discharge from the MS4 should have beneficial effects on the local receiving water bodies.

Table 1-1 presents the organization of the City's JURMP Annual Report and a summary of the corresponding permit requirement in Order No. 2007-0001. Some Report sections and permit requirements overlap and will be found in multiple locations throughout the document.

Table 1-1. City of Oceanside 2009-10 Annual Report Compliance Summary.

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction

Development is typically associated with land disturbance activities and increases in impervious surfaces. Studies indicate that unmitigated development of urban areas has the potential to negatively impact the surrounding environment. According to the Municipal Permit, an increase of "as little as 10%" is known to result in significant declines in physical habitat and biological integrity. Moreover, development projects that increase imperviousness are recognized as altering the hydrologic characteristics of a site, resulting in sediment pollutant generation, pollutant transport, and negative impacts to natural conveyances and the receiving waters. To counter these impacts, the City has developed and implemented a set of measures and procedures designed to reduce the negative effects associated with development. The application of these measures coupled with a consistent screening and review process, ensures that all applicable development projects are in compliance with the requirements of the Municipal Permit to the Maximum Extent Practicable (MEP).

This section of the JURMP Annual Report documents the Development Planning activities performed by the City of Oceanside during the reporting period beginning July 1, 2009 through June 30, 2010. During this reporting period, the City has continued to implement a comprehensive "Development Planning Component" consistent with Section D.1 of the San Diego RWQCB Order No. R9-2007-0001. Table 2-1 contains a directory of the applicable subsections found in the Municipal Permit §J.3.a.(3)(a) with corresponding sections of the Annual Report.

Table 2-1. Order No. R9-2007-0001 Compliance Summary.

J.3.a.(3)(a).xviii Notable activities	See Section 2.2.1.1 of this Annual Report

2.2 Land Use Planning

2.2.1 Background

The development planning component focuses on the collective effort to mitigate impacts which may result from new development and redevelopment projects. The process of verifying compliance with the Municipal Permit is accomplished through the consistent application of storm water principles and regulations during all phases of development.

The Land Use Element of the General Plan was amended in 2003 to include a number of water quality and watershed protection measures. The primary focus of the measures was to provide a more balanced relationship between the needs of the community and development interests, while managing finite natural resources. There were no water quality related amendments adopted into the General Plan during this reporting period. The specific policies are detailed in Section 4.2.3 of the 2008 Jurisdictional Urban Runoff Management Plan.

2.2.1.1 Notable Activities

During this reporting period, the City continued to actively participate in the Copermittee Workgroups, Sub-workgroups, and HMP-TAC. The combined Copermittee effort resulted in the

release of the Countywide Model SUSMP in February 2010, adoption of the Hydromodification Management Plan by the RWQCB in June 2010, and completion of the Regional Construction BMP Guidelines in June 2010.

During this same period the City released an update SUSMP in March 2010; consistent with the Countywide Model SUSMP and the Municipal Permit. Subsequent to the updated SUSMP, the City released a draft Storm Water Mitigation Plan (SWMP) template. The purpose of the template is to provide the design professional with a standardized presentation format while facilitating plan review. The SWMP template will become finalized upon complete implementation of the HMP.

Other notable activities that took place during this reporting period included the continued implementation of data tracking systems by multiple divisions within the City Water and Development Services Departments.

In an effort to improve productivity, the Development Services Department worked with staff from Code Enforcement, Fire Prevention, Information Technologies and Water Utilities to institute an efficient permitting system to make it easier to do business at City Hall. Following evaluation of several systems, staff selected TRAKiT, permitting software by CRW Systems, Inc. In October of 2009, the City went live with TRAKiT; the data management capabilities of TRAKiT assist front-line staff with the inputting and organization of permit data, while the software's enhanced reporting tools provide management staff with pertinent statistics and data to evaluate workflows and allocate resources. The integration of the data management systems of multiple Development Services Implements TRAKiT Software departments makes it easier to find and share this information, both with the public and among staff. In light of these benefits, the City plans to build on this system with electronic plan submittal and an Interactive Voice Response System. These features will facilitate better customer service, more efficient use of staff time, and increased collaboration between the various City disciplines involved in project review, permitting and ode enforcement.

In early 2010, Oceanside launched an online version of TRAKiT, called eTRAKiT, which is made available to the public. Public users are able to access records and view the status of projects, permits and cases via the Internet. For more information, visit www.ci.oceanside.ca.gov and click on the "eTRAKiT-Online Permitting" Quick Link.

2.2.2 Source Characterization

Source characterization is an integral component of any urban runoff program. A wide variety of land use types and activities, if left unmitigated, are known to be sources of pollutants that have the potential to negatively affect the surrounding environment and the project receiving waters.

The March 2010 SUSMP identifies ten (10) separate "Priority Project Categories", which are cited as anticipated or potential sources of storm water pollution based upon particular land use types and specific site conditions, such as site topography and proximity to environmentally sensitive areas. During this reporting period the number of PDP categories was reduced from twelve to ten by expanding the definitions for Heavy Industry projects and projects with the potential to affect Water Quality Environmentally Sensitive Areas (WQESAs).

Source characterization augments the implementation of Site Design, Low Impact Development, Treatment Control, and flow control management practices that enable development and redevelopment project to reduce impacts to the receiving waters and demonstrate compliance with the Maximum Extent Practicable (MEP) standard. Priority Project Categories and General Pollutant Categories appear in Table 1-1 of the updated SUSMP.

2.2.3 Best Management Practice Requirements

There are established minimum design requirements for all development projects, which are discussed in Section 4.4.3 of the 2008 JURMP. In addition, the Land Use Planning Element of the General Plan contains policies to protect water quality that are discussed in Section 4.2.3 of the 2008 JURMP.

The SUSMP was updated in March 2010 to address requirements of the Municipal Permit. New requirements include minimum standards for the implementation of Low Impact Development (LID) practices and the integration of flow control criteria designed to mitigate runoff peaks and durations from development sites. The updated SUSMP incorporates a unified LID procedure which combines site planning and design measures coupled with engineered, small-scale Integrated Management Practices (IMPs), such as bioretention facilities. The update approach divides a site into discrete "Drainage Management Areas", or DMAs. Runoff from an individual DMA is mitigated by a Low Impact Development – Integrated Management Practice which is specifically designed for the DMA.

The Interim SUSMP also includes an LID-IMP/Treatment Control BMP discussion which provides a direct correlation to pollutant types and physical characteristics that enable pollutant transport. This information assists the design professional in developing an effective IMP/BMP "treatment train" and facilitates the pursuit of the MEP standard. Proposed Treatment Control BMPs and IMPs are required to meet the medium removal efficiency standard for the identified Primary Pollutants of Concern for each development project. The implementation of Treatment Control BMPs with low removal efficiency is not permissible.
