Notes

SIC – Standard Industrial Classification Code

Potential Pollutants – Potential pollutants that may be generated by the facility. A facility can be identified as having more than one pollutant. Potential pollutants for each facility are determined by category if no inspection information is available.

Tributary to 303(d) – The facility is tributary to a waterbody listed in the Clean Water Act Section 303(d) list of impaired waterbodies

Generating Pollutants Tributary to 303(d) Listed – The facility is tributary to 303(d) listed receiving water and has potential to generate pollutants for which the water body is impaired

TTWQ – Threat to Water Quality

100	1/12/2011	Public Works Service Request	8450 La Mesa Boulevard	Residential	Report of a clogged storm drain causing flooding at location.	PW evaluated and cleaned/maintained as applicable	N/A
101	1/17/2011	San Diego County Haz Mat	4269 Lowell Ave	Residential	Report of ponded water in the rear of the building causing health concerns.	Case forwarded to County Vector Control who added larvacide and mosquito fish tot he pool. No discharge to the City's MS4 occurred. The area was later confirmed to be dry.	Compliance Letter
102	1/24/2011	City Staff	6145 Lake Murray Blvd	Commercial	Sediment observed tracked into street from multiple land slides that occurred at location.	The slide was determined to have occurred on SDG&E property, who performed the cleanup.	N/A
103	1/24/2011	Storm Water Hotline	4150 Violet St	Residential	Report of a resident draining pool water to the dirt alley at the rear of the property.	Source of water was determined to be from an irrigation leak. The water had been turned off and the irrigation line was repaired.	Written Warning
104	1/24/2011	Request Tracker	Residences on Anders Circle & Aztec Dr	Residential	Reported overirrigation at location.	Educational materials were distributed.	None
105	1/25/2011	Public Works	8000 Parkway Dr	Commercial	Report of a sewer lateral overflow due to a pipe blockage.	The responsible party cleaned the area and enlisted a plumber to clear the line.	N/A

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
106	2/1/2011	Public Works Service Request	Not Specified	Residential	Report of stagnant water in storm drain at location.	PW evaluated and cleaned/maintained as applicable	N/A
107	2/2/2011	Storm Water Hotline	4667 Judson Way	Residential	Report of residents detailing and washing cars at location.	No discharge was observed during the site visit. Code enforcement discussed the issues with the detailer and came to a solution.	N/A
108	2/2/2011	Public Works	9365 Carmichael Dr	Residential	Report of a septic tank overflow.	No evidence of discharge was observed.	N/A
109	2/4/2011	SDGE Staff	6201 Falmouth St	Utility	Report of a vehicle striking a SDG&E generator, releasing non PCB mineral oil into the gutter.	SDG&E recovered the spilled material.	N/A
110	2/9/2011	Storm Water Hotline	Intersection of Riviera Dr & Quarry Rd	Mobile	Report of spilled buckets of paint in street at location.	Public Works crew cleaned the area.	N/A
111	2/9/2011	Storm Water Hotline	8345 Monona Dr	Residential	Report of continual discharge from drainage pipe to the street.	The residence appeared vacant. The property owner was contacted and the investigation is ongoing.	Written Warning
112	2/11/2011	Public Works	6920 Tower St	Residential	Report of a clogged sewer line causing a small amount of wastewater discharge to the street. The wastewater did not reach the inlet.	The property owner hired a plumber to repair the sewer line and install a cleanout, and remedied the wastewater issue.	N/A
113	2/14/2011	Storm Water Hotline	4989 Taltec Dr	Residential	Report of a resident draining pool water onto a hillside causing erosion into the street.	No evidence of erosion was observed. Complaint was determined to be unfounded.	Pool Fact Sheet

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
114	2/15/2011	Storm Water Hotline	Intersection of Severin Dr & Gregory St	Residential	Report of a vehicle leaking oil in street at location.	No evidence of recent leaks observed. Truck is no longer parked at location. No additional action was necessary.	Compliance Letter, Residential Trifold
115	2/19/2011	Public Works Service Request	Orien Avenue	Residential	Report of storm drain at location blocked by contractor, impeding flow during rain event.	PW evaluated and cleaned/maintained as applicable	N/A
116	2/23/2011	Resident via Community Development	5640 Aztec Dr	Residential	Report of a vacant property lacking erosion control BMPs following tree removal.	The property owner was contacted and no evidence of erosion was noted.	N/A
117	2/28/2011	Storm Water Hotline	4710, 4712, & 4712 1/2 Hillcrest Dr	Residential	Report of overirrigation or irrigation system leak.	The property owner was notified and charged with remediation.	Compliance Letter, Over Irrigation Fact Sheet
118	3/1/2011	Public Works Service Request	Intersection of Normal and Parks	Residential	Report of a lost skateboard in the storm drain at location.	Advised over phone.	N/A
119	3/8/2011	Request Tracker	Alvarado west of Comanche	Residential	Report of drainage channel in need of maintenance.	PW evaluated and cleaned/maintained as applicable	N/A
120	3/9/2011	SDGE Staff	5424 Pennsylvania Ln	Utility	SDG&E crews broke a Helix Water District water main.	Helix water district personnel responded and resolved the issue.	N/A
121	3/10/2011	City Engineer	5900 El Cajon Blvd Ste L	Commercial	Grease interceptor/ sewer lateral was clogged leading to observed overflow into parking lot.	The building department condemned use of the sinks until cleanup could be performed. The responsible party had the sewer line cleared and the property management company had the parking lot cleaned. No additional action was neccesary.	Notice of Violation

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
122	3/11/2011	Public Works Service Request	Not Specified	Residential	Report of consistent standing water in the gutter at location.	PW evaluated and cleaned/maintained as applicable	N/A
123	3/14/2011	Storm Water Hotline	8308 Parkway Dr	Commercial	Gas odor in floor drains reported to County Hazmat.	County Hazmat staff responded and flushed the sewer line. No clear source could be identified but likely was the result of chemical dumping to sewer. City staff performed dye test and found no connection to the City's MS4.	None
124	3/19/2011	Public Works Service Request	7210 Blackton Drive	Residential	Report of oil in the storm drain.	PW evaluated and cleaned/maintained as applicable	N/A
125	3/21/2011	Public Works Service Request	Not Specified	Residential	Report of a clogged storm drain and landslide at location.	PW evaluated and cleaned/maintained as applicable	N/A
126	3/21/2011	Storm Water Hotline	7212 Blackton Dr	Residential	Report of a resident discharging oil to a backyard storm drain inlet.	Resident removed the material from the property.	Notice of Violation
127	3/24/2011	Public Works Service Request	6340 Meadowcrest	Residential	Report of a hole in the concrete channel behind the residence causing slope erosion.	PW evaluated and cleaned/maintained as applicable	N/A
128	3/30/2011	Storm Water Hotline	8899 La Mesa Blvd	Commercial	Report of water leaking through sidewalk at location.	Helix water district personnel responded, determined that the issue was a leaking irrigation system and had the responsible party repair the leak.	N/A

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
129	3/31/2011	Storm Water Hotline	4655 Normandie Pl	Residential	Resident requested information regarding automotive fluid disposal.	Resident was advised regarding waste disposal.	N/A
130	4/5/2011	Public Works Service Request	4057 King St	Residential	The storm drain is clogged causing flooding and standing water.	PW evaluated and cleaned/maintained as applicable	N/A
131	4/8/2011	City Staff	Glen St	Residential	Report of a resident discharging laundry wash water to the street.	Source of water was determined to be from foundation drains. No water quality concerns observed.	None
132	4/11/2011	Public Works Service Request	Not Specified	Residential	Report of a possible sinkhole forming at location.	PW evaluated and cleaned/maintained as applicable	N/A
133	4/11/2011	Storm Water Hotline	4533 Lee St	Residential	Report of a consistent water discharge from a residence that leaves a residue in the curb.	Source of water was determined to be a foundation sump pump. No evidence of wastewater discharge was observed. Resident was also found to be washing his car and was informed of storm water regulations regarding car washing.	Residential Trifold
134	4/13/2011	City Staff	4471-4451 Glen St	Residential	Discharge of unknown origin was observed flowing from a pipe located between two properties.	Resident was contacted and the pipe was found to be connected to a storm water inlet. No evidence of wastewater discharge was observed.	None
135	4/19/2011	Request Tracker	7990 Anders Circle	Residential	Report of water discharge from a curb outlet at location.	Source of water was determined to be a sump pump discharge. No further action was neccesary.	N/A
136	4/20/2011	Storm Water Hotline	8155 & 8125 St. Onge Dr	Residential	Report of vehicles leaking oil onto street at location.	The responsible party could not be identified.	None

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
137	4/22/2011	Public Works Service Request	Comanche Drive, at Saranac	Residential	Report of a sinkhole at location.	PW evaluated and cleaned/maintained as applicable	N/A
138	4/27/2011	Public Works Service Request	9223 Lovell Ln	Residential	Report of clogged storm drain at location causing flooding.	PW evaluated and cleaned/maintained as applicable	N/A
139	5/2/2011	Public Works	7213 Blackton Dr	Residential	Report of a dried white powder or paint being discharged from a residence.	Resident had their contractor remove the material.	N/A
140	5/9/2011	Public Works Service Request	8141 La Mesa Blvd	Residential	Report of storm drain clogged with debris and attracting insects.	PW evaluated and cleaned/maintained as applicable	N/A
141	5/12/2011	Storm Water Hotline	10833 Explorer Rd	Utility	Report of a hydraulic oil spill in the street.	Out of the City's jurisdiction. SDG&E performed cleanup.	N/A
142	5/26/2011	City Staff	8302 La Mesa Blvd	Commercial	Report of grease dumping into dumpster area at location.	Responsible party cleaned the area and arranged to have a new dumpster delivered.	N/A
143	5/30/2011	Public Works Service Request	West end of Highwood Park	Residential	Report of storm drain clogged at location.	PW evaluated and cleaned/maintained as applicable	N/A
144	6/8/2011	Storm Water Hotline	4389 Dale Ave	Residential	Report of spilled paint at location that has dried.	Area was powerwashed to remove paint residue. All wash water was reclaimed. No additional action was neccesary.	N/A
145	6/13/2011	City Staff	4309 Harbinson Ave	Residential	Report of erosion due to grading activities at residence withour erosion control BMPs.	Investigation/remediation is in progress.	N/A

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
146	6/14/2011	Public Works	6345 Meadowcrest Dr	Residential	Report of an unmaintained pool at location causing health concerns.	Case was forwarded to County Vector Control.	N/A
147	6/14/2011	Public Works	7284 Princeton Dr	Residential	Report of drywall or plaster discharge into the street from a residence.	The homeowner removed the material from the location.	Notice of Violation
148	6/20/2011	City Engineer	7779 Highwood Ave	Residential	Report of a mulch pile leaking into the gutter.	Resident cleaned up the area.	Notice of Violation, Enforcement Letter
149	6/22/2011	Storm Water Hotline	7080 Saranac Dr	Residential	Report of neighborhood children wasting water.	The activity was stopped and the responsible parties could not be contacted. The City will monitor for any recurring issues.	N/A
150	6/23/2011	Public Works Service Request	Not Specified	Residential	Report of a clogged storm drain at location.	PW evaluated and cleaned/maintained as applicable	N/A
151	6/28/2011	Public Works	3752 Harris Dr	Residential	Report of foul smelling water discharge from a pipe in front of residence.	Source of water was determined to be from foundation drains. No water quality concerns observed.	N/A

APPENDIX C

Appendix C
JURMP Annual Report Requirements Checklist

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	**Location in Report**
i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements.	2.2, 2.3
ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked.	2.4.4.2
iii. A listing of the development projects to which SUSMP requirements were applied.	2.4.4.2
iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked.	2.4.4.2
v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs.	2.4.4.2
vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible.	2.4.4.2
vii. An updated treatment control BMP inventory.	Appendix A.1
viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings.	2.4.4.3, Table 2-1 and 2-2
ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings.	2.4.4.3
x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked.	2.4.4.2
xi. A listing of any projects which received a SUSMP waiver.	2.4.4.2
xii. A description of implementation of any SUSMP waiver mitigation program.	2.4.4.2
xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation.	2.4.4.2
xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented.	2.4.4.2
xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements.	2.4.4.2

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	**Location in Report**
xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project.	2.4.4.2
xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	2.4.4.3, Table 2-2
xviii. A description of notable activities conducted to manage urban runoff from development projects.	Throughout Section

Construction

Permit Annual Reporting Requirement—Section J.3.a.(3).(b)	**Location in Report**
i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked.	3.5
ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed.	3.2
iii. A description of modifications made to the construction and grading ordinances and approval processes.	3.3
iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites.	3.5
v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites.	3.5
vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites.	3.5
vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites.	3.5, Appendix A.2
viii. A description of the general results of the inspections.	3.5
ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	3.5
x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	3.5 Table 3-1
xi. A description of notable activities conducted to manage urban runoff from construction sites.	Throughout Section

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
i. Any updates to the municipal inventory and prioritization.	Appendix A.3
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events.	4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4
iii. A description of inspections and maintenance conducted for municipal treatment controls.	2.4
iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned.	4.4 Table 4-2
v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned.	4.4 Table 4-2
vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned.	4.4 Table 4-2
vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category.	4.4 Table 4-2
viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding.	N/A for 2010/2011
ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities.	4.2.3
x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3 Table 4-1
xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4 Table 4-1
xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4 Table 4-1

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
xiii. Identification of the total distance of curb-miles swept.	4.3.4 Table 4-1
xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping.	4.3 Table 4-1
xv. Amount of material (tons) collected from street and parking lot sweeping.	4.3 Table 4-1
xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4	4.5.4
xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections.	4.2.4, 4.3.4, Table 4-5
xviii. A description of the general results of the inspections.	Table 4-5
xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	4.2.4
xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	4.2.4
xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities.	Throughout Section

Industrial and Commercial

Permit Annual Reporting Requirement—Section J.3.a.(3).(d)	**Location in Report**
i. Any updates to the industrial and commercial inventory.	5.2.2 (stationary), 5.3.2 (mobile), Appendices A.4, A.5
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources.	5.2.4, 5.3.3, 5.3.4
iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses.	5.2.4, 5.3.4
iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected.	5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1
v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection.	5.2.4
vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance.	5.2.4
vii. Identification of the number of third party inspections conducted.	N/A (5.2.4)
viii. Identification of efforts conducted to verify third party inspection effectiveness.	N/A (5.2.4)
ix. A description of efforts implemented to address mobile businesses.	5.3.4
x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	5.2.4, 5.3.4
xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees.	5.2.4
xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources.	Throughout Section

Residential

Permit Annual Reporting Requirement—Section J.3.a.(3).(e)	**Location in Report**
i. Identification of the high threat to water quality residential areas and activities that were focused on.	6.2
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities.	6.4
iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials.	6.4
iv. Types and amounts of household hazardous wastes collected, if applicable.	6.4
v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation.	6.4 (see discussion in JURMP)
vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	6.4
vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program.	6.4
viii. A description of notable activities conducted to manage urban runoff from residential areas and activities.	Throughout Section

IDDE*

Permit Annual Reporting Requirement—Section J.3.a.(3).(f)	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the 2010/2011Annual Report, will be submitted to the RWQCB no later than December 15, 2011.	

IDDE—Additional Dry Weather Monitoring Program Requirements*

Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the 2010/2011 Annual Report, will be submitted to the RWQCB no later than December 15, 2011.	

Education

Permit Annual Reporting Requirement—Section J.3.a.(3).(g)	Location in Report
i. A description of education efforts conducted for each target community.	8.3
ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges.	8.3
iii. A description of education efforts conducted for municipal departments and personnel.	8.2
iv. A description of education efforts conducted for the new development and construction communities.	8.3
v. A description of jurisdictional education efforts conducted for residents, the general public, and school children.	8.3

Public Participation

Permit Annual Reporting Requirement—Section J.3.a.(3).(h)	Location in Report
i. A description of public participation efforts conducted.	9.2 and 9.3

Effectiveness Assessment

Permit Annual Reporting Requirement—Section J.3.a.(3).(i)	Location in Report
i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order.	11

Fiscal Analysis

Permit Annual Reporting Requirement—Section J.3.a.(3).(j)	Location in Report
i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. (For 2007-2008, the requirements that apply are essentially the same as those found in Order No. 2001-01)	10

Special Investigations

Permit Annual Reporting Requirement—Section J.3.a.(3).(k)	Location in Report
i. A description of any special investigations conducted.	12

Non-Emergency Firefighting

Permit Annual Reporting Requirement—Section J.3.a.(3).(l)	**Location in Report**
i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows.	4.2.3, 13

JURMP Revisions

Permit Annual Reporting Requirement—Section J.3.a.(3).(m)	**Location in Report**
i. A description of any proposed revisions to the JURMP.	14 and each program component section

UPDATED BMP MANUAL II

City of La Mesa
Department of Public Works
Engineering Division

The City of La Mesa Storm Water Best Management Practices Manual – Part II

LA MESA LOCAL STANDARD URBAN STORM WATER MITIGATION PLAN (LOCAL SUSMP)
Adopted 2002
Updated January 2011

This page intentionally left blank.

Table of Contents

GLOSSARY

HOW TO USE THE STORM WATER BEST MANAGEMENT PRACTICES MANUAL 1

► Plan Ahead to Avoid the Three Most Common Mistakes 2

CHAPTER 1. POLICIES AND PROCEDURES 3

Background 3

Legal Framework 4

A Low Impact Development Design Procedure 5

Requirements for All Development Projects 5

Priority Development Projects 6
► New Development 6
► Previously Developed Sites 6
► The "50% Rule" for Previously Developed Projects 7
► Pollutant Generating Projects Which Disturb One Acre or More of Land 7

Project Review and Permitting Process 7

Compliance Process at a Glance 10
► Additional Notes on Compliance 10

Phased Projects 11

New Subdivisions 11

Compliance with Flow-Control Requirements 13
► HMP Applicability Requirements 13
► Flow Control Performance Criteria 20

Waivers from Numeric Sizing Criteria 31

CHAPTER 2. CONCEPTS AND CRITERIA 32

Water-Quality Regulations 33
► Maximum Extent Practicable 34
► Best Management Practices 34

Pollutants of Concern 34

► Grouping of Potential Pollutants of Concern 34
► Identifying Pollutants of Concern Based on Land Uses 36
► Watersheds with Special Pollutant Concerns 36

Selection of Permanent Source Control BMPs 39

Selection of Storm Water Treatment Facilities 39

Hydrology for NPDES Compliance 42
► Imperviousness 42
► Low Impact Development Requirements 43
► Sizing Requirements for Storm Water Treatment Facilities 43
► Flow-Control (Hydromodification Management) 44

Criteria for Infiltration Devices 44
► Most LID Features and Facilities Are Not Infiltration Devices 45

CHAPTER 3. PREPARING YOUR PROJECT SUBMITTAL 47

Step by Step 50

Step 1: Assemble Needed Information 50

Step 2: Identify Constraints & Opportunities 52

Step 3: Prepare and Document Your LID Design 52

Step 4. Specify Source Control BMPs 53
► Identify Pollutant Sources 54
► Note Locations on Submittal Drawing 54
► Prepare a Table and Narrative 54
► Identify Operational Source Control BMPs 54

Step 5: Storm Water Facility Maintenance 55

Step 6: Complete Your Project Submittal 55
► Coordination with Site, Architectural, and Landscaping Plans 55
► Construction Plan SUSMP checklist 56
► Certification 57
► Example Project Submittal Outline and Contents 58
► Specific Project Considerations 59

CHAPTER 4. LOW IMPACT DEVELOPMENT DESIGN GUIDE 60

Analyze Your Project for LID 61
► Optimize the Site Layout 62
► Use Pervious Surfaces 64
► Disperse Runoff to Adjacent Pervious Areas 64
► Direct Runoff to Integrated Management Practices 64

Develop and Document Your Drainage Design 66
► Step 1: Delineate Drainage Management Areas 66

► Step 2: Classify DMAs and Determine Runoff Factors 67
► Step 3: Tabulate Drainage Management Areas 70
► Step 4: Select and Lay Out IMPs on Site Plan 71
► Step 5: Review Sizing for Each IMP 71
► Step 6: Calculate Minimum Area and Volume of Each IMP 72
► Step 7: Determine If Available Space for IMP Is Adequate 82
► Step 8: Complete Your Summary Report 83

Specify Preliminary Design Details 84

Alternatives to Integrated LID Design 85
► Design of Alternative Treatment Facilities 85
► Treatment Facilities for Special Circumstances 88

CHAPTER 5. OPERATION & MAINTENANCE OF STORM WATER FACILITIES 89

Stage 1: Ownership and Responsibility 90
► Private Ownership and Maintenance 91
► Transfer to Public Ownership 91

Stage 2: General Maintenance Requirements 92

Stage 3: Detailed Maintenance Plan 92
► Your Detailed Maintenance Plan: Step by Step 93
► Step 1: Designate Responsible Individuals 93
► Step 2: Summarize Drainage and BMPs 94
► Step 3: Document Facilities "As Built" 94
► Step 4: Prepare Maintenance Plans for Each Facility 94
► Step 5: Compile Maintenance Plan 95
► Step 6: Updates 97

Stage 4: Interim Maintenance 97

Stage 5: Transfer Responsibility 97

Stage 6: Operation & Maintenance Verification 97

CHAPTER 6. CONSTRUCTION BMP REQUIREMENTS AND PERFORMANCE STANDARDS 99

Construction Storm Water BMP Requirements 99
► Step 1: Determine Applicable Storm Water BMP Requirements 101
► Step 2: Prepare & Submit Appropriate Plans 101
► Step 3: Determine Adequacy of Proposed Plans 102
► Step 4: Assure Implementation & Maintenance of Requirements 102

Construction Storm Water BMP Performance Standards 103
► 1. Minimum Construction BMP Requirements 103
► 2. Site Management Requirements 105
► 3. Performance Standards 106
► 4. Seasonal Requirements 107
► 5. Advanced Treatment Requirements 110
► 6. Additional Controls for Construction Sites 110

Implementation and Maintenance of Requirements 110

Glossary

Advanced Treatment

Using mechanical or chemical means to flocculate and remove suspended **sediment** from runoff from construction sites prior to discharge.

Attached Residential Development

Any development that provides residential units that share an interior/exterior wall. This category includes, but is not limited to: dormitories, condominiums, and apartments.

Automotive Repair Shop

A facility that is categorized in any one of the following **Standard Industrial Classification (SIC)** codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

Best Management Practice (BMP)

Any procedure or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. This manual groups storm water BMPs into the following categories: (1) Construction Storm Water BMPs, which are practices, procedures, devices or materials used to prevent the transport and introduction of pollutants both on and from a project during construction; and (2) Permanent Storm Water BMPs, which are the **Low Impact Development** design features, **source control** features, and **treatment control BMP**s that become a permanent part of a project site.

California Association of Stormwater Quality Association (CASQA)

Publisher of the California Stormwater Best Management Practices Handbooks, available at www.cabmphandbooks.com. Successor to the Storm Water Quality Task Force (SWQTF).

California BMP Method

A method for determining the required volume of storm water treatment facilities. Described in Section 5.5.1 of the California Stormwater Best Management Practice Manual (New Development) (CASQA, 2003).

Commercial Development

Commercial development is defined as any development on private land that is not for heavy industrial or residential uses. The category includes, but is not limited to, hospitals; laboratories and other medical facilities; educational institutions; recreational facilities; municipal facilities; commercial nurseries; multi-apartment buildings; car wash facilities; mini-malls and other business complexes; shopping malls; hotels; office buildings; public warehouses; automotive dealerships; commercial airfields; and other light industrial facilities. Any development on private land that is not exclusively industrial or residential uses. The **Priority Development Project** category is defined as commercial developments resulting in the disturbance of one acre or more of land.

Conditions of Approval (COAs)

Requirements a municipality may adopt for a project in connection with a discretionary action (e.g., adoption of an EIR or negative declaration or issuance of a use permit). COAs may include features to be incorporated into the final plans for the project and may also specify uses, activities, and operational measures that must be observed over the life of the project.

Construction Storm Water Management Plan (CSWMP)	A CSWMP is the document prepared and submitted to meet the City of La Mesa's construction BMP requirements for a project that causes land disturbance of less than one acre.
Continuous Simulation Modeling	A method of hydrological analysis in which a set of rainfall data (typically hourly for 30 years or more) is used as input, and runoff rates are calculated on the same time step. The output is then analyzed statistically for the purposes of comparing runoff patterns under different conditions (for example, pre- and post-development-project).
Copermittees	See **Dischargers**.
Detached Residential Development	Any development that provides freestanding residential units. This category includes, but is not limited to: detached homes, such as single-family homes and detached condominiums.
Detention	The practice of holding storm water runoff in ponds, vaults, within berms, or in depressed areas and letting it discharge slowly to the storm drain system. See definitions of **infiltration** and **retention**.
Direct Discharge	Connection of project site runoff to an exempt receiving water body, which could include an exempt river reach, reservoir or lagoon. To qualify as a direct discharge, the discharge elevation from the project site outfall must be below the elevations detailed in the HMP Applicability section of this BMP Manual.
Direct Infiltration	Infiltration via methods or devices, such as dry wells or infiltration trenches, designed to bypass unsaturated surface soils and transmit runoff directly to groundwater.
Directly Connected Impervious Area	Any **impervious surface** which drains into a catch basin, area drain, or other conveyance structure without first allowing flow across pervious areas (e.g. lawns).
Dischargers	The agencies named in the **storm water NPDES permit** (see definition): the County of San Diego; the Cities of Carlsbad, El Cajon, La Mesa, Poway, Solana Beach, Chula Vista, Encinitas, Lemon Grove, San Diego, Vista, Coronado, Escondido, National City, San Marcos, Del Mar, Imperial Beach, Oceanside, and Santee; the San Diego Unified Port District, and the San Diego County Regional Airport Authority.
Drainage Management Areas	Areas delineated on a map of the development site showing how drainage is detained, dispersed, or directed to **Integrated Management Practices**. There are four types of Drainage Management Areas, and specific criteria apply to each type of area. See Chapter 4.
Drawdown time	The time required for a storm water detention or infiltration facility to drain and return to the dry-weather condition. For detention facilities, drawdown time is a function of basin volume and outlet orifice size. For infiltration facilities, drawdown time is a function of basin volume and infiltration rate.

Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); water bodies designated with the RARE beneficial use by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); areas designated as preserves or their equivalent under the Multi Species Conservation Program within the Cities and County of San Diego; and any other equivalent environmentally sensitive areas which have been identified by the City of La Mesa.

Environmentally Sensitive Areas This **Priority Development Project** category includes all development and redevelopment located within or directly adjacent to or discharging directly to an environmentally sensitive area (where discharges from the development or redevelopment will enter receiving waters within the environmentally sensitive area), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the Environmentally Sensitive Area (ESA). "Discharging directly to "means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.

Flow Control Control of runoff rates and durations as required by the Hydromodification Management Plan.

Head In hydraulics, energy represented as a difference in elevation. In slow-flowing open systems, the difference in water surface elevation, e.g., between an inlet and outlet.

Higher-Rate Biofilter A biofilter with a design surface loading rate higher than the 5 inches per hour rate specified in this document for bioretention facilities and planter boxes.

Hillside Lands that have a natural gradient of 25 percent (4 feet of horizontal distance for every 1 foot of vertical distance) or greater and a minimum elevation differential of 50 feet, or a natural gradient of 200 percent (1 foot of horizontal distance for every 2 feet of vertical distance) or greater and a minimum elevation differential of 10 feet.

Hillside Development Greater Than 5,000 Square Feet This **Priority Development Project** category includes any development which creates 5,000 square feet of **impervious surface** which is located in an area with known erosive soil conditions, where the development will grade any natural slope that is 25 percent or greater.

Hydrograph Runoff flow rate plotted as a function of time.

Hydromodification The change in the natural hydrologic processes and runoff characteristics (i.e. interception, infiltration, overland flow, interflow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and changes in sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive stream bank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Hydromodification Management Plan (HMP)	A Plan implemented by the **dischargers** so that post-project runoff shall not exceed estimated pre-project rates and/or durations, where increased runoff would result in increased potential for erosion or other adverse impacts to beneficial uses. Also see definition for **flow control**. Specifically, Final HMP refers to the most recent Hydromodification Management Plan developed for San Diego County jurisdictions and approved by the San Diego RWQCB.
Hydrologic Soil Group	Classification of soils by the Natural Resources Conservation Service (NRCS) into A, B, C, and D groups according to infiltration capacity.
Industrial Development	Industrial facilities include those defined at 40 CFR 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit, operating and closed landfills, facilities subject to SARA Title III, and hazardous waste treatment, disposal, storage and recovery facilities. Examples of industrial facilities includes manufacturing plants, food processing plants, metal working facilities, printing plants, and fleet storage areas (bus, truck, etc.). The **Priority Development Project** category includes development of heavy industry resulting in the disturbance of one acre or more of land.
Impervious surface	Any material that prevents or substantially reduces infiltration of water into the soil. See discussion of imperviousness in Chapter Two.
Infeasible	As applied to best management practices, impossible to implement because of technical constraints specific to the site.
Infiltration	Seepage of runoff into soils underlying the site. See definition of **retention.**
Infiltration Device	Any structure, such as a dry well, that is designed to infiltrate storm water into the subsurface and, as designed, bypasses the natural groundwater protection afforded by surface or near-surface soil. See definition for **direct infiltration**.
Integrated Management Practice (IMP)	A facility **(BMP)** that provides small-scale treatment, retention, and/or detention and is integrated into site layout, landscaping, and drainage design. See **Low Impact Development.**
Integrated Pest Management (IPM)	An approach to pest management that relies on information about the life cycles of pests and their interaction with the environment. Pest control methods are applied with the most economical means and with the least possible hazard to people, property, and the environment.
Jurisdictional Urban Runoff Management Plan (JURMP)	A written description of the specific jurisdictional urban runoff management measures and programs that the City of La Mesa implements to comply with the **storm water NPDES permit** and ensure pollutant discharges are reduced to the MEP and do not cause or contribute to a violation of water quality standards. See **Storm Water Pollution Prevention Program.**
Lead Agency	The public agency that has the principal responsibility for carrying out or approving a project. (CEQA Guidelines §15367).

Low Impact Development	An integrated site design methodology that uses small-scale detention and retention (Integrated Management Practices, or **IMPs**) to mimic pre-existing site hydrological conditions.
Maximum Extent Practicable (MEP)	Standard, established by the 1987 amendments to the Clean Water Act, for the implementation of municipal **storm water pollution prevention programs** (see definition). According to the Act, municipal storm water NPDES permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."
National Pollutant Discharge Elimination System (NPDES)	As part of the 1972 Clean Water Act, Congress established the NPDES permitting system to regulate the discharge of pollutants from municipal sanitary sewers and industries. The NPDES was expanded in 1987 to incorporate permits for storm water discharges as well.
Natural Drainage	A natural swale or topographic depression which gathers and/or conveys runoff to a permanent or intermittent watercourse or waterbody.
New Development	Land disturbing activities; surface grading for structural development, including construction or installation of a building or structure, the creation of **impervious surfaces**; and land subdivision.
Numeric Criteria	Sizing requirements for storm water treatment facilities established in Provision D.1.d.(6)(c) of the San Diego RWQCB's storm water NPDES permit.
Operation and Maintenance (O&M)	Refers to requirements in the **Storm Water NPDES Permit** to inspect treatment BMPs and implement preventative and corrective maintenance in perpetuity. See Chapter Five.
Parking Lot	A land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce. This **Priority Development Project** category includes parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to urban runoff.
Permeable Pavements	Pavements for roadways, sidewalks, or plazas that are designed to infiltrate a portion of rainfall, including pervious concrete, pervious asphalt, unit-pavers-on-sand, and crushed gravel.
Pollutant Generating Development Project	Generally all projects which include **impervious surfaces** and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces.
Post Construction Water Quality Technical Report (PCWQTR)	A PCWQTR is the **Project Submittal** of a **Priority Development Project** to demonstrate compliance.

Priority Development Project A project subject to SUSMP requirements. Defined in **Storm water NPDES Permit** Provision D.1.d.(1). See Appendix A.

Project Area The entire project area comprises all areas to be altered or developed by the project, plus any additional areas that drain on to areas to be altered or developed.

Projects Discharging to Receiving Waters within Environmentally Sensitive Areas All development and significant redevelopment that would create 2,500 square feet of **impervious surfaces** or increase the area of imperviousness of a project site to 10% or more of its naturally occurring condition, and either (1) discharge urban runoff to a receiving water within or directly adjacent (where any portion of the project footprint is located within 200 feet of the **environmentally sensitive area**) to an environmentally sensitive area or (2) discharge to a receiving water within an environmentally sensitive area without mixing with flows from adjacent lands (where the **project footprint** is located more than 200 feet from the environmentally sensitive area).

Project Footprint The limits of all grading and ground disturbance, including landscaping, associated with a project.

Project Submittal Documents submitted to the City of La Mesa in connection with an application for development approval and demonstrating compliance with Storm Water NPDES Permit requirements for the project. Priority Development Projects submit a **Post Construction Water Quality Technical Report** and all other projects submit a **Standard Post Construction BMP Plan**.

Proprietary A proprietary device is one marketed under legal right of the manufacturer.

Receiving Waters Surface bodies of water, which directly or indirectly receive discharges from urban runoff conveyance systems, including naturally occurring wetlands, streams (perennial, intermittent, and ephemeral [exhibiting bed, bank, and ordinary high water mark]), creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays and the Pacific Ocean. La Mesa will determine the definition for wetlands and the limits thereof for the purposes of this definition as protective as the United States Environmental Protection Agency. Constructed wetlands are not considered wetlands under this definition, unless the wetlands were constructed as mitigation for habitat loss. Other constructed **BMP**s are not considered receiving waters under this definition, unless the BMP was originally constructed in receiving waters. Construction of treatment control BMPs in "Receiving Waters" is prohibited and therefore may not be used to satisfy **SUSMP** requirements.

Redevelopment The creation, addition, and or replacement of **impervious surface** on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces.

Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots and existing roadways; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Rational Method	A method of calculating runoff flows based on rainfall intensity, tributary area, and a factor representing the proportion of rainfall that runs off.
Regional (or Watershed) Storm Water Treatment Facility	A facility that treats runoff from more than one project or parcel.
Regional Water Quality Control Board (Regional Water Board or RWQCB)	California RWQCBs are responsible for implementing pollution control provisions of the Clean Water Act and California Water Code within their jurisdiction. There are nine California RWQCBs.
Residential Development	Any development on private land that provides living accommodations for one or more persons, including but not limited to: single-family homes, multi-family homes, condominiums, and apartments. This **Priority Development Category** is defined as housing subdivisions resulting in the disturbance of one acre or more of land or comprised of 10 or more dwelling units.
Residential Development of 10 Units or More	Any development that provides 10 or more residential units. Residential units can be attached or detached.
Restaurant	"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (**SIC** code 5812), where the land area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet shall meet all **SUSMP** requirements except for structural treatment BMP, numeric sizing criteria requirement, and hydromodification requirement.
Retail Gasoline Outlets (RGOs)	This **Priority Development Project** category includes RGOs that meet the following criteria: (a) 5,000 square feet or more, or (b) a projected average daily traffic (ADT) of 100 or more vehicles per day.
Retention	The practice of holding storm water in ponds or basins, or within berms or depressed areas, and allowing it to slowly infiltrate into underlying soils. Some portion will evaporate. See definitions for **infiltration** and **detention**.
Sediment	Soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organism survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.
Self-retaining area	An area designed to retain runoff. Self-retaining areas may include graded depressions with landscaping or pervious pavements and may also include tributary impervious areas up to a 2:1 impervious-to-pervious ratio.
Self-treating area	A natural, landscaped, or turf area drains directly off site or to the public storm drain system.

Significant Redevelopment	**Redevelopment** that would create or add or replace at least 5,000 square feet of **impervious surfaces** on an already developed site that falls under one or more priority development project categories. When redevelopment results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design. If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design.
Source Control	Land use or site planning practices, or structural or nonstructural measures that aim to prevent urban runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and urban runoff.
Standard Industrial Classification (SIC)	A Federal government system for classifying industries by 4-digit code. It is being supplanted by the North American Industrial Classification System but SIC codes are still referenced by the Regional Water Board in identifying development sites subject to regulation under the NPDES permit. Information and an SIC search function are available at http://www.bls.gov/bls/NAICS.htm
Standard Post Construction BMP Plan (SPCBMPP)	A SPCBMPP is the **Project Submittal** to demonstrate compliance for a project subject to only standard permanent BMP requirements.
Storm Water Conveyance System	Private and public drainage facilities by which storm water may be conveyed to Receiving Waters, such as: natural drainages, roads, streets, constructed channels, aqueducts, storm drains, pipes, street gutters, or catch basins.
Storm Water NPDES Permit	A permit issued by a **Regional Water Quality Control Board** (see definition) to local government agencies (**Dischargers**) placing provisions on allowable discharges of municipal storm water to waters of the state.
Storm Water Pollution Prevention Plan (SWPPP)	A plan providing for temporary measures to control sediment and other pollutants during construction as required by the statewide storm water NPDES permit for construction activities. A SWPPP is required for projects causing land disturbance of one acre or more.
Storm Water Pollution Prevention Program	A comprehensive program of activities designed to minimize the quantity of pollutants entering storm drains. See **Jurisdictional Urban Runoff Management Plan.**
Standard Urban Storm Water Mitigation Plan (SUSMP)	Refers to various documents prepared in connection with implementation of the storm water **NPDES permit** mandate to control pollutants from new development and redevelopment. Each **discharger** will adapt the **model countywide SUSMP** to create a local SUSMP for their respective jurisdiction. Applicants for development project approvals will use the local SUSMP to prepare a submittal for each **Priority Development Project** they propose.

Streets, Roads, Highways, and Freeways	This **Priority Development Project** category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles. For the purposes of SUSMP requirements, Streets, Roads, Highways and Freeways do not include trenching and resurfacing associated with utility work; applying asphalt overlay to existing pavement; new sidewalk, pedestrian ramps, or bike lane construction on existing roads; and replacement of damaged pavement.
Treatment	Removal of pollutants from runoff, typically by filtration or settling.
Treatment Control (Structural) BMP	Any engineered system designed and constructed to remove pollutants from urban runoff. Pollutant removal is achieved by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption, or any other physical, biological, or chemical process.
Water Board	See **Regional Water Quality Control Board.**
Water Quality Volume (WQV)	For storm water treatment facilities that depend on detention to work, the volume of water that must be detained to achieve maximum extent practicable pollutant removal. This volume of water must be detained for a specified **drawdown time**.

How to Use the Storm Water Best Management Practices Manual

Review Chapters 1 and 2 to get a general understanding of the requirements. Then follow step-by-step instructions in Chapter 3 to prepare your Project Submittal.

THIS Storm Water Best Management Practices Manual (BMP Manual) will help you ensure your project complies with both the Local Standard Urban Storm Water Mitigation Plan (SUSMP) requirements and the Construction BMP requirements of the City of La Mesa (City). Most applicants will require the assistance of a qualified civil engineer, architect, and/or landscape architect. Because every project is different, you should begin by checking specific requirements with municipal staff.

To use the BMP Manual, note that Construction BMPs are temporary measures to control sediment and other pollutants during construction, while SUSMP requirements apply to the development process during all stages of design, construction, completion, use, and maintenance in perpetuity. Start by completing Appendix A to find out how storm water quality requirements apply to your project.

To meet post-construction SUSMP requirements, see chapters one through five of the BMP Manual. To comply with construction BMP requirements, skip ahead to Chapter Six.

Chapter One provides an overview of the process of planning, design, construction, operation, and maintenance leading to compliance with post-construction SUSMP requirements.

If there are terms and issues you find confusing, try finding answers in the glossary or in **Chapter Two**. Chapter Two provides background on key storm water concepts and water quality regulations, including design criteria.

Then proceed to **Chapter Three** and follow the step-by-step guidance to prepare a Project Submittal for your site.

Chapter Four, the Low Impact Development Design Guide, includes design procedures, calculation procedures, and instructions for presenting your design and calculations in your Project Submittal.

In **Chapter Five** you'll find a detailed description of the process for ensuring operation and maintenance of your storm water facilities over the life of the project. The chapter includes step-by-step instructions for preparing a Storm Water Facilities Operation and Maintenance Plan.

The City of La Mesa's specific construction BMP requirements and performance standards are included in **Chapter Six**.

Throughout each Chapter, you'll find references and resources to help you understand the regulations, complete your Project Submittal, and design storm water control measures for your project.

Construction-Phase Controls

Your Project Submittal for SUSMP compliance is a separate document from the Storm Water Pollution Prevention Plan (SWPPP). A SWPPP provides for temporary measures to control sediment and other pollutants during construction at sites that disturb one acre or more. See Chapter 6 of this BMP manual for more information on SWPPPs.

The most recent, updated version of the BMP Manual is on the City website. The on-line BMP Manual is in Adobe Acrobat format. If you are reading the Acrobat version on a computer with an internet connection, you can use hyperlinks to navigate the document and to access various references. The hyperlinks are throughout the text, as well as in "References and Resources" sections within chapters and in "Bibliography and Suggested Resources" in Appendix F. Some of these links (URLs) may be outdated. In that case, try entering portions of the title or other keywords into a web search engine.

► PLAN AHEAD TO AVOID THE THREE MOST COMMON MISTAKES

The most common (and costly) errors made by applicants for development approvals with respect to storm water quality compliance are:

1. Not planning for compliance early enough. You should think about your strategy for storm water quality compliance before completing a conceptual site design or sketching a layout of subdivision lots (Chapter 3).

2. Assuming proprietary storm water treatment facilities will be adequate for compliance. Most aren't (Chapter 2).

3. Not planning for periodic inspections and maintenance of treatment and flow-control facilities. Consider who will own and who will maintain the facilities in perpetuity and how they will obtain access, and identify which arrangements are acceptable to the City of La Mesa (Chapter 5).

Chapter 1

Policies and Procedures

Determine if your development project must comply with storm water quality requirements, and review the steps to compliance.

Background

Urban runoff discharged from municipal storm water conveyance systems has been identified by local, regional, and national research programs as one of the principal causes of water quality problems in most urban areas. The City of La Mesa's storm water conveyance system, which collects runoff from our streets, rooftops, driveways, parking lots, and other impervious areas, flows directly to our rivers, beaches, and bays without receiving treatment (our storm water conveyance system is separate from our sanitary sewer system). Urban runoff potentially contains a host of pollutants like trash and debris, bacteria and viruses, oil and grease, sediments, nutrients, metals, and toxic chemicals. These contaminants can adversely affect receiving and coastal waters, associated wildlife, and public health. Urban runoff pollution is not only a problem during rainy seasons, but also year-round due to many types of urban water use that discharge runoff (dry weather flow) to the storm water conveyance system.

Land development and construction activities significantly alter drainage patterns and contribute pollutants to urban runoff primarily through erosion and removal or change of existing natural vegetation during construction, and the creation of new impervious surfaces, such as parking lots, which often permanently contribute pollutants throughout the "use" of the project site. When homes, work places, recreational areas, roads, parking lots, and structures are built, new impervious areas are built- creating the potential for an impact to water quality. The natural landscape's ability to infiltrate and cleanse storm water and urban runoff is "capped" by the impervious surfaces. As impervious surfaces increase, water that normally would have percolated into the soil now flows over the land surface directly to downstream wetlands, creeks, and eventually the Pacific Ocean. Accordingly, increases in impervious cover can increase the frequency and intensity of storm water flows. Second, new impervious surfaces often become a source of pollutants associated with development, such as automotive fluids, cleaning solvents, toxic or hazardous chemicals, detergents, sediment, metals, pesticides, oil and grease, and food wastes. These pollutants, which are often temporarily captured on impervious surfaces, are

transported to the storm water conveyance system by storm water and urban runoff. The pollutants flow untreated through the storm water conveyance system and ultimately into our creeks, rivers, beaches, and bays. With the growing concerns of urban runoff and storm water pollution, local, state, and federal agencies devised regulations requiring development planning and construction controls to treat storm water-related pollution from new development projects before it reaches any receiving waters.

On January 24th, 2007, the Regional Board issued Order No. R9-2007-0001, hereinafter referred to as "Municipal Permit." This Municipal Permit replaces the previous municipal permit, RWQCB Order No. 2001-01. The City has updated parts I and II of its BMP Manual to reflect the updated requirements of the current Municipal Permit. The primary objectives of the updated BMP Manual are to (1) Effectively prohibit non-storm water discharges; and (2) Reduce the discharge of pollutants from storm water conveyance systems to the MEP both during construction and throughout the use of a developed site. To maximize the use of LID practices as a means of reducing storm water runoff, Order No. R9-2007-0001 further required that the City define minimum LID and other BMP requirements in a document called the Model Standard Urban Storm Water Mitigation Plan (Model SUSMP), which was approved by the Regional Board on March 25, 2009. The permanent BMP requirements within the Model SUSMP were updated to comply with the current Municipal Permit, and these changes are included in this BMP Manual.

Legal Framework

The requirement to implement storm water BMP requirements for development projects is based on Section 402 (p) of the Clean Water Act. The Federal Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. Under the Federal Clean Water Act, municipalities throughout the nation are issued a Municipal NPDES Permit. The primary goal of the Municipal Permit is to stop polluted discharges from entering the storm water conveyance system and local receiving and coastal waters.

In California, the State Water Resources Control Board (SWRCB), through the nine Regional Boards, administers the NPDES storm water municipal permitting program. Based on the San Diego Municipal Permit issued by the San Diego Regional Board, the City is required to develop and implement construction and permanent storm water BMPs addressing pollution from new development projects.

In order to comply with the conditions of Order No. 2001-01, the City of La Mesa adopted the City of La Mesa Watercourse Protection, Storm Water Management and Discharge Control Ordinance ("Storm Water Ordinance") codified in Chapter 7.18 of the La Mesa Municipal Code. These ordinances have been updated as necessary to comply with the current Municipal Permit. This manual is an uncodified ordinance adopted by reference as Part II of the City of La Mesa Storm Water Best Practices Manual. The current Municipal Permit requires the City to categorize and prioritize land uses in order to establish effective BMPs. The City's current Storm Water Ordinance authorizes the City Engineer to establish Best Management Practices

(BMPs), including permanent improvements, for all types of land uses. This manual provides instructions on the City's construction phase and permanent BMP requirements, based on the most recent Model SUSMP, for development projects in the City of La Mesa.

The City Engineer may establish alternative BMPs. The allowable use of alternative BMPs at a specific site shall be determined at the sole discretion of the City Engineer. The City Engineer may establish BMPs for a specific site or activity if necessary to reduce Pollutants to the MEP or to comply with an order of the San Diego Regional Water Board. The City Engineer may also establish additional BMPs for a specific site if the City Engineer determines that the BMPs implemented at the site have not reduced the pollutants to the MEP.

A Low Impact Development Design Procedure

The San Diego Regional Water Board reissued a municipal storm water NPDES permit to the municipal **Copermittees** in January 2007. The permit updates and expands storm water requirements for new developments and redevelopments. Storm water treatment requirements have been made more stringent, minimum standards for **Low Impact Development** (LID) have been added, and the Copermittees are required to develop and implement criteria for the control of runoff peaks and durations from development sites.

To assist the land development community, streamline project reviews, and maximize cost-effective environmental benefits, the Copermittees have developed a unified LID design procedure, which has been adapted for use by the City of La Mesa. This design procedure integrates site planning and design measures with engineered, small-scale **Integrated Management Practices** (IMPs) such as bioretention. By following the procedure, applicants can develop a single integrated design which complies with the complex and overlapping NPDES permit LID requirements, storm water treatment requirements, and flow-control (hydromodification management) requirements.

The design approach is detailed in Chapter 4. General instructions for preparing a complete Project Submittal are in Chapter 3, and project-specific submittal requirements are available from municipal staff.

Applicants may choose not to use this design procedure, in which case they will need to demonstrate, in their submittal, compliance with applicable LID criteria, storm water treatment criteria, and flow-control criteria. These criteria are described in Chapter 2 and in the NPDES permit.

Requirements for All Development Projects

All development projects must include control measures to reduce the discharge of storm water pollutants to the maximum extent practicable.

Standard permanent storm water requirements, even for projects that are not "Priority Development Projects," include:

- Implementation of source control BMPs as listed in Appendix C.
- Inclusion of feasible LID features that conserve natural features, set back development from natural water bodies, minimize imperviousness, maximize infiltration, direct runoff to landscaping, and retain and slow runoff.
- Submittal of proof of a mechanism under which on-going long-term maintenance of all structural post-construction BMPs will be conducted.
- Compliance with requirements for construction-phase controls on sediment and other pollutants as described in Chapter 6.

Projects (requiring either discretionary actions or construction permits), subject to only standard permanent BMP requirements need to prepare a Standard Post Construction BMP Plan (SPCBMPP). See Appendix G for specific SPCBMPP requirements. Analysis of the project's anticipated pollutants of concern must also be included with the project submittal. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type. Municipal staff may also require additional controls appropriate to the project, which may include storm water treatment controls. LID treatment controls such as infiltration or bioretention are preferred. See "Selection of Treatment Facilities" on page 39.

Priority Development Projects

The NPDES permit requires more specific criteria be applied to Priority Development Projects. Projects (requiring either discretionary actions or construction permits), subject to the priority development project permanent BMP requirements must complete all of the analyses and incorporate all of the applicable BMP requirements in chapters 2 through 5 of this BMP Manual. This includes the LID and source control BMPs, and treatment control BMP requirements.

Projects subject to priority development project requirements must prepare and submit a Post Construction Water Quality Technical Report (PCWQTR) in accordance with Chapter 3 of this BMP Manual. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type.

► NEW DEVELOPMENT

Projects on previously undeveloped land are Priority Development Projects if they are in one or more of the categories listed in Appendix A. If a project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to Priority Project requirements. Note some thresholds are defined by square footage of impervious area created; others by the total area of the development.

► PREVIOUSLY DEVELOPED SITES

Projects on previously developed sites ("**redevelopment** projects") are Priority Development Projects if they create, add, or replace 5,000 square feet or more of impervious surface and also are in one of the categories listed in Appendix A.

Municipal staff may choose to designate projects not within the categories in Appendix A as Priority Development Projects, based on potential impacts to storm water quality.

► THE "50% RULE" FOR PREVIOUSLY DEVELOPED PROJECTS

Projects on previously developed sites may also need to retrofit drainage of **all** impervious areas of the **entire** site. For sites creating or replacing more than 5,000 square feet of impervious area:

- If the new project results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design.
- If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design.

If a new Development Project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to SUSMP requirements.

Projects limited to interior remodels, routine maintenance or repair, roof or exterior surface replacement, resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, or bike lanes on existing roads and routine replacement of damaged pavement such as pothole repair are not subject to treatment requirements. However, other requirements, including incorporation of appropriate source controls, still apply.

► POLLUTANT GENERATING PROJECTS WHICH DISTURB ONE ACRE OR MORE OF LAND

Projects that generate pollutants at levels greater than background levels and disturb one acre or more of land are considered Priority Development Projects. In most cases linear pathway projects that are for infrequent vehicle use (such as emergency or maintenance access) or for pedestrian or bicycle use are not considered pollutant generating above background levels if they are built with pervious surfaces or if they allow runoff to sheet flow to surrounding pervious surfaces.

Project Review and Permitting Process

The City of La Mesa's Watercourse Protection, Storm Water Management and Discharge Control Ordinance requires that all new development and redevelopment activities comply with the storm water pollution prevention requirements in Chapter 7.18 of the La Mesa Municipal Code, and Parts I and II of the City Of La Mesa Best Management Practices Manual. Applicants must also comply with the grading regulations in Chapter 14.05 of the Municipal Code. These storm water pollution prevention requirements, which are described in detail in this BMP Manual are site specific and vary based on the project's potential impact on receiving water quality.

The flow chart in Figure 1-1, "Review Process for Discretionary Actions" demonstrates how storm water requirements are incorporated into projects requiring subdivision approvals,

development permits or other discretionary actions. For information on the construction permit and review process, see Chapter 6 of this BMP Manual. The steps below in "Compliance Process at a Glance" describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 1-1. Review Process for Discretionary Actions

The following figure provides an overview of the project review process for projects that require a discretionary action by the City of La Mesa. Discretionary actions include land use plan amendments, re-zonings, subdivisions, planned development permits, conditional use permits, site development permits, variances, neighborhood development permits, and neighborhood use permits.

Compliance Process at a Glance

For the applicant for development project approval, storm water compliance follows these general steps:

1. Discuss requirements during a pre-application meeting with municipal staff.
2. Determine applicable storm water BMP requirements by completing the "Storm Water Requirements Applicability Checklist" in Appendix A prior to submittal.
3. Review the instructions in this BMP manual before you prepare your tentative map, preliminary site plan, drainage plan, and landscaping plan.
4. Prepare your Project Submittal, which is typically made with your application for development approvals (entitlements).
5. Prepare a draft Storm Water Facility Operation and Maintenance Plan and include it with your Project Submittal.
6. Under the authority of the City Engineer, Engineering staff will review the Project Submittal with Storm Water Facility Operation and Maintenance Plan for compliance with the applicable storm water requirements contained in this manual.
7. Create your detailed project design, incorporating the features described in your Project Submittal.
8. In a table on your construction plans, list each storm water compliance feature and facility and the plan sheet where it appears.
9. Maintain storm water facilities during construction and following construction.
10. The owner must periodically verify storm water facilities are properly maintained.

Preparation of a complete and detailed Project Submittal is the key to cost-effective storm water compliance and expeditious review of your project. Additional notes about these steps are provided below. Instructions for preparing your Project Submittal are in Chapter 3.

► ADDITIONAL NOTES ON COMPLIANCE

Storm Water Requirements Applicability Checklist. Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. (Note: this form must be completed for all permit applications, even if previous approvals exist. Projects requesting additional construction permits or discretionary approvals, even though previous permits and/or approvals have been obtained, will be required to comply with the storm water requirements in this document). This checklist must be

completed, signed by the responsible party for the project, and submitted with your permit application. Applicants may also verify the project's storm water BMP requirements through a single discipline preliminary review of the project. The project design must include all required permanent BMPs (as determined from the Storm Water Requirements Applicability Checklist in Appendix A), prior to deeming the application package complete.

Determining Adequacy of Proposed Plans. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs.

Phased Projects

When determining whether SUSMP requirements apply, a "project" should be defined consistent with California Environmental Quality Act (CEQA) definitions of "project." That is, the "project" is the whole of an action which has the potential for adding or replacing or resulting in the addition or replacement of roofs, pavement, or other impervious surfaces and thereby resulting in increased flows and storm water pollutants. "Whole of an action" means the project may not be segmented or piecemealed into small parts if the effect is to reduce the quantity of impervious area for any part to below the SUSMP thresholds.

Municipal staff may require, as part of an application for approval of a phased development project, a conceptual or master Project Submittal which describes and illustrates, in broad outline, how the drainage for the project will comply with the SUSMP requirements. The level of detail in the conceptual or master Project Submittal should be consistent with the scope and level of detail of the development approval being considered. The conceptual or master Project Submittal should specify that a more detailed Project Submittal for each later phase or portion of the project will be submitted with subsequent applications for discretionary approvals.

Note these minimum standards for SUSMP applicability are for the purpose of ensuring a consistent minimum level or "floor" for implementation consistent with the requirements of the NPDES permit. The City Engineer reserves the right to choose a more expansive interpretation of the NPDES permit's applicability and may also choose to apply source control, treatment, and flow-control requirements to projects that would be exempt under these minimum standards.

New Subdivisions

If a tentative map approval would potentially entitle future owners to construct new or replaced impervious area which, in aggregate, could exceed one of the SUSMP thresholds (Appendix A), then the applicant must take steps to ensure SUSMP requirements can and will be implemented as the subdivision is built out.

If the tentative map application does not include plans for site improvements, the applicant should nevertheless identify the type, size, location, and final ownership of storm water treatment and flow-control facilities adequate to serve common private roadways and any other common areas, and to also manage runoff from an expected reasonable estimate of the square footage of future roofs, driveways, and other impervious surfaces on each individual lot. The City Engineer may condition approval of the map on implementation of storm water treatment and other SUSMP measures when construction occurs on the individual lots. At the City Engineer's discretion, this condition may be enforced by a grant deed of development rights or by a development agreement.

If the City Engineer deems it necessary, the future impervious area of one or more lots may be limited by a deed restriction. This might be necessary when a project is exempted from one or all SUSMP provisions because the total impervious area is below a threshold, or to ensure runoff from impervious areas added after the project is approved does not overload a storm water treatment and flow-control facility.

The City Engineer may require subdivision maps to dedicate an "open space easement, as defined by Government Code Section 51075," to suitably restrict the future building of structures at each storm water facility location if necessary.

In general, in new subdivisions **storm water treatment, infiltration, or flow-control facilities should not be located on individual single-family residential lots**, particularly when those facilities manage runoff from other lots, from streets, or from common areas. A better alternative is to locate storm water facilities on one or more separate, jointly owned parcels.

After consulting with local planning staff, applicants for subdivision approvals will propose one of the following four options, depending on project characteristics and local policies:

1. Show the number of parcels and the total impervious area to be created on all parcels could not, in the future, exceed any of the thresholds in Appendix A.

2. Show that, for each and every lot, the intended use can be achieved with a design which disperses runoff from roofs, driveways, streets, and other impervious areas to self-retaining pervious areas, using the criteria in Chapter 4.

3. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and commit to constructing the facilities prior to transferring the lots.

4. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and provide appropriate legal instruments to ensure the proposed facilities will be constructed and maintained by subsequent owners.

For the option selected, municipal staff will determine the appropriate conditions of approval, easements, deed restrictions, or other legal instruments necessary to assure future compliance.

Compliance with Flow-Control Requirements

Priority Development Projects (Appendix A) must be designed so that runoff rates and durations are controlled to maintain or reduce pre-project downstream erosion conditions and protect stream habitat. The following text regarding HMP applicability requirements is based on the HMP document, provided in Appendix H. Additionally, the City has prepared an FAQ document related to hydromodification management, which is available on the City's website at www.cityoflamesa.com/stormwater under the "Development Requirements" tab.

► HMP APPLICABILITY REQUIREMENTS

To determine if a proposed project must implement hydromodification controls, refer to the HMP Decision Matrix in Figure 1-2. The HMP Decision Matrix can be used for all projects. For redevelopment projects, flow controls would only be required if the redevelopment project increases impervious area or peak flow rates as compared to pre-project conditions.

It should be noted that all Priority Development Projects will be subject to the Permit's LID and water quality treatment requirements even if hydromodification flow controls are not required.

As noted in Figure 1-2, projects may be exempt from HMP criteria under the following conditions.

- If the project is not a Priority Development Project.
- If the proposed project does not increase the impervious area or peak flows to any discharge location without flow mitigation.
- If the proposed project discharges runoff directly to an exempt receiving water such as the Pacific Ocean, San Diego Bay, an exempt river reach, an exempt reservoir, or a tidally-influenced area.
- If the proposed project discharges to a stabilized conveyance system that extends to the Pacific Ocean, San Diego Bay, a tidally-influenced area, an exempt river reach or reservoir.
- If the contributing watershed area to which the project discharges has an impervious area percentage greater than 70 percent.
- If an urban infill project discharges to an existing hardened or rehabilitated conveyance system that extends beyond the "domain of analysis," the potential for cumulative impacts in the watershed are low, and the ultimate receiving channel has a Low susceptibility to erosion as defined in the SCCWRP channel assessment tool.

If the proposed project decreases the pre-project impervious area and peak flows to each discharge location, without flow mitigation, then a flow-duration analysis is implicitly not required. If continuous simulation flow-frequency and flow duration curves were developed for

such a scenario, the unmitigated post-project flows and durations would be less as compared to pre-project curves.

Proposed exemptions for projects discharging runoff directly to the Pacific Ocean, San Diego Bay or to hardened conveyance systems which transport runoff directly to the Pacific Ocean or San Diego Bay are referred to the 2007 Municipal Permit. Per the Permit, hardened conveyance systems can include existing concrete channels, storm drain systems, etc.

FIGURE 1-2. HMP Applicability Determination

The Municipal Permit also contains language to support exemptions for projects located in highly urbanized areas where the impervious percentage exceeds 70 percent (as calculated for the sub-watershed between the project outfall downstream to the exempt receiving water).

- Figure 1-2, Node 1 – Hydromodification mitigation measures are only required if the proposed project is a Priority Development Project.

- Figure 1-2, Node 2 – Properly designed energy dissipation systems are required for all project outfalls to unlined channels. Such systems should be designed in accordance with the County of San Diego's Drainage Design Manual to ensure downstream channel protection from concentrated outfalls.

- Figure 1-2, Nodes 3 and 4 – Projects may be exempt from hydromodification criteria if the proposed project reduces the pre-project impervious area and if unmitigated post-project outflows (outflows without detention routing) to each outlet location are less as compared to the pre-project condition. The pre and post-project hydrologic analysis should be conducted for the 2 and 10-year design storms and follow single-event methodology set forth in the San Diego Hydrology Manual. This scenario may apply to redevelopment projects in particular.

- Figure 1-2, Node 5 – Potential exemptions may be granted for projects discharging runoff directly to an exempt receiving water, such as the Pacific Ocean, San Diego Bay, an exempt river system (detailed in Table 1-2), or an exempt reservoir system (detailed in Table 1-2). To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the 10-year floodplain elevation for a river exemption or below the typical water surface level in a reservoir system. The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of exempt river or reservoir systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and exempt river or reservoir water surface elevation.

- Figure 1-2, Node 6 – For projects discharging runoff directly to a tidally-influenced lagoon, potential exemptions may also be granted. To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the typical water surface level in the lagoon system (such as the mean high tide elevation). The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of lagoon systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and typical lagoon water surface elevation. Exemptions related to runoff discharging directly to tidally-influenced areas were drafted based upon precedent set in the Santa Clara HMP. Regarding the potential exemption, additional analysis would be required to assess the effects of the freshwater / saltwater balance and the resultant effects on lagoon-system biology. This assessment, which would be required by other permitting processes such as the Army Corps of Engineers, California Department of Fish and Game, etc., must be provided by a certified biologist or other specialist as approved by the City. Such discharges would include an energy dissipation system

(riprap, etc.) designed to mitigate 100-year outlet velocities based upon a free outfall condition. Such a design would be protective of the channel bed and bank from an erosion standpoint.

- Figure 1-2, Nodes 7 and 8 – For projects discharging runoff directly to a hardened conveyance or rehabilitated stream system that extends to exempt receiving waters detailed in Node 5, potential exemptions from hydromodification criteria may be granted. Such hardened or rehabilitated systems could include existing storm drain systems, existing concrete channels, or stable engineered unlined channels. To qualify for this exemption, the existing hardened or rehabilitated conveyance system must continue uninterrupted to the exempt system. In other words, the hardened or rehabilitated conveyance system cannot discharge to an unlined, non-engineered channel segment prior to discharge to the exempt system. Additionally, the project proponent must demonstrate that the hardened or rehabilitated conveyance system has capacity to convey the 10-year ultimate condition flow through the conveyance system. The 10-year flow should be calculated based upon single-event hydrologic criteria as detailed in the San Diego County Hydrology Manual.

- Figure 1-2, Node 9 – As allowed per the Municipal Permit, projects discharging runoff to a highly urbanized watershed (defined as an existing, pre-project impervious percentage greater than 70 percent) may be eligible for an exemption from hydromodification criteria.

  Watershed impervious area calculations for this potential exemption will be measured between the project site discharge location and the connection to a downstream exempt receiving conveyance system, such as the Pacific Ocean, San Diego Bay, or an exempt river system. If a tributary area connects with the main line drainage path between the project site and the exempt system, then the entire watershed area contributing to the tributary shall be included in the calculation. Initial review of County land use indicates that this exemption will likely only apply in a limited number of urbanized coastal areas.

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual and detailed below or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

- Figure 1-2, Nodes 10 through 13 – For urban infill projects discharging runoff to an existing hardened or rehabilitated conveyance system, potential limited exemptions from hydromodification criteria may apply where the existing impervious area percentage in the watershed exceeds 40 percent. For the potential exemption application, the domain of analysis must be determined and the existing hardened or rehabilitated conveyance system must extend beyond the downstream terminus of the domain of analysis. The hardened or rehabilitated conveyance system must discharge to a receiving channel with a Low potential for channel susceptibility for this exemption to be granted (channel susceptibility determined using SCCWRP tool). Finally, continuous simulation sensitivity analysis shows that an exemption could only be granted if the potential future development impacts in the watershed would increase the watershed's impervious area percentage by less than 3 percent (as compared to the existing condition in the year 2010). If the potential future cumulative impacts in the watershed could increase the impervious area percentage by more than 3 percent (as compared to existing condition), then no exemption could be granted based on this item. Watershed impervious area calculations for this potential exemption, in which a project discharges to a watershed with an existing impervious areas greater than 40 percent, will be measured upstream from the outfall of the urban conveyance system (to a non-concrete, non-riprap-lined or non-engineered channel) to the contributing watershed boundary (the entire watershed contributing to the discharge outfall).

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

Exemptions related to runoff discharging directly to certain river reaches were initially based upon the majority Technical Advisory Committee (TAC) opinion that such river reaches were depositional (aggrading) and that the effects of cumulative watershed impacts to these reaches is minimal. Subsequent justifications for the river reach exemptions were the result of a flow duration curve analysis for the San Diego River

Potential river reaches that would be exempt from hydromodification criteria include only those reaches for which the contributing drainage area exceeds 100 square miles and which have a 100-year design flow in excess of 20,000 cfs. For reference, proposed Caltrans HMP criteria allows for river/creek exemptions for drainage areas of only 10 square miles.

Per recommendations from members of the TAC, San Diego river systems meeting the drainage area and peak flow criteria are typically aggrading (depositional) and have very wide floodplain areas when in the natural condition. In all cases, river reaches meeting the drainage area and peak flow criteria are located downstream of large reservoir systems which effectively block outflows for most storm events. In addition, the river systems meeting these criteria typically have very low gradients. The combination of low gradients, significant peak flow attenuation, and wide floodplain areas translate to a low potential for channel erosion at the upper limit of the proposed geomorphic flow range (10-year flow event).

All exempt river reaches, which are presented in Table 1-1, have drainage areas in excess of 100 square miles and 100-year flow rates in excess of 20,000 cfs. In addition, all proposed river reaches are subject to significant upstream reservoir flow regulation, have wide floodplain or stabilized channel areas, and low gradients. This combination of factors, in association with field observations and years of historical perspective from the TAC members, justifies exemptions for direct discharges to the exempt river reaches provided that properly sized energy dissipation is provided at the outfall location.

TABLE 1-1. Summary of Exempt River Reaches in San Diego County

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Lower Otay Reservoir Dam
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Outfall to Pacific Ocean	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

Table 1-2 provides a summary of exempt reservoirs in San Diego County. Large reservoirs can be exempt systems from a hydromodification standpoint since reservoir storm water inflow velocities are naturally mitigated by the significant tailwater condition in the reservoir. HMP exemptions would only be granted for projects discharging runoff directly to the exempt reservoirs. The City will define "direct discharge" based on the project site conditions. To qualify for the potential exemption, the outlet elevation must be at or below either the normal operating water surface elevation or the reservoir spillway elevation and properly designed energy dissipation must be provided.

TABLE 1-2. Summary of Exempt Reservoirs in San Diego County

Reservoir	Watershed
Barrett Lake	Tijuana River
El Capitain Reservoir	San Diego River
Lake Dixon	Escondido Creek
Lake Heneshaw	San Luis Rey River
Lake Hodges	San Dieguito River
Lake Jennings	San Diego River
Lake Murray	San Diego River
Lake Poway	San Dieguito River
Lake San Marcos	San Marcos Creek
Lake Wohlford	Escondido Creek
Loveland Reservoir	Sweetwater River
Lower Otay Reservoir	Otay River
Miramar Lake	Los Penasquitos Creek
San Vicente Reservoir	San Diego River
Sweetwater Reservoir	Sweetwater River
Upper Otay Reservoir	Otay River

The final exemption category focuses on small urban infill projects where the potential for future cumulative watershed impacts is minimal.

Urban infill projects may be exempt from HMP criteria if:

1. The potential future development impacts within the sub-watershed, as measured from the entire sub-watershed area draining to the existing conveyance system outfall, would not increase the composite impervious area percentage of the sub-watershed by more than 3 percent

2. The project discharges runoff to an existing hardened or rehabilitated conveyance system (storm drain, concrete channel, or engineered vegetated channel) that extends beyond the Domain of Analysis determined for the project site, and

3. The stabilized conveyance system eventually discharges to a channel with a Low susceptibility to erosion, as designed by the SCCWRP channel assessment tool.

► FLOW CONTROL PERFORMANCE CRITERIA

Figures 1-2 and 1-3, which are part of the HMP Decision Matrix, detail how lower flow thresholds would be determined for a project site. Figures 1-4 and 1-5, which detail the SCCWRP lateral and vertical channel susceptibility requirements, complete the HMP Decision Matrix.

The project applicant must first determine whether field investigations will be conducted pursuant to the SCCWRP channel screening tools. If the screening tools are not completed for a proposed project, then the site must mitigate peak flows and durations based on a pre-project condition lower flow threshold of $0.1Q_2$. While a project applicant would be held to the $0.1Q_2$ standard if channel screening tools and assessments are not conducted, less restrictive standards are possible for more erosion-resistant receiving channel sections if the screening tools are completed and the SCCWRP method indicates either a Medium or Low susceptibility to channel erosion .

In such a scenario, the project applicant would also use the critical shear stress calculator to assist in determination of the predicted lower flow threshold. The SCCWRP screening tools and critical shear stress calculator work in concert to determine the lower flow threshold for a given site. Lower flow limits determined by the calculator have been grouped into one of three thresholds – $0.1Q_2$, $0.3Q_2$ or $0.5Q_2$. "Low" susceptibilities from the SCCWRP tool generally correspond to the $0.5Q_2$ threshold, "Medium" susceptibilities generally correspond to the $0.3Q_2$ threshold, and "High" susceptibilities generally correspond to the $0.1Q_2$ threshold. The SCCWRP channel screening tools are required to identify channel conditions not considered by the critical shear stress calculator, which focuses on channel material and cross section. Conversely, the SCCWRP channel screening tools considers other channel conditions including channel braiding, mass wasting, and proximity to the erosion threshold. In cases where the critical shear stress calculator and the SCCWRP screening tools return divergent values, then the most conservative value shall be used as the lower flow threshold for the analysis.

Low-Impact Development (LID) and extended detention facilities are required to meet peak flow and duration controls as follows:

4. For flow rates ranging from 10 percent, 30 percent or 50 percent of the pre-project 2-year runoff event ($0.1Q_2$, $0.3Q_2$, or $0.5Q_2$) to the pre-project 10-year runoff event (Q10), the post-project discharge rates and durations shall not deviate above the pre-project rates and durations by more than 10 percent over and more than 10 percent of the length of the flow duration curve. The specific lower flow threshold will depend on results from the SCCWRP channel screening study and the critical flow calculator.

5. For flow rates ranging from the lower flow threshold to Q_5, the post-project peak flows shall not exceed pre-project peak flows. For flow rates from Q_5 to Q_{10}, post-project peak flows may exceed pre-project flows by up to 10 percent for a 1-year frequency interval. For example, post-project flows could exceed pre-project flows by up to 10 percent for the interval from Q_9 to Q_{10} or from $Q_{5.5}$ to $Q_{6.5}$, but not from Q_8 to Q_{10}.

This HMP recommends the use of LID facilities to satisfy both 85th percentile water quality treatment as well as HMP flow control criteria. Detailed standards for LID implementation have been developed. These standards are provided in the City of La Mesa BMP Manual Part II.

The following methods may be used to meet mitigation requirements.

- Install BMPs that meet design requirements to control runoff from new impervious areas. BMPs including bioretention basins, vegetated swales, planter boxes, extended detention basins, etc. shall be designed pursuant to standard sizing and specification criteria detailed in the City of La Mesa BMP Manual Part II and the HMP/LID Sizing Calculator to ensure compliance with hydromodification criteria.

- Use of the automated sizing calculator (San Diego Sizing Calculator) that will allow project applicants to select and size LID treatment devices or flow control basins. The tool, akin to the sizing calculator developed for compliance with the Contra Costa HMP, uses pre-calculated sizing factors to determine required footprint sizes for flow control BMPs. Continuous simulation hydrologic analyses are currently being developed to determine the sizing factors for various flow control options and development scenarios. The Sizing Calculator also includes an automated pond sizing tool to assist in the design of extended detention facilities for mitigation of hydromodification effects. Because of the Sizing Calculator's ease of implementation, and since hydromodification BMPs can also serve as treatment BMPs, it is anticipated that most project applicants will choose this option instead of seeking compliance through site-specific continuous simulation model preparation. The HMP/LID Sizing Calculator is an implementation tool, which is currently under development by the consultant team and will be completed by the time final HMP criteria go into effect.

- Prepare continuous simulation hydrologic models and compare the pre-project and mitigated post-project runoff peaks and durations (with hydromodification flow controls) until compliance to flow control standards can be demonstrated. The project applicant will be required to quantify the long-term pre- and post-project runoff response from the site and establish runoff routing and stage-storage-discharge relationships for the planned flow control devices. Public domain software such as HSPF, HEC-HMS and SWMM can be used for preparation of a continuous simulation hydrologic analysis.

- Points of compliance must be selected to conduct the comparisons of pre-project and post-project flows and durations. Generally, points of compliance are selected at locations along the project boundary where concentrated flows discharge from the project site. If a point of compliance is selected downstream of the project boundary, then the City should be consulted in advance of the hydromodification analysis. For projects which convey offsite runoff through the site, it is assumed that the offsite runoff would be separated from site runoff. If this is not the case, then the City should be consulted to further refine the points of compliance for the site (an interior project site point of compliance could be required in such a scenario).

FIGURE 1-3. Mitigation Criteria and Implementation (Part 1)

- Figure 1-3, Node 1 – If the project applicant chooses to complete SCCWRP channel screening tools, then the applicant moves to Figures 1-4 and 1-5 to assess the vertical and lateral susceptibility of the receiving channel systems. Depending on the results of the SCCWRP screening tools and critical flow calculator, it is possible that lower flow thresholds in excess of $0.1Q_2$ may be used. If the project applicant chooses not to complete the SCCWRP channel assessment, then the applicant proceeds with Figure 1-3 of the Decision Matrix.

- Figure 1-3, Node 2 – If the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers), then consultation with a geotechnical engineer is required (Box 3). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 4.

- Figure 1-3, Node 3 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-3, Node 4 – In this scenario, the SCCWRP channel assessment was not conducted. Therefore, the project applicant would be held to the $0.1Q_2$ lower flow threshold. LID and extended detention facilities must be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to Q_{10}.

- Figure 1-3, Node 5 - The Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-4. Mitigation Criteria and Implementation (Part 2)

- Figure 1-4, Node 1 – Use of Figure 1-4 assumes that the project applicant conducted the SCCWRP channel assessment. Box 1 would begin following completion of both the lateral and vertical susceptibility flow charts depicted in Figures 1-4 and 1-5. Box 1 is a decision box asking if the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers). If the answer is Yes, then consultation with a geotechnical engineer is required (Box 2). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 3.

- Figure 1-4, Node 2 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-4, Node 3 – Pursuant to criteria detailed in HMP Section 5.2, the Domain of Analysis is determined downstream and upstream of the project site. This determination is used to ascertain the required reach length for data collection (channel bed and bank material, channel cross section data, etc.) required for the critical flow calculator (see Box 4).

- Figure 1-4, Node 4 – Pursuant to criteria detailed in HMP Section 5.1.4, the project applicant would run the critical shear stress calculator to determine if the recommended critical flow threshold should be $0.1Q_2$, $0.3Q_2$, or $0.5Q_2$. This result will be compared to the result from the SCCWRP screening analysis (Box 5) to determine the final lower flow threshold for the project.

- Figure 1-4, Node 5 – Pursuant to criteria detailed in HMP Appendix B, the project applicant would determine both the lateral and vertical channel susceptibility rating per guidelines set forth by SCCWRP. If the lateral and vertical tools returned divergent results, then the more conservative result would be used. SCCWRP susceptibility ratings include "High," "Medium" and "Low."

- Figure 1-4, Node 6 – A project applicant would arrive at Box 6 if the SCCWRP channel susceptibility rating was determined to be "High." This decision box inquires as to whether stream rehabilitation measures such as grade control and channel widening will be used as a mitigation measure instead of flow control. It should be noted that stream rehabilitation options are only allowed if the existing receiving channel susceptibility is considered to be "High."

- Figure 1-4, Node 7 – Stream rehabilitation measures are only allowed if the proposed mitigation project extends to a downstream exempt system (such as an exempt river system). If the mitigation measure did not extend to an exempt system, then the potential for cumulative watershed impacts would be more pronounced.

- Figure 1-4, Node 8 – If stream rehabilitation measures are allowed, then guidelines outlined in Section 6.3 of the HMP should be followed to design the in-stream mitigation approach.

- Figure 1-4, Node 9 - A project applicant would arrive at Box 9 if the SCCWRP channel susceptibility rating was determined to be "Medium." If the result from the critical shear stress calculator is also "Medium" (or $0.3Q_2$), then the lower flow threshold would be $0.3Q_2$ (Box 11). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10).

- Figure 1-4, Node 10 – For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "High" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to Q_{10}.

- Figure 1-4, Node 11 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Medium" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.3Q_2$ to Q_{10}.

- Figure 1-4, Node 12 - A project applicant would arrive at Box 12 if the SCCWRP channel susceptibility rating was determined to be "Low." If the result from the critical shear stress calculator is also "Low" (or $0.5Q_2$), then the lower flow threshold would be $0.5Q_2$ (Box 16 – note potential waiver in Box 13). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10). If the result from the critical flow calculator is "Medium" (or $0.3Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.3Q_2$ (Box 11).

- Figure 1-4, Node 13 – In some limited situations, namely small developments in rural or lightly developed areas, an allowance for a minimum outlet orifice size may be granted when the receiving channel susceptibility is "Low." This criteria may potentially be used for project footprints less than 5 acres. If the project footprint is greater than 5 acres, then the allowance may not be granted and the applicant would proceed to Box 16.

- Figure 1-4, Node 14 – The potential allowance discussed in Box 13 could only be granted if the ultimate potential impervious area in the sub-watershed is less than 10 percent. If there is potential for the sub-watershed impervious area to exceed 10 percent, then the minimum orifice size criteria may not be granted.

- Figure 1-4, Node 15 – If Boxes 12, 13, and 14 are satisfied, then mitigation facilities may be designed using a 3-inch minimum outlet orifice size.

- Figure 1-4, Node 16 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Low" susceptibility to erosion – and for projects where the minimum outlet orifice criteria does not apply - LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.5Q_2$ to Q_{10}.

- Figure 1-4, Node 17 – For all hydromodification mitigation designs, the Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-5. SCCWRP Vertical Susceptibility

FIGURE 1-6. Lateral Channel Susceptibility

Grandfathering. Projects with lawful approval prior to January 14, 2011 (such as a development agreement, vested tentative map, or a building or grading permit), may not have to meet the hydromodification management requirements. Verify with municipal staff.

Waivers from Numeric Sizing Criteria

The NPDES permit allows for a project to be waived from numeric sizing criteria for storm water treatment only if all available treatment facilities have been considered and found **infeasible**. Municipal staff must inform the Water Board within 5 days of granting a waiver. Other SUSMP requirements—including site designs to minimize imperviousness and source control BMPs—will still apply.

Experience has shown implementation of LID facilities, as described in Chapter 4, is feasible on nearly all development sites. However, the use of LID to retrofit existing drainage systems, to manage runoff from sites smaller than one acre in pedestrian-oriented developments, or to manage runoff from widened portions of roadways, sometimes presents special challenges. In these special situations, applicants should see the discussion of "Selection of Storm Water Treatment Facilities" in Chapter 2 and evaluate the options described on page 41 in order (depending on the specific characteristics of the project and as determined by the City Engineer). All the options listed meet the numeric sizing criteria in the NPDES permit.

If infeasibility of all these options can be established, the City Engineer may determine eligibility of the project for a waiver.

Chapter 2

Concepts and Criteria

Technical background and explanations of policies and design requirements

The Regional Water Board reissued a municipal storm water NPDES permit to San Diego County, its 18 cities, the San Diego Unified Port District, and the San Diego Regional Airport Authority in January 2007. The permit mandates a comprehensive program to prevent storm water pollution. That program now includes street sweeping, maintenance of storm drains, business inspections, public outreach, construction site inspections, monitoring, and studies of stream and ocean health, and control of runoff pollutants from new developments and redevelopments.

Permit Provision D.1.d. requires the City of La Mesa to regulate projects in specific categories (Appendix A) to:

1. Reduce discharges of pollutants to the maximum extent practicable.
2. Prevent runoff discharges from causing or contributing to a violation of water quality standards.

The City of La Mesa, along with the other Copermittees, have created a Low Impact Development (LID) design procedure (Chapter 4) that ensures consistent and thorough implementation of the Regional Water Board's requirements. This chapter explains the technical background of the LID approach and how it was derived.

The previous permit, issued in 2001, included a requirement to control the post-development peak storm water runoff rates and velocities to maintain or reduce pre-development downstream erosion and protect stream habitat. The 2007 permit includes, in addition to this ongoing requirement, a new requirement to develop a hydromodification management plan (HMP) to identify and define a methodology and performance criteria to ensure flow rates and durations do not exceed pre-project runoff where increased runoff could cause erosion or other significant adverse impacts to beneficial uses.

As required by the NPDES permit, the City of La Mesa has adopted final hydromodification criteria. See Chapter One.

Water-Quality Regulations

Provision D.1 requires the City of La Mesa to condition development approvals on incorporation of specified storm water controls.

Provision D.1 requires applicable new developments and redevelopments:

- Design the site to conserve natural areas, existing trees and vegetation and soils, to maintain natural drainage patterns, to minimize imperviousness, to detain runoff, and to infiltrate runoff where feasible
- Cover or control sources of storm water pollutants
- Treat runoff prior to discharge. Provision E.10 states: "Urban runoff treatment and/or mitigation must occur prior to the discharge of urban runoff into a receiving water. Federal regulations at 40 CFR 131.10(a) state that in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S."
- Ensure runoff does not exceed pre-project peaks and durations where increases could affect downstream habitat or other beneficial uses
- Maintain treatment and flow-control facilities

The City of La Mesa maintains a database to track approved installations of treatment facilities and to verify facilities are maintained. The City's annual report to the Regional Water Board includes a list of development projects subject to SUSMP conditions and descriptions of those projects that:

- Received a waiver from SUSMP criteria; or
- Used hydrologic controls used to meet HMP requirements, including a description of the controls.

The City of La Mesa must also report the number of violations and enforcement actions taken upon development projects. The City of La Mesa's programs are subject to audit by the Regional Water Board.

The City of La Mesa—not the Regional Water Board or its staff—is charged with ensuring development projects comply with the D.1 requirements. Regional Water Board staff sometimes review storm water controls and hydromodification impacts in connection with applications for Clean Water Act Section 401 water-quality certification, which is required for projects that involve work, such as dredging or placement of fill, within streams, creeks, or other waters of the US.

► MAXIMUM EXTENT PRACTICABLE

Clean Water Act Section 402(p)(3)(iii) sets the standard for storm water controls as "maximum extent practicable," but doesn't define that term. As implemented, "maximum extent practicable" is ever-changing and varies with conditions.

Many storm water controls, including LID facilities, have proven to be practicable in most site development projects. To achieve fair and effective implementation, criteria, and guidance, requirements for controls must be detailed and specific—while also offering the right amount of flexibility or exceptions for special cases. The NPDES permit includes various standards, including hydrologic criteria, which have been found to comprise "maximum extent practicable." This BMP Manual is to be continuously improved and refined based on the experience of municipal planners and engineers, with input from land developers and development professionals. By following the BMP Manual, applicants can ensure their project design meets "maximum extent practicable."

► BEST MANAGEMENT PRACTICES

Clean Water Act Section 402(p) and USEPA regulations (40 CFR 122.26) specify a municipal program of "management practices" to control storm water pollutants. **Best Management Practice (BMP)** refers to any kind of procedure, activity, or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs are typically used in place of assigning numeric effluent limits. The criteria for source control BMPs and treatment and flow-control facilities are crafted to fulfill "maximum extent practicable."

To minimize confusion, this guidebook refers to "facilities," "features," or "controls" to be incorporated into development projects. All of these are BMPs.

Pollutants of Concern

NPDES Permit Provision D.1.d.(3) requires the City of La Mesa to develop and implement a procedure for pollutants of concern to be identified for each Priority Development Project.

Documentation of the approach to identifying pollutants of concern and selecting BMPs and facilities follows.

► GROUPING OF POTENTIAL POLLUTANTS OF CONCERN

Urban runoff from a developed site has the potential to contribute pollutants, including oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system and receiving waters. For the purposes of identifying pollutants of concern and associated storm water BMPs, pollutants are grouped in nine general categories as follows:

- **Sediments** are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms

survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

- **Nutrients** are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

- **Metals** are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary sources of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

- **Organic compounds** are carbon-based. Commercially available or naturally occurring organic compounds are found in pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

- **Trash** (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

- **Oxygen-Demanding Substances** includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-

demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

- Primary sources of **oil and grease** are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

- **Bacteria and Viruses** are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. Also, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

- **Pesticides** (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

► IDENTIFYING POLLUTANTS OF CONCERN BASED ON LAND USES

Table 2-1 associates pollutants with the categories of Priority Development Projects. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern.

► WATERSHEDS WITH SPECIAL POLLUTANT CONCERNS

Receiving water conditions may require specialized attention. The three conditions to consider include:

- Ocean waters designated as an "Area of Special Biological Significance" (ASBS)
- 303(d) listed waters; and
- Waters with established TMDLs.

TABLE 2-1. Anticipated and Potential Pollutants Generated by Land Use Type.

	General Pollutant Categories								
Land Use Type	Sediment	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Detached Residential Development	X	X			X	X	X	X	X
Attached Residential Development	X	X			X	P(1)	P(2)	P	X
Commercial Development	P(1)	P(1)	X	P(2)	X	P(5)	X	P(3)	P(5)
Heavy Industry	X		X	X	X	X	X		
Automotive Repair Shops			X	X(4)(5)	X		X		
Restaurants					X	X	X	X	P(1)
Hillside Development >5,000 ft²	X	X			X	X	X		X
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Retail Gasoline Outlets			X	X	X	X	X		
Streets, Highways & Freeways	X	P(1)	X	X(4)	X	P(5)	X	X	P(1)

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

The State Water Resources Control Board's California Ocean Plan identifies thirty-four locations along the California coast as **Areas of Special Biological Significance (ASBS)**. Currently, there are no ASBS downstream of the City of La Mesa. See Table 2-2 for a list of applicable downstream water bodies. Please note that while runoff from the City drains to these water bodies, the actual water bodies are not located within the City itself.

TABLE 2-2. City of La Mesa Drainage Basins.

Drainage Basin	Percent of City of La Mesa Area	Receiving Waterbody	Hydrologic Subarea	Watershed
Alvarado	51	San Diego River	907.11	San Diego River
Lake Murray	1	Lake Murray		
University	28	Chollas Creek	908.22	San Diego Bay
Lemon Grove	6			
Spring Valley	14	Sweetwater River	909.12	

The NPDES Permit identifies several receiving waters as impaired for constituents or water quality effects pursuant to **Section 303(d)** of the Clean Water Act. Placement of a water onto the list requires the Regional Board to make further analysis of the impairment and development of total maximum daily loads (TMDLs) for addressing the impairment. The 303(d) listing in itself does not demand that a project proponent select BMPs on the basis of the impairment; however, the project proponent should be cognizant of the impairment and the future implications a TMDL might have upon the proposed land use. The San Diego River, Chollas Creek, and Lake Murray, all of which are on the 2010 CWA Section 303(d) list, are located downstream of the City of La Mesa. The San Diego River is impaired for *Enterococcus*, fecal coliform, low dissolved oxygen, nitrogen, phosphorus, total dissolved solids (TDS), and toxicity. Chollas Creek is impaired for indicator bacteria, copper, diazinon, lead, zinc, phosphorus, total nitrogen as N, and trash. Lake Murray, which drains a very small portion of the City, is 303(d) listed for nitrogen and pH.

Check the website below for the most current 303(d) listings.
http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

Once a TMDL is established it may impose conditions on development either through an implementation plan and schedule for the listed water, or through special conditions required of the City of La Mesa affected by the numeric criteria of the TMDL. At this time, several 303(d) listings in San Diego County are at various stages of TMDL development with only four TMDLs having been adopted by the Regional Board. However, there are approximately 190 pending TMDLs in the county.

Applicable current and pending **TMDLs** in the La Mesa area include:

- Adopted TMDL for diazinon for Chollas Creek;

- Adopted TMDL for copper, lead, and zinc for Chollas Creek,
- Adopted TMDL for indicator bacteria for twenty beaches and creeks in the San Diego Region.
- Pending TMDL for sediment toxicity for the mouth of Chollas Creek,

The applicant should meet with municipal staff to determine if any project characteristics or watershed characteristics affect selection and design of BMPs. Except in rare circumstances, the use of the LID Design Guide (Chapter 4) and the Storm Water Pollutant Sources/Source Control Checklist (Appendix C) will ensure your project complies with all storm water requirements.

Selection of Permanent Source Control BMPs

Based on identification of potential pollutants of concern associated with various types of facilities, the City of La Mesa has developed a Storm Water Pollutant Sources/Source Control Checklist (Appendix C) of "maximum extent practicable" source controls associated with each facility type. This approach ensures appropriate BMPs are applied to potential sources of each pollutant of concern.

Selection of Storm Water Treatment Facilities

Table 2-3, below, categorizes pollutants of concern related to fate and pathways.

Table 2-4, below, includes a general comparison of how various types of treatment facilities perform for each group of pollutants.

TABLE 2-3. Grouping of Potential Pollutants of Concern by Fate During Storm Water Treatment

Pollutant	Coarse Sediment and Trash	Pollutants that tend to associate with fine particles during treatment	Pollutants that tend to be dissolved following treatment
Sediment	X	X	
Nutrients		X	X
Heavy Metals		X	
Organic Compounds		X	
Trash & Debris	X		
Oxygen Demanding		X	
Bacteria		X	
Oil & Grease		X	
Pesticides		X	

TABLE 2-4. Groups of Pollutants and Relative Effectiveness of Treatment Facilities

Pollutants of Concern	Bioretention Facilities (LID)	Settling Basins (Dry Ponds)	Wet Ponds and Constructed Wetlands	Infiltration Facilities or Practices (LID)	Media Filters	Higher-rate biofilters*	Higher-rate media filters*	Trash Racks & Hydro -dynamic Devices	Vegetated Swales
Coarse Sediment and Trash	High	High	High	High	High	High	High	High	High
Pollutants that tend to associate with fine particles during treatment	High	High	High	High	High	Medium	Medium	Low	Medium
Pollutants that tend to be dissolved following treatment	Medium	Low	Medium	High	Low	Low	Low	Low	Low

*See page 41 for a discussion of selection of treatment facilities in special situations.

Based on this analysis, the City of La Mesa has determined that the following types of facilities are appropriate for treatment of runoff potentially containing most pollutants of concern. These types of facilities can be used for storm water treatment and hydromodification flow control for all land uses in all watersheds, except where site-specific constraints make them infeasible.

- Infiltration facilities or practices, including dry wells, infiltration trenches, infiltration basins, and other facilities that infiltrate runoff to native soils (sized to detain and infiltrate a volume equivalent to the 85th percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

- Bioretention facilities and media filters that detain storm water and filter it slowly through soil or sand (sized with a surface area at least 0.04 times the effectively impervious tributary area for water quality treatment – a larger sizing factor is required to provide hydromodification control).

- Extended detention basins, wet ponds, and wetlands or other facilities using settling (sized to detain a volume equivalent to runoff from the tributary area generated by the 85th percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

The recommended design procedure in Chapter 4 integrates LID practices—optimizing the site design, using pervious surfaces, and dispersing of runoff to adjacent pervious areas—with the use of infiltration facilities, detention basins, and bioretention facilities to meet NPDES permit LID requirements, treatment requirements, and flow-control requirements in a cost-effective, unified design.

Oil/water separators ("water quality inlets"), storm drain inlet filters, and hydrodynamic separators, including vortex separators and continuous deflection separators ("CDS units"), are

less effective means of storm water treatment, although they may be used in series with more effective facilities.

Underground vaults typically lack the detention time required for settling of fine particles associated with storm water pollutants. They also require frequent maintenance and may retain stagnant water, potentially providing harborage for mosquitoes. Because vaults may be "out of sight, out of mind," experience shows that the required maintenance may not occur.

Lack of space, in itself, is not a suitable justification for using a less-effective treatment on a development site, because the uses of the site and the site design can be altered as needed to accommodate bioretention facilities or planter boxes. In most cases, these effective facilities can be fit into required landscaping setbacks, easements, or other unbuildable areas.

Where possible, drainage to inlets, and drainage away from overflows and underdrains, should be by gravity. Where site topography makes it infeasible to accommodate gravity-fed facilities in the project design, the design flow may be captured in a vault or sump and pumped via force main to an effective facility.

The following situations sometimes present special challenges:

- Portions of sites which are not being developed or redeveloped, but which must be retrofit to meet treatment requirements in accordance with Provision D.1.d.(1)(a) which states in part: "Where redevelopment results in an increase of, or replacement of, more than fifty percent of the impervious surface of a previously existing development, the numeric sizing criteria applies to the entire development."

- Sites smaller than one acre approved for development or redevelopment as part of a municipality's stated objective to preserve or enhance a pedestrian-oriented "smart-growth" type of urban design.

- Roadway widening projects.

In these special situations, the following types of facilities should each be evaluated in priority order (depending on the specific characteristics of the site and as determined by the municipal storm water coordinator) until a feasible design is found.

1. Bioretention areas or planter boxes fed by gravity.

2. Capture of the design flow in a vault or sump and pumping to bioretention areas or planter boxes.

3. A subsurface sand or media filter with a maximum design surface loading rate of 5 inches per hour and a minimum media depth of 18 inches. The sand surface must be made accessible for periodic inspection and maintenance (for example, via a removable grating).

4. A higher-rate surface biofilter, such as a tree-pit-style unit. The grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units.

5. A higher-rate vault-based filtration unit (for example, vaults with replaceable cartridge filters filled with inorganic media).

Proprietary Devices
Many currently available proprietary devices do not meet City of La Mesa requirements when used alone for storm water treatment. Consult with municipal staff before proposing these devices.

Many proprietary storm water treatment devices are currently marketed, and new brands will be introduced. Applicants and applicants' engineers and design professionals should review with municipal staff any proposals for using proprietary devices for storm water treatment before they commence work on preliminary site layout, drainage plans, grading plans, or landscape plans.

Hydrology for NPDES Compliance

► IMPERVIOUSNESS

Schueler (1995) proposed **imperviousness** as a "unifying theme" for the efforts of planners, engineers, landscape architects, scientists, and local officials concerned with urban watershed protection. Schueler argued (1) that imperviousness is a useful indicator linking urban land development to the degradation of aquatic ecosystems, and (2) imperviousness can be quantified, managed, and controlled during land development.

Imperviousness has long been understood as the key variable in urban hydrology. Peak runoff flow and total runoff volume from small urban catchments is usually calculated as a function of the ratio of impervious area to total area **(rational method)**. The ratio correlates to the runoff factor, usually designated "C". Increased flows resulting from urban development tend to increase the frequency of small-scale flooding downstream.

Imperviousness links urban land development to degradation of aquatic ecosystems in two ways.

First, the combination of paved surfaces and piped runoff efficiently collects urban pollutants and transports them, in suspended or dissolved form, to surface waters. These pollutants may originate as airborne dust, be washed from the atmosphere during rains, or may be generated by automobiles and outdoor work activities.

Second, increased peak flows and runoff durations typically cause erosion of stream banks and beds, transport of fine sediments, and disruption of aquatic habitat. Measures taken to control stream erosion, such as hardening banks with riprap or concrete, may permanently eliminate habitat. By reducing infiltration to groundwater, imperviousness may also reduce dry-weather stream flows.

Imperviousness has two major components: rooftops and transportation (including streets, highways, and parking areas). The transportation component is usually larger and is more likely to be **directly connected** to the storm drain system.

The effects of imperviousness can be mitigated by disconnecting impervious areas from the drainage system and by encouraging detention and retention of runoff near the point where it is generated. Detention and retention reduce peak flows and volumes and allow pollutants to settle out or adhere to soils before they can be transported downstream.

► LOW IMPACT DEVELOPMENT REQUIREMENTS

The NPDES permit requires LID be used on all projects to minimize directly connected impervious area and promote infiltration. For Priority Development Projects, the minimum standards are:

- Drain a portion of impervious areas into pervious areas, if any.
- Design and construct pervious areas, if any, to effectively receive and infiltrate runoff from impervious areas, taking into account soil conditions, slope, and other pertinent factors.
- Construct a portion of paved areas with low traffic and appropriate soil conditions with permeable surfaces.

The LID design procedure in Chapter 4 incorporates these requirements into an integrated design which meets sizing requirements for storm water treatment facilities and flow-control (hydromodification management) requirements.

► SIZING REQUIREMENTS FOR STORM WATER TREATMENT FACILITIES

The guidance in Chapter 4 was crafted to ensure LID facilities comply with the NPDES permit's hydraulic sizing requirements for storm water treatment facilities and flow-control facilities. The technical background follows.

Most runoff is produced by frequent storms of small or moderate intensity and duration. Treatment facilities are designed to treat smaller storms and the first flush of larger storms—approximately 80% of average annual runoff.

The NPDES permit identifies two types of treatment facilities—volume-based and flow-based.

Volume-based facilities must be designed to infiltrate, filter, or treat the volume of runoff produced from a 24-hour 85th percentile storm event as determined from the County of San Diego's 85th Percentile Precipitation Isopluvial Map. As shown on the map, rainfall depths vary from about 0.55" to 1.55".

For **flow-based** facilities, the NPDES permit specifies the rational method be used to determine flow. The rational method uses the equation

$Q = CiA$, where

Q = flow

C = weighted runoff factor between 0 and 1

i = rainfall intensity

A = area

The permit identifies two alternatives for calculating rainfall intensity:

1. the 85th percentile rainfall intensity times two, or
2. 0.2 inches per hour.

It is typically found that both methods yield similar results. The 0.2 inches per hour rainfall intensity should be used for sizing flow-based treatment facilities.

The 0.2 inches per hour criterion is the basis for a **consistent countywide sizing factor** for bioretention facilities when used for storm water treatment only (i.e., not for flow control). The factor is based on maintaining a minimum percolation rate of 5 inches per hour through the engineered soil mix. The sizing factor is the ratio of the design intensity of rainfall on tributary impervious surfaces (0.2 inches/hour) to the design percolation rate in the facility (5 inches/hour), or **0.04** (dimensionless).

► FLOW-CONTROL (HYDROMODIFICATION MANAGEMENT)

The NPDES permit specifies for applicable projects:

> … post-project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations.

Refer to Appendix H to review the final Hydromodification Management Plan (HMP) developed by the San Diego Copermittees and approved by the RWQCB in July 2010. A summary of the applicability criteria from the HMP document is provided in Chapter 1 of this BMP Manual.

Criteria for Infiltration Devices

The NPDES permit restricts the design and location of "infiltration devices" that, as designed, may bypass filtration through surface soils before reaching groundwater. These devices include:

- Infiltration basins.
- Infiltration trenches (includes French drains).
- Unlined retention basins (i.e., basins with no outlets).

- Unlined or open-bottomed vaults or boxes installed below grade (dry wells).

Infiltration devices may not be used in:

- Areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway);
- Automotive repair shops;
- Car washes;
- Fleet storage areas (bus, truck, etc.);
- Nurseries;
- Other areas with pollutant sources that could pose a threat to groundwater, as designated by the City of La Mesa.

The vertical distance from the base of any infiltration device to the seasonal high groundwater mark shall be at least 10 feet. Infiltration devices shall be located a minimum of 100 feet horizontally from any known water supply wells.

In addition, infiltration devices are not recommended where:

- The infiltration device would receive drainage from areas where chemicals are used or stored, where vehicles or equipment are washed, or where refuse or wastes are handled.
- Surface soils or groundwater are polluted.
- The facility could receive sediment-laden runoff from disturbed areas or unstable slopes.
- Increased soil moisture could affect the stability of slopes of foundations.
- Soils are insufficiently permeable to allow the device to drain within 72 hours.

► MOST LID FEATURES AND FACILITIES ARE NOT INFILTRATION DEVICES

Self-treating and self-retaining areas, pervious pavements, bioretention facilities, and planter boxes are not considered to be infiltration devices.

Bioretention facilities work by percolating runoff through 18 inches or more of engineered soil. This removes most pollutants before the runoff is allowed to seep into native soils below. Further pollutant removal typically occurs in the unsaturated (vadose) zone before moisture reaches groundwater.

Where there is concern about the effects of increased soil moisture on slopes or foundations, an impermeable barrier may be added so the facility is "flow through" and all treated runoff is underdrained away from the facility. See the design sheets for Bioretention Facilities and Flow-Through Planters in Appendix B.

Chapter 3

Preparing Your Project Submittal

Step-by-step assistance to demonstrate compliance.

Your Project Submittal will demonstrate your project complies with all applicable requirements in the storm water NPDES permit—to minimize imperviousness, retain or detain storm water, slow runoff rates, incorporate required source controls, treat storm water prior to discharge, control runoff rates and durations, and provide for operation and maintenance of treatment and flow-control facilities.

Submittal requirements vary from jurisdiction to jurisdiction. See below for the specific requirements of the City of La Mesa.

Typically, your Project Submittal must be coordinated with your application for discretionary approvals and must have sufficient detail to ensure the storm water design, site plan, and landscaping plan are congruent.

A complete and thorough Project Submittal will facilitate quicker review and fewer cycles of review. The City of La Mesa requires a submittal for every applicable project. The procedures outlined in this chapter are preferred by the City of La Mesa; any other approaches to meeting the requirements of this BMP Manual must be shown by the project proponent to be defensibly equivalent or better. Review and approval of water quality documents by City of La Mesa staff will be most efficient when proponents follow the methodology and direction outlined in this Chapter.

In order to meet SUSMP requirements, your submittal will be a Standard Post Construction BMP Plan (SPCBMPP) or a Post Construction Water Quality Technical Report (PCWQTR), depending on the outcome of the "Storm Water Requirements Applicability Checklist" in Appendix A. If you need to prepare a SPCBMPP, see Appendix G for appropriate guidance. If your project is a Priority Development Project, you will need to prepare a PCWQTR as directed in this chapter. **Municipal staff may use a review checklist** such as the following example to evaluate your Project Submittal:

EXAMPLE PROJECT SUBMITTAL CHECKLIST

SUBMITTAL COMPONENT REQUIREMENTS FOR PRIORITY DEVELOPMENT PROJECTS

- ❒ Completed "Storm Water Requirements Applicability Checklist" (Appendix A)
- ❒ Vicinity Map
- ❒ Site Map (See below for contents of Exhibit.)
- ❒ PCWQTR (See below for contents of Report.)
- ❒ Drainage Study (with Hydromodification, if applicable)

CONTENTS OF EXHIBIT (SITE MAP)

Show all of the following on drawings:

- ❒ Show entire property on one map. Use key map if multiple sheets are necessary. (Step 1 in the following step-by-step instructions)
- ❒ Existing natural hydrologic features (depressions, watercourses, floodplains, relatively undisturbed areas) and significant natural resources. (Step 1)
- ❒ Areas of potential soil erosion on the property and downstream of the project. (Step 1)
- ❒ Soil types and depth to groundwater. (Step 1)
- ❒ Existing and proposed site drainage network and connections to drainage off-site, including surface conveyances, private storm drain systems, and municipal storm drain inlets. (Step 3)
- ❒ Proposed design features and surface treatments used to minimize imperviousness. (Step 3)
- ❒ Entire site divided into separate drainage areas, with each area identified as self-treating, self-retaining (zero-discharge), draining to a self-retaining area, or draining to an IMP. (Step 3)
- ❒ For each drainage area, types of impervious area proposed (roof, plaza/sidewalk, and streets/parking) and area of each. (Step 3)
- ❒ Proposed locations and sizes of treatment or flow-control facilities. (Step 3)
- ❒ Potential pollutant source areas, including refuse areas, outdoor work and storage areas, etc. listed in Appendix C and corresponding required source controls. (Step 4)

CONTENTS OF REPORT

Include all of the following in your PCWQTR:

- ❒ Table of Contents
- ❒ Identification of the watershed(s), downstream waterbodies, waterbody impairments, and pollutants of concern (Step 1)
- ❒ Narrative analysis or description of site features and conditions that constrain, or provide opportunities for, storm water control. (Step 2)
- ❒ If the project is exempt from HMP requirements, a discussion must be included demonstrating which exemption is being claimed and why the project qualifies (Step 2).

- ❒ Demonstrate how hydromodification requirements are met, including calculations justifying determination of lower flow thresholds and the sizing of LID or extended detention facilities to provide for hydromodification flow control. Field investigation results and continuous simulation results should also be included where applicable (Step 3).
- ❒ Narrative description of site design characteristics that protect natural resources. (Step 3)
- ❒ Narrative description and/or tabulation of site design characteristics, building features, and pavement selections that reduce imperviousness of the site. (Step 3)
- ❒ Basis for selection of each proposed engineered LID IMP or alternative treatment facility. (Step 3)
- ❒ Tabulation of proposed pervious and impervious area, showing self-treating areas, self-retaining areas, and areas tributary to each treatment or flow-control facility. (Step 3)
- ❒ Preliminary designs, including calculations, for each infiltration, treatment, or flow-control facility. Elevations should show sufficient hydraulic head for each. (Step 3)
- ❒ A table of identified pollutant sources and for each source, the source control measure(s) used to reduce pollutants to the maximum extent practicable. See worksheet in Appendix C. (Step 4)
- ❒ General maintenance requirements for infiltration, treatment, and flow-control facilities (Step 5)
- ❒ Means by which facility maintenance will be financed and implemented in perpetuity. (Step 5)
- ❒ Statement accepting responsibility for operation & maintenance of facilities (Step 5).
- ❒ Identification of any conflicts with codes or requirements or other anticipated obstacles to implementing the proposed facilities in the submittal (Step 6).
- ❒ Construction Plan SUSMP Checklist (Step 6).
- ❒ Certification by a registered civil engineer (Step 6).

Step by Step

Suggested coordination with site and landscape design

Plan and design your storm water controls integrally with the site planning and landscaping for your project. It's best to start with general project requirements and preliminary site design concepts, then prepare the detailed site design, landscape design, and storm water control design simultaneously. **This will help ensure that your site plan, landscape plan, and Project Submittal are congruent.**

Begin with general project requirements and program.

The following step-by-step procedure should optimize your design by identifying the best opportunities for storm water controls **early in the design process.**

The recommended steps are:

Sketch conceptual site layout, building locations, and circulation.

1. Assemble needed information.
2. Identify site opportunities and constraints.
3. Follow the LID design guidance in Chapter 4 to analyze your project for LID and to develop and document your drainage design.
4. Specify source controls using the sources/source control checklist in Appendix C.
5. Plan for ongoing maintenance of treatment and flow-control facilities.
6. Complete the Project Submittal.

Revise site layout, building locations, and circulation to accommodate LID design. Develop land-scaping plan.

Submit Site Plan, Landscape Plan, and SUSMP Submittal

Municipal staff may recommend you prepare and submit a preliminary site design prior to formally applying for planning and zoning approvals. Your preliminary site design should incorporate a conceptual plan for site drainage, including self-treating and self-retaining areas and the location and approximate sizes of any treatment facilities. This additional up-front design effort will save time and avoid potential delays later in the review process.

Step 1: Assemble Needed Information

To select types and locations of treatment facilities, the designer needs to know the following site characteristics:

- **Existing natural hydrologic features** and natural resources, including any contiguous natural areas, wetlands, watercourses, seeps, or springs.

- **Existing site topography**, including contours of any slopes of 4% or steeper, general direction of surface drainage, local high or low points or depressions, any outcrops or other significant geologic features.
- **Zoning**, including requirements for **setbacks** and **open space**.
- **Public Works Standards** or other local codes governing minimum street widths, sidewalk construction, allowable pavement types, and drainage. These codes may conflict with Low Impact Development objectives to minimize imperviousness and to maintain or restore natural site hydrology.
- Soil types (including **hydrologic soil groups**) and depth to groundwater, which may determine whether infiltration is a feasible option for managing site runoff. Depending on site location and characteristics, and on the selection of treatment and flow-control facilities, site-specific information (e.g. from boring logs or geotechnical studies) may be required.
- **Existing site drainage.** For undeveloped sites, this should be obtained by inspecting the site and examining topographic maps and survey data. For previously developed sites, site drainage and connection to the municipal storm drain system can be located from site inspection, municipal storm drain maps, and plans for previous development.
- Existing **vegetative cover** and **impervious areas**, if any.
- **Watershed(s)** in which the project area is located.
- **Applicable hydromodification management requirements** for the project, or evidence for any exemptions from requirements based on the Final HMP. Note that field investigation is typically required for projects subject to hydromodification management requirements.
- **Pollutants of Concern** in receiving waters. For each of the proposed project discharge points, identify the receiving water(s), including hydrologic unit basin number(s), as identified in the most recent version of the Water Quality Control Plan for the San Diego Basin[1], prepared by the San Diego Regional Water Quality Control Board. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies[2]. List any and all pollutants for which the receiving waters are impaired. Use Table 2-1 of this BMP Manual to list anticipated pollutants based on land use.

---

[1] Go to: http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

[2] Under Section 303(d) of the 1972 Clean Water Act, states, territories, and authorized tribes are required to develop a list of water quality limited segments. These waters on the list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. Go to: http://www.swrcb.ca.gov/rwqcb9/water_issues/programs/303d_list/index.shtml. San Diego is in Region 9.

References and Resources

- *Site Planning for Urban Stream Protection* (Schueler 1995).
- *Start at the Source* (BASMAA 1999), p. 36

Step 2: Identify Constraints & Opportunities

Review the information collected in Step 1. Identify the principal constraints on site design and selection of treatment and flow-control facilities as well as opportunities to reduce imperviousness and incorporate facilities into the site and landscape design. For example, **constraints** might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, restricted right-of-way, or safety concerns. **Opportunities** might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention facilities), and differences in elevation (which can provide hydraulic head). Note storm water treatment facilities should not be located within protected riparian areas.

Prepare a brief **narrative** describing site opportunities and constraints. This narrative will help you as you proceed with LID design and explain your design decisions to others.

Step 3: Prepare and Document Your LID Design

Use the Low Impact Development Design Guide (Chapter 4) to analyze your project for LID, design and document drainage, and specify preliminary design details for integrated management practices. **Follow the detailed instructions in Chapter 4 to ensure your project complies with NPDES permit LID requirements (Provision D.1.d.(4)) and storm water treatment requirements in Provision D.1.d.(6)).** The LID Design Guide has been designed so that hydromodification management requirements are also met via this unified design procedure. Chapter 4 includes calculation procedures and formats for presenting your calculations.

As shown in the example checklist (page 48), your Project Submittal may need to include a drawing showing:

- The entire site divided into separate drainage management areas (DMAs), with each area identified as one of the following: self-treating, self-retaining, draining to a self-retaining area, or draining to an IMP. Each area should be clearly marked with a unique identifier.
- For each drainage area, the types of impervious area proposed, and the area of each.
- Proposed locations and sizes of treatment facilities. Each facility should be clearly marked with a unique identifier.

Compliance

The design criteria for DMAs in Chapter 4 ensure the required volume of flow from all developed portions of the project, including landscaped areas, is infiltrated, filtered, or treated (Provision D.1.d.(6)(a).

Your Project Submittal may need to include:

- Tabulation of proposed self-treating areas, self-retaining areas, areas draining to self-retaining areas, and areas draining to IMPs, and the corresponding IMPs identified on the Exhibit.
- Calculations, in the format shown in Chapter 4, showing the minimum square footage required and proposed square footage for each IMP.
- Preliminary designs for each IMP. The design sheets and accompanying drawings in Appendix B may be used or adapted for this purpose.

The following may also be required, or may be advisable to assist the reviewer to understand your design:

- A narrative overview of your design and how your design decisions optimize the site layout, use pervious surfaces, disperse runoff from impervious surfaces, and drain impervious surfaces to engineered IMPs. See Chapter 4.
- A narrative briefly describing each **drainage management area** (DMA), its drainage, and where drainage will be directed.
- A narrative briefly describing each IMP. Include any special characteristics or features distinct from the design sheets in Appendix B.

Step 4. Specify Source Control BMPs

Some everyday activities – such as trash recycling/disposal and washing vehicles and equipment – generate pollutants that tend to find their way into storm drains. These pollutants can be minimized by applying **source control BMPs**.

Source control BMPs include **permanent**, structural features that must be incorporated into your project plans and **operational** BMPs, such as regular sweeping and "housekeeping," that must be implemented by the site's occupant or user. The maximum extent practicable standard typically requires both types of BMPs. In general, operational BMPs cannot be substituted for a feasible and effective permanent BMP.

Use the following procedure to specify source control BMPs for your site:

► IDENTIFY POLLUTANT SOURCES

Review the first column in the **Pollutant Sources/Source Control Checklist** (Appendix C). Check off the potential sources of pollutants that apply to your site.

► NOTE LOCATIONS ON SUBMITTAL DRAWING

Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist (Appendix C). Show the location of each pollutant source and each permanent source control BMP in your submittal drawing.

► PREPARE A TABLE AND NARRATIVE

Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist (Appendix C). Now, create a table using the format in Table 3-1. In the left column, list each potential source on your site (from Appendix C, Column 1). In the middle column, list the corresponding **permanent, structural BMPs** (from Columns 2 and 3, Appendix C) used to prevent pollutants from entering runoff. Accompany this table with a narrative that explains any special features, materials, or methods of construction that will be used to implement these permanent, structural BMPs.

► IDENTIFY OPERATIONAL SOURCE CONTROL BMPS

TABLE 3-1. Format for Table of Permanent and Operational Source Control Measures.

Potential source of runoff pollutants	*Permanent source control BMPs*	*Operational source control BMPs*

To complete your table, refer once again to the Pollutant Sources/Source Control Checklist (Appendix C, Column 4). List in the right column of your table the operational BMPs that should be implemented as long as the anticipated activities continue at the site. The same BMPs may also be required as a condition of a use permit or other revocable discretionary approval for use of the site.

References and Resources

- Appendix C: Storm Water Pollutant Sources/Source Control Checklist
- RWQCB Order R9-2007-0001, Provision D.1.d.(5)
- *Start at the Source*, Section 6.7: Details, Outdoor Work Areas
- *California Stormwater Industrial/Commercial Best Management Practice Handbook*
- *Urban Runoff Quality Management* (WEF/ASCE, 1998) Chapter 4: Source Controls

Step 5: Storm Water Facility Maintenance

As required by NPDES Permit Provision D.1.c.(5), projects that include permanent BMPs shall be conditioned to require submittal of proof of a mechanism under which ongoing long-term maintenance of storm water treatment and flow-control facilities will be conducted, satisfactory to the City Engineer. The City of La Mesa requires the following items be included in your Project Submittal:

1. A means to finance and implement facility maintenance in perpetuity.
2. Acceptance of responsibility for maintenance from the time the facilities are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the treatment and flow-control facilities you have selected.

The City Engineer may also require that you prepare and submit a detailed plan that sets forth a maintenance schedule for each of the treatment and flow-control facilities built on your site.

Details of these requirements, and instructions for preparing a detailed operation and maintenance plan, are in Chapter 5.

References and Resources

- *Chapter 5*
- Operation, Maintenance, and Management of Stormwater Management Systems (Watershed Management Institute, 1997)

Step 6: Complete Your Project Submittal

City staff may provide specific instructions for the content and format of your Project Submittal. Your Project Submittal should document the information gathered and decisions made in Steps 1-5. A clear, complete, well-organized Project Submittal will make it possible to confirm your design meets the minimum requirements of the NPDES permit, the City of La Mesa Storm Water Ordinance Municipal Code Chapter 7.18, and this BMP manual.

► COORDINATION WITH SITE, ARCHITECTURAL, AND LANDSCAPING PLANS

Before completing your Project Submittal, ensure your storm water control design is fully coordinated with the site plan, grading plan, and landscaping plan being proposed for the site.

Information submitted and presentations to design review committees, planning commissions, and other decision-making bodies must incorporate relevant aspects of the storm water design. In particular, ensure:

- Curb elevations, elevations, grade breaks, and other features of the drainage design are consistent with the delineation of DMAs.

- The top edge (overflow) of each bioretention facility is level all around its perimeter—this is particularly important in parking lot medians.
- The resulting grading and drainage design is consistent with the design for parking and circulation.
- Bioretention facilities and other IMPs do not create conflicts with pedestrian access between parking and building entrances.
- Vaults and utility boxes can be accommodated outside bioretention facilities and will not be placed within bioretention facilities.
- The visual impact of storm water facilities, including planter boxes at building foundations and any terracing or retaining walls required for the storm water control design, is shown in renderings and other architectural drawings.
- Landscaping plans, including planting plans, show locations of bioretention facilities, and the plant requirements are consistent with the engineered soils and conditions in the bioretention facilities.
- Renderings and representation of street views incorporate any storm water facilities located in street-side buffers and setbacks

► CONSTRUCTION PLAN SUSMP CHECKLIST

When you submit construction plans for City review and approval, the reviewer will compare that submittal with your earlier Project Submittal. By creating a Construction Plan SUSMP Checklist for your project, you can facilitate the reviewer's comparison and speed review of your project.

TABLE 3-2. Format for Construction Plan SUSMP Checklist.

SUSMP Page #	*BMP Description*	*See Plan Sheet #s*

Here's how:

4. Create a table similar to Table 3-2. Number and list each measure or BMP you have specified in your Project Submittal in Columns 1 and 2 of the table. Leave Column 3 blank. Incorporate the table into your Project Submittal.

5. When you submit construction plans, **duplicate the table** (by photocopy or electronically). Now fill in Column 3, identifying the plan sheets where the BMPs are shown. List all plan sheets on which the BMP appears. Submit the updated table with your construction plans.

Note that the updated table—or Construction Plan SUSMP Checklist—is **only a reference tool** to facilitate comparison of the construction plans to your Project Submittal. City Engineering staff can advise you regarding the process required to propose changes to your approved Project Submittal.

► CERTIFICATION

Your Project Submittal shall be certified by a registered civil engineer.

The certification should state: "The selection, sizing, and preliminary design of storm water treatment and other control measures in this plan meet the requirements of Regional Water Quality Control Board Order R9-2007-0001 and subsequent amendments."

► EXAMPLE PROJECT SUBMITTAL OUTLINE AND CONTENTS

Check with City Engineering staff for requirements specific to your project.

I. Project Setting

- A. Project Name, Location, Description of project activities
- B. Vicinity Map
- C. Existing site features and conditions
- D. Opportunities and constraints for storm water control
- E. Watershed(s), receiving water bodies, and water body impairments
- F. Pollutants of concern based on land use and downstream water body impairments
- G. Impacts to hydrologic regime

II. Low Impact Development Design Strategies

- A. Optimization of site layout
  - (1) Limitation of development envelope
  - (2) Preservation of natural drainage features
  - (3) Setbacks from creeks, wetlands, and riparian habitats
  - (4) Minimization of imperviousness
  - (5) Using drainage as a design element
- B. Use of permeable pavements
- C. Dispersal of runoff to pervious areas
- D. Use of Integrated Management Practices

III. Hydromodification Analysis

- A. Hydromodification Applicability
- B. Flow Control Performance Criteria

IV. Documentation of Drainage Design

- A. Drainage Management Areas
  - (1) Tabulation

(2) Descriptions

B. Integrated Management Practices

(1) Tabulation and Sizing Calculations

(2) Descriptions

V. Source Control Measures

A. Description of site activities and potential sources of pollutants

B. Table showing sources, permanent source controls, and operational source controls

VI. Facility Maintenance Requirements

A. Ownership and responsibility for maintenance in perpetuity.

(1) Commitment to execute any necessary agreements.

(2) Statement accepting responsibility for operation and maintenance of facilities until that responsibility is formally transferred.

B. Summary of maintenance requirements for each storm water facility.

VII. Construction Plan SUSMP Checklist

VIII. Certifications

IX. Attachment: SUSMP Exhibit (Site Map) clearly showing:

A. Entire property

B. Nearby water bodies and municipal storm drain inlets

C. Private storm drain systems

D. Drainage Management Areas

E. Integrated Management Practices

F. Source control measures and potential sources of pollutants

G. Any other proposed BMPs

► SPECIFIC PROJECT CONSIDERATIONS

Your submittal will reflect the unique character of your own project and should meet the requirements identified in this BMP manual. City Engineering staff can assist you to determine how specific requirements apply to your project.

Chapter 4

Low Impact Development Design Guide

Guidance for designing and documenting your LID site drainage, storm water treatment facilities, and flow-control facilities

Follow the Low Impact Development (LID) design in this BMP manual to achieve compliance with the storm water treatment requirements as well as the LID requirements in the storm water NPDES permit. The City of La Mesa encourages the use of the design and documentation strategies outlined in this chapter. While other approaches may be used, they must be defensibly shown by the project proponent to meet or exceed the low impact development standards in this BMP Manual.

This will require careful documentation of:

- Pervious and impervious areas in the planned project.
- Drainage from each of these areas.
- Locations, sizes, and types of proposed treatment facilities.

Your Project Submittal must include calculations showing the site drainage and proposed LID treatment facilities meet the criteria in this BMP Manual.

This Low Impact Development Design Guide will help you:

- **Analyze your project** and identify and select options for implementing LID techniques to meet runoff treatment requirements—and flow-control requirements, if they apply.
- **Design and document drainage** for the whole site and document how that design meets this BMP Manual's storm water treatment criteria.
- **Specify preliminary design details** and integrate your LID drainage design with your paving and landscaping design.

Alternatives to LID design are discussed in the final section of this chapter.

Analyze Your Project for LID

Conceptually, there are four LID strategies for managing runoff from buildings and paving:

1. **Optimize the site layout** by preserving natural drainage features and designing buildings and circulation to minimize the amount of roofs and paving.

2. **Use pervious surfaces** such as turf, gravel, or pervious pavement—or use surfaces that retain rainfall, such as vegetated roofs. All drainage from these surfaces is considered to be "self-retained" (a detailed definition corresponding to this concept is on page 67). No further management of runoff is necessary. An emergency overflow should be provided for extreme events.

3. **Disperse runoff** from impervious surfaces on to adjacent pervious surfaces (e.g., direct a roof downspout to disperse runoff onto a lawn).

4. Drain impervious surfaces to engineered **Integrated Management Practices** (IMPs), such as bioretention facilities, planter boxes, cisterns, or dry wells. IMPs infiltrate runoff to groundwater and/or percolate runoff through engineered soil and allow it to drain away slowly. Depending on site conditions and local regulations, it may be possible to harvest and reuse rainwater in conjunction with IMPs.

A combination of two or more strategies may work best for your project. With forethought in design, the four strategies can provide multiple, complementary benefits to your development. Pervious surfaces reduce heat island effects and temperature extremes. Landscaping improves air quality, creates a better place to live or work, and upgrades value for rental or sale. Retaining natural hydrology helps preserve and enhance the natural character of the area. LID drainage design can also conserve water and reduce the need for drainage infrastructure.

Table 4-1 includes ideas for applying LID strategies to site conditions and types of development.

TABLE 4-1. Ideas for Runoff Management

Site Features and Design Objectives	Vegetated Roof	Self-retaining Areas	Pervious Pavement	Bioretention Facility	Flow-through Planter	Dry Well	Cistern with bioretention
Clayey native soils	✓			✓	✓		✓
Permeable native soils	✓		✓	✓	✓	✓	
Very steep slopes	✓				✓		
Shallow groundwater	✓				✓		
Avoid saturating subsurface soils	✓		✓		✓		
Connect to roof downspouts		✓		✓	✓	✓	✓
Parking lots/islands and medians			✓	✓		✓	
Sites with extensive landscaping		✓	✓	✓			
Densely developed sites with limited space/landscape	✓		✓		✓	✓	✓
Fit IMPs into landscape and setback areas				✓			✓
Make drainage a design feature		✓		✓			✓
Convey as well as treat storm water				✓			

► OPTIMIZE THE SITE LAYOUT

To minimize storm water-related impacts, apply the following design principles to the layout of newly developed and redeveloped sites.

Conserve natural areas, soils, and vegetation. Define the development envelope and protected areas, identifying areas that are most suitable for development and areas that should be left undisturbed. Use the following guideline to determine the least sensitive areas of the site, in order of increasing sensitivity:

1. Areas devoid of vegetation, including previously graded areas and agricultural fields.
2. Areas of non-native vegetation, disturbed habitats, and eucalyptus woodlands where receiving waters are not present.
3. Areas of chamise or mixed chaparral, and non-native grasslands.
4. Areas containing coastal scrub communities.
5. All other upland communities.
6. Occupied habitat of sensitive species and all wetlands.

Within each of the previous categories, hillside areas should be considered more sensitive than flatter areas.

Coordination
Chapter One includes a presentation of how review of your project's site design and landscape design is coordinated with review for compliance with storm water NPDES requirements.

Where possible, conform the site layout along natural landforms, avoid excessive grading and disturbance of vegetation and soils, and replicate the site's natural drainage patterns. Set back development from creeks, wetlands, and riparian habitats. Preserve significant trees, especially native trees and shrubs, and identify locations for planting additional native or drought tolerant trees and large shrubs. Concentrate development on portions of the site with less permeable soils, and preserve areas that can promote infiltration.

For all types of development, **limit overall coverage** of paving and roofs. Where allowed by La Mesa zoning and design standards—and provided public safety and a walkable environment are not compromised—this can be accomplished by designing compact, taller structures, narrower and shorter streets and sidewalks, smaller parking lots (fewer stalls, smaller stalls, and more efficient lanes), and indoor or underground parking. Examine site layout and circulation patterns and identify areas where landscaping can be substituted for pavement.

Detain and retain runoff throughout the site. On flatter sites, it typically works best to intersperse landscaped areas and IMPs among the buildings and paving. On hillside sites, drainage from upper areas may be collected in conventional catch basins and piped to landscaped areas and IMPs in lower areas.

Use drainage as a design element. Use depressed landscape areas, vegetated buffers, and bioretention areas as amenities and focal points within the site and landscape design. Bioretention areas can be almost any shape and should be located at low points. Bioretention areas shaped as swales can detain and treat low runoff flows and also convey higher flows.

► USE PERVIOUS SURFACES

Consider a vegetated roof. Although not yet widely used in California, vegetated or "green" roofs are growing in popularity. Potential benefits include longer roof life, lower heating and cooling costs, and better sound insulation, in addition to air quality and water quality benefits. For SUSMP compliance purposes, vegetated roofs are considered not to produce increased runoff or runoff pollutants (i.e., any runoff from a vegetated roof requires no further treatment or detention). For more information on vegetated roofs, see www.greenroofs.org.

Consider permeable pavements and surface treatments. Inventory paved areas on your preliminary site plan. Identify where permeable pavements, such as crushed aggregate, turf block, unit pavers, pervious concrete, or pervious asphalt could be substituted for impervious concrete or asphalt paving.

► DISPERSE RUNOFF TO ADJACENT PERVIOUS AREAS

Look for opportunities to direct runoff from impervious areas to adjacent landscaping. The design, including slopes and soils, must reflect a reasonable expectation that an inch of rainfall will soak into the soil and produce no runoff. For example, a lawn or garden depressed 3-4" below surrounding walkways or driveways provides a simple but functional landscape design element.

For sites subject to storm water treatment requirements only, a 2:1 maximum ratio of impervious to pervious area is acceptable. Be sure soils will drain adequately.

Under some circumstances, it may be allowable to direct runoff from impervious areas to pervious pavement (for example, from roof downspouts to a parking lot paved with crushed aggregate or turf block). The pore volume of pavement and base course must be sufficient to retain an inch of rainfall, including runoff from the tributary area. The slopes and soils must be compatible with infiltrating that volume without producing runoff.

► DIRECT RUNOFF TO INTEGRATED MANAGEMENT PRACTICES

Design criteria have been developed for the following IMPs:

- **Bioretention facilities**, which can be configured as swales, free-form areas, or planters to integrate with your landscape design.
- **Flow-through planters**, which can be used near building foundations and other locations where infiltration to native soils is not desired.
- **Dry wells** and other infiltration facilities, which can be used only where soils are permeable.
- **Cisterns or vaults**, in combination with a bioretention facility.

See the design sheets in Appendix B.

It may be possible to create a site-specific design that uses cisterns to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Such a design could expand the multiple benefits of LID to include water conservation. Keep in mind:

- Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8 below. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse.

- Storage of water for longer than minimum standards set forth by the City of La Mesa (72 hours) creates the potential for mosquito harborage. Cisterns and vaults must be designed to prevent entry by mosquitoes.

- Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

Some references and resources for water harvesting appear at the end of this chapter.

Finding the right location for treatment facilities on your site involves a careful and creative integration of several factors:

- To make the most efficient use of the site and to maximize aesthetic value, **integrate IMPs with site landscaping**. Zoning codes may require landscape setbacks or buffers, or may specify that a minimum portion of the site be landscaped. It may be possible to locate some or all of your site's treatment and flow-control facilities within this same area, or within utility easements or other non-buildable areas.

- Planter boxes and bioretention areas must be **level or nearly level** all the way around. Bioretention areas configured as swales may be gently sloped in the linear direction, but opposite sides must be at the same elevation.

- For effective, low-maintenance operation, **locate facilities so drainage into and out of the device is by gravity flow.** Pumped systems are feasible, but are expensive, require more maintenance, are prone to untimely failure, and can cause mosquito control problems.

- If the property is being subdivided now or in the future, the facility should be in a **common, accessible area.** In particular, avoid locating facilities on private residential lots. Even if the facility will serve only one site owner or operator, make sure the facility is located for ready access by inspectors from the City of La Mesa and local vector control agency.

- The facility must be accessible to equipment needed for its maintenance. **Access requirements for maintenance** will vary with the type of facility selected. Planter

boxes and bioretention areas will typically need access for the same types of equipment used for landscape maintenance.

To complete your analysis, include in your Project Submittal a brief **narrative** documenting the site layout and site design decisions you made. This will provide background and context for how your design meets the quantitative LID design criteria.

Develop and Document Your Drainage Design

The **design documentation procedure** begins with careful delineation of pervious areas and impervious areas (including roofs) throughout the site. The procedure accounts for how runoff from each delineated area is managed. For areas draining to IMPs, the procedure ensures each IMP is appropriately sized.

The procedure results in a space-efficient, cost-efficient LID design for meeting SUSMP requirements on most residential and commercial/industrial developments. The procedure arranges documentation of drainage design and IMP sizing in a consistent format for presentation and review.

This procedure is intended to facilitate, not substitute for, creative interplay among site design, landscape design, and drainage design. **Several iterations may be needed** to optimize your drainage design as well as aesthetics, circulation, and use of available area for your site.

You should be able to complete the needed calculations using only the project's site development plan.

► STEP 1: DELINEATE DRAINAGE MANAGEMENT AREAS

This is the key first step. You must divide the **entire project area** into individual, discrete Drainage Management Areas (DMAs). Typically, lines delineating DMAs follow grade breaks and roof ridge lines. The Exhibit, tables, text, and calculations in your Project Submittal will illustrate, describe, and account for runoff from each of these areas.

Use separate DMAs for each surface type (e.g., landscaping, pervious paving, or roofs). Each DMA must be assigned a single hydrologic soil group. Assign each DMA an identification number and determine its size in square feet.

► STEP 2: CLASSIFY DMAS AND DETERMINE RUNOFF FACTORS

Next, determine how drainage from each DMA will be handled. Each DMA will be one of the following four types:

1. Self-treating areas.
2. Self-retaining areas (also called "zero-discharge" areas).
3. Areas that drain to self-retaining areas.
4. Areas that drain to IMPs.

Self-treating areas are landscaped or turf areas that do not drain to IMPs, but rather drain directly off site or to the storm drain system. Examples include upslope undeveloped areas which are ditched and drained around a development and grassed slopes which drain off-site to a street or storm drain. In general, self-treating areas include no impervious areas, unless the impervious area is very small (5 percent or less) in relationship to the receiving pervious area and slopes are gentle enough to ensure runoff will be absorbed into the vegetation and soil. Criteria for self-treating areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

Rationale

Pollutants in rainfall and windblown dust will tend to become entrained in the vegetation and soils of landscaped areas, so no additional treatment is needed. It is assumed the self-treating landscaped areas will produce runoff less than or equal to the pre-project site condition.

FIGURE 4-1. Self-treating areas are entirely pervious and drain directly off-site or to the storm drain system.

Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that a one-inch rainfall event would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Specify slopes, if any, toward the center of the pervious area. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

Criteria for self-retaining areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

FIGURE 4-2. Self-retaining areas. Berm or depress the grade to retain at least an inch of rainfall and set inlets of any area drains at least 3 inches above low point to allow ponding.

Areas draining to self-retaining areas. Runoff from impervious or partially pervious areas can be managed by routing it to self-retaining pervious areas. For example, roof downspouts can be directed to lawns, and driveways can be sloped toward landscaped areas. The maximum ratio is 2 parts impervious area for every 1 part pervious area.

FIGURE 4-3. Relationship of impervious to pervious area for self-retaining areas.
Ratio: ***pervious ≥ ½ impervious***

The drainage from the impervious area must be directed to and dispersed within the pervious area, and the entire area must be designed to retain an inch of rainfall without flowing off-site. For example, if the maximum ratio of 2 parts impervious area into 1 part pervious area is used, then the pervious area must absorb 3 inches of water over its surface before over-flowing to an off-site drain.

A partially pervious area may be drained to a self-retaining area. For example, a driveway composed of unit pavers may drain to an adjacent lawn. In this case, the maximum ratios are:

(Runoff factor) x (tributary area) ≤ 2 x (self-retaining area) *Equation 4-1*

Use the runoff factors in Table 4-2.

Prolonged ponding is a potential problem at higher impervious/pervious ratios. In your design, ensure that the pervious area soils can handle the additional run-on and are sufficiently well-drained.

Under some circumstances, pervious pavement (e.g., crushed stone, pervious asphalt or pervious concrete) can be self-retaining. Adjacent roofs or impervious pavement may drain on to the pervious pavement in the same maximum ratios as described above.

To design a pervious pavement to be a self-treating area, ensure:

- The gravel base course is a minimum of four or more inches deep.
- The base course is not to be underdrained.
- A qualified engineer has been consulted regarding infiltration rates, pavement stability, and suitability for the intended traffic.

Runoff from self-treating and self-retaining areas does not require any further treatment or flow control.

TABLE 4-2. Example Runoff Factors for Surfaces Draining to IMPs.

Surface	Factor
Roofs	1.0
Concrete	1.0
Pervious Concrete	0.1
Porous Asphalt	0.1
Grouted Unit Pavers	1.0
Solid Unit Pavers on granular base, min. 3/16 inch joint space	0.2
Crushed Aggregate	0.1
Turfblock	0.1
Amended, mulched soil	0.1
Landscape	0.1

Areas draining to IMPs are multiplied by a sizing factor to calculate the required size of the IMP. On most densely developed sites—such as commercial and mixed-use developments and small-lot residential subdivisions—most DMAs will drain to IMPs.

More than one drainage area can drain to the same IMP. However, because the minimum IMP sizes are determined by ratio to drainage area size, a drainage area may not drain to more than one IMP. See Figures 4-4 and 4-5.

FIGURE 4-4. More than one Drainage Management Area can drain to a single IMP.

FIGURE 4-5. One Drainage Management Area cannot drain to more than one IMP. Use a grade break to divide the DMA.

Where possible, design site drainage so **only impervious roofs and pavement** drain to IMPs. This yields a simpler, more efficient design and also helps protect IMPs from becoming clogged by sediment.

If it is necessary to include turf, landscaping, or pervious pavements within the area draining to an IMP, list each surface as a separate DMA. A runoff factor (similar to a "C" factor used in the rational method) is applied to account for the reduction in the quantity of runoff. For example, when a turf or landscaped drainage management area drains to an IMP, the resulting increment in IMP size is:

$$\Delta \text{ (Area)} = \text{(pervious area)} \times \text{(runoff factor)} \times \text{(sizing factor)}.$$

Use the runoff factors in Table 4-2.

► STEP 3: TABULATE DRAINAGE MANAGEMENT AREAS

- Tabulate self-treating areas in the format shown in Table 4-3.
- Tabulate self-retaining areas in the format shown in Table 4-4.
- Tabulate areas draining to self-retaining areas in the format shown in Table 4-5. Check to be sure the total product of (square feet of tributary area × runoff factor) for all DMAs draining to a receiving self-retaining area is no greater than a 2:1 ratio to the square footage of the receiving self-retaining area itself.

- Compile a list of DMAs draining to IMPs. Proceed to Step 4 to check the sizing of the IMPs.

TABLE 4-3. Format for Tabulating Self-Treating Areas

DMA Name	Area (square feet)

TABLE 4-4. Format for Tabulating Self-Retaining Areas

DMA Name	Area (square feet)

TABLE 4-5. Format for Tabulating Areas Draining to Self-Retaining Areas

DMA Name	Area (square feet)	Post-project surface type	Runoff factor	Receiving self-retaining DMA	Receiving self-retaining DMA Area (square feet)

► STEP 4: SELECT AND LAY OUT IMPS ON SITE PLAN

Select from the list of IMPs in Table 4-6. Illustrations, designs, and design criteria for the IMPs are in the "IMP Design Details and Criteria" at the end of this chapter.

Once you have laid out the IMPs, calculate the square footage you have set aside on your site plan for each IMP.

► STEP 5: REVIEW SIZING FOR EACH IMP

For each of the IMPs, use the appropriate "water quality only" sizing from Table 4-6. Sizing factors for integrated facilities that provide both water quality treatment and hydromodification flow control may be obtained using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H).

TABLE 4-6. "Water Quality Only" Sizing Factors

Bioretention Facilities	Sizing Factor for Area = 0.04
Flow-through Planters	Sizing Factor for Area = 0.04
Dry Well or Infiltration Basin	See Step 6 to Calculate Min. Volume
Cistern/Vault with Bioretention	See Step 6 to Calculate Min. Volume of Cistern or Vault; then use 0.04 to calculate minimum size of bioretention area

Q_2 = 2-year pre-project flow rate based upon partial duration analysis of long-term hourly rainfall records

Q_{10} = 10-year pre-project flow rate based upon partial duration analysis of long-term hourly rainfall records

A = Surface area sizing factor

V_1 = Surface volume sizing factor

V_2 = Subsurface volume sizing factor

Note: The Oceanside Rain Gauge was selected for use in La Mesa based on rain basin analysis performed by the consultant team for the San Diego regional Storm Water Co-permitees. The analysis took into account average annual rainfall, proximity, elevation, and data availability.

► STEP 6: CALCULATE MINIMUM AREA AND VOLUME OF EACH IMP

The minimum area of bioretention facilities and flow-through planters is found by summing up the contributions of each tributary DMA and multiplying by the adjusted sizing factor for the IMP. Note that if the IMP is designed to provide hydromodification flow control, then sizing factors from the using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used in lieu of the "water quality only" sizing factors presented in Table 4-6.

Equation 4-7

$$Min.\,IMP\,Area = \sum \begin{pmatrix} DMA & DMA \\ Square & \times Runoff \\ Footage & Factor \end{pmatrix} \times \begin{pmatrix} IMP \\ Sizing \\ Factor \end{pmatrix}$$

Use the format of Table 4-12 to present the calculations of the required minimum area and volumes for **bioretention areas** and **planter boxes**:

TABLE 4-12. Format for Presenting Calculations of Minimum IMP Areas for Bioretention Areas and Planter Boxes.

DMA Name	DMA Area (square feet)	Post-project surface type	DMA Runoff factor	DMA Area × runoff factor	Soil Type:	IMP Name			
					IMP Sizing factor (WQ only)		Minimum Area	Proposed Area	
			Total		*0.04*				*IMP Area*

To size **dry wells**, **infiltration basins**, or **infiltration trenches for the "water quality only" treatment option**, use the following procedure:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the minimum unit volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the facility. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the minimum unit volume.

Equation 4-8

$$Volume = [Tributary\ Area] \times [weighted\ runoff\ \ factor] \times [unit\ volume]$$

4. Select a facility depth.
5. Determine the required facility area. Dry wells may be designed as an open vault or with rock fill. If rock fill is used, assume a porosity of 40%.
6. Ensure the facility can infiltrate the entire volume within 72 hours, or the minimum drawdown time determined by the City.

To size a **cistern or vault in series with a bioretention facility (criteria below for "water quality**:

1. Use Equation 4-12 to calculate the required cistern or vault volume.
2. Design a discharge orifice for a drawdown time of 24 hours.
3. Determine the maximum discharge from the orifice.
4. The minimum area of the bioretention facility must treat this flow based on a percolation rate of 5" per hour through the engineered soil.

If a facility is designed to provide both water quality treatment and hydromodification flow control, using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used to determine the appropriate sizing factors for the IMP design.

► STEP 7: DETERMINE IF AVAILABLE SPACE FOR IMP IS ADEQUATE

Sizing and configuring IMPs may be an iterative process. After computing the minimum IMP area using Steps 1 – 6, review the site plan to determine if the reserved IMP area is sufficient. If so, the planned IMPs will meet the SUSMP sizing requirements. If not, revise the plan accordingly. Revisions may include:

- Reducing the overall imperviousness of the project site.
- Changing the grading and drainage to redirect some runoff toward other IMPs which may have excess capacity.
- Making tributary landscaped DMAs self-treating or self-retaining.
- Expanding IMP surface area.

► STEP 8: COMPLETE YOUR SUMMARY REPORT

Present your IMP sizing calculations in tabular form. Adapt the following format as appropriate to your project. Coordinate your presentation of DMAs and calculation of minimum IMP sizes with the Project Submittal drawing (labeled to show delineation of DMAs and locations of IMPs). It is also helpful to incorporate a brief description of each DMA and each IMP.

Sum the total area of all DMAs and IMPs listed and show it is equal to the total project area. This step may include adjusting the square footage of some DMAs to account for area used for IMPs.

Format:

Project Name:

Project Location:

APN or Subdivision Number:

Total Project Area (square feet):

Mean Annual Precipitation at Project Site:

I. Self-treating areas:

DMA Name	Area (square feet)

II. Self-retaining areas:

DMA Name	Area (square feet)

III. Areas draining to self-retaining areas:

DMA Name	Post-project surface type	Runoff factor	Area (square feet)	Receiving self-retaining DMA	Receiving self-retaining DMA Area (square feet)

IV. Areas draining to IMPs (repeat for each IMP):

DMA Name	DMA Area (square feet)	Post-project surface type	DMA Runoff factor	DMA Area × runoff factor	Soil Type:	IMP Name			
					IMP Sizing factor		Minimum Area or Volume	Proposed Area or Volume	
				Total					*IMP Area*

Specify Preliminary Design Details

In your Project Submittal, describe your IMPs in sufficient detail to demonstrate the area, volume, and other criteria of each can be met within the constraints of the site.

Ensure these details are consistent with preliminary site plans, landscaping plans, and architectural plans submitted with your application for planning and zoning approvals.

Appendix B includes design sheets for:

- Self-treating and self-retaining areas
- Pervious pavements
- Bioretention facilities
- Flow-through planter
- Dry wells and infiltration basins
- Cistern or vault with bioretention facility

These design sheets include recommended configurations and details, and example applications, for these IMPs. **The information in these design sheets must be adapted and applied to the**

conditions specific to the development project such as unstable slopes or the lack of available head. Designated municipal staff have final review and approval authority over the project design.

Keep in mind that proper and functional design of the IMP is the responsibility of the applicant. Effective operation of the IMP throughout the project's lifetime will be the responsibility of the property owner.

Alternatives to Integrated LID Design

If you believe design of features and facilities as described above is infeasible for your development site, consult with Engineering staff before preparing an alternative design for storm water treatment, flow control, and LID compliance.

For all alternative designs, the applicant must prepare a complete Project Submittal, including a drawing showing the entire site divided into discrete Drainage Management Areas, text and tables showing how drainage is routed from each DMA to a treatment facility, and calculations demonstrating that the design achieves the applicable design criteria for each storm water treatment facility. Alternative treatment facilities are limited to the circumstances and selection criteria identified beginning on page 39. The Project Submittal must also show how the project meets the minimum LID criteria (page 43) and ensures runoff rates, durations, and velocities are controlled to maintain or reduce downstream erosion conditions and protect stream habitat (NPDES Permit Provision D.1.d.(10)).

► DESIGN OF ALTERNATIVE TREATMENT FACILITIES

Here are criteria and design considerations for some alternative treatment facilities, also known as treatment control BMPs:

Sand Filters. To ensure effectiveness is not compromised by compacting or clogging of the filter surface, sand filters must be maintained frequently.

The following criteria apply to sand filters:

- Calculate the design flow using the rational method with an intensity of 0.2"/hour and the "C" factors for "treatment only" from Table 4-2.
- To determine the required filter surface area, divide the design flow by an allowable design surface loading rate of 5"/hour.
- The minimum depth of filter media is 18". The media should be washed sand, with gradation similar to that specified for fine aggregate in ASTM C-33.
- The entire filter area must be accessible for easy maintenance without the need to enter a confined space.

A typical filter design includes a gravel drain layer and a perforated pipe underdrain. Filter fabric may be used to prevent the filter media from entering the gravel layer.

The design should not include any permanent pool or other standing water. Instead of including a pretreatment basin, consider the following features in the area tributary to the filter to reduce the potential for filter clogging:

- Limit the size of the Drainage Management Area.
- Include only impervious areas in the DMA.
- Stabilize slopes and eliminate sources of sediment in the DMA.
- Provide screens for trash and leaves at storm drain inlets (if allowed by the City of La Mesa).

For additional design considerations and details, see *Design of Stormwater Filtering Systems* by Richard A. Claytor and Thomas R. Schueler, The Center for Watershed Protection, 1996, and *California Stormwater BMP Handbooks* Fact Sheet TC-40, Media Filter.

Sand filters do not provide adequate hydromodification flow controls.

Extended ("Dry") Detention Basins. The required detention volume for water quality treatment is based on the 85th percentile 24-hour storm depth. The steps to calculate the required detention volume are:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the unit basin volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the basin. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the unit basin volume.

For maximum effectiveness the basin should not be sized substantially larger than this volume. If the basin is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the basin meets peak flow and flow duration criteria.

For design considerations and details, see the *California Stormwater Best Management Practice Handbooks*, Fact Sheet TC-22, "Extended Detention Basins." The basin outlet should be designed for a 24-hour drawdown time.

As noted in Fact Sheet TC-22, "dry" detention basins may not be practicable for drainage areas less than 5 acres. The potential for mosquito harborage is a concern. In the design, do not create any areas that will hold standing water for 72 hours or more, the maximum drawdown time as determined by the City of La Mesa.

"Wet" Detention Ponds and Constructed Wetlands. The required water quality detention volume is determined as with a "dry" detention basin. If the pond is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the pond meets peak flow and flow duration criteria. Before proceeding with design, contact the local mosquito control agency to coordinate the design and plan ongoing inspection and maintenance of the facility for mosquito control. For design considerations and details, see the *California Stormwater Best Management Practices Handbooks*, Fact Sheet TC-20, "Wet Ponds," and Fact Sheet TC-21, "Constructed Wetlands."

Vegetated Swales. Design recommendations for conventional vegetated swales are in the *California Stormwater Best Management Practices Handbooks*. The conventional swale design uses available on-site soils and does not include an underdrain system. Where soils are clayey, there is little infiltration. Treatment occurs as runoff flows through grass or other vegetation before exiting at the downstream end. Recommended detention times are on the order of 10 minutes. It should be noted that such designs likely would not provide the required hydromodification flow control.

Conventional vegetated swales may be used to meet NPDES permit treatment requirements and LID requirements (see page 39). The following should be incorporated in the design:

- Determine the weighted runoff factor ("C" factor) for the area tributary to the swale. The factors in Table 4-2 may be used.
- Calculate the design flow by multiplying the weighted runoff factor times the tributary area times either (1) 0.2 inches of rainfall per hour, or (2) twice the 85th percentile hourly rainfall intensity.
- When sizing the swale, use a value of 0.25 for Manning's "n".
- Ensure that all flow enters the swale near its highest point and that no flow short-circuits treatment by entering the swale along its length.
- The swale should be a minimum 100 feet in length.
- Longitudinal slopes should not exceed 2.5%; on flatter slopes, incorporate measures to avoid prolonged surface ponding.

Consider using linear-shaped bioretention areas in place of conventional vegetated swales because:

- Conventional swale design has resulted in standing water and associated nuisances.
- Conventional swales often don't obtain even the design residence time because of the length required and because proper design requires runoff enter the swale at the upstream end rather than at various locations along its length, and
- Bioretention areas provide a more flexible drainage design, more effective practicable treatment, and more effective flow control within the same footprint.

In the western part of San Diego County (west of the Pacific Ocean drainage divide), rock swales would not generally provide adequate water quality treatment. In the eastern portion of the County, rock swales could potentially be used as part of the water quality treatment design given the prevalence of high-infiltration sandy soils and the harsh climatic conditions which prevent vegetation establishment. Implementation of rock swales would require approval from the City. The design of vegetated strips, potentially allowed by the City on a case-by-case basis, should follow Caltrans design guidance.

► TREATMENT FACILITIES FOR SPECIAL CIRCUMSTANCES

Higher-rate surface filters and vault-based proprietary filters can only be used in the circumstances described beginning on page 39 and when sand filters, extended "dry" detention basins, and "wet" detention ponds or constructed wetlands have been found infeasible.

For surface filters, the grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units. Proprietary facilities should be installed consistent with the manufacturer's instructions. It should be noted that such designs likely would not provide the required hydromodification flow control.

Chapter 5

Operation & Maintenance of Storm Water Facilities

How to prepare a customized Storm Water Maintenance Plan for the treatment BMPs on your site.

The storm water NPDES Permit requires the City of La Mesa to verify all treatment and flow-control facilities are adequately maintained. Note that treatment facilities include both LID IMPs and treatment control BMPs. Facilities you install as part of your project will be verified for effectiveness and proper performance. The City of La Mesa may also verify the ongoing function of storm water management features that are not treatment or flow control facilities, such as permeable pavements and limitations on impervious area.

Operation and maintenance of storm water facilities is a six-stage process:

1. Determine **who will own** the facility and be responsible for the maintenance of treatment facilities. Identify the means by which ongoing maintenance will be assured (for example, a maintenance agreement that runs with the land).

2. Identify typical maintenance requirements, and allow for these requirements in your project planning and preliminary design.

3. Prepare a **maintenance plan** for the site incorporating detailed requirements for **each treatment and flow-control facility**.

4. **Maintain** the facilities from the time they are constructed until ownership and maintenance responsibility is formally transferred.

5. **Formally transfer** operation and maintenance **responsibility** to the site owner or occupant. A warranty, secured by a bond, or other financial instrument, may be required to secure against lack of performance due to flaws in design or construction.

6. Maintain the facilities in perpetuity and comply with self-inspection, reporting, and verification requirements.

See the schedule for these stages in Table 5-1.

Stage 1: Ownership and Responsibility

You must specify a means to **ensure maintenance** of treatment and flow-control facilities **in perpetuity.**

Depending on the intended use of your site, this will require one or more of the following:

- Project proponent agreement to maintain storm water BMPs: The City may enter into a contract with the project proponent obliging the project proponent to maintain, repair, and replace the storm water BMP as necessary into perpetuity. Security may be required.

- Assessment districts: The City may approve an Assessment District or other funding mechanism proposed by the project proponent to provide funds for storm water BMP maintenance, repair, and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

- Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City may assure storm water BMP maintenance, repair, and replacement through conditions in the lease.

- Public entity maintenance: The City may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the permanent treatment BMP. Unless acceptable to the City, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City may seek protection from liability by appropriate releases and indemnities. The City shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The City must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

The City may accept alternative maintenance mechanisms if such mechanisms are as protective as those listed above.

Ownership and maintenance responsibility for treatment and flow-control facilities should be discussed at the **beginning of project planning**, typically at the pre-application meeting for

planning and zoning review. Experience has shown provisions to finance and implement maintenance of treatment and flow-control facilities can be a major stumbling block to project approval, particularly for **small residential subdivisions**. (See "New Subdivisions" in Chapter 1.)

► PRIVATE OWNERSHIP AND MAINTENANCE

The City of La Mesa requires—as a condition of project approval—that a maintenance agreement be executed.

TABLE 5-1. Schedule for Planning Operation and Maintenance of Storm Water Treatment BMPs

Stage	*Description*	*Schedule*
1	Determine facility ownership and maintenance responsibility	Discuss with planning staff at pre-application meeting
2	Identify typical maintenance requirements	In initial submittal, coordinate with planning & zoning application
3	Develop detailed operation and maintenance plan	Provided with Project Submittal, and updated as necessary if any information changes prior to Stage 5.
4	Interim operation and maintenance of facilities	During and following construction including warranty period
5	Formal transfer of operation & maintenance responsibility	On sale and transfer of property or permanent occupancy
6	Ongoing maintenance and compliance with inspection & reporting requirements	In perpetuity

These agreements could provide that the City of La Mesa may collect a management and/or inspection fee established by a standard fee schedule, as applicable. In addition, the agreement may provide that, if the property owner fails to maintain the storm water facility, the City may enter the property, restore the storm water facility to good working order, and obtain reimbursement, including administrative costs, from the property owner.

► TRANSFER TO PUBLIC OWNERSHIP

The City of La Mesa may sometimes choose to have a treatment and flow-control facility deeded to the public, in fee or as an easement, and maintain the facility as part of the municipal storm drain system. The City may recoup the costs of maintenance through a special tax, assessment district, or similar mechanism.

Locating an IMP in a public right-of-way or easement creates an additional design constraint—along with hydraulic grade, aesthetics, landscaping, and circulation. However, because sites typically drain to the street, it may be possible to locate a bioretention swale parallel with the edge of the parcel. The facility may complement, or substitute for, an underground storm drain system.

Even if the facility is to be transferred to the City of La Mesa after construction is complete, it is still the responsibility of the builder to identify general operation and maintenance requirements, prepare a detailed operation and maintenance plan, and to maintain the facility until that responsibility is formally transferred.

Stage 2: General Maintenance Requirements

Include in your Project Submittal a general description of anticipated facility maintenance requirements. This will help ensure that:

- Ongoing costs of maintenance have been considered in your facility selection and design.
- Site and landscaping plans provide for access for inspections and by maintenance equipment.
- Landscaping plans incorporate irrigation requirements for facility plantings.
- Initial maintenance and replacement of facility plantings is incorporated into landscaping contracts and guarantees.

Fact sheets available on the Project Clean Water web page describe general maintenance requirements for the types of storm water facilities featured in the LID Design Guide (Chapter 4). You can use this information to specify general maintenance requirements in your Project Submittal.

Maintenance fact sheets for conventional storm water facilities are available in the California Stormwater BMP Handbooks.

Stage 3: Detailed Maintenance Plan

Prepare a detailed maintenance plan and submit it as required by the City of La Mesa. A detailed maintenance plan must be included with the initial Project Submittal; however the maintenance plan may later be updated to incorporate solutions to any problems or changes that occurred during project construction.

Your detailed maintenance plan should be kept on-site for use by maintenance personnel and during site inspections. It is also recommended that a copy of your initial Project Submittal be kept onsite as a reference.

► YOUR DETAILED MAINTENANCE PLAN: STEP BY STEP

The following step-by-step guidance will help you prepare your detailed maintenance plan.

Preparation of the plan will require familiarity with your storm water facilities as they have been or will be constructed and a fair amount of "thinking through" plans for their operation and maintenance.

► STEP 1: DESIGNATE RESPONSIBLE INDIVIDUALS

To begin creating your detailed maintenance plan, designate and identify:

- The individual who will have direct responsibility for the maintenance of storm water controls. This individual should be the designated contact with City inspectors and should sign self-inspection reports and any correspondence with the City of La Mesa regarding verification inspections.
- Employees or contractors who will report to the designated contact and are responsible for carrying out BMP operation and maintenance.
- The corporate officer authorized to negotiate and execute any contracts that might be necessary for future changes to operation and maintenance or to implement remedial measures if problems occur.
- Your designated respondent to problems, such as clogged drains or broken irrigation mains, that would require immediate response should they occur during off-hours.

Updated contact information must be provided to the City of La Mesa immediately whenever a property is sold and whenever designated individuals or contractors change.

Draw or sketch an **organization chart** to show the relationships of authority and responsibility between the individuals responsible for maintenance. This need not be elaborate, particularly for smaller organizations.

Describe how **funding for BMP operation and maintenance** will be assured, including sources of funds, budget category for expenditures, process for establishing the annual maintenance budget, and process for obtaining authority should unexpected expenditures for major corrective maintenance be required.

Describe how your organization will accommodate initial **training** of staff or contractors regarding the purpose, mode of operation, and maintenance requirements for the storm water facilities on your site. Also, describe how your organization will ensure ongoing training as needed and in response to staff changes.

► STEP 2: SUMMARIZE DRAINAGE AND BMPS

Incorporate the following information from your Project Submittal into your maintenance plan:

- Figures delineating and designating pervious and impervious areas.
- Figures showing locations of storm water facilities on the site.
- Tables of pervious and impervious areas served by each facility.

Review the Project Submittal narrative, if any, that describes each facility and its tributary drainage area and update the text to incorporate any changes that may have occurred during planning and zoning review, building permit review, or construction. Incorporate the updated text into your maintenance plan.

► STEP 3: DOCUMENT FACILITIES "AS BUILT"

Include the following information from final construction drawings:

- Plans, elevations, and details of all facilities. Annotate if necessary with designations used in the initial Project Submittal.
- Design information or calculations submitted in the detailed design phase (i.e., not included in the initial Project Submittal.)
- Specifications of construction for facilities, including sand or soil, compaction, pipe materials and bedding.

In the maintenance plan, note field changes to design drawings, including changes to any of the following:

- Location and layouts of inflow piping, flow splitter boxes, and piping to off-site discharge
- Depths and layering of soil, sand, or gravel
- Placement of filter fabric or geotextiles
- Changes or substitutions in soil or other materials.
- Natural soils encountered (e.g., sand or clay lenses)

► STEP 4: PREPARE MAINTENANCE PLANS FOR EACH FACILITY

Prepare a maintenance plan, schedule, and inspection checklists (routine, annual, and after major storms) for each facility. Plans and schedules for two or more similar facilities on the same site may be combined.

Use the following resources to prepare your customized maintenance plan, schedule, and checklists.

- Specific information noted in Steps 2 and 3, above.
- Other input from the facility designer, municipal staff, or other sources.
- Operation and Maintenance Fact Sheets (available on the Project Clean Water website).

Note any particular characteristics or circumstances that could require attention in the future, and include any troubleshooting advice.

Also include manufacturer's data, operating manuals, and maintenance requirements for any:

- Pumps or other mechanical equipment.
- Proprietary devices used as BMPs.

Manufacturers' publications should be referenced in the text (including models and serial numbers where available). Copies of the manufacturers' publications should be included as an attachment in the back of your maintenance plan or as a separate document.

► STEP 5: COMPILE MAINTENANCE PLAN

The following general outline is provided as an example.

I. Inspection and Maintenance Log

II. Updates, Revisions and Errata

III. Introduction

A. Narrative overview describing the site; drainage areas, routing, and discharge points; and treatment facilities.

IV. Responsibility for Maintenance

A. General

(1) Name and contact information for responsible individual(s).

(2) Organization chart or charts showing organization of the maintenance function and location within the overall organization.

(3) Reference to Operation and Maintenance Agreement (if any). A copy of the agreement should be attached.

(4) Maintenance Funding

(1) Sources of funds for maintenance

(2) Budget category or line item

(3) Description of procedure and process for ensuring adequate funding for maintenance

B. Staff Training Program

C. Records

D. Safety

V. Summary of Drainage Areas and Storm Water Facilities

A. Drainage Areas

(1) Drawings showing pervious and impervious areas (copied or adapted from initial Project Submittal).

(2) Designation and description of each drainage area and how flow is routed to the corresponding facility.

B. Treatment and Flow-Control Facilities

(1) Drawings showing location and type of each facility

(2) General description of each facility (Consider a table if more than two facilities)

(1) Area drained and routing of discharge.

(2) Facility type and size

VI. Facility Documentation

A. "As-built" drawings of each facility (design drawings in the draft Plan)

B. Manufacturer's data, manuals, and maintenance requirements for pumps, mechanical or electrical equipment, and proprietary facilities (include a "placeholder" in the draft plan for information not yet available).

C. Specific operation and maintenance concerns and troubleshooting

VII. Maintenance Schedule or Matrix

A. Maintenance Schedule for each facility with specific requirements for:

(1) Routine inspection and maintenance

(2) Annual inspection and maintenance

(3) Inspection and maintenance after major storms

B. Service Agreement Information

Assemble and make copies of your maintenance plan. One copy must be submitted to the City of La Mesa, and at least one copy kept on-site. Here are some suggestions for formatting the maintenance plan:

- Format plans to 8½" x 11" to facilitate duplication, filing, and handling.
- Include the revision date in the footer on each page.
- Scan graphics and incorporate with text into a single electronic file. Keep the electronic file backed-up so that copies of the maintenance plan can be made if the hard copy is lost or damaged.

► STEP 6: UPDATES

Your maintenance plan will be **a living document**.

Operation and maintenance personnel may change; mechanical equipment may be replaced, and additional maintenance procedures may be needed. Throughout these changes, the maintenance plan must be kept up-to-date.

Updates may be transmitted to the City of La Mesa at any time. However, at a minimum, updates to the maintenance plan must be reported with the annual submittal of the "BMP Inspection & Maintenance Verification Form," or equivalent, to the City.

Stage 4: Interim Maintenance

Applicants will typically be required to warranty storm water facilities against lack of performance due to flaws in design or construction. The warranty may need to be secured by a bond or other financial instrument.

Stage 5: Transfer Responsibility

As part of the detailed maintenance plan, note the expected date when responsibility for operation and maintenance will be transferred. Notify the City of La Mesa when this transfer of responsibility takes place.

Stage 6: Operation & Maintenance Verification

The City of La Mesa implements an operation and maintenance verification program, including periodic site inspections.

Contact municipal staff to determine the frequency of inspections, whether self-inspections are allowed, and applicable fees, if any.

Chapter 6

Construction BMP Requirements and Performance Standards

Guideline to meeting construction BMP requirements in the SWPPP or CSWMP for your site.

The storm water NPDES Permit requires the City of La Mesa to regulate construction activities within the City in order to reduce construction site discharges of pollutants from the MS4 to the maximum extent practicable and to prevent construction site discharges from the MS4 from causing or contributing to a violation of water quality standards.

Compliance with the City of La Mesa's construction BMP requirements is a four-step process:

1. Determine the applicable storm water requirements for your site.
2. Prepare and submit the appropriate plans.
3. Determine the adequacy of the plans proposed.
4. Assure implementation and maintenance of the requirements.

These steps are described below in greater detail.

Construction Storm Water BMP Requirements

The flow chart in Figure 6-1, "Construction Permit Review & Approval Process" describes how storm water requirements are incorporated into projects during the construction permit review process. The steps below describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 6-1. Construction Permit Review and Approval Process

The following figure provides an overview of the project review process for projects that require a construction permit from the City of La Mesa. Construction permits include building permits, grading permits, demolition permits, and encroachment permits.

► STEP 1: DETERMINE APPLICABLE STORM WATER BMP REQUIREMENTS

Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. Projects subject to the construction storm water best management practices requirements must comply with the standards included in this BMP Manual, as appropriate depending on the site conditions, season, and project design, and construction methods. Each project must be given a priority ranking (high, medium, or low) for the construction phase (see Appendix A). The prioritization will determine the inspection frequency by the City but will not change the construction BMP requirements. Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in navigating through this BMP Manual to ensure construction BMP performance standards are met.

► STEP 2: PREPARE & SUBMIT APPROPRIATE PLANS

This BMP Manual describes the construction site management requirements that contractors must comply with. In addition, the next section of this chapter ("Construction Storm Water BMP Performance Standards") lists the performance standards that construction sites must meet, and provides a list of required erosion control, sediment control, and materials management BMPs for reference. Additionally, each project must determine if they are subject to s requirements and be given a priority of high, medium or low (see Appendix A).

Construction Projects Over 1 Acre. Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." If a project disturbs 1 acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by this chapter, in accordance with the current State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). Consistent with the State General Construction Permit, the City will require that <u>both</u> erosion and sediment control BMPs be installed and maintained for all applicable projects in addition to good housekeeping and site and materials management. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Additionally, each project determined to be subject to the City's advanced treatment requirements (see Appendix A) will need to include details on how the site plans to meet these requirements in the SWPPP and/or erosion control plan. Appendix D provides general guidelines for preparation of a SWPPP as well as a more detailed checklist to meet the requirements.

Construction Projects Under 1 Acre. Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all

construction BMP requirements required in this chapter, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

After preparing plans and supporting documents according to the requirements in this BMP Manual, submit plans to the Department of Public Works/Engineering for review (See Step 3).

► STEP 3: DETERMINE ADEQUACY OF PROPOSED PLANS

Under the authority of the City Engineer, Engineering staff will review submitted plans for compliance with the applicable storm water requirements contained in this BMP Manual. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs. After all storm water requirements have been approved by the City Engineer, proceed to Step 4 to assure implementation and maintenance of the approved BMPs through permit conditions, plan notes, and if necessary, maintenance agreements.

► STEP 4: ASSURE IMPLEMENTATION & MAINTENANCE OF REQUIREMENTS

Applicants must provide assurances that permanent storm water BMPs will be constructed and permanently maintained throughout the use of a developed site, and that construction BMPs will be implemented and maintained until construction is complete. The summaries below describe how construction and permanent BMP requirements must be assured during both discretionary actions and construction permit review processes. After the City Engineer has approved all construction and/or permanent BMPs, refer to the final section of this chapter, "Implementation and Maintenance of Requirements," to determine how construction and permanent BMP implementation and maintenance will be assured.

Discretionary Action. For any discretionary action, permanent storm water requirements shall be incorporated into the project design and be shown on the plans. In addition, project shall be conditioned to execute a maintenance agreement for ongoing permanent BMP maintenance, satisfactory to the City Engineer, prior to the issuance of any construction permits. This requirement shall be noted on the plans for the discretionary action. If the project will be required to provide construction BMPs, the permit/approval shall include the "Standard Construction BMP Implementation and Maintenance Condition" listed in "Implementation and Maintenance of Requirements" at the end of this chapter.

Construction Permits. For projects requiring construction permits, construction and permanent BMP requirements shall be incorporated into the project design and shown on the plans prior to the issuance of any permits. The project applicant shall execute a permanent BMP maintenance agreement, satisfactory to the City Engineer, prior to issuance of any construction permits. Construction maintenance requirements and the specific permanent BMP maintenance procedures shall be noted on the plans. Any construction BMP requirements that cannot be shown graphically must be noted on the plans.

Construction Storm Water BMP Performance Standards

Those projects that have been determined to require construction BMPs in Steps 1 and 2 of this chapter must identify the construction BMPs to be implemented in accordance with the performance standards in this section. The construction BMPs must be identified in a Storm Water Pollution Prevention Plan or Construction Storm Water Management Plan (CSWMP) for projects disturbing more than or less than 1 acre, respectively. Because all projects require BMPs during construction, those projects that disturb less than 1 acre are required to have a Construction Storm Water Management Plan (CSWMP) which identifies the pollution prevention measures that will be taken. These plans must be prepared in accordance with the guidelines in Appendix D.

► 1. MINIMUM CONSTRUCTION BMP REQUIREMENTS

The City has developed a set of minimum BMPs that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to select, install, and maintain general site management, soil stabilization and erosion prevention, and sediment containment BMPs to reduce, retain, and manage pollutant discharges to the MEP. Table 6-1 outlines the minimum construction BMPs required by the City along with the corresponding current fact sheets obtained from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003), where applicable. Additional information on the BMPs included in Table 6-1 can be found in the City of La Mesa Jurisdictional Urban Runoff Management Plan (JURMP), the Model Construction Program for San Diego Copermittees, the City of Los Angeles "Reference Guide for Stormwater Best Management Practices," and the California Stormwater Quality Association (CASQA) BMP Handbook for Construction.

It is the responsibility of the property owner or his/her designee to select, install and maintain appropriate BMPs that meet the City's minimum BMP requirements outlined in Table 6-1 below. BMPs must be installed in accordance with an industry recommended standard or in accordance with the requirements of the State General Construction Permit.

TABLE 6-1. Minimum Required BMPs for Construction

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
General Site Management		
Project Planning	Preserve natural hydrologic features where feasible	-
	Preserve riparian buffers and corridors where feasible	-
	Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction	-
	Minimize exposure time of disturbed soil areas	SS-1
	Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible	SS-1
	Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible	SS-1

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
	Educate construction site employees and subcontractors on minimum BMP requirements	-
Pollution Prevention	Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities: - Cleaning - Fueling - Maintenance	 NS-8 NS-9 NS-10
	Prevent the contamination of storm water from construction materials through proper management of the following types of activities: - Material Delivery and Storage - Material Use - Stockpile Management[1] - Spill Prevention and Control	 WM-1 WM-2 WM-3 WM-4
	Prevent the contamination of storm water by wastes through proper management of the following types of wastes: - Solid Waste - Hazardous Waste - Contaminated Soil - Concrete - Sanitary Waste - Liquid	 WM-5 WM-6 WM-7 WM-8 WM-9 WM-10
	Prevent the contamination of storm water through proper management of the follow activities: - Water Conservation Practices - Dewatering Operations - Paving and Grinding - Potable Water/Irrigation and Flushing	 NS-1 NS-2 NS-3 NS-7
Erosion Prevention and Sediment Containment		
Soil Stabilization and Erosion Prevention	Preserve existing vegetation where feasible	SS-2
	Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing one or more of the following BMPs: - Hydraulic Mulch - Hydroseeding - Soil Binders - Straw Mulch - Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats - Wood Mulch - Earth Dikes/Drainage Swales	 SS-3 SS-4 SS-5 SS-6 SS-7 SS-8 SS-9
	Reduce the velocity of storm water by using one or more of the following: - Outlet Protection/Velocity Dissipation - Slope Drains	 SS-10 SS-11
	Establish permanent re-vegetation or landscaping as early as feasible	SS-1

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
Sediment Containment	Protect the Perimeter of the site or exposed area from sediment discharge using one or more of the following: - Silt Fence - Gravel Bag Berm - Fiber Rolls	 SC-1 SC-6 SC-5
	Capture sediments in channeled storm water by using one or more of the following: - De-silting Basin[3] - Storm Drain Inlet Protection - Sediment Trap - Gravel Bag Barrier	 SC-2 SC-10 SC-3 SC-8
	Prevent sediment from being tracked off-site by using one or more of the following: - Stabilized Construction Entrance - Construction Road Stabilization - Entrance/Exit Tire Wash - Street Sweeping	 TC-1 TC-2 TC-3 SC-7

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans. If the project is one acre or greater the de-silting basin must be designed in accordance with the current State General Construction Permit.

► 2. SITE MANAGEMENT REQUIREMENTS

Construction is a dynamic operation where changes are expected. Storm water BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation, revision, and re-installation, particularly as project grading progresses. Therefore, owner/contractor self- inspections are required. They shall be performed by the owner's/contractor's Qualified Contact Person specifically trained in storm water pollution prevention site management and storm water BMPs, including the installation and maintenance of sediment and erosion control measures. Additional qualified persons may assist with the inspection activities under the direction of the Qualified Contact Person. A Qualified Contact Person is required for all sites during both wet and dry weather conditions.

There are four primary purposes of the self-inspections conducted by owners and contractors:

- To ensure that the owners/contractors take full responsibility for managing storm water pollution caused by their activities.
- To ensure that storm water BMPs are properly documented and implemented and are functioning effectively.
- To identify maintenance (e.g., sediment removal) and repair needs.

- To ensure that the project proponents implement their storm water management plans.

A self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested (note: the State General Construction Permit has additional inspection requirements that must be met to comply with the permit). Self-inspections must be performed by a Qualified Contact Person according to the following schedule:

- Daily forecasting at all times
- At 24-hour intervals during extended rainfall events
- Daily evaluations as earth moving/grading is being conducted during the wet season
- Weekly (every 7 days) in the dry season as earth moving/grading is progressing

Storm water pollution prevention site management requirements include:

A. A qualified person who is trained and competent in the use of BMPs shall be on site daily, although not necessarily full time, to evaluate the conditions of the site with respect to storm water pollution prevention. This qualified contact person shall represent the contractor/ owner on storm water issues.

B. The qualified person shall implement the conditions of the Storm Water Pollution Prevention Plan, contract documents, and/or local ordinances with respect to erosion and sediment control and other waste management regulations.

C. The qualified person is responsible for monitoring the weather and implementation of any emergency plans as needed. The weather shall be monitored on a 5-day forecast plan and a full BMP protection plan shall be activated when there is a 40% chance of rain.

D. The qualified person is responsible for overseeing any site grading and operations and evaluating the effectiveness of the BMPs. This person shall modify the BMPs as necessary to keep the dynamics of the site in compliance. This person or other qualified persons are responsible for checking the BMPs routinely for maintenance and documenting the BMPs being implemented.

► 3. PERFORMANCE STANDARDS

Construction The City Engineer will evaluate the adequacy of the owner's/contractor's site management for storm water pollution prevention, inclusive of BMP implementation, on construction sites based on performance standards for storm water BMPs. Poor BMP practices shall be challenged. Performance standards shall include:

A. No measurable increase of pollution (including sediment) in runoff from the site.

B. No slope erosion.

C. Water velocity moving offsite must not be greater than pre-construction levels.

A site will be considered inactive if construction activities have ceased for a period of 7 or more consecutive calendar days. At any time of year, an inactive site must be fully protected from erosion and discharges of sediment. It is also the owner's/contractor's responsibility at both active and inactive sites to implement a plan to address all potential non-storm water discharges.

Regardless of any inspections conducted by the City, property owners or contractors are required to prevent any construction-related materials, wastes, spills, or residues from entering a storm water conveyance system and to apply for coverage under the State General Construction Permit as applicable for the site.

► 4. SEASONAL REQUIREMENTS

BMP requirements differ between the wet season (Oct. 1 – Apr. 30) and the dry season (May 1 – Sept. 30), the type of the project and topography of the site, as described below.

A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

P. Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

Q. Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

R. Adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.

S. All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.

T. Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

► 5. ADVANCED TREATMENT REQUIREMENTS

The City requires advanced treatment methods to be employed at construction sites determined to be an exceptional threat to water quality (see Appendix A). Advanced treatment involves using mechanical or chemical means to flocculate and remove suspended sediment from construction site runoff. Projects required to implement advanced treatment must comply with the following:

1. Treatment effluent water quality shall meet or exceed the water quality objectives for sediment, turbidity, and any other parameter deemed necessary by the City Engineer as listed in the Water Quality Control Plan for the San Diego Basin (9) for inland surface waters and lagoons and estuaries for the appropriate hydrologic unit.

2. Applicant shall provide design, operations and maintenance schedule, monitoring plan, certification of training of staff to the satisfaction of the City Engineer.

► 6. ADDITIONAL CONTROLS FOR CONSTRUCTION SITES

The Municipal Permit requires implementation of additional controls for construction sites tributary to 303(d) listed water body segments impaired for sediment or within, adjacent to, or discharging directly to coastal lagoons or other receiving waters within ESAs. Additional requirements for theses site will be determined on a site-by-site basis at the discretion of the City Engineer.

Implementation and Maintenance of Requirements

Discretionary Actions. Projects seeking discretionary approvals are not required to graphically demonstrate any construction BMP requirements on the project plans. Instead, the discretionary action shall include the following standard condition, which shall also be noted on the plans:

> "The Permittee or designee shall incorporate any construction best management practices (BMPs) necessary to comply with the grading regulations in Chapter 14.05 of the La Mesa Municipal Code, into the construction plans and/or specifications, satisfactory to the City Engineer, prior to the issuance of any construction permits."

Construction Permits for Projects Under 1 Acre. Projects proposing to disturb less than 1 acre during construction shall include construction BMP requirements, where possible, on the plans. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted on, or stapled to, the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be

graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

Construction Permits for Projects Over 1 Acre. Projects proposing to disturb more than 1 acre during construction shall include all construction BMPs in a Storm Water Pollution Prevention Plan, prepared in accordance with Appendix D. The construction BMPs shall also be shown on the plans, where possible. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted or stapled to the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

Appendix

A

Storm Water Requirements Applicability Checklist

STORM WATER PROJECT DATA SHEET

PROJECT DATA:

Owner's Name & Phone No: _____

Address: _____ Permit No: _____

Project: _____ Date Applied: _____

PROJECT SITE DATA:

1. Area of the lot/parcel = _____ sf
2. Existing impervious area (roof/building foot print) = _____ sf
3. Existing impervious area (driveway, parking, walkway, hardscape etc.) = _____ sf
4. Impervious area after development (roof/building foot print) = _____ sf
5. Impervious area after development (driveway, parking, walkway, hardscape, etc.) = _____ sf
6. Total area to be disturbed = _____ sf
7. Storm water runoff based on Hydrology Study:

Existing runoff = _____ cfs, Post construction runoff = _____ cfs

8. Identify if the runoff from the site discharges to the public street or storm drain or open channel, detention or retention basin: _____
9. Watershed (Check One): San Diego River _____ San Diego Bay _____

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete the Storm Water Requirements Applicability Checklist

Notes:

- Items 1 through 9 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.

A Hydrology report may be required.

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS:

	YES	NO
1. Is the project a new development?	☐	☐
2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 ft^2 of impervious surface?*	☐	☐
** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".*		

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes," Complete Part A Below.

PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.

DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY DEVELOPMENT PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL PART II? (SEE GLOSSARY)*	YES	NO
1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units?	☐	☐
2. Commercial development resulting in the disturbance of one acre or more of land?	☐	☐
3. Industrial development resulting in the disturbance of one acre or more of land?	☐	☐
4. Automotive repair shop?	☐	☐
5. Restaurant greater than 5,000 square feet?	☐	☐
6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?	☐	☐
7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?	☐	☐
8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff?	☐	☐
9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater?	☐	☐
10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day	☐	☐
11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels.	☐	☐
**** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.***		

Limited Exclusion: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met.

If all answers to Part A are "No", continue to Part B.

PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.

DOES THE PROJECT PROPOSE:	YES	NO
1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks?	☐	☐
2. New pervious landscape areas and irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Trash storage areas?	☐	☐
5. Liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (except construction)?	☐	☐
8. Commercial/ industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. Any grading or ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?	☐	☐
**To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.shtml.*		

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the BMP Manual. All Priority Development Projects are also subject to hydromodification management requirements (unless an exemption applies) as discussed in the City's Storm Water BMP Manual Part II and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's Storm Water BMP Manual Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

Required submittals, Section 1:	**PCWQTR**	☐	**SPCBMPP**	☐	**Hydromodification**	☐

SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS:

PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	YES	NO
1. Does the project propose grading or soil disturbance of one acre or more?	☐	☐
2. Does the project propose any grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)?	☐	☐

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide NPDES General Permit for Storm Water Discharges Associated with Construction Activities (General Construction Permit) and the City's Construction Storm Water BMP Performance Standards. To enroll in the General Construction Permit, see the website at www.waterboards.ca.gov/water_issues/programs/stormwater/construction.shtml. A Storm Water Pollution Prevention Plan (SWPPP), a Notice of Intent (NOI), and other documents must be submitted electronically. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards. A Construction Storm Water Management Plan (CSWMP) must be prepared, and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to complete Parts D and E of this form, and neither a SWPPP nor CSWMP is required.

PART D: DETERMINE ADVANCED TREATMENT SUBJECTIVITY

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	YES	NO
1. Is the project located within, adjacent to, or is a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity?	☐	☐
2. Will the project disturb more than five acres, including all phases of the development?	☐	☐
If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below.		
3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water?	☐	☐
4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4?	☐	☐

If all answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the Storm Water BMP Manual Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer.

Required submittals, Section 2:	**SWPPP, NOI** ☐	**CSWMP** ☐	**Advanced Treatment** ☐

PART E: DETERMINE CONSTRUCTION SITE PRIORITY

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

According to the attached flow chart, this project has the following threat to water quality priority:

☐ **High** ☐ **Medium** ☐ **Low**

[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]

Appendix

B

Low Impact Development (LID) Integrated Management Practice (IMP) Design Sheets

Self-Treating and Self-Retaining Areas

Best Uses

- Heavily landscaped sites

Advantages

- No maintenance verification requirement
- Complements site landscaping

Limitations

- Requires substantial square footage
- Grading requirements must be coordinated with landscape design

► CRITERIA

Rainfall on self-treating areas infiltrates or—during intense storms— drains directly off-site or to the storm drain system.

Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. During intense storms, runoff may drain off-site, to the storm drain system, or to IMPs.

LID design seeks to manage runoff from roofs and paving so effects on water quality and hydrology are minimized. Runoff from landscaping, however, does not need to be managed the same way.

Runoff from landscaping can be managed by creating self-treating and self-retaining areas.

Self-treating areas are natural, landscaped, or turf areas that drain directly off site or to the storm drain system. Examples include upslope undeveloped areas that are ditched and drained around a development and grassed slopes that drain offsite to a street or storm drain. Self-treating areas may not drain on to adjacent paved areas.

Where a landscaped area is upslope from or surrounded by paved areas, a **self-retaining area** (also called a zero-discharge area) may be created. Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that the first inch of rainfall would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

Areas draining to self retaining areas. Drainage from roofs and paving can be directed to self-retaining areas and allowed to infiltrate into the soil. The maximum allowable ratio is 2 parts impervious: 1 part pervious.

The self-retaining area must be bermed or depressed to retain an inch of rainfall including the flow from the tributary impervious area.

► DETAILS

Drainage from self-treating areas must flow to off-site streets or storm drains without flowing on to paved areas.

Pavement within a self-treating area cannot exceed 5% of the total area.

In self-retaining areas, overflows and area drain inlets should be set high enough to ensure ponding over the entire surface of the self-retaining area.

Set overflows and area drain inlets high enough to ensure ponding (3" deep) over the surface of the self-retaining area.

Self–retaining areas should be designed to promote even distribution of ponded runoff over the area.

Leave enough reveal (from pavement down to landscaped surface) to accommodate buildup of turf or mulch.

► APPLICATIONS

Lawn or landscaped areas adjacent to streets can be considered self-treating areas.

Self-retaining areas can be created by depressing lawn and landscape below surrounding sidewalks and plazas.

Runoff from walkways or driveways in parks and park-like areas can sheet-flow to self-retaining areas.

Roof leaders can be connected to self-retaining areas by piping beneath plazas and walkways. If necessary, a "bubble-up" can be used.

Connecting a roof leader to a self-retaining area. The head from the eave height makes it possible to route roof drainage some distance away from the building.

Self-retaining areas can be created by terracing mild slopes. The elevation difference promotes subsurface drainage.

Mild slopes can be terraced to create self-retaining areas.

► DESIGN CHECKLIST FOR SELF-TREATING AREAS

- ❒ The self-treating area is at least 95% lawn or landscaping (not more than 5% impervious).
- ❒ Re-graded or re-landscaped areas have amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Runoff from the self-treating area does not enter an IMP or another drainage management area, but goes directly to the storm drain system.

► DESIGN CHECKLIST FOR SELF-RETAINING AREAS

- ❒ Area is bermed all the way around or graded concave.

- ❒ Slopes do not exceed 4%.
- ❒ Entire area is lawn, landscaping, or pervious pavement (see criteria in Chapter 4).
- ❒ Area has amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Any area drain inlets are at least 3 inches above surrounding grade.

► DESIGN CHECKLIST FOR AREAS DRAINING TO SELF-RETAINING AREAS

- ❒ Ratio of tributary impervious area to self-retaining area is not greater than 2:1.
- ❒ Roof leaders collect runoff and route it to the self-retaining area.
- ❒ Paved areas are sloped so drainage is routed to the self-retaining area.
- ❒ Inlets are designed to protect against erosion and distribute runoff across the area.

Pervious Pavements

► **CRITERIA**

Impervious roadways, driveways, and parking lots account for much of the hydrologic impact of land development. In contrast, pervious pavements allow rainfall to collect in a gravel or sand base course and infiltrate into native soil.

Pervious pavements are designed to transmit rainfall through the surface to storage in a base course. For example, a 4-inch-deep base course provides approximately 1.6 inches of storage. Runoff stored in the base course infiltrates to native soils over time. Except in the case of solid pavers, the surface course provides additional storage.

Areas with the following pervious pavements may be regarded as "self-treating" and require no additional treatment or flow control if they drain off-site (not to an IMP).

- Pervious concrete
- Porous asphalt
- Crushed aggregate (gravel)
- Open pavers with grass or plantings
- Open pavers with gravel
- Artificial turf

Areas with these pervious pavements can also be **self-retaining areas** and may receive runoff from impervious areas if they are bermed or depressed to retain the first one inch of rainfall, including runoff from the tributary impervious area.

Solid unit pavers—such as bricks, stone blocks, or precast concrete shapes—are considered to reduce runoff compared to impervious pavement, when the unit pavers are set in sand or gravel with d" gaps between the pavers. Joints must be filled with an open-graded aggregate free of fines.

Best Uses

- Areas with permeable native soils
- Low-traffic areas
- Where aesthetic quality can justify higher cost

Advantages

- No maintenance verification requirement
- Variety of surface treatments can complement landscape design

Limitations

- Initial cost
- Placement requires specially trained crews
- Geotechnical concerns, especially in clay soils
- Concerns about pavement strength and surface integrity
- Some municipalities do not allow in public right of way

When draining pervious pavements to an IMP, use the runoff factors in Table 4-2.

► DETAILS

Permeable pavements can be used in clay soils; however, special design considerations, including an increased depth of base course, typically apply and will increase the cost of this option. Geotechnical fabric between the base course and underlying clay soil is recommended.

Pavement strength and durability typically determines the required depth of base course. If underdrains are used, the outlet elevation must be a minimum of 3 inches above the bottom elevation of the base course.

Pervious concrete and porous asphalt must be installed by crews with special training and tools. Industry associations maintain lists of qualified contractors.

Parking lots with crushed aggregate or unit pavers may require signs or bollards to organize parking.

► DESIGN CHECKLIST FOR PERVIOUS PAVEMENTS

- ❒ No erodible areas drain on to pavement.
- ❒ Subgrade is uniform. Compaction is minimal.
- ❒ Reservoir base course is of open-graded crushed stone. Base depth is adequate to retain rainfall and support design loads.
- ❒ If a subdrain is provided, outlet elevation is a minimum of 3 inches above bottom of base course.
- ❒ Subgrade is uniform and slopes are not so steep that subgrade is prone to erosion.
- ❒ Rigid edge is provided to retain granular pavements and unit pavers.
- ❒ Solid unit pavers are installed with open gaps filled with open-graded aggregate free of fines.
- ❒ Permeable pavements are installed by industry-certified professionals according to vendor's recommendations.
- ❒ Selection and location of pavements incorporates Americans with Disabilities Act requirements, site aesthetics, and uses.

Bioretention Facilities

Bioretention facility configured for treatment-only requirements. Bioretention facilities can rectangular, linear, or nearly any shape.

Bioretention detains runoff in a surface reservoir, filters it through plant roots and a biologically active soil mix, and then infiltrates it into the ground. Where native soils are less permeable, an underdrain conveys treated runoff to storm drain or surface drainage.

Bioretention facilities can be configured in nearly any shape. When configured as linear **swales**, they can convey high flows while percolating and treating lower flows.

Bioretention facilities can be configured as in-ground or above-ground planter boxes, with the bottom open to allow infiltration to native soils underneath. Bioretention basins must be hydrologically connected with the underlying soil. Any Bioretention basin which is completely lined and sealed shall be sized as a Flow Through Planter.

Best Uses

- Commercial areas
- Residential subdivisions
- Industrial developments
- Roadways
- Parking lots
- Fit in setbacks, medians, and other landscaped areas

Advantages

- Can be any shape
- Low maintenance
- Can be landscaped

Limitations

- Require 4% of tributary impervious square footage
- Typically requires 3-4 feet of head
- Irrigation typically required

► CRITERIA

For development projects subject only to runoff treatment requirements, the following criteria apply:

Parameter	Criterion
Soil mix depth	18 inches minimum

Parameter	Criterion
Soil mix minimum percolation rate	5 inches per hour minimum sustained (10 inches per hour initial rate recommended)
Soil mix surface area	0.04 times tributary impervious area (or equivalent)
Surface reservoir depth	6 inches minimum; may be sloped to 4 inches where adjoining walkways.
Underdrain	Required in Group "C" and "D" soils. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point.

► DETAILS

Plan. On the surface, a bioretention facility should be one level, shallow basin—or a series of basins. As runoff enters each basin, it should flood and fill throughout before runoff overflows to the outlet or to the next downstream basin. This will help prevent movement of surface mulch and soil mix.

Use check dams for linear bioretention facilities (swales) on a slope.

In a linear swale, check dams should be placed so that the lip of each dam is at least as high as the toe of the next upstream dam. A similar principle applies to bioretention facilities built as terraced roadway shoulders.

Inlets. Paved areas draining to the facility should be graded, and inlets should be placed, so that runoff remains as sheet flow or as dispersed as possible. Curb cuts should be wide (12" is recommended) to avoid clogging with leaves or debris. Allow for a minimum reveal of 4"-6" between the inlet and soil mix elevations to ensure turf or mulch buildup does not block the

inlet. In addition, place an apron of stone or concrete, a foot square or larger, inside each inlet to prevent vegetation from growing up and blocking the inlet.

Recommended design details for bioretention facility inlets (see text).

Where runoff is collected in pipes or gutters and conveyed to the facility, protect the landscaping from high-velocity flows with energy-dissipating rocks. In larger installations, provide cobble-lined channels to better distribute flows throughout the facility.

Upturned pipe outlets can be used to dissipate energy when runoff is piped from roofs and upgradient paved areas.

Soil mix. The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

Storage and drainage layer. "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" washed pea gravel be substituted at the top of the crushed rock gravel layers. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer or the gravel drainage layer from the native soil.

Underdrains. No underdrain is required where native soils beneath the facility are Hydrologic Soil Group A or B. For treatment-only facilities where native soils are Group C or D, a perforated pipe must be bedded in the gravel layer and must terminate at a storm drain or other approved discharge point.

Outlets. In treatment-only facilities, outlets must be set high enough to ensure the surface reservoir fills and the entire surface area of soil mix is flooded before the outlet elevation is reached. In swales, this can be achieved with appropriately placed check dams.

The outlet should be designed to exclude floating mulch and debris.

Vaults, utility boxes, and light standards. It is best to locate utilities outside the bioretention facility—in adjacent walkways or in a separate area set aside for this purpose. If utility structures are to be placed within the facility, the locations should be anticipated and adjustments made to ensure the minimum bioretention surface area and volumes are achieved. Leaving the final locations to each individual utility can produce a haphazard, unaesthetic appearance and make the bioretention facility more difficult to maintain.

Emergency overflow. The site grading plan should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

Trees. Bioretention areas can accommodate small or large trees. There is no need to subtract the area taken up by roots from the effective area of the facility. Extensive tree roots maintain soil permeability and help retain runoff. Normal maintenance of a bioretention facility should not affect tree lifespan.

The bioretention facility can be integrated with a tree pit of the required depth and filled with structural soil. If a root barrier is used, it can be located to allow tree roots to spread throughout the bioretention facility while protecting adjacent pavement. Locations and planting elevations should be selected to avoid blocking the facility's inlets and outlets.

Bioretention facility configured as a tree well.
The root barrier is optional.

► APPLICATIONS

Multi-purpose landscaped areas. Bioretention facilities are easily adapted to serve multiple purposes. The loamy sand soil mix will support turf or a plant palette suitable to the location and a well-drained soil.

Example landscape treatments:

- Lawn with sloped transition to adjacent landscaping.
- Swale in setback area
- Swale in parking median
- Lawn with hardscaped edge treatment
- Decorative garden with formal or informal plantings
- Traffic island with low-maintenance landscaping
- Raised planter with seating
- Bioretention on a terraced slope

Bioretention facility configured as a recessed decorative lawn with hardscaped edge.

Bioretention facility configured and planted as a lawn/ play area.

Residential subdivisions. Some subdivisions are designed to drain roofs and driveways to the streets (in the conventional manner) and then drain the streets to bioretention areas, with one bioretention area for each 1 to 6 lots, depending on subdivision layout and topography.

If allowed by the local jurisdiction, bioretention areas can be placed on a separate, dedicated parcel with joint ownership.

Bioretention facility receiving drainage from individual lots and the street in a residential subdivision.

Sloped sites. Bioretention facilities must be constructed as a basin, or series of basins, with the circumference of each basin set level. It may be necessary to add curbs or low retaining walls.

Bioretention facility configured as a parking median.
Note use of bollards in place of curbs, eliminating the need for curb cuts.

Design Checklist for Bioretention

- ❒ Volume or depth of surface reservoir meets or exceeds minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term percolation rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ Perforated pipe underdrain bedded in "Class 2 perm" with connection and sufficient head to storm drain or discharge point (except in "A" or "B" soils).
- ❒ No filter fabric.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Bioretention area is designed as a basin (level edges) or a series of basins, and grading plan is consistent with these elevations. If facility is designed as a swale, check dams are set so the lip of each dam is at least as high as the toe of the next upstream dam.
- ❒ Inlets are 12" wide, have 4"-6" reveal and an apron or other provision to prevent blockage when vegetation grows in, and energy dissipation as needed.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.
- ❒ Vaults, utility boxes, and light standards are located outside the minimum soil mix surface area.
- ❒ When excavating, avoid smearing of the soils on bottom and side slopes. Minimize compaction of native soils and "rip" soils if clayey and/or compacted. Protect the area from construction site runoff.

Bioretention Facility Outlet Detail - A

Flow-through Planter

Portland 2004 Stormwater Manual

Best Uses

- Management of roof runoff
- Next to buildings
- Dense urban areas
- Where infiltration is not desired

Advantages

- Can be used next to structures
- Versatile
- Can be any shape
- Low maintenance

Limitations

- Can be used for flow-control only on sites with "C" and "D" soils
- Requires underdrain
- Requires 3-4 feet of head

Flow-through planters treat and detain runoff without allowing seepage into the underlying soil. They can be used next to buildings and on slopes where stability might be affected by adding soil moisture.

Flow-through planters typically receive runoff via downspouts leading from the roofs of adjacent buildings. However, they can also be set in-ground and receive sheet flow from adjacent paved areas.

Pollutants are removed as runoff passes through the soil layer and is collected in an underlying layer of gravel or drain rock. A perforated-pipe underdrain is typically connected to a storm drain or other discharge point. An overflow inlet conveys flows which exceed the capacity of the planter.

► CRITERIA

Treatment only. For development projects subject only to runoff treatment requirements, the following criteria apply:

Parameter	Criterion
Soil mix depth	18 inches minimum
Soil mix minimum percolation rate	5 inches per hour minimum sustained (10 inches per hour initial rate recommended)

Parameter	Criterion
Soil mix surface area	0.04 times tributary impervious area (or equivalent)
Surface reservoir depth	6" minimum; may be sloped to 4" where adjoining walkways.
Underdrain	Typically used. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point.

► DETAILS

Configuration. The planter must be level. To avoid standing water in the subsurface layer, set the perforated pipe underdrain and orifice as nearly flush with the planter bottom as possible.

Inlets. Protect plantings from high-velocity flows by adding rocks or other energy-dissipating structures at downspouts and other inlets.

Soil mix. The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

Gravel storage and drainage layer. "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" of washed pea gravel be substituted at the top of the crushed rock layer. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer.

Emergency overflow. The planter design and installation should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

► APPLICATIONS

Adjacent to buildings. Flow-through planters may be located adjacent to buildings, where the planter vegetation can soften the visual effect of the building wall. A setback with a raised planter box may be appropriate even in some neo-traditional pedestrian-oriented urban streetscapes.

At plaza level. Flow-through planters have been successfully incorporated into podium-style developments, with the planters placed on the plaza level and receiving runoff from the tower roofs above. Runoff from the plaza level is typically managed separately by additional flow-through planters or bioretention facilities located at street level.

Steep slopes. Flow-through planters provide a means to detain and treat runoff on slopes that cannot accept infiltration from a bioretention facility. The planter can be built into the slope similar to a retaining wall. The design should consider the need to access the planter for

periodic maintenance. Flows from the planter underdrain and overflow must be directed in accordance with local requirements. It is sometimes possible to disperse these flows to the downgradient hillside.

Flow-through planter on the plaza level of a podium-style development.

Flow-through planter built into a hillside. Flows from the underdrain and overflow must be directed in accordance with local requirements.

Design Checklist for Flow-through Planter

- ❒ Reservoir depth is 4-6" minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term infiltration rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ "Class 2 perm" drainage layer.
- ❒ No filter fabric.
- ❒ Perforated pipe underdrain with outlet located flush or nearly flush with planter bottom. Connection with sufficient head to storm drain or discharge point.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Planter is set level.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.

NOTES:

1. FLOW-THROUGH PLANTER SHALL BE SIZED TO MEET CCCWP CRITERIA FOR TREATMENT AND/OR FLOW CONTROL.
2. MINIMUM SURFACE AREA OF PLANTER IS 4% OF TRIBUTARY IMPERVIOUS AREA FOR TREATMENT ONLY DESIGN. FOR FLOW CONTROL AND TREATMENT, REFER TO CCCWP SIZING TOOL CRITERIA.
3. SHAPE OF PLANTER CAN VARY TO MEET PROJECT DESIGN REQUIREMENTS AND LOCATION.
4. CLASS 2 PERMEABLE MATERIAL
5. DOWNSPOUTS/INLET PIPES REQUIRE ENERGY DISSIPATION.
6. USE COUNTY APPROVED ADDITIVE MIXTURE FOR WATERPROOFING CONCRETE.
7. PLANTINGS: SEE CCCWP RECOMMENDED PLANT LIST AND GUIDELINES.
8. PLANTER DESIGN MAY REQUIRE STRUCTURAL ENGINEERING DESIGN.
9. AREA = W x L (ABOVE). EXCLUDES AREA OF VAULT

Flow-Through Planter Outlet Detail

Dry Wells and Infiltration Basins

The typical dry well is a prefabricated structure, such as an open-bottomed vault or box, placed in an excavation or boring. The vault may be empty, which provides maximum space efficiency, or may be filled in rock.

An infiltration basin has the same functional components—a volume to store runoff and sufficient area to infiltrate that volume into the native soil—but is open rather than covered.

Note: Small diameter deep drilled storm water dry wells are not included in this sheet. These shall be considered "Alternative BMPs" and shall be sized per flow or volume based requirements.

Best Uses

- Alternative to bioretention in areas with permeable soils

Advantages

- Compact footprint
- Can be installed in paved areas

Limitations

- Can be used only on sites with "A" and "B" soils
- Requires minimum of 10' from bottom of facility to seasonal high groundwater
- Not suitable for drainage from some industrial areas or arterial roads
- Must be maintained to prevent clogging.

► CRITERIA

Dry wells and infiltration basins must be designed with the minimum volume calculated by Equation 4-8 using a unit volume based on the County of San Diego's 85th Percentile Isopluvial Map.

Consult with the local jurisdiction engineer regarding the need to verify soil permeability and other site conditions are suitable for dry wells and infiltration basins. Some proposed criteria are on Page 5-12 of Caltrans' 2004 *BMP Retrofit Pilot Study Final Report* (CTSW-RT-01-050).

The infiltration rate and infiltrative area must be sufficient to drain a full facility within 72 hours.

► DETAILS

Dry wells should be sited to allow for the potential future need for removal and replacement.

In locations where native soils are coarser than a medium sand, the area directly beneath the facility should be over-excavated by two feet and backfilled with sand as a groundwater protection measure.

Design Checklist for Dry Well

- ❒ Volume and infiltrative area meet or exceed minimum.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Depth from bottom of the facility to seasonally high groundwater elevation is ≥10'.
- ❒ Areas tributary to the facility do not include automotive repair shops; car washes; fleet storage areas (Bus, truck, etc.); nurseries, or other uses that may present an exceptional threat to groundwater quality.
- ❒ Underlying soils are in Hydrologic Soil Group A or B. Infiltration rate is sufficient to ensure a full basin will drain completely within 72 hours. Soil infiltration rate has been confirmed.
- ❒ Set back from structures 10' or as recommended by structural or geotechnical engineer.

Cistern or Vault with Bioretention Facility

A cistern or vault in series with a bioretention facility can meet treatment requirements where space is limited. In this configuration, the cistern or vault is equipped with a flow-control orifice and the bioretention facility is sized to treat a trickle outflow from the cistern or vault.

Best Uses

- In series with a bioretention facility to meet treatment requirement in limited space.
- Management of roof runoff
- Dense urban areas

Advantages

- Storage volume can be in any configuration

Limitations

- Somewhat complex to design, build, and operate
- Requires head for both cistern and bioretention facility

► CRITERIA

Cistern or Vault. The cistern or vault must detain the volume calculated by Equation 4-8 and must include an orifice or other device designed for a 24-hour drawdown time.

Bioretention facility. See the design sheet for bioretention facilities. The area of the bioretention facility must be sized to treat the maximum discharge flow, assuming a percolation rate of 5" per hour through the engineered soil.

Use with sand filter. A cistern or vault in series with a sand filter can meet treatment requirements. See the discussion of treatment facility selection in Chapter 2 and the design guidance for sand filters in Chapter 4.

► DETAILS

Flow-control orifice. The cistern or vault must be equipped with an orifice plate or other device to limit flow to the bioretention area.

Preventing mosquito harborage. Cisterns and vaults should be designed to drain completely, leaving no standing water. Drains should be located flush with the bottom of the cistern. Alternatively—or in addition—all entry and exit points, should be provided with traps or sealed or screened to prevent mosquito entry. Note mosquitoes can enter through openings 1/16" or larger and will fly for many feet through pipes as small as ¼".

Exclude debris. Provide leaf guards and/or screens to prevent debris from accumulating in the cistern.

Ensure access for maintenance. Design the cistern or vault to allow for cleanout. Avoid creating the need for maintenance workers to enter a confined space. Ensure the outlet orifice can be easily accessed for cleaning and maintenance.

► APPLICATIONS

Shallow ponding on a flat roof. The "cistern" storage volume can be designed in any configuration, including simply storing rainfall on the roof where it falls and draining it away slowly. See the County of San Diego's 85th percentile isopluvial diagrams for required average depths.

Cistern attached to a building and draining to a planter. This arrangement allows a planter box to be constructed with a smaller area.

Vault with pumped discharge to bioretention facility. In this arrangement, runoff from a parking lot and/or building roofs can be captured and detained underground and then pumped to a bioretention facility on the surface. Alternatively, treatment can be accomplished with a sand filter. See the discussion of selection of storm water treatment facilities in Chapter 2.

Water harvesting or gray water reuse. It may be possible to create a site-specific design that uses cisterns or vaults to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse. Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

Design Checklist for Cistern or Vault

- ❒ Volume meets or exceeds minimum.
- ❒ Outlet with orifice or other flow-control device restricts flow and is designed to provide a 24-hour drawdown time.
- ❒ Outlet is piped to a bioretention facility designed to treat the maximum discharge from the cistern orifice.
- ❒ Cistern or vault is designed to drain completely and/or sealed to prevent mosquito harborage.
- ❒ Design provides for exclusion of debris and accessibility for maintenance.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.

NOTES:
1. DESIGNER SHALL ACCOUNT FOR AND ACCOMODATE FOR POSSIBLE OVERFLOW.
2. OVERFLOW OUTLET CAPACITY SHALL EQUAL OR EXCEED POTENTIAL RUNOFF VOLUME AND RATE.
3. CISTERN PROVIDES FLOW CONTROL ONLY. USE IN COMBINATION WITH TREATMENT IMP.
4. PROVIDE ACCESS FOR CLEAN OUT OF OUTLET ORIFICE. SEE FLOW-THROUGH PLANTER OUTLET DETAIL.
5. PREVENT MOSQUITO BREEDING BY SEALING OR SCREENING ALL OPENINGS TO THE WATER SURFACE AND/OR ENSURE COMPLETE DRAINAGE.

C

Storm Water Pollutant Sources/ Source Control Checklist

How to use this worksheet (also see instructions in Step 4 of Chapter 3 of this BMP Manual):

1. Review Column 1 and identify which of these potential sources of storm water pollutants apply to your site. Check each box that applies.

2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your Project-Specific SUSMP drawings.

3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in a table in your Project-Specific SUSMP. Use the format shown in Table 3-1 in Step 4 of Chapter 3 of this BMP Manual. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternatives.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **A.** On-site storm drain inlets	❑ Locations of inlets.	❑ Mark all inlets with the words "No Dumping! Flows to Bay" or similar.	❑ Maintain and periodically repaint or replace inlet markings. ❑ Provide storm water pollution prevention information to new site owners, lessees, or operators. ❑ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ❑ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on SUSMP Drawings	3 Permanent Controls—List in SUSMP Table and Narrative	4 Operational BMPs—Include in SUSMP Table and Narrative
❑ **B.** Interior floor drains and elevator shaft sump pumps		❑ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	❑ Inspect and maintain drains to prevent blockages and overflow.
❑ **C.** Interior parking garages		❑ State that parking garage floor drains will be plumbed to the sanitary sewer.	❑ Inspect and maintain drains to prevent blockages and overflow.
❑ **D1.** Need for future indoor & structural pest control		❑ Note building design features that discourage entry of pests.	❑ Provide Integrated Pest Management information to owners, lessees, and operators.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **D2.** Landscape/ Outdoor Pesticide Use	❑ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained. ❑ Show self-retaining landscape areas, if any. ❑ Show storm water treatment facilities.	State that final landscape plans will accomplish all of the following. ❑ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. ❑ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to storm water pollution. ❑ Where landscaped areas are used to retain or detain storm water, specify plants that are tolerant of saturated soil conditions. ❑ Consider using pest-resistant plants, especially adjacent to hardscape. ❑ To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	❑ Maintain landscaping using minimum or no pesticides. ❑ See applicable operational BMPs in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ❑ Provide IPM information to new owners, lessees, and operators.
❑ **E.** Pools, spas, ponds, decorative fountains, and other water features.	❑ Show location of water feature, nearest landscaped areas, and nearest storm drains.	❑ Describe how water removed from the water feature would drain to nearby landscaping or be dechlorinated before discharge in accordance with City requirements.	❑ See applicable operational BMPs in Fact Sheet SC-72, "Fountain and Pool Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **F.** Food service	❑ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment. ❑ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.	❑ Describe the location and features of the designated cleaning area. ❑ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.	❑
❑ **G.** Refuse areas	❑ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas. ❑ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area. ❑ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	❑ State how site refuse will be handled and provide supporting detail to what is shown on plans. ❑ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.	❑ State how the following will be implemented: Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **H.** Industrial processes.	❑ Show process area.	❑ If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system."	❑ See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
❑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)	❑ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area. ❑ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. ❑ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	❑ Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains. Where appropriate, reference documentation of compliance with the requirements of local Hazardous Materials Programs for: ▪ Hazardous Waste Generation ▪ Hazardous Materials Release Response and Inventory ▪ California Accidental Release (CalARP) ▪ Aboveground Storage Tank ▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991 ▪ Underground Storage Tank	❑ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **J.** Vehicle and Equipment Cleaning	❑ Show on drawings as appropriate: (1) Commercial/industrial facilities having vehicle /equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses. (2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use). (3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer. (4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.	❑ If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced.	Describe operational measures to implement the following (if applicable): ❑ Wash water from vehicle and equipment washing operations shall not be discharged to the storm drain system. ❑ See Fact Sheet SC-21, "Vehicle and Equipment Cleaning," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **K.** Vehicle/Equipment Repair and Maintenance	❑ Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of storm water. ❑ Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas. ❑ Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.	❑ State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area. ❑ State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements. ❑ State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.	In the SUSMP report, note that all of the following restrictions apply to use the site: ❑ No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinse water from parts cleaning into storm drains. ❑ No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately. ❑ No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **L.** Fuel Dispensing Areas	❑ Fueling areas[3] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of storm water to the maximum extent practicable. ❑ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.		❑ The property owner shall dry sweep the fueling area routinely. ❑ See the Business Guide Sheet, "Automotive Service—Service Stations" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

[3] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **M.** Loading Docks	❑ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct storm water away from the loading area. Water from loading dock areas should be drained to the sanitary sewer where feasible. Direct connections to storm drains from depressed loading docks are prohibited. ❑ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer. ❑		❑ Move loaded and unloaded items indoors as soon as possible. ❑ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **N.** Fire Sprinkler Test Water		❑ Provide a means to drain fire sprinkler test water to the sanitary sewer.	❑ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
O. Miscellaneous Drain or Wash Water ❑ Boiler drain lines ❑ Condensate drain lines ❑ Rooftop equipment ❑ Drainage sumps ❑ Roofing, gutters, and trim.		❑ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. ❑ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. ❑ Rooftop mounted equipment with potential to produce pollutants shall be roofed and/or have secondary containment. ❑ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. ❑ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.	

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **P.** Plazas, sidewalks, and parking lots.			❑ Plazas, sidewalks, and parking lots shall be swept regularly to prevent the accumulation of litter and debris. Debris from pressure washing shall be collected to prevent entry into the storm drain system. Wash water containing any cleaning agent or degreaser shall be collected and discharged to the sanitary sewer and not discharged to a storm drain.

Appendix

D

SWPPP and CSWMP Guidelines

STORM WATER POLLUTION PREVENTION PLAN/CONSTRUCTION STORM WATER MANAGEMENT PLAN GUIDELINES

At a minimum, the Storm Water Pollution Prevention Plan (SWPPP) or Construction Storm Water Management Plan (CSWMP) whichever is required, must cover the areas listed below.

If a project disturbs 1-acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by Chapter Six, in accordance with the State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). The SWPPP must be kept on site and made available upon request of a representative of the City. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Projects that are also required to obtain a general construction National Pollutant Discharge Elimination System (NPDES) Permit are encouraged to visit the State Water Resource Control Board's website for permit application instructions, NOI and NOT forms and guidance in preparing a Storm Water Pollution Prevention Plan (go to: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml).

For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all construction BMP requirements required by Chapter Six, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

Planning and Organization

- Identify the pollution prevention team members who will maintain and implement the SWPPP/CSWMP.
- If applicable, incorporate or reference the appropriate elements of other regulatory requirements.

Site Map

Features displayed on the map must include:

- An outline of the entire property
- Drainage areas on the property and direction of flow
- Areas of soil erosion
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing storm water controls (oil/ water separators, sumps, etc.)
- Location of "impervious" areas- paved areas, buildings, covered areas
- Locations where materials are directly exposed to storm water
- Locations where toxic or hazardous materials have spilled in the past
- Location of building and activity areas (e.g. fueling islands, garages, waste container area, wash racks, hazardous material storage areas, etc.)

List of Significant Materials

List materials stored and handled at the site. Include the location and typical quantities.

Description of Potential Pollutant Sources

- Provide a narrative description of the site's activities and list the potential pollutant sources and the

potential pollutants that could be discharged in storm water discharges from each activity.

- List non-storm water discharges including the source, quantity, frequency, and characteristics of the discharges and drainage area.

Assessment of Potential Sources

Describe which activities are likely to be sources of pollution in storm water and which pollutants are likely to be present in storm water discharges.

Best Management Practices

Describe the BMPs that will be implemented at the site for each potential pollutant and its source.

Appendix

E

Example Construction Best Management Practices

A. Erosion Control

Physical stabilization BMPs, vegetation stabilization BMPs, or both, will be required to prevent erosion and sediment runoff from exposed graded areas. BMPs for physical and vegetation stabilization include:

1) Physical Stabilization

a) Geotextiles
b) Mats
c) Fiber blankets
d) Hydraulic mulch, Bonded Fiber Matrix
e) Sprayed on binders
f) Mulch on flat areas
g) Other material approved by the City Engineer for use in specific circumstances

If physical stabilization is selected, materials must be appropriate to the circumstances in which they are deployed, and sufficient material must be deployed.

2) Vegetation Stabilization

h) Preservation of existing vegetation
i) Established interim vegetation (via Hydroseed, seeded mats, etc.)
j) Established permanent landscaping

If vegetation stabilization is selected, the stabilizing vegetation must be installed, irrigated and established (uniform vegetative coverage with 70% coverage established) prior to October 1. In the event stabilizing vegetation has not been established by October 1, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.

B. Sediment Control

1) Perimeter protection. Protect the perimeter of the site or exposed area from sediment ingress/discharge in sheet flows using:

k) Silt fencing
l) Gravel bag barriers
m) Fiber rolls

2) Resource protection. Protect Environmentally Sensitive Areas and watercourses from sediment in sheet flows by using**:**

a) Silt fencing
b) Gravel bag barriers
c) Fiber rolls

3) Sediment Capture. Capture sediments in channeled storm water by using:

a) Storm-drain inlet protection measures
b) De-silting basins (Designed in accordance with an industry standard such as Caltrans, California Storm water BMP manual etc. If the project is 5 acres or greater the desilting basin(s) must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.)

4) Velocity Reduction. Reduce the velocity of storm water by using:

a) Outlet protection (energy dissipater)
b) Equalization basins
c) Check dams

5) Off-site Sediment Tracking. Prevent sediment from being tracked off-site by using:

a) Stabilized construction entrances/exits
b) Construction road stabilization
c) Tracking control (i.e., corrugated steel panels, wheel washes)
d) Dust control

C. Materials Management

6) Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

a) Solid
b) Sanitary
c) Concrete
d) Hazardous
e) Equipment – related wastes
f) Stock piles (protection from wind and rain)

7) Prevent the contamination of storm water by construction materials by:

a) Covering and/or providing secondary containment of storage areas
b) Taking adequate precautions when handling materials.

SPCBMPP Worksheet

CITY OF LA MESA
JEWEL of the HILLS

Standard Post-Construction BMP Plan

Standard Permanent Storm Water BMPs

Project Name: _____ Project Address: _____
Person completing form: _____Telephone number: (____)____-_____
Signature: _____ Date: ____/_____/_____

The following planning, design, and post-construction BMPs are required for all land development and redevelopment projects in the City of La Mesa. All BMPs listed below shall be selected and implemented where applicable and feasible.

List pollutants of concern: _____

Each selected BMP must be shown on the applicable plan(s) for the project.

Required BMPs	Check if Selected	If the BMP is not selected, explain why below (attach additional pages if necessary).
1. BMPs for permanent control of erosion from slopes.		
a. Convey runoff safely from the tops of slopes		
b. Vegetate slopes with native or drought tolerant vegetation		
c. Other (describe):		
2. BMPs to control flows, velocity and erosion. Flow control and downstream erosion protection measures shall prevent any significant increase in downstream erosion as a result of the new development, but shall not prevent flows needed to sustain downstream riparian habitats or wetlands.		
a. Minimize disturbances to Natural Drainages		
b. Stabilize permanent channel crossings		
c. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels		
d. Provide buffer zones for natural water bodies		
e. Other (describe):		
3. Low Impact Development (LID) and site design BMPs.		
a. Conserve natural areas, soils, and vegetation where feasible		
b. Construct walkways, trails, patios. overflow parking lots, alleys, and other low-traffic areas with permeable surfaces		
c. Construct impervious surfaces to minimum widths necessary		
d. Use natural drainage systems		
e. Minimize soil compaction in areas that will remain pervious after development		

Required BMPs	Check if Selected	If the BMP is not selected, explain why below (attach additional pages if necessary).
f. Drain runoff from impervious roofs into adjacent landscaping		
g. Drain runoff from impervious sidewalks and/or walkways into adjacent landscaping		
h. Drain runoff from impervious parking lots into adjacent landscaping		
i. Drain runoff from other impervious areas into adjacent landscaping		
j. Other (describe):		
4. Storm drain stenciling and signage		
5. BMPs for outdoor materials storage and exposed work areas, to reduce pollution introduction.		
a. Provide overhead coverage for outdoor storage or work areas		
b. Divert storm water run-on away from outdoor storage or work areas		
6. BMPs for trash storage areas, to reduce pollution introduction. Store trash containers on an impervious surface in a screened or walled area designed to prevent run-on from flowing through the trash area, and provide a roof or awning to prevent direct contact with rain.		
7. BMPs for irrigation systems and landscape design, to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential developments)		
a. Use rain shutoff devices		
b. Design irrigation system to each landscape area's water requirements		
c. Use flow reducers		
d. Other (describe):		
8. Structural BMPs[1] to treat and/or to infiltrate storm water where a development project would otherwise cause or contribute to a violation of water quality standards in receiving waters.		

[1] Off-site structural BMPs may be used for treatment and infiltration necessary to meet water quality standards only if the conveyance of run-off to those facilities prior to treatment will not cause or contribute to an exceedance of water quality standards or deprive wetlands or riparian habitats of needed flows. Offsite facilities shall not substitute for the use of any on-site source control BMPs required by the manual. When an infiltration BMP is used, related BMPs set out in the manual (including but not limited to siting constraints), to protect present uses of ground water and future uses of that ground water as currently designated in the applicable RWQCB Basin Plan. (Discharges to infiltration BMPs may also require an RWQCB permit and additional state requirements may also be applicable to these discharges.)

City Use Only

If Structural BMPs are proposed, a maintenance agreement is required. Has a maintenance agreement for this project been submitted? □ Yes □ No □ NA

Approved □ Yes □ No

6. Watershed (Check One): San Diego River Watershed _____ San Diego Bay Watershed _____

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete Storm Water Requirements Applicability Checklist.

Notes:

- Items 1 through 6 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.
- A Hydrology report may be required.

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS:

	Yes	No
1. Is the project a new development?	☐	☐
2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 ft^2 of impervious surface?*	☐	☐
* *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".*		

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes", complete Part A below.

PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.

DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL, PART II? (SEE GLOSSARY)*	**Yes**	**No**
1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units?	☐	☐
2. Commercial development resulting in the disturbance of one acre or more of land?	☐	☐
3. Industrial development resulting in the disturbance of one acre or more of land?	☐	☐
4. Automotive repair shop?	☐	☐
5. Restaurant greater than 5,000 square feet?	☐	☐
6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?	☐	☐
7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?	☐	☐
8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff?	☐	☐
9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater?	☐	☐
10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day	☐	☐
11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels.	☐	☐
***** *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.*		

Limited Exclusion: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met.

If all answers to Part A are "No", continue to Part B.

PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.

DOES THE PROJECT PROPOSE:	**Yes**	**No**
1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks?	☐	☐
2. New pervious landscape areas and irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Trash storage areas?	☐	☐
5. Liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (Except construction)?	☐	☐
8. Commercial/ industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. Any grading or ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?	☐	☐
**To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/water_issues/programs/stormwater/industrial.shtml*		

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the *Storm Water BMP Manual*. All Priority Development Project are also subject to the Hydromodification Management Requirements as discussed in the City's *Storm Water BMP Manual, Part II*, and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's *Storm Water BMP Manual*, Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

Required submittals, Section 1:	☐	PCWQTR	☐	SPCBMPP	☐	Hydromodification

SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS:

PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	**Yes**	**No**
1. Does the project proposed grading or soil disturbance over one acre?	☐	☐
2. Does the project propose any grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)?	☐	☐

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide General NPDES Permit for Storm Water Discharges Associated with Construction Activities and the City's Construction Storm Water BMP Performance Standards. A Storm Water Pollution Prevention Plan (SWPPP) and Notice of Intent to enroll in the General Construction Permit must be prepared. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards and a Construction Storm Water Management Plan (CSWMP) must be prepared and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to completed Parts D and E of this form and neither a SWPPP nor a CSWMP is required.

PART D: DETERMINE ADVANCE TREATMENT SUBJECTIVITY

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	**Yes**	**No**
1. Is the project located within, adjacent to, or a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity?	☐	☐
2. Will the project disturb more than five acres, including all phases of the development?	☐	☐
If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below.		
3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water?	☐	☐
4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4?	☐	☐

If <u>all</u> answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the *Storm Water BMP Manual,* Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer based.

<u>Required submittals, Section 2</u>:	☐	SWPPP, NOI	☐	CSWMP	☐	Advanced Treatment

PART E: DETERMINE CONSTRUCTION SITE PRIORITY

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

* Sites with a low or medium threat to water quality priority can be given a higher threat prioritization at the discretion of City staff based on additional factors, such as project type and non-storm water discharge potential.

Note: High soil erosion potential and significant slope are determined at the discretion of City staff.

According to the attached flow chart this project has the following threat to water quality priority:

☐ A) High Priority ☐ B) Medium Priority ☐ C) Low Priority

[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]

Completed By: _____

ATTACHMENT 3.1

CONSTRUCTION STORM WATER MANAGEMENT PLAN

CITY OF LA MESA
JEWEL of the HILLS

CONSTRUCTION STORM WATER MGMT. PLAN

PUBLIC WORKS DEPARTMENT / ENGINEERING DIVISION
8130 Allison Avenue, La Mesa, CA 91941
Phone: (619) 667-1166 • Fax: (619) 667-1380

Project Name: _____ Project Address: _____
Person completing form: _____ Telephone number: (_____)_____-_____
Signature: _____ Date: ____/____/_____

Construction projects less than one acre but answer "Yes" to questions 2, 3, or 4 in Section 2 Part C of the City's Appendix A document are required to prepare a Construction Storm Water Management Plan (CSWMP). Completion of this form along with submittal of a site map with the features described at the end of this form can adequately meet this requirement.

Planning and Organization

Person responsible for implementing items in this CSWMP:_____

Is this project subject to other construction regulations? ~ Yes ~ No
If yes, please list: _____

Significant Materials

List all significant materials that will be stored and handled at the site in the table below.
Include a brief description of the location where the materials will be stored and expected quantities.

Material	Storage Location	Expected Quantity

Potential Pollutant Sources

Provide a brief narrative description of the site's activities and list the potential pollutants that could be transported from the site by storm water in the following table.

Activity	Potential Pollutants Sources and Pollutants Generated by Activity

Best Management Practices

Every construction site within the City's jurisdiction is required to select, install, and maintain construction BMPs to reduce, retain, and manage pollutant discharges to the maximum extent practicable. The BMPs listed below are required by the City where applicable. The corresponding Caltrans fact sheet for the listed BMPs is indicated in parenthesis. These fact sheets are obtainable from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003) and provide additional details on how to implement the BMP.

Please check all BMPs below that are applicable and feasible for the construction that will be implemented and maintained for the length of construction.

- ☐ Preserve natural hydrologic features where feasible
- ☐ Preserve riparian buffers and corridors where feasible
- ☐ Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction
- ☐ Minimize exposure time of disturbed soil areas
- ☐ Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible
- ☐ Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible
- ☐ Preserve existing vegetation where feasible (SS-2)
- ☐ Establish permanent re-vegetation or landscaping as early as feasible

Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities:

- ☐ Cleaning (NS-8)
- ☐ Fueling (NS-9)

☐ Maintenance (NS-10)

Prevent the contamination of storm water from construction materials through proper management of the following types of activities:

☐ Material Delivery and Storage (WM-1)
☐ Material Use (WM-2)
☐ Stockpile Management1 (WM-3)
☐ Spill Prevention and Control (WM-4)

Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

☐ Solid Waste (WM-5)
☐ Hazardous Waste (WM-6)
☐ Contaminated Soil (WM-7)
☐ Concrete (WM-8)
☐ Sanitary Waste (WM-9)
☐ Liquid (WM-10)

Prevent the contamination of storm water through proper management of the follow activities:

☐ Water Conservation Practices (NS-1)
☐ Dewatering Operations (NS-2)
☐ Paving and Grinding (NS-3)
☐ Potable Water/Irrigation and Flushing (NS-7)

Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing <u>one or more</u> of the following BMPs:

☐ Hydraulic Mulch (SS-3)
☐ Hydroseeding (SS-4)
☐ Soil Binders (SS-5)
☐ Straw Mulch (SS-6)
☐Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats (SS-7)
☐ Wood Mulch (SS-8)
☐ Earth Dikes/Drainage Swales (SS-9)

Reduce the velocity of storm water by using <u>one or more</u> of the following:

☐ Outlet Protection/Velocity Dissipation (SS-10)
☐ Slope Drains (SS-11)

Protect the Perimeter of the site or exposed area from sediment discharge using <u>one or more</u> of the following:

☐ Silt Fence (SC-1)
☐ Gravel Bag Berm (SC-6)
☐ Fiber Rolls (SC-5)

Capture sediments in channeled storm water by using <u>one or more</u> of the following:

☐ De-silting Basin3 (SC-2)
☐ Storm Drain Inlet Protection (SC-10)
☐ Sediment Trap (SC-3)
☐ Gravel Bag Barrier (SC-8)

Prevent sediment from being tracked off-site by using <u>one or more</u> of the following:

☐ Stabilized Construction Entrance (TC-1)
☐ Construction Road Stabilization (TC-2)
☐ Entrance/Exit Tire Wash (TC-3)
☐ Street Sweeping (SC-7)

Notes on above BMPs:

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans.

All construction sites must implement the above BMPs in accordance with the City's dry and wet season requirements, which are detailed below.

A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.
- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.

B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not

considered to be "exposed" for purposes of this requirement.

- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.
- Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.
- All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.
- Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

Project Site Map

A site map of the project must be attached to this form and contain the following features:

- An outline of the entire property
- Drainage areas on the property and direction of flow
- Areas of soil erosion
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing storm water controls (oil water separators, sumps, etc.)
- Location of impervious areas (paved areas, buildings, covered areas)
- Locations where toxic or hazardous materials spilled in the past
- Location of building and activity areas (e.g. fueling islands, garages, waste container areas, wash racks, hazardous material storage areas, etc.)
- Locations where BMPs proposed in this document will be installed
- Locations where materials will be temporarily stored onsite

City Use Only

Manager/Operator(s) Email:_____

Facility Personnel Present_____

B. Facility Site Information

Principal activity:_____

JURMP Classification_____

New JURMP Classification?_____

Does facility maintain SWPPP/BMP Plan? ☐ Yes ☐ No

If yes, what is the date of last SWPPP/BMP Plan revision?_____

If yes, does the SWPPP/BMP Plan include applicable minimum BMPs from the JURMP? (if no, describe in Section E) ☐ Yes ☐ No

If yes, does the SWPPP/BMP Plan include a current list of individuals Responsible for implementing BMPs at the site? ☐ Yes ☐ No

Does facility have a map/sketch of the site with flow lines and storm drains? ☐ Yes ☐ No

C. Initial Observations

Drainage basin: ☐ Alvarado ☐ University ☐ Spring Valley ☐ Lemon Grove ☐ Lake Murray

Nearest conveyances or water bodies: _____ Hydrologic Area: _____

Approximate distance to water bodies: ☐ □ 200 ft. ☐ 200 □ 1000 ft. ☐ 1000 ft.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by industrial or commercial activities: _____ square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

D. BMP Assessment

BMPs	N/A	Yes	No	Comments
D.1 General				
Is the site free of excessive litter and debris?				
Are discharge locations free of excessive sediment and debris?				
Are parking lots, sidewalks and streets free of excessive sediment and debris?				
Are roof downspouts directed away from areas of potential pollutants?				
Is wash water from pressure washing / hosing managed appropriately?				
Are employees trained in storm water management?				
Does the facility have a current log of employees who have participated in training?				
D.2 Landscaping				
Are adequate erosion prevention measures employed? (vegetation or physical stabilization)				
Are irrigation systems programmed to minimize over-watering and runoff?				
If reclaimed water is used for irrigation, is the site free of evidence of irrigation water entering the storm drain?				
Are stockpiles of soil or landscape waste covered when feasible and equipped to prevent runoff transport?				
Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs?				
D.3 Materials and Wastes				
Are adequate trash containers provided?				
Are adequate recycling containers provided?				
Is the trash/recycling area adequately covered (closed lids or permanent overhead cover)?				
Is the trash/recycling area free of litter and debris?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are outdoor materials that pose a threat to water quality stored appropriately (covered or in sealed containers)?				
Are outdoor storage containers properly labeled?				
Is there an accessible, appropriate spill response kit?				
Is there a written spill response plan? If so, please provide to inspector. (NA if no significant materials to spill)				
Are liquid storage containers/tanks equipped with secondary containment?				
Is secondary containment free of spills and rainwater?				
Are loading and unloading areas free of spills and debris?				
Is water from pools and/or fountains disposed of properly?				
D.4 Equipment and Vehicles				
Are exposed parking areas free of significant spills and leaks?				
Are vehicle maintenance activities conducted within contained areas when feasible (garage, canopy, work shop)?				

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

BMPs	N/A	Yes	No	Comments
Are equipment and vehicles inspected daily for leaks and repaired as necessary?				
Are storm drain inlets near vehicle-fueling areas protected from spills and leaks?				
Is vehicle washing preformed in a designated area where runoff does not enter the MS4?				
Are biodegradable soaps used when appropriate?				
D.5 Building Repair/Construction				
Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization)				
Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters)				
Are impervious areas free of debris and spills from painting, scraping, and/or sandblasting activities?				
D.6 Structural BMPs				
Are structural BMPs adequately maintained? (NA if no structural BMPs at facility)				
D.7 Non-Storm Water Management				
Is the site free of evidence of illicit connections and illegal discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				
D.8 Other				
Are there any other potential storm water pollution issues or concerns? If yes, explain below.				
E. ADDITIONAL COMMENTS (describe any additional deficiencies not represented above and/or notable BMP improvements)				

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

F. Corrective Action

Is corrective action needed? ☐ Yes ☐ No (If **BMP-related** corrective action is required, describe below.)

Operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax ☐ E-Mail

G. Violations

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described in Section F.

☐ Violation of City Ordinance(s):

- ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
  Description
- ☐ Illegal connection(s) to the storm drain system
  Location_____
- ☐ Littering
- ☐ Failure to properly implement required BMPs

☐ Other Violation_____

Specific action(s) required to correct the violation described above:

☐ Implement the recommended corrective actions listed in Section F.

Additional actions required:

H. Additional Recommended City Actions

Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff

Does this facility require a follow-up inspection? ☐ Yes ☐ No

Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff	☐	☐	☐	☐	
Identify and eliminate illicit connections and illegal discharges	☐	☐	☐	☐	

D.6 Additional Required Actions

D.7 Additional Questions	Comments/Results
Are there any potential air sources that could contribute to atmospheric deposition of pollutants?	☐Painting ☐Sandblasting ☐Fuel Distribution ☐Dust dispersion or mineral processing ☐Metal smelting ☐Metal plating or anodizing ☐Chemical production or mixing ☐Large fuel burning device ☐Incinerator
Are there any treatment control BMPs on site?	☐Filter insert ☐Hydrodynamic separator ☐Debris screen ☐Sewer diversion ☐Vegetated swale ☐Vegetated filter strip ☐Biofiltration ☐Detention/sedimentation basin ☐Containment and evaporation or reuse ☐Filtration
Are treatment control BMPs regularly maintained?	☐Yes ☐No ☐Unknown ☐N/A
What is the approximate percentage of the site that drains to the treatment control BMPs?	☐N/A
Do major potential pollutant sources drain to treatment BMP(s)?	☐All ☐Some ☐None ☐N/A
If any illicit connections and/or illegal discharges were identified have the appropriate authorities been notified?	☐Yes ☐No ☐N/A
If any illicit connections and/or illegal discharges were identified, were they eliminated during the site visit?	☐Yes ☐No ☐N/A
Were any non IC/ID related corrective actions implemented during the site visit?	☐Yes ☐No ☐N/A
Were any educational materials distributed?	NOI ☐ NONA/NEC ☐

E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

- ☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional notes and/or actions required:

F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions and Re-inspection Required.** Please refer to sections D.1-D.6, E, and F of this form.

☐ No Corrective Actions Required at this time.

G. RECOMMENDED CITY ACTIONS

ASSESSMENT

Level of knowledge regarding stormwater issues:	☐1	☐2	☐3	☐4	☐5
Level of cleanliness, BMP implementation, orderliness of site:	☐1	☐2	☐3	☐4	☐5

Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Watershed (circle one): ---

Questions for Facility Contact Person

When water (from rain, sprinklers, etc.) leaves your site where does it go? ☐ Treatment Plant/Sewer ☐ Storm Drain System ☐ A Water Body (any) ☐ Don't Know/Unsure

Runoff leaving your site eventually reaches what water body (more than one can be checked)? ☐ San Diego Bay ☐ Chollas Creek ☐ Pacific Ocean ☐ San Diego River ☐ Mission Bay ☐ Don't Know/Unsure

What is your impression of the water quality/condition of the downstream water body? ☐ Good ☐ Fair ☐ Poor ☐ Don't Know

In general, what do you think are the main areas or activities at local businesses that could contribute to pollution of runoff? ☐ Washing Activities ☐ Washing Activities Done by Mobile Businesses ☐ Material Storage ☐ Material Processing ☐ Landscaping ☐ Repair Services ☐ Illegal Dumping ☐ Trash Area ☐ Don't Know/Unsure ☐ Other

Other than today's inspection, have you received any information or education about what your business should do to prevent pollution from entering the environment? ☐ Yes ☐ No

Observations

Was evidence of any non-storm water discharge (including allowable discharges) observed? ☐ Significant ☐ Minimal ☐ No

If irrigation system is present, which sprinkler head types are present (check all that apply)? ☐ Spray ☐ Rotor ☐ Microspray ☐ Drip ☐ Bubblers ☐ Water by hand ☐ Other ☐ NA

Approximate percentage of site's total pervious area that is landscaped: _____ %

Attitude toward compliance with storm water regulations: ☐ Receptive ☐ Neutral ☐ Resistant

Overall Source Ranking (for Watershed Pollutants of Concern)

☐ Significant ☐ Not Significant

DEADLINE FOR VOTER REGISTRATION

MONDAY, OCT 18

FOR THE GENERAL ELECTION ON NOVEMBER 2

YOUR VOTE COUNTS!

You will need to register to vote if you:

- Have moved recently
- Changed your name
- Wish to change your political affiliation
- Will be at least 18 years of age on or before the next election

Postcard registration forms are available at a variety of public offices including:

- Registrar of Voters Main Office
- All City Clerk Offices
- Department of Motor Vehicles
- U.S. Postal Services
- Public Libraries

Call the Registrar of Voters main office at 858.565.5800 or visit their website at www.sdvote.com for more information.

Grossmont Transit Center Begins Pedestrian Improvements

The construction of the public improvements at the Grossmont Transit Center began earlier this year. The improvements are being completed by SANDAG and funded through multiple sources, including funds from the City of La Mesa, the Metropolitan Transit System (MTS), SANDAG, and stimulus dollars, for a total of $8 million. The public improvements include platform enhancements and two elevators with a bridge structure that allows ease of access from the transit platform to the host of businesses that are located around Grossmont Center Drive and Center Drive, including Grossmont Shopping Center and Grossmont Hospital.

SANDAG chose a La Mesa contractor, Riha Construction, to construct the public improvements and MTS will maintain and operate the facility. The contractor has installed a temporary stairway for continual access to the trolley platform during construction. The temporary stairway starts near the roadway across from the trolley platform and goes up to Grossmont Center Drive, near Fletcher Parkway. The project is expected to be completed in the summer of 2011.

Coming in September New La Mesa Police Facility

GRAND OPENING

Check the calendar for opening date and events.

SWIPE SOME PARKING:
Smart Meters to be Installed in the Village

Let's say you're running late for a lunch appointment at one of the many restaurants in the Downtown Village such as Gio's, Por Favor, Tira Misu, San Fillippo's, or Johnny B's. You arrive downtown on time, pull into your parking space on La Mesa Blvd; bolt out of your car to the parking meter, reach into your pocket for change but come up empty. What do you do? Look under your car seats for stray coins? Ask a passerby to break a dollar for you? Leave the meter unpaid and risk a parking citation while you run into a shop to ask for change? In the very near future you'll be able to pull out your credit or debit card, swipe it, and get to your appointment on time.

As yet another sign of the City's commitment to modernize and upgrade the Downtown Village area, the City Council voted 5-0 on June 22 to accept the recommendation of the La Mesa Community Parking Commission to purchase and install 100 smart parking meters for the Downtown Village. The new parking meters, manufactured by IPS Group, Inc., will offer visitors and shoppers greater flexibility when paying for parking by accepting credit cards, debit cards or coins. Credit or debit card transactions are processed wirelessly, using secure, encrypted cellular technology. Identical meters are already in service in parts of San Diego and in Del Mar, and representatives of both cities report the public response has been overwhelmingly positive. The meters will replace existing coin-only meters on both sides of La Mesa Blvd, between 4th Street and Acacia Avenue, and La Mesa will provide the added payment flexibility to parking customers at no additional charge. The cost of these smart meters is being funded as a reinvestment of Downtown Parking Fund monies generated from parking meter revenues. No change to the existing parking meter rates will result from the installation of the new smart parking meters.

Update of La Mesa's General Plan

The General Plan contains the City's vision for the future of La Mesa. The City Council authorized a comprehensive update to the General Plan to be completed by the City's centennial celebration in 2012. The General Plan Update will look ahead 20 years and document the goals, objectives, and policies that will get us there. City Staff has been working on getting the community involved in the General Plan Update. Two workshops are scheduled for 2010 to receive citizen input. One workshop took place on April 15. The second workshop will be held on September 23. There are two surveys on the City's website so check out both and sign up for email updates.

General Plans are divided into individual sections called "elements." State law mandates specific topics that must be covered in every General Plan (land use, mobility, housing, open space, conservation, noise and safety) but there are additional, optional topics that can also be included. La Mesa's current General Plan contains the following elements:

LAND USE AND URBAN DESIGN - specifies the general location and intensity of housing, business, industry, open space, education, public buildings and grounds, and other land uses.

CIRCULATION - describes the planned road systems in our community, as well as other ways that people and goods move around—by foot, bicycle, and rail.

CONSERVATION AND OPEN SPACE - addresses the demands placed on the City's parks and open space areas and discusses regional resource conservation issues.

HISTORIC PRESERVATION - describes the cultural and historic resources our community has and how the City will enhance and preserve them.

NOISE - describes existing and future noise sources and the City's standards for protecting residents from excessive noise.

SAFETY - identifies hazards within the community and contains policies designed to mitigate the risk to the public.

PUBLIC SERVICES & FACILITIES - outlines the City's policies and programs for keeping our community safe during both manmade and natural hazards like earthquakes and floods.

HOUSING - provides strategies for providing adequate housing to meet the current and future housing needs of everyone in our community. The Housing element is required to be updated more frequently than the other elements and was most recently revised in 2005.

In addition, the updated General Plan will address health and sustainability to respond to new laws and initiatives related to childhood obesity and climate change.

All citizens are encouraged to get involved in this update to the General Plan. This is your opportunity to give input about your community's future.

ARE YOU READY?

Here are some tools to help you prepare for a natural disaster...

September is National Disaster Preparedness Month. In order to encourage Americans to prepare themselves, their families and their communities, the Ready Campaign was created by the Federal Emergency Management Agency (FEMA) and asks individuals to do three key things to prepare for the unexpected: (1) get an emergency supply kit, (2) make a family emergency plan, and (3) be informed about the different types of emergencies that could occur and their appropriate responses. To help you prepare go to www.ready.gov for helpful tips.

Another way to prepare you and your family for an earthquake is to practice what you should do in the event of one. Join millions of Californians who are getting ready, sign up at www.shakeout.org for the earthquake drill slated for October 21, 2010 at 10:21 am. This is one way to get better prepared for major earthquakes, and to practice how to protect ourselves when they happen.

SMOKE ALARMS:
Up, Down and All Around

La Mesa Fire Department Reinforces Newer Smoke Alarm Recommendations During Fire Prevention Week, October 3-9

In an effort to better educate communities throughout the U.S. about smoke alarm recommendations, the nonprofit National Fire Protection Association (NFPA) is promoting "Smoke Alarms: A Sound You Can Live With!" as the theme for this year's Fire Prevention Week campaign, October 3 through 9.

La Mesa Fire Department offers the following tips for making sure smoke alarms are maintained and working properly:

- Test smoke alarms at least once a month using the test button, and make sure everyone in your home knows their sound.
- If an alarm "chirps," warning the battery is low, replace the battery right away.
- Replace all smoke alarms, including alarms that use 10-year batteries and hard-wired alarms, when they're 10 years old (or sooner) if they do not respond properly when tested.
- Never remove or disable a smoke alarm.

The La Mesa Fire Department will be hosting a Fire Prevention Week Open House on October 9 from 10:00 am until 2:00 pm at Fire Station 11, 8034 Allison Avenue. Through educational, family-oriented activities residents can learn more about the power of smoke alarms, newer options for installing and maintaining them properly, and ultimately, how to better protect their loved ones from fire. There will also be refreshments available and giveaway items for the kids!

To learn more about "Smoke Alarms: A Sound You Can Live With!," visit NFPA's Web site at www.firepreventionweek.org.

PARK APPRECIATION DAY

Volunteers clean up landscaping at the Adult Enrichment Center during 2009 Park Appreciation Day

Saturday October 23

8:00 am to 12:00 pm

La Mesa's Parks are Our City's Jewels, Help Make Them Shine!

For individuals – Bring your own gloves, rakes, or trowels to your favorite park. Signed waivers are required – download from the City website and bring with you to the park. Parents must accompany children under age 18 unless with a supervised large group.

Have a large group? We can help you find a project all your members can do. Give us a call at 667.1300.

Miss La Mesa and Miss Santee Pageants

LA MESA AND SANTEE PAGEANTS ANNOUNCE

2nd ANNUAL SCHOLARSHIP FUNDRAISER

The City of La Mesa and the City of Santee will hold the second annual fashion show fundraiser "Fashion Rocks the East" benefiting the Miss La Mesa and Miss Santee Pageants Scholarship Fund.

Sunday, August 8
3:00 pm
La Mesa Community Center
Arbor View Room

Tickets are $20 each and can be purchased by contacting pageant director Alexandra Kuty at 698.4163 or misslamesapageant@yahoo.com.

Curfew Ordinance Amended

This summer the La Mesa City Council approved several changes to the City's curfew ordinance. The curfew ordinance deals with juveniles under the age of 18, and regulates how late they can be out at night without parental supervision or permission. The changes approved by the City Council are designed to keep the ordinance consistent with the most recent court case dealing with curfew provisions. These changes clarify that juveniles may be present in public space during curfew hours when going to or coming from an activity related to expressing First Amendment rights or when traveling directly to an activity excepted from curfew restrictions from another such activity.

Generally, juveniles are not allowed to be out in public between the hours of 10:00 pm and 5:00 am. The ordinance lists several exceptions to this prohibition however. These include when they are accompanied by a parent, guardian, or responsible adult; going to or coming from a job; in an emergency; going to or coming from an activity organized by a school, church, or other similar organization; on an errand at the direction of a parent, guardian, or responsible adult; and exercising First Amendment rights.

Complete information on the changes to the City's curfew ordinance is available in the Staff Report to the City Council, presented on June 22, item 12.

City's Pavement Management Program – What's Your Zone?

As part of the City's Pavement Management Program, the City hires contractors to perform maintenance work on streets throughout the City. The work includes tree trimming, installation of pedestrian ramps, replacement of broken curb and gutter, filling street cracks and applying a slurry seal to select streets. Preparation work for this contract is completed in advance by City crews. With this year's contract approximately 3 million square feet of slurry will be applied to Zone 1, the area located in the northwest corner of the City which is bound by City Limits on the north and west sides, Interstate 8/Fletcher Parkway on the south side, and Jackson Drive to the east. Other streets recently disturbed to complete sewer repairs will also be treated under this contract. The City performs this work annually to different areas of the City in an effort to protect and prolong pavement life on City streets. The City uses rubberized slurry that makes use of recycled rubber from tires to complete this process. The application of crack seal and slurry seal act as a protective coating to protect the streets against further deterioration. Not every street within a zone will be completed. Streets are selected by their condition, availability of funding, and coordination of other work with agencies, City projects and private developments.

To see a map of Zone 1, streets to be completed with this year's contract, and find your zone, go to www.cityoflamesa.com. We treat one zone per year on a rotational basis, and will be working in Zone 2 next year.

Allison Avenue Streetscape Improvement Project

Allison Avenue is the main access road to the newly revitalized civic center that includes the library, post office, city hall, Fire Station 11 and administration building, and the new police station. Allison Avenue also provides a connection to the downtown village. With a number of bus routes and the adjacent trolley station on Spring Street, Allison Avenue also serves as a major transit and pedestrian corridor.

The streetscape improvement project along Allison Avenue will continue the improvements that were recently completed on University Avenue around the north side of the Civic Center, all designed to improve walkability. Improvements will include: landscaped and sheltered bus stops, mid-block crosswalks in front of the new library and bus stop, street lighting, sidewalk, enhanced crosswalks, street trees, landscaping, and an asphalt overlay. The design of Allison Avenue is consistent with La Mesa's walkability and smart growth plans. The work will take place along Allison Avenue between Palm Avenue and University Avenue.

The City has awarded a construction contract to Hazard Construction. Construction is phased to minimize inconvenience to property owners, businesses, and the general public. Construction of that portion of the project between Spring Street and Palm Avenue is scheduled for completion over the summer. The portion of the project from Spring Street to University Avenue will begin in September and is scheduled for completion in early 2011.

During construction traffic flow may be restricted and parking will be limited. Please seek alternate routes if possible. The City apologizes for any inconvenience. Should you have any questions regarding this project, please call the Engineering Department at 667.1166.

The La Mesa Environmental Sustainability Commission is pleased to announce the

3rd ANNUAL "SUSTAIN LA MESA" Environmental Festival

October 9, 10:00 am – 2:00 pm

Harry Griffen Park, 9550 Milden St., La Mesa

See exhibits and interactive displays on water and energy conservation, waste reduction and recycling, composting, healthy gardening and living, pollution prevention and more. Speakers will be presenting special topics throughout the event and free items will be handed out.

AND

"OUR PLANET, OUR HOME" K-12 Environmental Art & Literacy Contest

Deadline September 29

Award Ceremony at the Festival on October 9

Winning pieces to be exhibited at the La Mesa Library

For information or booth reservations please contact Scott Munzenmaier at 667.1338 or envirosvcs@ci.la-mesa.ca.us. For contest rules and entry form visit www.cityoflamesa.com/EnvironmentalAwareness.

Intergenerational Games

Thursday, October 14
9:00 am – 12:30 pm

This FREE fun filled half-day event pairs active older adults with local students in grades 4 through 6 in a circuit of physical activity games and knowledge challenges. Focus is on non-competitive fun activities that encourage lifelong fitness.

Active adults age 55+ and La Mesa/Spring Valley students in grades 4 through 6 are encouraged to sign up. It's a great way to get kids active during the fall school break. Sponsorships are available. Go to the City website for registration forms and information or call the Community Center office at 667.1300 or the Adult Enrichment Center at 464.0505.

ATTENTION DOG OWNERS

Animals Prohibited on Athletic Fields

On April 27, City Council adopted an ordinance that prohibits animals on athletic fields in La Mesa. The second reading occurred on May 11 and the ordinance went into effect June 10.

Section 9.08.115 – Animals prohibited on athletic fields reads as follows:

"It shall be unlawful to allow any animal, except a certified assistance dog, to enter or be on any city owned or operated athletic field and any accessory facilities serving or related to the use."

The ordinance applies to athletic fields in City parks as well as fields on school properties scheduled by the Community Services Department for community use outside of school hours. City crews have posted notification signs at City park fields and the La Mesa-Spring Valley School District is installing signs at school fields.

RECYCLING PROGRAM EXPANDS TO ACCEPT ALL RIGID PLASTICS!

EDCO's recycling program which is available to all residents and businesses now includes all rigid plastics marked 1 through 7. Previously only some plastics and CRV items were accepted.

NEW ACCEPTABLE ITEMS (but not limited to): Plastic buckets with metal handles, plastic drums, totes & empty garbage cans, plastic milk crates, kitty litter buckets, laundry baskets, lawn furniture, and pet carriers, plastic toys, plastic agricultural trays/pots, plastic pallets, yogurt containers, cottage cheese containers, and other mixed plastic containers.

NON-ACCEPTABLE COMPONENTS: Styrofoam, PVC pipe, vinyl siding, plastic film (grocery bags & stretch film).

LARGE ITEMS: Recyclable items that are too large to place in blue recycling carts can be dropped off at no cost at EDCO's Buyback Center at 8184 Commercial Street.

-FREE-

Household Hazardous Waste and Electronic Waste Disposal

NEXT COLLECTION:

AUGUST 28

This is your chance to safely and properly dispose of the following materials and items:

GENERAL

Batteries, Fluorescent lights, Medical sharps, Latex & oil based paints, Solvents & cleaners, Pesticides & garden products, Pool products, Propane, Any items labeled flammable, hazardous, toxic, or corrosive

ELECTRONICS

TVs, Computer monitors & hardware, Cell phones & telephones, MP3 players, VCRs, Radios

AUTOMOTIVE

Batteries, Used oil & filters, Antifreeze

Collection events for City residents are available by appointment only by calling EDCO at 619.287.5696 x4270 or emailing to lmhhw@edcodisposal.com.

These items are considered hazardous and are not allowed to be placed in the trash because of their destructive effect on the environment. If you reside within the City limits of La Mesa, you are eligible to participate in the City's free HHW drop-off program.

E-waste can be recycled at the EDCO Station buy back center during business hours without an appointment. The center is open Monday through Saturday from 8:00 am to 4:00 pm. A small fee may apply to some items.

To request additional information about the program, please contact the Department of Public Works Environmental Services Division at 667.1338 or by email at envirosvcs@ci.la-mesa.ca.us. For general HHW information or other disposal and recycling options, visit www.cityoflamesa.com/hhw.

La Mesa Centennial Logo Unveiled at Flag Day Parade

The City of La Mesa Centennial Logo was officially presented to the community at the annual Flag Day Parade on June 5. Committee volunteers were on hand to provide centennial stickers and request volunteer support. The year 2012 will mark the City of La Mesa's 100th birthday, having incorporated on February 16, 1912. The La Mesa's Centennial Committee Volunteers, a community based volunteer committee, is looking to coordinate efforts to mark the City's 100th anniversary year through the work of volunteers and through private donations. The committee hopes to promote La Mesa's 100th birthday, through a community directed celebration of its heritage--past, present, and future. Our goals are to:

- Provide a structure to celebrate the City's history and culture through exhibits, educational venues, institutional presentations and community events.
- Create opportunities to participate and to celebrate the Centennial for service, educational, civic, faith-based groups, businesses, and tourist organizations.
- Foster civic pride and economic prosperity through Centennial promotional activities recognizing historical achievements of businesses.
- Develop a centennial project that would leave a legacy for future generations.

The committee is seeking community groups, businesses, individuals, or organizations that would like to participate in Centennial Celebration events by providing sponsorships or donations, volunteering, or incorporating the Centennial Celebration theme, goals, items or information into their own existing events and programs.

For more information about Centennial opportunities, you can contact the Committee at 667.1172, option #5; email at LaMesa100@ci.la-mesa.ca.us or visit the Centennial webpage.

Historic Homes Tour

Saturday, November 6 will be the fifth annual Historic Home Tour presented by the La Mesa Historical Society (LMHS), co-sponsored by the Historic Preservation Commission of the City of La Mesa. The tour, which highlights five La Mesa/Grossmont historic homes, will run from 10:00 am to 3:00 pm. The sites to visit include Spanish eclectic, Cottswald Cottage/Tudor, Mission revival, and 1940s storybook homes. La Mesa's Foothills Art Association will provide working artists at the sites with displays of original art by local artists. Some artists' works will be available for sale.

Due to limited parking and vehicle access to the homes, free Old Town Trolley shuttle buses will operate from the Tour Center at the La Mesa Women's Club located at 5220 Wilson Street on Grossmont Blvd, opposite the former Linens 'n Things and Circuit City stores, just west of Drew Ford. Abundant free parking will be available.

Tickets purchased the day of the event will be $15 for LMHS members and $18 for non-members. Pre-sale tickets at $12 for LMHS members and $15 non-members are available until October 29 by telephoning 465.1883.

SAVE THE DATE

ARE YOU DROWNING IN PAPER?
Would you like to discard old bank statements and other personal records, but are concerned with identity theft?

The City of La Mesa is sponsoring a free shredding event on Saturday, November 13, from 9:00 am to 12:00 pm at La Mesa's EDCO Station, 8184 Commercial Street. The special program is available to La Mesa residents only and will be limited to TWO bankers boxes (10"x12"x15") per household.

This City event is made possible through the generous support of the EDCO Disposal Corporation.

9th Annual

Kids Care Fest

Saturday, September 25 • 9:00 am – 2:00 pm

Briercrest Park and Grossmont Healthcare District
9001 Wakarusa Street, La Mesa

A FREE event for kids and the whole family!

- health information
- fun zone
- children's fingerprinting
- health screenings
- art activities
- meet fire & police

In partnership between the City of La Mesa, Grossmont Healthcare District, and La Mesa Park & Recreation Foundation

Details coming soon on the City website or www.grossmonthealthcare.org

La Mesa Library is a Terrific Two!

The La Mesa Library celebrated its second anniversary this June. Since opening the new facility in 2008 more than 700,000 people have walked through the doors and 1,134,619 items have been checked out. Liz Hildreth, La Mesa Branch Librarian, reported this April the La Mesa Branch was #1 in circulation (items checked out - books, movies, music) among the 33 San Diego County Library braches!

The La Mesa Branch Library is open seven days a week and now offers a better check out system, RFID (radio frequency identifier device), that customers have found really easy to use. The County library system has expanded its service. If a book isn't in the system the library can borrow it from one of four local universities (Circuit System) or (Link+ System) which is 15 public library systems like San Francisco Public and 38 Academic Libraries like Claremont Colleges. Stop by and ask the friendly library staff to show you how this works.

The library continues to offer popular story time programs for infants, toddlers, and pre-schoolers, afternoon science programs, and tween programs, as well as a teen book club and a teen advisory group. Adult programs include a book club, coffee and books, concerts and more. The library has a great 'Friends of the La Mesa Library' group and their book-store just off the lobby is open daily from 1:00 to 4:00 pm.

Some of our hottest days of the year are yet to come so don't forget that the La Mesa Branch Library is a local Cool Zone. Come cool off and enjoy everything the library has to offer. If you'd like more information about library programs and services please call 469.2151 or Text-a-Librarian at 928.2251.

Now that summer school vacation is over or nearly over, students need to focus their attention on back to school type safety measures. Whether walking or riding bicycles to and from school, students must remember all of the bicycle and pedestrian traffic safety measures taught in elementary school:

- Look both ways before crossing the street
- Ride bicycles on the right side of the street
- Always wear approved helmets when riding bicycles
- Cross the street only at street corners
- When crossing the street at street lights, make sure you have enough time left to cross before the green light turns to red.
- When entering or exiting vehicles, make sure the driver pulls over to the curb to stop first
- When walking and using cell phones use good instincts and always be aware of your surroundings
- When walking to and from school, always walk with a friend, and never approach unknown persons in vehicles to give directions or answer questions
- Never hitchhike

All of the above listed safety tips should not be new to students and along with many others they should help insure that students' back to school travels are filled with fun and adequate personal safety.

HALLOWEEN SAFETY

Most people think Halloween is only a time for fun, games, costumes, and treats for children. While this may be true, Halloween is also a time for parents to think about safety issues for their children and their residences. All parents should consider taking adequate safety measures to insure that their children's Halloween night is a safe night, filled with fun and lasting good memories, and that their homes are safe and secure with all windows and doors secured. The following is a list of basic Halloween safety suggestions to keep your children safe:

PLAN YOUR EVENING

To help keep children safe on Halloween night, the American Academy of Pediatrics, the Centers for Disease Control and Prevention, and the National Safety Council, make the following suggestions:

- Visit only well lit houses in familiar neighborhoods and remain outside
- Travel in small groups visible to parents and have someone carry a cell phone
- Use flashlights and stay on sidewalks
- Cross streets at the corner and never between parked cars
- Have names and addresses attached to your child's costume
- Have a predetermined meeting place if child is separated from parent or group

COSTUME SAFETY

Within reason, allowing your child to choose his/her own costume will probably add to their sense of pride and lead to a fun filled night. However, make sure their costume is made of a flame retardant material, reflective to light, properly fitted, and if wearing a mask, make sure the eye holes are large enough to see from side to side. Never allow your child to carry toy guns or weapons that appear to be real.

TRICK OR TREAT SAFETY

Even though kids enjoy the process of dressing-up and going trick or treating on Halloween night, they really enjoy eating the candy and other treats they receive. However, parents should set guidelines regarding the consumption of these treats:

- Take all candy home for parental inspection before eating
- Don't eat anything that isn't commercially wrapped
- Wash all fresh fruit thoroughly and inspect for holes and punctures

DON'T FORGET YOUR PETS:

Halloween night, with kids yelling and screaming, along with doorbells ringing for hours, can be a frightening time for dogs, cats, or other animals at your home. If possible, set aside a room near the rear of your home to keep your animals as far away from the noise as possible. Also, for those of you who like to dress your pets in their own costumes, remember, what you think looks cute, can be uncomfortable and cumbersome for your pets.

The La Mesa Police Department is available for all emergency (9-1-1) and non emergency (667.1400) situations. Please use the appropriate telephone number.

8th Annual Creek to Bay Cleanup

Creek to Bay Cleanup Day was held on Saturday, April 24. This county-wide cleanup event featured 69 clean-up sites with 5,181 volunteers removing 160,000 pounds of debris from the shorelines, coast and inland areas. The City of La Mesa coordinated and sponsored cleanup locations located along Alvarado Creek and University Channel. We would like to thank the 39 local volunteers who took part in removing over 800 pounds of trash and debris from our local waterways.

Mark your calendars! Our next clean-up event will be California Coastal Cleanup Day on September 25. The City of La Mesa will again sponsor sites along Alvarado Creek and University Channel and will be looking for more volunteers to ensure as much trash and debris is removed from our local waterways as is possible.

For more information, call Joe Kuhn, storm water program manager, at 667.1134.

Want to get more involved in your Community?

The La Mesa Police Department has a large contingent of volunteers who assist the Department by providing a variety of services. The Department has a number of volunteer opportunities available and is currently seeking applications from community members interested in donating their time.

The Department will be moving into its new police station, at 8085 University Avenue, and would like to add volunteers to our staff who will work at the reception counter. These volunteers will serve as the first point of contact for people who come into the police station and will assist them by answering questions and arranging for needed services.

We are also recruiting community members who are interested in serving in our Retired Senior Volunteer Patrol (RSVP) program. These volunteers work in uniform and their duties include patrolling the city, assisting with traffic control, working at special events, parking enforcement, and conducting vacation home checks. As part of our RSVP program, the Police Department is also recruiting volunteers to assist in the RSVP office in the new police station to help coordinate appointments and payments for people who need fingerprinting services.

If you are at least 50 years of age, want to be part of the Police Department, and feel you could usually volunteer six hours a week, the Police Department would love to talk to you and give you more information about volunteer opportunities. Contact Maxine Lynch at 667.1447 for applications or more information.

Attention Middle and High School Students

The City is currently seeking applicants for several upcoming vacancies on the Youth Advisory Commission. Applicants must live within the city limits of La Mesa and be at least 13 years old, but not more than 20 years old, at the time of appointment in September.

The Commission serves as an advisory body to the City Council on matters pertaining to programs, projects, and issues that address the concerns of the youth in our community. It is also the Commission's responsibility to explore and develop activities that will promote positive youth relations in the City.

Commission meetings are held on the second and fourth Monday of each month at 4:30 pm in the Community Center, 4975 Memorial Drive.

Applications are available at City Hall, 8130 Allison Avenue or by calling the City Clerk's office at 667.1120. Applications must be received in the City Clerk's office no later than 5:30 pm, Friday, September 10.

Council Actions

April 13, 2010

Adopted a resolution accepting bid proposal of Russ Bassett Corporation and awarding contract for design, supply and installation of radio communications dispatch furniture for new Police Facility.

Adopted a resolution adopting the Negative Declaration and authorizing the execution of a Purchase and Sale Agreement presented in substantial form for 4865-67 Cypress Street and related parking lot located at the southeast corner of University Avenue and Cypress Street from the Esther M. Ludwick Trust.

Appointed members to fill unscheduled vacancies on the Community Services Commission and Youth Advisory Commission.

April 27, 2010

Ratified the Design Review Board's approval of DRB-09-09 (Rutherford) – for a proposed addition to a single family residence at 8229 Pasadena Avenue.

Approved a letter of support from the San Diego County Board of Supervisors and the Mayors of San Diego County encouraging the Governor to issue another Executive Order for increased firefighting resources in San Diego County for the 2010 fire season.

Adopted a resolution authorizing execution of an Agreement with the San Diego Unified School District for the use of the La Mesa Municipal Pool.

Approved the installation of speed cushions on Parks Avenue between University Avenue and El Cajon Boulevard.

Adopted the Fee Schedule for Fiscal Year 2010-2011.

May 11, 2010

Adopted a resolution authorizing execution of the First Amendment to the Heartland Fire Training Authority Joint Powers Agreement.

Adopted a resolution approving Rules of Conduct for Community Services Department Facilities.

Adopted a resolution awarding a contract to Roy Allan Slurry Seal, Inc. for Bid No. 09-24, Annual Street Maintenance Project, Crack Sealing and Rubberized Emulsion Aggregate Slurry Coating of Various Streets.

Adopted a resolution authorizing the execution of Grant Agreements between the San Diego Association of Governments (SANDAG) and the City for three projects funded by the TDA/Transnet Bicycle, Pedestrian and Neighborhood Safety Program Funds.

Adopted an ordinance adding Section 9.08.115 to the La Mesa Municipal Code to Prohibit Animals on Athletic Fields.

Appointed an alternate member to fill an unscheduled vacancy on the Youth Advisory Commission.

May 25, 2010

Adopted a resolution declaring there were weeds, rubbish and refuse existing upon certain streets, sidewalks and private property in the City which constitute a public nuisance and declaring the intention of the Council to order its abatement.

Adopted a resolution amending Section 12.44.130 of the La Mesa Municipal Code installing a disabled persons parking space at 9405 Gregory Street.

Adopted a resolution amending Section 12.64.010 of the La Mesa Municipal Code to reflect approved speed limits on three City streets – Allison Avenue, High Street and Amaya Drive.

June 8, 2010

Ratified the Design Review Board's approval of DRB 08-03 (Mansour) - for proposed modifications to previously approved design review for a new commercial/retail building on a vacant site addressed as 5980 Severin Drive.

Ratified the Design Review Board's approval of DRB-09-24 (Clearwire) – for a proposed wireless communications facility at 6062 Lake Murray Boulevard.

Approved the special event permit application for the 2010 Oktoberfest, subject to conditions; and adopted a resolution authorizing the temporary closure of portions of City streets for the event.

June 22, 2010

Ratified the Design Review Board's approval of DRB-09-16 (Clearwire) – for a proposed wireless communications facility at 5565 Grossmont Center Drive.

Ratified the Design Review Board's approval of DRB-09-17 (Clearwire) – for a proposed wireless communications facility at 7840 El Cajon Boulevard.

Ratified the Design Review Board's approval of DRB-09-23 (Clearwire) – for a proposed wireless communications facility at 7484 University Avenue.

Ratified the Design Review Board's approval of DRB-10-05 (Union Bank) – for proposed exterior alterations to a commercial building at 4771 Spring Street.

Adopted resolutions calling and giving notice of the holding of a General Municipal Election to be held in the City on Tuesday, November 2, 2010; requesting the County Board of Supervisors to conduct the election and to consolidate it with the Statewide General Election; and adopting regulations for candidates for elective office pertaining to candidates' statements.

Adopted a resolution awarding Bid No.10-01 for an annual contract for furnishing labor, equipment and material for supplying and delivering asphalt and asphalt emulsions to the cities of La Mesa, National City, Carlsbad and Santee.

Adopted a resolution awarding a contract for Bid No. 09-30 for building demolition project to Flores Sierra Contractors Incorporated for the old Post Office building and the buildings located at 4865 Cypress Street.

Adopted a resolution amending Section 12.44.130 of the La Mesa Municipal Code deleting disabled persons parking spaces at 4144 Blackton Drive, 7330 Mohawk Street, and 7311 Waite Drive.

Authorized the introduction and first reading of an ordinance amending Chapter 10.20 of the La Mesa Municipal Code to bring the curfew ordinance into conformance with the most current court ruling.

Adopted resolutions approving the 2010-2011 amended final budget; and adopting the Appropriations Limit for Fiscal Year ending June 30, 2011 and the annual adjustment factors used to calculate the limit.

Adopted a resolution approving the purchase and installation of new smart parking meters on La Mesa Boulevard in the Downtown Parking District.

Students Celebrate International Walk to School Day

It never rains in La Mesa, California. Well, almost never. But it did on October 6 when more than 500 enthusiastic students donned walking shoes and rain gear and made their way to school from their homes or other predetermined starting points within their school communities.

Students at Lemon Avenue Elementary, Rolando Elementary, Maryland Avenue Elementary, Northmont Elementary, and La Mesa Middle School were joined by elected officials, Police, Firefighters, and City staff in walks and assembly events to celebrate the advantages of walking and riding bikes to school.

Continued on page 2

2011 LA MESA TOWN HALL MEETINGS

Tue, Jan 18, 6:30 – 8:30 pm
Parkway Middle School,9009 Park Plaza Dr.

Thu, Jan 20, 6:30 – 8:30 pm
Maryland Avenue Elementary School, 5400 Maryland Avenue

The City Council encourages all who are interested in the present and future of La Mesa to attend and provide their ideas, comments, and opinions. Information gathered at Town Hall meetings is used by staff and the City Council to recommend and set priorities for the City's next budget.

Daylight Savings Time

Ends at 2:00am Sunday, November 7.

Set your clocks back 1 hour before you go to bed Saturday night and enjoy an extra hour of sleep!

This is also a good time to change the batteries in your smoke alarms. Have a Happy and Safe Holiday Season.

Are You Drowning in Paper?

Would you like to discard personal records but have concerns with identity theft? The City of La Mesa is sponsoring a free shredding event for La Mesa residents only on Saturday, November 13, from 9:00 am to noon at EDCO Station, 8184 Commercial Street in La Mesa. There will be a limit of two boxes (approximate size 10"x12"x15") per household. Proof of residency will be required. This City event is made possible through the generous support of EDCO Disposal. Questions can be directed to 667.1167.

RECYCLE THOSE CHRISTMAS TREES!

Christmas trees, including flocked trees, may be recycled in EDCO's yard waste recycling program. Place cut trees in your designated yard waste recycling container, or bundle tree sections together with twine (maximum 4 feet in length and 18 inches in diameter) and place at the curb on collection day.

Residents may also drop off holiday trees to be recycled at EDCO Station, located at 8184 Commercial Street in La Mesa from December 26 to January 15. Holiday tree drop-off available: Monday - Saturday, 7:00 am - 4:30 pm, and Sunday, 8:00 am - 4:30 pm (Closed Christmas and New Year's Day.) Free holiday tree mulch will be available on a self-load/self-haul basis.

La Mesa Employees Take Health and Wellness to New Heights

The City has actively supported several programs to promote health and wellness in the community this year. One group of City employees literally has taken this objective to new heights. The group set a goal for themselves of climbing Mount Whitney, the tallest peak in the lower 48 states. Training started last Spring and lasted through the Summer with a summit attempt on August 31, 2010. All the hard work and commitment paid off with all 8 staff in the group successfully and safely making it to the summit and back with a real sense of accomplishment and many tales to tell. Congratulations goes out to La Mesa's healthy mountaineers: Tamaryn Boston, Bill Chopyk, Michele Greenberg-McClung, Enrique Nunez, John O'Donnell, Don Palmer, Karen Rakestraw, and Patty Rios.

International Walk to School Day

Continued from page 1

La Mesa's celebration of Walk to School Day was organized by the City and the non-profit WALKSan Diego as part of a 4-year Safe Routes to School federal grant project entitled La Mesa Kids Walk and Roll to School. With increasing concerns over childhood obesity rates, school transportation budget cuts, and personal safety, parents are searching for alternate ways to get their children to school. This project emphasizes the importance of increasing physical activity among students, pedestrian safety, preserving the environment, improving air quality, and decreasing traffic congestion, especially around schools. As more and more kids and adults walk to school, traffic congestion will diminish and safety in school neighborhoods will increase.

La Mesa has received over $1.6 million in grants to improve walkability around schools, with the latest award of $165,000 to fund the addition of sidewalks across from La Mesa Middle School awarded in October 2010.

New Police Station Complete

On September 20 the La Mesa Police Department began full time operations in a new police station located at 8085 University Avenue.

Public tours of the new La Mesa Police Station will be available beginning Saturday, January 8, 2011 and will be offered the second Saturday of each month thereafter at either 9:00 or 11:00 am. Reservations are required. If you are interested in taking the tour contact the La Mesa Police Department at 667.7514 to schedule.

City officials and members of the Independent Citizens' Bond Oversight Committee (ICBOC) gathered in front of the new Police Station to unveil the dedication plaque. Pictured left to right: Chief Alan Lanning, Councilmember Dave Allan, ICBOC member Bob Duggan, Councilmember Ernie Ewin, Councilmember Mark Arapostathis, Vice Mayor Ruth Sterling, ICBOC member Helen Givens, ICBOC member John Camp, ICBOC member Dr. Glen Sparrow, Mayor Art Madrid, ICBOC Vice Chairman Robert Duff, and City Manager Dave Witt. Not pictured: ICBOC Chairman Steve South.

DOWNTOWN VILLAGE DESIGN UPDATE

City is on schedule with Village renovation

The City of La Mesa has been hard at work to stay on schedule in the design of the downtown Village renovation. A concept plan was recently finalized and the project is proceeding with construction plans for Village Streetscape Improvements. The plan includes replacing sidewalks, lighting, landscaping, street furnishings, and crosswalks with new equipment and new treatments. In addition, the project introduces new amenities, such as safety bollards and power supplies for special events and will create lighted entry points or "gateways" to the Village to let visitors know they have arrived at a destination. The project will enhance the sense of place for the downtown Village and further establish the area as a competitive commercial district offering patrons a wide array of dining options, products, and services in a safe and visually appealing environment. The City is pursuing grant funds to supplement the $991,000 in American Recovery and Reinvestment Act funds already awarded for this project. Visit www.cityoflamesa.com/DowntownVillage for additional information and project updates.

What is your vision for La Mesa?

EVERYDAY SUSTAINABILITY:

- Wash only full loads in dishwashers and washing machines
- Always sweep with a broom, never a hose
- Reduce use of dryers and air conditioning units
- Buy minimally packaged goods
- Check out EDCO for recycling tips
- Condense auto trips and try to replace trips with biking, walking or public transit
- Check out La Mesa's Friday afternoon Farmer's Market for fresh local produce

The City is updating the General Plan (GP) for La Mesa's centennial celebration in 2012. The GP document guides the vision of the future of La Mesa through goals and policies. The document is divided into individual sections called "elements" currently: land use, circulation, conservation and open space, noise, safety, historic preservation, public services and facilities, and housing. New for the centennial update, the GP will also address health, wellness, and sustainability in response to new laws and initiatives related to childhood obesity and climate change.

Sustainability is a way of life, not an end goal. For the City of La Mesa this means protecting water quality and supply, strengthening alternative transportation options, encouraging land uses and buildings that conserve energy, and reducing greenhouse gas (GHG) emissions. Preserving quality of life in our "jewel of the hills" will require measures that ensure environmental sustainability and the health of all residents.

Public participation remains a valuable component of the GP update. If you would like the City to know about your vision for the future of La Mesa, please take a few minutes to fill out the online survey.

The City held the second workshop for citizen input on the GP Thursday, September 23 in the La Mesa Community Center. The workshop was an open forum so attendees were able to speak with City staff and consultants about land use, sustainability, and bicycle and pedestrian accessibility. If you'd like to stay informed about the GP update process or about a future workshop, sign up for "General Plan Update" through Notify Me on the City website.

Attention Drivers!

The City of La Mesa Rides4Neighbors Program needs your help for riders like the the gentleman pictured here. We have many other riders who need drivers!

- We are seeking adult volunteer drivers with excellent driving records willing to use their personal vehicles to provide a ride to a neighbor in need.
- Volunteers complete an application, provide a copy of a valid Drivers' License and insurance certificate, authorize a DMV records check, complete a Livescan background check, and complete orientation and training.
- Volunteer drivers are reimbursed for mileage and receive secondary liability insurance.
- As a volunteer, you decide your availability and choose the rides you wish to provide. There is no minimum time commitment or number of rides required to be a volunteer.

Please call 667.1321 for information on becoming a Rides-4Neighbors volunteer! ***We need you!***

El Cajon Boulevard and La Mesa Blvd. & Spring St. and High St.

INTERSECTION MODIFICATIONS

Beginning this winter, modifications will begin to the intersection of El Cajon Boulevard and La Mesa Boulevard and the intersection of Spring Street and High Street. Work will consist of upgrades to signals, installation of an environmentally friendly Low Impact Design grass swale to treat storm water runoff, and ADA pedestrian improvements. Construction is anticipated to last approximately four months. Residents are asked to be aware of traffic control within these areas. The project is funded through a grant from the San Diego Association of Governments Transnet Funds and Community Development Block Grants. For questions regarding this project contact Dirk Epperson in the Engineering Department at 667.1152 or depperson@ci.la-mesa.ca.us.

Ordinance Regarding Animal Noises Revised

On September 28th the City Council approved changes to Section 8.04.060 of the La Mesa Municipal Code, the City's "Animal Noises" ordinance, based on recommendations received from City Attorney Glenn Sabine. To establish a bona-fide complaint under the revised ordinance, the animal noise disturbance must rise to a level that disturbs a person of normal sensitivity in the vicinity, and requires a written affirmation of disturbance by people living in two separate residences. The revised ordinance exempts areas where animal noises are related to the permitted use of the property. The ordinance revisions will take effect November 10.

Adult Softball

(18 years and older)

Fee: $525 for season payable in full at time of registration. Umpire fees not included - $15/game each team

Visit the Adult Softball for additional information regarding registration and season schedule.

Jackson Park Playground Renovation Watch the City Calendar for information regarding a Grand Reopening of the playground at Jackson Park.

La Mesa's Watersheds In Focus

DO YOU KNOW YOUR WATERSHEDS?

Watersheds are areas of land which drain water, sediment, and dissolved materials to a common receiving water body or outlet. These areas serve to provide water in the form of drainage to a river or stream.Therefore, a watershed consists of all land and waterways that drain into the same body of water.

San Diego County is situated within 11 major watersheds. The City of La Mesa are within two of these watersheds: San Diego River Watershed and San Diego Bay Watershed.

SAN DIEGO RIVER WATERSHED

The San Diego River Watershed is comprised of 443 square miles and extends from the mountains near Julian to the San Diego River mouth at Ocean Beach. Portions of the watershed fall within the cities of El Cajon, Poway, San Diego, Santee, several unincorporated areas, and the City of La Mesa. Primary tributaries to the San Diego River include Boulder Creek, Conejos Creek, Los Coches Creek, San Vicente Creek, and Forester Creek.

Water quality concerns associated with the watershed include elevated bacteria levels, low dissolved oxygen, and the presence of elevated levels of dissolved solids and nutrients. Ensuring that urban runoff is not contaminated with pollutants is very important to the City and your responsibility as a resident and business owner in the City of La Mesa.

SAN DIEGO BAY WATERSHED

The San Diego Bay Watershed is comprised of 415 square miles. It extends from the Laguna Mountains to San Diego Bay. The watershed falls within the cities of Chula Vista, Coronado, Imperial Beach, Lemon Grove, National City, San Diego, unincorporated areas of the County, and the City of La Mesa. Approximately four square miles in the southern portion of the City of La Mesa are part of this watershed. The major discharge sources to San Diego Bay include Sweetwater River, Otay River, Chollas Creek, Paleta Creek, Paradise Creek, and Switzer Creek.

Water quality concerns associated with the watershed include elevated levels of bacteria, copper, lead, and zinc. The sources of these pollutants are the result of many factors, including, automobile brake dust and exhaust, industrial waste, pet waste, littering, and improper commercial/industrial materials storage.

WHAT CAN YOU DO?

It is your responsibility as residents and business owners in La Mesa to help keep these pollutants from impacting our water bodies. Keep in mind, the only water that should enter the storm drain is rain water. Do not hose down your property. Pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris may inadvertently be flushed into the storm drain contributing to gross contamination of urban runoff. Moreover, store materials properly to ensure they are not exposed to storm water, and do not over irrigate your landscape. If you observe storm water pollution or potential for activities around the City to contribute to storm water pollution, report it to the City Storm Water Hotline 667.1134.

Volunteers Clear Over 500 lbs. of Trash from Local Waterways

The 26th Annual California Coastal Cleanup Day was held on Saturday, September 25.

This statewide event featured volunteers removing trash and debris from designated clean up sites across California. In San Diego County alone more than 10,000 volunteers removed over 50 tons of trash from waterways, parks, and beaches.

The City of La Mesa coordinated and sponsored clean-up locations along Alvarado Creek and University Channel. We would like to thank the 60 local volunteers who took part in removing over 500 pounds of trash and debris from our local waterways. Their hard work on a very hot Saturday morning was greatly appreciated. The removal of this trash helps improve water quality as well as the appearance of our community.

For more information about future events, call Storm Water Program Manager Joe Kuhn at 667.1134.

City of La Mesa PARK APPRECIATION DAY 2010 held on Saturday, October 23

The staff of the City of La Mesa would like to thank the 234 participants in La Mesa's 2010 Park Appreciation Day. Volunteers removed 89 yards of green material and 5.5 yards of trash from City parks, in addition to painting tables, trimming, and raking. Special thanks to the following groups: Christ Lutheran Church, Cub Scout Pack 319, Friends of Canine Corners, Grossmont Navy ROTC, Helix High Interact, Journey Community Church, La Mesa Beautiful, La Mesa Kiwanis, La Mesa Lions, La Mesa Rotary, St. Andrews Episcopal Church, and City staff volunteers from the Police Department and City Hall.

Plan on joining next year's one-day event on October 22, 2011. Don't miss an opportunity to join others in the camaraderie of community involvement.

Free Household Hazardous Waste and Electronic Waste Disposal

UPCOMING COLLECTION DATE: November 20

Collection events are available by appointment only by calling EDCO at 287.5696 x4270 or emailing to lmhhw@edcodisposal.com.

E-waste can be recycled at the EDCO Station buy back center during business hours without an appointment. The center is open Monday through Saturday from 8:00 am to 4:00 pm. A small fee may apply to some items.

A list of household hazardous waste and electronic waste items included in these programs can be found on the City website. To request additional information about the program, please contact the Department of Public Works Environmental Services Division at 667.1338 or by email at envirosvcs@ci.la-mesa.ca.us. For general HHW information or other disposal and recycling options, visit www.cityoflamesa.com/hhw.

HEAD FOR THE HILLS!

Saturday, November 6, 2010 will be the 5th Annual Historic Home Tour presented by the La Mesa Historical Society and the La Mesa Historic Preservation Commission. The tour will run from 10:00 am to 3:00 pm and highlights five La Mesa/Grossmont historic homes.

Vehicle access and parking at the homes is limited. Free Old Town Trolley shuttle buses will operate from the Tour Center at the La Mesa Women's Club, 5220 Wilson Street at Grossmont Blvd, (opposite the former Circuit City store and across the street from Discount Tire). Abundant free parking is available at the Tour Center.

Tickets may be purchased on the day of the event for $18. Call 465.1883 for additional information.

SMALL STEPS TO BIG CHANGE!

Part 3 of 3

You do not have to be rich or famous to make healthy choices. There are small steps that anyone can take to live more sustainably.

WHAT IS SUSTAINABILITY?

"Sustainable societies are those whose infrastructure, institutions, practices (social, economic, and environmental) meet the needs of the present generation without compromising the ability of future generations to meet their own needs."

- Brundtland Commission, U.N. Commission on Sustainable Development

CHANGE THE WORLD ONE LIGHT AT A TIME.

Turn off lights when you leave a room, install dimmers, sensors, and timers to reduce energy use, and best of all, take advantage of natural sunlight. Compact fluorescent lights (CFLs) use about a quarter of the energy compared to incandescent, and last ten times longer.

Did you know? It would be like taking eight million cars off the road if each home in America replaced five bulbs in frequently used rooms. 150 pounds of carbon dioxide are saved by replacing just one regular light bulb with a CFL.

BE WATER WISE.

While waiting for tap water to heat, collect it in a bucket to water plants. Adjust automatic watering systems to prevent runoff and detect leaks and repair them within 48 hours. Dispose of hazardous waste and medicines properly, not down the drain. Water outdoors in the early morning or evening, and sweep, don't hose, patios and driveways.

Did you know? Less than 1% of all water on earth can be used by people. It is important that we use our water wisely and not waste it.

LANDSCAPE SMART.

Plant more trees and replace lawns and thirsty plants with low-water varieties. The garden section of bewaterwise.com has plant lists. Use pesticides and herbicides only with restraint and knowledge (visit ipm.ucdavis.edu). Design landscape to attract birds, butterflies, bees, bats, lizards, frogs and beneficial insects. Call the free UCCE Master Gardener Hotline for help at 858.694.2860 or online at mastergardenerssandiego.org.

Did you know? Trees reduce CO_2 in the atmosphere, reduce storm water runoff, provide shade, fruit and nuts for food, and habitat for wildlife.

TEACH YOUR CHILDREN.

Model sustainable practices. Tell your children what you are doing. Ask your children to share in making smart purchasing choices.

(Parts 1 and 2 of this article can be reviewed in the February 2010 and May 2010 issues of FOCUS available in City website archives.)

COUNCIL ACTIONS

July 13, 2010

Adopted a resolution authorizing reapplication for a Playful City USA designation in 2010 as part of the City's continuing Wellness Initiative.

Adopted a resolution waiving formal bidding and authorizing integration and installation of upgrades to TV Broadcast and Media Systems Equipment for the City Council Chambers.

Adopted a resolution to award a contract for household hazardous waste services with PSC Environmental Services, LLC.

Adopted a resolution authorizing the City Manager to sign a permanent household hazardous waste collection facility use agreement with the City of Lemon Grove allowing their residents to continue to use La Mesa's facility for disposal.

Adopted a resolution amending Section 12.44.130 of the La Mesa Municipal Code installing a disabled persons parking space at 8018 University Avenue.

Adopted a resolution authorizing staff to submit an application for a State funded Safe Routes to School Grant for the purpose of designing and constructing a sidewalk on the north side of Junior High Drive.

Adopted an ordinance amending La Mesa Municipal Code Chapter 10.20 pertaining to minors' curfew.

Appointed Members to the City's Boards, Commissions and Committees

July 27, 2010

Ratified the Design Review Board's approval of DRB-10-03 (Clearwire) for a proposed wireless communications facility at 4711 Spring Street.

Adopted a resolution establishing the property tax rate for bonded indebtedness for fiscal year 2010-2011.

Adopted a resolution authorizing the delegation of authority to request disbursements on behalf of the employer from the other post employment prefunding plan.

Adopted a resolution approving the 2010-2011 Memorandum of Understanding between the City of La Mesa and the La Mesa City Employees' Association.

Adopted a resolution authorizing unrepresented employees to receive same changes to retirement and benefits as the La Mesa City Employees' Association.

Adopted a resolution awarding a specialized professional services agreement for design of sewer replacement project at various locations to Psomas.

Adopted an ordinance amending Chapter 10.80 pertaining to the regulation of the operation of sound amplifying equipment.

Adopted an ordinance repealing La Mesa Municipal Code Section 12.36.020 pertaining to pedestrian crossings.

Appointed members to the Community Services Commission and Planning Commission.

Adopted a resolution confirming the list of delinquent sewer service charges and making each charge a special assessment against the respective parcel of land.

August 10, 2010

Ratified the Design Review Board's approval of DRB-10-02 (AT&T) for a proposed wireless communications facility at 6001 Lake Murray Boulevard.

Adopted a resolution authorizing extension of a contract for move management and relocation services for the new police facility with Changing Places.

September 14, 2010

Ratified the Design Review Board's approval of DRB-10-09 (La Mesa Learning Center) for a proposed exterior alterations to an existing commercial building at 8208-8216 Parkway Drive.

Adopted a resolution approving the 2010-2011 Memorandum of Understanding between the City of La Mesa and the La Mesa Police Officers' Association.

Adopted a resolution amending the 2010-11 Capital Improvement Program to add CIP Account 30211BOT and allocating $38,800 from the Downtown Parking Fund Reserve to same the account to pay for current and future municipal parking lot maintenance.

Adopted a resolution awarding a professional services contract for north Spring Street pedestrian improvements to Kimley-Horn and Associates.

Adopted a resolution awarding Bid 10-06 for the Jackson Park and Briercrest Park fencing project to Exquisite Fence Company.

September 28, 2010

Ratified the Design Review Board's approval of DRB-10-08 (Clearwire) for a proposed wireless communications facility at 6952 University Avenue.

Adopted a resolution of intention authorizing the execution of the fourth amendment to the agreement for management and implementation of a HOME Investment Partnerships Program Project with the County of San Diego to fund the La Mesa Down Payment and Closing Cost Assistance Loan Program and accept the HOME allocation of $1,985,170.95.

Adopted a resolution approving the 2010-2011 HOME administration contract for management and implementation of a HOME Investment Partnerships Project.

Adopted a resolution authorizing the acceptance of a grant from the California Office of Traffic Safety to conduct a local DUI Enforcement and Awareness Program by approving the addition of the grant funds to the fiscal year 2010-2011 budget.

Adopted a resolution awarding the contract for citywide replacement of high pressure sodium street lights with energy saving induction lights using American Recovery and Reinvestment Act grant funds to Republic Intelligent Transportation Services.

Adopted a resolution allocating $27,000 from the Downtown Parking Fund to pay for Property Based Business Improvement District (PBID) formation services, as requested by the Downtown Steering Committee, and authorizing the execution of a contract with Ed Henning Associates to provide PBID formation services.

Adopted a resolution authorizing the preparation of a downtown parking garage feasibility study using Downtown Parking Funds as recommended by the La Mesa Community Parking Commission.

Directed staff to enhance the City's community notification system by promoting the County of San Diego's Office of Emergency Services "Alert San Diego" efforts; expand the number of e-service tools to improve the City's community notification system; and allocated $2,500 to implement a marketing plan for the City's e services.

Approved an administrative charge of 45 percent to recover costs for the 2010 Weed Abatement Program and adopted a resolution confirming the report of the cost of abatement, and making each charge a special assessment against the respective parcel of land.

La Mesa Continues to Focus on Live Well Initiative by Improving Walkability

The City of La Mesa has focused on community wellness through its award winning "ready…set…Live Well" Initiative for the last several years. New sidewalks near schools, urban walking trails, modified vending machines, and new playgrounds are just a few of the additions that have been made in the community to support increased access to healthier eating and active lifestyles. In 2011 the City continues its focus to support living well.

In 2009, the City was awarded a planning grant to increase walking and biking around La Mesa's eight schools. The "La Mesa Kids Walk & Roll to School" Safe Routes program will host a series of workshops, in several school neighborhoods including Murray Manor Elementary, Northmont Elementary, La Mesa Dale Elementary, and Parkway Middle School. Parents, school staff, and other interested stakeholders will receive education on identifying barriers to walking and bicycling to school, along with education on traffic calming methods. Workshop attendees will then perform Walk Audits within a ¼ mile radius of each school to identify and prioritize barriers. The information gained from these workshops will then be compiled into reports and submitted to the City of La Mesa's Public Works Department to be used as leverage for funding to mediate identified barriers. The workshops are also the first step in creating "Parent Suggested Safe Routes to School" maps.

Other schools, Rolando Elementary, Lemon Avenue Elementary, Maryland Avenue Elementary, and La Mesa Middle, are in their second year of "Walk to School" programming – therefore drivers should be aware of more children walking and bicycling to school. In addition, the City recently received a Safe Routes to School Grant to add a sidewalk across

La Mesa is Gearing Up for its 100th Birthday in 2012… *Find out more!*

La Mesa COMMUNITY SERVICES

Summer Day Camp Schedules are Now Available!

Make the New Year Safer

At the beginning of the year many people make New Year's resolutions. Resolutions often include weight loss or exercise goals, eating more healthfully, or quitting a bad habit. These are all great plans to improve your life but it's not too late to make another resolution this year. Make a resolution to help yourself and the community by

Continue on next page.

Make the New Year Safer — *continued*

learning what you can do to prevent crime in La Mesa. You can practice safety at home, online, and in your neighborhood.

Here are a few ideas:

PERSONAL SAFETY AND HOME SECURITY

- Stay alert! Be aware of your surroundings.
- Park your car in well lit areas.
- Always close and lock windows and doors in your home and car.
- Consider installing an alarm system in your home.

ONLINE SAFETY

- Use security software that updates automatically.
- Create complex passwords and keep them secure.
- Don't reply to an email, text, or pop-up message that asks for personal or financial information, and don't click on links in the message. If you want to go to a bank or business's website, type the web address into your browser yourself. If you need to reach an organization with which you do business, call the number on your financial statement, or use a telephone directory.

NEIGHBORHOOD SAFETY

- Get to know your neighbors.
- Start or rejuvenate a Neighborhood Watch Group.
- Report suspicious activity to the Police Department by calling 667.1400. Dial 9-1-1 for emergencies only.

Learn more about protecting yourself and your home by viewing the Police Department's Crime Prevention Video for Residents and other resources available. For more information on the Neighborhood Watch program, contact the Crime Prevention Specialist at 667.7545.

Improving Walkability... — *continued*

from La Mesa Middle School. The grant in the amount of $162,000 brings the total amount for walkability improvements around schools to $1.6 million in the last three years. This work is slated for 2012.

Additionally the City has received both a Community Development Block Grant and SANDAG Pedestrian/Bike funds for intersection improvements at Spring St and High St, and at El Cajon Blvd and La Mesa Blvd. Improvements at these intersections will help to increase pedestrian safety, improve accessibility, and improve traffic flow through the intersections.

Improvements at El Cajon Blvd and La Mesa Blvd include creating a pedestrian crosswalk, extending curbs and sidewalk to narrow the street on the north side of El Cajon Blvd, and installing drainage and plants. An island will provide a refuge area for pedestrians between lanes of traffic on La Mesa Blvd. Bike lanes will be added to El Cajon Blvd from Parks Av to Guava St. In addition, various traffic signal improvements will improve traffic flow. At the intersection of Lee Av and La Mesa Blvd, new pedestrian signals and high visibility crosswalks will be installed to improve safety for pedestrians and vehicles.

More improvements will be made at the intersection of Spring St and High St. The pedestrian crosswalk across Spring St will be extended on the east side of the street and new pedestrian signals and high visibility crosswalks will be added to improve accessibility. A sidewalk will be built on the trolley station property to provide a continuous path of travel from Spring St to the trolley station. Finally, bike lanes will be added along Spring St near the intersection. The design was recently completed for this work – so look for construction to begin in early 2011.

For more information about these intersection improvements, please contact Dirk Epperson at 667.1152 or depperson@ci.la-mesa.ca.us. For more information on how you can participate in the Safe Routes program, please contact Kim Shannon at 667.1319 or kshannon@ci.la- mesa.ca.us.

2011 FLAG DAY PARADE
"A Salute to Old Glory"

We are asking for your help to honor the flag of our country by supporting the 2011 Flag Day Parade "A Salute to Old Glory." The Parade is organized by volunteers and supported financially by community individuals, organizations, and businesses. The cost for hosting the parade is $15,000 and we need financial donations to begin Parade planning and production. The Parade will march through La Mesa Village at 10:00 am on Saturday, June 4th. This parade is one of many events that make La Mesa a special town – we hope you become on of our sponsoring partners!

VIEW DONOR OPPORTUNITIES AND BENEFITS FORM

SAVE THE DATE!

The 2011 Transportation and Mobility Expo will take place on **WEDNESDAY, JUNE 15,** at the La Mesa Community Center. This half-day event is geared toward older adults, adult children of aging parents, and persons with disabilities who want to learn more about transportation resources and mobility options.

More information will appear in the May edition of FOCUS!

VOLUNTEER FOR A CITY BOARD, COMMISSION, OR COMMITTEE

La Mesa residents are encouraged to get involved in local government by serving on a City Board, Commission, or Committee. Please use the links below to review specific information regarding qualifications, requirements for serving, and meeting days and times for each board, commission, and committee.

Commission on Aging
Design Review Board
Environmental Sustainability Commission
Historic Preservation Commission
Human Relations Advisory Commission
La Mesa Community Parking Commission
Planning Commission
Loan Committee for Real Estate Rehabilitation
Personnel Appeals Board
Youth Advisory Commission

You will find an application and can learn more about the roles and responsibilities of the various boards, commissions, and committees by visiting the Boards & Commissions Overview page.

Please consider this opportunity to serve on a board, commission, or committee.

Completed applications must be submitted to the City Clerk's office no later than 5:30 pm, Thursday, June 16, to be included in the June interview process that has been tentatively scheduled for 6:30 pm on Tuesday, June 28. The interview and selection process for the Youth Advisory Commission occurs in September.

Household Hazardous Waste and Electronic Waste Disposal

March 19

This is your chance to safely and properly dispose of paint, electronics, batteries, fluorescent lights, medical sharps, garden products, automotive fluids, and more. See complete list.

These items are considered hazardous and are not allowed to be placed in the trash because of their destructive effect on the environment.

Collection for City residents is available by appointment only, Email EDCO at lmhhw@edcodisposal.com or call 287.5696, extension 4270. Please provide your name, address, and phone number.

To request additional information about the program, please contact the Department of Public Works Environmental Services Division at 667.1338 or email at envirosvcs@ci.la-mesa.ca.us. For more information, visit cityoflamesa.com/hhw.

9th Annual Creek to Bay Cleanup - April 30th 2011

Mark your calendars! Working together with "I Love A Clean San Diego," the City of La Mesa will sponsor and host two creek cleanup sites on April 30 from 9:00 am to 12:00 pm as part of the Creek to Bay Cleanup Day.

Clean up sites will consist of one location along the Alvarado Channel and one location within the Chollas Creek Watershed. At the 2010 event 475 pounds of trash was removed from the Alvarado Channel site and 350 pounds of trash and 10 pounds of recyclables were removed from the University Channel. Combined, 39 volunteers from the local community demonstrated their true concern to protect the environment and also had fun in the process. This year, we hope to increase our collection totals and will give prizes to volunteers who take part in helping clean up our local environment.

For more information, feel free to contact Joe Kuhn, Storm Water Program Manager with the City of La Mesa 667.1340.

SPACE IS LIMITED. REGISTER NOW!

Are you a young person concerned about the environment?

Among the many projects of the Environmental Sustainability Commission is the annual "Sustain La Mesa" Environmental Festival

The City is currently looking for someone to represent the youth population of La Mesa on the Environmental Sustainability Commission. Applicants must live within the city limits of La Mesa and shall be not more than 21 years of age.

The purpose of the Commission is to advise the City Council on how the actions and policies of the City may preserve and enhance the quality of La Mesa's environment, address the effects of climate change and assist in the identification of measures that will improve environmental sustainability in La Mesa and the region.

Applications will be accepted until the position is filled.

If you have any questions about the Commission, please call Greg Humora, Director of Public Works at 667.1146 or the City Clerk's office at 667.1120.

fostering the arts in our community

CONVENIENT RECYCLING FOR APARTMENTS AND CONDOS

The City of La Mesa has received a grant for $113,000 from the Department of Resources Recycling and Recovery (CalRecycle) to improve recycling opportunities for apartment and condominium complexes. Under the grant, eligible properties may receive indoor/outdoor recycling receptacles for use in common areas, can crushers and/or smaller below-the-counter containers for indoor use. The goal of the grant is to increase recycling opportunities for items with a California Redemption Value (CRV) such as beverage containers. Notices of the program inviting participation will be mailed directly to property owners and managers.

Look for your eligibility notice and the program flyer in the mail in the coming months. For more information about the program or to be placed on the participation list, please contact the Department of Public Works Environmental Services Division at 667.1338 or by email at envirosvcs@ci.la-mesa.ca.us. Find additional resources and information at cityoflamesa.com/environmentalawareness.

2011 SPRING CLEAN UP

Want to clean out the garage or spruce up the yard but don't know what to do with all that stuff? Bring it to the annual Spring Clean Up event being held on two Saturdays in April – It's free to City of La Mesa residents!

The event will be held from 7:00 am to 2:00 pm at EDCO Station, located at 8184 Commercial Street. Proof of residency is required, so bring a California Driver's License showing your La Mesa address.

If you live SOUTH of Interstate 8, your clean-up day is April 9

If you live NORTH of Interstate 8, your clean-up day is April 16

This is your opportunity to dispose of old appliances, broken or unwanted furniture, reusable items, landscape material, waste debris from improvement projects, trash and yard waste, or just plain junk.

There are some restrictions on the items than can be accepted.
We will NOT accept waste from businesses, contractors or professional landscapers.

For questions please call 667.1338 or email envirosvcs@ci.la-mesa.ca.us.

La Mesa Seeks Contestants for 2011 Pageant

On Friday, March 4 the cities of La Mesa and Santee will hold one of their most grand traditions, the Miss La Mesa and Miss Santee Pageants. Pageant organizers are currently seeking outgoing women ages 13-26 to participate in a program that has been a tradition in the cities since the late 1960's and is an outstanding mentoring program for young women. The pageants are sponsored by the local Chamber of Commerce and focus on community service. There is no swimsuit competition and there is no entry fee to participate.

Miss La Mesa and Miss Santee 2011 will each receive at $1,000.00 scholarship while Miss La Mesa Teen and Miss Santee Teen 2011 will each receive a $500.00 scholarship. Scholarships are funded through the successful "Fashion Rocks the East" fashion show fundraiser held at the La Mesa Community Center in August 2010.

For more information including information on the Princess Program for girls ages 6-16, or to become a contestant please contact pageant director, Alexandra Kuty at 698.4163 or via email MissLaMesaPageant@yahoo.com.

St. Patrick's Day Celebrate Responsibly

St. Patrick's Day is a holiday often celebrated by wearing green clothing and getting together with family and friends to celebrate the day with food and drink.

While most show restraint during the holiday, some take it upon themselves to consume too many alcoholic drinks.

The serious problem with drinking and driving is that most people who have had a few drinks feel like they are fine to drive, when in fact they are impaired and pose a significant danger. A general rule of thumb is in order for someone to likely not be impaired; they should drink no more than one normal size alcoholic drink per hour.

Law enforcement agencies throughout the State of California are on the lookout for drivers driving under the influence of alcohol and/or drugs every day and night throughout the year.

The La Mesa Police Department encourages people to celebrate with restraint and responsibility.

HERE ARE SOME SUGGESTIONS:

- **Establish a designated driver among friends and family.**
- **Rent a limo for the evening. Share the cost of the limo service with friends/ family and let the driver get you to your destination safely.**
- **Take the trolley. The trolley runs throughout San Diego, and maybe with a short cab ride to and from the trolley station you can get to your destination safely.**

Abandoned Shopping Carts an Unsightly Nuisance

We all use shopping carts, thus we all share responsibility in keeping shopping carts in their proper place. In the City of La Mesa it is illegal to remove a cart from the premises of a business.

If you see a cart that has been abandoned 1 – Please note the cart owner and the location. (Example: a Vons cart at the intersection of Jackson Dr and Fletcher Pkwy). 2 – Call the store manager and notify them of the cart location. 3 – If shopping carts are not picked up in a reasonable period of time, call the California Shopping Cart Retrieval Corporation (CSCRC) at 800.252.4613. The CSCRC will typically pick up the cart(s) within 2-3 days. If you have any questions please call the City of La Mesa Planning Division, 667.1177.

Outdoor Wedding Venues

Springtime wedding plans naturally turn thoughts to an outdoor wedding that is beautiful and romantic. Lush grass, trees, and plants are natural decorations as the bride and groom exchange vows in a park setting that they have chosen for their special day.

The City of La Mesa offers two scenic locations for an outdoor wedding. The Amphitheatre at Harry Griffen Park sets the stage with a gazebo where the bride may wait until she makes her entrance walking down the paved path to join her groom. Seating for up to 350 guests face the staging area where the wedding party awaits.

The West Terrace Patio at the La Mesa Community Center offers another choice for an outdoor wedding. Vine-covered red brick columns edge a semi-circular patio that overlooks a golf course. White fan-back chairs provide seating for up to 150 guests, and a decorated trellis is available to provide a frame for the bride and groom as they exchange vows.

An outdoor wedding can be the dream wedding for many couples. If you would like additional information and pricing for La Mesa's outdoor wedding sites, please call the Facilities Specialist at 667.1307.

COUNCIL ACTIONS

October 12, 2010

Adopted a resolution authorizing the acceptance of Grossmont Healthcare District Grant Funds in the amount of $4,930 for the provision of equipment and services for transmission of patient EKG data to the hospital.

Adopted an Ordinance amending La Mesa Municipal Code Section 8.04.060 pertaining to animal noises.

Adopted a resolution confirming the appointments of applicants to various City boards, commissions and committees.

October 26, 2010

Adopted a resolution to adopt a policy for the painting of address numbers on curb faces in the City of La Mesa.

Adopted a resolution amending Sections 12.44.060(b) and 12.44.070 of the La Mesa Municipal Code to allow diagonal parking on a portion of Wilson Street and adding streets to the list of streets designated for diagonal parking.

Approved the designation of the property located at 9125 Dillon Drive as a historic landmark and established a Property Preservation (Mills Act) Agreement for the site.

CIVIC CENTER STREETSCAPE IMPROVEMENTS

Street and landscape improvements were recently completed on Allison Avenue west of Spring Street.

Crosswalks on Allison Avenue at Date Avenue by City Hall and in front of the La Mesa Library improve pedestrian access to those buildings.

STREET RESURFACING & SIDEWALK ADDITIONS

There will soon be fewer potholes to fill and safer paths for La Mesa pedestrians. Sixteen collector streets will be resurfaced within the next year as well as two new sidewalks installed along busy streets. This project alleviates the ongoing problem of potholes along these streets and addresses pedestrian safety concerns in two high traffic areas.

Portions of the following streets [as shown on the map] will be affected by resurfacing:

- Center Street
- Guild Street
- Commercial Street
- Center Drive
- Marengo Avenue
- Dallas Street
- La Mesa Boulevard
- Bancroft Drive
- Waite Drive
- Yale Avenue
- Orien Avenue
- Lowell Street
- Normal Avenue
- Parks Avenue
- Dale Avenue
- Lee Avenue

The resurfacing process will grind out approximately two inches of existing asphalt and replace it with new asphalt to provide these streets with many more years of comfortable travel.

Continued on page 2

Graffiti Tracker and Graffiti Reporting

In 2011 the La Mesa Police Department received a new tool to combat graffiti. The tool is called Graffiti Tracker and it was approved by the City Council to enhance the City's anti-graffiti program. Graffiti Tracker gives police the ability to track graffiti suspects countywide. How it works is each law enforcement agency in the County downloads graffiti photographs from their area into a central database. These photographs can then be viewed and compared to known suspects using the same type design, moniker, or image. This makes it easier for police to build a case against a suspect and obtain court ordered restitution for the crime.

In addition to the Graffiti Tracker Program, the City Council approved transfer of $1,000 from the Police Department's Donation fund to the San Diego County Crime Stoppers fund. This provides the ability to offer financial rewards for information related to graffiti vandalism in La Mesa.

The La Mesa Police Department receives hundreds of vandalism calls for service each year. The majority of these calls involve some form of graffiti on either public or private property. The Police and Public Works Departments do their best to quickly clean or paint over the graffiti on public property and encourage private citizens and business owners to take care of graffiti quickly on their own property.

Here are several ways to report graffiti:

- *Call the non-emergency Police Department line at 667.1400*
- *Call the Graffiti Hotline at 466.3789 and report the location of the graffiti*
- *Go to cityoflamesa.com, click on "Report a Problem" on the left side of the screen, select the "Police" section for non-emergency requests and follow the prompts*

LA MESA FLAG DAY PARADE

"A Salute to Old Glory"

Saturday, June 4 • 10:00 am

Best viewing along La Mesa Blvd. in the Downtown Village

Thanks to our major donors who make this year's event possible:
Drew Ford, Sycuan Band of the Kumeyaay Nation, Viejas Enterprises, Robert & Laura Duggan, Pamela Wagner, South Baltimore LLC, Shannon O'Dunn, EDCO, Barona Band of Mission Indians

Street Resurfacing Continued from page 1

Sewer repairs will be performed on Center Street and Commercial Street prior to resurfacing. Additionally, the first phase of undergrounding overhead utilities on Normal Avenue will take place as conduit is installed for the electrical and communication cables. The second phase will be to install cables, remove the poles, and install new street lights. This phase is expected to take another year to complete.

One new sidewalk project will occur on Waite Drive and Murray Hill Road connecting the existing sidewalk on Murray Hill Road to High Street. This is a very busy route for students walking to Helix Charter High School. The second new sidewalk project will be on Bancroft Drive from Spice Street to Johnson Drive. This will complete a missing section of sidewalk along that major street.

The entire resurfacing and sidewalk project will take approximately one year to complete. Residents can receive updated information as it becomes available by signing up for Nixle, a La Mesa e-Gov service, through the City website.

CITY OF LA MESA AWARDED FOUR GRANTS

The City was recently awarded four grants totaling $182,233 from the San Diego Association of Governments (SANDAG) as part of the County's distribution of $16 million received through the Centers for Disease Control and Prevention Communities Putting Prevention to Work Program. "We are proud to have received funding for all four of the proposals the City submitted," reported Assistant City Manager Yvonne Garrett. Funding received will be used for the following projects:

- $75,000 Healthy Community Planning Grant for a citywide Parks Master Plan
- $50,000 Active Community Transportation Grant for a study "Closing the Last Half Mile" that will identify barriers to walking and biking in the community and develop a prioritized plan to improve La Mesa residents' access to transit service points
- $47,583 Safe Routes to School Capacity Building and Planning Grant for a citywide Safe Routes to School Implementation Plan that will provide a training curriculum and recruitment program walking school bus and crossing guard volunteers in the "La Mesa Kids Walk & Roll to School" Safe Routes program
- $9,650 Safe Routes to School Education, Encouragement, and Enforcement Grant to conduct "WalkShops" to engage middle school students in the official planning process to create a prioritization list of infrastructure improvements that will encourage walking and biking to school

Projects began in April with completion scheduled for the end of the grant program period in February 2012.

UPDATE

La Mesa Kids Walk & Roll to School

Workshops have been held at six elementary and two middle schools in La Mesa to map barriers to walking and biking at each school and prioritize mitigation projects as part of La Mesa Kids Walk & Roll to School – Safe Routes to School Grant Program. Two additional grants recently awarded to the City will serve to enhance this Safe Routes program through 1) development of a training curriculum and recruitment plan for volunteers at each school; and 2) special workshops specifically conducted to engage and involve middle school students who represent the lowest number of students walking and biking to school.

WANT TO MAKE A DIFFERENCE IN YOUR COMMUNITY?

Volunteer for a City Board, Commision, or Committee

The City of La Mesa is currently seeking La Mesa residents interested in serving their community by becoming a member of a City board, commission, or committee.

The City encourages citizen participation in municipal government and welcomes your interest in serving on a board, commission, or committee. These groups provide valuable public input into government and assist in the decision making process.

Recruitment is currently open for appointments on the City's boards, commissions, and committees. Serving in an advisory capacity, each group has specific roles and responsibilities. Most advisory groups meet once a month for a couple of hours. Use these links to learn more about the various boards, commissions, and committees:

Building Codes Review Board
Commission on Aging
Design Review Board
Environmental Sustainability Commission
Historic Preservation Commission
Human Relations Advisory Commission
La Mesa Community Parking Commission
Loan Committee for Real Estate Rehabilitation
Personnel Appeals Board
Planning Commission
Youth Advisory Commission

Applications and specific information regarding qualifications, requirements for serving, and meeting days and times are available on the City's website, by visiting the City Clerk's office at City Hall, 8130 Allison Avenue, or by calling the Clerk's office at 667.1120.

Applications must be submitted to the City Clerk's office no later than 5:30 pm, Tuesday, June 7 to be included in the interview process tentatively scheduled for 6:30 pm Tuesday, June 28. The interview and selection process for the Youth Advisory Commission will occur in September.

Spring, Gardens, and Storm Water Pollution?

Summer is not too far away and flowers are beginning to bloom, but did you know your garden maintenance activities may be a threat to our environment? Yes, your activities may be compromising water quality in nearby streams and creeks such as the San Diego River or Chollas Creek. Simple modifications to your gardening technique can keep pollutants from being introduced into the environment and our receiving water bodies without compromising the aesthetics and health of your landscape. Here are some garden tips:

Change the Spray! Make bug sprays from garlic, onions, horseradish, hot pepper, and/or mint. There are many non-toxic organic remedies that may be used to kill insects. Many commonly available chemical pesticides can increase toxicity in our local creeks when they are washed off by rainwater.

Go Natural! Attract or acquire bugs that feed on pests. Ladybugs, praying mantis, and parasitic wasps are just a few insects that are beneficial in reducing pests that destroy your garden. Plants such as mints, catnip, and marigolds also make great insect deterrents.

Compost It! Eliminate the need for pesticides and synthetic fertilizers by adding two inches of compost to the top six to eight inches of topsoil. This improves the quality of your soil and produces plants that are healthier and more resistant to pests and diseases.

Grow Native! Native vegetation is suited for the terrain and rainfall we receive in Southern California. Planting varieties of sage, laurel sumac, buckwheat, monkey flowers, and other natives requires less irrigation, fertilizers, and pesticides because they are less prone to disease.

Try some of the above methods and know that you are eliminating many of the pollutants that make their way through the storm drain system to nearby creeks and ultimately to the ocean. Moreover, you will have removed harmful toxins from your home garden and created a healthier environment for your family!

CITY OF LA MESA PRESCRIPTION DISCOUNT CARD

Lower the cost of your prescriptions and start saving today! The City of La Mesa has partnered with the National League of Cities to offer this free Prescription Discount Card. It's easy to use and can be used any time your prescription is not covered by insurance. The program includes:

- Average savings of 20%
- It's FREE, no enrollment or membership fees
- All family members are covered
- Even some pet prescriptions are covered
- No limit on how many times you use the card
- Accepted by 9 out of 10 pharmacies

For more program information visit www.caremark.com/nlc or call toll free 1.888.620.1749.

It's easy to get a card from the Internet, go to www.caremark.com/nlc, select 'Print a Card Now' and follow the easy steps. Cards are also available at the following locatio La Mesa Community Center, and La Mesa Adult Enrichment Center.

- Staples ok
- Shredding will be done onsite by ShredEx
- No appointment necessary

This City event is made possible through the generous support of the EDCO Disposal and ShredEx. Questions can be directed to 619.667.1167.

Are You Ready for Kitten Season?

Kitten Season is the time of year when cats give birth, flooding animal shelters and rescue groups nation wide. La Mesa Animal Control receives an influx of kitten calls during spring every year, usually starting in May.

Kitten season presents many challenges for shelters and rescue groups caring for cats. Resources already hard to come by—like food, money, and space—are often stretched to their limit as shelters and other rescue groups, which often take in thousands of animals every year, are inundated with homeless cats. The easiest way to help reduce the overwhelming numbers of unwanted cats is to spay and neuter your own cat and encourage others to do the same.

If you know that a litter of kittens has been orphaned, or you have found a sick or injured kitten, it is best to call La Mesa Animal Control at 667.7536 or the El Cajon Animal Shelter at 441.1580 for assistance.

F R E E E V E N T !

And our community partners: La Mesa Park & Recreation Foundation, Readers Inc., La Mesa Branch Library, and Friends of the La Mesa Library

Rides4Neighbors

Enhancing Community Mobility

Did you know?

- On average, men outlive their ability to drive by 6 years and women outlive their driving ability by 10 years.
- More than 600,000 people age 70+ stop driving each year.
- By the time the youngest baby boomers turn 65 in 2029, 1 in 5 Americans will be 65 or older. The percentage of 85-year-olds will grow even faster.

Participants learn practical skills to maintain their independence

Remaining independent as they age is a concern of many La Mesa residents. What happens when they are no longer able to drive? Under a SANDAG grant awarded to the City of La Mesa, the Rides4Neighbors program developed a unique solution for adults who are 60+ or disabled to address their concerns.

"Travel San Diego" is a group travel training program educating adults on how to confidently and safely use public transportation. Successfully piloted in 2010, classes are held over a nine-week period teaching adults the logistics of using buses, trains, and trolleys. The goals of the program are to develop confidence, knowledge, and skills so participants can independently use public transportation in their daily lives and remain mobile within the community.

The program begins with an orientation on fare cards, schedules, personal safety, and transportation resources. Subsequent classes are conducted in the community and include trips to Encinitas, Coronado, Chula Vista, and El Cajon.

Each trip is designed to build practical skills needed to travel independently throughout San Diego County. Traveling as a group provides participants with social interaction, physical activity, and knowledge of public transportation. By the end of the program participants have extensively used buses, trolleys, and learned to plan trips. What do participants say? "It's expanded my world," "I'm able to go places without worrying about driving and parking," "My fare card is magic."

Perhaps you have a family member or know of someone in the community who can benefit from the program. If so have them contact Judi Bonilla, Travel Trainer at 667.1322 for more information.

SMOKE ALARM SAFETY

FACTS: Roughly two-thirds of home fire deaths occur in homes without smoke alarms. Working smoke alarms cut the risk of dying in reported home fires in half.

SAFETY TIPS: Install smoke alarms inside every bedroom, outside each sleeping area, and on every level of the home, including basements.

Replace batteries in all smoke alarms at least once a year. If an alarm "chirps" a low battery warning, replace it right away.

DON'T FORGET: All smoke alarms should be tested at least once a month using the alarm's test button.

More information is available from the National Fire Protection Association at www.nfpa.org/education.

Adult Softball

REGISTRATION

Leave your name and daytime telephone number at 667-1172 #6

Last day to register new teams for fall is July 29

Team rosters will be issued once teams have registered.

Fee: $525 for season payable in full at time of registration. Umpire fees not included - $15/game each team

Visit the City website for additional information regarding registration and season schedule.

(18 years and older)

Cut Out FOG!

FOG refers to the Fats, Oil, and Grease that can solidify and clog drains and pipes. FOG is the City's number one maintenance problem in sewer pipes. Clogged sewer laterals are the responsibility of property owners and repairs can be costly. This problem can be minimized if we all do our part. Dispose of FOG in the proper manner; don't pour it down the drain! For more information concerning FOG control methods or questions concerning the City's Food Service Establishment FOG program visit cityoflamesa.com/FOG or call 667.1340.

Questions? Call La Mesa Community Services at 667-1300.

PHONEBOOKS WILL BE APPEARING

Surprised to find another yellow pages at your door? If you are wondering why you get so many, or any at all in the age of Internet - you have control! Delivery of Yellowbook phone books will be taking place during the months of May and June. By registering at http://www.yellowpagesoptout.com, a collaborative of the Yellow Pages Association and the Association of Directory Publishers, you can opt out of any or all of the different yellow pages that are delivered. Help sustain La Mesa by saving resources and reducing the number of unwanted phonebooks printed.

Not sure what to do with all those old books? Recycle them! Phone books are 100% recyclable through EDCO's recycling program available to all residents and businesses in La Mesa. Just drop them in your blue recycling bin or dumpster and EDCO will do the rest.

CITY HONORS VETERANS

The La Mesa City Council has been honoring veterans of major military actions since January as part of an effort to recognize our armed forces. The City of La Mesa will be designating a portion of Fletcher Parkway, one of our main thoroughfares, as "Veterans Memorial Parkway" by adding three signs along the parkway. The project does not change the name of Fletcher Parkway. This picture shows how the existing sign at Baltimore and Fletcher Parkway will be modified to include the new designation. A monument sign will be added on Fletcher Parkway and Dallas and a vehicular sign at Fletcher Parkway and Grossmont Center will complete the additions. A Veterans Memorial Recognition Committee has been meeting since June 2010 to plan and raise funds for the project. The community has raised nearly $10,000 and the City has matched up to $13,000 for the project.

The signs will be unveiled at a festive ceremony on Friday, June 3 at 10:00 am at Parkway Middle School, 9009 Park Plaza Dr. The ceremony will be preceeded by a FREE pancake breakfast to be held at La Mesita Park, 8855 Dallas St. from 8-9:30am, hosted by the La Mesa Firemen's Association. Please RSVP attendance for the breakfast by calling 667-1105 or email cmoff@ci.la-mesa.ca.us. We will continue honoring our country's freedom the next day at the La Mesa Flag Day Parade. See page 2 for parade information.

COUNCIL ACTIONS

January 11, 2011

Ratified the Design Review Board's approval of DRB-07-31 (Schmidt / Naranjo) and approval of the Negative Declaration for a proposed 4-unit condominium project on two parcels located at 4740 Hillcrest Avenue.

Ratified the Design Review Board's approval of DRB-10-13 (Banks & Banks Fiduciary Services) for proposed exterior alterations to a commercial building at 8270 La Mesa Boulevard.

Ratified the Design Review Board's approval of DRB-03-04 (Zephyr Partners) for proposed modifications to an approved 36-unit residential development on an 8.34-acre site located between Massachusetts and Orien Avenues.

Adopted a resolution updating and approving revised penalties pertaining to the City's civil parking penalty schedule pursuant to state law.

Adopted a resolution implementing the National League of Cities (NLC) prescription discount card program for a one-year trial period.

January 25, 2011

Adopted a resolution authorizing the filing of grant applications under the Communities Putting Prevention to Work program through the San Diego Association of Governments, accepting the terms of the grant agreement, and stating the assurance of the City of La Mesa to complete the project(s) by February 1, 2012.

Approved a Memorandum of Understanding between the San Diego Sheriff's Department and the La Mesa Police Department for the operation Stonegarden Grant for reimbursement of expenses related to regional border crime enforcement.

Adopted a resolution adopting the Athletic Fields Capital Improvement Plan User Fee

February 8, 2011

Adopted a resolution authorizing the Chief of Police to enter into a Memorandum of Understanding between the Police Department and the County of San Diego for the San Diego County Regional Gang Enforcement Collaborative Grant.

Approved an extension of amplified sound on March 17, 2011 from 10:00 p.m. to 12 a.m. in accordance with La Mesa Municipal Code Section 10.80.170(B) for a special event sponsored by Hooley's Irish Pub and Grill.

February 22, 2011

Adopted a resolution authorizing execution of an easement agreement with AP-Fletcher Parkway LLC, and payment of a lump sum amount to compensate for removal of existing landscaping necessary for sewer construction.

Adopted a resolution authorizing the Mayor to execute the cooperative agreement to form a HOME Consortium.

Approved the enhancement of the existing entry monument sign at Baltimore and Fletcher Parkway; construction of a new entry sign near the eastern border of the City; the addition of a vehicular sign to Fletcher Parkway; and adopted a resolution allocating $13,000 from the unallocated general fund to pay for three signs designating Fletcher Parkway as a Veterans Memorial Parkway.

Adopted a resolution authorizing the Chief of Police to receive relinquished prescription medications for destruction.

March 8, 2011

Adopted a resolution authorizing contract Change Order No. 1 to PBS&J for amendment of environmental study and permits for the Massachusetts Avenue and Boulevard Drive Sewer Upgrade Project.

March 22, 2011

Accepted the 2010 Annual Report – Implementation of the General Plan and authorized staff to transmit the report to the state Office of Planning and Research and Department of Housing and Community Development.

Adopted a resolution authorizing the application and acceptance of funding from the California Department of Resources Recycling and Recovery for beverage container recycling and litter abatement projects for City facilities, parks, and other public places and the reduction and diversion of household hazardous waste through used oil collection center support and public education.

Adopted a resolution accepting Bid 10-04 and awarding a contract for the 2011 Collector Street Resurfacing Project to TC Construction Company and allocating Wastewater Fund reserves to the project.

Adopted a resolution authorizing the execution of an agreement to perform construction inspection services for the 2011 Collector Street Resurfacing Project with Infrastructure Engineering Corporation.

Adopted a resolution authorizing the execution of an agreement to perform materials testing services for the 2011 Collector Street Resurfacing Project with GEOCON Incorporated.

Adopted a resolution authorizing the acceptance of the FY07 State Homeland Security Grant Program (SHSGP) grant of $43,579 for terrorism preparedness.

SUN VALLEY GOLF COURSE

5080 Memorial Drive

7:00 am to Sunset • 7 Days a Week

Adults $10 for 9 holes, $14 for 18 holes

Students* $8 for 9 holes, $12 for 18 holes

*(*includes college with valid student ID)*

Clinics, lessons, and special programs are available.

For details go to **www.sunvalleygolfclub.com** or call 466.6102

City of La Mesa
Storm Water Pollution Prevention
Tips for Outdoor Vendors

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying storm water runoff into receiving water bodies, such as creeks, lakes and oceans. Unlike the sewer system, storm water runoff entering the storm drain system is not treated. Harmful pollutants, as listed below, can be transported during non-storm water discharges such as hosing down side walks or equipment. These types of pollutants are harmful to the environment and negatively impact water quality, aquatic animal and plant life as well as our quality of life. Non-storm water discharges are prohibited and in violation of the City Ordinance. A list of common pollutants and pollution prevention tips are provided below.

Pollutants of Concern

1. Sediment
2. Fertilizers
3. Metals
4. Detergents
5. Pesticides
6. Organic Compounds (solvents)
7. Trash and Debris
8. Oil and Grease
9. Bacteria

Good House Keeping

- Dry sweep exterior paved areas. **Do not use a hose or water!** Place debris in dumpster and keep dumpster lid closed.
- If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer system (sink or toilet). Wash water is not allowed to enter the storm drain.

Outdoor Material and Equipment Management

- Store material under covered areas.
- Place liquid material in secondary containment to ensure spills are contained.
- Ensure that frying oil is contained and managed properly without dropping/leaking on to the pavement.
- If using frying oil, ensure that you purchase absorbent material (absorbent pads) to address cleanup of potential oil spills.
- Inspect/fix equipment to ensure no leaks.
- Do not wash equipment at the event!

Waste Management

- Place trash in dumpsters with lids always closed.
- Cleanup leaks/spills immediately and place waste material into the dumpster

Should you require clarification or additional information on storm water pollution prevention, please contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.2

OVER IRRIGATION FACT SHEET

City of La Mesa
Storm Water Pollution Prevention
Over-Irrigation

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

With La Mesa's clay soils, it doesn't take much to moisten the ground before water starts running off your property to the curb, down the street and into the storm drain. Runoff from over-irrigation may transport pollutants such as sediment, pesticides, fertilizers, pet waste, bacteria, and automobile fluids. These pollutants enter our local creeks and streams and discharge into the ocean.

Over-irrigation is not prohibited; however, the following measures are recommended.

1. Over-irrigation runoff shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Irrigate to meet site-specific conditions to prevent over-watering.
3. Ensure that your irrigation system has control devices, sensors or shut-off switches to address malfunctions.
4. Place or group plants with similar water needs within the same area.
5. Don't irrigate non-planted areas.
6. Inspect your irrigation system regularly for potential problems
7. Consider drip irrigation to save water and prevent over-irrigation and runoff.
8. Adjust irrigation rates according to seasons, weather conditions and the soil's ability to absorb water. Instead of watering for 15-minutes straight, break up the session into 5-minute intervals, allowing water to soak in before the next application.
9. Irrigate in the early morning; it's the most efficient time to water plants with minimal evaporation.
10. Refrain from irrigation during hot, windy periods of the day. Do not let water run out into the street.

Do the right thing, stay in compliance and protect our environment. For more information contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.3

CHOLLAS CREEK TMDL FACT SHEET

Chollas Creek TMDL Fact Sheet

What are the Chollas Creek TMDLs?
In 2003 and 2007, Total Maximum Daily Load (TMDL) allocations for the pesticide diazinon and for heavy metals (copper, lead, and zinc), respectively, were adopted by the Regional Water Quality Control Board (a State Regulatory Agency) for Chollas Creek. The regulations establish strict numeric limits on the amounts of heavy metals and diazinon that can be present in urban runoff. Southwestern La Mesa, roughly bounded by El Cajon Boulevard to the north and Spring Street to the east (see map), eventually drains to Chollas Creek and is subject to these requirements. Businesses within this area are impacted by these new requirements. The City is monitoring water quality near your business to identify and eliminate sources of these pollutants to comply with new State regulations. The following activities/sources contribute to the discharge of heavy metals and diazinon.

Heavy metals are commonly associated with industrial waste, uncontained storage of certain metal products or materials (such as galvanized steel), cutting and grinding activities, atmospheric deposition, metal smelting or plating, and automobile tires and brakes.
Diazinon is a pesticide associated with landscaping activities. It has been banned for use and is no longer available at retail outlets. Diazinon acquired prior to the ban should be disposed of in accordance with state and federal regulations.

What is the City of La Mesa doing about these TMDLs?
The City's many efforts to protect water quality and comply with State regulations include regularly sweeping its streets and cleaning out its storm drain system, inspecting businesses and construction sites, and applying strict water pollution control standards to new development projects.

What do these TMDLs mean for my business?
The City's Municipal Code requires that businesses take measures to ensure that urban runoff (water that leaves your business and enters storm drains) is not contaminated with pollutants. Chapter 7.18 of the Municipal Code requires businesses to implement measures including those listed below. Taking these actions will help meet TMDL requirements.

- Eliminate non-storm water discharges, such as hosing off property and allowing the water to leave the site, dumping liquids into a storm drain, and runoff from excessive irrigation.
- Cover and contain metal products or materials that may contain heavy metals where feasible. Examples of such materials include galvanized metal, brake pads, tires, and metal recycling bins.
- Conduct metal cutting, grinding, welding, automotive or equipment repair, and similar activities in indoor, contained areas where feasible.
- Regularly sweep paved areas of your site to keep them clean and dispose of debris appropriately.
- Do not use any product containing diazinon. Contact County of San Diego Hazmat for instructions on proper disposal (619-338-2231).
- Store all pesticides and fertilizers in covered and contained areas. Consider alternative, non-chemical pest control methods.
- Do not apply pesticides before storms and eliminate overspray of pesticides onto paved surfaces.

If you observe illegal dumping into a storm drain, please report it to the City at 619-667-1134.

ATTACHMENT 8.4

RESIDENTIAL PREVENTING URBAN RUNOFF POLLUTION BROCHURE

Sanitary Sewer vs. Storm Drain System

The water that drains down a sink or toilet in a home or business flows to the sanitary sewer and is treated by the City of San Diego at a wastewater treatment plant.

The storm drain system, on the other hand, is designed to carry rainwater from City streets and driveways to prevent flooding. This water does not receive any treatment. It flows directly to creeks and rivers – terminating at the Pacific Ocean!

Unfortunately, as rainfall flows over the ground it picks up debris and pollutants and deposits them into our watersheds.

Preventing Urban Runoff Pollution

A Guide for Residents

Urban storm water runoff is the **largest contributor** to **watershed pollution** in San Diego County.

The City of La Mesa's Storm Water Ordinance Requires the implementation of **Best Management Practices** (BMPs) to prevent urban runoff pollution.

The City monitors activities within the City's jurisdiction and may take enforcement measures to ensure the prevention of urban runoff pollution.

Pollutants of Concern

As rainfall flows over the ground, it picks up a variety of pollutants and deposits them into our watersheds. The following pollutants are commonly transported in the storm drain system and have been found to degrade water quality.

- Sediments
- Fertilizers
- Metals
- Detergents
- Pesticides
- Organic Compounds (solvents)
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

The following Best Management Practices (BMPs) are required to be used in residential areas to reduce urban runoff pollution in our streams and waterways. To do your part in protecting our water quality, please implement the following BMPs, where applicable or checked by the City inspector.

Maintenance & Good Housekeeping

- ❑ Regularly, dry sweep exterior paved areas. **Do Not use a hose!** Place debris in the dumpsters.
- ❑ If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer (sink or toilet).
- ❑ Water used for cleaning exterior surfaces must be contained and disposed of into the sanitary sewer in compliance with local regulations. Wash water is not allowed to enter the storm drain or leave the property.
- ❑ Regularly inspect and maintain storm drain inlets.

Landscaping

- ❑ Only irrigate during early morning or late evening to avoid evaporation.
- ❑ Aim sprinklers to avoid watering other areas.
- ❑ Time sprinklers to avoid over watering and causing runoff.
- ❑ Minimize pesticide, herbicide and fertilizer use, which are harmful to animals downstream.
- ❑ Hand pull weeds instead of using herbicides.
- ❑ Do not use pesticides that eliminate beneficial insects (i.e., Integrated Pest Management).

Outdoor Material Storage

- ❑ Store all material indoors or under a covered area not exposed to rain. Include secondary containment for liquid material.
- ❑ Have a spill response kit available to clean up potential spills such as kitty litter or other absorbents.
- ❑ Keep material storage areas free from rainwater accumulation.
- ❑ Keep lids closed on all outdoor storage containers and ensure containers are labeled.

Waste Management

- ❑ Keep all outdoor garbage and dumpster areas free of trash, sediment and debris.
- ❑ Keep lids closed on dumpsters and trash cans and never wash down dumpsters.
- ❑ Fix any leaks in garbage cans or dumpsters.
- ❑ Schedule regular waste pick-up.

Vehicle /Equipment Maintenance

- ❑ Perform all vehicle maintenance indoors when possible.
- ❑ Use drip-pans to collect fluids from leaky vehicles.
- ❑ Clean up spills immediately using kitty litter or other absorbents. Properly dispose of used absorbents.

Vehicle /Equipment Washing

- ❑ Wash vehicles at a commercial car wash when possible. (Commercial car washes drain to the sanitary sewer and not to the storm drain).
- ❑ Wash vehicles over a pervious (absorbent) surface such as dirt, gravel or grass to prevent runoff.
- ❑ Minimize the use of soaps and water while washing.
- ❑ Protect storm drains or curb inlets and then collect all wash water by vacuum. Recycle or dispose of wash water via the sanitary sewer system.
- ❑ Drain excess wash water to the sanitary sewer (sink or toilet), not to storm drains.

Loading Areas & Operations

- ❑ Load and unload in designated areas.
- ❑ Regularly dry sweep loading and unloading areas.
- ❑ If possible, cover loading areas.
- ❑ Divert storm water away from all loading and unloading areas.
- ❑ Check shipments and trucks for leaks and spills.
- ❑ Cleanup spills/leaks immediately and dispose of properly.
- ❑ If you must use water for cleaning, use a mop and bucket and dispose of wash water into the sanitary sewer.
- ❑ Major cleaning of exterior surfaces must include capturing all wash water and disposing of it into the sanitary sewer in compliance with local regulations. Wash water should not be allowed to enter the street gutter or storm drains.

POOL AND SPA FACT SHEET

PUBLIC WORKS DEPARTMENT / ENGINEERING DIVISION
8130 Allison Avenue, La Mesa, CA 91942
Phone: 619.667.1166 • Fax: 619.667.1380

City of La Mesa
Storm Water Pollution Prevention
Pools & Spas

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

Discharging of pool or spa water is not prohibited; however, the following measures are required.

1. Water shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Pool water must be dechlorinated
3. Water pH acceptable range from 7 to 8
4. No algae present in water
5. Water shall not contain chemicals to counteract the chlorine
6. Water does not contain hydrogen peroxide based products
7. Controlled discharge eliminating potential for erosion

Chlorine

Test pool or spa water for chlorine prior to discharge. Chlorine naturally dissipates overtime and if pool or spa water is left 3 to 5 days, it will become dechlorinated. Pool water needs to be drained before it turns green. Draining pool water gradually over landscaped areas will help prevent erosion problems.

Pool Filters

Pool filters should be cleaned over landscaped areas or anything that will absorb the discharge. Material may be collected over a filter cloth and disposed of in the trash. Filter backwash must be discharged into the sewer system with a pH of 5 to 12.5.

Pool Construction

Material must be contained and disposed of appropriately. Waste generated from plaster, gunite, cement, sediment, and other construction materials is prohibited from entering the storm drain system.

Do the Right Thing, Stay in Compliance and Protect Our Environment. For more information, contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.6

INTEGRATED PEST MANAGEMENT CARDS

Ants

Ants are one of the most prevalent pests in California. Although ants are annoying when they come indoors, they can be beneficial by feeding on fleas, termites, and other pests in the garden. While spraying chemicals inside the house may seem effective, it won't prevent more ants from entering your home, which is essential for control because most ants nest outside. Focus management efforts on excluding ants from buildings or valuable plants.

Make your house less attractive to ants:

- Caulk cracks and crevices that provide entry inside.
- Store attractive food in closed containers.
- Clean up grease and spills.
- Look for and remove indoor nesting sites, such as inside potted plants.
- Ant-proof kitchen garbage pails with sticky barriers such as petroleum jelly under the lip and pet dishes by placing them in a moat of water.
- Remove sweet food sources next to your house such as aphid-infested bushes and ripened fruit on trees.

When ants invade your house, take these steps:

- Sponge invaders with soapy water as soon as they enter.
- Plug up ant entryways with caulk or petroleum jelly.
- Remove infested potted plants.
- Clean up food sources.
- Rely on baits to control the ant colony.
- Indoor sprays are not usually necessary.

How and why baits work best:

When using bait, place it along ant trails and at nest openings. Worker ants will be attracted to bait and take it back to the nest where the entire colony, including queens, may be killed. The bait must be slow-acting so workers won't be killed before they get back to the nest. It may take several weeks for results to be evident. Just killing workers foraging in your home or garden does little to control the colony, because as few as one percent of a colony's foraging worker ants are able to provide sufficient food to support nestbound queens and larvae. Baits in bait stations or ant stakes are easiest to use and safest for the environment.

(actual size)

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Aphids

HEALTHY GARDEN HEALTHY HOME

Almost every plant has one or more aphid species that occasionally feeds on it, but low to moderate numbers of aphids are usually not damaging in gardens or on landscape trees. Although aphids can curl leaves and produce sticky honeydew, they rarely kill plants and can often be washed off with water. When aphid numbers get high, natural enemies frequently feed on them, eliminating the need for pesticides. Insecticidal soaps and oils are less toxic pesticides that can be used when treatment is necessary.

Aphids are common in your garden because:

- Aphids like lush new growth. Don't over fertilize. Use organic fertilizers or slow-release products.
- Aphids build up on flowering plums, roses, tulip trees, crape myrtles, apples, and many vegetables. Expect aphids when you grow these plants.
- Ants protect aphids from their natural enemies. Keep ants off plants to get more benefit from these beneficial insects.

To reduce aphids:

- Prune out infested leaves and stems.
- Knock aphid populations off plants by shaking or spraying with a strong stream of water.
- Protect seedlings with covers or aluminum soil mulches.
- Wait for hot weather; most aphids are heat-intolerant and will be gone by mid-June.

Protect aphids' natural enemies:

- Lady beetles, both adults and larvae
- Lacewings
- Syrphid fly larvae
- Soldier beetles
- Parasitic mini-wasps that turn aphids into crusty mummies (See reverse for insect drawings.)

Natural enemies of aphids such as lady beetles and lacewings will come into your garden naturally when aphids are abundant. Protect these good bugs by avoiding the use of insecticides that may be toxic to a broad variety of insects.

If insecticides seem necessary, use the safest products:

- Nonchemical pest control methods should be used first to manage aphid populations. However, if you feel insecticides are necessary, choose less toxic products.
- Insecticidal oils and soaps are the safest products. When properly used, these materials solve most pest problems.
- Oils and soaps work by smothering aphids, so application must be thorough. Don't apply to drought-stressed plants or when it is very hot. A few plants are sensitive to these products.
- Insecticidal soaps, soap-pyrethrum mixtures, or neem oils are often applied on vegetables or small bushes like roses.
- Narrow range oils, like parafinic, supreme or superior oils, are appropriate for larger trees.
- Oils and soaps don't kill aphids hidden within curled leaves. Prune these out. Systemic insecticides can kill hidden aphids, but they are much more toxic and not registered for use on garden vegetables or fruit trees.

aphid

lady beetle

parasitic mini-wasp killing aphid

Cockroaches

HEALTHY GARDEN HEALTHY HOME

Cockroaches thrive in warm environments that provide food, water, and shelter. Roaches hide in cracks, crawl spaces, and other dark places during the day and come out at night to feed. Pesticide sprays alone will not control roaches and are not usually required. Baits provide better control. You must integrate several strategies to make your home a less roach-friendly environment. Thoroughness is essential for effective control.

Identify your cockroach species first:

- Effective management options vary according to species.
- Cockroach traps provide an easy way to catch roaches for identification.
- Control practices for outdoor invaders (American, oriental roaches) and indoor residents (brownbanded and German roaches) differ.
- For help with identification go to www.ipm.ucdavis.edu.

Remove food and water sources:

- Even tiny crumbs or liquids in cracks provide good food sources.
- Store food in sealed containers.
- Keep trash in containers with tight lids.
- Eliminate plumbing leaks.
- Vacuum cracks and crevices and clean floors and counters daily.

Remove roach hiding places:

- Seal cracks and other openings to prevent invaders from the outside.
- Seal cracks in false bottoms of cupboards and other indoor hiding places.
- Seal or clean up other areas where you find roaches or their egg cases hiding.
- Remove old newspapers, boxes, and other clutter in kitchens and bathrooms.
- The oriental cockroach hides outdoors under ivy and other shelter. Check to see if you have this roach and remove outdoor hiding places or bait.

Use traps to identify and track cockroach populations:

- Cockroach traps are available in hardware stores.
- Place traps on the floor around edges of walls, in cupboards and other places where you think roaches are foraging. Place bait stations at locations where you trap roaches.
- Check traps daily.
- Sticky traps with pheromones may provide some control of German cockroaches.

Using chemicals to control cockroaches:

- Avoid use of foggers, bombs, or aerosol sprays — they just disperse populations.
- Boric acid powder blown into cracks, crevices, hollow walls, under refrigerators, or other undisturbed hiding places is very effective (allow 7 days or more for an effect to be seen).
- Bait stations containing boric acid, abamectin, fipronil, or hydramethylnon placed near hiding places can be effective if other food sources are removed (allow 7 days or more for an effect to be seen). Replace stations as needed as long as roaches are being caught.
- Insecticide sprays alone do not give long-term control. They are not necessary if other methods such as baits and boric acid powder are combined along with cleanup and removal of hiding places.
- Contact a professional pest control operator for very serious infestations, but be sure they use an integrated program as described above.

Earwigs

HEALTHY GARDEN HEALTHY HOME

While their prominent tail-end pincers may look ferocious, earwigs are not harmful to people. Earwigs may seriously damage seedling vegetables and chew holes in annual flowers, soft fruit, and corn silks, but earwigs also play a beneficial role by feeding on aphids and other insects. Nocturnal in habit, earwigs feed at night and hide during the day in dark, cool, moist places in the yard or within flowers or vegetables. To manage earwigs, reduce hiding places and moisture, and employ a vigilant trapping program.

Should you be concerned about earwigs in your garden?

- Yes, if you are growing vegetables, herbaceous flowering plants, sweet corn, or plants with soft fruits like strawberries and apricots.
- No, if your garden is primarily lawn, trees, and woody ornamentals or native plants.

Reduce outdoor hiding places:

- Eliminate dense undergrowth of vines, ground cover and weeds around vegetable and flower gardens.
- Prune away fruit tree suckers.
- Remove leaves, boards, boxes, trash, and other debris from planting areas.
- Move flower pots and other garden objects and structures that can harbor earwigs.
- Check plastic or organic mulches and remove them to limit earwig numbers.

Trap earwigs until they are gone!

- Trap earwigs with rolled newspaper, bamboo tubes, or short pieces of hose. Place these traps on the soil near plants just before dark, and shake accumulated earwigs out into a pail of soapy water in the morning. A low-sided can filled with oil and a drop of bacon grease or fish oil also makes a good trap. Daily trapping will reduce earwig populations to tolerable levels.

Other ways to reduce earwig problems:

- Drip irrigate where possible to reduce surface moisture.
- Keep earwigs out of stone fruit trees with a band of sticky substance like Tanglefoot, around the trunk, and harvest fruit as soon as it ripens.
- Insecticides should rarely be needed.

Inside the home:

Earwigs may seek refuge indoors when conditions outside are too dry, hot, or cold. Large accumulations of earwigs can be annoying but present no health hazards. When earwigs invade your home follow these steps:

- Sweep or vacuum up invading earwigs.
- Seal up cracks or other entry points.
- Remove debris from gutters and around entryways.
- Keep water and moisture away from structures.
- Replace white outdoor lights with yellow ones, which are less attractive to earwigs.
- Indoor application of pesticides is not recommended.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org.

Fleas

Fleas are particularly annoying to people and pets, especially during spring and early summer when their numbers tend to increase dramatically. The common flea in California is the cat flea. Despite its name, it attacks both dogs and cats and will also bite humans. To keep fleas out of your home, control fleas on your pet and regularly clean pet sleeping areas.

On the pet:

Recently, a number of very effective and safe new products for flea control on the pet have become available. Remember to supplement pet treatments with regular cleaning of your home and periodic combing with a pet flea comb to detect new infestations.

- Spot-on formulations are applied to the animal's coat, providing flea control for 1 to 3 months. Available from veterinarians or over-the-counter.
- Systemic flea control products, available from vets, are given as a pill or food additive. While they do not kill adult fleas, they prevent reproduction.
- Flea collars containing insect growth regulators (IGRs) give protection for up to 6 months on dogs and up to a year on cats. Be sure to choose collars containing methoprene or pyriproxyfen.
- Flea shampoos and soaps, powders and dusts, spray-on liquids, and dips are less effective and more hazardous to pets, people, and the environment than the three types of products above.

In the yard:

Outdoor treatment is rarely needed, but if your pet regularly sleeps outside and flea numbers are high, these areas can be treated with a spray containing pyriproxyfen. If possible, open sleeping areas to sunlight by removing low hanging vegetation. Immature fleas are unlikely to survive in areas with exposure to sunlight.

Inside the home:

Whether or not you are aware of fleas in your home, regularly vacuum and launder areas where your pet rests to avoid flea buildup. If you have a major flea problem, treat your pet with one of the options on the front of this card and follow the steps below.

- Locate heavily infested areas (usually areas where the pet rests) and concentrate treatment there.
- Wash throw rugs and pet bedding.
- Vacuum upholstered furniture, cleaning under cushions and in crevices.
- Vacuum carpets, especially beneath furniture.
- Use a hand sprayer or aerosol to treat all carpets and unwashable upholstered furniture with an insecticide that contains an IGR (methoprene or pyriproxyfen). This treatment kills larvae but not pupae, so fleas may continue to emerge for up to 2 weeks.
- Over the next 2 weeks vacuum regularly to remove adult fleas that emerge from pupae. Do not reapply pesticides.
- Seal vacuum bags and discard them so fleas don't escape.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Gardening with Good Bugs

HEALTHY GARDEN HEALTHY HOME

Most gardens contain far more types of good bugs,or beneficial insects, than pest insects. Beneficial insects and other organisms that kill pest insects are called natural enemies. In any pest management or plant care program, it is important to encourage these natural enemies by avoiding pesticides that kill them. You can also encourage beneficial insects by choosing plants that provide them with pollen, nectar, and shelter and keeping ants out of pest-infested plants. Learn to identify good bugs, both in their adult forms and immature (larval) stages.

Common good bugs found in California gardens include:

- Lady beetles: Both adults and larvae consume aphids.
- Lacewings: Lacewing larvae feed on many insect pests; adults are often seen around lights.
- Syrphid flies: Syrphid fly larvae consume aphids; adults hover around flowers.
- Parasitic mini-wasps: Many species of tiny wasps lay their eggs in pests like aphids or caterpillars; their hatching larvae consume the pest and kill it.
- Spiders: All spiders feed on insects or other arthropods and are beneficial in the garden.

(See reverse for drawings of good bugs mentioned above.)

What is Integrated Pest Management?

Integrated pest management (IPM) uses environmentally sound, yet effective, ways to keep pests from annoying you or damaging plants. IPM programs usually combine several pest control methods for long- term prevention and management of pest problems without harming you, your family, or the environment — IPM also reduces pollution in California waterways. Successful IPM begins with correct identification of the pest. Only then can selection of the appropriate IPM methods and materials be made.

Preferred IPM methods include:

- Planting pest-resistant or well-adapted plant varieties like native plants.
- Discouraging pests by modifying the way you design, irrigate, fertilize, and manage your garden.
- Altering the garden or home environment to deprive pests of the food, water, shelter or other requirements they need to thrive.
- Keeping pests out of the home and garden using barriers, screens, and caulking.
- Squashing, trapping, washing off or pruning out pests.
- Relying on good bugs in your garden to eat pests, thereby eliminating the need for insecticides that may end up in our waterways.

Turning to pesticides:

- Only use pesticides when non-chemical controls are ineffective and pests are reaching intolerable levels.
- Use pesticides in combination with the methods described above.
- Choose pesticides carefully so that the least toxic, most effective material is used to protect human health and the environment.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Head Lice

HEALTHY GARDEN HEALTHY HOME

Head lice can infest anybody, but children are prone to infestations because they play closely and share items that come in contact with the head like hats, headphones, and combs. Head lice are not known to transmit any infectious diseases; they are more of a nuisance than a health risk. Children with head lice, however, are generally not allowed to attend school as long as nits are found in their hair.

Head lice facts:

- Head lice cannot hop, fly, or jump; they crawl. Lice spread only through direct contact with an infested object or person.
- Head lice spend their entire life in head hair and can only survive off a human head for about 1 or 2 days.
- A newly hatched louse must ingest blood within minutes of birth to survive.
- Head lice cannot live on family pets.
- Nits (eggs) that are more than 1 1/4 inch from the scalp probably are dead or have already hatched.

What to look for:

- Intense scratching on the back of the head or neck.
- Tiny white eggs (nits) glued to hair near the scalp.
- Small, rapidly crawling flat insects.

Four steps necessary to manage an infestation of head lice:

1 Use a head louse shampoo if you observe active lice or viable eggs.

- Avoid shampoo products containing lindane, which are available by prescription only. Pyrethrin and permethrin are safer, more effective, and less polluting to wastewater than lindane. Not all eggs will be killed.
- To avoid insecticides entirely, use soap shampoos that contain coconut or olive oils. Most soap shampoos kill all stages of the louse except the egg. Because they are not as effective as products containing pesticides, you must be sure to comb and repeat these shampoos four times at 3-day intervals. Successive shampooing kills newly hatched lice.

2 Remove nits from the head by combing with a specially designed nit comb.

- This step is the key to successful control. Repeat daily as long as you find live lice or nits within 1¦4 inch of the scalp. Use a metal comb specially designed for removing head lice and their eggs. Combs sold with head lice shampoos are not generally effective. Infested hair can also be cut out with small safety scissors.

3 Remove lice and nits from the household.

- Wash clothing and bedding of the infested person in hot water (at least 140°F) and dry in a hot dryer or have them dry cleaned. Place other items (earphones, bike helmets) in plastic and put in a freezer that is 5°F or lower for at least 10 hours. Clean any object that might have come in contact with the infested person's head (stuffed animals, car seats). Vacuum carpets and upholstery. Pesticide sprays are not recommended.

4 Check heads and remove nits daily until infestation is gone. Follow with weekly head checks to detect reinfestation.

Lawn Insects

HEALTHY GARDEN HEALTHY HOME

Contrary to popular belief, insects are not a common cause of residential lawn damage in California. Poor lawn care, especially improper watering and planting inappropriate grass species, are more likely causes of unhealthy or dying lawns. Disease-causing agents, excess orinappropriate use of chemicals such as fertilizer and herbicides, or dog urine also produce lawn damage resembling that of insects. Many insects in the lawn are beneficial. Never apply an insecticide unless a damaging level of a known insect pest is confirmed. Insecticides are only effective if applied at the right time and in the right manner. Some insecticides may kill good bugs too.

How do you know if insects are causing damage?

- Brown spots in lawns can be caused by over- or under-irrigation, plant disease, improper use of chemicals, or dog urine as well as insects.
- Confirm presence of insects before applying an insecticide. For grubs, dig around roots, for other insects perform a drench test. (See reverse.)

Keep your lawn healthy by:

- Planting grass species that do well in your area
- Irrigating deeply and infrequently
- Doing routine maintenance on sprinkler heads
- Applying only 3 to 6 pounds of actual nitrogen per 1000 square feet per year when fertilizing
- Aerating your lawn annually; remove thatch if it exceeds 1/2 inch
- Cutting only one-third to one-half of grass height at each mowing and keeping lawnmower blades sharp

See the UC Guide to Healthy Lawns at www.ipm.ucdavis.edu

If a damaging level of insects is confirmed, do the following:

- Choose an insecticide based on the pest you're targeting.
- Find out which insecticide ingredients target specific lawn insects:
  - *Bacillus thuringiensis* (Bt) kills only caterpillars, including cutworms, lawn moths, and skippers.
  - Insect-attacking nematodes control caterpillars or grubs.
  - Azadirachtin controls cutworms, armyworms, and larvae of lawn moths.
  - Imidacloprid is effective against young lawn grubs.
  - Pyrethroids (e.g., cyfluthrin, bifenthrin) are broadly toxic insecticides that kill chinch bugs, lawn moths, and cutworms, but also kill beneficial insects and should be avoided.
- Get help from UC Cooperative Extension.

HOW TO PERFORM A DRENCH TEST

- Mix 3–4 tablespoons of dishwashing liquid to 2 gallons of water.
- Evenly apply the 2 gallons to 1 square yard of your lawn.
- Monitor the area for 10 minutes and count the number of armyworms, cutworms, or lawn moth larvae that rise to the surface.
- Treat the area only if insect numbers exceed 5 armyworms or cutworms or 15 lawn moths per square yard.

Safe Use & Disposal of Pesticides

HEALTHY GARDEN HEALTHY HOME

Pesticides are designed to be toxic to the pests they target — insects, weeds, and other unwanted home and garden invaders. Always read pesticide product labels carefully and follow all directions on proper use, storage, and disposal of empty pesticide containers. Product labels are your main source of information on how to use a product safely and legally. They include guidelines needed to protect you, your family, and pets. The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For the site nearest you in San Diego County call 1-877-713-2784 .

If you must use pesticides, follow these tips to reduce pesticide effects on your local waterways:

- Identify your pest problem and choose the least toxic pesticide that targets your pest and achieves the results you want. If you need help identifying the least toxic pest control method, contact your University of California Cooperative Extension office.
- Determine the right amount of pesticide to purchase. Purchasing exactly the amount you need for the application eliminates the need for storing unused pesticides.
- Use spot treatments whenever possible.

Outdoors

- Avoid overwatering after applying pesticides. Never let pesticide runoff flow into storm drains.
- Do not apply pesticides outdoors when rain is forecast or when it is windy.
- Avoid applying pesticides on paved areas.

Indoors

- Avoid applying pesticides in or near floor drains or sinks.
- Avoid applying pesticides on areas that will be washed or mopped with water, or where food is prepared or stored.

When using and storing pesticides take these precautions:

- Always wear a long-sleeved shirt, pants, and eye protection, and other equipment suggested on the label.
- Store products tightly capped in a locked cabinet out of reach from children and pets.
- Always keep pesticides in their original container.
- Know where to call for help in an emergency!

Pesticide disposal:

- If you cannot use up your pesticides, fertilizers, and weed killers, give them to a friend who may need them.
- Sewage treatment plants are not designed to treat for certain toxic pesticides like diazinon and chlorpyrifos — dumping pesticides into the stormdrain or down the sink is never an option.
- The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For household pesticide disposal information for San Diego County, call 877-713-2784.

Finding active ingredients on a pesticide label:

Pesticide labels are required by law to show the active ingredient and its percentage. Minimize or avoid the use of products that contain diazinon and chlorpyrifos – these materials are polluting our waterways. Always read the label before you buy!

Active Ingredient
Chlorpyrifos 4.38%
Inactive Ingredients 95.62%
KEEP OUT OF REACH OF CHILDREN
CAUTION See back panel booklet for additional precautionary statements.
NET CONTENTS 32 FL OZ (1 QT) 946mL

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Snails & Slugs

HEALTHY GARDEN HEALTHY HOME

Snails and slugs rank among our most despised garden pests. These slimy mollusks emerge from hiding at night and chew holes in leaves and flowers of many succulent garden plants and fruit. Slugs and snails are similar in structure and biology, except slugs lack the snails' external spiral shell. Management requires a vigilant and integrated approach that includes eliminating moisture and hiding spots, trapping, barriers, and handpicking. Baits can be helpful, but by themselves, don't provide adequate control in gardens that contain plenty of shelter, food, and moisture.

How do you know snails and slugs are causing damage?

- You may not observe these pests at first because they feed at night and hide during the day. Go out at night or early morning to view them in action.
- Other pests can cause holes in leaves, flowers, and fruit. Look for the shiny, slimy trails slugs and snails leave behind.

What must be done to reduce snails and slugs?

- Remove daytime hiding places — ivy, weedy areas, debris, or boards.
- Regularly remove snails from shelters you cannot eliminate such as low ledges on fences, undersides of decks, meter boxes.
- Place traps in your garden and dispose of trapped snails and slugs daily.
- Reduce moist surfaces by switching to drip irrigation or sprinkling in the morning rather than later in the day.
- Consider snail-proof plants such as impatiens, geraniums, begonias, lantana, nasturtiums, and many plants with stiff leaves and highly scented foliage like sage, rosemary,and lavender.

How can I manage snails and slugs without using pesticides?

- Make sure the garden is mollusk-free before planting. Then erect a copper barrier around it. Use a 4- to 6-inch-wide band of copper, buried an inch below the soil and bent over at the top or attach it around the edge of a raised bed.
- Place your garden in the sunniest spot possible. Remove garden objects or adjacent plants or ground cover that may serve as shady shelter. Reduce moist surfaces as much as possible.
- Build a trap using a 12"x15" board raised off the ground by 1-inch runners. As the mollusks collect under the board, scrape them off and destroy them daily.

What about baits?

- Baits will not be very effective unless you also remove shelter, food, and moisture.
- Metaldehyde baits are especially poisonous to dogs and birds. Metaldehyde also loses its effectiveness rapidly in sunlight and after rain or irrigation.
- Iron phosphate baits are safe for use around dogs, children, and wildlife.
- Irrigate before applying bait and apply in evening on warm days when mollusks are active.
- Scatter bait around sprinklers and in moist and protected areas where snails and slugs travel.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm

Spiders

HEALTHY GARDEN HEALTHY HOME

Spiders are mostly beneficial because they feed on pest insects. However, many people think that all spiders are dangerous and aggressive. In California, the main spider capable of causing serious injury is the black widow, which generally remains outdoors and out of sight. Spiders seen out in the open during the day are unlikely to bite people. Focus pest management efforts on removing webs and hiding places. Pesticides are not generally recommended.

What to know about spiders:

- In California, the main spider capable of causing serious injury is the black widow:
  - The poisonous black widow spider is commonly found outdoors, in sheltered, dry, undisturbed areas such as wood piles.
  - Female black widows have shiny black bodies with a red hourglass marking on the underside.
  - Only large female black widows can injure people.

  Anyone bitten by a black widow spider should remain calm and seek medical advice, or call California's Poison Control Center at 1-800-8-POISON (1-800-876-4766).
- The brown recluse spider does not live in California.
- The jaws of most spiders are too small to bite humans.
- Some other spiders bite when trapped in clothing, but the reaction is usually no more severe than itching or a bee sting. See www.ipm.ucdavis.edu for more information about these spiders.

To prevent spiders from entering your house, take these steps:

- Seal home foundation cracks and other access holes.
- Inspect window and door screens for good seals that keep out spiders and the insects they prey on.
- Keep areas around home foundations free of clutter.

Manage spiders using these tips:

- Indoors, regular housecleaning provides adequate spider control.
- Vacuum up the spider and its web.
- Prevent clutter buildup that can provide hiding places.
- Remove spider webs from the exterior of the house with a broom or high pressure hose.
- Indoors, squash spiders or capture them in a jar and release them outdoors.

When removing spiders, don't overlook the fact that spiders eat a large number and variety of nuisance and pest insects. Spiders also have natural enemies — wasps, other spiders, birds, reptiles, and others — that sometimes keep them from becoming too numerous.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm

Termites

Because of the serious damage they can cause to wooden structures, termites are among the pests most feared by homeowners. However, swarms of flying termites do not always mean your building is infested. A careful inspection of the structure is required to confirm an infestation. People also frequently mistake swarms of flying ants for termites. If you suspect that your house is infested, call a professional. Do-it-yourself sprays cannot be relied on to reduce a damaging infestation. Common termites in California are the subterranean termites that build nests in soil, dampwood termites that nest in moist wood and soil, and drywood termites that nest above ground in dry wood. Management of each termite species is different.

Distinguish flying ants from termites:

- Check the antennae, wings and waist to confirm that pest insects are termites. (Please refer to ant vs. termite drawing on back.)

Design your building to keep termites out:

- Keep a 12-inch barrier of smooth concrete, sand, or other material between the soil surface and substructure wood beneath a building.
- Choose termite-resistant wood for fences or other structures that must contact soil.
- Remove wood piles, untreated fence posts, and buried scrap wood near structures.
- Provide adequate ventilation to substructures and keep them dry.
- Immediately repair foundation cracks.

If termites are invading your home:

- Destroy shelter tubes that subterranean termites build between soil and wood structures.
- If dampwood termite nests are accessible, remove infested wood and eliminate excess moisture.
- Drywood termites can be controlled with heat, freezing, electricity, microwaves, fumigation, or spot treatments of chemicals.
- For any infestation, contact a professional for help. Pesticides licensed only for use by a pest control operator are usually necessary to control subterranean and dampwood infestations.

Using pesticides for termite control:

- Pesticides may be injected into the soil by professional applicators through drilling or rodding. Special procedures must be followed to prevent contamination of ground or surface water.
- For soil injections, ask your applicator to use a product other than chlorpyrifos. Newer types of products such as fipronil and chloronicotinyls are safer for your health and the environment.
- Baits can be effective in some cases, but may take several months to control the problem and must be followed up with constant monitoring.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Giant Whitefly

HEALTHY GARDEN HEALTHY HOME

Giant whiteflies can cover a beautiful plant with white fuzzy wax and sticky honeydew, turning it into an unsightly mess. First discovered in San Diego County in October 1992, this whitefly has spread northward into other areas of California. Since its introduction into San Diego, giant whitefly has spread rapidly northward along the coast. Although affected plants may be weakened, they rarely die. To manage giant whitefly, wash plants off with water and encourage natural enemies.

What plants are affected?

- Many ornamentals including hibiscus, giant bird of paradise, begonia, Xylosma.
- Fruit trees including citrus, avocado, mulberry and banana.

Look for these damage symptoms on affected plants:

- Long, white, waxy filaments produced by the whitefly give the leaf surface a bearded appearance. These hairlike strands may be mistaken for a fungal infection.
- Large amounts of sticky honeydew excreted by the whitefly as it feeds on plant sap.
- Black sooty mold growing on the honeydew.

How to recognize the whitefly:

- Adults are small (3/16") and white with light brown markings on wings and usually found in groups on undersides of leaves.
- Nymphs are yellowish, small, oval, have no legs and don't move.

To reduce problems, use an integrated program that includes:

- Removing infested leaves.
- Washing giant whiteflies off leaves with a strong stream of water.
- Planting species less susceptible to giant whitefly.
- Avoiding insecticides that injure natural enemies, such as lacewings, lady beetles, syrphid flies, and parasitic wasps.

What about insecticides?

- **Don't use insecticides if beneficial insects, including parasites and predators, are present in the area.**
- **To confirm the presence of parasitic wasps, use a magnifying glass to look for parasite exit holes on giant whitefly nymphs or darkened nymphs as indicated in drawings below.**
- **If you do choose to use an insecticide, select least toxic products such as insecticidal soaps or oils. Remember to follow label directions and spray the undersides of the leaves where whitefly colonies are found.**

(adult)  (actual size) I

Examine whitefly colonies for grayish-black or yellow nymphs with exit holes (a), or darkened nymphs (b), or healthy nymphs (c).

Use NON-CHEMICAL methods & LEAST TOXIC pesticides. WHY? Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes, and oceans.

Learn more about San Diego regional water quality at www.ThinkBlueSD.org & www.ProjectCleanWater.org.
For more pest information, visit the University of California IPM Web site at **www.ipm.ucdavis.edu**. or contact the UCCE Master Gardeners at (858) 694-2860, Mon-Fri, 9 am to 3 pm.

SAN DIEGO RIVER AND SAN DIEGO BAY FACT SHEETS

San Diego River Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego River and the San Diego Bay. Your business or facility is located within the San Diego River Watershed.

San Diego River Watershed

The San Diego River Watershed is comprised of 443 square miles. It extends from the mountains near Julian to the Pacific Ocean. Portions of the watershed fall within the cities of El Cajon, Poway, San Diego, Santee, several unincorporated areas, and the City of La Mesa. Primary tributaries to the San Diego River include Boulder Creek, Conejos Creek, Los Coches Creek, San Vicente Creek, and Forester Creek. Alvarado Creek in La Mesa is also tributary to the San Diego River. Alvarado Creek flows into the San Diego River and ultimately into the Pacific Ocean between South Mission Beach and Ocean Beach near Dog Beach.

Pollutants of concern listed in the 2002 Clean Water Act Section 303(d) List Of Water Quality for the lower San Diego River Watershed include fecal coliform (sewage/urban runoff), low dissolved oxygen (decay of organic matter), total dissolved solids (industrial waste/chemical spills), and phosphorus (phosphate based detergents). Between 1996 and 1999, coliform bacteria more than doubled due to urban runoff and sewage.

Other pollutants of concern not listed above include pesticides such as Diazinon and Chlorpyrifos (commercial, agricultural, and residential application), Total Suspended Solids/Turbidity (suspended sediment/solids, construction, sewage, eutrophication), Copper and Zinc (industrial waste or automobiles), and pH/Phosphate (industrial waste, automobiles, sewage, fertilizers, eutrophication, hardening/concrete of creeks).

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

What Can You Do?

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Store materials properly to ensure it is not exposed to storm water. Do not over-irrigate your landscape. If you observe illegal dumping into a storm drain, you should call the City's storm water pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.

San Diego Bay Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego Bay and the San Diego River. Your business or facility is located within the San Diego Bay Watershed.

San Diego Bay Watershed

The San Diego Bay Watershed is comprised of 415 square miles. It extends from the Laguna Mountains to San Diego Bay. The watershed falls within the cities of La Mesa, Chula Vista, Coronado, Imperial Beach, Lemon Grove, National City, San Diego, and unincorporated areas of the County. Approximately 4 square miles in the southern portion of the City of La Mesa is part of this watershed. The major discharge sources to San Diego Bay include Sweetwater River, Otay River, Chollas Creek, Paleta Creek, Paradise Creek, and Switzer Creek.

Three drainage basins in the City of La Mesa are part of the San Diego Bay Watershed. Runoff from the Spring Valley Basin flows to the Sweetwater River. Runoff from the University Channel and Lemon Grove Basin contribute to Chollas Creek. The aforementioned creek and river flow into San Diego Bay.

Pollutants of concern associated with the watershed include diazinon, copper and zinc, fecal coliform, turbidity, and total suspended solids. The sources of these pollutants are a result of residential, agriculture or commercial pesticide application, automobiles and industrial waste, sewer spills, encampments, wildlife, erosion, suspended sediment, and fertilizers. Pollutants of concern for Chollas Creek in particular include metals such as copper, lead, zinc, cadmium, and coliform bacteria.

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

What Can You Do?

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Moreover, store materials properly to ensure it is not exposed to storm water and do not over-irrigate your landscape. If you observe storm water pollution or illegal dumping into a storm drain, you should call the City's Storm Water Pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.

CERTIFICATION STATEMENT

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Gregory P. Humora
Director of Public Works/City Engineer

Date: September 2012

Telephone Number: (619) 667-1105

EXECUTIVE SUMMARY

In January 2007, the San Diego Regional Water Quality Control Board (RWQCB) issued Order No. R9-2007-0001 (Municipal Permit), a National Pollutant Discharge Elimination System (NPDES) permit regulating discharges to the municipal separate storm sewer system (MS4) within 18 municipalities in San Diego County, the County of San Diego, the San Diego County Regional Airport Authority, and the San Diego Unified Port District (collectively referred to as "Copermittees"). As required by the Municipal Permit, the City of La Mesa (City) has developed and maintains a Jurisdictional Urban Runoff Management Program (JURMP) intended to minimize the amount of pollutants present in runoff that may be generated within the City's jurisdiction.

Through the development and implementation of the City's JURMP, the City strives to improve the water quality of local receiving water bodies and to protect human and aquatic health from potentially harmful pollutants such as bacteria/viruses, organic compounds, oil & grease, etc.

The City's JURMP includes Best Management Practice (BMP) standards for internal activities, industrial and commercial businesses, construction and development projects, and residents. It also incorporates programs for water quality monitoring, public participation, and educational outreach.

This JURMP Annual Report presents the City's activities implemented as its JURMP during the 2011/2012 fiscal year, which began on July 1, 2011, and ended on June 30, 2012. Each section of this JURMP Annual Report discusses the City's efforts to protect and enhance storm water quality during the current reporting period and how those efforts met the requirements of the Municipal Permit. Significant activities conducted for the major components of the City's JURMP are summarized below.

Development Planning Component

The City continued to oversee development activities occurring in the City to mitigate potential threats to water quality at the design stage. This included distributing a development requirements checklist to all projects applying for permits to identify Priority Development Projects. Additionally, the City implemented updated hydromodification requirements as applicable. The City maintained and updated its inventory of installed treatment control BMPs and implemented its maintenance verification program through which parties responsible for maintaining BMPs at each of the City's 18 inventoried sites certify in writing that their treatment devices have been maintained and are in working order. Eleven sites in the City with approved treatment control BMPs were also inspected by City staff. Enforcement actions successfully achieved the return of all maintenance verification forms and the correction of all deficiencies noted during inspections.

Construction Component

During 2011/2012, a total of 65 routine construction inspections were completed at 27 sites. The City's plan check and inspection program required projects to comply with the City's

minimum BMP requirements. Enforcement actions were taken where necessary and were effective in bringing about compliance. Notably, the City inspected almost every low priority construction site during the wet season and notified small projects and homeowners of the City's BMP requirements.

Municipal Component

The City inspected all high threat to water quality (TTWQ) municipal fixed facilities, as required by the Municipal Permit. Over 526 tons of sediment and debris were removed during routine street sweeping activities. Approximately 263 cubic yards of sediment and debris were also removed during standard MS4 maintenance; this is the largest amount yet collected. The City also televised 25,214 linear feet of sewer line and replaced or rehabilitated 2,451 linear feet of sanitary sewer line to decrease the potential for sanitary sewer overflows (SSOs). In keeping with its regular practice, the City trained its staff regarding the most current storm water pollution prevention concepts and practices.

Industrial and Commercial Component

During 2011/2012, the City's full-time Storm Water Inspector continued to build upon cooperative working relationships with local businesses, in order to keep businesses accountable to the storm water education they have received, and to achieve BMP compliance through routine inspections and in some cases, through enforcement actions. The City met the Municipal Permit requirement to inspect at least 25 percent of the City's industrial and commercial inventory. The City inspected all high TTWQ sites on its industrial and commercial inventory as well as additional medium TTWQ sites. An inspection fee continues to be collected to recover costs for site visits. Since the institution of fees assessed for each visit, including follow-up visits, businesses have generally become more willing to comply with BMP requirements in a smaller number of inspection visits. In 2011/2012, 89 percent of inspected businesses were in compliance with the City's minimum BMPs during routine inspections and required no follow-up actions. After brief re-inspections were conducted, this increased to 97 percent of businesses that were in compliance. No inspected businesses were observed to be out of compliance with the State of California Industrial General Permit, Order No. 97-03-DWQ (Industrial Permit).

Residential Component

Residential areas comprise more than half of the City of La Mesa's land use, and the City worked to educate these residents through a variety of means. The City provided its quarterly *La Mesa Focus* newsletter to City residents via email and the City's website. Some newsletters published during 2011/2012 contained storm water articles and announcements relating to residential activities. The City encouraged its residents to participate in a variety of waste disposal events and volunteer-based cleanup events, and 784 participants dropped off 87,249 pounds of household hazardous waste (HHW) during the City's eight HHW events. The City's residents are considered important allies in reporting complaints to the City Storm Water Hotline. During 2011/2012, 96 complaints related to residential issues were received by the City's Storm Water Hotline and Public Works maintenance hotline. This is the greatest number of residential complaints reported over the past five years, possibly suggesting an increased knowledge among residents regarding storm water

regulations. Complaint investigations in residential areas were used as opportunities both to enforce BMP requirements and to educate residents about storm water pollution prevention.

Illicit Discharge Detection and Elimination Component

On September 10, 2008, the RWQCB adopted Addendum No. 2 to the Municipal Permit. This addendum requires the City to wait to submit the illicit discharge detection and elimination (IDDE) section of its JURMP Annual Report until the report for 2012 Dry Weather Field Screening and Analytical Monitoring Program (Dry Weather Monitoring Program), which took place after July 1, 2012, is finalized. The section must be submitted to the RWQCB no later than December 15, 2012.

While the full section will not be submitted until after September 30, 2012, the City did implement its IDDE program component during 2011/2012. During this period, the City responded to and resolved 119 complaints made to its Storm Water Hotline and the Public Works maintenance hotline. The City also continued maintenance of the sanitary sewer system to prevent SSOs.

Education Component

As a means to raise storm water awareness in various communities, the City continued to conduct various educational and outreach activities throughout 2011/2012. The City's efforts resulted in an estimated 26,933 impressions made, which is 4,090 more impressions than the previous reporting period. I Love A Clean San Diego (ILACSD) partnered with the City to educate residents of all ages at special events and school presentations. The City continued to circulate the *La Mesa Focus* newsletter to businesses and residents, and some newsletters sent during the reporting period included storm water-related announcements and articles. Additionally, the City continued to maintain a storm water bulletin board at City Hall, which is strategically located to maximize exposure to both City personnel and project proponents that visit the Engineering Division. To better serve the City's diverse population, some educational materials were also distributed in Spanish. Additionally, City staff participated in various training sessions.

Public Participation Component

Public participation activities in 2011/2012 included multiple volunteer-based cleanup events, which have a direct effect on water quality, and public outreach activities intended to increase general knowledge and awareness regarding storm water issues. The City participated in Coastal Cleanup Day and the Creek to Bay Cleanup, with two cleanup sites located in the City for each event. During these events over 1,234 pounds of trash and 157 pounds of recyclables were collected. Other cleanup activities completed during 2011/2012 included Park Appreciation Day, Adopt-a-Park, Adopt-a-Block, and the La Mesa Spring Cleanup. A variety of waste disposal events, including HHW disposal events, were also held in the City.

Fiscal Analysis Component

The City continued to fund its storm water program though the City's Sanitation Fund and the collection of a storm water inspection fee. As required by the Municipal Permit, the City

continued to use the new fiscal analysis reporting standards, developed and implemented by the Copermittees starting in 2009/2010.

Effectiveness Assessment Component

The City continued to evaluate the effectiveness of its storm water program based on the approach presented in the City's JURMP. The City has seen a consistent trend of decreasing median concentrations and exceedance numbers for various polluting constituents in its Dry Weather Monitoring Program. Additionally, a decrease in dry weather flow rates has been measured since 2008, suggesting that the City's efforts to reduce dry weather discharges to the MS4 have been successful.

In both the treatment control BMP program and the industrial and commercial inspection program, enforcement has been very effective in reaching compliance. The City has implemented additional City-maintained treatment control BMPs for the University drainage area and its Public Works Operation Center, and also conducts additional street sweeping to aid in meeting watershed requirements.

Special Investigations

Aside from upstream investigations conducted as part of the Dry Weather Monitoring Program, no special investigations were needed or conducted during this reporting period.

Conclusions and Recommendations

The City will continue to implement the programs in its JURMP during 2012/2013; it is anticipated that some program refinements will be made as implementation progresses. The City will also continue to collaborate with other Copermittees as applicable within its watersheds and regionally.

Beyond the JURMP Program, the City is also subject to additional requirements associated with Total Maximum Daily Load (TMDL) regulations, which set numeric compliance limits. The City of La Mesa has been collaborating with other Copermittees in the Chollas Creek watershed to conduct annual reporting and monitoring for the Chollas Creek Diazinon and dissolved metals TMDLs. During 2010/2011, the City also developed a Strategic Plan for Watershed and TMDL Activity Implementation, coinciding with the adoption of bacteria TMDLs for both the San Diego River and Chollas Creek watersheds. Since that time, the City has been collaborating with other Copermittees to conduct monitoring and modeling, develop the Implementation Plan for San Diego River's bacteria TMDL, and update the Chollas Creek Implementation Plan to include the new bacteria TMDL. These efforts will continue throughout the TMDL timelines.

1.0 INTRODUCTION

1.1 BACKGROUND

This JURMP Annual Report presents an activity summary for the City of La Mesa during the 2011/2012 fiscal year. The JURMP Annual Report preparation and submission are required by the Municipal Permit.

1.1.1 REGULATORY BACKGROUND

The 1987 amendments to the Federal Water Pollution Control Act, also known as the Clean Water Act (CWA), established a framework for regulating MS4 discharges under the NPDES. In 1990, the RWQCB issued the first regional NPDES permit for municipalities in the San Diego Region, followed by a revised permit in 2001. RWQCB Order No. 2001-01 was replaced by the current Municipal Permit in 2007.

In 2002, the City, like all Copermittees, developed and submitted a JURMP to the RWQCB. The City then submitted an updated JURMP, as required by the Municipal Permit, in March 2008. The JURMP explains management measures for different sectors, including municipal, industrial, commercial, construction, and significant development and re-development activities.

Annual reports documenting the implementation of the JURMP are required to be submitted to the RWQCB by September 30. This JURMP Annual Report presents data from the 2011/2012 fiscal year, which extended from July 1, 2011, to June 30, 2012.

1.1.2 CITY SETTING

The City of La Mesa, located in central San Diego County, covers an area of approximately nine square miles and has a population size of almost 58,000 residents. Although the primary land use in La Mesa is residential, there are areas of industrial and commercial development, parks and open space, and other types of development.

Approximately 52 percent of La Mesa is located within the San Diego River Watershed, while the remaining 48 percent is located in the San Diego Bay Watershed. In total, the City constitutes about one percent of the land area in each watershed. Runoff generated in La Mesa is conveyed through five drainage basins: Alvarado, University, Spring Valley, Lemon Grove, and Lake Murray.

Table 1-1 lists the approximate percentage of each drainage area in La Mesa, the corresponding hydrologic unit (HU) of the basin, and the receiving water body to which each basin drains. Figure 1-1 presents the drainage basins as they relate to land use activities in the City.

Table 1-1
City of La Mesa Drainage Basins

Drainage Basin	Percent of City Area	Hydrologic Subarea	Receiving Water Body	Watershed
Alvarado	51	907.11 Mission San Diego	San Diego River	San Diego River
University	28	908.22 Chollas	Chollas Creek	San Diego Bay
Spring Valley	14	909.12 La Nacion	Sweetwater River	San Diego Bay
Lemon Grove	6	908.22 Chollas	Chollas Creek	San Diego Bay
Lake Murray	1	907.11 Mission San Diego	San Diego River	San Diego River

The Alvarado and Lake Murray drainage basins ultimately discharge to the San Diego River. The Lower San Diego River is listed in the 2010 CWA Section 303(d) for fecal coliform, *Enterococcus*, phosphorus, low dissolved oxygen, total dissolved solids, manganese, toxicity, and nitrogen. Alvarado Creek, a receiving water body located within the City of La Mesa jurisdiction and tributary to the San Diego River, is listed as impaired for selenium. Runoff from the University and Lemon Grove drainage basins drains to Chollas Creek, which is impaired for indicator bacteria, dissolved copper, lead and zinc, diazinon, phosphorus, total nitrogen, and trash. Finally, the Spring Valley drainage basin in La Mesa is part of the larger watershed of the Sweetwater River. The Lower Sweetwater River is listed in the 2010 CWA Section 303(d) for *Enterococcus*, fecal coliform, phosphorus, selenium, total dissolved solids, total nitrogen, and toxicity. The City is also subject to additional requirements associated with TMDLs for bacteria in the San Diego River watershed and for bacteria, dissolved metals, and the pesticide diazinon in the Chollas Creek watershed.

1.2 Purpose and Objectives

The City's JURMP presents strategies to reduce the discharge of pollutants from the MS4 to the maximum extent practicable (MEP). The JURMP describes various programs intended to minimize or eliminate the effects of urban runoff from the City on receiving water bodies. This JURMP Annual Report has been prepared to document the implementation of the City of La Mesa's JURMP during the 2011/2012 reporting period.

1.3 Report Organization

This report follows the standard reporting outline jointly developed by the Copermittees and submitted to the RWQCB in July 2007. The following sections are included in the JURMP Annual Report.

Section 1	**Introduction**
Section 2	**Development Planning Component**
Section 3	**Construction Component**
Section 4	**Municipal Component**
Section 5	**Industrial and Commercial Component**
Section 6	**Residential Component**
Section 7	**Illicit Discharge Detection and Elimination Component**
Section 8	**Education Component**
Section 9	**Public Participation Component**
Section 10	**Fiscal Analysis Component**
Section 11	**Effectiveness Assessment Component**
Section 12	**Special Investigations**
Section 13	**Non-Emergency Fire Fighting**
Section 14	**JURMP Revisions**
Section 15	**Conclusions and Recommendations**
Section 16	**References**

Each section includes all components required by the standard JURMP Annual Report format. In some cases, additional subsections within the standardized sections have been added to provide a more detailed explanation of the City's activities during the reporting period. For example, in this introduction section, the standard reporting format only includes subsections 1.1 and 1.2. Background, subsection 1.1, has been divided into Regulatory Background, subsection 1.1.1, and City Setting, subsection 1.1.2, for clarity.

2.0 DEVELOPMENT PLANNING COMPONENT

2.1 INTRODUCTION

The development planning component of the City's JURMP aims to improve overall storm water quality by reducing the discharge of pollutants from development projects to the MEP and by managing the increase in runoff from development projects that have the potential to negatively affect downstream water bodies. During the 2011/2012 fiscal year, the City accomplished these goals through implementation of its JURMP document.

2.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the development planning component during the 2011/2012 reporting period are presented in the following bulleted list. The remainder of this section provides more detail about the City's implementation of this component of its storm water program.

- Distributed the City's development requirements checklist ("Appendix A" of the City of La Mesa BMP Manual II) to projects applying for permits.
- Implemented updated hydromodification requirements as required by the Municipal Permit.
- Used the City's treatment control BMP database to track completed Priority Development Projects (PDPs).
- Conducted maintenance inspections of treatment control BMPs at eleven completed development projects in the City. See Table 2-1 in this section for a comparison of inspection numbers and Municipal Permit requirements.
- Obtained verification of BMP maintenance from all inventoried projects.

2.2 LAND USE PLANNING

2.2.1 BACKGROUND

The City's General Plan was last updated in 1996 and contains water quality and watershed protection principles in its Public Services and Facilities Element. The principles established in 1996 provide a framework for implementing the current Municipal Permit requirements, and no changes to these policies were made during the reporting period. An update to the General Plan had been planned for 2012; however, no updates were completed during the 2011/2012 reporting period.

2.2.2 SOURCE CHARACTERIZATION

The City's General Plan contains established restrictions on the types of new development projects based on their planned land uses to ensure public safety and limit negative impacts

to the surrounding environment. No changes to the development restrictions in the City's General Plan for storm water purposes were implemented during the reporting period. The City Council-approved comprehensive update to the General Plan has not yet been completed.

2.2.3 Best Management Practice Requirements

Please refer to the City's updated JURMP document for a list of the water protection policies included in the City's General Plan. These policies remained the same throughout the reporting period.

2.2.4 Program Implementation

The City implemented its water protection related land use policies during the reporting period primarily through the City's Municipal Code. The City's BMP Manual II, a formatted guidance manual based on the regional Model SUSMP document, is an uncodified appendix to Chapter 7.18 of its Municipal Code. No updates were made to the BMP Manual II during 2011/2012. The current City of La Mesa Storm Water BMP Manual – Part II (BMP Manual II) is included as Attachment 2.1. The BMP Manual and other documents for development project proponents are available on the City's website at http://www.cityoflamesa.com/index.aspx?NID=988.

Details on how the City implemented its established water protection policies through its environmental review process and its development project approval and verification processes during the reporting period are provided in Sections 2.3 and 2.4 of this JURMP Annual Report document.

2.3 Environmental Review Process

The City's current environmental review process is detailed in the City's updated JURMP. The overall structure of the review process, such as the City's departments involved and the document submissions required, remains the same as in previous reporting years. No modifications to the City's environmental review process have been made since the submittal of the updated JURMP.

2.4 Development Project Approval and Verification Process

2.4.1 Background

During the 2011/2012 fiscal year, the City implemented the watershed protection principles in the City's General Plan through various aspects of the City's development project approval and verification process, as detailed below.

2.4.2 Source Characterization

The different priority pollutants, sources, and activities associated with development projects within the City are addressed through the implementation of the City's BMP Manual II, which contains the City's SUSMP regulations. These regulations are included in Municipal Code Chapter 7.18. Projects subject to SUSMP regulations are identified by completion of applicability checklists. More detail about this process is provided in Section 2.4.4.2.

2.4.3 Best Management Practice Requirements

The BMP requirements for development projects did not change during 2011/2012.

2.4.4 Program Implementation

During the 2011/2012 fiscal year, the City required BMP implementation for all development projects through education, a comprehensive development project approval process, and a treatment control BMP inspection and maintenance verification program.

2.4.4.1 Outreach and Staff Training

The City provides training for staff involved in the planning and review of development projects within the City and works closely with the development community to communicate its development requirements throughout the entire approval process. City staff review Water Quality Technical Reports (WQTRs) submitted for development purposes. Outside consultants may also be used for review assistance. Details on trainings conducted and educational materials developed and distributed during the reporting period can be found in Section 8 of this JURMP Annual Report document. Based on results from the beginning years of the program, distribution of treatment control BMP maintenance verification letters appears to continue increasing the level of knowledge of regulated parties.

2.4.4.2 Urban Runoff Approval Process for Development Projects

All development projects that required City permits were subject to the City's urban runoff approval process as detailed in the City's JURMP. Forms completed by project applicants are kept with the project's file at the City for future reference. As discussed in the City's JURMP, the City required all projects applying for construction and building permits with any potential to impact storm water to complete an "Appendix 'A' – Storm Water Requirements and Project Data Sheet" that guides project applicants to submit proper documents to the City for review. A current "Appendix A" form is available as Attachment 2.2. All development projects determined to be PDPs after completing "Appendix A" were required to implement the City's SUSMP requirements and prepare Post Construction WQTRs in accordance with the City's BMP Manual II. All PDPs are tracked by the City.

During the reporting year, five development projects submitted WQTRs, which were subjected to the City's SUSMP requirements, as applicable. The projects and the results of the reviews are listed below.

- 7171 Stanford Residential. The WQTR for this PDP was reviewed once and not approved during 2011/2012.
- Big Lots Parking Lot. The WQTR for this PDP was reviewed twice and approved during 2011/2012.
- Care Meridian. The WQTR for this PDP was reviewed once and approved during 2011/2012.
- Grossmont Hospital Prop G Improvements. The WQTR for this PDP was reviewed once and not approved during 2011/2012.
- Lemon Avenue Apartments. The WQTR for this PDP was reviewed twice and not approved during 2011/2012.
- Park Station – Kitzman. The WQTR for this PDP was reviewed and not approved during 2010/2011. This project continues to await discretionary approvals by the City Council.

Several projects subjected to SUSMP requirements in previous reporting periods have not submitted revised plans nor have the existing plans been approved. If these projects are resumed, they will be subjected to the City's SUSMP requirements at the time of approval. Some other proposed development projects have been abandoned. Additionally, some projects listed above as approved may have had additional submittals during previous program years. No projects approved during 2011/2012 were allowed to implement low removal efficiency BMPs. During the reporting period, no projects received a SUSMP waiver for implementation of treatment control BMPs. The City has never issued a SUSMP waiver, and at this time the City has no plans to develop a SUSMP waiver mitigation program.

The Big Lots Parking Lot is one example of a Priority Development Project that was conditioned to meet SUSMP requirements in 2011/2012. The project involved the removal and replacement of an asphalt concrete parking lot with subgrade compaction at a large commercial site. City staff initially determined that the project was working without the appropriate permits and immediately issued a stop work order (see Section 3.5.4). The project was then retroactively subjected to the City's development approval process. After the City's rigorous reviews of the project's WQTR, a Filterra unit was approved for treatment of onsite runoff.

Hydromodification Management Plan

During the reporting period the Copermittee Land Development Workgroup met to discuss Hydromodification Management Plan (HMP) development issues and provide updates on the status of consultant work products. The City of La Mesa continued participation in the workgroup meetings. The City incorporated the final regional HMP requirements into its

local development requirements in January 2011 and posted information about the new HMP requirements on its website to educate project proponents. These requirements have superseded the Interim Hydromodification Criteria (IHC) that were effective prior to that time.

All of the projects approved during 2011/2012 qualified for an HMP exemption, and were therefore not subject to HMP requirements. All projects currently under review are subject to the new hydromodification requirements unless they qualify for one of the exemption categories. This will be evaluated during review and reported in the applicable reporting period.

BMP Installation Verification

During the course of 2011/2012, after maintenance verification letters had been sent out during the summer of 2011, the City tracked PDPs within the City's jurisdiction completed during the remainder of the reporting period to be added to the treatment control BMP inventory. When a project is completed, the City checks for BMPs prior to occupancy, records the site information, assigns it a TTWQ priority, and then adds it to the inventory of projects subject to the City's inspection and annual maintenance verification program the following fiscal year. This process helps the City focus its inspection resources on sites more likely to have maintenance deficiencies, as maintenance deficiencies are generally less likely at sites with recently installed BMPs.

2.4.4.3 Treatment Control BMP Inspection and Maintenance Verification Program

2011/2012 Annual Maintenance Verification

The Municipal Permit requires annual verification of operation and maintenance of treatment control BMPs installed within the City's jurisdiction. Annual verification must be provided by the party responsible for treatment control BMP maintenance and must be returned to the City prior to the start of the wet season (October 1st). Using the property owner names and addresses recorded in the City's BMP database, BMP maintenance verification forms were mailed to all the projects included in the City's BMP database in early 2011/2012.

The City required that completed maintenance verification forms be returned no later than October 1, 2011. The City was able to obtain appropriate responses from every site on the inventory in 2011/2012. Out of the 18 projects on the City's inventory, five projects did not return their verification forms by the deadline and were issued NOVs in October 2011. After receiving NOVs, all sites promptly submitted the annual maintenance verification form.

Operation and Maintenance Inspections

During the 2011/2012 fiscal year, the City conducted inspections of projects with treatment control BMPs in accordance with the inspection frequencies outlined in the City's JURMP. Table 2-1 provides a summary of the number of inspections performed and how these met

the requirements of the Municipal Permit. All high TTWQ inspections were performed prior to October 1, 2011.

Table 2-1
Assessment of Compliance with Required Inspection Frequencies

Site Class	Number of Sites	Full BMP Assessments	Percent Inspected	Permit Requirement	Requirement Met
All Inventoried Sites	18	11	61%	20%	Yes
Sites with Drainage Inserts	9	5	56%	50%	Yes
High TTWQ	6	6	100%	100%	Yes

During full inspections, each BMP was visually assessed, GPS coordinates were recorded, and deficiencies were documented in writing and in photographs. Table 2-2 lists the development projects inspected, the number of BMPs installed at each site, the number of BMPs inspected, the number of BMPs found in need of maintenance, a brief description of inspection findings, and, if applicable, any follow-up actions taken. The BMP types installed at these sites and the TTWQ priority for each site is included in the City's treatment control BMP inventory, which is included in Appendix A.1 of this JURMP Annual Report. Further discussion of some of the inspection results and follow-up actions is provided in the text below.

Enforcement

Follow-up actions were recommended for all development projects with BMPs observed in need of maintenance. Since sites are notified by mail of deficiencies in BMP maintenance, with specific corrective actions listed, official verbal and written warnings are typically not used. The City has found that there is often significant turnover at property management companies responsible for BMP maintenance, and the City typically follows-up with non-responders by phone to verify that documents have reached the correct individual prior to issuance of an NOV. Enforcement actions are administered in an escalating manner as described in the City's updated JURMP. The City follows up with any sites that fail to verify that the required corrective actions and regular BMP maintenance were conducted. The City issued five NOVs to projects failing to respond with appropriate maintenance verification documents and/or projects with deficiencies discovered during routine inspection. All deficiencies noted in the 2011/2012 reporting period have been resolved. An example of follow-up action and resolution is described below.

During the inspection at the Grossmont Medical Offices Building and Parking Structure at 8860/8870 Center Drive, multiple deficiencies were noted. Significant trash, debris, and sediment were observed in the drainage insert and vortex separator. Additionally, the vegetated swale had sparse vegetation and was not in working order. The City worked with the responsible party to verify that appropriate maintenance was conducted. The

maintenance verification letter was returned to the City, showing maintenance had been performed by the end of September 2011.

Copies of the forms utilized to administer the above enforcement actions can be found in Appendix D of the City's JURMP.

During the reporting period, no sites were observed to present a significant threat to human health or the environment during inspections, so none were reported to the RWQCB.

2.5 Development Planning Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

2.6 Program Review and Modification

The City's SUSMP requirements have been updated as described above in Section 2.2.4.

Table 2-2
Summary of Treatment Control BMP Inspection Results

#	Project Name	Inspection Date	TTWQ	BMP(s) Installed	BMP(s) Inspected	BMPs Requiring Maintenance	Inspection Notes	Follow-Up Notes	Resolution Status
1	Grossmont Trolley Theatre Conversion	8.23.2011	High	2	2	2	Significant trash, debris, and sediment were observed in both drainage inserts. One insert appeared to have a torn filter fabric.	Maintenance indicated on 9.26.2011 on verification form.	Resolved
2	Grossmont Medical Offices and Parking Structure	8.23.2011	Medium	3	3	3	Significant trash, debris, and sediment were observed in the drainage insert. Significant trash and debris accumulation was observed in the vortex separator. Vegetated swale had very sparse vegetation and was not in working order.	Maintenance indicated on 9.17.2011 and 9.26.2011 on verification form.	Resolved
3	Alterra/Pravada at Grossmont Trolley Apartments	8.23.2011	High	20	14	16 (including 6 not accessible downspout filters)	Downspout filters could not be accessed during inspection. Significant trash, debris, and/or sediment were observed in all drainage inserts.	Maintenance indicated on verification form. City conducted a re-inspection to verify maintenance.	Resolved

Table 2-2 (Continued)
Summary of Treatment Control BMP Inspection Results

#	Project Name	Inspection Date	TTWQ	BMP(s) Installed	BMP(s) Inspected	BMPs Requiring Maintenance	Inspection Notes	Follow-Up Notes	Resolution Status
4/5	County Library, La Mesa Branch and La Mesa Police Department	8.31.2011	High	5	1	1	Significant sediment was observed in the vortex separator.	Maintenance indicated on 12.2011 on verification form.	Resolved
6	La Mesa Fire Station #11	8.31.2011	High	1	1	1	Significant sediment and standing water was observed in storm screen.	Maintenance indicated on 2.15.2012 on verification form.	Resolved
7	Parkview	9.1.2011	Medium	17	17	1	Significant trash, debris, and sediment were observed in the drainage insert.	Maintenance indicated on verification form dated 11.2.2011.	Resolved
8	La Mesita (Belvedere)	9.1.2011	Medium	2	2	2	Significant trash, debris and/or sediment were observed in both drainage inserts.	Maintenance indicated on verification form.	Resolved
9	Eastridge Serramar	9.1.2011	Medium	3	3	2	Significant trash, debris, and sediment were observed in two vortex separators. An unpleasant odor was present as well at one separator.	Maintenance indicated on verification form.	Resolved

Table 2-2 (Continued)
Summary of Treatment Control BMP Inspection Results

#	Project Name	Inspection Date	TTWQ	BMP(s) Installed	BMP(s) Inspected	BMPs Requiring Maintenance	Inspection Notes	Follow-Up Notes	Resolution Status
10	Lowell Street Condominiums	9.1.2011	Medium	4	4	2	Significant trash, debris, and/or sediment were observed in two drainage inserts. Proper installation of one filter needed to be verified.	Maintenance indicated on verification form.	Resolved
11	Kaiser	9.12.2011	High	1	1	0	No maintenance deficiencies were observed during the inspection.	N/A	N/A

3.0 CONSTRUCTION

3.1 INTRODUCTION

The City's construction program is designed to control construction and grading activities in the City. These types of projects have the potential to impact nearby water bodies due to the presence of disturbed soils and building materials and the potential for associated pollutants to be transported off site by storm water or non-storm water flows. The City continued to implement its construction program throughout 2011/2012.

3.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the construction component during the 2011/2012 reporting period are presented in the following bulleted list. The following subsections provide more detail on how the City complied with the Municipal Permit during the reporting period.

- Distributed appropriate checklists to all projects applying for grading and building permits.
- Conducted plan checks of erosion control plans to ensure construction projects comply with the City's minimum BMP requirements.
- Conducted two training seminars prior to the wet season on construction BMPs for applicable City staff in 2011/2012.
- Conducted 65 construction inspections at 27 sites during 2011/2012.
- Issued 10 verbal warnings, 6 written warnings, three NOVs, and one stop work order to construction sites and activities during 2011/2012.
- Required construction sites less than one acre to complete a Construction Storm Water Management Plan (CSWMP), similar to a Storm Water Pollution Prevention Plan, which details the planned construction phase BMPs for the project.

3.2 SOURCE CHARACTERIZATION

An inventory of active construction projects during the reporting period is presented in Appendix A.2 of this JURMP Annual Report. The City's inventory was maintained throughout the reporting period by the City's Engineering Division. New construction projects were added to the inventory at the start of construction, and projects were removed from the inventory after construction was completed. Inventory updates were completed once per month.

Since construction activities that involve grading activities are generally more of a threat to water quality than other construction activities such as tenant improvements, the City has chosen to include projects that have applied for grading permits on the construction inventory. Although other, smaller, construction projects are not included on the City's construction inventory; the City requires BMP implementation and maintains oversight of these projects. The City's building inspectors inspect these sites for proper BMP implementation during their routine building construction inspections. Building inspectors will notify the Engineering Division of the Public Works Department if any major BMP deficiencies are noted or if a facility is required to submit an application for a grading permit, and thus be included on the City's construction inventory. Inspections by the Building Department are not tracked by Storm Water Staff like the City's construction inspections, but these inspections are used as a supplemental tool to implement the City's construction storm water requirements.

3.3 Updates to Ordinances and Approval Processes

The City did not make any changes or updates to City ordinances during 2011/2012. However, the City revised the CSWMP, which is required to be completed by construction sites not subject to the State of California General Construction Permit (Construction Permit). Additionally, Capital Improvement Program (CIP) projects are now required to submit CSWMP plan sheets for approval through the Virtual Project Manager website. This requirement facilitates the process of issuing penalties for poor BMP implementation and withholding payment to those contractors involved in the CIP projects.

3.4 Best Management Practice Requirements

The City's current construction and grading project requirements are detailed in the City's current BMP Manual Part II, which can be found as Appendix C in the City's JURMP and Attachment 2.1. The City did not make any changes to these BMPs during 2011/2012.

3.5 Program Implementation

The City implemented the construction component of its JURMP throughout the reporting period through education and staff training, its comprehensive construction and grading approval process, and its construction inspection program, as detailed below.

3.5.1 Education and Staff Training

During 2011/2012, City staff involved in construction program implementation was trained on dry weather and wet weather requirements, erosion control, material management BMPs, enforcement action and procedures. Please see Section 8 of this JURMP Annual Report document for details on trainings performed and construction-related educational materials distributed.

3.5.2 Construction and Grading Approval Process

The City's grading approval process is described thoroughly in Section 5 of the City's JURMP. During 2011/2012, City personnel verified that all construction projects planned to implement the City's minimum BMP requirements prior to issuing any building or grading permits. The City continued to distribute Appendix A, which helps the City and the project proponent identify whether coverage under the Construction Permit is needed. Appendix A was not updated during 2011/2012. Additionally, the City continued to require construction projects that are not subject to the Construction Permit to complete a CSWMP, which details BMPs planned for construction sites not required to develop a storm water pollution prevention plan (SWPPP). A copy of the City's updated CSWMP form is included as Attachment 3.1. Approved forms and documents completed by project proponents are kept with the each project's file at the City for reference.

During 2011/2012, the City continued to enforce a 17 acre maximum disturbed area for grading activities. None of the City's active construction sites were larger than 17 acres, and the maximum disturbed area limitation did not apply. However, all construction sites were still required to limit exposed cleared or graded areas to the amount of area that could be protected prior to a rain event, as prescribed in the City's seasonal BMP requirements.

The City also continued implementing advanced treatment requirements during the reporting period. Criteria for determining when advanced treatment is required are detailed in the City's JURMP. During the reporting period, the City's minimum BMP requirements were adequate at controlling sediment discharges at all of the active construction sites within the City's jurisdiction, and advanced treatment methods were not required at any construction sites.

3.5.3 Inspection of Construction Sites

Construction projects that were active during 2011/2012, along with their assigned TTWQ, the number of weeks the site was active during the rainy season, the number of inspections conducted during wet and dry seasons, and the total number of inspections for each site are included in Appendix A.2. A total of 65 routine construction inspections were performed at 27 construction sites during 2011/2012.

Construction inspections conducted during the reporting period were performed as described in the City's JURMP. Key components of the inspections include checks for coverage under the Construction Permit during the initial inspection and assessment of compliance with the City's BMP and discharge requirements. Responsible parties at the sites are educated as needed during inspections. Copies of the inspection forms are kept on file at the City.

3.5.4 Enforcement Measures

Any violations were noted on the project's inspection form, and the sites were given a list of corrective actions necessary to fix the observed violations. When necessary, a verbal or

written warning was issued for the violation, and the City followed up with the site until compliance was achieved. Table 3-1, below, includes the number of violations and enforcement actions taken during the reporting period in response to violations of the City's minimum construction BMP requirements. Enforcement actions are administered in an escalating manner as described in the City's JURMP. Copies of the forms utilized to administer enforcement actions can be found in Appendix D of the City's JURMP.

Table 3-1
Construction Enforcement Actions Taken

Enforcement Context	Verbal Warnings	Written Warnings	NOVs	Stop Work Orders
Routine Inspections	10	6	3	1

During the reporting period, one stop work order was issued to the Big Lots Parking Lot project (referred to as Park Lot Slurry and Water Quality in Appendix A.2). City staff determined that the project was active without the necessary permits and water quality controls, and required the site to stop work immediately. City staff met with the responsible party and retroactively subjected the project to the City's development approval process. The project applied for the appropriate permits and submitted a Water Quality Technical Report as required for Priority Development Projects. Refer to Section 2.4.4.2 for additional details.

None of the violations observed at construction sites during the reporting period were found to endanger human health or the environment. The City was able to bring about compliance at all sites for which enforcement actions were taken, and it was not necessary to report any of these sites to the RWQCB.

3.6 Construction Activities Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

3.7 Program Review and Modification

The City's JURMP was updated in March 2008. No significant changes to the City's construction component have been made since that time.

4.0 MUNICIPAL COMPONENT

4.1 INTRODUCTION

Throughout the 2011/2012 reporting period, the City managed municipal areas and activities to reduce municipal discharges of pollutants to the MS4 to the MEP. As discussed in detail in the City's JURMP, the City owns and operates a variety of municipal facilities and conducts various municipal activities. Public parks and recreation facilities, administrative buildings, fire stations, and public works facilities make up the bulk of the municipal facilities in the City. Municipal activities conducted by the City or City contractors include power washing, graffiti abatement, building maintenance, landscaping activities, street sweeping, street and sidewalk repair, and MS4 and sanitary sewer system maintenance. Additionally, the City continued to respond to complaints made to the City's Storm Water Hotline. All complaints made to the City's Storm Water Hotline are included in Appendix B.

4.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the municipal component during the 2011/2012 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the municipal component and of its storm water program during the reporting period are provided in the remainder of Section 4.

- The City inspected all high TTWQ fixed municipal facilities.
- Municipal personnel participated in several training seminars and meetings.
- The City maintained an informational storm water bulletin board in City Hall.
- The City removed a total of 526.12 tons of sediment and debris from street sweeping activities.
- The City removed approximately 263 cubic yards of sediment and debris from standard MS4 cleaning activities, not including drainage insert maintenance.
- The City removed over 12.5 cubic yards of sediment and debris from filter inserts maintained by the City.
- City personnel continued to restock the pet waste bag dispensers in City parks, using approximately 22,500 pet waste bags during 2011/2012.
- A total of 25,214 linear feet of sewer line were televised during 2011/2012, which led to the discovery of some areas of the sanitary sewer in need of repair. The City also replaced or rehabilitated 2,451 linear feet of sanitary sewer line.

4.2 FIXED FACILITIES

4.2.1 BACKGROUND

The City owns and operates a variety of municipal fixed facilities. As mentioned in the City's JURMP, municipal fixed facilities have been grouped under one category, fixed facilities. This is because these facilities receive routine inspections as part of the City's municipal program, making program implementation generally similar.

4.2.2 SOURCE CHARACTERIZATION

All fixed facilities are included on the City's municipal inventory; descriptions of the facilities and activities can be found in the City's JURMP. The City's inventory is included in this JURMP Annual Report as Appendix A.3. The designations of pollutants potentially generated by municipal facilities on the inventory are based on the pollutant loading potentials shown in Table 6-1 of the City's JURMP. TTWQ prioritizations are assigned via the process laid out in the flow chart shown in Figure 6-1 of the City's JURMP.

4.2.3 BEST MANAGEMENT PRACTICE REQUIREMENTS

The City continues to implement and assess the effectiveness of BMPs at fixed municipal facilities. As mentioned in the City's JURMP, the City uses the California Stormwater Quality Association (CASQA) Municipal BMP Handbook to establish appropriate BMPs for fixed municipal facilities. Table 6-2 in the City's JURMP describes the CASQA fact sheets that are used for specific facility types.

The City continues to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. The City also continues to use Calsense Computerized Irrigation Control (Calsense) at a number of fixed municipal facilities to reduce water use and decrease the chance of transporting pollutants to the City's MS4 by over-irrigation. BMP implementation for parks and recreational facilities, as described in the City's JURMP, has not changed.

City public works employees, fire station employees, and employees at other fixed facilities in the City continue to implement BMPs appropriate to the facility type as described in the City's JURMP. City fire response personnel continue to be trained in implementing BMPs for non-emergency fire fighting activities as described in Section 3 of the City's JURMP. There have been no changes in BMP requirements for any fixed municipal facilities.

4.2.4 PROGRAM IMPLEMENTATION

As mentioned above, the City's BMP requirements have not changed since the development of the revised JURMP. Some notable examples of implementation of those BMPs are provided below.

Calsense Computerized Central Irrigation Control

The City continues to use Calsense, an advanced automated irrigation system designed to prevent over irrigation at several fixed municipal facilities. Since Calsense is automated, it has a lower chance of malfunction than manual irrigation systems and allows the City to monitor irrigation activity from a central computer. A total of 24 municipal facilities, including both parks and various fixed facilities, are equipped with Calsense technology.

The Calsense system monitors irrigation by including the use of master valves and flow sensors to prevent over-irrigation and also decrease the amount of water that is used. A break in the system is recognized as a high flow, and the system is shut off until it is repaired. The use of this technology allows the City to prevent major leaks by the early detection of smaller leaks. The automatic shut-off by Calsense saves thousands of gallons of water and prevents the runoff generated by a leak from carrying pollutants from parks and other fixed municipal facilities to the storm drain system. The irrigation system can be controlled by a central computer, which calculates the best time for irrigation based on moisture readings, weather, and real time flow rates at every valve. Additionally, the system allows staff to manage it more efficiently and with less chance of over-irrigation. The irrigation schedules can be designed for a long period of time or easily modified for weekly or daily needs if necessary. The system allows for the most efficient usage of water while minimizing the chance of over-irrigation and consequent introduction of pollutants to the City's storm drain system.

Parks and Recreational Facilities

During 2011/2012, the City continued to maintain 38 pet waste bag dispensers installed throughout 14 parks. City personnel restock the dispensers as necessary; approximately 22,500 pet waste bags were used during the reporting period. As mentioned in the City's JURMP, a number of volunteers continue to assist in keeping the designated dog area at Harry Griffen Park free of pet waste as part of the Canine Corners Program. The City also continues to host the Adopt-A-Park program, which engages residents of the City in volunteering to pick up trash throughout local parks. In 2011/2012, the Adopt-A-Park program sponsored several events at various locations and welcomed six new volunteer groups. The City continued its partnership with the St. Madeline Sophie's Center, which employs developmentally disabled individuals in park maintenance activities.

During 2011/2012, the City maintained the informational kiosks in four City parks: La Mesita Park, Vista La Mesa Park, and Jackson Park, and Harry Griffen Park. These kiosks present storm water pollution prevention information to park patrons and are updated with information regarding upcoming outreach events. The Adopt-A-Park program, the partnership with St. Madeline Sophie's Center, and the storm water kiosks are also discussed in Section 9 of this Annual Report.

As previously mentioned, the City continued to implement strict minimum BMP requirements for the use and management of pesticides, herbicides, and fertilizers, as described in the City's JURMP. In 2011/2012, the City used 3.5 tons of fertilizer, 75.2 gallons of herbicide, and 9 pounds of pesticides.

Public Works Facilities, Fire Stations, Other Fixed Facilities
As previously mentioned, City personnel continued to implement appropriate BMPs for municipal fixed facilities as described in the City's JURMP. BMPs are also implemented during regular maintenance (i.e. landscaping, building maintenance, etc.) as necessary. Parking facilities associated with fixed municipal facilities are included as part of the regular sweeping activities and were swept weekly during 2011/2012. The large paved area at the City's Public Works Operation Center was swept at least once weekly during 2011/2012, and twice weekly if needed. Public Works employees continued to implement the storm water management plan at the Public Works Operations Center. Public Works employees also continued to maintain the seven filter inserts on the property; these inserts are cleaned twice annually. Additionally, the City performed additional periodic inspections at the Public Works Operations Center to ensure compliance is achieved year round. Corrective actions were relayed to the superintendent who then coordinates the cleanup/remedy.

Municipal Inspections
All high TTWQ fixed municipal facilities received a routine annual inspection in 2011/2012. Table 4-4 at the end of this section lists all high TTWQ municipal fixed facilities requiring inspection in 2011/2012, the date the inspection was performed, and the recommended corrective actions from the inspection. The City's inspection approach, as described in the JURMP, was implemented for all municipal inspections conducted in 2011/2012. The City's municipal inspection form is included as Attachment 4.1.

Six municipal facilities were recommended for follow-up during 2011/2012: Collier Park/Pump House, MacArthur Park, Porter Hall, Public Works yard, Sunset Park/Gardener's Shack and Recreational Building, and Sunshine Park. Since the inspections were conducted near the end of the 2011/2012 reporting period, confirmation that the corrective actions required to achieve full compliance were completed will be assessed in 2012-2013.

4.3 Roads, Streets, Highways, and Parking Facilities

4.3.1 Background

The City conducts regular maintenance of roads, streets, highways, and parking facilities in the City to control pollutants such as sediment, metals, and litter and debris.

4.3.2 Source Characterization

The City maintains roads, streets, and highways; the City also maintains four stand-alone parking facilities. Roads, streets, and highways, are included as one entity on the City's municipal inventory and each individual stand-alone parking facility is also included on the City's municipal inventory, which is included in Appendix A.3.

4.3.3 BEST MANAGEMENT PRACTICES

The City's primary BMP for roads, streets, highways, and parking facilities is street sweeping. Other BMPs are chosen as needed based on the CASQA Municipal Handbook. The City's sweeping frequency is outlined in the JURMP and described in the following subsection. There were no changes to the BMPs implemented for roads, streets, highways, and parking facilities in 2011/2012.

4.3.4 PROGRAM IMPLEMENTATION

During 2011/2012, the City swept a total of 9,038 curb miles, removing approximately 526.12 tons of debris. Similar to previous reporting periods, the debris removed by sweeping activities was approximately 80 percent sediment and 20 percent leaves, debris, and trash. Table 4-1, below, describes the areas assigned high, medium, and low sweeping priorities, and the associated sweeping frequency. The City met the Municipal Permit sweeping frequency requirements of the high, medium, and low priority streets as described in both the table below and in the JURMP. Parking lots associated with City parks were swept every two weeks; parking lots associated with all other fixed facilities in the City were swept every week during 2011/2012.

Table 4-1
Street Sweeping Prioritization and Frequency

Category	Description	Approximate Mileage of Route	Sweeping Frequency
High	Downtown areas, designated residential areas, designated commercial areas, four stand-alone parking facilities	10.6 miles	At least every two weeks
Medium	Center islands	9 miles	At least once per month
Low	Designated residential areas	140 miles	As needed, at least annually
Fixed Facilities	Eleven parking lots associated with municipal fixed facilities	N/A*	Weekly
Fixed Facilities - Parks	Twelve parking lots associated with parks	N/A*	Every two weeks
Fixed Facilities – PW Operations Center	Public Works Operation Center, including the two parking lots	N/A*	At least weekly, twice weekly if needed
Total Amount of Debris Collected from Street Sweeping Activities: 526.12 tons			

* Mileage data is not available for the swept area of stand-alone parking facilities, parking facilities associated with municipal facilities, and the PW Operations Center. Mileage accrued while sweeping these facilities is included in the total mileage.

As a means to address priority pollutants in the San Diego Bay and the San Diego River Watersheds, the City continued to conduct additional sweepings of some City streets. Designated residential areas that are low priority were actually swept monthly during 2011/2012 and selected high priority streets were actually swept weekly.

Inspections
Trash, debris, and sediment that have accumulated on City streets are identified and cleaned up via street sweeping, so additional inspections beyond this effort are not necessary.

4.4 MS4

4.4.1 Background

The City's storm water conveyance system is designed to collect and convey surface runoff to receiving waters to prevent flooding during rain events. The City's MS4 consists of approximately 56 miles of pipes of varying materials, natural channels, concrete channels, and culverts and over 400 curb inlets and catch basins.

4.4.2 SOURCE CHARACTERIZATION

The City's MS4, as one complete entity, is included on the City's high TTWQ municipal inventory.

4.4.3 BEST MANAGEMENT PRACTICES

The City maintains a strict MS4 maintenance and cleaning schedule in order to keep the MS4 in good operating condition and remove any trash or debris that may otherwise be carried to receiving waters. As described in the City's JURMP, BMPs for MS4 maintenance activities are chosen based on the CASQA Municipal Handbook and have not changed during 2011/2012.

The City has installed and maintains 21 filter inserts in catch basins in the University drainage basin, which are designed to prevent debris from entering the MS4. These filter inserts are maintained as part of the routine MS4 maintenance schedule. Figure 4-1 shows the locations of these drainage inserts.

During 2009/2010, two Filterra Bioretention System units were installed at Orien Avenue at Lowell Street. The manufacturer's warranty included maintenance for the first two years, and now the City's Public Works employees maintain the units twice per year, once prior to the rainy season. These two Filterra Bioretention System units are located in the University drainage basin and are included with the drainage inserts in Figure 4-1.

4.4.4 PROGRAM IMPLEMENTATION

The City implemented a rigorous MS4 inspection and cleaning schedule during 2011/2012. The City inspected and cleaned all MS4 cleanout locations twice in 2011/2012; at least one cleaning was conducted between May 1 and September 30. The City's MS4 inspection and cleaning data for 2011/2012 is shown in Table 4-2.

Table 4-2
MS4 Maintenance Data

	Percent Inspected and/or Cleaned*	Percent of Open Channels Found with Anthropogenic Litter Cleaned	Amount of Debris Removed from Cleaning Activities
Catch Basins/Self Cleaning MS4 Facilities	100%	N/A	143 cubic yards
Open Channels	100%	100%	120 cubic yards
Drainage Inserts	100%	N/A	12.5 cubic yards
Filterras	100%	N/A	0 cubic yards
Total Debris Removed From MS4 Maintenance Activities: 275.5 cubic yards or 74.4 tons			

* No structures were observed at least 33% of capacity during the reporting period. However, the City cleans out any structures, including self-cleaning structures, in which trash and debris is observed at the time of inspection.

The City's cleanout locations are access points to various sections in the City's MS4, so no additional pipe beyond the cleanout location is typically cleaned. The City may flush the MS4 line and then reclaim the water in the event of a spill. During 2011/2012, there was no need to flush any MS4 line, so there is no data to report for additional MS4 cleanout activities. As previously mentioned, the City continued to maintain the filter inserts installed in the University drainage basin.

During 2011/2012, the City continued to inspect the open channels in the City and remove trash and debris as necessary. If litter or debris is observed during the routine inspections, it is removed immediately. The total length of the channel segments inspected and cleaned by City staff was approximately 4,930 feet.

As described in Table 4-2, approximately 275.5 cubic yards of debris was removed during MS4 maintenance activities. The weight of the material removed was not recorded, though an overall estimation of the composition of debris removed from MS4 maintenance activities is 80 percent trash and leaves and 20 percent rocks and soil. The volumes were converted to estimated weights using the percent composition estimates from City maintenance staff and conversion factors of 2,300 pounds per cubic yard of rocks and soil and 400 pounds per cubic yard of trash, leaves, and similar material. The total weight of material removed was estimated at 74.4 tons.

4.5 SANITARY SEWER SYSTEM

4.5.1 BACKGROUND

To reduce the possibility of a spill or leak caused by a malfunction of a component of the City's sanitary sewer system, the City conducts routine maintenance of the system. A spill that introduces untreated sewage to receiving waters can contain high concentrations of

bacteria, viruses, and even hazardous chemicals. Routine inspection and maintenance of the sanitary sewer system works to reduce the potential for a spill or SSO and also helps prevent the infiltration of seepage from the sanitary sewer system to the City's MS4.

4.5.2 Source Characterization

The City maintains a system of public sanitary sewer pipes to convey wastewater from the City to be treated. The sanitary sewer system, as one complete entity, is included on the City's high TTWQ municipal inventory.

4.5.3 Best Management Practices

The City implements BMPs from the CASQA Municipal Handbook, as described in the City's JURMP, during sanitary sewer maintenance. There have been no changes to these BMPs during 2011/2012. The City inspects and maintains the sanitary sewer system as part of regular wastewater activities. The City clears blockages and repairs leaks as needed.

4.5.4 Program Implementation

As part of the City's regular maintenance schedule, the City maintains areas known to be "hot spots" for grease buildup on a monthly basis. During 2011/2012, the City continued to implement a Fats, Oils, and Grease (FOG) program that targets grease-producing facilities, such as eating establishments. The goal of the program is to reduce grease buildup in the sanitary sewer system, which can cause or contribute to SSOs. Additionally, the City's FOG Ordinance, No. 2009-2794 and 2009-2795, went into effect on July 1, 2009. The FOG Ordinance provides legal authority for the City to regulate grease producing facilities and outlines specific details of the program. During 2011/2012, the City conducted FOG inspections at FOG facilities and will continue to conduct FOG inspections during 2012/2013. The City also will enforce any storm water violations noted during FOG inspections.

In addition to the monthly maintenance at known grease "hot spots," the City seeks to eliminate seepage from the sanitary sewer system to the MS4 by routine preventative maintenance of both systems. Routine maintenance of both systems allows the City to find areas that are likely to become problems in the future and make the necessary repairs/replacements before any larger issues arise. A total of 25,214 linear feet of sewer line was televised during 2011/2012 in order to find and repair any areas where seepage could occur. The City also continued to conduct flow metering in its sanitary sewer system to monitor for evidence of potential problems. During 2011/2012, the City replaced or rehabilitated 2,451 linear feet of sewer line. The City is awaiting final decisions regarding funding for a subsequent phase of the State Revolving Fund loan program in order to conduct wastewater infrastructure upgrades. The City has completed California Environmental Quality Act and engineering documentation for these future projects; however the funding process has been delayed. The City is hopeful that funding will be secured in 2012/2013.

In case of an SSO, the City maintains a spill response plan that establishes procedures for responding to an SSO. Detailed information about the City's SSO spill response plan is included in the City's JURMP. Spills were reported to the RWQCB within 24 hours through the California Integrated Water Quality System, as required by the Municipal Permit.

4.6 Mobile Municipal Activities, Including Power Washing

4.6.1 Background

The City conducts a variety of different mobile municipal activities, typically involving infrastructure maintenance, landscape maintenance, graffiti removal, and power washing. Power washing is not considered a part of any normal maintenance activities, but it is used when other methods of cleaning or graffiti removal are not effective.

4.6.2 Source Characterization

Both power washing and graffiti removal are listed on the City's high TTWQ municipal inventory. Infrastructure maintenance and landscape maintenance are listed on the City's medium TTWQ municipal inventory.

4.6.3 Best Management Practices

The City implements BMPs for mobile activities as described in the City's JURMP and as applicable to the activity. City personnel are trained to implement BMPs for the specific activity in which they are involved. For example, City personnel performing power washing are trained to collect all waste water and City personnel conducting graffiti removal are trained to store and handle any chemicals properly.

4.6.4 Program Implementation

Power washing and graffiti removal, both high TTWQ activities, are conducted on an as needed basis and are therefore not on a set schedule. Neither power washing nor graffiti removal was scheduled to be conducted during the timeframe that routine municipal inspections were conducted. Facility personnel responsible for graffiti removal and power washing have been trained and are aware of the BMPs necessary for each activity to prevent discharge to the MS4. Water produced by these activities is either directed to landscaping or storm drains are blocked and water is vacuumed up once the project is complete.

Municipal personnel that conduct other mobile activities such as infrastructure maintenance and landscape maintenance are trained regularly regarding BMPs for material use and disposal. Emergency vehicle maintenance personnel are trained on the proper handling and use of pesticides, herbicides, and fertilizers as described in the City's JURMP.

4.7 Special Events

4.7.1 Background

The La Mesa Oktoberfest is the only priority designated annual special event that occurs in the City. Oktoberfest is a three-day celebration occurring in early October. There are no other regular major special events, although smaller events may occur on occasion.

4.7.2 Source Characterization

As required by the Municipal Permit, special events are included on the city's high TTWQ municipal inventory.

4.7.3 Best Management Practices

As detailed in the City's JURMP, the City has selected BMPs for special events hosted in the City. In general, the goal of the City's special event BMPs are to properly manage trash and litter generated by the event, keep catch basins and other nearby MS4 facilities free of litter/debris from the event, and raise storm water awareness among the vendors and patrons of the event, as applicable. During smaller events, City staff ensure that any trash and debris left over from the events is cleaned up.

4.7.4 Program Implementation

Individuals or groups interested in hosting events in the City are required to obtain a permit from the City, if applicable. Both Community Assembly Permits and Block Party Permits are available from Public Works and Park Use Permits are available from the Community Services Department. Permits require individuals responsible for the event to control trash and clean up after the event. If vendors are anticipated at the event, the "Tips for Outdoor Vendors" fact sheet (Attachment 8.1) is provided to the permit applicant.

During 2011/2012, the City provided "Tips for Outdoor Vendors" to the vendors of the Oktoberfest event. This fact sheet informed the vendors of the difference between the storm drain system and the sanitary sewer system and the effects of polluted urban runoff. The sheet also included event-specific BMPs, such as using dry cleaning methods, having spill response materials if using cooking grease, and managing trash and other wastes properly. The City distributed approximately 50 copies of the aforementioned fact sheet.

On the Monday following the three-day Oktoberfest event, the City conducted a post inspection of the area where the event took place. Minor amounts of litter and debris were observed, which were cleaned up as part of the routine special event BMPs.

4.8 Public Reporting of Illicit Discharges and Connections

Reporting and Response

Public and municipal involvement is crucial to preventing and eliminating Illicit Connections and Illicit Discharges (IC/IDs) from the MS4. The Storm Water Hotline

provides an effective means for individuals in the City to report suspected IC/IDs. The hotline number is provided on the City's website, in distributed storm water educational material, in storm water articles in the *La Mesa Focus* newsletter, and on the Storm Water Bulletin Board. Storm water complaints may also be reported through the City's website. All complaints received through the hotline and website are logged onto a spreadsheet for documentation and tracking. Each logged complaint is investigated by City personnel to determine if an IC/ID is present. Responsible parties for any confirmed IC/ID are sought out and educated and/or cited as necessary and required to stop any and all illegal discharges. The Public Works Department also receives complaints regarding storm water, often due to infrastructure concerns. Complaints to the Public Works Department are also tracked and investigated.

Complaints received by the City during the 2011/2012 reporting period and the City's response to each are listed in Appendix B. A total of 119 complaints were documented this year.

Enforcement

As previously stated, complaints received via the Storm Water Hotline, City website, and Public Works Hotline are included in a table in Appendix B. The table also includes a description of how each complaint was resolved during the reporting period. Resolutions to investigated complaints included issuing warnings, violations, and/or educational material. Table 4-3, below, summarizes the enforcement actions taken in response to complaints received.

Table 4-3
Enforcement Actions Resulting from Complaints Received by the Storm Water Hotline

	Educational Material Distributed	Verbal Warning	Compliance/ Enforcement Letter	Written Warning	NOV
Commercial	2	0	4	0	2
Industrial	0	0	0	0	0
Mobile	0	0	0	0	0
Municipal	0	0	0	0	0
Residential	3	1	10	3	5
Construction	0	1	0	0	0

Note: Hotline calls received that are not represented in this table were able to be resolved without requiring formal enforcement means. Generally, formal warnings, enforcement letters, and violations are issued if a discharge is observed or facilitating responsible party action requires higher levels of enforcement.

4.9 Spill Reporting, Response, and Prevention

The City has documented procedures for preventing and responding to sanitary sewer overflows. Preventative maintenance is regularly conducted on the City's sanitary sewer system, and video inspections and sewer surveys are regularly conducted to monitor the condition of the public sewer lines and to determine the necessity of maintenance. City

crews do not maintain private laterals, but the City assists in the containment and cleanup of spills from private laterals if the spill could potentially reach the City's MS4.

Individuals in the City are encouraged to report any SSOs to the City's Storm Water Hotline. Additional information regarding the City's mitigation efforts for the SSOs can be found in the technical report that was submitted to the RWQCB during 2011/2012.

4.10 Education and Outreach

During 2011/2012, the City continued to educate municipal personnel regarding proper BMP implementation and other storm water and watershed concepts. The City held a variety of training sessions for City personnel. The City also continued to maintain a storm water bulletin board in City Hall, which provided storm water information and brochures.

Detailed information regarding the education and outreach conducted for City personnel is described in detail in Section 8 of this Annual Report.

4.11 Municipal Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

4.12 Program Modification and Review

The City's JURMP was updated in March 2008. No changes to the City's municipal component have been made since that time.

Table 4-4
Routine Municipal Inspection Results

#	Facility Name	TTWQ	Municipal Category	Inspection Date	Corrective Actions Needed	Follow-Up Steps Taken	Resolution Status
1	Allison Avenue Lot (Parking Facility)	High	Roads, Streets, Highways, and Parking Facilities	6.20.12	None	N/A	N/A
2	Aztec Park	High	Parks and Recreation Facilities	6.6.12	None	N/A	N/A
3	Briercrest Park	High	Parks and Recreation Facilities	6.19.12	None	N/A	N/A
4	Collier Park and Pump House	High	Parks and Recreation Facilities	6.21.12	Vegetative debris is a major concern on this site. Concrete channel in the middle of the park is full of debris and it is creating a blockage at the bridge in the middle.	Parks Maintenance Notified	Re-Assess in 2012-2013
5	Community Pool	High	Parks and Recreation Facilities	6.28.12	None	N/A	N/A
6	Harry Griffen Park	High	Parks and Recreation Facilities	6.19.12	None	N/A	N/A
7	Highwood Park	High	Parks and Recreation Facilities	5.31.12	None	N/A	N/A
8	Jackson Park	High	Parks and Recreation Facilities	6.18.12	None	N/A	N/A
9	Junior Seau Sports Complex	High	Parks and Recreation Facilities	6.21.12	None	N/A	N/A
10	La Mesa Blvd (Parking Facility)	High	Roads, Streets, Highways, and Parking Facilities	6.11.12	None	N/A	N/A
11	La Mesita Park and Gardener's Shack	High	Parks and Recreation Facilities	6.18.12	None	N/A	N/A

Table 4-4 (Continued)
Routine Municipal Inspection Results

#	Facility Name	TTWQ	Municipal Category	Inspection Date	Corrective Actions Needed	Follow-Up Steps Taken	Resolution Status
12	Lemon Ave Lot (Parking Facility)	High	Roads, Streets, Highways, and Parking Facilities	6.11.12	None	N/A	N/A
13	MacArthur Park	High	Parks and Recreation Facilities	6.12.12	Trash needs to be picked up along the northern fence and around the bullpen.	Parks Maintenance Notified	Re-Assess in 2012-2013
14	Northmont Park	High	Parks and Recreation Facilities	6.6.12	None	N/A	N/A
15	Palm Avenue Lot (Parking Facility)	High	Roads, Streets, Highways, and Parking Facilities	6.7.12	None	N/A	N/A
16	Porter Hall	High	Parks and Recreation Facilities	6.12.12	Lids should remain closed on the dumpster.	Parks Maintenance Notified	Re-Assess in 2012-2013
17	Porter Park	High	Parks and Recreation Facilities	6.12.12	None	N/A	N/A

Table 4-4 (Continued)
Routine Municipal Inspection Results

#	Facility Name	TTWQ	Municipal Category	Inspection Date	Corrective Actions Needed	Follow-Up Steps Taken	Resolution Status
18	Public Works Facility	High	Public Works Facilities	10.26.11	1) Catch basin at west end along the wall (across from sign shop) needs maintenance. The inlet filter appeared to be in good condition but basin was full of trash and debris and needed to be cleaned out. 2) Area where the paver is kept has improved but drip pans should be used under the truck because a leak was observed. Any spills should be cleaned up immediately. 3) Most stockpiles adjacent to the drying bed area have been covered but the plastic could be secured better. Broken asphalt and dirt needs to be covered. Areas around containment should be swept as needed; significant dirt and sediment was observed. 4) Materials and debris that are located by the storage container in the middle of the yard need to be properly thrown away if they are empty, or kept under cover. 5) White sand/silt was observed at the north end of the yard and should be swept up.	PW Operations Superintendent Notified.	Re-Assess in 2012-2013
19	Rolando Park	High	Parks and Recreation Facilities	6.26.12	None	N/A	N/A
20	Sunset Park, Gardener's Shack and Recreational Building	High	Parks and Recreation Facilities	5.31.12	Slope along the northwest side of the park is contributing large amounts of sediment into the paved parking lot and cross gutters.	Parks Maintenance Notified	Re-Assess in 2012-2013

Table 4-4 (Continued)
Routine Municipal Inspection Results

#	Facility Name	TTWQ	Municipal Category	Inspection Date	Corrective Actions Needed	Follow-Up Steps Taken	Resolution Status
21	Sunshine Park	High	Parks and Recreation Facilities	6.15.12	Leaves and debris along the south and west sides of the park are a significant problem. Part of the issue is located on the opposite side of the fence and may be the responsibility of the resident.	Parks Maintenance Notified	Re-Assess in 2012-2013
22	Vista La Mesa Park	High	Parks and Recreation Facilities	6.26.12	None	N/A	N/A

Note: Roads, streets, highways, parking lots, the MS4, and the sanitary sewer system were inspected via the maintenance effort described earlier in this section.

5.0 INDUSTRIAL AND COMMERCIAL

5.1 INTRODUCTION

During 2011/2012, the City continued to implement a storm water program to reduce urban runoff pollution from the areas and activities of industrial and commercial businesses. The City aims to reduce the amount of pollutants discharged from industrial and commercial facilities by implementing various aspects of its industrial and commercial program.

5.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Notable achievements for the industrial and commercial component during the 2011/2012 reporting period are outlined below. Additional details about the City's implementation of the industrial and commercial component and of its storm water program during the reporting period are provided in the remainder of Section 5.

- The City met the Municipal Permit requirement of inspecting at least 25 percent of its stationary industrial and commercial inventory.
- The City inspected all high TTWQ stationary industrial and commercial facilities.
- The City completed pollutant discharge potential assessment (PDPA) forms and additional watershed-specific questionnaires at inspections to aid watershed management and source identification efforts.
- The City continued to conduct brief re-inspections at sites with minor violations to achieve full compliance in a timely and efficient manner.
- In 2011/2012, the City conducted an outreach effort to small car lots where auto detailing was done and distributed mobile washing pamphlets explaining storm water regulations and proper BMP implementation.
- Based on inspection findings and complaints made to the Storm Water Hotline, the City took enforcement actions against industrial and commercial businesses, as necessary.

5.2 STATIONARY INDUSTRIAL AND COMMERCIAL SITES / SOURCES ELEMENT

5.2.1 BACKGROUND

The City's updated industrial and commercial inventories can be found in Appendix A.4 and include all stationary facilities known to be operating in the City that are required to be included on the City's inventories. Stationary facilities in the City include, but are not limited to, manufacturing facilities, wholesalers, auto dealerships, auto repair shops, and restaurants. The City requires industrial and commercial businesses to implement pollution

prevention measures and minimum, activity-specific BMPs to mitigate the impacts of business activities on water quality.

5.2.2 Source Characterization

The City's industrial and commercial inventories include both stationary and mobile businesses, as required by the Municipal Permit, and were updated during 2011/2012. The City's updated inventory includes 367 stationary industrial and commercial facilities.

Information on how the City prioritizes the industrial and commercial inventories based on TTWQ is discussed in detail in the City's JURMP. The City considers the following factors when prioritizing the inventories:

- Industrial Permit subjectivity
- Consideration of downstream water bodies and whether the business is likely to discharge pollutants for which the water body is impaired
- Results from previous inspections and institutional knowledge
- Proximity to the receiving water body

In August 2011, the City received comments from Coastkeeper indicating that information could not be located regarding pollutants potentially generated by inventoried businesses, the identification of which businesses may discharge to impaired water bodies, and the businesses most likely generating pollutants for which the receiving water bodies are impaired. As presented in the 2010/2011 JURMP Annual Report, the City's 2011/2012 industrial and commercial inventory in Appendix A.4 clearly shows this information. Additionally, the City continues to conduct PDPAs during routine site inspections, and utilizes a numeric scoring system to quantify the level of discharge potential. Site-specific information is reflected on the updated inventory where applicable.

5.2.3 Best Management Practice Requirements

Industrial and commercial businesses in the City are required to implement pollution prevention methods and other designated BMPs to reduce or potentially eliminate the generation of pollutants from business areas and activities. The City has established a set of minimum BMPs based on the CASQA Industrial and Commercial Handbook. The requirements include BMPs applicable to all facilities as well as activity-specific BMPs. The City's BMP requirements are described in more detail in the City's BMP Manual Part I, which is an attachment to the City's JURMP. BMP requirements for stationary industrial and commercial businesses did not change during 2011/2012.

5.2.4 Program Implementation

As previously mentioned, the City updated its industrial and commercial inventory during 2011/2012. The updated industrial and commercial inventories are included as Appendix A.4, to this JURMP Annual Report.

Industrial and Commercial Inspections

During 2011/2012, the City conducted storm water compliance inspections at selected stationary industrial and commercial facilities. All high TTWQ sites were selected for routine inspection. Additional sites selected for routine inspection were selected randomly, with consideration for sites with previous issues that had not recently been inspected.

Table 5-1 provides a summary of the industrial and commercial site visits. In the table, full inspections have been counted as one full inspection. Because facilities move/go out of business, are duplicates of other businesses listed on the City's inventory, or are conducting activities for which inclusion on the City's inventory is not necessary, full inspections are not conducted at all visited facilities. Since time and effort are required to visit these facilities, visits where a full inspection is not conducted are considered equivalent to one half of a full inspection. The only time a site visit would not count as half of a full inspection is if the facility moved and was replaced by a facility where a full inspection was conducted or if the facility was a duplicate of another facility selected for inspection.

Table 5-1
Summary of Routine Site Visits

Facility Category	Inventoried Stationary Sites	Equivalent Full Inspections*	Percentage of Total Inventory
High TTWQ Sites	36	35**	9.5%
Additional Sites	332	57	15.5%
Totals	**367**	**92**	**25.0%**

* "Equivalent Full Inspections" includes full inspections and also counts at 50 percent value the site visits where a full inspection could not be conducted but where effort was taken to document the visit and update the inventory. It does not include any businesses that were duplicate listings of other inspected facilities or facilities replaced by other businesses inspected during the reporting period.
** One high TTWQ facility, Rainbow Steel Inc., is no longer conducting business within the City, however the existing site was still inspected in 2011/2012 in order to evaluate site conditions and corrective actions were communicated to the property owner.

Facility inspections were conducted in accordance with the protocol set in the City's JURMP. Inspections involved a thorough examination of the facility and all outdoor activities. BMP deficiencies and corrective actions were recorded on the City's industrial and commercial inspection form and discussed with facility personnel present during the inspection. Businesses were given a copy of corrective actions at the time of inspection.

During the inspection process, the City also checked Industrial Permit compliance status when applicable. The City also reviews SWPPPs and monitoring results when applicable. Furthermore, the City completed PDPA forms and supplemental watershed questionnaire forms during the inspections in an effort to collect more data from inspected facilities. These forms are included with the City's inspection form, which is included in Attachment 5.1.

During 2011/2012, the City conducted the following inspections:

- Follow-up inspections at sites not in compliance in 2010/2011
- Routine inspections for 2011/2012
- Brief re-inspections at sites with minor violations during routine 2011/2012 inspections

Follow-up inspections conducted in 2011/2012 are included in Table 5-2. Results of full routine inspections conducted in 2011/2012 are included in Table 5-3.

In 2010/2011, a minor re-inspection form was developed to document a no-fee inspection that is completed within 48 hours of the initial inspection. These are for minor issues that do not warrant a full fee-imposed re-inspection (e.g. small amounts of trash). These inspections are still categorized as a failure to comply and re-prioritized as such. The purpose of this minor re-inspection form is to get small issues corrected quickly. If the issues are not corrected within 48 hours, then a full re-inspection is required. Facilities where minor re-inspections were completed and a full re-inspection was not required have a correction status of "Completed" in Table 5-3. The conditions at three facilities inspected at the end of the reporting period warranted a full re-inspection, and the City's follow-up and enforcement activities at these sites will continue into 2012/2013. These sites have a correction status of "In Progress" in Table 5-3.

One of the two facilities recommended for follow-up during 2010/2011 was observed to be in compliance during the follow-up inspection conducted in 2011/2012. This site received a routine inspection subsequent to the follow-up inspection to confirm continued compliance with City requirements during which it was determined that the business was no longer in operation. The other facility recommended for follow-up during 2010/2011 was out of compliance during the 2011/2012 follow-up and routine inspections but continues to show effort and improvement. The City is committed to working with them to achieve long term full compliance.

Additionally, the City completed approximately 170 FOG inspections during 2011/2012. These inspections also include a quick check for storm water compliance in addition to the FOG requirements for restaurants.

The City did not rely on third party inspections to satisfy its industrial and commercial inspection requirements during the reporting period. The City does not presently maintain a third party inspection program.

General Industrial Permit

Subjectivity to the Industrial Permit was evaluated during the industrial and commercial inspection process. If the business was new and had not previously been inspected, or if the business had recently changed activities, the inspector gathered information about the business activities that occur on site and assigned or reassigned the business' standard industrial classification (SIC) code(s). Based on the assigned SIC code, the inspector evaluated the Industrial Permit subjectivity of the business. Notably, none of the inspected

businesses in the City were observed to be in violation regarding obtaining coverage under the Industrial Permit in 2011/2012.

Education and Outreach

In addition to checking for compliance with the City's requirements and the Industrial Permit, inspections provide a venue to give site-specific one-on-one education regarding storm water concepts and BMPs. The City Inspector discusses a variety of topics including watershed concepts, the Industrial Permit, and minimum, activity-specific BMP requirements. Prior to performing industrial and commercial inspections, the City sent a letter to all businesses informing them of the upcoming inspection. At the time of inspection, businesses are given a copy of corrective actions. Additionally, automotive-related facilities receive the "Green Wrench Guide", and food-related facilities receive the "What's Cookin'?" brochure as applicable. The San Diego Bay or River Watershed factsheets were also distributed to businesses interested in more information on storm water beyond basic compliance.

The City Inspector works directly with businesses that have historically had repeat violations, such as A-1 Equipment and Walter H. Barber & Sons, Inc., to ensure long term compliance. The City's inspector has visited businesses more frequently than for official annual inspections in order to build a relationship with the personnel and to clarify storm water regulations. Also, the City provides a customized list of corrective actions during the inspection to facilitate prompt compliance.

The City continued to publish storm water-related articles in the *La Mesa Focus* newsletter. The 2011/2012 issues were distributed to the residents and businesses in the City that have elected to receive it; approximately 960 were sent electronically. Summaries of the articles in the newsletter can be found in Section 6; the newsletters are included as Attachment 5.2 to this JURMP Annual Report.

Enforcement

Ten industrial and commercial facilities were observed to be out of compliance with the City's municipal storm water ordinance during routine inspections conducted in 2011/2012. As previously mentioned, brief re-inspections were performed in 2011/2012 in order to address minor corrective actions. Seven of the ten facilities had achieved compliance at the time of the re-inspection. Three commercial facilities were found to have ongoing issues that will require additional follow-up. These inspections were conducted near the end of the 2011/2012 reporting period, so actions to bring the sites into compliance will continue into the 2012/2013 reporting period. The City did, however, give Corrective Action Sheets to all businesses for failing to properly implement BMPs. Again this year, a smaller percentage of business inspections resulted in the need for a follow-up visit compared to previous years. The likely explanation for this continued increase in compliance is the storm water inspection fee program. While the initial purpose of the inspection fee was to fund the inspection program, charging businesses for each routine inspection and follow-up visit provides the additional benefit of encouraging businesses to come into compliance with the City requirements to avoid the fees associated with additional follow-up inspections. Businesses are required to pay for all necessary re-inspections until they are in

compliance, which has made it fiscally possible for the City to have one inspector as point person who personally coordinates compliance assistance and enforcement. No industrial and commercial IC/IDs were discovered during routine inspections.

During the course of the 2011/2012 reporting period, the City received 15 complaints regarding stationary industrial and commercial businesses. These came directly from residents as calls into the Storm Water Hotline, complaints entered through La Mesa's Request Tracker and the Civic Plus websites, or complaints from City staff. Details of the industrial and commercial complaint investigations are included in the City's complaint log, which is included as Appendix B. The City took appropriate enforcement actions during investigations conducted in response to these complaints including verbal discussions, distribution of educational materials, written warnings, enforcement letters, and NOVs, as necessary.

There were no instances of noncompliance that posed significant threat to human health or the environment observed during 2011/2012. No non-filers were noted, as discussed earlier in this section, and no other businesses were reported to the RWQCB.

5.3 Mobile Sources

5.3.1 Background

Due to the nature of activities of most mobile businesses, a major area of concern is illegal discharges. In general, mobile businesses can be difficult to identify, as many do not have City business licenses. Additionally, many mobile businesses may be home-based and/or conduct activities that do not occur in one fixed location, so inspections of such facilities are impractical.

5.3.2 Source Characterization

Known mobile industrial and commercial businesses, as described in the City's JURMP, are included on the City's inventory and are marked as mobile. A total of 989 businesses are included on the City's 2011/2012 mobile inventory.

5.3.3 Best Management Practice Requirements

BMPs for stationary industrial and commercial facilities are required to be implemented for all outdoor activities, as applicable. BMPs for mobile businesses, including key principles, such as proper collection and disposal of any discharge, are discussed in the City's JURMP. The City has also established a program that requires mobile businesses operating in the City to sign an affidavit making businesses aware of the City's BMP requirements and commits them to implementing the required BMPs.

The City participates in the Regional Industrial and Commercial Workgroup, which developed regional mobile business BMP standards in 2008/2009. These standards were devised to create a uniform set of minimum BMPs for mobile businesses operating within the region. The regional mobile business BMP standards are provided on the Project Clean Water website.

5.3.4 Program Implementation

During the 2011/2012 inspection program, the City responded to one call to the City's Storm Water Hotline regarding a mobile business. More detail about the complaint is included in the City's complaint log, included in Appendix B.

Mobile Affidavits
The City requires mobile businesses to sign an affidavit when applying for a business license to acknowledge the City's BMP requirements. Additionally, the affidavit states that the business owner agrees to implement BMPs as required by the City's JURMP and acknowledges that failure to do so will result in enforcement action and possible legal action. During 2011/2012, affidavits were distributed to mobile auto detailing businesses that applied for business licenses, and one affidavit was signed during this reporting period.

Education and Outreach and Enforcement
As previously mentioned, one complaint was made to the City's Storm Water Hotline regarding a mobile business. City personnel investigated this case and resolved it.

This year, the City's Storm Water Staff conducted outreach to small car lots where auto detailing was being done on site. They distributed approximately 25 mobile washing pamphlets to these sites explaining the storm water regulations and proper BMP implementation.

There were no instances of noncompliance of mobile businesses that were believed to present potential threats to human health or the environment observed during 2011/2012, so none were reported to the RWQCB.

5.4 Industrial and Commercial Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

5.5 Program Review and Modification

The City's JURMP was updated in March 2008. No changes to the City's industrial and commercial component have been made since that time.

6.0 RESIDENTIAL

6.1 INTRODUCTION

Over half of the land use in the City of La Mesa is designated as residential. Therefore, residential activities that take place within these areas have the potential to impact the quality of the receiving water bodies. Residential activities like vehicle washing, over-irrigation, pesticide and fertilizer application, and home maintenance can potentially contribute pollutants to the City's MS4 if BMPs are not properly implemented. Additionally, improper disposal of household hazardous waste (HHW) can also contribute pollutants to the MS4. Pollutants of concern typically include sediment, pesticides, herbicides, fertilizers, surfactants, oil and grease, and metals. The City has worked to implement a range of programs to address these residential activities and reduce pollutant loads associated with such activities.

Figure 6-1 depicts the residential land use in the City. Yellow areas indicate single-family homes, orange areas indicate multi-family homes such as duplexes and apartment buildings, brown areas indicate mobile home parks, and purple areas indicate other residential areas such as nursing homes.

Figure 6-1
Residential Land Use in the City

Base Data Sources: USGS, SanGIS, SANDAG

6.1.1 Summary of Notable Accomplishments

Some notable achievements for the residential component during the 2011/2012 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the residential component and of its storm water program during the reporting period are provided in the remainder of Section 6.

- The City continued to maintain four informational storm water kiosks located in City parks.
- The City hosted eight HHW events; 784 participants dropped off 87,249 pounds of HHW.
- The City hosted the La Mesa Spring Clean Up on two consecutive Saturdays during 2011/2012. The event was held at the City's EDCO station and allowed residents to dispose of large items, unwanted household materials (not including HHW), and green waste free of charge.
- The City continued to distribute the *La Mesa Focus* newsletter to residents in the City.
- The City continued to respond to complaints made to the City's Storm Water Hotline and submitted online regarding residential areas and activities.

6.2 Source Characterization

The City has identified several high TTWQ residential areas within its jurisdiction and has designated various high TTWQ residential activities, which are discussed in the following subsections.

6.2.1 High TTWQ Activities

During 2011/2012, the City continued to identify the following activities as high TTWQ:

- Automobile repair and maintenance
- Automobile washing
- Automobile parking
- Home and garden care activities and product use
- Disposal of pet waste

6.2.2 High Threat to Water Quality Areas

In addition to high TTWQ activities, the City has identified residential areas that pose a high TTWQ relative to other residential areas. High TTWQ residential areas are designated by considering complaint investigations, institutional knowledge, data from the City's Dry Weather Monitoring Program, and criteria as defined in the Municipal Permit. The following residential areas have been designated high TTWQ.

East of Helix High School
This area drains to University Channel and includes the residential area east of Helix High School around Lowell Street, Normal Avenue, and Olive Avenue. University Channel serves as a part of the storm water conveyance system for the City and is part of the Chollas Creek Watershed. During the 2009 Dry Weather Monitoring Program, a transient dissolved copper exceedance was detected in this area.

Baltimore Drive, North of Interstate 8
The area surrounding Baltimore Drive is largely composed of high-density housing. Runoff from this area drains to Alvarado Channel via two internal storm drain networks. Storm Water Hotline calls related to high TTWQ activities in this area have been recorded in past years. Some past Dry Weather Monitoring results have indicated that this area could be a source of bacteria, although that has not been found in monitoring programs during recent sampling years. The area is still classified as a high TTWQ to be conservative, although the City may reevaluate the prioritization in future years if recent dry weather monitoring trends continue. Potential runoff sources include residences located on Parkway Drive, Aztec Drive, and Baltimore Drive.

Nagel Street and Sarita Street
The residential area around the intersection of Nagel Street and Sarita Street drains to Alvarado Channel. Past Dry Weather Monitoring Program upstream investigations have indicated that this area has been a source of bacteria.

Residential areas within the City designated as high TTWQ receive additional attention and periodic visual inspection from storm water staff to check for evidence of IC/IDs and high TTWQ activities.

6.3 Best Management Practice Requirements

The City has continued to provide information regarding the implementation of pollution prevention measures, like good housekeeping practices, for residential areas and activities. The City's BMP Manual Part I includes lists of general residential BMP requirements as well as BMP requirements for specific residential activities. The manual is included in Appendix C of the JURMP. General residential BMPs include erosion control; non-storm water discharge management, including elimination of IC/IDs; and good housekeeping measures, such as sweeping rather than hosing off driveways and sidewalks. Specific BMPs for the high priority activities outlined above are also included in the City's BMP Manual Part I. There have been no changes to the City's residential BMP requirements as discussed in Appendix C of the City's JURMP.

6.4 Program Implementation

The City's residential program has been designed to ensure that adequate City enforcement, complaint investigation, and complaint reporting is conducted. This ensures that pollutants associated with residential activities and areas are minimized. The residential program has an educational component so that residents are made aware of appropriate BMPs and high TTWQ activities.

6.4.1 TRAINING, EDUCATION, AND OUTREACH

The City has continued to conduct training, education, and outreach activities for residents, as described below.

***La Mesa Focus* Newsletter Articles**

The City publishes storm water related articles in the *La Mesa Focus* newsletter. The newsletter had been published quarterly but was redesigned in February 2012. Based on community input, each issue of the newsletter is now shorter in length and is published more frequently. Six newsletters were printed during the reporting period (August 2011, February 2012, March 2012, April 2012, May 2012, and June 2012). The issues are archived on the City's website; approximately 960 individuals are signed up to receive e-mail notification when a new newsletter has been posted on the website. Additionally, copies were left out at the Friends of La Mesa Library for patrons to read and are accessible on the La Mesa Neighborhood Watch website. The newsletter is also available in presentation format on Cox Cable channel 24 and AT&T U-verse channel 99. Articles related to storm water that were published in 2011/2012 are summarized below and included as Attachment 5.2.

The August 2011 newsletter contained the following storm water-related articles and announcements:

- "GRANT TO INCREASE RECYCLING OPPORTUNITIES FOR RESIDENTS IN MULTIFAMILY HOUSING" discussed how a grant received from the California Department of Resources Recycling and Recovery will be used to improve recycling opportunities for apartment and condominium complexes.
- "FREE HOUSEHOLD HAZARDOUS WASTE AND ELECTRONIC WASTE DISPOSAL" notified residents of the details and dates of the next collection events.
- "10th ANNUAL KIDS CARE FEST" was advertised. ILACSD provided information about watersheds and storm water during this event.
- "2011 SUSTAIN LA MESA ENVIRONMENTAL FESTIVAL" informed residents of the free upcoming event, which provided resources on water conservation, waste reduction and recycling, pollution prevention, and other environmental issues.
- "INTERGENERATIONAL GAMES" announced the upcoming event to residents. ILACSD demonstrated storm water pollution concepts at during this event.
- "I&I AND YOU" discussed the problems of sewer inflow and infiltration and educated residents on ways to reduce them.
- "SAY 'NO' TO RUNOFF. STOP OVER WATERING!" discussed the problem of over irrigation and listed tips for residents to eliminate over watering. The article also directed readers to the Helix Water District for information on water conservation rebates.
- "PARK APPRECIATION DAY" announced the upcoming park cleanup event and encouraged residents to participate.

The February 2012 newsletter contained the following storm water-related announcement:

- "HOUSEHOLD HAZARDOUS WASTE COLLECTION" announced the date of the next collection event.

The March 2012 newsletter focused on recycling and contained the following storm water-related articles and announcements:

- "NEW BACKYARD COMPOSTING BINS AVAILABLE…DISCOUNT TO LA MESA RESIDENTS"discussed a partnership with Dixieline ProBuild that allowed residents to purchase composting bins at a reduced cost. The article also directed residents to classes on backyard composting.
- "HOUSEHOLD HAZARDOUS WASTE COLLECTION – EDCO STATION" announced the date of the next collection event.

The April 2012 newsletter contained the following storm water-related announcements:

- "SPRING CLEAN UP" notified residents of the upcoming event, which provided free disposal of unwanted items at the EDCO station.
- "ANNUAL CREEK TO BAY CLEANUP" announced the upcoming cleanup event and directed residents to the Creek to Bay website for more information.

The May 2012 newsletter contained the following storm water-related articles and announcements:

- "HOUSEHOLD HAZARDOUS WASTE COLLECTION" announced the date of the next collection event.
- "LUBBOCK PARK SAFE ROUTES TO SCHOOL CLEAN-UP DAY" announced the park clean-up date.
- "WANT TO MAKE A DIFFERENCE IN YOUR COMMUNITY" invited residents to get involved and volunteer for a City Board, Commission, or Committee.
- "STYROFOAM CAN NOW BE RECYCLED IN YOUR BLUE BIN" notified residents that Styrofoam is now accepted in their EDCO bins.

The June 2012 newsletter contained the following storm water-related announcements:

- "HOUSEHOLD HAZARDOUS WASTE COLLECTION" announced the date of the next collection event.
- "FREE PAPER SHREDDING EVENT" notified residents of the event details and date at the EDCO Station.

Other Educational Outreach Materials and Activities

The City has continued to provide storm water information and contacts on their website (www.cityoflamesa.com). The City's Storm Water Hotline also provides an avenue for City residents to obtain storm water information and file storm water related complaints. Other educational outreach materials and activities that targeted residents are discussed in detail in Sections 8 of this report.

During 2011/2012, the City continued to participate in the Regional Residential Education Program.

6.4.1.1 HHW EVENTS

The City hosted eight HHW collection events throughout the 2011/2012 reporting period at the City's EDCO station on Commercial Street. Door-to-door pick-up was also offered for disabled and senior residents. A total of 784 people participated in the events, and 87,249 pounds of HHW were collected. Storm water pollution prevention tri-folds were distributed to participants as requested. Approximately 15 storm water brochures were distributed at HHW events.

Other Collection Events
In addition to the HHW disposal events, the City hosted the La Mesa Spring Clean Up on two consecutive Saturdays during 2011/2012. The event was held at the City's EDCO station and allowed residents to dispose of large items, unwanted household materials (not including HHW), and green waste without charge. Details about this event can be found in Section 9 of this report.

6.4.2 COMPLIANCE AND ENFORCEMENT

The City continues to implement compliance and enforcement measures by identifying potential sources of pollutants in residential areas from Dry Weather Monitoring Program data, complaints received by the Storm Water Hotline, and observations made by the City's municipal personnel. To help focus efforts on high priority areas, the City maintains a map of the high TTWQ areas in the City, which is available to City staff. The staff are especially vigilant for potential threats to storm water quality in these areas of the City and report any observed threats to the Storm Water Hotline. A copy of the map is included as Attachment 6.1. If a potential to impact water quality is present, the City provides a verbal warning, written warning, Notice to Comply, and NOVs as applicable. The City received 96 residential-related complaints during this reporting period. Complaints were submitted through the Storm Water Hotline and through La Mesa's Request Tracker and the Civic Plus website as well as internally through the Public Works Department; the City's complaint log is included as Appendix B to this annual report.

Three written warnings, one verbal warning, 5 NOVs, and 10 compliance letters were issued to residents and/or landlords during this reporting period. Many of the verified complaints involved residents who were unaware of residential BMPs. These issues were resolved with a verbal warning and distribution of educational materials. The City issued NOVs to more serious violations including stucco and mud discharge into the street, wastewater discharge, and dumping of illegal fill. City personnel also cleaned areas in the public right of way as necessary to resolve complaints. All residential complaints were resolved and no further actions, such as fines or reports to the RWQCB aside from this JURMP Annual Report, were deemed necessary.

6.5 Residential Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

6.6 Program Review and Modification

The City's JURMP was updated in March 2008. No changes to the City's residential component have been made since that time.

7.0 ILLICIT DISCHARGE DETECTION AND ELIMINATION

7.1 INTRODUCTION

In accordance with the September 10, 2008 RWQCB adoption of Addendum No. 2 to Order No. R9-2007-0001, the City will submit the 2011/2012 Illicit Discharge Detection and Elimination section and attachments to the RWQCB no later than December 15, 2012.

8.0 EDUCATION COMPONENT

8.1 INTRODUCTION

During 2011/2012, the City continued to provide education and outreach to a variety of audiences within the City. The City's education program targets municipal personnel, industrial and commercial businesses, construction site owners and operators, residents, and underserved audiences. The City aims to reduce storm water pollution by increasing awareness about the storm water conveyance system and promoting the implementation of BMPs. Through education and outreach, the City works to foster change in both the attitude and behaviors of the regulated community regarding storm water.

8.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the education component during the 2011/2012 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the education component and of its storm water program during the reporting period are provided in the remainder of Section 8.

- Storm water staff attended outside training events and provided training sessions for other municipal personnel.
- During 2011/2012, the City's newsletter, the *La Mesa Focus*, featured storm water-related articles and announcements aimed at businesses and residents of the City.
- Educational materials were made available to project proponents and City personnel at City Hall through the informational Storm Water Bulletin Board.
- The City partnered with ILACSD to educate residents at special events and through school presentations during 2011/2012.
- Approximately 50 vendors at the City's Oktoberfest event were provided with a handout entitled "Tips for Outdoor Vendors."
- The City conducted 36 FOG inspections in conjunction with routine Storm Water Compliance Inspections for commercial businesses and distributed educational materials on FOG during the "Sustain La Mesa" Festival.
- The City maintained four storm water kiosks in City parks, which provided educational material to park patrons.

8.2 STAFF TRAINING ELEMENT

The City has provided extensive training and educational outreach to its municipal personnel. Many municipal personnel are out in the field on a daily basis, so it is imperative that they understand the importance of implementing BMPs. Additionally, municipal personnel are encouraged to report any IC/IDs observed to the appropriate City staff and to

educate other municipal personnel and the general public about storm water pollution prevention.

During 2011/2012, five training sessions outlining Integrated Pest Management (IPM) procedures and Construction BMPs were provided for the Parks and Public Works divisions. The City's Storm Water Inspector also participated in a meeting that reviewed Grease Control Devices (GCD's). This presentation discussed appropriate GCD maintenance activities and frequencies, which were then incorporated into the City's FOG inspection program of local businesses. Two City staff members also received certificates of completion for a U.S. Environmental Protection Agency webcast course on Conducting Effective Stormwater Outreach.

The informational storm water bulletin board at City Hall is continually updated with information about storm water topics. The bulletin board is visible to City personnel, project proponents, and other City Hall visitors. In addition, there are educational materials for the public to take located at the bulletin board including storm water hotline magnets, IPM cards, and residential storm water pollution prevention trifolds. Additionally, staff members were reminded about the City's Park Appreciation Day and posters for California Coastal Cleanup Day and the Creek to Day Cleanup were displayed to encourage participation.

Table 8-1, below, includes all training sessions that were provided for various municipal departments during 2011/2012.

Table 8-1
Municipal Training Sessions

#	Date	Event	Topic(s)	Participants
1	9/2011	Pesticide Applicators Professional Association Seminar	Invasive pests and alternative treatments, Pesticide safety programs for compliance	4 Parks Department Staff Members
2	9/7/2011	ICC San Diego Area Chapter Plumbing and Mechanical Subcommittee Meeting	Discussed of proper sizing, maintenance, and types of Grease Control Devices	1 Engineering Staff Member
3	9/22/2011	Construction BMP Training Seminar	Controlling sediment and erosion	3 Public Works Department Staff Members
4	9/28/2011	Construction BMP Training Seminar	Controlling sediment and erosion	9 Public Works Department Staff Members
5	11/2011	Professional Horticultural Seminar	Controlling weeds, pests, and fungus with IPM, Worker safety standards	4 Parks Department Staff Members

Table 8-1
Municipal Training Sessions

#	Date	Event	Topic(s)	Participants
6	3/2012	Ewing Irrigation	IPM for turf pest problems, Worker safety standards	2 Parks Department Staff Members

8.3 EDUCATIONAL OUTREACH ELEMENT

In addition to municipal staff, the City has continued to provide education and outreach to industrial and commercial businesses, construction site owners and developers, residential areas, and underserved audiences. These efforts promote storm water awareness and BMP implementation.

8.3.1 INDUSTRIAL AND COMMERCIAL BUSINESSES

As required by the Municipal Permit, the City inspects its inventoried businesses to evaluate compliance with the City's BMP requirements and provides site-specific education outreach to business owners and operators. Violations of the City's BMP requirements are corrected through enforcement actions as necessary. During each inspection, facility personnel received verbal education on the importance of implementing proper BMPs. Additionally, a letter describing the City's inspection program and BMP requirements was sent to all industrial and commercial businesses selected for routine inspection during 2011/2012. A discussion of the City's FOG program and BMPs that industrial or commercial businesses can implement is available on the City's website at www.cityoflamesa.com.

As previously mentioned, the City's *La Mesa Focus* newsletter featured articles highlighting storm water topics that were aimed at businesses and residents of the City. For example, the August 2011 issue included an article entitled "Say 'No' to Runoff. Stop Overwatering", along with announcements and details of various storm water-related events. These events included clean-up days and recycling programs available to residents and businesses within the City. Newsletters published during 2011/2012 are included as Attachment 5.2.

During the 2011/2012 reporting period, the City again distributed a handout with tips for outdoor commercial vendors (Attachment 8.1). These handouts were distributed to vendors that had booths at the Oktoberfest event, which is the City's largest special event. Approximately 50 handouts were distributed, which detailed specific BMPs that could be implemented by the vendors at the event and explained the difference between the storm drain system and the sanitary sewer system.

8.3.2 Construction Site Owners and Developers

Due to the nature of activities, construction sites have the potential to discharge many types of pollutants to receiving waters if not managed properly. Many construction site owners, contractors, and developers visit the City's Engineering Division to apply for necessary permits. The Storm Water Bulletin Board located across from the front counter where permits are issued, includes material about construction BMPs to provide education for these parties. Several construction related brochures, specifically the construction site management tri fold and a construction SWPPP tri fold are available for project proponents to take from the bulletin board.

8.3.3 Residential Areas

Since residential areas make up more than half the City, the City understands the importance of reaching this particular audience through educational outreach programs. During January, February, and May 2012, ILACSD visited local schools for grades Kindergarten through 6th grade, and gave storm water presentations to the students. The City also continued to publish the *La Mesa Focus* newsletter (Attachment 5.2), which reaches residents in the City. As previously mentioned, storm water-related articles and announcements were included in the newsletters distributed in 2011/2012.

The City's Storm Water Bulletin Board provided information to residents that may have been visiting City Hall. Various posters provide storm water information and information about clean-up events. Additionally, there are several brochures and fact sheets available for the public to take, which included the Over-irrigation Fact Sheet (Attachment 8.2), Chollas Creek TDML Fact Sheet (Attachment 8.3), Residential Preventing Urban Runoff Pollution brochure (Attachment 8.4), Pools and Spa Fact Sheet (Attachment 8.5), and IPM cards (Attachment 8.6).

Educational material was also distributed at various events in the City, such as the "Sustain La Mesa" Environmental Festival, Intergenerational Games, and Kids Care Fest. Materials distributed included the residential Preventing Urban Runoff Pollution brochure (Attachment 8.4) and San Diego River Fact Sheet (Attachment 8.7). Other media like pencils, temporary tattoos, coasters, magnets, jar openers, and stickers with storm water messages on them were also provided during these special events. Details of the events are included in Section 9.

In addition to the educational materials that were provided at various locations and during various events, the City continued to display storm water-related educational material at storm water kiosks at select City parks. The City now maintains four kiosks in four City parks. Storm water-related educational material including the San Diego River Watershed Fact Sheet (Attachment 8.7), Over-irrigation Fact Sheet (Attachment 8.2), Pool and Spa Fact Sheet (Attachment 8.5), the Residential Preventing Urban Runoff Pollution brochure (Attachment 8.4), and excerpts from storm water calendars and a Helix Water District brochure, were displayed at the kiosks for patrons of the park.

The City website, www.cityoflamesa.com, is another resource for City residents to become familiar with the design and intended utilization of the storm drain system, proper HHW disposal, IPM, and other residential activity BMPs, as well as find information regarding volunteer opportunities and applicable City contact information. As previously mentioned, the City provided electronic copies of each *La Mesa Focus* newsletter on the website during 2011/2012.

8.3.4 Underserved Communities

As discussed in the City's JURMP, the City has identified the several residential areas along University Avenue as "underserved" communities. Two residential areas have been identified as Low/Moderate Income Block Groups. A third area has been identified as a Hispanic Household Concentration area. In an effort to promote outreach and education in these underserved communities, the City has developed Spanish versions of several educational materials distributed to residents. Additionally, the City continues to offer the Spanish language option on the City's Storm Water Hotline. The City plans to continue outreach to these underserved communities by providing more educational programs in future reporting years.

8.3.5 Complaint Investigations

To further aid the process of identifying illegal discharges, the City encourages the public and City staff to report IC/IDs. In addition to the City's Storm Water Hotline, Public Works also has a maintenance hotline for complaints regarding issues with the MS4 and sewer lines. These complaints are followed up by Public Works personnel. If a representative for the targeted business, residential area, or construction site is present, the inspector will provide site-specific information regarding storm water issues as well as applicable educational materials.

8.4 Outreach Component Effectiveness Assessment

The estimated number of impressions made by the City's education and outreach efforts during 2011/2012 is presented and described below. Please refer to Section 11 of this JURMP Annual Report for the remainder the effectiveness assessment for this program component.

Impressions Made

The City has continued to provide residents and businesses storm water-related education through inspections, distribution, and mailing of educational materials, and various events throughout the year. The City calculates an estimate of impressions based on the number and type of educational materials distributed. Estimates of the numbers of impressions generated by the City's efforts allow for a more realistic evaluation of the effectiveness of the NPDES storm water program.

The estimated number of impressions was generated by multiplying each effort by the number of impressions thought to be generated by that particular effort. For example, inspections have been presumed to generate three impressions, with the exception of

municipal inspections. Municipal inspections generally involve more people and are assumed to generate five impressions. Training sessions and cleanup events have been assumed to generate a number of impressions equal to four times the number of attendees because it is likely that the attendees will discuss the content with others after the training session. Printed educational materials and other items such as pencils and stickers are assumed to generate three impressions each.

Table 8-2 details the number of impressions made by the City during this reporting year.

Table 8-2
Impressions Made by the City

Impression Type	Count	Unit	Estimated Impressions
Complaint Investigation	119	Investigations	357
Construction Inspection	65	Inspections	195
Industrial/ Commercial Inspection	87	Inspections	261
Industrial/ Commercial Inspection BMP letter	87	Letters	261
Mobile Detailing Pamphlet	25	Brochures	75
Green Wrench Guide	10	Brochures	30
What's Cookin'? Brochure	5	Brochures	15
Municipal Inspection	22	Inspections	110
Treatment Control BMP Inspection	10	Inspections	30
Training Session/ Activities and Events	4086	Attendees	16,344
La Mesa Focus Newsletter	960	News letter	2,880
Residential Preventing Urban Runoff Pollution	100	Brochures	300

		Total	***26,933***

8.5 Program Review and Modification

The City's JURMP was updated in March 2008. No changes to the City's education component have been made since that time.

9.0 PUBLIC PARTICIPATION COMPONENT

9.1 INTRODUCTION

The City encourages public participation in the City's JURMP as a means to foster storm water awareness and improve water quality. Public participation includes, but is not limited to, cleanup events, special community projects, reporting observed IC/IDs, and participating in City-hosted waste disposal events. Collaboration between the City and the community should help encourage a sense of shared responsibility in protecting water quality both locally and regionally. The City has encouraged public participation through the programs discussed within this section.

9.1.1 SUMMARY OF NOTABLE ACCOMPLISHMENTS

Some notable achievements for the public participation component during the 2011/2012 reporting period are presented in the following bulleted list. Additional details about the City's implementation of the public participation component and of its storm water program during the reporting period are provided in the remainder of Section 9.

- During 2011/2012, the City hosted clean-up events at Alvarado and University channels as part of California Coastal Cleanup and Creek to Bay Cleanup. Approximately 96 volunteers removed over 1,234 pounds of trash and debris and 157 pounds of recyclables during these events.
- The City hosted 8 HHW collection events. A total of 784 vehicle loads disposed of 87,249 pounds of HHW in these events.
- Similar to previous years, the City hosted the La Mesa Spring Cleanup event on two separate weekends in April during 2011/2012. A total of 1,353 vehicles disposed of over 724 tons of large items, green waste, and other trash and recyclables.
- Volunteers for the City's Park Appreciation Day event and Adopt-a-Block, Adopt-a-Park, and Canine Corner programs, continued to get residents and community members involved in keeping local streets and parks free of litter and pet waste.
- The City contracted ILACSD to conduct 6 watershed presentations at 4 elementary schools and present "Operation Cleanup," an interactive watershed game, at the Intergenerational Games and Kids Care Fest.

9.2 PUBLIC PARTICIPATION ACTIVITIES

Cleanup Events and Programs

During 2011/2012, the City hosted cleanup events and activities at various locations in the City. Cleanup events provide a direct benefit to water quality and an opportunity for the City to distribute educational materials and information to the event's volunteers.

California Coastal Cleanup Day

The City hosted the California Coastal Cleanup Day in specific areas of Alvarado and University channels on September 17, 2011. A total of 16 volunteers removed over 401 pounds of trash and 25 pounds of recyclables at the Alvarado site, and 22 volunteers removed 481 pounds of trash and 10 pounds of recyclables in the channel and surrounding walkways at the University site (Figure 9-1). In addition to trash and recyclables removal, volunteers were taught to identify items that do not belong in the waterways and the importance of keeping creeks cleans.

Figure 9-1 – Coastal Cleanup Day at University Channel

Park Appreciation Day

Park Appreciation Day was a cleanup event held throughout 14 parks in the City on October 22, 2011. Site captains briefly discussed watershed concepts, local watersheds' constituents of concern, the benefits of cleanups, and the TMDL for the San Diego Bay. Chollas Creek was mentioned at the parks that fell within the San Diego Bay Watershed. Over nine groups of volunteers worked to collect green waste and trash within the City's parks. Volunteers that were not affiliated with a group were still encouraged to come out to their local parks for trash pickup and park maintenance.

Creek to Bay Cleanup

The City hosted the Creek to Bay Cleanup in specific areas of Alvarado and University channels on April 28, 2012. At Alvarado Channel, 22 volunteers participated in removing 122 pounds of trash and 116 pounds of recyclables (Figure 9-2). At University Channel, 36 volunteers removed 230 pounds of trash and 6 pounds of recyclables. City personnel explained general watershed concepts, pollutants of concern, and required BMPs to all event volunteers. At the University Channel site, event volunteers were also presented with information on the TMDL for Chollas Creek. These cleanup events and results were advertised on the City website and were posted on the City's Storm Water Bulletin Board.

Figure 9-2 – Creek to Bay Cleanup at Alvarado Channel

Adopt-a-Park and Adopt-a-Block

The City's Adopt-a-Park Program has continued to involve local businesses, schools, service organizations, families, and other individuals in keeping the City's parks free of trash. Currently, about half of the public parks in La Mesa have been adopted. Volunteers involved in this program are encouraged to remove trash on a regular basis from City parks and open spaces. The program hosted clean-ups events and other volunteer-related activities at the teen center, Harry Griffen Park, Collier Park, and Lubbock mini-park in 2011/2012. Additionally, the Adopt-a-Park program welcomed six new volunteer groups this year.

The City's Adopt-a-Block Program promotes cleanliness in the City by encouraging City residents to keep neighborhoods free of trash and debris. Information about this program is made available to residents and businesses on the City's website at http://www.cityoflamesa.com.

Canine Corners

Canine Corners volunteers pick up pet waste in designated areas of Harry Griffen Regional Park and encourage patrons of the park to pick up after their pets. This prevents bacteria and viruses associated with pet waste from being discharged to the City's MS4. In combination with the City's Adopt-a-Park and Adopt-a-Block programs, volunteers remove trash and pet waste from parks and streets throughout the City.

Saint Madeline Sophie's Center

The City maintains a contract with Saint Madeline Sophie's Center, which employs developmentally disabled individuals to aid in picking up trash and debris at various parks throughout the City. The scope of services includes trash and debris cleanup, emptying trash receptacles and replacement of plastic liners, sweeping/cleaning picnic area tables, as well as some janitorial responsibilities at the park restrooms. Crews consist of three to five individuals and a job coach. Parks included in this program are Aztec Park, Collier Park,

Highwood Park, Jackson Park, La Mesita Park, Northmont Park, Rolando Park, Sunset Park, Sunshine Park, and Vista La Mesa Park.

Hazardous Waste Collection and Used Oil Recycling Program
The City's Community Hazardous Waste Collection and Used Oil Recycling Programs encourage City residents and business owners to properly dispose of HHW. The City hosted eight HHW collection events at EDCO's disposal transfer station facility, which is located near the center of the City. As previously mentioned, events were advertised in the City's *La Mesa Focus* newsletter (Attachment 5.2), which was circulated electronically to hundreds of residents and businesses within the City. A total of 784 participants disposed of hazardous waste at the events and a total of 87,249 pounds of HHW was collected. Door-to-door pickup service was also provided for the senior and disabled communities. Storm water pollution prevention brochures were distributed as requested during the collection events.

Throughout the City of La Mesa, there are also 10 certified collection centers for used oil that are advertised on the HHW disposal dates flyer, as well as four tire recycling centers.

Additionally, I Love A Clean San Diego participated in the La Mesa Car Show, Sustain La Mesa, and Christmas in the Village events during which they distributed 121 oil pans, 72 oil filters, 8 oil filter holders, 2 funnels, and other materials to residents. Participants were also provided with informational materials on used oil recycling locations. ILACSD also hosted an oil filter exchange event on February 25, 2012 at the La Mesa O'Reilly Auto Parts store where twenty-five oil filters were exchanged.

Other Waste Disposal
The City hosted the La Mesa Spring Clean Up event on two consecutive Saturdays in 2011/2012 (April 14 and 21, 2012). Residents were allowed to bring large items, unwanted household materials (not including HHW), and green waste to the EDCO location in the City for free disposal. A total of 1,353 vehicles disposed of over 724 tons of waste and recycling. Recyclable materials were estimated to account for 41 percent (on 4/14) and 50 percent (on 4/21) of the disposed waste.

Public Reporting
As discussed in Section 4, complaints are received through the City's Storm Water Hotline and online website reporting system. The number for the hotline is advertised in articles published in the *La Mesa Focus* newsletter and on various educational materials given out at public outreach events. The residential, industrial, commercial, construction and municipal communities are encouraged to utilize the hotline to report IC/IDs. The City investigates each complaint and tracks the complaint and follow-up actions, as applicable.

9.3 Outreach Events

The City has continued to provide educational outreach programs for a variety of different communities in the City. Since it is an effective way of reaching large numbers of individuals, educational outreach is typically associated with an event. Other outreach

events in the City include the participation of commercial businesses in distributing educational materials and the City's participation in regional meetings and events.

Kids Care Fest

Kids Care Fest is a free event designed to promote healthy choices and attitudes for children and their families. The festival was held at Briercrest Park on September 24, 2011. ILACSD hosted a booth and used the interactive watershed model, "Operation Cleanup", to demonstrate storm water pollution concepts and emphasize the importance of keeping waterways free of pollutants (Figure 9-3). Approximately 350 people visited the ILACSD storm water booth during the festival. During the event, 50 temporary recycling tattoos, 125 storm water magnets, 150 recycling magnets and coasters, 25 San Diego River fact sheets, and 25 residential preventing urban runoff brochures were distributed to the public.

Figure 9-3 – ILACSD booth with "Operation Cleanup" at Kids Care Fest

Intergenerational Games

ILACSD also hosted a booth at the Intergenerational Games at the La Mesa Middle School on October 13, 2011. During this event, ILACSD displayed the "Operation Cleanup", an interactive watershed game for children, where pollutants are located and removed from the model (Figure 9-4). This allowed for explanation of storm water pollution concepts, emphasizing the importance of a healthy environment. Approximately 150 students visited the booth and a total of 100 recycling temporary tattoos, 100 recycling pencils, 150 recycling stickers, 25 storm water and recycling magnets, 25 recycling coasters, and 30 residential Preventing Urban Runoff Pollution brochures were distributed.

Figure 9-4 – ILACSD booth with "Operation Cleanup" at the Intergenerational Games

Oktoberfest

Oktoberfest is the largest festival in the City and was held from September 30, 2011 through October 2, 2011. As previously mentioned in Section 8.3.1, approximately 50 vendors at the event were provided a handout entitled "Tips for Outdoor Vendors" (Attachment 8.1). This handout listed constituents of concern and BMPs during events designed to eliminate pollutant discharges.

"Sustain La Mesa" Environmental Festival

On October 8, 2011, the "Sustain La Mesa" Environmental Festival was held at Harry Griffen Regional Park that was attended by more than 500 people. There were booths and activities emphasizing water conservation, storm water pollution prevention, energy efficiency, sustainable gardening techniques, and recycling. During this event there was an electronic waste and recyclables collection. Electronic waste, metal, plastic numbers 1-7, plastic bags, blister pack, six pack rings, bubble wrap, and Styrofoam packaging were collected. Throughout the festival, speakers from the Solana Center for Environmental Innovations, National Wildlife Foundation, and the California Center for Sustainable Energy spoke to the public. The City's Public Works Department also hosted a booth (Figure 9-5) at the event and distributed 30 residential trifolds, 30 San Diego River fact sheets, 100 FOG scrapers, 200 recycling pencils, 200 storm water coasters and jar openers, 100 storm water and recycling magnets, and 100 recycling coasters to an estimated 250 booth visitors.

Figure 9-5 – Public Works booth at the "Sustain La Mesa" Environmental Festival

Storm Water Information Kiosks

As mentioned in Section 8, the City has maintained the storm water kiosks that were constructed with the help of the local Eagle Scouts. The park kiosks present storm water pollution prevention information to park patrons. During 2011/2012, outreach material was updated and educational events were publicized throughout the year at the four kiosks.

ILACSD School Presentations

During 2011/2012, ILACSD was contracted to conduct six watershed education presentations for Rolando, Murdock, Northmont, and Lemon Avenue Elementary Schools. Two presentations were given on May 25, 2012 at Lemon Avenue Elementary School to 350 students ranging from kindergarten through 3rd grade, and 300 4th through 6th graders. Similarly, two presentations were given to 58 3rd graders at Northmont Elementary School on May 9, 2012. Storm water knowledge surveys were collected for these 58 students. Additionally, ILACSD provided a watershed presentation to 29 5th graders at Murdock Elementary and and 86 5th graders at Rolando Elementary School.

Chollas Creek TMDL Stakeholder Meetings

The jurisdictions named as dischargers for Chollas Creek TMDLs regularly meet to share information, develop reports, and discuss strategies. The City actively engaged in the annual public stakeholder meeting on July 23, 2012. During this year's meeting, a portion was devoted to discussing a source control project within the City.

Storm Water Copermittee Meetings and Other City Participation

The meetings of various storm water Copermittee workgroups provide a forum for representatives from various jurisdictions within San Diego County and other interested parties, including the general public, to exchange information and ideas regarding the management of storm water programs. Several of these meetings were attended by the City during the reporting period and this will continue for the 2012/2013 reporting period.

9.4 Public Participation Component Effectiveness Assessment

Please refer to Section 11 of this JURMP Annual Report for the assessment of program effectiveness.

9.5 Program Review and Modification

The City's JURMP was updated in March 2008. No significant changes to the City's public participation component have been made since that time.

10.0 FISCAL ANALYSIS

10.1 INTRODUCTION

The City's Sanitation Fund provides almost all funding for the Storm Water Program. There have not been any changes to this funding mechanism during this reporting period. During 2009/2010, a fiscal analysis reporting template was developed collectively by the Copermittees. The City has used this template to report the 2011/2012 expenditures and funding sources in this JURMP Annual Report.

San Diego County Copermittees Fiscal Analysis Report
for Urban Runoff Management Programs

EXPENDITURE SUMMARY

JURISDICTIONAL COMPONENTS	
Administration	$101,780.98
Development Planning	$26,213.96
Construction	$13,272.63
Municipal	$3,715.00
Industrial and Commercial	$51,297.72
Residential	$1,316.00
IDDE	$42,967.08
Education	$7,215.00
Public Participation	$6,132.01
Special Investigations	$10,215.00
Non-Emergency Firefighting	$0.00
Jurisdictional Total	**$264,125.39**

WATERSHED	
Watershed 1 – San Diego River	$29,236.02
Watershed 2 – San Diego Bay	$62,501.06
Watershed Total	**$91,737.08**

REGIONAL	
Annual Permit Fee to Regional Board	$18,196.00
Copermittee Cost Share of Regional Budget	$46,062.00
Regional Total	**$64,258.00**

TOTAL COSTS	**$420,120.47**

FUND SUMMARY

FUNDING BY SOURCE	
General Fund	$10,016.73
Storm Water Fee	$0.00
Permit Fees	$0.00
Developer Deposits and Fees	$7,686.87
Registration and Inspection Fees	$22,185.00
Flood Control Fees	$0.00
Franchise Fees	$0.00
Gas Tax	$0.00
Utility Tax	$0.00
Road Fund	$0.00
Enterprise Funds	$0.00
Trust Funds	$0.00
Special Assessment Districts	$0.00
State Appropriated Funds	$0.00
Grant Funds	$0.00
Other – Sanitation Fund	$391,726.87
Total	**$431,615.47**

ONE-TIME FUNDING	
Grants	$0.00
Donations	$0.00
Total	**$0.00**

TOTAL FUNDING	**$431,615.47**

Watershed Urban Runoff Management Program (WURMP)

	Watershed 1 – San Diego River	Watershed 2 – San Diego Bay
Administration (1)	3,290.01	9,870.03
Cost Share	1,942.00	475.00
Watershed Activities	3,290.01	9,870.03
Other	$0.00	$0.00
TOTAL	**$8,522.02**	**$20,215.06**

(1) Administration – includes Watershed strategic planning, management, mapping, assessment, and reporting.

Regional Urban Runoff Management Program (RURMP)

Regional Programs	Jurisdictional Cost Share Amount
Administration (1)	$0.00
Cost Share Contribution	$0.00
Other (2)	$0.00
TOTAL	**$0.00**

(1) Administration – includes assessment, reporting, management, etc.
(2) Other – examples include regional and special studies.

11.0 EFFECTIVENESS ASSESSMENT

11.1 INTRODUCTION

Per the Municipal Permit, the City's JURMP is routinely assessed in order to evaluate its effectiveness at reducing pollutants in urban runoff to the MEP. The overall structure of the City's JURMP consists of three major components: Program Planning, Program Implementation, and Effectiveness Assessment.

Program Planning
The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next, the program developed during the planning step is implemented.

Program Implementation
Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

Effectiveness Assessment
Results of the program implementation phase of the JURMP provide the City with various metrics used to interpret the overall effectiveness of the program in achieving progress toward targeted outcomes. Example metrics were provided in Section 13 of the City's 2008 JURMP, and the City has refined those metrics in the reporting periods since then. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes (Level 1) to more difficult to measure, quality-based outcomes (Level 6). The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

11.2 EFFECTIVENESS ASSESSMENT RESULTS

The Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1, Level 5, and Level 6 outcomes are discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment

that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Outcome Level Assessments

Level 1

Level 1 outcomes are basic measures of permit compliance. The component-specific sections in this JURMP Annual Report provide details of programmatic actions taken to comply with the applicable Municipal Permit requirements. Appendix C of this JURMP Annual Report also includes a checklist that matches the Municipal Permit's annual reporting requirements with the section(s) or appendix of this report that addresses each requirement.

Levels 2 and 3

See tables 11-1 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Figure 11-1 compares storm water complaint data from this fiscal year to previous years. Please note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

Level 4

Tables 11-1 through 11-8, at the end of this section, provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is possible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. Reliable load estimation methods have not yet been developed for most other programs. Note that the City has installed Calsense in various City parks and medians, as described in Section 4. Calsense is designed to decrease water usage, which is likely to have reduced the load of pollutants potentially transported by irrigation runoff.

Figures 11-2 and 11-3, at the end of this section, present historical dry weather flow rates for monitoring sites located downstream of the Alvarado, Spring Valley, and University drainage basins. Each graph illustrates a general decrease in dry weather flows, which may indicate that dry weather discharges to the MS4 have decreased since 2008. A decrease in dry weather flow rates may further indicate a decrease in pollutant loads.

Level 5

The Dry Weather Monitoring Program is the City's primary mechanism for measuring the quality of discharges. The City also conducts an additional monitoring program at six sites; five of these sites are located in the City's MS4, and one is located in an improved channel that has also been identified as a receiving water body. In 2009, the City began collecting MS4 outfall water quality data to help characterize pollutant discharges from its MS4, although not enough data to make definitive conclusions has been collected at this point.

Figure 11-4, at the end of this section, presents historical average dry weather monitoring results for selected field constituents. Figures 11-5 and 11-6 present the average and median concentrations for selected constituents, along with the number of exceedances noted since 1993. Both graphs show a general decrease in concentration and in number of exceedances for ammonia-nitrogen and detergents. *Enterococcus* bacteria counts have been consistently

low since 2002 while fecal coliform bacteria counts show a general decrease over time as shown in Figure 11-7.

Level 6
No Regional Monitoring Program stations are located within or close to the City of La Mesa. The western portion of Alvarado Channel is the only receiving water body within City limits. The City has monitored sites at the downstream point of the Alvarado and University drainage basins in the past and continues to monitor the University site as a collaborative activity associated with the Chollas Creek TMDL. No long term trends have been identified in data from these sites. The City will continue to work with the San Diego River and San Diego Bay WURMP workgroups to improve the quality of water bodies downstream of the City of La Mesa.

Beyond the JURMP Program, the City is also subject to additional requirements associated with TMDL regulations, which set numeric compliance limits. The City of La Mesa has been collaborating with other Copermittees in the Chollas Creek watershed to conduct annual reporting and monitoring for the Chollas Creek Diazinon and dissolved metals TMDLs. During 2010/2011, the City also developed a Strategic Plan for Watershed and TMDL Activity Implementation targeted at TMDL requirements for the San Diego River and Chollas Creek watersheds. Since that time, the City has been collaborating with other Copermittees to develop an implementation plan for the San Diego River bacteria TMDL and an updated implementation plan that incorporates bacteria TMDL requirements along with previously adopted TMDLs for dissolved metals and Diazinon in the Chollas Creek watershed.

11.2.2 Overall Component Assessments

Development Planning
The City's review process for development projects effectively requires BMPs with higher pollutant removal efficiency. City interaction with responsible parties during the reporting period has resulted in BMP installation and a greater level of awareness of the need for regular treatment control BMP maintenance within the City, particularly with newly completed projects. The City will continue to work with the parties responsible for maintenance of treatment control BMPs during 2012/2013.

Construction
Available data indicate that on the whole the City's construction program effectively requires BMP implementation. Any BMP deficiencies observed during inspection are typically remedied promptly through City follow-up. As a result, there have not been any unresolved construction BMP deficiencies from 2002-2012. The City continued to require even small projects to complete a CSWMP and performed inspections on low priority construction sites beyond the minimum requirements of the Municipal Permit to ensure compliance.

Municipal
The City's municipal activities effectively implement BMPs and reduce pollutant loading. The City's municipal staff are regularly trained on storm water issues, and the City's MS4 cleaning and street sweeping programs meet or exceed minimum Municipal Permit frequency requirements. In particular, the City sweeps its streets more often than the permit requirements to aid in WURMP efforts. The City has also installed drainage inserts along University Avenue and at the Public Works Operation Center to reduce the discharge of pollutants. Additional treatment controls, two Filterra bioretention system units, were installed in the University drainage basin during 2009/2010. The City continues implementation of a sophisticated system, Calsense, to control irrigation runoff from parks and medians. The City also distributes pet waste bags through dispensers in its parks.

Industrial and Commercial
The City employs a dedicated storm water inspector that works with businesses during and following inspections to ensure compliance. During this reporting period, the City followed-up with non-compliant sites and will continue to do so into 2012/2013. The City continued invoicing businesses in order to recover costs of inspections and it appears that this practice has stimulated more interest in the program and more of a desire to comply with regulations. The practice of charging businesses for each routine inspection and follow-up visit provides the additional benefit of encouraging businesses to comply in a timely manner. Notably, there has been an increase in the number of fully compliant sites each year since 2007. In 2011/2012, compliance was 26 percent greater than it was following the 2007 inspection results.

Residential
The City's residential component achieves BMP implementation through complaint response, education, and routine monitoring to detect IC/IDs. In 2011/2012, the largest number of residential-related complaints was received by the City's Storm Water Hotline and Public Works maintenance hotline. This suggests that the City's efforts to increase residential awareness of storm water pollution prevention through various measures have been effective. Residential areas within the City designated as high TTWQ receive additional attention from City staff to check for evidence of IC/IDs and high TTWQ activities.

Illicit Discharge Detection and Elimination
The City's IDDE program has effectively responded to complaints. No IC/IDs were observed during the 2011 or 2012 Dry Weather Monitoring Programs. The City will continue to respond appropriately and take action to prevent and eliminate IC/IDs.

Education
During 2011/2012, the City continued to educate various communities in the City. The City also continued to distribute the *La Mesa Focus* newsletter, which often included articles or announcements regarding storm water and pollution prevention, to residents and businesses in the City. The City also contracted ILACSD to conduct school presentations to children and provide interactive educational booths at events such as at the Kids Care Fest and the Intergenerational Games.

Public Participation
The City continued to encourage participation in public events, such as cleanup events, and reporting potential storm water violations via the City's Storm Water Hotline. While the total number of hotline calls decreased between 2010/2011 and 2011/2012, possibly indicating a decreased overall number of storm water issues occurring in the City, the majority of calls received were from residents, suggesting an increased public awareness of storm water pollution prevention.

11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of that document.

Table 11-1
Development Planning Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Review and approve project plans	External A small number of projects submitted reports during 2011/2012. Based on meetings with applicants and BMPs proposed, it appears that the level of knowledge is increasing. Internal The City's Storm Water Program Manager worked with engineers in the City to improve their level of understanding of the new SUSMP and HMP requirements. The City's consultant is also available to review WQTRs submitted to the City.	Overall WQTR approval rate during reporting period	40%; two of five new priority projects were reviewed and approved	N/A, addressed through other significant activities for this component
		Percent of projects proposing BMPs besides filter inserts	100%	
		Percent of approved projects implementing BMPs with high or medium removal efficiencies for key pollutants of concern	100%	
Verify proposed BMPs are implemented	External N/A, knowledge is evaluated by appropriate implementation of BMPs as shown in Level 3 Internal The City performs treatment control BMP inspections.	Percent of projects implementing proposed BMPs	100%, due to City follow-up	BMP implementation is likely to have reduced pollutant loads.
		Resolution status of enforcement actions	See Section 2	
Verify BMPs are properly maintained	External Verification letters were sent to all 18 projects on the City's inventory. Internal N/A, verification letters were prepared by the City	Percent of sites properly maintaining BMPs	100%, due to City follow-up	Load reduction can be achieved through regular BMP maintenance.
		Resolution status of enforcement actions	See Section 2	
		Percent of sites submitting proper verification forms	100%, due to City follow-up	
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-2
Construction Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Review proposed plans and BMPs	External Projects submit plans for construction BMP implementation for their projects; the level of awareness of construction BMP requirements is fairly high. Internal Training for City staff is described in Section 8. City staff are familiar with relevant construction BMPs.	BMPs proposed for construction projects generally meet requirements; no significant problems have been noted.		Proper pre-project planning is likely to have reduced pollutant loading.
Verify proposed BMPs are implemented	External Grading projects implement BMPs as required by permit conditions, and contractors are familiar with the City's requirements. Internal Training for City staff is described in Section 8. City inspectors are familiar with relevant construction BMPs.	Percent of BMP deficiencies resolved by City follow-up within the reporting period	100%	Proper BMP implementation is likely to have reduced pollutant loading.
		Details about resolution and enforcement actions	See Section 3	
		Number of dry weather monitoring exceedances traced to construction sources	0	
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-3
Municipal Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Verify proposed BMPs are implemented at facilities	City staff are regularly trained on BMP implementation; see sections 4 and 8.	Percent of inspected facilities/activities in compliance with BMP requirements	73%	Proper BMP implementation is likely to have reduced pollutant loading.	
		Resolution status of sites requiring follow-up inspections	See Section 4	Number of pet waste bags distributed	22,500
		Number of dry weather monitoring exceedances traced to municipal sites	0		
Sweep streets and parking facilities		N/A, streets and parking facilities are swept as often as directed by management.		Amount of sediment and debris removed (weight or volume)	526.12 tons
				Amount of sediment and debris removed per length of street swept (weight or volume per curb mile)	0.06 tons/ curb mile
Maintain and clean out MS4		N/A, MS4 structures are maintained as often as directed by management.		Amount of sediment and debris removed (weight or volume) not including debris removed from treatment BMPs	263 cubic yards
Maintain sanitary sewer system		N/A, the sanitary sewer system is maintained as often as directed by management.		Total volume of SSO discharge recovered	100 gallons
Maintain municipal treatment control BMPs		N/A, treatment control BMPs are maintained as often as directed by management.		Amount of sediment and debris removed from treatment BMPs	12.5 cubic yards
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only	

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-4
Industrial and Commercial Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Require BMP implementation	External The City's inspector regularly interacts with business owners and provides site-specific BMP corrective actions at each full inspection visit. See Section 8 for more detail on educational materials and other outreach efforts. Internal The City regularly hosts and attends training events. See Section 8 for more detail on specific training sessions.	Percent of inspected sites in compliance with BMP requirements (not including follow-ups)	89%	Proper BMP implementation is likely to have reduced pollutant loading.	
		Percent of inspected sites in compliance with BMP requirements following brief re-inspection.	97%		
		Resolution status of enforcement actions	See Section 5		
		Number of dry weather monitoring exceedances traced to industrial or commercial sources	0	Number of IC/IDs encountered during inspections	0
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only	

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-5: Residential Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4
Require BMP implementation	External Residents were educated in variety of ways in 2011/2012; see sections 6 and 8 for details. Internal The City's Storm Water Program Manager is heavily involved in the implementation of the residential component. Other City staff involved in the program also have a good understanding of the goals of the storm water program.	Number of residential incidents reported to storm water hotline	96	Resolution of residential incidents reported to the hotline likely resulted in a decrease in pollutant loading through improved BMP implementation.
		Resolution of enforcement actions	See Section 6	
		Number of dry weather monitoring exceedances traced to residential sources	0	
Maintain an accurate inventory	N/A, data management only	N/A, data management only		N/A, data management only

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-6: Illicit Discharge Detection and Elimination Component Assessment Measures

Significant Activity	Level 2	Level 3	Level 4
Conduct Dry Weather Monitoring Program	The City contracts with a qualified consultant to perform its Dry Weather Monitoring Program.	N/A, personnel conduct monitoring as directed by management.	No significant, long term IC/IDs were eliminated, so a reliable estimate of load reduction cannot be made.
Respond to incidents reported to storm water hotline	The City's Storm Water Program Manager trains City staff as needed. See sections 4 and 8. City staff were responsible for some of the reports made to the hotline.	N/A, personnel respond to incidents as directed by management.	Resolution of the incidents reported to the hotline and listed in Section 7 are likely to have resulted in a pollutant loading reduction.
Respond to and clean up SSOs	City staff are thoroughly trained on how to respond to SSOs.	The City conducts additional preventative inspections and maintenance in areas with a higher history of problems. See Section 4 for details.	There was one public SSO during the reporting period; 100gallons of wastewater were recaptured.

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-7: Education Component Assessment Measures

Significant Activity	Level 2		Level 3	Level 4
Provide storm water education to the public	External The City actively educates the various audiences in its jurisdiction. See Section 8 for details.		See Level 3 outcomes for other program components for information about behavior change.	Sufficient data to estimate load reductions due to educational efforts is not available for 2011/2012.
	Estimated number of impressions made	26,933		

Notes

Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Table 11-8: Public Participation Component Assessment Measures

Significant Activity	Level 2	Level 3		Level 4	
Involve the public in activities that relate to storm water protection	External The City and City partners put on a number of opportunities for the public to participate. See section 9 for details. See Figure 11-1 for a summary of hotline reports in recent years.	Number of attendees at events	4,086	Amount of trash and debris collected at cleanup events	1,234 pounds
		Number of calls received to the storm water hotline	119	Amount of HHW collected	87,249 pounds

Notes: Level 2 - Changes in Knowledge/Awareness; Level 3 - Behavioral Change/BMP Implementation; Level 4 - Load Reductions; N/A – Not Applicable

Figure 11-1
Storm Water Complaints Logged

Figure 11-2
Dry Weather Monitoring, Alvarado and Spring Valley Drainage Basin Flow Rates, 2008-2012

Note: gpm – gallons per minute

Figure 11-3
Dry Weather Monitoring, University Drainage Basin Flow Rates, 2002-2012

Note: Flow measurements for years 2004-2007 are a sum of flow rates measured at sites 908-UNI-002 and 908-UNI-14A since flow at these sites contribute to site 908-UNI-001 and routine dry weather monitoring was not conducted at 908-UNI-001 during that time.

12.0 Special Investigations

The City takes a proactive approach to storm water management in an attempt not only to protect receiving water quality, but also to improve the quality of water that is discharged from the City's MS4. Data collected through the City's various monitoring and inspection programs are used to identify locations within the City that may be contributing to storm water contamination. Source identification investigations are then initiated to pinpoint the exact cause of detected pollution. Aside from upstream investigations conducted as part of the dry weather monitoring and sampling program (to be reported as part of the Illicit Discharge Detection and Elimination component in December), no special investigations were needed or conducted during this reporting period.

13.0 NON-EMERGENCY FIRE FIGHTING

Please reference Section 4.2.3 of this JURMP Annual Report for information about BMPs and procedures associated with non-emergency fire fighting activities.

14.0 JURMP REVISIONS

Changes to the JURMP made since the overall JURMP update in the spring of 2008 are discussed in the individual "Program Review and Modification" subsections in the preceding sections in this JURMP Annual Report.

15.0 Conclusions and Recommendations

During 2011/2012, the City of La Mesa continued to implement its storm water program based on the 2008 JURMP. Additionally, the City continued to work collaboratively with the other Copermittees to facilitate sharing of information about how best to run these programs and to provide regional guidance on standardized implementation where applicable. The City will continue to refine and improve its storm water program based on information made available by these collaborative efforts.

Beyond the JURMP Program, City is also subject to additional requirements associated with TMDL regulations, which set numeric compliance limits. The City of La Mesa has been collaborating with other Copermittees in the Chollas Creek watershed to conduct annual reporting and monitoring for the Chollas Creek Diazinon and dissolved metals TMDLs. During 2010/2011, the City also developed a Strategic Plan for Watershed and TMDL Activity Implementation, coinciding with the adoption of bacteria TMDLs for both the San Diego River and Chollas Creek watersheds. Since that time, the City has been collaborating with other Copermittees to conduct monitoring and modeling, develop the Implementation Plan for San Diego River's bacteria TMDL, and update the Chollas Creek Implementation Plan to include the new bacteria TMDL. These efforts will continue throughout the TMDL timelines.

Notes:

[1]Likely Source: Has a pollutant discharge potential of "Likely" for one or more of the pollutants of concern associated with the receiving water

L = Likely, PO = Possible, UL= Unlikely

* Discharge of heavy metals and oil and grease is possible if the facility has on-site parking

** Sediment and oxygen demanding substances are possible pollutants for earthen or natural conveyances. Bacteria, but generally not viruses and other pathogens, may regrow in MS4s under certain conditions. While other pollutants may be discharged from the MS4, the MS4 itself is not a direct source of those pollutants.

***The sanitary sewer system is only a potential source of pollutants in the event of sewer line breaks or SSOs.

Notes:

SIC – Standard Industrial Classification Code

Potential Pollutants – Potential pollutants that may be generated by the facility. A facility can be identified as having more than one pollutant. Potential pollutants for each facility are determined by category if no inspection information is available.

Tributary to 303(d) – The facility is tributary to a waterbody listed in the Clean Water Act Section 303(d) list of impaired waterbodies

Generating Pollutants Tributary to 303(d) Listed – The facility is tributary to 303(d) listed receiving water and has potential to generate pollutants for which the water body is impaired

TTWQ – Threat to Water Quality

69	2/1/2012	Public Works	5058 Pine St	Residential	Report of waste water leaking from sewer lateral.	Waste water discharge did not reach the storm drain. PW evaluated and cleaned/maintained as applicable. Homeowner also had plumber service the lateral.	Notice of Violation
70	2/2/2012	Request Tracker	Water St south of Janfred Way and Milden St	Residential/ Utility	Report of water flowing in gutter and algae growth.	Contacted Helix Water District. Water tests determined it was likely groundwater. Compliance letters issued to adjacent property owners regarding over-irrigation. PW evaluated the site for algae and cleaned/maintained as applicable. Property owner to install better drainage to prevent algae growth.	2 Compliance Letters
71	2/6/2012	Public Works Service Request	Water St	Residential	Report of water seepage.	PW evaluated and cleaned/maintained as applicable.	N/A
72	2/9/2012	Public Works Service Request	Palm Ave	Residential	Report of debris in storm drain and grate that needs to be secured.	PW evaluated and cleaned/maintained as applicable.	N/A
73	2/10/2012	Public Works	8120 Commercial St	Commercial	Report of vehicle and equipment wash water discharge to street.	Business owner was advised of the storm water regulations and associated fines for non-compliance.	N/A
74	2/15/2012	Public Works Service Request	Cinnabar Dr	Residential	Report of storm drain grate that needs to be secured.	PW evaluated and cleaned/maintained as applicable.	N/A

Appendix B (Continued)
Complaint Log

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
75	2/15/2012	Public Works	8653 Hayes St	Residential	Report of damaged sewer lateral causing foul smell and overflows.	No overflow potential was observed during site visit. NOV issued to resident to fix lateral immediately. Installation verified.	Notice of Violation
76	2/16/2012	Storm Water Hotline	6170 Severin Dr	Residential	Report of car leaking oil to storm drain.	No evidence of discharge. Car owner reported that leak was fixed and it would be monitored. Advised to use drip pan.	N/A
77	2/21/2012	Public Works Service Request	Baltimore Dr	Residential	Report of missing storm drain grate.	PW evaluated and cleaned/maintained as applicable.	N/A
78	2/23/2012	Public Works Service Request	Lubbock Ave	Residential	Report of storm drain line to be CCTV'd.	PW evaluated and cleaned/maintained as applicable.	N/A
79	2/27/2012	Code Compliance	Lake Murray Blvd and Baltimore Dr	Commercial	Report of possible discharge from cart cleaning.	Store management was advised of storm water regulations and appropriate BMPs to implement for power washing.	Mobile Wash Pamphlet
80	3/1/2012	Storm Water Hotline	7566 Malorey St	Residential	Report of spray painting furniture on the sidewalk.	No evidence of discharge was noted. Complaint appears unfounded.	N/A
81	3/8/2012	Code Compliance	4667 Judson Way	Residential	Report of car detailing on-site.	Compliance letter issued to property owner advising him/her of storm water regulations.	Compliance Letter
82	3/12/2012	Request Tracker	Highfield Ave and Garfield St	Residential/ Construction	Report of material storage on property.	Homeowner was advised of storm water regulations and communicated them to contractor. Clean up verified.	N/A
83	3/12/2012	Public Works Service Request	Allison Ave	Residential	Report of gutter grate that needs to be secured.	PW evaluated and cleaned/maintained as applicable.	N/A
84	3/15/2012	Public Works Service Request	Lemon Ave	Residential	Report of debris in storm drain.	PW evaluated and cleaned/maintained as applicable.	N/A
85	3/19/2012	Public Works Service Request	Palm Ave	Residential	Report of storm drain overflow.	PW evaluated and cleaned/maintained as applicable.	N/A
86	3/19/2012	Public Works Service Request	Merritt Blvd	Residential	Report of flooding caused by clogged storm drain.	PW evaluated and cleaned/maintained as applicable.	N/A

#	Date Received	Complaint Origin	Responsible Party/ Location of Problem	Responsible Party Type	Issue/Problem	Response	Enforcement Type/ Educational Material Distributed
87	3/22/2012	Public Works Service Request	Baltimore Dr	Residential	Report of storm drain lines to be CCTV'd.	PW evaluated and cleaned/maintained as applicable.	N/A
88	3/22/2012	Public Works	5424 Wellsley St	Construction	Report of dirt in street and gutter from construction.	Contractor advised of storm water regulations and implemented appropriate BMPs.	N/A
89	3/25/2012	Storm Water Hotline	6150 Horton Dr	Residential	Report of car leaking antifreeze.	Compliance letter issued to resident advising him/her of storm water regulations.	Compliance Letter, Written Warning
90	3/29/2012	Public Works Service Request	Wakarusa St	Residential	Report of three missing manhole covers.	PW evaluated and cleaned/maintained as applicable.	N/A
91	4/2/2012	Request Tracker	5577 Lake Murray Dr	Commercial	Report of discharge of contaminated rain water to storm drain.	Store management was advised of storm water regulations. Inspection priority of facility has been increased to "high" which will result in consistent storm water inspections.	N/A
92	4/3/2012	Request Tracker	4580 73rd St	Residential	Report of low lying gutter with stagnant water.	Contacted homeowner and explained that the issue was forwarded to the City Engineer for assessment.	N/A
93	4/9/2012	Public Works Service Request	Harris St	Residential	Report of stagnant water caused by clogged storm drain.	PW evaluated and cleaned/maintained as applicable.	N/A
94	4/12/2012	Public Works Service Request	Boulevard Dr	Residential	Report of dirt around storm drain inlet.	PW evaluated and cleaned/maintained as applicable.	N/A
95	4/12/2012	Public Works Service Request	La Mesa Blvd	Residential	Report of hazardous road condition due to bent curb.	PW evaluated and cleaned/maintained as applicable.	N/A
96	4/16/2012	Storm Water Hotline	4197 E. Arietta Cir	Residential	Report of exposed rubble and concrete.	Property owner was advised of storm water regulations and acknowledged that dirt pile would be covered.	N/A

118	6/19/2012	Public Works Service Request	Lake Park Way	Residential	Report of storm drain bars that need to be secured.	PW evaluated and cleaned/maintained as applicable.	N/A
119	6/22/2012	Public Works Service Request	Riviera Dr	Residential	Report of missing manhole cover.	PW evaluated and cleaned/maintained as applicable.	N/A

APPENDIX C

Appendix C
JURMP Annual Report Requirements Checklist

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	**Location in Report**
i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements.	2.2, 2.3
ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked.	2.4.4.2
iii. A listing of the development projects to which SUSMP requirements were applied.	2.4.4.2
iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked.	2.4.4.2
v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs.	2.4.4.2
vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible.	2.4.4.2
vii. An updated treatment control BMP inventory.	Appendix A.1
viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings.	2.4.4.3, Table 2-1 and 2-2
ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings.	2.4.4.3
x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked.	2.4.4.2
xi. A listing of any projects which received a SUSMP waiver.	2.4.4.2
xii. A description of implementation of any SUSMP waiver mitigation program.	2.4.4.2
xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation.	2.4.4.2
xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented.	2.4.4.2
xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements.	2.4.4.2

Development Planning Component

Permit Annual Reporting Requirement—Section J.3.a.(3).(a)	**Location in Report**
xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project.	2.4.4.2
xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	2.4.4.3, Table 2-2
xviii. A description of notable activities conducted to manage urban runoff from development projects.	Throughout Section

Construction

Permit Annual Reporting Requirement—Section J.3.a.(3).(b)	**Location in Report**
i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked.	3.5
ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed.	3.2
iii. A description of modifications made to the construction and grading ordinances and approval processes.	3.3
iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites.	3.5
v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites.	3.5
vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites.	3.5
vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites.	3.5, Appendix A.2
viii. A description of the general results of the inspections.	3.5
ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	3.5
x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	3.5 Table 3-1
xi. A description of notable activities conducted to manage urban runoff from construction sites.	Throughout Section

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
i. Any updates to the municipal inventory and prioritization.	Appendix A.3
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events.	4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4
iii. A description of inspections and maintenance conducted for municipal treatment controls.	4.4.3, 4.4.4, 2.4
iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned.	4.4 Table 4-2
v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned.	4.4 Table 4-2
vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned.	4.4 Table 4-2
vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category.	4.4 Table 4-2
viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding.	N/A for 2011/2012
ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities.	4.2.3
x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3 Table 4-1
xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4 Table 4-1
xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways.	4.3.4 Table 4-1

Municipal

Permit Annual Reporting Requirement—Section J.3.a.(3).(c)	**Location in Report**
xiii. Identification of the total distance of curb-miles swept.	4.3.4 Table 4-1
xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping.	4.3 Table 4-1
xv. Amount of material (tons) collected from street and parking lot sweeping.	4.3 Table 4-1
xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4	4.5.4
xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections.	4.2.4, 4.3.4, Table 4-4
xviii. A description of the general results of the inspections.	Table 4-4
xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance.	4.2.4
xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	4.2.4, Table 4-4
xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities.	Throughout Section

Industrial and Commercial

Permit Annual Reporting Requirement—Section J.3.a.(3).(d)	**Location in Report**
i. Any updates to the industrial and commercial inventory.	5.2.2 (stationary), 5.3.2 (mobile), Appendix A.4
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources.	5.2.3, 5.2.4, 5.3.3, 5.3.4
iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses.	5.2.4, 5.3.4
iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected.	5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1
v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection.	5.2.4
vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance.	5.2.4
vii. Identification of the number of third party inspections conducted.	N/A (5.2.4)
viii. Identification of efforts conducted to verify third party inspection effectiveness.	N/A (5.2.4)
ix. A description of efforts implemented to address mobile businesses.	5.3.4
x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	5.2.4, 5.3.4
xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees.	5.2.4
xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources.	Throughout Section

Residential

Permit Annual Reporting Requirement—Section J.3.a.(3).(e)	**Location in Report**
i. Identification of the high threat to water quality residential areas and activities that were focused on.	6.2
ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities.	6.4
iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials.	6.4
iv. Types and amounts of household hazardous wastes collected, if applicable.	6.4
v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation.	6.4 (see discussion in JURMP)
vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance.	6.4
vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program.	6.4
viii. A description of notable activities conducted to manage urban runoff from residential areas and activities.	Throughout Section

IDDE*

Permit Annual Reporting Requirement—Section J.3.a.(3).(f)	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the 2011/2012Annual Report, will be submitted to the RWQCB no later than December 15, 2012.	

IDDE—Additional Dry Weather Monitoring Program Requirements*

Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d	Location in Report
* Section 7, the Illicit Discharge Detection and Elimination component, of the 2011/2012 Annual Report, will be submitted to the RWQCB no later than December 15, 2012.	

Education

Permit Annual Reporting Requirement—Section J.3.a.(3).(g)	Location in Report
i. A description of education efforts conducted for each target community.	8.3
ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges.	8.3
iii. A description of education efforts conducted for municipal departments and personnel.	8.2
iv. A description of education efforts conducted for the new development and construction communities.	8.3
v. A description of jurisdictional education efforts conducted for residents, the general public, and school children.	8.3

Public Participation

Permit Annual Reporting Requirement—Section J.3.a.(3).(h)	Location in Report
i. A description of public participation efforts conducted.	9.2 and 9.3

Effectiveness Assessment

Permit Annual Reporting Requirement—Section J.3.a.(3).(i)	Location in Report
i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order.	11

Fiscal Analysis

Permit Annual Reporting Requirement—Section J.3.a.(3).(j)	Location in Report
i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. (For 2007-2008, the requirements that apply are essentially the same as those found in Order No. 2001-01)	10

Special Investigations

Permit Annual Reporting Requirement—Section J.3.a.(3).(k)	Location in Report
i. A description of any special investigations conducted.	12

Non-Emergency Firefighting

Permit Annual Reporting Requirement—Section J.3.a.(3).(l)	Location in Report
i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows.	4.2.3, 13

JURMP Revisions

Permit Annual Reporting Requirement—Section J.3.a.(3).(m)	Location in Report
i. A description of any proposed revisions to the JURMP.	14 and each program component section

Engineering Division

The City of La Mesa Storm Water Best Management Practices Manual – Part II

LA MESA LOCAL STANDARD URBAN STORM WATER MITIGATION PLAN (LOCAL SUSMP)
Adopted 2002
Updated January 2011

This page intentionally left blank.

Table of Contents

GLOSSARY

HOW TO USE THE STORM WATER BEST MANAGEMENT PRACTICES MANUAL 1

► Plan Ahead to Avoid the Three Most Common Mistakes 2

CHAPTER 1. POLICIES AND PROCEDURES 3

Background 3

Legal Framework 4

A Low Impact Development Design Procedure 5

Requirements for All Development Projects 5

Priority Development Projects 6
► New Development 6
► Previously Developed Sites 6
► The "50% Rule" for Previously Developed Projects 7
► Pollutant Generating Projects Which Disturb One Acre or More of Land 7

Project Review and Permitting Process 7

Compliance Process at a Glance 10
► Additional Notes on Compliance 10

Phased Projects 11

New Subdivisions 11

Compliance with Flow-Control Requirements 13
► HMP Applicability Requirements 13
► Flow Control Performance Criteria 20

Waivers from Numeric Sizing Criteria 31

CHAPTER 2. CONCEPTS AND CRITERIA 32

Water-Quality Regulations 33
► Maximum Extent Practicable 34
► Best Management Practices 34

Pollutants of Concern 34

► Grouping of Potential Pollutants of Concern 34
► Identifying Pollutants of Concern Based on Land Uses 36
► Watersheds with Special Pollutant Concerns 36

Selection of Permanent Source Control BMPs 39

Selection of Storm Water Treatment Facilities 39

Hydrology for NPDES Compliance 42
► Imperviousness 42
► Low Impact Development Requirements 43
► Sizing Requirements for Storm Water Treatment Facilities 43
► Flow-Control (Hydromodification Management) 44

Criteria for Infiltration Devices 44
► Most LID Features and Facilities Are Not Infiltration Devices 45

CHAPTER 3. PREPARING YOUR PROJECT SUBMITTAL 47

Step by Step 50

Step 1: Assemble Needed Information 50

Step 2: Identify Constraints & Opportunities 52

Step 3: Prepare and Document Your LID Design 52

Step 4. Specify Source Control BMPs 53
► Identify Pollutant Sources 54
► Note Locations on Submittal Drawing 54
► Prepare a Table and Narrative 54
► Identify Operational Source Control BMPs 54

Step 5: Storm Water Facility Maintenance 55

Step 6: Complete Your Project Submittal 55
► Coordination with Site, Architectural, and Landscaping Plans 55
► Construction Plan SUSMP checklist 56
► Certification 57
► Example Project Submittal Outline and Contents 58
► Specific Project Considerations 59

CHAPTER 4. LOW IMPACT DEVELOPMENT DESIGN GUIDE 60

Analyze Your Project for LID 61
► Optimize the Site Layout 62
► Use Pervious Surfaces 64
► Disperse Runoff to Adjacent Pervious Areas 64
► Direct Runoff to Integrated Management Practices 64

Develop and Document Your Drainage Design 66
► Step 1: Delineate Drainage Management Areas 66

► Step 2: Classify DMAs and Determine Runoff Factors 67
► Step 3: Tabulate Drainage Management Areas 70
► Step 4: Select and Lay Out IMPs on Site Plan 71
► Step 5: Review Sizing for Each IMP 71
► Step 6: Calculate Minimum Area and Volume of Each IMP 72
► Step 7: Determine If Available Space for IMP Is Adequate 82
► Step 8: Complete Your Summary Report 83

Specify Preliminary Design Details 84

Alternatives to Integrated LID Design 85
► Design of Alternative Treatment Facilities 85
► Treatment Facilities for Special Circumstances 88

CHAPTER 5. OPERATION & MAINTENANCE OF STORM WATER FACILITIES 89

Stage 1: Ownership and Responsibility 90
► Private Ownership and Maintenance 91
► Transfer to Public Ownership 91

Stage 2: General Maintenance Requirements 92

Stage 3: Detailed Maintenance Plan 92
► Your Detailed Maintenance Plan: Step by Step 93
► Step 1: Designate Responsible Individuals 93
► Step 2: Summarize Drainage and BMPs 94
► Step 3: Document Facilities "As Built" 94
► Step 4: Prepare Maintenance Plans for Each Facility 94
► Step 5: Compile Maintenance Plan 95
► Step 6: Updates 97

Stage 4: Interim Maintenance 97

Stage 5: Transfer Responsibility 97

Stage 6: Operation & Maintenance Verification 97

CHAPTER 6. CONSTRUCTION BMP REQUIREMENTS AND PERFORMANCE STANDARDS 99

Construction Storm Water BMP Requirements 99
► Step 1: Determine Applicable Storm Water BMP Requirements 101
► Step 2: Prepare & Submit Appropriate Plans 101
► Step 3: Determine Adequacy of Proposed Plans 102
► Step 4: Assure Implementation & Maintenance of Requirements 102

Construction Storm Water BMP Performance Standards 103
► 1. Minimum Construction BMP Requirements 103
► 2. Site Management Requirements 105
► 3. Performance Standards 106
► 4. Seasonal Requirements 107
► 5. Advanced Treatment Requirements 110
► 6. Additional Controls for Construction Sites 110

Implementation and Maintenance of Requirements 110

Appendices

APPENDIX A STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST 112

APPENDIX B LOW IMPACT DEVELOPMENT (LID) INTEGRATED MANAGEMENT PRACTICES (IMP) DESIGN SHEETS 118

APPENDIX C POLLUTANT SOURCES / SOURCE CONTROL CHECKLIST 145

APPENDIX D SWPPP AND CSWMP GUIDELINES 157

APPENDIX E EXAMPLE CONSTRUCTION BEST MANAGEMENT PRACTICES 160

APPENDIX F BIBLIOGRAPHY AND SUGGESTED RESOURCES 163

APPENDIX G SPCBMPP WORKSHEET 165

APPENDIX H HYDROMODIFICATION MANAGEMENT PLAN 168

Glossary

Advanced Treatment

Using mechanical or chemical means to flocculate and remove suspended **sediment** from runoff from construction sites prior to discharge.

Attached Residential Development

Any development that provides residential units that share an interior/exterior wall. This category includes, but is not limited to: dormitories, condominiums, and apartments.

Automotive Repair Shop

A facility that is categorized in any one of the following **Standard Industrial Classification (SIC)** codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

Best Management Practice (BMP)

Any procedure or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. This manual groups storm water BMPs into the following categories: (1) Construction Storm Water BMPs, which are practices, procedures, devices or materials used to prevent the transport and introduction of pollutants both on and from a project during construction; and (2) Permanent Storm Water BMPs, which are the **Low Impact Development** design features, **source control** features, and **treatment control BMP**s that become a permanent part of a project site.

California Association of Stormwater Quality Association (CASQA)

Publisher of the California Stormwater Best Management Practices Handbooks, available at www.cabmphandbooks.com. Successor to the Storm Water Quality Task Force (SWQTF).

California BMP Method

A method for determining the required volume of storm water treatment facilities. Described in Section 5.5.1 of the California Stormwater Best Management Practice Manual (New Development) (CASQA, 2003).

Commercial Development

Commercial development is defined as any development on private land that is not for heavy industrial or residential uses. The category includes, but is not limited to, hospitals; laboratories and other medical facilities; educational institutions; recreational facilities; municipal facilities; commercial nurseries; multi-apartment buildings; car wash facilities; mini-malls and other business complexes; shopping malls; hotels; office buildings; public warehouses; automotive dealerships; commercial airfields; and other light industrial facilities. Any development on private land that is not exclusively industrial or residential uses. The **Priority Development Project** category is defined as commercial developments resulting in the disturbance of one acre or more of land.

Conditions of Approval (COAs)

Requirements a municipality may adopt for a project in connection with a discretionary action (e.g., adoption of an EIR or negative declaration or issuance of a use permit). COAs may include features to be incorporated into the final plans for the project and may also specify uses, activities, and operational measures that must be observed over the life of the project.

Construction Storm Water Management Plan (CSWMP)	A CSWMP is the document prepared and submitted to meet the City of La Mesa's construction BMP requirements for a project that causes land disturbance of less than one acre.
Continuous Simulation Modeling	A method of hydrological analysis in which a set of rainfall data (typically hourly for 30 years or more) is used as input, and runoff rates are calculated on the same time step. The output is then analyzed statistically for the purposes of comparing runoff patterns under different conditions (for example, pre- and post-development-project).
Copermittees	See **Dischargers**.
Detached Residential Development	Any development that provides freestanding residential units. This category includes, but is not limited to: detached homes, such as single-family homes and detached condominiums.
Detention	The practice of holding storm water runoff in ponds, vaults, within berms, or in depressed areas and letting it discharge slowly to the storm drain system. See definitions of **infiltration** and **retention**.
Direct Discharge	Connection of project site runoff to an exempt receiving water body, which could include an exempt river reach, reservoir or lagoon. To qualify as a direct discharge, the discharge elevation from the project site outfall must be below the elevations detailed in the HMP Applicability section of this BMP Manual.
Direct Infiltration	Infiltration via methods or devices, such as dry wells or infiltration trenches, designed to bypass unsaturated surface soils and transmit runoff directly to groundwater.
Directly Connected Impervious Area	Any **impervious surface** which drains into a catch basin, area drain, or other conveyance structure without first allowing flow across pervious areas (e.g. lawns).
Dischargers	The agencies named in the **storm water NPDES permit** (see definition): the County of San Diego; the Cities of Carlsbad, El Cajon, La Mesa, Poway, Solana Beach, Chula Vista, Encinitas, Lemon Grove, San Diego, Vista, Coronado, Escondido, National City, San Marcos, Del Mar, Imperial Beach, Oceanside, and Santee; the San Diego Unified Port District, and the San Diego County Regional Airport Authority.
Drainage Management Areas	Areas delineated on a map of the development site showing how drainage is detained, dispersed, or directed to **Integrated Management Practices**. There are four types of Drainage Management Areas, and specific criteria apply to each type of area. See Chapter 4.
Drawdown time	The time required for a storm water detention or infiltration facility to drain and return to the dry-weather condition. For detention facilities, drawdown time is a function of basin volume and outlet orifice size. For infiltration facilities, drawdown time is a function of basin volume and infiltration rate.

Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); water bodies designated with the RARE beneficial use by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); areas designated as preserves or their equivalent under the Multi Species Conservation Program within the Cities and County of San Diego; and any other equivalent environmentally sensitive areas which have been identified by the City of La Mesa.

Environmentally Sensitive Areas

This **Priority Development Project** category includes all development and redevelopment located within or directly adjacent to or discharging directly to an environmentally sensitive area (where discharges from the development or redevelopment will enter receiving waters within the environmentally sensitive area), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the Environmentally Sensitive Area (ESA). "Discharging directly to "means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.

Flow Control

Control of runoff rates and durations as required by the Hydromodification Management Plan.

Head

In hydraulics, energy represented as a difference in elevation. In slow-flowing open systems, the difference in water surface elevation, e.g., between an inlet and outlet.

Higher-Rate Biofilter

A biofilter with a design surface loading rate higher than the 5 inches per hour rate specified in this document for bioretention facilities and planter boxes.

Hillside

Lands that have a natural gradient of 25 percent (4 feet of horizontal distance for every 1 foot of vertical distance) or greater and a minimum elevation differential of 50 feet, or a natural gradient of 200 percent (1 foot of horizontal distance for every 2 feet of vertical distance) or greater and a minimum elevation differential of 10 feet.

Hillside Development Greater Than 5,000 Square Feet

This **Priority Development Project** category includes any development which creates 5,000 square feet of **impervious surface** which is located in an area with known erosive soil conditions, where the development will grade any natural slope that is 25 percent or greater.

Hydrograph

Runoff flow rate plotted as a function of time.

Hydromodification

The change in the natural hydrologic processes and runoff characteristics (i.e. interception, infiltration, overland flow, interflow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and changes in sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive stream bank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

Hydromodification Management Plan (HMP)	A Plan implemented by the **dischargers** so that post-project runoff shall not exceed estimated pre-project rates and/or durations, where increased runoff would result in increased potential for erosion or other adverse impacts to beneficial uses. Also see definition for **flow control**. Specifically, Final HMP refers to the most recent Hydromodification Management Plan developed for San Diego County jurisdictions and approved by the San Diego RWQCB.
Hydrologic Soil Group	Classification of soils by the Natural Resources Conservation Service (NRCS) into A, B, C, and D groups according to infiltration capacity.
Industrial Development	Industrial facilities include those defined at 40 CFR 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit, operating and closed landfills, facilities subject to SARA Title III, and hazardous waste treatment, disposal, storage and recovery facilities. Examples of industrial facilities includes manufacturing plants, food processing plants, metal working facilities, printing plants, and fleet storage areas (bus, truck, etc.). The **Priority Development Project** category includes development of heavy industry resulting in the disturbance of one acre or more of land.
Impervious surface	Any material that prevents or substantially reduces infiltration of water into the soil. See discussion of imperviousness in Chapter Two.
Infeasible	As applied to best management practices, impossible to implement because of technical constraints specific to the site.
Infiltration	Seepage of runoff into soils underlying the site. See definition of **retention.**
Infiltration Device	Any structure, such as a dry well, that is designed to infiltrate storm water into the subsurface and, as designed, bypasses the natural groundwater protection afforded by surface or near-surface soil. See definition for **direct infiltration**.
Integrated Management Practice (IMP)	A facility **(BMP)** that provides small-scale treatment, retention, and/or detention and is integrated into site layout, landscaping, and drainage design. See **Low Impact Development.**
Integrated Pest Management (IPM)	An approach to pest management that relies on information about the life cycles of pests and their interaction with the environment. Pest control methods are applied with the most economical means and with the least possible hazard to people, property, and the environment.
Jurisdictional Urban Runoff Management Plan (JURMP)	A written description of the specific jurisdictional urban runoff management measures and programs that the City of La Mesa implements to comply with the **storm water NPDES permit** and ensure pollutant discharges are reduced to the MEP and do not cause or contribute to a violation of water quality standards. See **Storm Water Pollution Prevention Program.**
Lead Agency	The public agency that has the principal responsibility for carrying out or approving a project. (CEQA Guidelines §15367).

Low Impact Development	An integrated site design methodology that uses small-scale detention and retention (Integrated Management Practices, or **IMPs**) to mimic pre-existing site hydrological conditions.
Maximum Extent Practicable (MEP)	Standard, established by the 1987 amendments to the Clean Water Act, for the implementation of municipal **storm water pollution prevention programs** (see definition). According to the Act, municipal storm water NPDES permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."
National Pollutant Discharge Elimination System (NPDES)	As part of the 1972 Clean Water Act, Congress established the NPDES permitting system to regulate the discharge of pollutants from municipal sanitary sewers and industries. The NPDES was expanded in 1987 to incorporate permits for storm water discharges as well.
Natural Drainage	A natural swale or topographic depression which gathers and/or conveys runoff to a permanent or intermittent watercourse or waterbody.
New Development	Land disturbing activities; surface grading for structural development, including construction or installation of a building or structure, the creation of **impervious surfaces**; and land subdivision.
Numeric Criteria	Sizing requirements for storm water treatment facilities established in Provision D.1.d.(6)(c) of the San Diego RWQCB's storm water NPDES permit.
Operation and Maintenance (O&M)	Refers to requirements in the **Storm Water NPDES Permit** to inspect treatment BMPs and implement preventative and corrective maintenance in perpetuity. See Chapter Five.
Parking Lot	A land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce. This **Priority Development Project** category includes parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to urban runoff.
Permeable Pavements	Pavements for roadways, sidewalks, or plazas that are designed to infiltrate a portion of rainfall, including pervious concrete, pervious asphalt, unit-pavers-on-sand, and crushed gravel.
Pollutant Generating Development Project	Generally all projects which include **impervious surfaces** and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces.
Post Construction Water Quality Technical Report (PCWQTR)	A PCWQTR is the **Project Submittal** of a **Priority Development Project** to demonstrate compliance.

Priority Development Project A project subject to SUSMP requirements. Defined in **Storm water NPDES Permit** Provision D.1.d.(1). See Appendix A.

Project Area The entire project area comprises all areas to be altered or developed by the project, plus any additional areas that drain on to areas to be altered or developed.

Projects Discharging to Receiving Waters within Environmentally Sensitive Areas All development and significant redevelopment that would create 2,500 square feet of **impervious surfaces** or increase the area of imperviousness of a project site to 10% or more of its naturally occurring condition, and either (1) discharge urban runoff to a receiving water within or directly adjacent (where any portion of the project footprint is located within 200 feet of the **environmentally sensitive area**) to an environmentally sensitive area or (2) discharge to a receiving water within an environmentally sensitive area without mixing with flows from adjacent lands (where the **project footprint** is located more than 200 feet from the environmentally sensitive area).

Project Footprint The limits of all grading and ground disturbance, including landscaping, associated with a project.

Project Submittal Documents submitted to the City of La Mesa in connection with an application for development approval and demonstrating compliance with Storm Water NPDES Permit requirements for the project. Priority Development Projects submit a **Post Construction Water Quality Technical Report** and all other projects submit a **Standard Post Construction BMP Plan**.

Proprietary A proprietary device is one marketed under legal right of the manufacturer.

Receiving Waters Surface bodies of water, which directly or indirectly receive discharges from urban runoff conveyance systems, including naturally occurring wetlands, streams (perennial, intermittent, and ephemeral [exhibiting bed, bank, and ordinary high water mark]), creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays and the Pacific Ocean. La Mesa will determine the definition for wetlands and the limits thereof for the purposes of this definition as protective as the United States Environmental Protection Agency. Constructed wetlands are not considered wetlands under this definition, unless the wetlands were constructed as mitigation for habitat loss. Other constructed **BMP**s are not considered receiving waters under this definition, unless the BMP was originally constructed in receiving waters. Construction of treatment control BMPs in "Receiving Waters" is prohibited and therefore may not be used to satisfy **SUSMP** requirements.

Redevelopment The creation, addition, and or replacement of **impervious surface** on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces.

Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots and existing roadways; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

Rational Method	A method of calculating runoff flows based on rainfall intensity, tributary area, and a factor representing the proportion of rainfall that runs off.
Regional (or Watershed) Storm Water Treatment Facility	A facility that treats runoff from more than one project or parcel.
Regional Water Quality Control Board (Regional Water Board or RWQCB)	California RWQCBs are responsible for implementing pollution control provisions of the Clean Water Act and California Water Code within their jurisdiction. There are nine California RWQCBs.
Residential Development	Any development on private land that provides living accommodations for one or more persons, including but not limited to: single-family homes, multi-family homes, condominiums, and apartments. This **Priority Development Category** is defined as housing subdivisions resulting in the disturbance of one acre or more of land or comprised of 10 or more dwelling units.
Residential Development of 10 Units or More	Any development that provides 10 or more residential units. Residential units can be attached or detached.
Restaurant	"Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (**SIC** code 5812), where the land area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet shall meet all **SUSMP** requirements except for structural treatment BMP, numeric sizing criteria requirement, and hydromodification requirement.
Retail Gasoline Outlets (RGOs)	This **Priority Development Project** category includes RGOs that meet the following criteria: (a) 5,000 square feet or more, or (b) a projected average daily traffic (ADT) of 100 or more vehicles per day.
Retention	The practice of holding storm water in ponds or basins, or within berms or depressed areas, and allowing it to slowly infiltrate into underlying soils. Some portion will evaporate. See definitions for **infiltration** and **detention**.
Sediment	Soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organism survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.
Self-retaining area	An area designed to retain runoff. Self-retaining areas may include graded depressions with landscaping or pervious pavements and may also include tributary impervious areas up to a 2:1 impervious-to-pervious ratio.
Self-treating area	A natural, landscaped, or turf area drains directly off site or to the public storm drain system.

Significant Redevelopment	**Redevelopment** that would create or add or replace at least 5,000 square feet of **impervious surfaces** on an already developed site that falls under one or more priority development project categories. When redevelopment results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design. If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design.
Source Control	Land use or site planning practices, or structural or nonstructural measures that aim to prevent urban runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and urban runoff.
Standard Industrial Classification (SIC)	A Federal government system for classifying industries by 4-digit code. It is being supplanted by the North American Industrial Classification System but SIC codes are still referenced by the Regional Water Board in identifying development sites subject to regulation under the NPDES permit. Information and an SIC search function are available at http://www.bls.gov/bls/NAICS.htm
Standard Post Construction BMP Plan (SPCBMPP)	A SPCBMPP is the **Project Submittal** to demonstrate compliance for a project subject to only standard permanent BMP requirements.
Storm Water Conveyance System	Private and public drainage facilities by which storm water may be conveyed to Receiving Waters, such as: natural drainages, roads, streets, constructed channels, aqueducts, storm drains, pipes, street gutters, or catch basins.
Storm Water NPDES Permit	A permit issued by a **Regional Water Quality Control Board** (see definition) to local government agencies (**Dischargers**) placing provisions on allowable discharges of municipal storm water to waters of the state.
Storm Water Pollution Prevention Plan (SWPPP)	A plan providing for temporary measures to control sediment and other pollutants during construction as required by the statewide storm water NPDES permit for construction activities. A SWPPP is required for projects causing land disturbance of one acre or more.
Storm Water Pollution Prevention Program	A comprehensive program of activities designed to minimize the quantity of pollutants entering storm drains. See **Jurisdictional Urban Runoff Management Plan.**
Standard Urban Storm Water Mitigation Plan (SUSMP)	Refers to various documents prepared in connection with implementation of the storm water **NPDES permit** mandate to control pollutants from new development and redevelopment. Each **discharger** will adapt the **model countywide SUSMP** to create a local SUSMP for their respective jurisdiction. Applicants for development project approvals will use the local SUSMP to prepare a submittal for each **Priority Development Project** they propose.

Streets, Roads, Highways, and Freeways	This **Priority Development Project** category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles. For the purposes of SUSMP requirements, Streets, Roads, Highways and Freeways do not include trenching and resurfacing associated with utility work; applying asphalt overlay to existing pavement; new sidewalk, pedestrian ramps, or bike lane construction on existing roads; and replacement of damaged pavement.
Treatment	Removal of pollutants from runoff, typically by filtration or settling.
Treatment Control (Structural) BMP	Any engineered system designed and constructed to remove pollutants from urban runoff. Pollutant removal is achieved by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption, or any other physical, biological, or chemical process.
Water Board	See **Regional Water Quality Control Board.**
Water Quality Volume (WQV)	For storm water treatment facilities that depend on detention to work, the volume of water that must be detained to achieve maximum extent practicable pollutant removal. This volume of water must be detained for a specified **drawdown time**.

How to Use the Storm Water Best Management Practices Manual

Review Chapters 1 and 2 to get a general understanding of the requirements. Then follow step-by-step instructions in Chapter 3 to prepare your Project Submittal.

THIS Storm Water Best Management Practices Manual (BMP Manual) will help you ensure your project complies with both the Local Standard Urban Storm Water Mitigation Plan (SUSMP) requirements and the Construction BMP requirements of the City of La Mesa (City). Most applicants will require the assistance of a qualified civil engineer, architect, and/or landscape architect. Because every project is different, you should begin by checking specific requirements with municipal staff.

To use the BMP Manual, note that Construction BMPs are temporary measures to control sediment and other pollutants during construction, while SUSMP requirements apply to the development process during all stages of design, construction, completion, use, and maintenance in perpetuity. Start by completing Appendix A to find out how storm water quality requirements apply to your project.

To meet post-construction SUSMP requirements, see chapters one through five of the BMP Manual. To comply with construction BMP requirements, skip ahead to Chapter Six.

Chapter One provides an overview of the process of planning, design, construction, operation, and maintenance leading to compliance with post-construction SUSMP requirements.

If there are terms and issues you find confusing, try finding answers in the glossary or in **Chapter Two**. Chapter Two provides background on key storm water concepts and water quality regulations, including design criteria.

Then proceed to **Chapter Three** and follow the step-by-step guidance to prepare a Project Submittal for your site.

Chapter Four, the Low Impact Development Design Guide, includes design procedures, calculation procedures, and instructions for presenting your design and calculations in your Project Submittal.

In **Chapter Five** you'll find a detailed description of the process for ensuring operation and maintenance of your storm water facilities over the life of the project. The chapter includes step-by-step instructions for preparing a Storm Water Facilities Operation and Maintenance Plan.

The City of La Mesa's specific construction BMP requirements and performance standards are included in **Chapter Six**.

Throughout each Chapter, you'll find references and resources to help you understand the regulations, complete your Project Submittal, and design storm water control measures for your project.

Construction-Phase Controls

Your Project Submittal for SUSMP compliance is a separate document from the Storm Water Pollution Prevention Plan (SWPPP). A SWPPP provides for temporary measures to control sediment and other pollutants during construction at sites that disturb one acre or more. See Chapter 6 of this BMP manual for more information on SWPPPs.

The most recent, updated version of the BMP Manual is on the City website. The on-line BMP Manual is in Adobe Acrobat format. If you are reading the Acrobat version on a computer with an internet connection, you can use hyperlinks to navigate the document and to access various references. The hyperlinks are throughout the text, as well as in "References and Resources" sections within chapters and in "Bibliography and Suggested Resources" in Appendix F. Some of these links (URLs) may be outdated. In that case, try entering portions of the title or other keywords into a web search engine.

► PLAN AHEAD TO AVOID THE THREE MOST COMMON MISTAKES

The most common (and costly) errors made by applicants for development approvals with respect to storm water quality compliance are:

1. Not planning for compliance early enough. You should think about your strategy for storm water quality compliance before completing a conceptual site design or sketching a layout of subdivision lots (Chapter 3).

2. Assuming proprietary storm water treatment facilities will be adequate for compliance. Most aren't (Chapter 2).

3. Not planning for periodic inspections and maintenance of treatment and flow-control facilities. Consider who will own and who will maintain the facilities in perpetuity and how they will obtain access, and identify which arrangements are acceptable to the City of La Mesa (Chapter 5).

Chapter 1

Policies and Procedures

Determine if your development project must comply with storm water quality requirements, and review the steps to compliance.

Background

Urban runoff discharged from municipal storm water conveyance systems has been identified by local, regional, and national research programs as one of the principal causes of water quality problems in most urban areas. The City of La Mesa's storm water conveyance system, which collects runoff from our streets, rooftops, driveways, parking lots, and other impervious areas, flows directly to our rivers, beaches, and bays without receiving treatment (our storm water conveyance system is separate from our sanitary sewer system). Urban runoff potentially contains a host of pollutants like trash and debris, bacteria and viruses, oil and grease, sediments, nutrients, metals, and toxic chemicals. These contaminants can adversely affect receiving and coastal waters, associated wildlife, and public health. Urban runoff pollution is not only a problem during rainy seasons, but also year-round due to many types of urban water use that discharge runoff (dry weather flow) to the storm water conveyance system.

Land development and construction activities significantly alter drainage patterns and contribute pollutants to urban runoff primarily through erosion and removal or change of existing natural vegetation during construction, and the creation of new impervious surfaces, such as parking lots, which often permanently contribute pollutants throughout the "use" of the project site. When homes, work places, recreational areas, roads, parking lots, and structures are built, new impervious areas are built- creating the potential for an impact to water quality. The natural landscape's ability to infiltrate and cleanse storm water and urban runoff is "capped" by the impervious surfaces. As impervious surfaces increase, water that normally would have percolated into the soil now flows over the land surface directly to downstream wetlands, creeks, and eventually the Pacific Ocean. Accordingly, increases in impervious cover can increase the frequency and intensity of storm water flows. Second, new impervious surfaces often become a source of pollutants associated with development, such as automotive fluids, cleaning solvents, toxic or hazardous chemicals, detergents, sediment, metals, pesticides, oil and grease, and food wastes. These pollutants, which are often temporarily captured on impervious surfaces, are

transported to the storm water conveyance system by storm water and urban runoff. The pollutants flow untreated through the storm water conveyance system and ultimately into our creeks, rivers, beaches, and bays. With the growing concerns of urban runoff and storm water pollution, local, state, and federal agencies devised regulations requiring development planning and construction controls to treat storm water-related pollution from new development projects before it reaches any receiving waters.

On January 24th, 2007, the Regional Board issued Order No. R9-2007-0001, hereinafter referred to as "Municipal Permit." This Municipal Permit replaces the previous municipal permit, RWQCB Order No. 2001-01. The City has updated parts I and II of its BMP Manual to reflect the updated requirements of the current Municipal Permit. The primary objectives of the updated BMP Manual are to (1) Effectively prohibit non-storm water discharges; and (2) Reduce the discharge of pollutants from storm water conveyance systems to the MEP both during construction and throughout the use of a developed site. To maximize the use of LID practices as a means of reducing storm water runoff, Order No. R9-2007-0001 further required that the City define minimum LID and other BMP requirements in a document called the Model Standard Urban Storm Water Mitigation Plan (Model SUSMP), which was approved by the Regional Board on March 25, 2009. The permanent BMP requirements within the Model SUSMP were updated to comply with the current Municipal Permit, and these changes are included in this BMP Manual.

Legal Framework

The requirement to implement storm water BMP requirements for development projects is based on Section 402 (p) of the Clean Water Act. The Federal Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. Under the Federal Clean Water Act, municipalities throughout the nation are issued a Municipal NPDES Permit. The primary goal of the Municipal Permit is to stop polluted discharges from entering the storm water conveyance system and local receiving and coastal waters.

In California, the State Water Resources Control Board (SWRCB), through the nine Regional Boards, administers the NPDES storm water municipal permitting program. Based on the San Diego Municipal Permit issued by the San Diego Regional Board, the City is required to develop and implement construction and permanent storm water BMPs addressing pollution from new development projects.

In order to comply with the conditions of Order No. 2001-01, the City of La Mesa adopted the City of La Mesa Watercourse Protection, Storm Water Management and Discharge Control Ordinance ("Storm Water Ordinance") codified in Chapter 7.18 of the La Mesa Municipal Code. These ordinances have been updated as necessary to comply with the current Municipal Permit. This manual is an uncodified ordinance adopted by reference as Part II of the City of La Mesa Storm Water Best Practices Manual. The current Municipal Permit requires the City to categorize and prioritize land uses in order to establish effective BMPs. The City's current Storm Water Ordinance authorizes the City Engineer to establish Best Management Practices

(BMPs), including permanent improvements, for all types of land uses. This manual provides instructions on the City's construction phase and permanent BMP requirements, based on the most recent Model SUSMP, for development projects in the City of La Mesa.

The City Engineer may establish alternative BMPs. The allowable use of alternative BMPs at a specific site shall be determined at the sole discretion of the City Engineer. The City Engineer may establish BMPs for a specific site or activity if necessary to reduce Pollutants to the MEP or to comply with an order of the San Diego Regional Water Board. The City Engineer may also establish additional BMPs for a specific site if the City Engineer determines that the BMPs implemented at the site have not reduced the pollutants to the MEP.

A Low Impact Development Design Procedure

The San Diego Regional Water Board reissued a municipal storm water NPDES permit to the municipal **Copermittees** in January 2007. The permit updates and expands storm water requirements for new developments and redevelopments. Storm water treatment requirements have been made more stringent, minimum standards for **Low Impact Development** (LID) have been added, and the Copermittees are required to develop and implement criteria for the control of runoff peaks and durations from development sites.

To assist the land development community, streamline project reviews, and maximize cost-effective environmental benefits, the Copermittees have developed a unified LID design procedure, which has been adapted for use by the City of La Mesa. This design procedure integrates site planning and design measures with engineered, small-scale **Integrated Management Practices** (IMPs) such as bioretention. By following the procedure, applicants can develop a single integrated design which complies with the complex and overlapping NPDES permit LID requirements, storm water treatment requirements, and flow-control (hydromodification management) requirements.

The design approach is detailed in Chapter 4. General instructions for preparing a complete Project Submittal are in Chapter 3, and project-specific submittal requirements are available from municipal staff.

Applicants may choose not to use this design procedure, in which case they will need to demonstrate, in their submittal, compliance with applicable LID criteria, storm water treatment criteria, and flow-control criteria. These criteria are described in Chapter 2 and in the NPDES permit.

Requirements for All Development Projects

All development projects must include control measures to reduce the discharge of storm water pollutants to the maximum extent practicable.

Standard permanent storm water requirements, even for projects that are not "Priority Development Projects," include:

- Implementation of source control BMPs as listed in Appendix C.
- Inclusion of feasible LID features that conserve natural features, set back development from natural water bodies, minimize imperviousness, maximize infiltration, direct runoff to landscaping, and retain and slow runoff.
- Submittal of proof of a mechanism under which on-going long-term maintenance of all structural post-construction BMPs will be conducted.
- Compliance with requirements for construction-phase controls on sediment and other pollutants as described in Chapter 6.

Projects (requiring either discretionary actions or construction permits), subject to only standard permanent BMP requirements need to prepare a Standard Post Construction BMP Plan (SPCBMPP). See Appendix G for specific SPCBMPP requirements. Analysis of the project's anticipated pollutants of concern must also be included with the project submittal. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type. Municipal staff may also require additional controls appropriate to the project, which may include storm water treatment controls. LID treatment controls such as infiltration or bioretention are preferred. See "Selection of Treatment Facilities" on page 39.

Priority Development Projects

The NPDES permit requires more specific criteria be applied to Priority Development Projects. Projects (requiring either discretionary actions or construction permits), subject to the priority development project permanent BMP requirements must complete all of the analyses and incorporate all of the applicable BMP requirements in chapters 2 through 5 of this BMP Manual. This includes the LID and source control BMPs, and treatment control BMP requirements.

Projects subject to priority development project requirements must prepare and submit a Post Construction Water Quality Technical Report (PCWQTR) in accordance with Chapter 3 of this BMP Manual. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type.

► NEW DEVELOPMENT

Projects on previously undeveloped land are Priority Development Projects if they are in one or more of the categories listed in Appendix A. If a project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to Priority Project requirements. Note some thresholds are defined by square footage of impervious area created; others by the total area of the development.

► PREVIOUSLY DEVELOPED SITES

Projects on previously developed sites ("**redevelopment** projects") are Priority Development Projects if they create, add, or replace 5,000 square feet or more of impervious surface and also are in one of the categories listed in Appendix A.

Municipal staff may choose to designate projects not within the categories in Appendix A as Priority Development Projects, based on potential impacts to storm water quality.

► THE "50% RULE" FOR PREVIOUSLY DEVELOPED PROJECTS

Projects on previously developed sites may also need to retrofit drainage of **all** impervious areas of the **entire** site. For sites creating or replacing more than 5,000 square feet of impervious area:

- If the new project results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design.
- If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design.

If a new Development Project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to SUSMP requirements.

Projects limited to interior remodels, routine maintenance or repair, roof or exterior surface replacement, resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, or bike lanes on existing roads and routine replacement of damaged pavement such as pothole repair are not subject to treatment requirements. However, other requirements, including incorporation of appropriate source controls, still apply.

► POLLUTANT GENERATING PROJECTS WHICH DISTURB ONE ACRE OR MORE OF LAND

Projects that generate pollutants at levels greater than background levels and disturb one acre or more of land are considered Priority Development Projects. In most cases linear pathway projects that are for infrequent vehicle use (such as emergency or maintenance access) or for pedestrian or bicycle use are not considered pollutant generating above background levels if they are built with pervious surfaces or if they allow runoff to sheet flow to surrounding pervious surfaces.

Project Review and Permitting Process

The City of La Mesa's Watercourse Protection, Storm Water Management and Discharge Control Ordinance requires that all new development and redevelopment activities comply with the storm water pollution prevention requirements in Chapter 7.18 of the La Mesa Municipal Code, and Parts I and II of the City Of La Mesa Best Management Practices Manual. Applicants must also comply with the grading regulations in Chapter 14.05 of the Municipal Code. These storm water pollution prevention requirements, which are described in detail in this BMP Manual are site specific and vary based on the project's potential impact on receiving water quality.

The flow chart in Figure 1-1, "Review Process for Discretionary Actions" demonstrates how storm water requirements are incorporated into projects requiring subdivision approvals,

development permits or other discretionary actions. For information on the construction permit and review process, see Chapter 6 of this BMP Manual. The steps below in "Compliance Process at a Glance" describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 1-1. Review Process for Discretionary Actions

The following figure provides an overview of the project review process for projects that require a discretionary action by the City of La Mesa. Discretionary actions include land use plan amendments, re-zonings, subdivisions, planned development permits, conditional use permits, site development permits, variances, neighborhood development permits, and neighborhood use permits.

Compliance Process at a Glance

For the applicant for development project approval, storm water compliance follows these general steps:

1. Discuss requirements during a pre-application meeting with municipal staff.
2. Determine applicable storm water BMP requirements by completing the "Storm Water Requirements Applicability Checklist" in Appendix A prior to submittal.
3. Review the instructions in this BMP manual before you prepare your tentative map, preliminary site plan, drainage plan, and landscaping plan.
4. Prepare your Project Submittal, which is typically made with your application for development approvals (entitlements).
5. Prepare a draft Storm Water Facility Operation and Maintenance Plan and include it with your Project Submittal.
6. Under the authority of the City Engineer, Engineering staff will review the Project Submittal with Storm Water Facility Operation and Maintenance Plan for compliance with the applicable storm water requirements contained in this manual.
7. Create your detailed project design, incorporating the features described in your Project Submittal.
8. In a table on your construction plans, list each storm water compliance feature and facility and the plan sheet where it appears.
9. Maintain storm water facilities during construction and following construction.
10. The owner must periodically verify storm water facilities are properly maintained.

Preparation of a complete and detailed Project Submittal is the key to cost-effective storm water compliance and expeditious review of your project. Additional notes about these steps are provided below. Instructions for preparing your Project Submittal are in Chapter 3.

► ADDITIONAL NOTES ON COMPLIANCE

Storm Water Requirements Applicability Checklist. Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. (Note: this form must be completed for all permit applications, even if previous approvals exist. Projects requesting additional construction permits or discretionary approvals, even though previous permits and/or approvals have been obtained, will be required to comply with the storm water requirements in this document). This checklist must be

completed, signed by the responsible party for the project, and submitted with your permit application. Applicants may also verify the project's storm water BMP requirements through a single discipline preliminary review of the project. The project design must include all required permanent BMPs (as determined from the Storm Water Requirements Applicability Checklist in Appendix A), prior to deeming the application package complete.

Determining Adequacy of Proposed Plans. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs.

Phased Projects

When determining whether SUSMP requirements apply, a "project" should be defined consistent with California Environmental Quality Act (CEQA) definitions of "project." That is, the "project" is the whole of an action which has the potential for adding or replacing or resulting in the addition or replacement of roofs, pavement, or other impervious surfaces and thereby resulting in increased flows and storm water pollutants. "Whole of an action" means the project may not be segmented or piecemealed into small parts if the effect is to reduce the quantity of impervious area for any part to below the SUSMP thresholds.

Municipal staff may require, as part of an application for approval of a phased development project, a conceptual or master Project Submittal which describes and illustrates, in broad outline, how the drainage for the project will comply with the SUSMP requirements. The level of detail in the conceptual or master Project Submittal should be consistent with the scope and level of detail of the development approval being considered. The conceptual or master Project Submittal should specify that a more detailed Project Submittal for each later phase or portion of the project will be submitted with subsequent applications for discretionary approvals.

Note these minimum standards for SUSMP applicability are for the purpose of ensuring a consistent minimum level or "floor" for implementation consistent with the requirements of the NPDES permit. The City Engineer reserves the right to choose a more expansive interpretation of the NPDES permit's applicability and may also choose to apply source control, treatment, and flow-control requirements to projects that would be exempt under these minimum standards.

New Subdivisions

If a tentative map approval would potentially entitle future owners to construct new or replaced impervious area which, in aggregate, could exceed one of the SUSMP thresholds (Appendix A), then the applicant must take steps to ensure SUSMP requirements can and will be implemented as the subdivision is built out.

If the tentative map application does not include plans for site improvements, the applicant should nevertheless identify the type, size, location, and final ownership of storm water treatment and flow-control facilities adequate to serve common private roadways and any other common areas, and to also manage runoff from an expected reasonable estimate of the square footage of future roofs, driveways, and other impervious surfaces on each individual lot. The City Engineer may condition approval of the map on implementation of storm water treatment and other SUSMP measures when construction occurs on the individual lots. At the City Engineer's discretion, this condition may be enforced by a grant deed of development rights or by a development agreement.

If the City Engineer deems it necessary, the future impervious area of one or more lots may be limited by a deed restriction. This might be necessary when a project is exempted from one or all SUSMP provisions because the total impervious area is below a threshold, or to ensure runoff from impervious areas added after the project is approved does not overload a storm water treatment and flow-control facility.

The City Engineer may require subdivision maps to dedicate an "open space easement, as defined by Government Code Section 51075," to suitably restrict the future building of structures at each storm water facility location if necessary.

In general, in new subdivisions **storm water treatment, infiltration, or flow-control facilities should not be located on individual single-family residential lots**, particularly when those facilities manage runoff from other lots, from streets, or from common areas. A better alternative is to locate storm water facilities on one or more separate, jointly owned parcels.

After consulting with local planning staff, applicants for subdivision approvals will propose one of the following four options, depending on project characteristics and local policies:

1. Show the number of parcels and the total impervious area to be created on all parcels could not, in the future, exceed any of the thresholds in Appendix A.

2. Show that, for each and every lot, the intended use can be achieved with a design which disperses runoff from roofs, driveways, streets, and other impervious areas to self-retaining pervious areas, using the criteria in Chapter 4.

3. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and commit to constructing the facilities prior to transferring the lots.

4. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and provide appropriate legal instruments to ensure the proposed facilities will be constructed and maintained by subsequent owners.

For the option selected, municipal staff will determine the appropriate conditions of approval, easements, deed restrictions, or other legal instruments necessary to assure future compliance.

Compliance with Flow-Control Requirements

Priority Development Projects (Appendix A) must be designed so that runoff rates and durations are controlled to maintain or reduce pre-project downstream erosion conditions and protect stream habitat. The following text regarding HMP applicability requirements is based on the HMP document, provided in Appendix H. Additionally, the City has prepared an FAQ document related to hydromodification management, which is available on the City's website at www.cityoflamesa.com/stormwater under the "Development Requirements" tab.

► HMP APPLICABILITY REQUIREMENTS

To determine if a proposed project must implement hydromodification controls, refer to the HMP Decision Matrix in Figure 1-2. The HMP Decision Matrix can be used for all projects. For redevelopment projects, flow controls would only be required if the redevelopment project increases impervious area or peak flow rates as compared to pre-project conditions.

It should be noted that all Priority Development Projects will be subject to the Permit's LID and water quality treatment requirements even if hydromodification flow controls are not required.

As noted in Figure 1-2, projects may be exempt from HMP criteria under the following conditions.

- If the project is not a Priority Development Project.
- If the proposed project does not increase the impervious area or peak flows to any discharge location without flow mitigation.
- If the proposed project discharges runoff directly to an exempt receiving water such as the Pacific Ocean, San Diego Bay, an exempt river reach, an exempt reservoir, or a tidally-influenced area.
- If the proposed project discharges to a stabilized conveyance system that extends to the Pacific Ocean, San Diego Bay, a tidally-influenced area, an exempt river reach or reservoir.
- If the contributing watershed area to which the project discharges has an impervious area percentage greater than 70 percent.
- If an urban infill project discharges to an existing hardened or rehabilitated conveyance system that extends beyond the "domain of analysis," the potential for cumulative impacts in the watershed are low, and the ultimate receiving channel has a Low susceptibility to erosion as defined in the SCCWRP channel assessment tool.

If the proposed project decreases the pre-project impervious area and peak flows to each discharge location, without flow mitigation, then a flow-duration analysis is implicitly not required. If continuous simulation flow-frequency and flow duration curves were developed for

such a scenario, the unmitigated post-project flows and durations would be less as compared to pre-project curves.

Proposed exemptions for projects discharging runoff directly to the Pacific Ocean, San Diego Bay or to hardened conveyance systems which transport runoff directly to the Pacific Ocean or San Diego Bay are referred to the 2007 Municipal Permit. Per the Permit, hardened conveyance systems can include existing concrete channels, storm drain systems, etc.

FIGURE 1-2. HMP Applicability Determination

The Municipal Permit also contains language to support exemptions for projects located in highly urbanized areas where the impervious percentage exceeds 70 percent (as calculated for the sub-watershed between the project outfall downstream to the exempt receiving water).

- Figure 1-2, Node 1 – Hydromodification mitigation measures are only required if the proposed project is a Priority Development Project.

- Figure 1-2, Node 2 – Properly designed energy dissipation systems are required for all project outfalls to unlined channels. Such systems should be designed in accordance with the County of San Diego's Drainage Design Manual to ensure downstream channel protection from concentrated outfalls.

- Figure 1-2, Nodes 3 and 4 – Projects may be exempt from hydromodification criteria if the proposed project reduces the pre-project impervious area and if unmitigated post-project outflows (outflows without detention routing) to each outlet location are less as compared to the pre-project condition. The pre and post-project hydrologic analysis should be conducted for the 2 and 10-year design storms and follow single-event methodology set forth in the San Diego Hydrology Manual. This scenario may apply to redevelopment projects in particular.

- Figure 1-2, Node 5 – Potential exemptions may be granted for projects discharging runoff directly to an exempt receiving water, such as the Pacific Ocean, San Diego Bay, an exempt river system (detailed in Table 1-2), or an exempt reservoir system (detailed in Table 1-2). To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the 10-year floodplain elevation for a river exemption or below the typical water surface level in a reservoir system. The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of exempt river or reservoir systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and exempt river or reservoir water surface elevation.

- Figure 1-2, Node 6 – For projects discharging runoff directly to a tidally-influenced lagoon, potential exemptions may also be granted. To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the typical water surface level in the lagoon system (such as the mean high tide elevation). The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of lagoon systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and typical lagoon water surface elevation. Exemptions related to runoff discharging directly to tidally-influenced areas were drafted based upon precedent set in the Santa Clara HMP. Regarding the potential exemption, additional analysis would be required to assess the effects of the freshwater / saltwater balance and the resultant effects on lagoon-system biology. This assessment, which would be required by other permitting processes such as the Army Corps of Engineers, California Department of Fish and Game, etc., must be provided by a certified biologist or other specialist as approved by the City. Such discharges would include an energy dissipation system

(riprap, etc.) designed to mitigate 100-year outlet velocities based upon a free outfall condition. Such a design would be protective of the channel bed and bank from an erosion standpoint.

- Figure 1-2, Nodes 7 and 8 – For projects discharging runoff directly to a hardened conveyance or rehabilitated stream system that extends to exempt receiving waters detailed in Node 5, potential exemptions from hydromodification criteria may be granted. Such hardened or rehabilitated systems could include existing storm drain systems, existing concrete channels, or stable engineered unlined channels. To qualify for this exemption, the existing hardened or rehabilitated conveyance system must continue uninterrupted to the exempt system. In other words, the hardened or rehabilitated conveyance system cannot discharge to an unlined, non-engineered channel segment prior to discharge to the exempt system. Additionally, the project proponent must demonstrate that the hardened or rehabilitated conveyance system has capacity to convey the 10-year ultimate condition flow through the conveyance system. The 10-year flow should be calculated based upon single-event hydrologic criteria as detailed in the San Diego County Hydrology Manual.

- Figure 1-2, Node 9 – As allowed per the Municipal Permit, projects discharging runoff to a highly urbanized watershed (defined as an existing, pre-project impervious percentage greater than 70 percent) may be eligible for an exemption from hydromodification criteria.

  Watershed impervious area calculations for this potential exemption will be measured between the project site discharge location and the connection to a downstream exempt receiving conveyance system, such as the Pacific Ocean, San Diego Bay, or an exempt river system. If a tributary area connects with the main line drainage path between the project site and the exempt system, then the entire watershed area contributing to the tributary shall be included in the calculation. Initial review of County land use indicates that this exemption will likely only apply in a limited number of urbanized coastal areas.

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual and detailed below or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

- Figure 1-2, Nodes 10 through 13 – For urban infill projects discharging runoff to an existing hardened or rehabilitated conveyance system, potential limited exemptions from hydromodification criteria may apply where the existing impervious area percentage in the watershed exceeds 40 percent. For the potential exemption application, the domain of analysis must be determined and the existing hardened or rehabilitated conveyance system must extend beyond the downstream terminus of the domain of analysis. The hardened or rehabilitated conveyance system must discharge to a receiving channel with a Low potential for channel susceptibility for this exemption to be granted (channel susceptibility determined using SCCWRP tool). Finally, continuous simulation sensitivity analysis shows that an exemption could only be granted if the potential future development impacts in the watershed would increase the watershed's impervious area percentage by less than 3 percent (as compared to the existing condition in the year 2010). If the potential future cumulative impacts in the watershed could increase the impervious area percentage by more than 3 percent (as compared to existing condition), then no exemption could be granted based on this item. Watershed impervious area calculations for this potential exemption, in which a project discharges to a watershed with an existing impervious areas greater than 40 percent, will be measured upstream from the outfall of the urban conveyance system (to a non-concrete, non-riprap-lined or non-engineered channel) to the contributing watershed boundary (the entire watershed contributing to the discharge outfall).

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

Exemptions related to runoff discharging directly to certain river reaches were initially based upon the majority Technical Advisory Committee (TAC) opinion that such river reaches were depositional (aggrading) and that the effects of cumulative watershed impacts to these reaches is minimal. Subsequent justifications for the river reach exemptions were the result of a flow duration curve analysis for the San Diego River

Potential river reaches that would be exempt from hydromodification criteria include only those reaches for which the contributing drainage area exceeds 100 square miles and which have a 100-year design flow in excess of 20,000 cfs. For reference, proposed Caltrans HMP criteria allows for river/creek exemptions for drainage areas of only 10 square miles.

Per recommendations from members of the TAC, San Diego river systems meeting the drainage area and peak flow criteria are typically aggrading (depositional) and have very wide floodplain areas when in the natural condition. In all cases, river reaches meeting the drainage area and peak flow criteria are located downstream of large reservoir systems which effectively block outflows for most storm events. In addition, the river systems meeting these criteria typically have very low gradients. The combination of low gradients, significant peak flow attenuation, and wide floodplain areas translate to a low potential for channel erosion at the upper limit of the proposed geomorphic flow range (10-year flow event).

All exempt river reaches, which are presented in Table 1-1, have drainage areas in excess of 100 square miles and 100-year flow rates in excess of 20,000 cfs. In addition, all proposed river reaches are subject to significant upstream reservoir flow regulation, have wide floodplain or stabilized channel areas, and low gradients. This combination of factors, in association with field observations and years of historical perspective from the TAC members, justifies exemptions for direct discharges to the exempt river reaches provided that properly sized energy dissipation is provided at the outfall location.

TABLE 1-1. Summary of Exempt River Reaches in San Diego County

River	Downstream Limit	Upstream Limit
Otay River	Outfall to San Diego Bay	Lower Otay Reservoir Dam
San Diego River	Outfall to Pacific Ocean	Confluence with San Vicente Creek
San Dieguito River	Outfall to Pacific Ocean	Lake Hodges Dam
San Luis Rey River	Outfall to Pacific Ocean	Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15
Sweetwater River	Outfall to San Diego Bay	Sweetwater Reservoir Dam

Table 1-2 provides a summary of exempt reservoirs in San Diego County. Large reservoirs can be exempt systems from a hydromodification standpoint since reservoir storm water inflow velocities are naturally mitigated by the significant tailwater condition in the reservoir. HMP exemptions would only be granted for projects discharging runoff directly to the exempt reservoirs. The City will define "direct discharge" based on the project site conditions. To qualify for the potential exemption, the outlet elevation must be at or below either the normal operating water surface elevation or the reservoir spillway elevation and properly designed energy dissipation must be provided.

TABLE 1-2. Summary of Exempt Reservoirs in San Diego County

Reservoir	Watershed
Barrett Lake	Tijuana River
El Capitain Reservoir	San Diego River
Lake Dixon	Escondido Creek
Lake Heneshaw	San Luis Rey River
Lake Hodges	San Dieguito River
Lake Jennings	San Diego River
Lake Murray	San Diego River
Lake Poway	San Dieguito River
Lake San Marcos	San Marcos Creek
Lake Wohlford	Escondido Creek
Loveland Reservoir	Sweetwater River
Lower Otay Reservoir	Otay River
Miramar Lake	Los Penasquitos Creek
San Vicente Reservoir	San Diego River
Sweetwater Reservoir	Sweetwater River
Upper Otay Reservoir	Otay River

The final exemption category focuses on small urban infill projects where the potential for future cumulative watershed impacts is minimal.

Urban infill projects may be exempt from HMP criteria if:

1. The potential future development impacts within the sub-watershed, as measured from the entire sub-watershed area draining to the existing conveyance system outfall, would not increase the composite impervious area percentage of the sub-watershed by more than 3 percent

2. The project discharges runoff to an existing hardened or rehabilitated conveyance system (storm drain, concrete channel, or engineered vegetated channel) that extends beyond the Domain of Analysis determined for the project site, and

3. The stabilized conveyance system eventually discharges to a channel with a Low susceptibility to erosion, as designed by the SCCWRP channel assessment tool.

► FLOW CONTROL PERFORMANCE CRITERIA

Figures 1-2 and 1-3, which are part of the HMP Decision Matrix, detail how lower flow thresholds would be determined for a project site. Figures 1-4 and 1-5, which detail the SCCWRP lateral and vertical channel susceptibility requirements, complete the HMP Decision Matrix.

The project applicant must first determine whether field investigations will be conducted pursuant to the SCCWRP channel screening tools. If the screening tools are not completed for a proposed project, then the site must mitigate peak flows and durations based on a pre-project condition lower flow threshold of $0.1Q_2$. While a project applicant would be held to the $0.1Q_2$ standard if channel screening tools and assessments are not conducted, less restrictive standards are possible for more erosion-resistant receiving channel sections if the screening tools are completed and the SCCWRP method indicates either a Medium or Low susceptibility to channel erosion .

In such a scenario, the project applicant would also use the critical shear stress calculator to assist in determination of the predicted lower flow threshold. The SCCWRP screening tools and critical shear stress calculator work in concert to determine the lower flow threshold for a given site. Lower flow limits determined by the calculator have been grouped into one of three thresholds – $0.1Q_2$, $0.3Q_2$ or $0.5Q_2$. "Low" susceptibilities from the SCCWRP tool generally correspond to the $0.5Q_2$ threshold, "Medium" susceptibilities generally correspond to the $0.3Q_2$ threshold, and "High" susceptibilities generally correspond to the $0.1Q_2$ threshold. The SCCWRP channel screening tools are required to identify channel conditions not considered by the critical shear stress calculator, which focuses on channel material and cross section. Conversely, the SCCWRP channel screening tools considers other channel conditions including channel braiding, mass wasting, and proximity to the erosion threshold. In cases where the critical shear stress calculator and the SCCWRP screening tools return divergent values, then the most conservative value shall be used as the lower flow threshold for the analysis.

Low-Impact Development (LID) and extended detention facilities are required to meet peak flow and duration controls as follows:

4. For flow rates ranging from 10 percent, 30 percent or 50 percent of the pre-project 2-year runoff event ($0.1Q_2$, $0.3Q_2$, or $0.5Q_2$) to the pre-project 10-year runoff event (Q10), the post-project discharge rates and durations shall not deviate above the pre-project rates and durations by more than 10 percent over and more than 10 percent of the length of the flow duration curve. The specific lower flow threshold will depend on results from the SCCWRP channel screening study and the critical flow calculator.

5. For flow rates ranging from the lower flow threshold to Q_5, the post-project peak flows shall not exceed pre-project peak flows. For flow rates from Q_5 to Q_{10}, post-project peak flows may exceed pre-project flows by up to 10 percent for a 1-year frequency interval. For example, post-project flows could exceed pre-project flows by up to 10 percent for the interval from Q_9 to Q_{10} or from $Q_{5.5}$ to $Q_{6.5}$, but not from Q_8 to Q_{10}.

This HMP recommends the use of LID facilities to satisfy both 85th percentile water quality treatment as well as HMP flow control criteria. Detailed standards for LID implementation have been developed. These standards are provided in the City of La Mesa BMP Manual Part II.

The following methods may be used to meet mitigation requirements.

- Install BMPs that meet design requirements to control runoff from new impervious areas. BMPs including bioretention basins, vegetated swales, planter boxes, extended detention basins, etc. shall be designed pursuant to standard sizing and specification criteria detailed in the City of La Mesa BMP Manual Part II and the HMP/LID Sizing Calculator to ensure compliance with hydromodification criteria.

- Use of the automated sizing calculator (San Diego Sizing Calculator) that will allow project applicants to select and size LID treatment devices or flow control basins. The tool, akin to the sizing calculator developed for compliance with the Contra Costa HMP, uses pre-calculated sizing factors to determine required footprint sizes for flow control BMPs. Continuous simulation hydrologic analyses are currently being developed to determine the sizing factors for various flow control options and development scenarios. The Sizing Calculator also includes an automated pond sizing tool to assist in the design of extended detention facilities for mitigation of hydromodification effects. Because of the Sizing Calculator's ease of implementation, and since hydromodification BMPs can also serve as treatment BMPs, it is anticipated that most project applicants will choose this option instead of seeking compliance through site-specific continuous simulation model preparation. The HMP/LID Sizing Calculator is an implementation tool, which is currently under development by the consultant team and will be completed by the time final HMP criteria go into effect.

- Prepare continuous simulation hydrologic models and compare the pre-project and mitigated post-project runoff peaks and durations (with hydromodification flow controls) until compliance to flow control standards can be demonstrated. The project applicant will be required to quantify the long-term pre- and post-project runoff response from the site and establish runoff routing and stage-storage-discharge relationships for the planned flow control devices. Public domain software such as HSPF, HEC-HMS and SWMM can be used for preparation of a continuous simulation hydrologic analysis.

- Points of compliance must be selected to conduct the comparisons of pre-project and post-project flows and durations. Generally, points of compliance are selected at locations along the project boundary where concentrated flows discharge from the project site. If a point of compliance is selected downstream of the project boundary, then the City should be consulted in advance of the hydromodification analysis. For projects which convey offsite runoff through the site, it is assumed that the offsite runoff would be separated from site runoff. If this is not the case, then the City should be consulted to further refine the points of compliance for the site (an interior project site point of compliance could be required in such a scenario).

FIGURE 1-3. Mitigation Criteria and Implementation (Part 1)

- Figure 1-3, Node 1 – If the project applicant chooses to complete SCCWRP channel screening tools, then the applicant moves to Figures 1-4 and 1-5 to assess the vertical and lateral susceptibility of the receiving channel systems. Depending on the results of the SCCWRP screening tools and critical flow calculator, it is possible that lower flow thresholds in excess of $0.1Q_2$ may be used. If the project applicant chooses not to complete the SCCWRP channel assessment, then the applicant proceeds with Figure 1-3 of the Decision Matrix.

- Figure 1-3, Node 2 – If the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers), then consultation with a geotechnical engineer is required (Box 3). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 4.

- Figure 1-3, Node 3 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-3, Node 4 – In this scenario, the SCCWRP channel assessment was not conducted. Therefore, the project applicant would be held to the $0.1Q_2$ lower flow threshold. LID and extended detention facilities must be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to Q_{10}.

- Figure 1-3, Node 5 - The Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-4. Mitigation Criteria and Implementation (Part 2)

- Figure 1-4, Node 1 – Use of Figure 1-4 assumes that the project applicant conducted the SCCWRP channel assessment. Box 1 would begin following completion of both the lateral and vertical susceptibility flow charts depicted in Figures 1-4 and 1-5. Box 1 is a decision box asking if the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers). If the answer is Yes, then consultation with a geotechnical engineer is required (Box 2). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 3.

- Figure 1-4, Node 2 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-4, Node 3 – Pursuant to criteria detailed in HMP Section 5.2, the Domain of Analysis is determined downstream and upstream of the project site. This determination is used to ascertain the required reach length for data collection (channel bed and bank material, channel cross section data, etc.) required for the critical flow calculator (see Box 4).

- Figure 1-4, Node 4 – Pursuant to criteria detailed in HMP Section 5.1.4, the project applicant would run the critical shear stress calculator to determine if the recommended critical flow threshold should be $0.1Q_2$, $0.3Q_2$, or $0.5Q_2$. This result will be compared to the result from the SCCWRP screening analysis (Box 5) to determine the final lower flow threshold for the project.

- Figure 1-4, Node 5 – Pursuant to criteria detailed in HMP Appendix B, the project applicant would determine both the lateral and vertical channel susceptibility rating per guidelines set forth by SCCWRP. If the lateral and vertical tools returned divergent results, then the more conservative result would be used. SCCWRP susceptibility ratings include "High," "Medium" and "Low."

- Figure 1-4, Node 6 – A project applicant would arrive at Box 6 if the SCCWRP channel susceptibility rating was determined to be "High." This decision box inquires as to whether stream rehabilitation measures such as grade control and channel widening will be used as a mitigation measure instead of flow control. It should be noted that stream rehabilitation options are only allowed if the existing receiving channel susceptibility is considered to be "High."

- Figure 1-4, Node 7 – Stream rehabilitation measures are only allowed if the proposed mitigation project extends to a downstream exempt system (such as an exempt river system). If the mitigation measure did not extend to an exempt system, then the potential for cumulative watershed impacts would be more pronounced.

- Figure 1-4, Node 8 – If stream rehabilitation measures are allowed, then guidelines outlined in Section 6.3 of the HMP should be followed to design the in-stream mitigation approach.

- Figure 1-4, Node 9 - A project applicant would arrive at Box 9 if the SCCWRP channel susceptibility rating was determined to be "Medium." If the result from the critical shear stress calculator is also "Medium" (or $0.3Q_2$), then the lower flow threshold would be $0.3Q_2$ (Box 11). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10).

- Figure 1-4, Node 10 – For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "High" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to Q_{10}.

- Figure 1-4, Node 11 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Medium" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.3Q_2$ to Q_{10}.

- Figure 1-4, Node 12 - A project applicant would arrive at Box 12 if the SCCWRP channel susceptibility rating was determined to be "Low." If the result from the critical shear stress calculator is also "Low" (or $0.5Q_2$), then the lower flow threshold would be $0.5Q_2$ (Box 16 – note potential waiver in Box 13). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10). If the result from the critical flow calculator is "Medium" (or $0.3Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.3Q_2$ (Box 11).

- Figure 1-4, Node 13 – In some limited situations, namely small developments in rural or lightly developed areas, an allowance for a minimum outlet orifice size may be granted when the receiving channel susceptibility is "Low." This criteria may potentially be used for project footprints less than 5 acres. If the project footprint is greater than 5 acres, then the allowance may not be granted and the applicant would proceed to Box 16.

- Figure 1-4, Node 14 – The potential allowance discussed in Box 13 could only be granted if the ultimate potential impervious area in the sub-watershed is less than 10 percent. If there is potential for the sub-watershed impervious area to exceed 10 percent, then the minimum orifice size criteria may not be granted.

- Figure 1-4, Node 15 – If Boxes 12, 13, and 14 are satisfied, then mitigation facilities may be designed using a 3-inch minimum outlet orifice size.

- Figure 1-4, Node 16 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Low" susceptibility to erosion – and for projects where the minimum outlet orifice criteria does not apply - LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.5Q_2$ to Q_{10}.

- Figure 1-4, Node 17 – For all hydromodification mitigation designs, the Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-5. SCCWRP Vertical Susceptibility

FIGURE 1-6. Lateral Channel Susceptibility

Grandfathering. Projects with lawful approval prior to January 14, 2011 (such as a development agreement, vested tentative map, or a building or grading permit), may not have to meet the hydromodification management requirements. Verify with municipal staff.

Waivers from Numeric Sizing Criteria

The NPDES permit allows for a project to be waived from numeric sizing criteria for storm water treatment only if all available treatment facilities have been considered and found **infeasible**. Municipal staff must inform the Water Board within 5 days of granting a waiver. Other SUSMP requirements—including site designs to minimize imperviousness and source control BMPs—will still apply.

Experience has shown implementation of LID facilities, as described in Chapter 4, is feasible on nearly all development sites. However, the use of LID to retrofit existing drainage systems, to manage runoff from sites smaller than one acre in pedestrian-oriented developments, or to manage runoff from widened portions of roadways, sometimes presents special challenges. In these special situations, applicants should see the discussion of "Selection of Storm Water Treatment Facilities" in Chapter 2 and evaluate the options described on page 41 in order (depending on the specific characteristics of the project and as determined by the City Engineer). All the options listed meet the numeric sizing criteria in the NPDES permit.

If infeasibility of all these options can be established, the City Engineer may determine eligibility of the project for a waiver.

Chapter 2

Concepts and Criteria

Technical background and explanations of policies and design requirements

The Regional Water Board reissued a municipal storm water NPDES permit to San Diego County, its 18 cities, the San Diego Unified Port District, and the San Diego Regional Airport Authority in January 2007. The permit mandates a comprehensive program to prevent storm water pollution. That program now includes street sweeping, maintenance of storm drains, business inspections, public outreach, construction site inspections, monitoring, and studies of stream and ocean health, and control of runoff pollutants from new developments and redevelopments.

Permit Provision D.1.d. requires the City of La Mesa to regulate projects in specific categories (Appendix A) to:

1. Reduce discharges of pollutants to the maximum extent practicable.
2. Prevent runoff discharges from causing or contributing to a violation of water quality standards.

The City of La Mesa, along with the other Copermittees, have created a Low Impact Development (LID) design procedure (Chapter 4) that ensures consistent and thorough implementation of the Regional Water Board's requirements. This chapter explains the technical background of the LID approach and how it was derived.

The previous permit, issued in 2001, included a requirement to control the post-development peak storm water runoff rates and velocities to maintain or reduce pre-development downstream erosion and protect stream habitat. The 2007 permit includes, in addition to this ongoing requirement, a new requirement to develop a hydromodification management plan (HMP) to identify and define a methodology and performance criteria to ensure flow rates and durations do not exceed pre-project runoff where increased runoff could cause erosion or other significant adverse impacts to beneficial uses.

As required by the NPDES permit, the City of La Mesa has adopted final hydromodification criteria. See Chapter One.

Water-Quality Regulations

Provision D.1 requires the City of La Mesa to condition development approvals on incorporation of specified storm water controls.

Provision D.1 requires applicable new developments and redevelopments:

- Design the site to conserve natural areas, existing trees and vegetation and soils, to maintain natural drainage patterns, to minimize imperviousness, to detain runoff, and to infiltrate runoff where feasible
- Cover or control sources of storm water pollutants
- Treat runoff prior to discharge. Provision E.10 states: "Urban runoff treatment and/or mitigation must occur prior to the discharge of urban runoff into a receiving water. Federal regulations at 40 CFR 131.10(a) state that in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S."
- Ensure runoff does not exceed pre-project peaks and durations where increases could affect downstream habitat or other beneficial uses
- Maintain treatment and flow-control facilities

The City of La Mesa maintains a database to track approved installations of treatment facilities and to verify facilities are maintained. The City's annual report to the Regional Water Board includes a list of development projects subject to SUSMP conditions and descriptions of those projects that:

- Received a waiver from SUSMP criteria; or
- Used hydrologic controls used to meet HMP requirements, including a description of the controls.

The City of La Mesa must also report the number of violations and enforcement actions taken upon development projects. The City of La Mesa's programs are subject to audit by the Regional Water Board.

The City of La Mesa—not the Regional Water Board or its staff—is charged with ensuring development projects comply with the D.1 requirements. Regional Water Board staff sometimes review storm water controls and hydromodification impacts in connection with applications for Clean Water Act Section 401 water-quality certification, which is required for projects that involve work, such as dredging or placement of fill, within streams, creeks, or other waters of the US.

► MAXIMUM EXTENT PRACTICABLE

Clean Water Act Section 402(p)(3)(iii) sets the standard for storm water controls as "maximum extent practicable," but doesn't define that term. As implemented, "maximum extent practicable" is ever-changing and varies with conditions.

Many storm water controls, including LID facilities, have proven to be practicable in most site development projects. To achieve fair and effective implementation, criteria, and guidance, requirements for controls must be detailed and specific—while also offering the right amount of flexibility or exceptions for special cases. The NPDES permit includes various standards, including hydrologic criteria, which have been found to comprise "maximum extent practicable." This BMP Manual is to be continuously improved and refined based on the experience of municipal planners and engineers, with input from land developers and development professionals. By following the BMP Manual, applicants can ensure their project design meets "maximum extent practicable."

► BEST MANAGEMENT PRACTICES

Clean Water Act Section 402(p) and USEPA regulations (40 CFR 122.26) specify a municipal program of "management practices" to control storm water pollutants. **Best Management Practice (BMP)** refers to any kind of procedure, activity, or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs are typically used in place of assigning numeric effluent limits. The criteria for source control BMPs and treatment and flow-control facilities are crafted to fulfill "maximum extent practicable."

To minimize confusion, this guidebook refers to "facilities," "features," or "controls" to be incorporated into development projects. All of these are BMPs.

Pollutants of Concern

NPDES Permit Provision D.1.d.(3) requires the City of La Mesa to develop and implement a procedure for pollutants of concern to be identified for each Priority Development Project.

Documentation of the approach to identifying pollutants of concern and selecting BMPs and facilities follows.

► GROUPING OF POTENTIAL POLLUTANTS OF CONCERN

Urban runoff from a developed site has the potential to contribute pollutants, including oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system and receiving waters. For the purposes of identifying pollutants of concern and associated storm water BMPs, pollutants are grouped in nine general categories as follows:

- **Sediments** are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms

survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

- **Nutrients** are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

- **Metals** are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary sources of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

- **Organic compounds** are carbon-based. Commercially available or naturally occurring organic compounds are found in pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

- **Trash** (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

- **Oxygen-Demanding Substances** includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-

demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

- Primary sources of **oil and grease** are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

- **Bacteria and Viruses** are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. Also, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

- **Pesticides** (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

► IDENTIFYING POLLUTANTS OF CONCERN BASED ON LAND USES

Table 2-1 associates pollutants with the categories of Priority Development Projects. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern.

► WATERSHEDS WITH SPECIAL POLLUTANT CONCERNS

Receiving water conditions may require specialized attention. The three conditions to consider include:

- Ocean waters designated as an "Area of Special Biological Significance" (ASBS)
- 303(d) listed waters; and
- Waters with established TMDLs.

TABLE 2-1. Anticipated and Potential Pollutants Generated by Land Use Type.

	General Pollutant Categories								
Land Use Type	Sediment	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Detached Residential Development	X	X			X	X	X	X	X
Attached Residential Development	X	X			X	P(1)	P(2)	P	X
Commercial Development	P(1)	P(1)	X	P(2)	X	P(5)	X	P(3)	P(5)
Heavy Industry	X		X	X	X	X	X		
Automotive Repair Shops			X	X(4)(5)	X		X		
Restaurants					X	X	X	X	P(1)
Hillside Development >5,000 ft²	X	X			X	X	X		X
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Retail Gasoline Outlets			X	X	X	X	X		
Streets, Highways & Freeways	X	P(1)	X	X(4)	X	P(5)	X	X	P(1)

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

The State Water Resources Control Board's California Ocean Plan identifies thirty-four locations along the California coast as **Areas of Special Biological Significance (ASBS)**. Currently, there are no ASBS downstream of the City of La Mesa. See Table 2-2 for a list of applicable downstream water bodies. Please note that while runoff from the City drains to these water bodies, the actual water bodies are not located within the City itself.

TABLE 2-2. City of La Mesa Drainage Basins.

Drainage Basin	Percent of City of La Mesa Area	Receiving Waterbody	Hydrologic Subarea	Watershed
Alvarado	51	San Diego River	907.11	San Diego River
Lake Murray	1	Lake Murray		
University	28	Chollas Creek	908.22	San Diego Bay
Lemon Grove	6			
Spring Valley	14	Sweetwater River	909.12	

The NPDES Permit identifies several receiving waters as impaired for constituents or water quality effects pursuant to **Section 303(d)** of the Clean Water Act. Placement of a water onto the list requires the Regional Board to make further analysis of the impairment and development of total maximum daily loads (TMDLs) for addressing the impairment. The 303(d) listing in itself does not demand that a project proponent select BMPs on the basis of the impairment; however, the project proponent should be cognizant of the impairment and the future implications a TMDL might have upon the proposed land use. The San Diego River, Chollas Creek, and Lake Murray, all of which are on the 2010 CWA Section 303(d) list, are located downstream of the City of La Mesa. The San Diego River is impaired for *Enterococcus*, fecal coliform, low dissolved oxygen, nitrogen, phosphorus, total dissolved solids (TDS), and toxicity. Chollas Creek is impaired for indicator bacteria, copper, diazinon, lead, zinc, phosphorus, total nitrogen as N, and trash. Lake Murray, which drains a very small portion of the City, is 303(d) listed for nitrogen and pH.

Check the website below for the most current 303(d) listings.
http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

Once a TMDL is established it may impose conditions on development either through an implementation plan and schedule for the listed water, or through special conditions required of the City of La Mesa affected by the numeric criteria of the TMDL. At this time, several 303(d) listings in San Diego County are at various stages of TMDL development with only four TMDLs having been adopted by the Regional Board. However, there are approximately 190 pending TMDLs in the county.

Applicable current and pending **TMDLs** in the La Mesa area include:

- Adopted TMDL for diazinon for Chollas Creek;

- Adopted TMDL for copper, lead, and zinc for Chollas Creek,
- Adopted TMDL for indicator bacteria for twenty beaches and creeks in the San Diego Region.
- Pending TMDL for sediment toxicity for the mouth of Chollas Creek,

The applicant should meet with municipal staff to determine if any project characteristics or watershed characteristics affect selection and design of BMPs. Except in rare circumstances, the use of the LID Design Guide (Chapter 4) and the Storm Water Pollutant Sources/Source Control Checklist (Appendix C) will ensure your project complies with all storm water requirements.

Selection of Permanent Source Control BMPs

Based on identification of potential pollutants of concern associated with various types of facilities, the City of La Mesa has developed a Storm Water Pollutant Sources/Source Control Checklist (Appendix C) of "maximum extent practicable" source controls associated with each facility type. This approach ensures appropriate BMPs are applied to potential sources of each pollutant of concern.

Selection of Storm Water Treatment Facilities

Table 2-3, below, categorizes pollutants of concern related to fate and pathways.

Table 2-4, below, includes a general comparison of how various types of treatment facilities perform for each group of pollutants.

TABLE 2-3. Grouping of Potential Pollutants of Concern by Fate During Storm Water Treatment

Pollutant	Coarse Sediment and Trash	Pollutants that tend to associate with fine particles during treatment	Pollutants that tend to be dissolved following treatment
Sediment	X	X	
Nutrients		X	X
Heavy Metals		X	
Organic Compounds		X	
Trash & Debris	X		
Oxygen Demanding		X	
Bacteria		X	
Oil & Grease		X	
Pesticides		X	

TABLE 2-4. Groups of Pollutants and Relative Effectiveness of Treatment Facilities

Pollutants of Concern	Bioretention Facilities (LID)	Settling Basins (Dry Ponds)	Wet Ponds and Constructed Wetlands	Infiltration Facilities or Practices (LID)	Media Filters	Higher-rate biofilters*	Higher-rate media filters*	Trash Racks & Hydro -dynamic Devices	Vegetated Swales
Coarse Sediment and Trash	High	High	High	High	High	High	High	High	High
Pollutants that tend to associate with fine particles during treatment	High	High	High	High	High	Medium	Medium	Low	Medium
Pollutants that tend to be dissolved following treatment	Medium	Low	Medium	High	Low	Low	Low	Low	Low

*See page 41 for a discussion of selection of treatment facilities in special situations.

Based on this analysis, the City of La Mesa has determined that the following types of facilities are appropriate for treatment of runoff potentially containing most pollutants of concern. These types of facilities can be used for storm water treatment and hydromodification flow control for all land uses in all watersheds, except where site-specific constraints make them infeasible.

- Infiltration facilities or practices, including dry wells, infiltration trenches, infiltration basins, and other facilities that infiltrate runoff to native soils (sized to detain and infiltrate a volume equivalent to the 85th percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

- Bioretention facilities and media filters that detain storm water and filter it slowly through soil or sand (sized with a surface area at least 0.04 times the effectively impervious tributary area for water quality treatment – a larger sizing factor is required to provide hydromodification control).

- Extended detention basins, wet ponds, and wetlands or other facilities using settling (sized to detain a volume equivalent to runoff from the tributary area generated by the 85th percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

The recommended design procedure in Chapter 4 integrates LID practices—optimizing the site design, using pervious surfaces, and dispersing of runoff to adjacent pervious areas—with the use of infiltration facilities, detention basins, and bioretention facilities to meet NPDES permit LID requirements, treatment requirements, and flow-control requirements in a cost-effective, unified design.

Oil/water separators ("water quality inlets"), storm drain inlet filters, and hydrodynamic separators, including vortex separators and continuous deflection separators ("CDS units"), are

less effective means of storm water treatment, although they may be used in series with more effective facilities.

Underground vaults typically lack the detention time required for settling of fine particles associated with storm water pollutants. They also require frequent maintenance and may retain stagnant water, potentially providing harborage for mosquitoes. Because vaults may be "out of sight, out of mind," experience shows that the required maintenance may not occur.

Lack of space, in itself, is not a suitable justification for using a less-effective treatment on a development site, because the uses of the site and the site design can be altered as needed to accommodate bioretention facilities or planter boxes. In most cases, these effective facilities can be fit into required landscaping setbacks, easements, or other unbuildable areas.

Where possible, drainage to inlets, and drainage away from overflows and underdrains, should be by gravity. Where site topography makes it infeasible to accommodate gravity-fed facilities in the project design, the design flow may be captured in a vault or sump and pumped via force main to an effective facility.

The following situations sometimes present special challenges:

- Portions of sites which are not being developed or redeveloped, but which must be retrofit to meet treatment requirements in accordance with Provision D.1.d.(1)(a) which states in part: "Where redevelopment results in an increase of, or replacement of, more than fifty percent of the impervious surface of a previously existing development, the numeric sizing criteria applies to the entire development."

- Sites smaller than one acre approved for development or redevelopment as part of a municipality's stated objective to preserve or enhance a pedestrian-oriented "smart-growth" type of urban design.

- Roadway widening projects.

In these special situations, the following types of facilities should each be evaluated in priority order (depending on the specific characteristics of the site and as determined by the municipal storm water coordinator) until a feasible design is found.

1. Bioretention areas or planter boxes fed by gravity.

2. Capture of the design flow in a vault or sump and pumping to bioretention areas or planter boxes.

3. A subsurface sand or media filter with a maximum design surface loading rate of 5 inches per hour and a minimum media depth of 18 inches. The sand surface must be made accessible for periodic inspection and maintenance (for example, via a removable grating).

4. A higher-rate surface biofilter, such as a tree-pit-style unit. The grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units.

5. A higher-rate vault-based filtration unit (for example, vaults with replaceable cartridge filters filled with inorganic media).

Proprietary Devices
Many currently available proprietary devices do not meet City of La Mesa requirements when used alone for storm water treatment. Consult with municipal staff before proposing these devices.

Many proprietary storm water treatment devices are currently marketed, and new brands will be introduced. Applicants and applicants' engineers and design professionals should review with municipal staff any proposals for using proprietary devices for storm water treatment before they commence work on preliminary site layout, drainage plans, grading plans, or landscape plans.

Hydrology for NPDES Compliance

► IMPERVIOUSNESS

Schueler (1995) proposed **imperviousness** as a "unifying theme" for the efforts of planners, engineers, landscape architects, scientists, and local officials concerned with urban watershed protection. Schueler argued (1) that imperviousness is a useful indicator linking urban land development to the degradation of aquatic ecosystems, and (2) imperviousness can be quantified, managed, and controlled during land development.

Imperviousness has long been understood as the key variable in urban hydrology. Peak runoff flow and total runoff volume from small urban catchments is usually calculated as a function of the ratio of impervious area to total area **(rational method)**. The ratio correlates to the runoff factor, usually designated "C". Increased flows resulting from urban development tend to increase the frequency of small-scale flooding downstream.

Imperviousness links urban land development to degradation of aquatic ecosystems in two ways.

First, the combination of paved surfaces and piped runoff efficiently collects urban pollutants and transports them, in suspended or dissolved form, to surface waters. These pollutants may originate as airborne dust, be washed from the atmosphere during rains, or may be generated by automobiles and outdoor work activities.

Second, increased peak flows and runoff durations typically cause erosion of stream banks and beds, transport of fine sediments, and disruption of aquatic habitat. Measures taken to control stream erosion, such as hardening banks with riprap or concrete, may permanently eliminate habitat. By reducing infiltration to groundwater, imperviousness may also reduce dry-weather stream flows.

Imperviousness has two major components: rooftops and transportation (including streets, highways, and parking areas). The transportation component is usually larger and is more likely to be **directly connected** to the storm drain system.

The effects of imperviousness can be mitigated by disconnecting impervious areas from the drainage system and by encouraging detention and retention of runoff near the point where it is generated. Detention and retention reduce peak flows and volumes and allow pollutants to settle out or adhere to soils before they can be transported downstream.

► LOW IMPACT DEVELOPMENT REQUIREMENTS

The NPDES permit requires LID be used on all projects to minimize directly connected impervious area and promote infiltration. For Priority Development Projects, the minimum standards are:

- Drain a portion of impervious areas into pervious areas, if any.
- Design and construct pervious areas, if any, to effectively receive and infiltrate runoff from impervious areas, taking into account soil conditions, slope, and other pertinent factors.
- Construct a portion of paved areas with low traffic and appropriate soil conditions with permeable surfaces.

The LID design procedure in Chapter 4 incorporates these requirements into an integrated design which meets sizing requirements for storm water treatment facilities and flow-control (hydromodification management) requirements.

► SIZING REQUIREMENTS FOR STORM WATER TREATMENT FACILITIES

The guidance in Chapter 4 was crafted to ensure LID facilities comply with the NPDES permit's hydraulic sizing requirements for storm water treatment facilities and flow-control facilities. The technical background follows.

Most runoff is produced by frequent storms of small or moderate intensity and duration. Treatment facilities are designed to treat smaller storms and the first flush of larger storms—approximately 80% of average annual runoff.

The NPDES permit identifies two types of treatment facilities—volume-based and flow-based.

Volume-based facilities must be designed to infiltrate, filter, or treat the volume of runoff produced from a 24-hour 85th percentile storm event as determined from the County of San Diego's 85th Percentile Precipitation Isopluvial Map. As shown on the map, rainfall depths vary from about 0.55" to 1.55".

For **flow-based** facilities, the NPDES permit specifies the rational method be used to determine flow. The rational method uses the equation

$Q = CiA$, where

Q = flow

C = weighted runoff factor between 0 and 1

i = rainfall intensity

A = area

The permit identifies two alternatives for calculating rainfall intensity:

1. the 85th percentile rainfall intensity times two, or
2. 0.2 inches per hour.

It is typically found that both methods yield similar results. The 0.2 inches per hour rainfall intensity should be used for sizing flow-based treatment facilities.

The 0.2 inches per hour criterion is the basis for a **consistent countywide sizing factor** for bioretention facilities when used for storm water treatment only (i.e., not for flow control). The factor is based on maintaining a minimum percolation rate of 5 inches per hour through the engineered soil mix. The sizing factor is the ratio of the design intensity of rainfall on tributary impervious surfaces (0.2 inches/hour) to the design percolation rate in the facility (5 inches/hour), or **0.04** (dimensionless).

► FLOW-CONTROL (HYDROMODIFICATION MANAGEMENT)

The NPDES permit specifies for applicable projects:

> … post-project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations.

Refer to Appendix H to review the final Hydromodification Management Plan (HMP) developed by the San Diego Copermittees and approved by the RWQCB in July 2010. A summary of the applicability criteria from the HMP document is provided in Chapter 1 of this BMP Manual.

Criteria for Infiltration Devices

The NPDES permit restricts the design and location of "infiltration devices" that, as designed, may bypass filtration through surface soils before reaching groundwater. These devices include:

- Infiltration basins.
- Infiltration trenches (includes French drains).
- Unlined retention basins (i.e., basins with no outlets).

- Unlined or open-bottomed vaults or boxes installed below grade (dry wells).

Infiltration devices may not be used in:

- Areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway);
- Automotive repair shops;
- Car washes;
- Fleet storage areas (bus, truck, etc.);
- Nurseries;
- Other areas with pollutant sources that could pose a threat to groundwater, as designated by the City of La Mesa.

The vertical distance from the base of any infiltration device to the seasonal high groundwater mark shall be at least 10 feet. Infiltration devices shall be located a minimum of 100 feet horizontally from any known water supply wells.

In addition, infiltration devices are not recommended where:

- The infiltration device would receive drainage from areas where chemicals are used or stored, where vehicles or equipment are washed, or where refuse or wastes are handled.
- Surface soils or groundwater are polluted.
- The facility could receive sediment-laden runoff from disturbed areas or unstable slopes.
- Increased soil moisture could affect the stability of slopes of foundations.
- Soils are insufficiently permeable to allow the device to drain within 72 hours.

► MOST LID FEATURES AND FACILITIES ARE NOT INFILTRATION DEVICES

Self-treating and self-retaining areas, pervious pavements, bioretention facilities, and planter boxes are not considered to be infiltration devices.

Bioretention facilities work by percolating runoff through 18 inches or more of engineered soil. This removes most pollutants before the runoff is allowed to seep into native soils below. Further pollutant removal typically occurs in the unsaturated (vadose) zone before moisture reaches groundwater.

Where there is concern about the effects of increased soil moisture on slopes or foundations, an impermeable barrier may be added so the facility is "flow through" and all treated runoff is underdrained away from the facility. See the design sheets for Bioretention Facilities and Flow-Through Planters in Appendix B.

Chapter 3

Preparing Your Project Submittal

Step-by-step assistance to demonstrate compliance.

Your Project Submittal will demonstrate your project complies with all applicable requirements in the storm water NPDES permit—to minimize imperviousness, retain or detain storm water, slow runoff rates, incorporate required source controls, treat storm water prior to discharge, control runoff rates and durations, and provide for operation and maintenance of treatment and flow-control facilities.

Submittal requirements vary from jurisdiction to jurisdiction. See below for the specific requirements of the City of La Mesa.

Typically, your Project Submittal must be coordinated with your application for discretionary approvals and must have sufficient detail to ensure the storm water design, site plan, and landscaping plan are congruent.

A complete and thorough Project Submittal will facilitate quicker review and fewer cycles of review. The City of La Mesa requires a submittal for every applicable project. The procedures outlined in this chapter are preferred by the City of La Mesa; any other approaches to meeting the requirements of this BMP Manual must be shown by the project proponent to be defensibly equivalent or better. Review and approval of water quality documents by City of La Mesa staff will be most efficient when proponents follow the methodology and direction outlined in this Chapter.

In order to meet SUSMP requirements, your submittal will be a Standard Post Construction BMP Plan (SPCBMPP) or a Post Construction Water Quality Technical Report (PCWQTR), depending on the outcome of the "Storm Water Requirements Applicability Checklist" in Appendix A. If you need to prepare a SPCBMPP, see Appendix G for appropriate guidance. If your project is a Priority Development Project, you will need to prepare a PCWQTR as directed in this chapter. **Municipal staff may use a review checklist** such as the following example to evaluate your Project Submittal:

EXAMPLE PROJECT SUBMITTAL CHECKLIST

SUBMITTAL COMPONENT REQUIREMENTS FOR PRIORITY DEVELOPMENT PROJECTS

- ❒ Completed "Storm Water Requirements Applicability Checklist" (Appendix A)
- ❒ Vicinity Map
- ❒ Site Map (See below for contents of Exhibit.)
- ❒ PCWQTR (See below for contents of Report.)
- ❒ Drainage Study (with Hydromodification, if applicable)

CONTENTS OF EXHIBIT (SITE MAP)

Show all of the following on drawings:

- ❒ Show entire property on one map. Use key map if multiple sheets are necessary. (Step 1 in the following step-by-step instructions)
- ❒ Existing natural hydrologic features (depressions, watercourses, floodplains, relatively undisturbed areas) and significant natural resources. (Step 1)
- ❒ Areas of potential soil erosion on the property and downstream of the project. (Step 1)
- ❒ Soil types and depth to groundwater. (Step 1)
- ❒ Existing and proposed site drainage network and connections to drainage off-site, including surface conveyances, private storm drain systems, and municipal storm drain inlets. (Step 3)
- ❒ Proposed design features and surface treatments used to minimize imperviousness. (Step 3)
- ❒ Entire site divided into separate drainage areas, with each area identified as self-treating, self-retaining (zero-discharge), draining to a self-retaining area, or draining to an IMP. (Step 3)
- ❒ For each drainage area, types of impervious area proposed (roof, plaza/sidewalk, and streets/parking) and area of each. (Step 3)
- ❒ Proposed locations and sizes of treatment or flow-control facilities. (Step 3)
- ❒ Potential pollutant source areas, including refuse areas, outdoor work and storage areas, etc. listed in Appendix C and corresponding required source controls. (Step 4)

CONTENTS OF REPORT

Include all of the following in your PCWQTR:

- ❒ Table of Contents
- ❒ Identification of the watershed(s), downstream waterbodies, waterbody impairments, and pollutants of concern (Step 1)
- ❒ Narrative analysis or description of site features and conditions that constrain, or provide opportunities for, storm water control. (Step 2)
- ❒ If the project is exempt from HMP requirements, a discussion must be included demonstrating which exemption is being claimed and why the project qualifies (Step 2).

- ❒ Demonstrate how hydromodification requirements are met, including calculations justifying determination of lower flow thresholds and the sizing of LID or extended detention facilities to provide for hydromodification flow control. Field investigation results and continuous simulation results should also be included where applicable (Step 3).
- ❒ Narrative description of site design characteristics that protect natural resources. (Step 3)
- ❒ Narrative description and/or tabulation of site design characteristics, building features, and pavement selections that reduce imperviousness of the site. (Step 3)
- ❒ Basis for selection of each proposed engineered LID IMP or alternative treatment facility. (Step 3)
- ❒ Tabulation of proposed pervious and impervious area, showing self-treating areas, self-retaining areas, and areas tributary to each treatment or flow-control facility. (Step 3)
- ❒ Preliminary designs, including calculations, for each infiltration, treatment, or flow-control facility. Elevations should show sufficient hydraulic head for each. (Step 3)
- ❒ A table of identified pollutant sources and for each source, the source control measure(s) used to reduce pollutants to the maximum extent practicable. See worksheet in Appendix C. (Step 4)
- ❒ General maintenance requirements for infiltration, treatment, and flow-control facilities (Step 5)
- ❒ Means by which facility maintenance will be financed and implemented in perpetuity. (Step 5)
- ❒ Statement accepting responsibility for operation & maintenance of facilities (Step 5).
- ❒ Identification of any conflicts with codes or requirements or other anticipated obstacles to implementing the proposed facilities in the submittal (Step 6).
- ❒ Construction Plan SUSMP Checklist (Step 6).
- ❒ Certification by a registered civil engineer (Step 6).

Step by Step

Suggested coordination with site and landscape design

Plan and design your storm water controls integrally with the site planning and landscaping for your project. It's best to start with general project requirements and preliminary site design concepts, then prepare the detailed site design, landscape design, and storm water control design simultaneously. **This will help ensure that your site plan, landscape plan, and Project Submittal are congruent.**

Begin with general project requirements and program.

The following step-by-step procedure should optimize your design by identifying the best opportunities for storm water controls **early in the design process.**

The recommended steps are:

Sketch conceptual site layout, building locations, and circulation.

1. Assemble needed information.
2. Identify site opportunities and constraints.
3. Follow the LID design guidance in Chapter 4 to analyze your project for LID and to develop and document your drainage design.
4. Specify source controls using the sources/source control checklist in Appendix C.
5. Plan for ongoing maintenance of treatment and flow-control facilities.
6. Complete the Project Submittal.

Revise site layout, building locations, and circulation to accommodate LID design. Develop land-scaping plan.

Submit Site Plan, Landscape Plan, and SUSMP Submittal

Municipal staff may recommend you prepare and submit a preliminary site design prior to formally applying for planning and zoning approvals. Your preliminary site design should incorporate a conceptual plan for site drainage, including self-treating and self-retaining areas and the location and approximate sizes of any treatment facilities. This additional up-front design effort will save time and avoid potential delays later in the review process.

Step 1: Assemble Needed Information

To select types and locations of treatment facilities, the designer needs to know the following site characteristics:

- **Existing natural hydrologic features** and natural resources, including any contiguous natural areas, wetlands, watercourses, seeps, or springs.

- **Existing site topography**, including contours of any slopes of 4% or steeper, general direction of surface drainage, local high or low points or depressions, any outcrops or other significant geologic features.
- **Zoning**, including requirements for **setbacks** and **open space**.
- **Public Works Standards** or other local codes governing minimum street widths, sidewalk construction, allowable pavement types, and drainage. These codes may conflict with Low Impact Development objectives to minimize imperviousness and to maintain or restore natural site hydrology.
- Soil types (including **hydrologic soil groups**) and depth to groundwater, which may determine whether infiltration is a feasible option for managing site runoff. Depending on site location and characteristics, and on the selection of treatment and flow-control facilities, site-specific information (e.g. from boring logs or geotechnical studies) may be required.
- **Existing site drainage.** For undeveloped sites, this should be obtained by inspecting the site and examining topographic maps and survey data. For previously developed sites, site drainage and connection to the municipal storm drain system can be located from site inspection, municipal storm drain maps, and plans for previous development.
- Existing **vegetative cover** and **impervious areas**, if any.
- **Watershed(s)** in which the project area is located.
- **Applicable hydromodification management requirements** for the project, or evidence for any exemptions from requirements based on the Final HMP. Note that field investigation is typically required for projects subject to hydromodification management requirements.
- **Pollutants of Concern** in receiving waters. For each of the proposed project discharge points, identify the receiving water(s), including hydrologic unit basin number(s), as identified in the most recent version of the Water Quality Control Plan for the San Diego Basin[1], prepared by the San Diego Regional Water Quality Control Board. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies[2]. List any and all pollutants for which the receiving waters are impaired. Use Table 2-1 of this BMP Manual to list anticipated pollutants based on land use.

---

[1] Go to: http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

[2] Under Section 303(d) of the 1972 Clean Water Act, states, territories, and authorized tribes are required to develop a list of water quality limited segments. These waters on the list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. Go to: http://www.swrcb.ca.gov/rwqcb9/water_issues/programs/303d_list/index.shtml. San Diego is in Region 9.

References and Resources

- *Site Planning for Urban Stream Protection* (Schueler 1995).
- *Start at the Source* (BASMAA 1999), p. 36

Step 2: Identify Constraints & Opportunities

Review the information collected in Step 1. Identify the principal constraints on site design and selection of treatment and flow-control facilities as well as opportunities to reduce imperviousness and incorporate facilities into the site and landscape design. For example, **constraints** might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, restricted right-of-way, or safety concerns. **Opportunities** might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention facilities), and differences in elevation (which can provide hydraulic head). Note storm water treatment facilities should not be located within protected riparian areas.

Prepare a brief **narrative** describing site opportunities and constraints. This narrative will help you as you proceed with LID design and explain your design decisions to others.

Step 3: Prepare and Document Your LID Design

Use the Low Impact Development Design Guide (Chapter 4) to analyze your project for LID, design and document drainage, and specify preliminary design details for integrated management practices. **Follow the detailed instructions in Chapter 4 to ensure your project complies with NPDES permit LID requirements (Provision D.1.d.(4)) and storm water treatment requirements in Provision D.1.d.(6)).** The LID Design Guide has been designed so that hydromodification management requirements are also met via this unified design procedure. Chapter 4 includes calculation procedures and formats for presenting your calculations.

As shown in the example checklist (page 48), your Project Submittal may need to include a drawing showing:

- The entire site divided into separate drainage management areas (DMAs), with each area identified as one of the following: self-treating, self-retaining, draining to a self-retaining area, or draining to an IMP. Each area should be clearly marked with a unique identifier.
- For each drainage area, the types of impervious area proposed, and the area of each.
- Proposed locations and sizes of treatment facilities. Each facility should be clearly marked with a unique identifier.

Compliance

The design criteria for DMAs in Chapter 4 ensure the required volume of flow from all developed portions of the project, including landscaped areas, is infiltrated, filtered, or treated (Provision D.1.d.(6)(a).

Your Project Submittal may need to include:

- Tabulation of proposed self-treating areas, self-retaining areas, areas draining to self-retaining areas, and areas draining to IMPs, and the corresponding IMPs identified on the Exhibit.
- Calculations, in the format shown in Chapter 4, showing the minimum square footage required and proposed square footage for each IMP.
- Preliminary designs for each IMP. The design sheets and accompanying drawings in Appendix B may be used or adapted for this purpose.

The following may also be required, or may be advisable to assist the reviewer to understand your design:

- A narrative overview of your design and how your design decisions optimize the site layout, use pervious surfaces, disperse runoff from impervious surfaces, and drain impervious surfaces to engineered IMPs. See Chapter 4.
- A narrative briefly describing each **drainage management area** (DMA), its drainage, and where drainage will be directed.
- A narrative briefly describing each IMP. Include any special characteristics or features distinct from the design sheets in Appendix B.

Step 4. Specify Source Control BMPs

Some everyday activities – such as trash recycling/disposal and washing vehicles and equipment – generate pollutants that tend to find their way into storm drains. These pollutants can be minimized by applying **source control BMPs**.

Source control BMPs include **permanent**, structural features that must be incorporated into your project plans and **operational** BMPs, such as regular sweeping and "housekeeping," that must be implemented by the site's occupant or user. The maximum extent practicable standard typically requires both types of BMPs. In general, operational BMPs cannot be substituted for a feasible and effective permanent BMP.

Use the following procedure to specify source control BMPs for your site:

► IDENTIFY POLLUTANT SOURCES

Review the first column in the **Pollutant Sources/Source Control Checklist** (Appendix C). Check off the potential sources of pollutants that apply to your site.

► NOTE LOCATIONS ON SUBMITTAL DRAWING

Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist (Appendix C). Show the location of each pollutant source and each permanent source control BMP in your submittal drawing.

► PREPARE A TABLE AND NARRATIVE

Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist (Appendix C). Now, create a table using the format in Table 3-1. In the left column, list each potential source on your site (from Appendix C, Column 1). In the middle column, list the corresponding **permanent, structural BMPs** (from Columns 2 and 3, Appendix C) used to prevent pollutants from entering runoff. Accompany this table with a narrative that explains any special features, materials, or methods of construction that will be used to implement these permanent, structural BMPs.

► IDENTIFY OPERATIONAL SOURCE CONTROL BMPS

TABLE 3-1. Format for Table of Permanent and Operational Source Control Measures.

Potential source of runoff pollutants	*Permanent source control BMPs*	*Operational source control BMPs*

To complete your table, refer once again to the Pollutant Sources/Source Control Checklist (Appendix C, Column 4). List in the right column of your table the operational BMPs that should be implemented as long as the anticipated activities continue at the site. The same BMPs may also be required as a condition of a use permit or other revocable discretionary approval for use of the site.

References and Resources

- Appendix C: Storm Water Pollutant Sources/Source Control Checklist
- RWQCB Order R9-2007-0001, Provision D.1.d.(5)
- *Start at the Source*, Section 6.7: Details, Outdoor Work Areas
- *California Stormwater Industrial/Commercial Best Management Practice Handbook*
- *Urban Runoff Quality Management* (WEF/ASCE, 1998) Chapter 4: Source Controls

Step 5: Storm Water Facility Maintenance

As required by NPDES Permit Provision D.1.c.(5), projects that include permanent BMPs shall be conditioned to require submittal of proof of a mechanism under which ongoing long-term maintenance of storm water treatment and flow-control facilities will be conducted, satisfactory to the City Engineer. The City of La Mesa requires the following items be included in your Project Submittal:

1. A means to finance and implement facility maintenance in perpetuity.
2. Acceptance of responsibility for maintenance from the time the facilities are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the treatment and flow-control facilities you have selected.

The City Engineer may also require that you prepare and submit a detailed plan that sets forth a maintenance schedule for each of the treatment and flow-control facilities built on your site.

Details of these requirements, and instructions for preparing a detailed operation and maintenance plan, are in Chapter 5.

References and Resources

- *Chapter 5*
- Operation, Maintenance, and Management of Stormwater Management Systems (Watershed Management Institute, 1997)

Step 6: Complete Your Project Submittal

City staff may provide specific instructions for the content and format of your Project Submittal. Your Project Submittal should document the information gathered and decisions made in Steps 1-5. A clear, complete, well-organized Project Submittal will make it possible to confirm your design meets the minimum requirements of the NPDES permit, the City of La Mesa Storm Water Ordinance Municipal Code Chapter 7.18, and this BMP manual.

► COORDINATION WITH SITE, ARCHITECTURAL, AND LANDSCAPING PLANS

Before completing your Project Submittal, ensure your storm water control design is fully coordinated with the site plan, grading plan, and landscaping plan being proposed for the site.

Information submitted and presentations to design review committees, planning commissions, and other decision-making bodies must incorporate relevant aspects of the storm water design. In particular, ensure:

- Curb elevations, elevations, grade breaks, and other features of the drainage design are consistent with the delineation of DMAs.

- The top edge (overflow) of each bioretention facility is level all around its perimeter—this is particularly important in parking lot medians.
- The resulting grading and drainage design is consistent with the design for parking and circulation.
- Bioretention facilities and other IMPs do not create conflicts with pedestrian access between parking and building entrances.
- Vaults and utility boxes can be accommodated outside bioretention facilities and will not be placed within bioretention facilities.
- The visual impact of storm water facilities, including planter boxes at building foundations and any terracing or retaining walls required for the storm water control design, is shown in renderings and other architectural drawings.
- Landscaping plans, including planting plans, show locations of bioretention facilities, and the plant requirements are consistent with the engineered soils and conditions in the bioretention facilities.
- Renderings and representation of street views incorporate any storm water facilities located in street-side buffers and setbacks

► CONSTRUCTION PLAN SUSMP CHECKLIST

When you submit construction plans for City review and approval, the reviewer will compare that submittal with your earlier Project Submittal. By creating a Construction Plan SUSMP Checklist for your project, you can facilitate the reviewer's comparison and speed review of your project.

TABLE 3-2. Format for Construction Plan SUSMP Checklist.

SUSMP Page #	*BMP Description*	*See Plan Sheet #s*

Here's how:

4. Create a table similar to Table 3-2. Number and list each measure or BMP you have specified in your Project Submittal in Columns 1 and 2 of the table. Leave Column 3 blank. Incorporate the table into your Project Submittal.

5. When you submit construction plans, **duplicate the table** (by photocopy or electronically). Now fill in Column 3, identifying the plan sheets where the BMPs are shown. List all plan sheets on which the BMP appears. Submit the updated table with your construction plans.

Note that the updated table—or Construction Plan SUSMP Checklist—is **only a reference tool** to facilitate comparison of the construction plans to your Project Submittal. City Engineering staff can advise you regarding the process required to propose changes to your approved Project Submittal.

► CERTIFICATION

Your Project Submittal shall be certified by a registered civil engineer.

The certification should state: "The selection, sizing, and preliminary design of storm water treatment and other control measures in this plan meet the requirements of Regional Water Quality Control Board Order R9-2007-0001 and subsequent amendments."

► EXAMPLE PROJECT SUBMITTAL OUTLINE AND CONTENTS

Check with City Engineering staff for requirements specific to your project.

I. Project Setting

- A. Project Name, Location, Description of project activities
- B. Vicinity Map
- C. Existing site features and conditions
- D. Opportunities and constraints for storm water control
- E. Watershed(s), receiving water bodies, and water body impairments
- F. Pollutants of concern based on land use and downstream water body impairments
- G. Impacts to hydrologic regime

II. Low Impact Development Design Strategies

- A. Optimization of site layout
  - (1) Limitation of development envelope
  - (2) Preservation of natural drainage features
  - (3) Setbacks from creeks, wetlands, and riparian habitats
  - (4) Minimization of imperviousness
  - (5) Using drainage as a design element
- B. Use of permeable pavements
- C. Dispersal of runoff to pervious areas
- D. Use of Integrated Management Practices

III. Hydromodification Analysis

- A. Hydromodification Applicability
- B. Flow Control Performance Criteria

IV. Documentation of Drainage Design

- A. Drainage Management Areas
  - (1) Tabulation

(2) Descriptions

B. Integrated Management Practices

(1) Tabulation and Sizing Calculations

(2) Descriptions

V. Source Control Measures

A. Description of site activities and potential sources of pollutants

B. Table showing sources, permanent source controls, and operational source controls

VI. Facility Maintenance Requirements

A. Ownership and responsibility for maintenance in perpetuity.

(1) Commitment to execute any necessary agreements.

(2) Statement accepting responsibility for operation and maintenance of facilities until that responsibility is formally transferred.

B. Summary of maintenance requirements for each storm water facility.

VII. Construction Plan SUSMP Checklist

VIII. Certifications

IX. Attachment: SUSMP Exhibit (Site Map) clearly showing:

A. Entire property

B. Nearby water bodies and municipal storm drain inlets

C. Private storm drain systems

D. Drainage Management Areas

E. Integrated Management Practices

F. Source control measures and potential sources of pollutants

G. Any other proposed BMPs

► SPECIFIC PROJECT CONSIDERATIONS

Your submittal will reflect the unique character of your own project and should meet the requirements identified in this BMP manual. City Engineering staff can assist you to determine how specific requirements apply to your project.

Chapter 4

Low Impact Development Design Guide

Guidance for designing and documenting your LID site drainage, storm water treatment facilities, and flow-control facilities

Follow the Low Impact Development (LID) design in this BMP manual to achieve compliance with the storm water treatment requirements as well as the LID requirements in the storm water NPDES permit. The City of La Mesa encourages the use of the design and documentation strategies outlined in this chapter. While other approaches may be used, they must be defensibly shown by the project proponent to meet or exceed the low impact development standards in this BMP Manual.

This will require careful documentation of:

- Pervious and impervious areas in the planned project.
- Drainage from each of these areas.
- Locations, sizes, and types of proposed treatment facilities.

Your Project Submittal must include calculations showing the site drainage and proposed LID treatment facilities meet the criteria in this BMP Manual.

This Low Impact Development Design Guide will help you:

- **Analyze your project** and identify and select options for implementing LID techniques to meet runoff treatment requirements—and flow-control requirements, if they apply.
- **Design and document drainage** for the whole site and document how that design meets this BMP Manual's storm water treatment criteria.
- **Specify preliminary design details** and integrate your LID drainage design with your paving and landscaping design.

Alternatives to LID design are discussed in the final section of this chapter.

Analyze Your Project for LID

Conceptually, there are four LID strategies for managing runoff from buildings and paving:

1. **Optimize the site layout** by preserving natural drainage features and designing buildings and circulation to minimize the amount of roofs and paving.

2. **Use pervious surfaces** such as turf, gravel, or pervious pavement—or use surfaces that retain rainfall, such as vegetated roofs. All drainage from these surfaces is considered to be "self-retained" (a detailed definition corresponding to this concept is on page 67). No further management of runoff is necessary. An emergency overflow should be provided for extreme events.

3. **Disperse runoff** from impervious surfaces on to adjacent pervious surfaces (e.g., direct a roof downspout to disperse runoff onto a lawn).

4. Drain impervious surfaces to engineered **Integrated Management Practices** (IMPs), such as bioretention facilities, planter boxes, cisterns, or dry wells. IMPs infiltrate runoff to groundwater and/or percolate runoff through engineered soil and allow it to drain away slowly. Depending on site conditions and local regulations, it may be possible to harvest and reuse rainwater in conjunction with IMPs.

A combination of two or more strategies may work best for your project. With forethought in design, the four strategies can provide multiple, complementary benefits to your development. Pervious surfaces reduce heat island effects and temperature extremes. Landscaping improves air quality, creates a better place to live or work, and upgrades value for rental or sale. Retaining natural hydrology helps preserve and enhance the natural character of the area. LID drainage design can also conserve water and reduce the need for drainage infrastructure.

Table 4-1 includes ideas for applying LID strategies to site conditions and types of development.

TABLE 4-1. Ideas for Runoff Management

Site Features and Design Objectives	Vegetated Roof	Self-retaining Areas	Pervious Pavement	Bioretention Facility	Flow-through Planter	Dry Well	Cistern with bioretention
Clayey native soils	✓			✓	✓		✓
Permeable native soils	✓		✓	✓	✓	✓	
Very steep slopes	✓				✓		
Shallow groundwater	✓				✓		
Avoid saturating subsurface soils	✓		✓		✓		
Connect to roof downspouts		✓		✓	✓	✓	✓
Parking lots/islands and medians			✓	✓		✓	
Sites with extensive landscaping		✓	✓	✓			
Densely developed sites with limited space/landscape	✓		✓		✓	✓	✓
Fit IMPs into landscape and setback areas				✓			✓
Make drainage a design feature		✓		✓			✓
Convey as well as treat storm water				✓			

► OPTIMIZE THE SITE LAYOUT

To minimize storm water-related impacts, apply the following design principles to the layout of newly developed and redeveloped sites.

Conserve natural areas, soils, and vegetation. Define the development envelope and protected areas, identifying areas that are most suitable for development and areas that should be left undisturbed. Use the following guideline to determine the least sensitive areas of the site, in order of increasing sensitivity:

1. Areas devoid of vegetation, including previously graded areas and agricultural fields.
2. Areas of non-native vegetation, disturbed habitats, and eucalyptus woodlands where receiving waters are not present.
3. Areas of chamise or mixed chaparral, and non-native grasslands.
4. Areas containing coastal scrub communities.
5. All other upland communities.
6. Occupied habitat of sensitive species and all wetlands.

Within each of the previous categories, hillside areas should be considered more sensitive than flatter areas.

Coordination
Chapter One includes a presentation of how review of your project's site design and landscape design is coordinated with review for compliance with storm water NPDES requirements.

Where possible, conform the site layout along natural landforms, avoid excessive grading and disturbance of vegetation and soils, and replicate the site's natural drainage patterns. Set back development from creeks, wetlands, and riparian habitats. Preserve significant trees, especially native trees and shrubs, and identify locations for planting additional native or drought tolerant trees and large shrubs. Concentrate development on portions of the site with less permeable soils, and preserve areas that can promote infiltration.

For all types of development, **limit overall coverage** of paving and roofs. Where allowed by La Mesa zoning and design standards—and provided public safety and a walkable environment are not compromised—this can be accomplished by designing compact, taller structures, narrower and shorter streets and sidewalks, smaller parking lots (fewer stalls, smaller stalls, and more efficient lanes), and indoor or underground parking. Examine site layout and circulation patterns and identify areas where landscaping can be substituted for pavement.

Detain and retain runoff throughout the site. On flatter sites, it typically works best to intersperse landscaped areas and IMPs among the buildings and paving. On hillside sites, drainage from upper areas may be collected in conventional catch basins and piped to landscaped areas and IMPs in lower areas.

Use drainage as a design element. Use depressed landscape areas, vegetated buffers, and bioretention areas as amenities and focal points within the site and landscape design. Bioretention areas can be almost any shape and should be located at low points. Bioretention areas shaped as swales can detain and treat low runoff flows and also convey higher flows.

► USE PERVIOUS SURFACES

Consider a vegetated roof. Although not yet widely used in California, vegetated or "green" roofs are growing in popularity. Potential benefits include longer roof life, lower heating and cooling costs, and better sound insulation, in addition to air quality and water quality benefits. For SUSMP compliance purposes, vegetated roofs are considered not to produce increased runoff or runoff pollutants (i.e., any runoff from a vegetated roof requires no further treatment or detention). For more information on vegetated roofs, see www.greenroofs.org.

Consider permeable pavements and surface treatments. Inventory paved areas on your preliminary site plan. Identify where permeable pavements, such as crushed aggregate, turf block, unit pavers, pervious concrete, or pervious asphalt could be substituted for impervious concrete or asphalt paving.

► DISPERSE RUNOFF TO ADJACENT PERVIOUS AREAS

Look for opportunities to direct runoff from impervious areas to adjacent landscaping. The design, including slopes and soils, must reflect a reasonable expectation that an inch of rainfall will soak into the soil and produce no runoff. For example, a lawn or garden depressed 3-4" below surrounding walkways or driveways provides a simple but functional landscape design element.

For sites subject to storm water treatment requirements only, a 2:1 maximum ratio of impervious to pervious area is acceptable. Be sure soils will drain adequately.

Under some circumstances, it may be allowable to direct runoff from impervious areas to pervious pavement (for example, from roof downspouts to a parking lot paved with crushed aggregate or turf block). The pore volume of pavement and base course must be sufficient to retain an inch of rainfall, including runoff from the tributary area. The slopes and soils must be compatible with infiltrating that volume without producing runoff.

► DIRECT RUNOFF TO INTEGRATED MANAGEMENT PRACTICES

Design criteria have been developed for the following IMPs:

- **Bioretention facilities**, which can be configured as swales, free-form areas, or planters to integrate with your landscape design.
- **Flow-through planters**, which can be used near building foundations and other locations where infiltration to native soils is not desired.
- **Dry wells** and other infiltration facilities, which can be used only where soils are permeable.
- **Cisterns or vaults**, in combination with a bioretention facility.

See the design sheets in Appendix B.

It may be possible to create a site-specific design that uses cisterns to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Such a design could expand the multiple benefits of LID to include water conservation. Keep in mind:

- Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8 below. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse.

- Storage of water for longer than minimum standards set forth by the City of La Mesa (72 hours) creates the potential for mosquito harborage. Cisterns and vaults must be designed to prevent entry by mosquitoes.

- Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

Some references and resources for water harvesting appear at the end of this chapter.

Finding the right location for treatment facilities on your site involves a careful and creative integration of several factors:

- To make the most efficient use of the site and to maximize aesthetic value, **integrate IMPs with site landscaping**. Zoning codes may require landscape setbacks or buffers, or may specify that a minimum portion of the site be landscaped. It may be possible to locate some or all of your site's treatment and flow-control facilities within this same area, or within utility easements or other non-buildable areas.

- Planter boxes and bioretention areas must be **level or nearly level** all the way around. Bioretention areas configured as swales may be gently sloped in the linear direction, but opposite sides must be at the same elevation.

- For effective, low-maintenance operation, **locate facilities so drainage into and out of the device is by gravity flow.** Pumped systems are feasible, but are expensive, require more maintenance, are prone to untimely failure, and can cause mosquito control problems.

- If the property is being subdivided now or in the future, the facility should be in a **common, accessible area.** In particular, avoid locating facilities on private residential lots. Even if the facility will serve only one site owner or operator, make sure the facility is located for ready access by inspectors from the City of La Mesa and local vector control agency.

- The facility must be accessible to equipment needed for its maintenance. **Access requirements for maintenance** will vary with the type of facility selected. Planter

boxes and bioretention areas will typically need access for the same types of equipment used for landscape maintenance.

To complete your analysis, include in your Project Submittal a brief **narrative** documenting the site layout and site design decisions you made. This will provide background and context for how your design meets the quantitative LID design criteria.

Develop and Document Your Drainage Design

The **design documentation procedure** begins with careful delineation of pervious areas and impervious areas (including roofs) throughout the site. The procedure accounts for how runoff from each delineated area is managed. For areas draining to IMPs, the procedure ensures each IMP is appropriately sized.

The procedure results in a space-efficient, cost-efficient LID design for meeting SUSMP requirements on most residential and commercial/industrial developments. The procedure arranges documentation of drainage design and IMP sizing in a consistent format for presentation and review.

This procedure is intended to facilitate, not substitute for, creative interplay among site design, landscape design, and drainage design. **Several iterations may be needed** to optimize your drainage design as well as aesthetics, circulation, and use of available area for your site.

You should be able to complete the needed calculations using only the project's site development plan.

► STEP 1: DELINEATE DRAINAGE MANAGEMENT AREAS

This is the key first step. You must divide the **entire project area** into individual, discrete Drainage Management Areas (DMAs). Typically, lines delineating DMAs follow grade breaks and roof ridge lines. The Exhibit, tables, text, and calculations in your Project Submittal will illustrate, describe, and account for runoff from each of these areas.

Use separate DMAs for each surface type (e.g., landscaping, pervious paving, or roofs). Each DMA must be assigned a single hydrologic soil group. Assign each DMA an identification number and determine its size in square feet.

► STEP 2: CLASSIFY DMAS AND DETERMINE RUNOFF FACTORS

Next, determine how drainage from each DMA will be handled. Each DMA will be one of the following four types:

1. Self-treating areas.
2. Self-retaining areas (also called "zero-discharge" areas).
3. Areas that drain to self-retaining areas.
4. Areas that drain to IMPs.

Self-treating areas are landscaped or turf areas that do not drain to IMPs, but rather drain directly off site or to the storm drain system. Examples include upslope undeveloped areas which are ditched and drained around a development and grassed slopes which drain off-site to a street or storm drain. In general, self-treating areas include no impervious areas, unless the impervious area is very small (5 percent or less) in relationship to the receiving pervious area and slopes are gentle enough to ensure runoff will be absorbed into the vegetation and soil. Criteria for self-treating areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

Rationale

Pollutants in rainfall and windblown dust will tend to become entrained in the vegetation and soils of landscaped areas, so no additional treatment is needed. It is assumed the self-treating landscaped areas will produce runoff less than or equal to the pre-project site condition.

FIGURE 4-1. Self-treating areas are entirely pervious and drain directly off-site or to the storm drain system.

Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that a one-inch rainfall event would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Specify slopes, if any, toward the center of the pervious area. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

Criteria for self-retaining areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

FIGURE 4-2. Self-retaining areas. Berm or depress the grade to retain at least an inch of rainfall and set inlets of any area drains at least 3 inches above low point to allow ponding.

Areas draining to self-retaining areas. Runoff from impervious or partially pervious areas can be managed by routing it to self-retaining pervious areas. For example, roof downspouts can be directed to lawns, and driveways can be sloped toward landscaped areas. The maximum ratio is 2 parts impervious area for every 1 part pervious area.

FIGURE 4-3. Relationship of impervious to pervious area for self-retaining areas.
Ratio: ***pervious ≥ ½ impervious***

The drainage from the impervious area must be directed to and dispersed within the pervious area, and the entire area must be designed to retain an inch of rainfall without flowing off-site. For example, if the maximum ratio of 2 parts impervious area into 1 part pervious area is used, then the pervious area must absorb 3 inches of water over its surface before over-flowing to an off-site drain.

A partially pervious area may be drained to a self-retaining area. For example, a driveway composed of unit pavers may drain to an adjacent lawn. In this case, the maximum ratios are:

(Runoff factor) x (tributary area) ≤ 2 x (self-retaining area) *Equation 4-1*

Use the runoff factors in Table 4-2.

Prolonged ponding is a potential problem at higher impervious/pervious ratios. In your design, ensure that the pervious area soils can handle the additional run-on and are sufficiently well-drained.

Under some circumstances, pervious pavement (e.g., crushed stone, pervious asphalt or pervious concrete) can be self-retaining. Adjacent roofs or impervious pavement may drain on to the pervious pavement in the same maximum ratios as described above.

To design a pervious pavement to be a self-treating area, ensure:

- The gravel base course is a minimum of four or more inches deep.
- The base course is not to be underdrained.
- A qualified engineer has been consulted regarding infiltration rates, pavement stability, and suitability for the intended traffic.

Runoff from self-treating and self-retaining areas does not require any further treatment or flow control.

TABLE 4-2. Example Runoff Factors for Surfaces Draining to IMPs.

Surface	Factor
Roofs	1.0
Concrete	1.0
Pervious Concrete	0.1
Porous Asphalt	0.1
Grouted Unit Pavers	1.0
Solid Unit Pavers on granular base, min. 3/16 inch joint space	0.2
Crushed Aggregate	0.1
Turfblock	0.1
Amended, mulched soil	0.1
Landscape	0.1

Areas draining to IMPs are multiplied by a sizing factor to calculate the required size of the IMP. On most densely developed sites—such as commercial and mixed-use developments and small-lot residential subdivisions—most DMAs will drain to IMPs.

More than one drainage area can drain to the same IMP. However, because the minimum IMP sizes are determined by ratio to drainage area size, a drainage area may not drain to more than one IMP. See Figures 4-4 and 4-5.

FIGURE 4-4. More than one Drainage Management Area can drain to a single IMP.

FIGURE 4-5. One Drainage Management Area cannot drain to more than one IMP. Use a grade break to divide the DMA.

Where possible, design site drainage so **only impervious roofs and pavement** drain to IMPs. This yields a simpler, more efficient design and also helps protect IMPs from becoming clogged by sediment.

If it is necessary to include turf, landscaping, or pervious pavements within the area draining to an IMP, list each surface as a separate DMA. A runoff factor (similar to a "C" factor used in the rational method) is applied to account for the reduction in the quantity of runoff. For example, when a turf or landscaped drainage management area drains to an IMP, the resulting increment in IMP size is:

$$\Delta \text{ (Area)} = \text{(pervious area)} \times \text{(runoff factor)} \times \text{(sizing factor)}.$$

Use the runoff factors in Table 4-2.

► STEP 3: TABULATE DRAINAGE MANAGEMENT AREAS

- Tabulate self-treating areas in the format shown in Table 4-3.
- Tabulate self-retaining areas in the format shown in Table 4-4.
- Tabulate areas draining to self-retaining areas in the format shown in Table 4-5. Check to be sure the total product of (square feet of tributary area × runoff factor) for all DMAs draining to a receiving self-retaining area is no greater than a 2:1 ratio to the square footage of the receiving self-retaining area itself.

- Compile a list of DMAs draining to IMPs. Proceed to Step 4 to check the sizing of the IMPs.

TABLE 4-3. Format for Tabulating Self-Treating Areas

DMA Name	Area (square feet)

TABLE 4-4. Format for Tabulating Self-Retaining Areas

DMA Name	Area (square feet)

TABLE 4-5. Format for Tabulating Areas Draining to Self-Retaining Areas

DMA Name	Area (square feet)	Post-project surface type	Runoff factor	Receiving self-retaining DMA	Receiving self-retaining DMA Area (square feet)

► STEP 4: SELECT AND LAY OUT IMPS ON SITE PLAN

Select from the list of IMPs in Table 4-6. Illustrations, designs, and design criteria for the IMPs are in the "IMP Design Details and Criteria" at the end of this chapter.

Once you have laid out the IMPs, calculate the square footage you have set aside on your site plan for each IMP.

► STEP 5: REVIEW SIZING FOR EACH IMP

For each of the IMPs, use the appropriate "water quality only" sizing from Table 4-6. Sizing factors for integrated facilities that provide both water quality treatment and hydromodification flow control may be obtained using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H).

TABLE 4-6. "Water Quality Only" Sizing Factors

Bioretention Facilities	Sizing Factor for Area = 0.04
Flow-through Planters	Sizing Factor for Area = 0.04
Dry Well or Infiltration Basin	See Step 6 to Calculate Min. Volume
Cistern/Vault with Bioretention	See Step 6 to Calculate Min. Volume of Cistern or Vault; then use 0.04 to calculate minimum size of bioretention area

Q_2 = 2-year pre-project flow rate based upon partial duration analysis of long-term hourly rainfall records

Q_{10} = 10-year pre-project flow rate based upon partial duration analysis of long-term hourly rainfall records

A = Surface area sizing factor

V_1 = Surface volume sizing factor

V_2 = Subsurface volume sizing factor

Note: The Oceanside Rain Gauge was selected for use in La Mesa based on rain basin analysis performed by the consultant team for the San Diego regional Storm Water Co-permitees. The analysis took into account average annual rainfall, proximity, elevation, and data availability.

► STEP 6: CALCULATE MINIMUM AREA AND VOLUME OF EACH IMP

The minimum area of bioretention facilities and flow-through planters is found by summing up the contributions of each tributary DMA and multiplying by the adjusted sizing factor for the IMP. Note that if the IMP is designed to provide hydromodification flow control, then sizing factors from the using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used in lieu of the "water quality only" sizing factors presented in Table 4-6.

Equation 4-7

$$Min.\,IMP\,Area = \sum \begin{pmatrix} DMA & DMA \\ Square & \times Runoff \\ Footage & Factor \end{pmatrix} \times \begin{pmatrix} IMP \\ Sizing \\ Factor \end{pmatrix}$$

Use the format of Table 4-12 to present the calculations of the required minimum area and volumes for **bioretention areas** and **planter boxes**:

TABLE 4-12. Format for Presenting Calculations of Minimum IMP Areas for Bioretention Areas and Planter Boxes.

DMA Name	DMA Area (square feet)	Post-project surface type	DMA Runoff factor	DMA Area × runoff factor	Soil Type:	IMP Name			
					IMP Sizing factor (WQ only)		Minimum Area	Proposed Area	
			Total		*0.04*				*IMP Area*

To size **dry wells**, **infiltration basins**, or **infiltration trenches for the "water quality only" treatment option**, use the following procedure:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the minimum unit volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the facility. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the minimum unit volume.

Equation 4-8

$$Volume = [Tributary\ Area] \times [weighted\ runoff\ \ factor] \times [unit\ volume]$$

4. Select a facility depth.
5. Determine the required facility area. Dry wells may be designed as an open vault or with rock fill. If rock fill is used, assume a porosity of 40%.
6. Ensure the facility can infiltrate the entire volume within 72 hours, or the minimum drawdown time determined by the City.

To size a **cistern or vault in series with a bioretention facility (criteria below for "water quality**:

1. Use Equation 4-12 to calculate the required cistern or vault volume.
2. Design a discharge orifice for a drawdown time of 24 hours.
3. Determine the maximum discharge from the orifice.
4. The minimum area of the bioretention facility must treat this flow based on a percolation rate of 5" per hour through the engineered soil.

If a facility is designed to provide both water quality treatment and hydromodification flow control, using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used to determine the appropriate sizing factors for the IMP design.

► STEP 7: DETERMINE IF AVAILABLE SPACE FOR IMP IS ADEQUATE

Sizing and configuring IMPs may be an iterative process. After computing the minimum IMP area using Steps 1 – 6, review the site plan to determine if the reserved IMP area is sufficient. If so, the planned IMPs will meet the SUSMP sizing requirements. If not, revise the plan accordingly. Revisions may include:

- Reducing the overall imperviousness of the project site.
- Changing the grading and drainage to redirect some runoff toward other IMPs which may have excess capacity.
- Making tributary landscaped DMAs self-treating or self-retaining.
- Expanding IMP surface area.

► STEP 8: COMPLETE YOUR SUMMARY REPORT

Present your IMP sizing calculations in tabular form. Adapt the following format as appropriate to your project. Coordinate your presentation of DMAs and calculation of minimum IMP sizes with the Project Submittal drawing (labeled to show delineation of DMAs and locations of IMPs). It is also helpful to incorporate a brief description of each DMA and each IMP.

Sum the total area of all DMAs and IMPs listed and show it is equal to the total project area. This step may include adjusting the square footage of some DMAs to account for area used for IMPs.

Format:

Project Name:

Project Location:

APN or Subdivision Number:

Total Project Area (square feet):

Mean Annual Precipitation at Project Site:

I. Self-treating areas:

DMA Name	Area (square feet)

II. Self-retaining areas:

DMA Name	Area (square feet)

III. Areas draining to self-retaining areas:

DMA Name	Post-project surface type	Runoff factor	Area (square feet)	Receiving self-retaining DMA	Receiving self-retaining DMA Area (square feet)

IV. Areas draining to IMPs (repeat for each IMP):

DMA Name	DMA Area (square feet)	Post-project surface type	DMA Runoff factor	DMA Area × runoff factor	Soil Type:	IMP Name			
					IMP Sizing factor		Minimum Area or Volume	Proposed Area or Volume	
				Total					*IMP Area*

Specify Preliminary Design Details

In your Project Submittal, describe your IMPs in sufficient detail to demonstrate the area, volume, and other criteria of each can be met within the constraints of the site.

Ensure these details are consistent with preliminary site plans, landscaping plans, and architectural plans submitted with your application for planning and zoning approvals.

Appendix B includes design sheets for:

- Self-treating and self-retaining areas
- Pervious pavements
- Bioretention facilities
- Flow-through planter
- Dry wells and infiltration basins
- Cistern or vault with bioretention facility

These design sheets include recommended configurations and details, and example applications, for these IMPs. **The information in these design sheets must be adapted and applied to the**

conditions specific to the development project such as unstable slopes or the lack of available head. Designated municipal staff have final review and approval authority over the project design.

Keep in mind that proper and functional design of the IMP is the responsibility of the applicant. Effective operation of the IMP throughout the project's lifetime will be the responsibility of the property owner.

Alternatives to Integrated LID Design

If you believe design of features and facilities as described above is infeasible for your development site, consult with Engineering staff before preparing an alternative design for storm water treatment, flow control, and LID compliance.

For all alternative designs, the applicant must prepare a complete Project Submittal, including a drawing showing the entire site divided into discrete Drainage Management Areas, text and tables showing how drainage is routed from each DMA to a treatment facility, and calculations demonstrating that the design achieves the applicable design criteria for each storm water treatment facility. Alternative treatment facilities are limited to the circumstances and selection criteria identified beginning on page 39. The Project Submittal must also show how the project meets the minimum LID criteria (page 43) and ensures runoff rates, durations, and velocities are controlled to maintain or reduce downstream erosion conditions and protect stream habitat (NPDES Permit Provision D.1.d.(10)).

► DESIGN OF ALTERNATIVE TREATMENT FACILITIES

Here are criteria and design considerations for some alternative treatment facilities, also known as treatment control BMPs:

Sand Filters. To ensure effectiveness is not compromised by compacting or clogging of the filter surface, sand filters must be maintained frequently.

The following criteria apply to sand filters:

- Calculate the design flow using the rational method with an intensity of 0.2"/hour and the "C" factors for "treatment only" from Table 4-2.
- To determine the required filter surface area, divide the design flow by an allowable design surface loading rate of 5"/hour.
- The minimum depth of filter media is 18". The media should be washed sand, with gradation similar to that specified for fine aggregate in ASTM C-33.
- The entire filter area must be accessible for easy maintenance without the need to enter a confined space.

A typical filter design includes a gravel drain layer and a perforated pipe underdrain. Filter fabric may be used to prevent the filter media from entering the gravel layer.

The design should not include any permanent pool or other standing water. Instead of including a pretreatment basin, consider the following features in the area tributary to the filter to reduce the potential for filter clogging:

- Limit the size of the Drainage Management Area.
- Include only impervious areas in the DMA.
- Stabilize slopes and eliminate sources of sediment in the DMA.
- Provide screens for trash and leaves at storm drain inlets (if allowed by the City of La Mesa).

For additional design considerations and details, see *Design of Stormwater Filtering Systems* by Richard A. Claytor and Thomas R. Schueler, The Center for Watershed Protection, 1996, and *California Stormwater BMP Handbooks* Fact Sheet TC-40, Media Filter.

Sand filters do not provide adequate hydromodification flow controls.

Extended ("Dry") Detention Basins. The required detention volume for water quality treatment is based on the 85th percentile 24-hour storm depth. The steps to calculate the required detention volume are:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the unit basin volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the basin. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the unit basin volume.

For maximum effectiveness the basin should not be sized substantially larger than this volume. If the basin is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the basin meets peak flow and flow duration criteria.

For design considerations and details, see the *California Stormwater Best Management Practice Handbooks*, Fact Sheet TC-22, "Extended Detention Basins." The basin outlet should be designed for a 24-hour drawdown time.

As noted in Fact Sheet TC-22, "dry" detention basins may not be practicable for drainage areas less than 5 acres. The potential for mosquito harborage is a concern. In the design, do not create any areas that will hold standing water for 72 hours or more, the maximum drawdown time as determined by the City of La Mesa.

"Wet" Detention Ponds and Constructed Wetlands. The required water quality detention volume is determined as with a "dry" detention basin. If the pond is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the pond meets peak flow and flow duration criteria. Before proceeding with design, contact the local mosquito control agency to coordinate the design and plan ongoing inspection and maintenance of the facility for mosquito control. For design considerations and details, see the *California Stormwater Best Management Practices Handbooks*, Fact Sheet TC-20, "Wet Ponds," and Fact Sheet TC-21, "Constructed Wetlands."

Vegetated Swales. Design recommendations for conventional vegetated swales are in the *California Stormwater Best Management Practices Handbooks*. The conventional swale design uses available on-site soils and does not include an underdrain system. Where soils are clayey, there is little infiltration. Treatment occurs as runoff flows through grass or other vegetation before exiting at the downstream end. Recommended detention times are on the order of 10 minutes. It should be noted that such designs likely would not provide the required hydromodification flow control.

Conventional vegetated swales may be used to meet NPDES permit treatment requirements and LID requirements (see page 39). The following should be incorporated in the design:

- Determine the weighted runoff factor ("C" factor) for the area tributary to the swale. The factors in Table 4-2 may be used.
- Calculate the design flow by multiplying the weighted runoff factor times the tributary area times either (1) 0.2 inches of rainfall per hour, or (2) twice the 85th percentile hourly rainfall intensity.
- When sizing the swale, use a value of 0.25 for Manning's "n".
- Ensure that all flow enters the swale near its highest point and that no flow short-circuits treatment by entering the swale along its length.
- The swale should be a minimum 100 feet in length.
- Longitudinal slopes should not exceed 2.5%; on flatter slopes, incorporate measures to avoid prolonged surface ponding.

Consider using linear-shaped bioretention areas in place of conventional vegetated swales because:

- Conventional swale design has resulted in standing water and associated nuisances.
- Conventional swales often don't obtain even the design residence time because of the length required and because proper design requires runoff enter the swale at the upstream end rather than at various locations along its length, and
- Bioretention areas provide a more flexible drainage design, more effective practicable treatment, and more effective flow control within the same footprint.

In the western part of San Diego County (west of the Pacific Ocean drainage divide), rock swales would not generally provide adequate water quality treatment. In the eastern portion of the County, rock swales could potentially be used as part of the water quality treatment design given the prevalence of high-infiltration sandy soils and the harsh climatic conditions which prevent vegetation establishment. Implementation of rock swales would require approval from the City. The design of vegetated strips, potentially allowed by the City on a case-by-case basis, should follow Caltrans design guidance.

► TREATMENT FACILITIES FOR SPECIAL CIRCUMSTANCES

Higher-rate surface filters and vault-based proprietary filters can only be used in the circumstances described beginning on page 39 and when sand filters, extended "dry" detention basins, and "wet" detention ponds or constructed wetlands have been found infeasible.

For surface filters, the grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units. Proprietary facilities should be installed consistent with the manufacturer's instructions. It should be noted that such designs likely would not provide the required hydromodification flow control.

Chapter 5

Operation & Maintenance of Storm Water Facilities

How to prepare a customized Storm Water Maintenance Plan for the treatment BMPs on your site.

The storm water NPDES Permit requires the City of La Mesa to verify all treatment and flow-control facilities are adequately maintained. Note that treatment facilities include both LID IMPs and treatment control BMPs. Facilities you install as part of your project will be verified for effectiveness and proper performance. The City of La Mesa may also verify the ongoing function of storm water management features that are not treatment or flow control facilities, such as permeable pavements and limitations on impervious area.

Operation and maintenance of storm water facilities is a six-stage process:

1. Determine **who will own** the facility and be responsible for the maintenance of treatment facilities. Identify the means by which ongoing maintenance will be assured (for example, a maintenance agreement that runs with the land).

2. Identify typical maintenance requirements, and allow for these requirements in your project planning and preliminary design.

3. Prepare a **maintenance plan** for the site incorporating detailed requirements for **each treatment and flow-control facility**.

4. **Maintain** the facilities from the time they are constructed until ownership and maintenance responsibility is formally transferred.

5. **Formally transfer** operation and maintenance **responsibility** to the site owner or occupant. A warranty, secured by a bond, or other financial instrument, may be required to secure against lack of performance due to flaws in design or construction.

6. Maintain the facilities in perpetuity and comply with self-inspection, reporting, and verification requirements.

See the schedule for these stages in Table 5-1.

Stage 1: Ownership and Responsibility

You must specify a means to **ensure maintenance** of treatment and flow-control facilities **in perpetuity.**

Depending on the intended use of your site, this will require one or more of the following:

- Project proponent agreement to maintain storm water BMPs: The City may enter into a contract with the project proponent obliging the project proponent to maintain, repair, and replace the storm water BMP as necessary into perpetuity. Security may be required.

- Assessment districts: The City may approve an Assessment District or other funding mechanism proposed by the project proponent to provide funds for storm water BMP maintenance, repair, and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

- Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City may assure storm water BMP maintenance, repair, and replacement through conditions in the lease.

- Public entity maintenance: The City may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the permanent treatment BMP. Unless acceptable to the City, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City may seek protection from liability by appropriate releases and indemnities. The City shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The City must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

The City may accept alternative maintenance mechanisms if such mechanisms are as protective as those listed above.

Ownership and maintenance responsibility for treatment and flow-control facilities should be discussed at the **beginning of project planning**, typically at the pre-application meeting for

planning and zoning review. Experience has shown provisions to finance and implement maintenance of treatment and flow-control facilities can be a major stumbling block to project approval, particularly for **small residential subdivisions**. (See "New Subdivisions" in Chapter 1.)

► PRIVATE OWNERSHIP AND MAINTENANCE

The City of La Mesa requires—as a condition of project approval—that a maintenance agreement be executed.

TABLE 5-1. Schedule for Planning Operation and Maintenance of Storm Water Treatment BMPs

Stage	*Description*	*Schedule*
1	Determine facility ownership and maintenance responsibility	Discuss with planning staff at pre-application meeting
2	Identify typical maintenance requirements	In initial submittal, coordinate with planning & zoning application
3	Develop detailed operation and maintenance plan	Provided with Project Submittal, and updated as necessary if any information changes prior to Stage 5.
4	Interim operation and maintenance of facilities	During and following construction including warranty period
5	Formal transfer of operation & maintenance responsibility	On sale and transfer of property or permanent occupancy
6	Ongoing maintenance and compliance with inspection & reporting requirements	In perpetuity

These agreements could provide that the City of La Mesa may collect a management and/or inspection fee established by a standard fee schedule, as applicable. In addition, the agreement may provide that, if the property owner fails to maintain the storm water facility, the City may enter the property, restore the storm water facility to good working order, and obtain reimbursement, including administrative costs, from the property owner.

► TRANSFER TO PUBLIC OWNERSHIP

The City of La Mesa may sometimes choose to have a treatment and flow-control facility deeded to the public, in fee or as an easement, and maintain the facility as part of the municipal storm drain system. The City may recoup the costs of maintenance through a special tax, assessment district, or similar mechanism.

Locating an IMP in a public right-of-way or easement creates an additional design constraint—along with hydraulic grade, aesthetics, landscaping, and circulation. However, because sites typically drain to the street, it may be possible to locate a bioretention swale parallel with the edge of the parcel. The facility may complement, or substitute for, an underground storm drain system.

Even if the facility is to be transferred to the City of La Mesa after construction is complete, it is still the responsibility of the builder to identify general operation and maintenance requirements, prepare a detailed operation and maintenance plan, and to maintain the facility until that responsibility is formally transferred.

Stage 2: General Maintenance Requirements

Include in your Project Submittal a general description of anticipated facility maintenance requirements. This will help ensure that:

- Ongoing costs of maintenance have been considered in your facility selection and design.
- Site and landscaping plans provide for access for inspections and by maintenance equipment.
- Landscaping plans incorporate irrigation requirements for facility plantings.
- Initial maintenance and replacement of facility plantings is incorporated into landscaping contracts and guarantees.

Fact sheets available on the Project Clean Water web page describe general maintenance requirements for the types of storm water facilities featured in the LID Design Guide (Chapter 4). You can use this information to specify general maintenance requirements in your Project Submittal.

Maintenance fact sheets for conventional storm water facilities are available in the California Stormwater BMP Handbooks.

Stage 3: Detailed Maintenance Plan

Prepare a detailed maintenance plan and submit it as required by the City of La Mesa. A detailed maintenance plan must be included with the initial Project Submittal; however the maintenance plan may later be updated to incorporate solutions to any problems or changes that occurred during project construction.

Your detailed maintenance plan should be kept on-site for use by maintenance personnel and during site inspections. It is also recommended that a copy of your initial Project Submittal be kept onsite as a reference.

► YOUR DETAILED MAINTENANCE PLAN: STEP BY STEP

The following step-by-step guidance will help you prepare your detailed maintenance plan.

Preparation of the plan will require familiarity with your storm water facilities as they have been or will be constructed and a fair amount of "thinking through" plans for their operation and maintenance.

► STEP 1: DESIGNATE RESPONSIBLE INDIVIDUALS

To begin creating your detailed maintenance plan, designate and identify:

- The individual who will have direct responsibility for the maintenance of storm water controls. This individual should be the designated contact with City inspectors and should sign self-inspection reports and any correspondence with the City of La Mesa regarding verification inspections.
- Employees or contractors who will report to the designated contact and are responsible for carrying out BMP operation and maintenance.
- The corporate officer authorized to negotiate and execute any contracts that might be necessary for future changes to operation and maintenance or to implement remedial measures if problems occur.
- Your designated respondent to problems, such as clogged drains or broken irrigation mains, that would require immediate response should they occur during off-hours.

Updated contact information must be provided to the City of La Mesa immediately whenever a property is sold and whenever designated individuals or contractors change.

Draw or sketch an **organization chart** to show the relationships of authority and responsibility between the individuals responsible for maintenance. This need not be elaborate, particularly for smaller organizations.

Describe how **funding for BMP operation and maintenance** will be assured, including sources of funds, budget category for expenditures, process for establishing the annual maintenance budget, and process for obtaining authority should unexpected expenditures for major corrective maintenance be required.

Describe how your organization will accommodate initial **training** of staff or contractors regarding the purpose, mode of operation, and maintenance requirements for the storm water facilities on your site. Also, describe how your organization will ensure ongoing training as needed and in response to staff changes.

► STEP 2: SUMMARIZE DRAINAGE AND BMPS

Incorporate the following information from your Project Submittal into your maintenance plan:

- Figures delineating and designating pervious and impervious areas.
- Figures showing locations of storm water facilities on the site.
- Tables of pervious and impervious areas served by each facility.

Review the Project Submittal narrative, if any, that describes each facility and its tributary drainage area and update the text to incorporate any changes that may have occurred during planning and zoning review, building permit review, or construction. Incorporate the updated text into your maintenance plan.

► STEP 3: DOCUMENT FACILITIES "AS BUILT"

Include the following information from final construction drawings:

- Plans, elevations, and details of all facilities. Annotate if necessary with designations used in the initial Project Submittal.
- Design information or calculations submitted in the detailed design phase (i.e., not included in the initial Project Submittal.)
- Specifications of construction for facilities, including sand or soil, compaction, pipe materials and bedding.

In the maintenance plan, note field changes to design drawings, including changes to any of the following:

- Location and layouts of inflow piping, flow splitter boxes, and piping to off-site discharge
- Depths and layering of soil, sand, or gravel
- Placement of filter fabric or geotextiles
- Changes or substitutions in soil or other materials.
- Natural soils encountered (e.g., sand or clay lenses)

► STEP 4: PREPARE MAINTENANCE PLANS FOR EACH FACILITY

Prepare a maintenance plan, schedule, and inspection checklists (routine, annual, and after major storms) for each facility. Plans and schedules for two or more similar facilities on the same site may be combined.

Use the following resources to prepare your customized maintenance plan, schedule, and checklists.

- Specific information noted in Steps 2 and 3, above.
- Other input from the facility designer, municipal staff, or other sources.
- Operation and Maintenance Fact Sheets (available on the Project Clean Water website).

Note any particular characteristics or circumstances that could require attention in the future, and include any troubleshooting advice.

Also include manufacturer's data, operating manuals, and maintenance requirements for any:

- Pumps or other mechanical equipment.
- Proprietary devices used as BMPs.

Manufacturers' publications should be referenced in the text (including models and serial numbers where available). Copies of the manufacturers' publications should be included as an attachment in the back of your maintenance plan or as a separate document.

► STEP 5: COMPILE MAINTENANCE PLAN

The following general outline is provided as an example.

I. Inspection and Maintenance Log

II. Updates, Revisions and Errata

III. Introduction

A. Narrative overview describing the site; drainage areas, routing, and discharge points; and treatment facilities.

IV. Responsibility for Maintenance

A. General

(1) Name and contact information for responsible individual(s).

(2) Organization chart or charts showing organization of the maintenance function and location within the overall organization.

(3) Reference to Operation and Maintenance Agreement (if any). A copy of the agreement should be attached.

(4) Maintenance Funding

(1) Sources of funds for maintenance

(2) Budget category or line item

(3) Description of procedure and process for ensuring adequate funding for maintenance

B. Staff Training Program

C. Records

D. Safety

V. Summary of Drainage Areas and Storm Water Facilities

A. Drainage Areas

(1) Drawings showing pervious and impervious areas (copied or adapted from initial Project Submittal).

(2) Designation and description of each drainage area and how flow is routed to the corresponding facility.

B. Treatment and Flow-Control Facilities

(1) Drawings showing location and type of each facility

(2) General description of each facility (Consider a table if more than two facilities)

(1) Area drained and routing of discharge.

(2) Facility type and size

VI. Facility Documentation

A. "As-built" drawings of each facility (design drawings in the draft Plan)

B. Manufacturer's data, manuals, and maintenance requirements for pumps, mechanical or electrical equipment, and proprietary facilities (include a "placeholder" in the draft plan for information not yet available).

C. Specific operation and maintenance concerns and troubleshooting

VII. Maintenance Schedule or Matrix

A. Maintenance Schedule for each facility with specific requirements for:

(1) Routine inspection and maintenance

(2) Annual inspection and maintenance

(3) Inspection and maintenance after major storms

B. Service Agreement Information

Assemble and make copies of your maintenance plan. One copy must be submitted to the City of La Mesa, and at least one copy kept on-site. Here are some suggestions for formatting the maintenance plan:

- Format plans to 8½" x 11" to facilitate duplication, filing, and handling.
- Include the revision date in the footer on each page.
- Scan graphics and incorporate with text into a single electronic file. Keep the electronic file backed-up so that copies of the maintenance plan can be made if the hard copy is lost or damaged.

► STEP 6: UPDATES

Your maintenance plan will be **a living document**.

Operation and maintenance personnel may change; mechanical equipment may be replaced, and additional maintenance procedures may be needed. Throughout these changes, the maintenance plan must be kept up-to-date.

Updates may be transmitted to the City of La Mesa at any time. However, at a minimum, updates to the maintenance plan must be reported with the annual submittal of the "BMP Inspection & Maintenance Verification Form," or equivalent, to the City.

Stage 4: Interim Maintenance

Applicants will typically be required to warranty storm water facilities against lack of performance due to flaws in design or construction. The warranty may need to be secured by a bond or other financial instrument.

Stage 5: Transfer Responsibility

As part of the detailed maintenance plan, note the expected date when responsibility for operation and maintenance will be transferred. Notify the City of La Mesa when this transfer of responsibility takes place.

Stage 6: Operation & Maintenance Verification

The City of La Mesa implements an operation and maintenance verification program, including periodic site inspections.

Contact municipal staff to determine the frequency of inspections, whether self-inspections are allowed, and applicable fees, if any.

Chapter 6

Construction BMP Requirements and Performance Standards

Guideline to meeting construction BMP requirements in the SWPPP or CSWMP for your site.

The storm water NPDES Permit requires the City of La Mesa to regulate construction activities within the City in order to reduce construction site discharges of pollutants from the MS4 to the maximum extent practicable and to prevent construction site discharges from the MS4 from causing or contributing to a violation of water quality standards.

Compliance with the City of La Mesa's construction BMP requirements is a four-step process:

1. Determine the applicable storm water requirements for your site.
2. Prepare and submit the appropriate plans.
3. Determine the adequacy of the plans proposed.
4. Assure implementation and maintenance of the requirements.

These steps are described below in greater detail.

Construction Storm Water BMP Requirements

The flow chart in Figure 6-1, "Construction Permit Review & Approval Process" describes how storm water requirements are incorporated into projects during the construction permit review process. The steps below describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 6-1. Construction Permit Review and Approval Process

The following figure provides an overview of the project review process for projects that require a construction permit from the City of La Mesa. Construction permits include building permits, grading permits, demolition permits, and encroachment permits.

► STEP 1: DETERMINE APPLICABLE STORM WATER BMP REQUIREMENTS

Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. Projects subject to the construction storm water best management practices requirements must comply with the standards included in this BMP Manual, as appropriate depending on the site conditions, season, and project design, and construction methods. Each project must be given a priority ranking (high, medium, or low) for the construction phase (see Appendix A). The prioritization will determine the inspection frequency by the City but will not change the construction BMP requirements. Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in navigating through this BMP Manual to ensure construction BMP performance standards are met.

► STEP 2: PREPARE & SUBMIT APPROPRIATE PLANS

This BMP Manual describes the construction site management requirements that contractors must comply with. In addition, the next section of this chapter ("Construction Storm Water BMP Performance Standards") lists the performance standards that construction sites must meet, and provides a list of required erosion control, sediment control, and materials management BMPs for reference. Additionally, each project must determine if they are subject to s requirements and be given a priority of high, medium or low (see Appendix A).

Construction Projects Over 1 Acre. Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." If a project disturbs 1 acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by this chapter, in accordance with the current State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). Consistent with the State General Construction Permit, the City will require that <u>both</u> erosion and sediment control BMPs be installed and maintained for all applicable projects in addition to good housekeeping and site and materials management. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Additionally, each project determined to be subject to the City's advanced treatment requirements (see Appendix A) will need to include details on how the site plans to meet these requirements in the SWPPP and/or erosion control plan. Appendix D provides general guidelines for preparation of a SWPPP as well as a more detailed checklist to meet the requirements.

Construction Projects Under 1 Acre. Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all

construction BMP requirements required in this chapter, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

After preparing plans and supporting documents according to the requirements in this BMP Manual, submit plans to the Department of Public Works/Engineering for review (See Step 3).

► STEP 3: DETERMINE ADEQUACY OF PROPOSED PLANS

Under the authority of the City Engineer, Engineering staff will review submitted plans for compliance with the applicable storm water requirements contained in this BMP Manual. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs. After all storm water requirements have been approved by the City Engineer, proceed to Step 4 to assure implementation and maintenance of the approved BMPs through permit conditions, plan notes, and if necessary, maintenance agreements.

► STEP 4: ASSURE IMPLEMENTATION & MAINTENANCE OF REQUIREMENTS

Applicants must provide assurances that permanent storm water BMPs will be constructed and permanently maintained throughout the use of a developed site, and that construction BMPs will be implemented and maintained until construction is complete. The summaries below describe how construction and permanent BMP requirements must be assured during both discretionary actions and construction permit review processes. After the City Engineer has approved all construction and/or permanent BMPs, refer to the final section of this chapter, "Implementation and Maintenance of Requirements," to determine how construction and permanent BMP implementation and maintenance will be assured.

Discretionary Action. For any discretionary action, permanent storm water requirements shall be incorporated into the project design and be shown on the plans. In addition, project shall be conditioned to execute a maintenance agreement for ongoing permanent BMP maintenance, satisfactory to the City Engineer, prior to the issuance of any construction permits. This requirement shall be noted on the plans for the discretionary action. If the project will be required to provide construction BMPs, the permit/approval shall include the "Standard Construction BMP Implementation and Maintenance Condition" listed in "Implementation and Maintenance of Requirements" at the end of this chapter.

Construction Permits. For projects requiring construction permits, construction and permanent BMP requirements shall be incorporated into the project design and shown on the plans prior to the issuance of any permits. The project applicant shall execute a permanent BMP maintenance agreement, satisfactory to the City Engineer, prior to issuance of any construction permits. Construction maintenance requirements and the specific permanent BMP maintenance procedures shall be noted on the plans. Any construction BMP requirements that cannot be shown graphically must be noted on the plans.

Construction Storm Water BMP Performance Standards

Those projects that have been determined to require construction BMPs in Steps 1 and 2 of this chapter must identify the construction BMPs to be implemented in accordance with the performance standards in this section. The construction BMPs must be identified in a Storm Water Pollution Prevention Plan or Construction Storm Water Management Plan (CSWMP) for projects disturbing more than or less than 1 acre, respectively. Because all projects require BMPs during construction, those projects that disturb less than 1 acre are required to have a Construction Storm Water Management Plan (CSWMP) which identifies the pollution prevention measures that will be taken. These plans must be prepared in accordance with the guidelines in Appendix D.

► 1. MINIMUM CONSTRUCTION BMP REQUIREMENTS

The City has developed a set of minimum BMPs that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to select, install, and maintain general site management, soil stabilization and erosion prevention, and sediment containment BMPs to reduce, retain, and manage pollutant discharges to the MEP. Table 6-1 outlines the minimum construction BMPs required by the City along with the corresponding current fact sheets obtained from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003), where applicable. Additional information on the BMPs included in Table 6-1 can be found in the City of La Mesa Jurisdictional Urban Runoff Management Plan (JURMP), the Model Construction Program for San Diego Copermittees, the City of Los Angeles "Reference Guide for Stormwater Best Management Practices," and the California Stormwater Quality Association (CASQA) BMP Handbook for Construction.

It is the responsibility of the property owner or his/her designee to select, install and maintain appropriate BMPs that meet the City's minimum BMP requirements outlined in Table 6-1 below. BMPs must be installed in accordance with an industry recommended standard or in accordance with the requirements of the State General Construction Permit.

TABLE 6-1. Minimum Required BMPs for Construction

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
General Site Management		
Project Planning	Preserve natural hydrologic features where feasible	-
	Preserve riparian buffers and corridors where feasible	-
	Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction	-
	Minimize exposure time of disturbed soil areas	SS-1
	Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible	SS-1
	Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible	SS-1

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
	Educate construction site employees and subcontractors on minimum BMP requirements	-
Pollution Prevention	Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities: - Cleaning - Fueling - Maintenance	 NS-8 NS-9 NS-10
	Prevent the contamination of storm water from construction materials through proper management of the following types of activities: - Material Delivery and Storage - Material Use - Stockpile Management[1] - Spill Prevention and Control	 WM-1 WM-2 WM-3 WM-4
	Prevent the contamination of storm water by wastes through proper management of the following types of wastes: - Solid Waste - Hazardous Waste - Contaminated Soil - Concrete - Sanitary Waste - Liquid	 WM-5 WM-6 WM-7 WM-8 WM-9 WM-10
	Prevent the contamination of storm water through proper management of the follow activities: - Water Conservation Practices - Dewatering Operations - Paving and Grinding - Potable Water/Irrigation and Flushing	 NS-1 NS-2 NS-3 NS-7
Erosion Prevention and Sediment Containment		
Soil Stabilization and Erosion Prevention	Preserve existing vegetation where feasible	SS-2
	Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing one or more of the following BMPs: - Hydraulic Mulch - Hydroseeding - Soil Binders - Straw Mulch - Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats - Wood Mulch - Earth Dikes/Drainage Swales	 SS-3 SS-4 SS-5 SS-6 SS-7 SS-8 SS-9
	Reduce the velocity of storm water by using one or more of the following: - Outlet Protection/Velocity Dissipation - Slope Drains	 SS-10 SS-11
	Establish permanent re-vegetation or landscaping as early as feasible	SS-1

BMP Type	Minimum Required BMP(s)	Corresponding Caltrans Fact sheet
Sediment Containment	Protect the Perimeter of the site or exposed area from sediment discharge using one or more of the following: - Silt Fence - Gravel Bag Berm - Fiber Rolls	 SC-1 SC-6 SC-5
	Capture sediments in channeled storm water by using one or more of the following: - De-silting Basin[3] - Storm Drain Inlet Protection - Sediment Trap - Gravel Bag Barrier	 SC-2 SC-10 SC-3 SC-8
	Prevent sediment from being tracked off-site by using one or more of the following: - Stabilized Construction Entrance - Construction Road Stabilization - Entrance/Exit Tire Wash - Street Sweeping	 TC-1 TC-2 TC-3 SC-7

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans. If the project is one acre or greater the de-silting basin must be designed in accordance with the current State General Construction Permit.

► 2. SITE MANAGEMENT REQUIREMENTS

Construction is a dynamic operation where changes are expected. Storm water BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation, revision, and re-installation, particularly as project grading progresses. Therefore, owner/contractor self- inspections are required. They shall be performed by the owner's/contractor's Qualified Contact Person specifically trained in storm water pollution prevention site management and storm water BMPs, including the installation and maintenance of sediment and erosion control measures. Additional qualified persons may assist with the inspection activities under the direction of the Qualified Contact Person. A Qualified Contact Person is required for all sites during both wet and dry weather conditions.

There are four primary purposes of the self-inspections conducted by owners and contractors:

- To ensure that the owners/contractors take full responsibility for managing storm water pollution caused by their activities.
- To ensure that storm water BMPs are properly documented and implemented and are functioning effectively.
- To identify maintenance (e.g., sediment removal) and repair needs.

- To ensure that the project proponents implement their storm water management plans.

A self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested (note: the State General Construction Permit has additional inspection requirements that must be met to comply with the permit). Self-inspections must be performed by a Qualified Contact Person according to the following schedule:

- Daily forecasting at all times
- At 24-hour intervals during extended rainfall events
- Daily evaluations as earth moving/grading is being conducted during the wet season
- Weekly (every 7 days) in the dry season as earth moving/grading is progressing

Storm water pollution prevention site management requirements include:

A. A qualified person who is trained and competent in the use of BMPs shall be on site daily, although not necessarily full time, to evaluate the conditions of the site with respect to storm water pollution prevention. This qualified contact person shall represent the contractor/ owner on storm water issues.

B. The qualified person shall implement the conditions of the Storm Water Pollution Prevention Plan, contract documents, and/or local ordinances with respect to erosion and sediment control and other waste management regulations.

C. The qualified person is responsible for monitoring the weather and implementation of any emergency plans as needed. The weather shall be monitored on a 5-day forecast plan and a full BMP protection plan shall be activated when there is a 40% chance of rain.

D. The qualified person is responsible for overseeing any site grading and operations and evaluating the effectiveness of the BMPs. This person shall modify the BMPs as necessary to keep the dynamics of the site in compliance. This person or other qualified persons are responsible for checking the BMPs routinely for maintenance and documenting the BMPs being implemented.

► 3. PERFORMANCE STANDARDS

Construction The City Engineer will evaluate the adequacy of the owner's/contractor's site management for storm water pollution prevention, inclusive of BMP implementation, on construction sites based on performance standards for storm water BMPs. Poor BMP practices shall be challenged. Performance standards shall include:

A. No measurable increase of pollution (including sediment) in runoff from the site.

B. No slope erosion.

C. Water velocity moving offsite must not be greater than pre-construction levels.

A site will be considered inactive if construction activities have ceased for a period of 7 or more consecutive calendar days. At any time of year, an inactive site must be fully protected from erosion and discharges of sediment. It is also the owner's/contractor's responsibility at both active and inactive sites to implement a plan to address all potential non-storm water discharges.

Regardless of any inspections conducted by the City, property owners or contractors are required to prevent any construction-related materials, wastes, spills, or residues from entering a storm water conveyance system and to apply for coverage under the State General Construction Permit as applicable for the site.

► 4. SEASONAL REQUIREMENTS

BMP requirements differ between the wet season (Oct. 1 – Apr. 30) and the dry season (May 1 – Sept. 30), the type of the project and topography of the site, as described below.

A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

P. Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

Q. Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

R. Adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.

S. All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.

T. Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

► 5. ADVANCED TREATMENT REQUIREMENTS

The City requires advanced treatment methods to be employed at construction sites determined to be an exceptional threat to water quality (see Appendix A). Advanced treatment involves using mechanical or chemical means to flocculate and remove suspended sediment from construction site runoff. Projects required to implement advanced treatment must comply with the following:

1. Treatment effluent water quality shall meet or exceed the water quality objectives for sediment, turbidity, and any other parameter deemed necessary by the City Engineer as listed in the Water Quality Control Plan for the San Diego Basin (9) for inland surface waters and lagoons and estuaries for the appropriate hydrologic unit.

2. Applicant shall provide design, operations and maintenance schedule, monitoring plan, certification of training of staff to the satisfaction of the City Engineer.

► 6. ADDITIONAL CONTROLS FOR CONSTRUCTION SITES

The Municipal Permit requires implementation of additional controls for construction sites tributary to 303(d) listed water body segments impaired for sediment or within, adjacent to, or discharging directly to coastal lagoons or other receiving waters within ESAs. Additional requirements for theses site will be determined on a site-by-site basis at the discretion of the City Engineer.

Implementation and Maintenance of Requirements

Discretionary Actions. Projects seeking discretionary approvals are not required to graphically demonstrate any construction BMP requirements on the project plans. Instead, the discretionary action shall include the following standard condition, which shall also be noted on the plans:

> "The Permittee or designee shall incorporate any construction best management practices (BMPs) necessary to comply with the grading regulations in Chapter 14.05 of the La Mesa Municipal Code, into the construction plans and/or specifications, satisfactory to the City Engineer, prior to the issuance of any construction permits."

Construction Permits for Projects Under 1 Acre. Projects proposing to disturb less than 1 acre during construction shall include construction BMP requirements, where possible, on the plans. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted on, or stapled to, the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be

graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

Construction Permits for Projects Over 1 Acre. Projects proposing to disturb more than 1 acre during construction shall include all construction BMPs in a Storm Water Pollution Prevention Plan, prepared in accordance with Appendix D. The construction BMPs shall also be shown on the plans, where possible. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted or stapled to the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

Appendix

A

Storm Water Requirements Applicability Checklist

STORM WATER PROJECT DATA SHEET

PROJECT DATA:

Owner's Name & Phone No: _____

Address: _____ Permit No: _____

Project: _____ Date Applied: _____

PROJECT SITE DATA:

1. Area of the lot/parcel = _____ sf
2. Existing impervious area (roof/building foot print) = _____ sf
3. Existing impervious area (driveway, parking, walkway, hardscape etc.) = _____ sf
4. Impervious area after development (roof/building foot print) = _____ sf
5. Impervious area after development (driveway, parking, walkway, hardscape, etc.) = _____ sf
6. Total area to be disturbed = _____ sf
7. Storm water runoff based on Hydrology Study:

Existing runoff = _____ cfs, Post construction runoff = _____ cfs

8. Identify if the runoff from the site discharges to the public street or storm drain or open channel, detention or retention basin: _____
9. Watershed (Check One): San Diego River _____ San Diego Bay _____

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete the Storm Water Requirements Applicability Checklist

Notes:

- Items 1 through 9 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.

A Hydrology report may be required.

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS:

	YES	NO
1. Is the project a new development?	☐	☐
2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 ft^2 of impervious surface?*	☐	☐
** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".*		

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes," Complete Part A Below.

PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.

DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY DEVELOPMENT PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL PART II? (SEE GLOSSARY)*	YES	NO
1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units?	☐	☐
2. Commercial development resulting in the disturbance of one acre or more of land?	☐	☐
3. Industrial development resulting in the disturbance of one acre or more of land?	☐	☐
4. Automotive repair shop?	☐	☐
5. Restaurant greater than 5,000 square feet?	☐	☐
6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?	☐	☐
7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?	☐	☐
8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff?	☐	☐
9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater?	☐	☐
10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day	☐	☐
11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels.	☐	☐
**** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.***		

Limited Exclusion: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met.

If all answers to Part A are "No", continue to Part B.

PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.

DOES THE PROJECT PROPOSE:	YES	NO
1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks?	☐	☐
2. New pervious landscape areas and irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Trash storage areas?	☐	☐
5. Liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (except construction)?	☐	☐
8. Commercial/ industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. Any grading or ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?	☐	☐
**To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.shtml.*		

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the BMP Manual. All Priority Development Projects are also subject to hydromodification management requirements (unless an exemption applies) as discussed in the City's Storm Water BMP Manual Part II and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's Storm Water BMP Manual Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

Required submittals, Section 1:	**PCWQTR**	☐	**SPCBMPP**	☐	**Hydromodification**	☐

SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS:

PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	YES	NO
1. Does the project propose grading or soil disturbance of one acre or more?	☐	☐
2. Does the project propose any grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)?	☐	☐

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide NPDES General Permit for Storm Water Discharges Associated with Construction Activities (General Construction Permit) and the City's Construction Storm Water BMP Performance Standards. To enroll in the General Construction Permit, see the website at www.waterboards.ca.gov/water_issues/programs/stormwater/construction.shtml. A Storm Water Pollution Prevention Plan (SWPPP), a Notice of Intent (NOI), and other documents must be submitted electronically. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards. A Construction Storm Water Management Plan (CSWMP) must be prepared, and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to complete Parts D and E of this form, and neither a SWPPP nor CSWMP is required.

PART D: DETERMINE ADVANCED TREATMENT SUBJECTIVITY

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	YES	NO
1. Is the project located within, adjacent to, or is a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity?	☐	☐
2. Will the project disturb more than five acres, including all phases of the development?	☐	☐
If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below.		
3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water?	☐	☐
4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4?	☐	☐

If all answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the Storm Water BMP Manual Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer.

Required submittals, Section 2:	**SWPPP, NOI** ☐	**CSWMP** ☐	**Advanced Treatment** ☐

PART E: DETERMINE CONSTRUCTION SITE PRIORITY

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

According to the attached flow chart, this project has the following threat to water quality priority:

☐ **High** ☐ **Medium** ☐ **Low**

[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]

B

Low Impact Development (LID) Integrated Management Practice (IMP) Design Sheets

Self-Treating and Self-Retaining Areas

Best Uses

- Heavily landscaped sites

Advantages

- No maintenance verification requirement
- Complements site landscaping

Limitations

- Requires substantial square footage
- Grading requirements must be coordinated with landscape design

► CRITERIA

Rainfall on self-treating areas infiltrates or—during intense storms— drains directly off-site or to the storm drain system.

Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. During intense storms, runoff may drain off-site, to the storm drain system, or to IMPs.

LID design seeks to manage runoff from roofs and paving so effects on water quality and hydrology are minimized. Runoff from landscaping, however, does not need to be managed the same way.

Runoff from landscaping can be managed by creating self-treating and self-retaining areas.

Self-treating areas are natural, landscaped, or turf areas that drain directly off site or to the storm drain system. Examples include upslope undeveloped areas that are ditched and drained around a development and grassed slopes that drain offsite to a street or storm drain. Self-treating areas may not drain on to adjacent paved areas.

Where a landscaped area is upslope from or surrounded by paved areas, a **self-retaining area** (also called a zero-discharge area) may be created. Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that the first inch of rainfall would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

Areas draining to self retaining areas. Drainage from roofs and paving can be directed to self-retaining areas and allowed to infiltrate into the soil. The maximum allowable ratio is 2 parts impervious: 1 part pervious.

The self-retaining area must be bermed or depressed to retain an inch of rainfall including the flow from the tributary impervious area.

► DETAILS

Drainage from self-treating areas must flow to off-site streets or storm drains without flowing on to paved areas.

Pavement within a self-treating area cannot exceed 5% of the total area.

In self-retaining areas, overflows and area drain inlets should be set high enough to ensure ponding over the entire surface of the self-retaining area.

Set overflows and area drain inlets high enough to ensure ponding (3" deep) over the surface of the self-retaining area.

Self–retaining areas should be designed to promote even distribution of ponded runoff over the area.

Leave enough reveal (from pavement down to landscaped surface) to accommodate buildup of turf or mulch.

► APPLICATIONS

Lawn or landscaped areas adjacent to streets can be considered self-treating areas.

Self-retaining areas can be created by depressing lawn and landscape below surrounding sidewalks and plazas.

Runoff from walkways or driveways in parks and park-like areas can sheet-flow to self-retaining areas.

Roof leaders can be connected to self-retaining areas by piping beneath plazas and walkways. If necessary, a "bubble-up" can be used.

Connecting a roof leader to a self-retaining area. The head from the eave height makes it possible to route roof drainage some distance away from the building.

Self-retaining areas can be created by terracing mild slopes. The elevation difference promotes subsurface drainage.

Mild slopes can be terraced to create self-retaining areas.

► DESIGN CHECKLIST FOR SELF-TREATING AREAS

- ❒ The self-treating area is at least 95% lawn or landscaping (not more than 5% impervious).
- ❒ Re-graded or re-landscaped areas have amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Runoff from the self-treating area does not enter an IMP or another drainage management area, but goes directly to the storm drain system.

► DESIGN CHECKLIST FOR SELF-RETAINING AREAS

- ❒ Area is bermed all the way around or graded concave.

- ❒ Slopes do not exceed 4%.
- ❒ Entire area is lawn, landscaping, or pervious pavement (see criteria in Chapter 4).
- ❒ Area has amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Any area drain inlets are at least 3 inches above surrounding grade.

► DESIGN CHECKLIST FOR AREAS DRAINING TO SELF-RETAINING AREAS

- ❒ Ratio of tributary impervious area to self-retaining area is not greater than 2:1.
- ❒ Roof leaders collect runoff and route it to the self-retaining area.
- ❒ Paved areas are sloped so drainage is routed to the self-retaining area.
- ❒ Inlets are designed to protect against erosion and distribute runoff across the area.

Pervious Pavements

► CRITERIA

Impervious roadways, driveways, and parking lots account for much of the hydrologic impact of land development. In contrast, pervious pavements allow rainfall to collect in a gravel or sand base course and infiltrate into native soil.

Pervious pavements are designed to transmit rainfall through the surface to storage in a base course. For example, a 4-inch-deep base course provides approximately 1.6 inches of storage. Runoff stored in the base course infiltrates to native soils over time. Except in the case of solid pavers, the surface course provides additional storage.

Areas with the following pervious pavements may be regarded as "self-treating" and require no additional treatment or flow control if they drain off-site (not to an IMP).

- Pervious concrete
- Porous asphalt
- Crushed aggregate (gravel)
- Open pavers with grass or plantings
- Open pavers with gravel
- Artificial turf

Areas with these pervious pavements can also be **self-retaining areas** and may receive runoff from impervious areas if they are bermed or depressed to retain the first one inch of rainfall, including runoff from the tributary impervious area.

Solid unit pavers—such as bricks, stone blocks, or precast concrete shapes—are considered to reduce runoff compared to impervious pavement, when the unit pavers are set in sand or gravel with d" gaps between the pavers. Joints must be filled with an open-graded aggregate free of fines.

Best Uses

- Areas with permeable native soils
- Low-traffic areas
- Where aesthetic quality can justify higher cost

Advantages

- No maintenance verification requirement
- Variety of surface treatments can complement landscape design

Limitations

- Initial cost
- Placement requires specially trained crews
- Geotechnical concerns, especially in clay soils
- Concerns about pavement strength and surface integrity
- Some municipalities do not allow in public right of way

When draining pervious pavements to an IMP, use the runoff factors in Table 4-2.

► DETAILS

Permeable pavements can be used in clay soils; however, special design considerations, including an increased depth of base course, typically apply and will increase the cost of this option. Geotechnical fabric between the base course and underlying clay soil is recommended.

Pavement strength and durability typically determines the required depth of base course. If underdrains are used, the outlet elevation must be a minimum of 3 inches above the bottom elevation of the base course.

Pervious concrete and porous asphalt must be installed by crews with special training and tools. Industry associations maintain lists of qualified contractors.

Parking lots with crushed aggregate or unit pavers may require signs or bollards to organize parking.

► DESIGN CHECKLIST FOR PERVIOUS PAVEMENTS

- ❒ No erodible areas drain on to pavement.
- ❒ Subgrade is uniform. Compaction is minimal.
- ❒ Reservoir base course is of open-graded crushed stone. Base depth is adequate to retain rainfall and support design loads.
- ❒ If a subdrain is provided, outlet elevation is a minimum of 3 inches above bottom of base course.
- ❒ Subgrade is uniform and slopes are not so steep that subgrade is prone to erosion.
- ❒ Rigid edge is provided to retain granular pavements and unit pavers.
- ❒ Solid unit pavers are installed with open gaps filled with open-graded aggregate free of fines.
- ❒ Permeable pavements are installed by industry-certified professionals according to vendor's recommendations.
- ❒ Selection and location of pavements incorporates Americans with Disabilities Act requirements, site aesthetics, and uses.

Bioretention Facilities

Bioretention facility configured for treatment-only requirements. Bioretention facilities can rectangular, linear, or nearly any shape.

Bioretention detains runoff in a surface reservoir, filters it through plant roots and a biologically active soil mix, and then infiltrates it into the ground. Where native soils are less permeable, an underdrain conveys treated runoff to storm drain or surface drainage.

Bioretention facilities can be configured in nearly any shape. When configured as linear **swales**, they can convey high flows while percolating and treating lower flows.

Bioretention facilities can be configured as in-ground or above-ground planter boxes, with the bottom open to allow infiltration to native soils underneath. Bioretention basins must be hydrologically connected with the underlying soil. Any Bioretention basin which is completely lined and sealed shall be sized as a Flow Through Planter.

Best Uses

- Commercial areas
- Residential subdivisions
- Industrial developments
- Roadways
- Parking lots
- Fit in setbacks, medians, and other landscaped areas

Advantages

- Can be any shape
- Low maintenance
- Can be landscaped

Limitations

- Require 4% of tributary impervious square footage
- Typically requires 3-4 feet of head
- Irrigation typically required

► CRITERIA

For development projects subject only to runoff treatment requirements, the following criteria apply:

Parameter	Criterion
Soil mix depth	18 inches minimum

Parameter	Criterion
Soil mix minimum percolation rate	5 inches per hour minimum sustained (10 inches per hour initial rate recommended)
Soil mix surface area	0.04 times tributary impervious area (or equivalent)
Surface reservoir depth	6 inches minimum; may be sloped to 4 inches where adjoining walkways.
Underdrain	Required in Group "C" and "D" soils. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point.

► DETAILS

Plan. On the surface, a bioretention facility should be one level, shallow basin—or a series of basins. As runoff enters each basin, it should flood and fill throughout before runoff overflows to the outlet or to the next downstream basin. This will help prevent movement of surface mulch and soil mix.

Use check dams for linear bioretention facilities (swales) on a slope.

In a linear swale, check dams should be placed so that the lip of each dam is at least as high as the toe of the next upstream dam. A similar principle applies to bioretention facilities built as terraced roadway shoulders.

Inlets. Paved areas draining to the facility should be graded, and inlets should be placed, so that runoff remains as sheet flow or as dispersed as possible. Curb cuts should be wide (12" is recommended) to avoid clogging with leaves or debris. Allow for a minimum reveal of 4"-6" between the inlet and soil mix elevations to ensure turf or mulch buildup does not block the

inlet. In addition, place an apron of stone or concrete, a foot square or larger, inside each inlet to prevent vegetation from growing up and blocking the inlet.

Recommended design details for bioretention facility inlets (see text).

Where runoff is collected in pipes or gutters and conveyed to the facility, protect the landscaping from high-velocity flows with energy-dissipating rocks. In larger installations, provide cobble-lined channels to better distribute flows throughout the facility.

Upturned pipe outlets can be used to dissipate energy when runoff is piped from roofs and upgradient paved areas.

Soil mix. The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

Storage and drainage layer. "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" washed pea gravel be substituted at the top of the crushed rock gravel layers. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer or the gravel drainage layer from the native soil.

Underdrains. No underdrain is required where native soils beneath the facility are Hydrologic Soil Group A or B. For treatment-only facilities where native soils are Group C or D, a perforated pipe must be bedded in the gravel layer and must terminate at a storm drain or other approved discharge point.

Outlets. In treatment-only facilities, outlets must be set high enough to ensure the surface reservoir fills and the entire surface area of soil mix is flooded before the outlet elevation is reached. In swales, this can be achieved with appropriately placed check dams.

The outlet should be designed to exclude floating mulch and debris.

Vaults, utility boxes, and light standards. It is best to locate utilities outside the bioretention facility—in adjacent walkways or in a separate area set aside for this purpose. If utility structures are to be placed within the facility, the locations should be anticipated and adjustments made to ensure the minimum bioretention surface area and volumes are achieved. Leaving the final locations to each individual utility can produce a haphazard, unaesthetic appearance and make the bioretention facility more difficult to maintain.

Emergency overflow. The site grading plan should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

Trees. Bioretention areas can accommodate small or large trees. There is no need to subtract the area taken up by roots from the effective area of the facility. Extensive tree roots maintain soil permeability and help retain runoff. Normal maintenance of a bioretention facility should not affect tree lifespan.

The bioretention facility can be integrated with a tree pit of the required depth and filled with structural soil. If a root barrier is used, it can be located to allow tree roots to spread throughout the bioretention facility while protecting adjacent pavement. Locations and planting elevations should be selected to avoid blocking the facility's inlets and outlets.

Bioretention facility configured as a tree well.
The root barrier is optional.

► APPLICATIONS

Multi-purpose landscaped areas. Bioretention facilities are easily adapted to serve multiple purposes. The loamy sand soil mix will support turf or a plant palette suitable to the location and a well-drained soil.

Example landscape treatments:

- Lawn with sloped transition to adjacent landscaping.
- Swale in setback area
- Swale in parking median
- Lawn with hardscaped edge treatment
- Decorative garden with formal or informal plantings
- Traffic island with low-maintenance landscaping
- Raised planter with seating
- Bioretention on a terraced slope

Bioretention facility configured as a recessed decorative lawn with hardscaped edge.

Bioretention facility configured and planted as a lawn/ play area.

Residential subdivisions. Some subdivisions are designed to drain roofs and driveways to the streets (in the conventional manner) and then drain the streets to bioretention areas, with one bioretention area for each 1 to 6 lots, depending on subdivision layout and topography.

If allowed by the local jurisdiction, bioretention areas can be placed on a separate, dedicated parcel with joint ownership.

Bioretention facility receiving drainage from individual lots and the street in a residential subdivision.

Sloped sites. Bioretention facilities must be constructed as a basin, or series of basins, with the circumference of each basin set level. It may be necessary to add curbs or low retaining walls.

Bioretention facility configured as a parking median.
Note use of bollards in place of curbs, eliminating the need for curb cuts.

Design Checklist for Bioretention

- ❒ Volume or depth of surface reservoir meets or exceeds minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term percolation rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ Perforated pipe underdrain bedded in "Class 2 perm" with connection and sufficient head to storm drain or discharge point (except in "A" or "B" soils).
- ❒ No filter fabric.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Bioretention area is designed as a basin (level edges) or a series of basins, and grading plan is consistent with these elevations. If facility is designed as a swale, check dams are set so the lip of each dam is at least as high as the toe of the next upstream dam.
- ❒ Inlets are 12" wide, have 4"-6" reveal and an apron or other provision to prevent blockage when vegetation grows in, and energy dissipation as needed.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.
- ❒ Vaults, utility boxes, and light standards are located outside the minimum soil mix surface area.
- ❒ When excavating, avoid smearing of the soils on bottom and side slopes. Minimize compaction of native soils and "rip" soils if clayey and/or compacted. Protect the area from construction site runoff.

Bioretention Facility Outlet Detail - A

Flow-through Planter

Portland 2004 Stormwater Manual

Best Uses

- Management of roof runoff
- Next to buildings
- Dense urban areas
- Where infiltration is not desired

Advantages

- Can be used next to structures
- Versatile
- Can be any shape
- Low maintenance

Limitations

- Can be used for flow-control only on sites with "C" and "D" soils
- Requires underdrain
- Requires 3-4 feet of head

Flow-through planters treat and detain runoff without allowing seepage into the underlying soil. They can be used next to buildings and on slopes where stability might be affected by adding soil moisture.

Flow-through planters typically receive runoff via downspouts leading from the roofs of adjacent buildings. However, they can also be set in-ground and receive sheet flow from adjacent paved areas.

Pollutants are removed as runoff passes through the soil layer and is collected in an underlying layer of gravel or drain rock. A perforated-pipe underdrain is typically connected to a storm drain or other discharge point. An overflow inlet conveys flows which exceed the capacity of the planter.

► CRITERIA

Treatment only. For development projects subject only to runoff treatment requirements, the following criteria apply:

Parameter	Criterion
Soil mix depth	18 inches minimum
Soil mix minimum percolation rate	5 inches per hour minimum sustained (10 inches per hour initial rate recommended)

Parameter	Criterion
Soil mix surface area	0.04 times tributary impervious area (or equivalent)
Surface reservoir depth	6" minimum; may be sloped to 4" where adjoining walkways.
Underdrain	Typically used. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point.

► DETAILS

Configuration. The planter must be level. To avoid standing water in the subsurface layer, set the perforated pipe underdrain and orifice as nearly flush with the planter bottom as possible.

Inlets. Protect plantings from high-velocity flows by adding rocks or other energy-dissipating structures at downspouts and other inlets.

Soil mix. The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

Gravel storage and drainage layer. "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" of washed pea gravel be substituted at the top of the crushed rock layer. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer.

Emergency overflow. The planter design and installation should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

► APPLICATIONS

Adjacent to buildings. Flow-through planters may be located adjacent to buildings, where the planter vegetation can soften the visual effect of the building wall. A setback with a raised planter box may be appropriate even in some neo-traditional pedestrian-oriented urban streetscapes.

At plaza level. Flow-through planters have been successfully incorporated into podium-style developments, with the planters placed on the plaza level and receiving runoff from the tower roofs above. Runoff from the plaza level is typically managed separately by additional flow-through planters or bioretention facilities located at street level.

Steep slopes. Flow-through planters provide a means to detain and treat runoff on slopes that cannot accept infiltration from a bioretention facility. The planter can be built into the slope similar to a retaining wall. The design should consider the need to access the planter for

periodic maintenance. Flows from the planter underdrain and overflow must be directed in accordance with local requirements. It is sometimes possible to disperse these flows to the downgradient hillside.

Flow-through planter on the plaza level of a podium-style development.

Flow-through planter built into a hillside. Flows from the underdrain and overflow must be directed in accordance with local requirements.

Design Checklist for Flow-through Planter

- ❒ Reservoir depth is 4-6" minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term infiltration rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ "Class 2 perm" drainage layer.
- ❒ No filter fabric.
- ❒ Perforated pipe underdrain with outlet located flush or nearly flush with planter bottom. Connection with sufficient head to storm drain or discharge point.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Planter is set level.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.

NOTES:

1. FLOW-THROUGH PLANTER SHALL BE SIZED TO MEET CCCWP CRITERIA FOR TREATMENT AND/OR FLOW CONTROL.
2. MINIMUM SURFACE AREA OF PLANTER IS 4% OF TRIBUTARY IMPERVIOUS AREA FOR TREATMENT ONLY DESIGN. FOR FLOW CONTROL AND TREATMENT, REFER TO CCCWP SIZING TOOL CRITERIA.
3. SHAPE OF PLANTER CAN VARY TO MEET PROJECT DESIGN REQUIREMENTS AND LOCATION.
4. CLASS 2 PERMEABLE MATERIAL
5. DOWNSPOUTS/INLET PIPES REQUIRE ENERGY DISSIPATION.
6. USE COUNTY APPROVED ADDITIVE MIXTURE FOR WATERPROOFING CONCRETE.
7. PLANTINGS: SEE CCCWP RECOMMENDED PLANT LIST AND GUIDELINES.
8. PLANTER DESIGN MAY REQUIRE STRUCTURAL ENGINEERING DESIGN.
9. AREA = W x L (ABOVE). EXCLUDES AREA OF VAULT

Flow-Through Planter Outlet Detail

Dry Wells and Infiltration Basins

The typical dry well is a prefabricated structure, such as an open-bottomed vault or box, placed in an excavation or boring. The vault may be empty, which provides maximum space efficiency, or may be filled in rock.

An infiltration basin has the same functional components—a volume to store runoff and sufficient area to infiltrate that volume into the native soil—but is open rather than covered.

Note: Small diameter deep drilled storm water dry wells are not included in this sheet. These shall be considered "Alternative BMPs" and shall be sized per flow or volume based requirements.

Best Uses

- Alternative to bioretention in areas with permeable soils

Advantages

- Compact footprint
- Can be installed in paved areas

Limitations

- Can be used only on sites with "A" and "B" soils
- Requires minimum of 10' from bottom of facility to seasonal high groundwater
- Not suitable for drainage from some industrial areas or arterial roads
- Must be maintained to prevent clogging.

► CRITERIA

Dry wells and infiltration basins must be designed with the minimum volume calculated by Equation 4-8 using a unit volume based on the County of San Diego's 85th Percentile Isopluvial Map.

Consult with the local jurisdiction engineer regarding the need to verify soil permeability and other site conditions are suitable for dry wells and infiltration basins. Some proposed criteria are on Page 5-12 of Caltrans' 2004 *BMP Retrofit Pilot Study Final Report* (CTSW-RT-01-050).

The infiltration rate and infiltrative area must be sufficient to drain a full facility within 72 hours.

► DETAILS

Dry wells should be sited to allow for the potential future need for removal and replacement.

In locations where native soils are coarser than a medium sand, the area directly beneath the facility should be over-excavated by two feet and backfilled with sand as a groundwater protection measure.

Design Checklist for Dry Well

- ❒ Volume and infiltrative area meet or exceed minimum.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Depth from bottom of the facility to seasonally high groundwater elevation is ≥10'.
- ❒ Areas tributary to the facility do not include automotive repair shops; car washes; fleet storage areas (Bus, truck, etc.); nurseries, or other uses that may present an exceptional threat to groundwater quality.
- ❒ Underlying soils are in Hydrologic Soil Group A or B. Infiltration rate is sufficient to ensure a full basin will drain completely within 72 hours. Soil infiltration rate has been confirmed.
- ❒ Set back from structures 10' or as recommended by structural or geotechnical engineer.

Cistern or Vault with Bioretention Facility

A cistern or vault in series with a bioretention facility can meet treatment requirements where space is limited. In this configuration, the cistern or vault is equipped with a flow-control orifice and the bioretention facility is sized to treat a trickle outflow from the cistern or vault.

Best Uses

- In series with a bioretention facility to meet treatment requirement in limited space.
- Management of roof runoff
- Dense urban areas

Advantages

- Storage volume can be in any configuration

Limitations

- Somewhat complex to design, build, and operate
- Requires head for both cistern and bioretention facility

► CRITERIA

Cistern or Vault. The cistern or vault must detain the volume calculated by Equation 4-8 and must include an orifice or other device designed for a 24-hour drawdown time.

Bioretention facility. See the design sheet for bioretention facilities. The area of the bioretention facility must be sized to treat the maximum discharge flow, assuming a percolation rate of 5" per hour through the engineered soil.

Use with sand filter. A cistern or vault in series with a sand filter can meet treatment requirements. See the discussion of treatment facility selection in Chapter 2 and the design guidance for sand filters in Chapter 4.

► DETAILS

Flow-control orifice. The cistern or vault must be equipped with an orifice plate or other device to limit flow to the bioretention area.

Preventing mosquito harborage. Cisterns and vaults should be designed to drain completely, leaving no standing water. Drains should be located flush with the bottom of the cistern. Alternatively—or in addition—all entry and exit points, should be provided with traps or sealed or screened to prevent mosquito entry. Note mosquitoes can enter through openings $^{1}/_{16}$" or larger and will fly for many feet through pipes as small as ¼".

Exclude debris. Provide leaf guards and/or screens to prevent debris from accumulating in the cistern.

Ensure access for maintenance. Design the cistern or vault to allow for cleanout. Avoid creating the need for maintenance workers to enter a confined space. Ensure the outlet orifice can be easily accessed for cleaning and maintenance.

► APPLICATIONS

Shallow ponding on a flat roof. The "cistern" storage volume can be designed in any configuration, including simply storing rainfall on the roof where it falls and draining it away slowly. See the County of San Diego's 85th percentile isopluvial diagrams for required average depths.

Cistern attached to a building and draining to a planter. This arrangement allows a planter box to be constructed with a smaller area.

Vault with pumped discharge to bioretention facility. In this arrangement, runoff from a parking lot and/or building roofs can be captured and detained underground and then pumped to a bioretention facility on the surface. Alternatively, treatment can be accomplished with a sand filter. See the discussion of selection of storm water treatment facilities in Chapter 2.

Water harvesting or gray water reuse. It may be possible to create a site-specific design that uses cisterns or vaults to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse. Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

Design Checklist for Cistern or Vault

- ❒ Volume meets or exceeds minimum.
- ❒ Outlet with orifice or other flow-control device restricts flow and is designed to provide a 24-hour drawdown time.
- ❒ Outlet is piped to a bioretention facility designed to treat the maximum discharge from the cistern orifice.
- ❒ Cistern or vault is designed to drain completely and/or sealed to prevent mosquito harborage.
- ❒ Design provides for exclusion of debris and accessibility for maintenance.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.

NOTES:
1. DESIGNER SHALL ACCOUNT FOR AND ACCOMODATE FOR POSSIBLE OVERFLOW.
2. OVERFLOW OUTLET CAPACITY SHALL EQUAL OR EXCEED POTENTIAL RUNOFF VOLUME AND RATE.
3. CISTERN PROVIDES FLOW CONTROL ONLY. USE IN COMBINATION WITH TREATMENT IMP.
4. PROVIDE ACCESS FOR CLEAN OUT OF OUTLET ORIFICE. SEE FLOW-THROUGH PLANTER OUTLET DETAIL.
5. PREVENT MOSQUITO BREEDING BY SEALING OR SCREENING ALL OPENINGS TO THE WATER SURFACE AND/OR ENSURE COMPLETE DRAINAGE.

C

Storm Water Pollutant Sources/ Source Control Checklist

How to use this worksheet (also see instructions in Step 4 of Chapter 3 of this BMP Manual):

1. Review Column 1 and identify which of these potential sources of storm water pollutants apply to your site. Check each box that applies.

2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your Project-Specific SUSMP drawings.

3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in a table in your Project-Specific SUSMP. Use the format shown in Table 3-1 in Step 4 of Chapter 3 of this BMP Manual. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternatives.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **A.** On-site storm drain inlets	❑ Locations of inlets.	❑ Mark all inlets with the words "No Dumping! Flows to Bay" or similar.	❑ Maintain and periodically repaint or replace inlet markings. ❑ Provide storm water pollution prevention information to new site owners, lessees, or operators. ❑ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ❑ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains."

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 Potential Sources of Runoff Pollutants	2 Permanent Controls—Show on SUSMP Drawings	3 Permanent Controls—List in SUSMP Table and Narrative	4 Operational BMPs—Include in SUSMP Table and Narrative
❑ **B.** Interior floor drains and elevator shaft sump pumps		❑ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	❑ Inspect and maintain drains to prevent blockages and overflow.
❑ **C.** Interior parking garages		❑ State that parking garage floor drains will be plumbed to the sanitary sewer.	❑ Inspect and maintain drains to prevent blockages and overflow.
❑ **D1.** Need for future indoor & structural pest control		❑ Note building design features that discourage entry of pests.	❑ Provide Integrated Pest Management information to owners, lessees, and operators.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **D2.** Landscape/ Outdoor Pesticide Use	❑ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained. ❑ Show self-retaining landscape areas, if any. ❑ Show storm water treatment facilities.	State that final landscape plans will accomplish all of the following. ❑ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. ❑ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to storm water pollution. ❑ Where landscaped areas are used to retain or detain storm water, specify plants that are tolerant of saturated soil conditions. ❑ Consider using pest-resistant plants, especially adjacent to hardscape. ❑ To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	❑ Maintain landscaping using minimum or no pesticides. ❑ See applicable operational BMPs in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com ❑ Provide IPM information to new owners, lessees, and operators.
❑ **E.** Pools, spas, ponds, decorative fountains, and other water features.	❑ Show location of water feature, nearest landscaped areas, and nearest storm drains.	❑ Describe how water removed from the water feature would drain to nearby landscaping or be dechlorinated before discharge in accordance with City requirements.	❑ See applicable operational BMPs in Fact Sheet SC-72, "Fountain and Pool Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **F.** Food service	❑ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment. ❑ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer.	❑ Describe the location and features of the designated cleaning area. ❑ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.	❑
❑ **G.** Refuse areas	❑ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas. ❑ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area. ❑ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	❑ State how site refuse will be handled and provide supporting detail to what is shown on plans. ❑ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar.	❑ State how the following will be implemented: Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **H.** Industrial processes.	❑ Show process area.	❑ If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system."	❑ See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
❑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.)	❑ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area. ❑ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. ❑ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	❑ Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains. Where appropriate, reference documentation of compliance with the requirements of local Hazardous Materials Programs for: ▪ Hazardous Waste Generation ▪ Hazardous Materials Release Response and Inventory ▪ California Accidental Release (CalARP) ▪ Aboveground Storage Tank ▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991 ▪ Underground Storage Tank	❑ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	**2** **Permanent Controls—Show on SUSMP Drawings**	**3** **Permanent Controls—List in SUSMP Table and Narrative**	**4** **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **J.** Vehicle and Equipment Cleaning	❑ Show on drawings as appropriate: (1) Commercial/industrial facilities having vehicle /equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses. (2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use). (3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer. (4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed.	❑ If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced.	Describe operational measures to implement the following (if applicable): ❑ Wash water from vehicle and equipment washing operations shall not be discharged to the storm drain system. ❑ See Fact Sheet SC-21, "Vehicle and Equipment Cleaning," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **K.** Vehicle/Equipment Repair and Maintenance	❑ Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of storm water. ❑ Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas. ❑ Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained.	❑ State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area. ❑ State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements. ❑ State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.	In the SUSMP report, note that all of the following restrictions apply to use the site: ❑ No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinse water from parts cleaning into storm drains. ❑ No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately. ❑ No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **L.** Fuel Dispensing Areas	❑ Fueling areas[3] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of storm water to the maximum extent practicable. ❑ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area.		❑ The property owner shall dry sweep the fueling area routinely. ❑ See the Business Guide Sheet, "Automotive Service—Service Stations" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

[3] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **M.** Loading Docks	❑ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct storm water away from the loading area. Water from loading dock areas should be drained to the sanitary sewer where feasible. Direct connections to storm drains from depressed loading docks are prohibited. ❑ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer. ❑		❑ Move loaded and unloaded items indoors as soon as possible. ❑ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **N.** Fire Sprinkler Test Water		❑ Provide a means to drain fire sprinkler test water to the sanitary sewer.	❑ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com
O. Miscellaneous Drain or Wash Water ❑ Boiler drain lines ❑ Condensate drain lines ❑ Rooftop equipment ❑ Drainage sumps ❑ Roofing, gutters, and trim.		❑ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. ❑ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. ❑ Rooftop mounted equipment with potential to produce pollutants shall be roofed and/or have secondary containment. ❑ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. ❑ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.	

IF THESE SOURCES WILL BE ON THE PROJECT SITE ...	... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs		
1 **Potential Sources of Runoff Pollutants**	2 **Permanent Controls—Show on SUSMP Drawings**	3 **Permanent Controls—List in SUSMP Table and Narrative**	4 **Operational BMPs—Include in SUSMP Table and Narrative**
❑ **P.** Plazas, sidewalks, and parking lots.			❑ Plazas, sidewalks, and parking lots shall be swept regularly to prevent the accumulation of litter and debris. Debris from pressure washing shall be collected to prevent entry into the storm drain system. Wash water containing any cleaning agent or degreaser shall be collected and discharged to the sanitary sewer and not discharged to a storm drain.

Appendix

D

SWPPP and CSWMP Guidelines

STORM WATER POLLUTION PREVENTION PLAN/CONSTRUCTION STORM WATER MANAGEMENT PLAN GUIDELINES

At a minimum, the Storm Water Pollution Prevention Plan (SWPPP) or Construction Storm Water Management Plan (CSWMP) whichever is required, must cover the areas listed below.

If a project disturbs 1-acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by Chapter Six, in accordance with the State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). The SWPPP must be kept on site and made available upon request of a representative of the City. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Projects that are also required to obtain a general construction National Pollutant Discharge Elimination System (NPDES) Permit are encouraged to visit the State Water Resource Control Board's website for permit application instructions, NOI and NOT forms and guidance in preparing a Storm Water Pollution Prevention Plan (go to: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml).

For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all construction BMP requirements required by Chapter Six, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

Planning and Organization

- Identify the pollution prevention team members who will maintain and implement the SWPPP/CSWMP.
- If applicable, incorporate or reference the appropriate elements of other regulatory requirements.

Site Map

Features displayed on the map must include:

- An outline of the entire property
- Drainage areas on the property and direction of flow
- Areas of soil erosion
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing storm water controls (oil/ water separators, sumps, etc.)
- Location of "impervious" areas- paved areas, buildings, covered areas
- Locations where materials are directly exposed to storm water
- Locations where toxic or hazardous materials have spilled in the past
- Location of building and activity areas (e.g. fueling islands, garages, waste container area, wash racks, hazardous material storage areas, etc.)

List of Significant Materials

List materials stored and handled at the site. Include the location and typical quantities.

Description of Potential Pollutant Sources

- Provide a narrative description of the site's activities and list the potential pollutant sources and the

potential pollutants that could be discharged in storm water discharges from each activity.

- List non-storm water discharges including the source, quantity, frequency, and characteristics of the discharges and drainage area.

Assessment of Potential Sources

Describe which activities are likely to be sources of pollution in storm water and which pollutants are likely to be present in storm water discharges.

Best Management Practices

Describe the BMPs that will be implemented at the site for each potential pollutant and its source.

Appendix

E

Example Construction Best Management Practices

A. Erosion Control

Physical stabilization BMPs, vegetation stabilization BMPs, or both, will be required to prevent erosion and sediment runoff from exposed graded areas. BMPs for physical and vegetation stabilization include:

1) Physical Stabilization

a) Geotextiles
b) Mats
c) Fiber blankets
d) Hydraulic mulch, Bonded Fiber Matrix
e) Sprayed on binders
f) Mulch on flat areas
g) Other material approved by the City Engineer for use in specific circumstances

If physical stabilization is selected, materials must be appropriate to the circumstances in which they are deployed, and sufficient material must be deployed.

2) Vegetation Stabilization

h) Preservation of existing vegetation
i) Established interim vegetation (via Hydroseed, seeded mats, etc.)
j) Established permanent landscaping

If vegetation stabilization is selected, the stabilizing vegetation must be installed, irrigated and established (uniform vegetative coverage with 70% coverage established) prior to October 1. In the event stabilizing vegetation has not been established by October 1, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.

B. Sediment Control

1) Perimeter protection. Protect the perimeter of the site or exposed area from sediment ingress/discharge in sheet flows using:

k) Silt fencing
l) Gravel bag barriers
m) Fiber rolls

2) Resource protection. Protect Environmentally Sensitive Areas and watercourses from sediment in sheet flows by using**:**

a) Silt fencing
b) Gravel bag barriers
c) Fiber rolls

3) Sediment Capture. Capture sediments in channeled storm water by using:

a) Storm-drain inlet protection measures
b) De-silting basins (Designed in accordance with an industry standard such as Caltrans, California Storm water BMP manual etc. If the project is 5 acres or greater the desilting basin(s) must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.)

4) Velocity Reduction. Reduce the velocity of storm water by using:

a) Outlet protection (energy dissipater)
b) Equalization basins
c) Check dams

5) Off-site Sediment Tracking. Prevent sediment from being tracked off-site by using:

a) Stabilized construction entrances/exits
b) Construction road stabilization
c) Tracking control (i.e., corrugated steel panels, wheel washes)
d) Dust control

C. Materials Management

6) Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

a) Solid
b) Sanitary
c) Concrete
d) Hazardous
e) Equipment – related wastes
f) Stock piles (protection from wind and rain)

7) Prevent the contamination of storm water by construction materials by:

a) Covering and/or providing secondary containment of storage areas
b) Taking adequate precautions when handling materials.

SPCBMPP Worksheet

CITY OF LA MESA
JEWEL of the HILLS

Standard Post-Construction BMP Plan

Standard Permanent Storm Water BMPs

Project Name: _____ Project Address: _____
Person completing form: _____Telephone number: (____)____-_____
Signature: _____ Date: ____/_____/_____

The following planning, design, and post-construction BMPs are required for all land development and redevelopment projects in the City of La Mesa. All BMPs listed below shall be selected and implemented where applicable and feasible.

List pollutants of concern: _____

Each selected BMP must be shown on the applicable plan(s) for the project.

Required BMPs	Check if Selected	If the BMP is not selected, explain why below (attach additional pages if necessary).
1. BMPs for permanent control of erosion from slopes.		
a. Convey runoff safely from the tops of slopes		
b. Vegetate slopes with native or drought tolerant vegetation		
c. Other (describe):		
2. BMPs to control flows, velocity and erosion. Flow control and downstream erosion protection measures shall prevent any significant increase in downstream erosion as a result of the new development, but shall not prevent flows needed to sustain downstream riparian habitats or wetlands.		
a. Minimize disturbances to Natural Drainages		
b. Stabilize permanent channel crossings		
c. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels		
d. Provide buffer zones for natural water bodies		
e. Other (describe):		
3. Low Impact Development (LID) and site design BMPs.		
a. Conserve natural areas, soils, and vegetation where feasible		
b. Construct walkways, trails, patios. overflow parking lots, alleys, and other low-traffic areas with permeable surfaces		
c. Construct impervious surfaces to minimum widths necessary		
d. Use natural drainage systems		
e. Minimize soil compaction in areas that will remain pervious after development		

Required BMPs	Check if Selected	If the BMP is not selected, explain why below (attach additional pages if necessary).
f. Drain runoff from impervious roofs into adjacent landscaping		
g. Drain runoff from impervious sidewalks and/or walkways into adjacent landscaping		
h. Drain runoff from impervious parking lots into adjacent landscaping		
i. Drain runoff from other impervious areas into adjacent landscaping		
j. Other (describe):		
4. Storm drain stenciling and signage		
5. BMPs for outdoor materials storage and exposed work areas, to reduce pollution introduction.		
a. Provide overhead coverage for outdoor storage or work areas		
b. Divert storm water run-on away from outdoor storage or work areas		
6. BMPs for trash storage areas, to reduce pollution introduction. Store trash containers on an impervious surface in a screened or walled area designed to prevent run-on from flowing through the trash area, and provide a roof or awning to prevent direct contact with rain.		
7. BMPs for irrigation systems and landscape design, to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential developments)		
a. Use rain shutoff devices		
b. Design irrigation system to each landscape area's water requirements		
c. Use flow reducers		
d. Other (describe):		
8. Structural BMPs[1] to treat and/or to infiltrate storm water where a development project would otherwise cause or contribute to a violation of water quality standards in receiving waters.		

[1] Off-site structural BMPs may be used for treatment and infiltration necessary to meet water quality standards only if the conveyance of run-off to those facilities prior to treatment will not cause or contribute to an exceedance of water quality standards or deprive wetlands or riparian habitats of needed flows. Offsite facilities shall not substitute for the use of any on-site source control BMPs required by the manual. When an infiltration BMP is used, related BMPs set out in the manual (including but not limited to siting constraints), to protect present uses of ground water and future uses of that ground water as currently designated in the applicable RWQCB Basin Plan. (Discharges to infiltration BMPs may also require an RWQCB permit and additional state requirements may also be applicable to these discharges.)

City Use Only

If Structural BMPs are proposed, a maintenance agreement is required. Has a maintenance agreement for this project been submitted? □ Yes □ No □ NA

Approved □ Yes □ No

ATTACHMENT 2.2

UPDATED APPENDIX 'A' STORM WATER REQUIREMENTS CHECKLIST

APPENDIX 'A' – STORM WATER REQUIREMENTS AND PROJECT DATA SHEET

PUBLIC WORKS DEPARTMENT / ENGINEERING DIVISION
8130 Allison Avenue, La Mesa, CA 91942
Phone: 619.667.1166 • Fax: 619.667.1380

PROJECT DATA:

Owner's Name & Phone No: _____

Address: _____ **Permit No:** _____

Project: _____ **Date Applied:** _____

PROJECT SITE DATA:

1. Total area of the lot/parcel = _____ sf
2. Existing impervious area = _____ sf
3. Impervious area after development = _____ sf
4. Total area to be disturbed = _____ sf
5. Identify if the runoff from the site discharged to the public street or storm drain or open channel, detention or retention basin: Choose One
6. Watershed (Check One): San Diego River Watershed ☐ San Diego Bay Watershed ☐

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete Storm Water Requirements Applicability Checklist.

Notes:

- Items 1 through 6 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.
- A Hydrology report may be required.

STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS:

	Yes	No
1. Is the project a new development?	☐	☐
2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 ft^2 of impervious surface?*	☐	☐
* *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".*		

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes", complete Part A below.

PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.

DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL, PART II? (SEE GLOSSARY)*	Yes	No
1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units?	☐	☐
2. Commercial development resulting in the disturbance of one acre or more of land?	☐	☐
3. Industrial development resulting in the disturbance of one acre or more of land?	☐	☐
4. Automotive repair shop?	☐	☐
5. Restaurant greater than 5,000 square feet?	☐	☐
6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface?	☐	☐
7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition?	☐	☐
8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff?	☐	☐
9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater?	☐	☐
10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day	☐	☐
11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels.	☐	☐
***** *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.*		

Limited Exclusion: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met.

If all answers to Part A are "No", continue to Part B.

PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.

DOES THE PROJECT PROPOSE:	**Yes**	**No**
1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks?	☐	☐
2. New pervious landscape areas and irrigation systems?	☐	☐
3. Permanent structures within 100 feet of any natural water body?	☐	☐
4. Trash storage areas?	☐	☐
5. Liquid or solid material loading and unloading areas?	☐	☐
6. Vehicle or equipment fueling, washing, or maintenance areas?	☐	☐
7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (Except construction)?	☐	☐
8. Commercial/ industrial waste handling or storage, excluding typical office or household waste?	☐	☐
9. Any grading or ground disturbance during construction?	☐	☐
10. Any new storm drains, or alteration to existing storm drains?	☐	☐
**To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/water_issues/programs/stormwater/industrial.shtml*		

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the *Storm Water BMP Manual*. All Priority Development Project are also subject to the Hydromodification Management Requirements as discussed in the City's *Storm Water BMP Manual, Part II*, and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's *Storm Water BMP Manual*, Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

Required submittals, Section 1:	☐	PCWQTR	☐	SPCBMPP	☐	Hydromodification

SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS:

PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	**Yes**	**No**
1. Does the project proposed grading or soil disturbance over one acre?	☐	☐
2. Does the project propose any grading or soil disturbance?	☐	☐
3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas?	☐	☐
4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)?	☐	☐

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide General NPDES Permit for Storm Water Discharges Associated with Construction Activities and the City's Construction Storm Water BMP Performance Standards. A Storm Water Pollution Prevention Plan (SWPPP) and Notice of Intent to enroll in the General Construction Permit must be prepared. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards and a Construction Storm Water Management Plan (CSWMP) must be prepared and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to completed Parts D and E of this form and neither a SWPPP nor a CSWMP is required.

PART D: DETERMINE ADVANCE TREATMENT SUBJECTIVITY

WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?	**Yes**	**No**
1. Is the project located within, adjacent to, or a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity?	☐	☐
2. Will the project disturb more than five acres, including all phases of the development?	☐	☐
If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below.		
3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water?	☐	☐
4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors k_f greater than or equal to 0.4?	☐	☐

If <u>all</u> answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the *Storm Water BMP Manual,* Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer based.

<u>Required submittals, Section 2</u>:	☐	SWPPP, NOI	☐	CSWMP	☐	Advanced Treatment

PART E: DETERMINE CONSTRUCTION SITE PRIORITY

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

* Sites with a low or medium threat to water quality priority can be given a higher threat prioritization at the discretion of City staff based on additional factors, such as project type and non-storm water discharge potential.

Note: High soil erosion potential and significant slope are determined at the discretion of City staff.

According to the attached flow chart this project has the following threat to water quality priority:

☐ A) High Priority ☐ B) Medium Priority ☐ C) Low Priority

[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]

STORM WATER POLLUTION PREVENTION, DISCHARGE & EROSION CONTROL

Under the regulations that govern grading and construction activities in the (City of La Mesa Municipal Code Sections 7.18. and 14.05) property owners and permit holders are required to control erosion and storm water pollution by incorporating erosion and storm water pollution prevention Best Management Practices (BMPs) into all construction projects. Property owners and employed contractors are responsible for adhering the City's Construction BMP Standards including installing as needed:

- Sediment Control BMPs
- Erosion Control BMPs
- Materials Management BMPs
- Tracking Control BMPs

Additional information related Construction BMPs can be obtained at the Engineering Counter at City Hall, or at **www.cityoflamesa.com/stormwater**.

City inspectors will be inspecting your project periodically to ensure that required BMPs are installed correctly onsite. Property owners and the contractors are responsible for ensuring that the site is in compliance. The City will issue a Notice of Violation to both the contractor and owner for occurrences of non-compliance. Repeated violators may be subject to an administrative citation penalty.

I/We the owner/agent agree to follow Construction Best Management Practices and perform construction accordingly. We, the owners also agree to comply with City Storm Water Pollution Prevention Ordinance and permit the city employees to enter our property at any time to inspect for compliance with the ordinance/municipal code sections listed above.

_____ _____ _____

Signature (Owner or Agent) Address & Phone No. Date

RELATIONSHIP BETWEEN PERFORMANCE STANDARDS, SITE MANAGEMENT REQUIREMENTS AND BMPs

Site management requirements and BMPs are the tools necessary to achieve compliance with the performance standards. When properly implemented, monitored and maintained, the site management requirements and BMPs will function as a system to prevent pollutants (including sediment) from leaving the site.

The City of La Mesa is committed to protecting the public interest and the environment from pollutants in site runoff. We are asking for your support and cooperation in making sure that all construction sites comply with these standards.

Your cooperation will enable all of us to share the benefits of a cleaner environment without the expense of enforcement actions.

GENERAL The owner/contractor shall notify the City ***at least 48 hrs*** prior to commencement of any type of grading and/or construction activities. Erosion control plans shall be required in conjunction with the grading plans in the event the site is exposed to erosion during the period between November 1 and April 15.

Erosion control measures shall include, but not be limited to the following;

1. All building pads shall be diked and the dikes maintained to prevent water from flowing from the pad until the streets and driveways are paved and water can flow from the pads without causing erosion; drainage facilities shall be constructed to the satisfaction of the City Engineer that will allow water to drain from the pad without causing erosion.
2. The tops of all slopes shall be diked or trenched to prevent water from flowing over the crests of slopes.
3. As soon as cuts or embankments are completed, but no later than November 1, all cut and fill slopes shall be stabilized with a hydro mulch mixture or an equal treatment approved by the City Engineer. Between November 1 and April 30, approved slope protection measures shall proceed immediately behind the exposure of cut slopes and/or the creation of embankment slopes.
4. An irrigation system shall be installed not later than May 15 following the planting of the slopes.
5. Gravel bag check dams shall be placed in a manner approved by the City Engineer in unpaved streets with gradients in excess of 2% and or in other graded or excavated areas as required by the City Engineer. The location and details of the sand bags shall be shown on the plans, if required.
6. Catch basins, desilting basins and storm drain systems shall be installed to the satisfaction of the City Engineer.
7. At or near every point where concentrated flow leaves the development, a desilting basin and an energy dissipater may be required to be constructed to remove silt from the water and release the water at a non-erosive velocity.
8. The owner/contractor shall maintain the plantings and erosion control measures described above. The owner/contractor shall remove all soil intercepted by the sand bags, catch basins and desilting basins and keep these facilities clean and free of silt and sand as directed by the City Engineer. The owner/contractor shall repair any eroded slopes as directed by the geotechnical engineer.
9. The City of La Mesa reserves the right to provide emergency temporary erosion control measures during, if the owner/Contractor fails to provide such controlling measures, and charge double the expenses plus overhead to the owner/contractor.

PERFORMANCE STANDARDS

- No measurable sediment pollution in runoff from the site.
- Rills or gullies on slopes shall not be greater than 3" wide or deep and must be repaired as soon as it is safe to do so.
- The velocity **of water leaving the site must not be greater than pre-construction levels.**

Property owners are responsible for meeting the performance standards described above. These performance standards cannot be achieved without proper site management and effective BMPs.

SITE MANAGEMENT REQUIREMENTS

All construction sites must implement BMPs in accordance with the City's dry and wet season requirements, which are detailed below.

A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.
- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.

B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.
- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.
- Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- Adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.

- All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.
- Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

BEST MANAGEMENT PRACTICES

Every construction site within the City's jurisdiction is required to select, install, and maintain construction BMPs to reduce, retain, and manage pollutant discharges to the maximum extent practicable. The BMPs listed below are required by the City where applicable. The corresponding Caltrans fact sheet for the listed BMPs is indicated in parenthesis. These fact sheets are obtainable from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003) and provide additional details on how to implement the BMP.

Please check all BMPs below that are applicable and feasible for the construction that will be implemented and maintained for the length of construction.

- ☐ Preserve natural hydrologic features where feasible
- ☐ Preserve riparian buffers and corridors where feasible
- ☐ Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction
- ☐ Minimize exposure time of disturbed soil areas
- ☐ Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible
- ☐ Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible
- ☐ Preserve existing vegetation where feasible (SS-2)
- ☐ Establish permanent re-vegetation or landscaping as early as feasible

Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities:

- ☐ Cleaning (NS-8)
- ☐ Fueling (NS-9)
- ☐ Maintenance (NS-10)

Prevent the contamination of storm water from construction materials through proper management of the following types of activities:

- ☐ Material Delivery and Storage (WM-1)
- ☐ Material Use (WM-2)
- ☐ Stockpile Management1 (WM-3)
- ☐ Spill Prevention and Control (WM-4)

Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

- ☐ Solid Waste (WM-5)
- ☐ Hazardous Waste (WM-6)
- ☐ Contaminated Soil (WM-7)
- ☐ Concrete (WM-8)
- ☐ Sanitary Waste (WM-9)
- ☐ Liquid (WM-10)

Prevent the contamination of storm water through proper management of the follow activities:

- ☐ Water Conservation Practices (NS-1)
- ☐ Dewatering Operations (NS-2)
- ☐ Paving and Grinding (NS-3)
- ☐ Potable Water/Irrigation and Flushing (NS-7)

Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing <u>one or more</u> of the following BMPs:

- ☐ Hydraulic Mulch (SS-3)
- ☐ Hydroseeding (SS-4)
- ☐ Soil Binders (SS-5)
- ☐ Straw Mulch (SS-6)
- ☐ Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats (SS-7)
- ☐ Wood Mulch (SS-8)
- ☐ Earth Dikes/Drainage Swales (SS-9)

Reduce the velocity of storm water by using <u>one or more</u> of the following:

- ☐ Outlet Protection/Velocity Dissipation (SS-10)
- ☐ Slope Drains (SS-11)

Protect the Perimeter of the site or exposed area from sediment discharge using <u>one or more</u> of the following:

- ☐ Silt Fence (SC-1)
- ☐ Gravel Bag Berm (SC-6)
- ☐ Fiber Rolls (SC-5)

Capture sediments in channeled storm water by using <u>one or more</u> of the following:

- ☐ De-silting Basin3 (SC-2)
- ☐ Storm Drain Inlet Protection (SC-10)
- ☐ Sediment Trap (SC-3)
- ☐ Gravel Bag Barrier (SC-8)

Prevent sediment from being tracked off-site by using <u>one or more</u> of the following:

- ☐ Stabilized Construction Entrance (TC-1)
- ☐ Construction Road Stabilization (TC-2)
- ☐ Entrance/Exit Tire Wash (TC-3)
- ☐ Street Sweeping (SC-7)

Notes on above BMPs:

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans.

It is the responsibility of the property owner and permit holder to select, install and maintain appropriate BMPs. BMPs must be installed in accordance with an industry standard (e.g., Caltrans or California Storm water BMP Handbook).

At a minimum, the City requires that at least one of the BMPs listed in each category (A-E) below be installed and

maintained for all grading projects.

A. Erosion Control

Physical Stabilization BMPs, Hydraulic Stabilization BMPs, Vegetation Stabilization BMPs or a combination thereof, will be required to prevent erosion from exposed slopes. The City will not accept tracking, mulch, non-watered hydroseed or jute netting as a means to protect exposed slopes from erosion.

City approved BMPs for erosion control are as follows:

1. Physical Stabilization
   a) Geotextiles
   b) Straw or Coconut Blankets
2. Hydraulic Stabilization
   a) Bonded Fiber Matrix
3. Vegetation Stabilization
   a) Established interim vegetation (e.g., hydroseed)
   b) Established permanent landscaping

If vegetation stabilization (planting, hydroseeding) is selected for erosion control, the vegetative cover must be established by October 1st. If, in the opinion of the City Official, the vegetative cover is not established by October 1st, additional hydraulic or physical erosion control BMPs will be required.

B. Sediment Control

City approved BMPs for sediment control are as follows:

1. Perimeter Protection – Protect the perimeter of the site or disturbed area from sediment discharge.
   a) Silt Fencing
   b) Gravel Bags
   c) Straw Wattles
2. Resource Protection – Protect environmentally sensitive areas and watercourses from sediment.
   a) Silt Fencing
   b) Gravel Bags
   c) Straw Wattles

Private streets & paved area shall be swept by combination of broom and / or air vacuum sweepers.

C. Offsite Sediment Control

City approved BMPs for offsite sediment tracking control are as follows:

1. Offsite Sediment Tracking – Prevent sediment from being tracked offsite.
   a) Stabilized Construction Entrance
   b) Entrance/Exit Tire Wash
   c) Entrance/Exit Inspection and Cleaning Facility
   d) Streets shall be swept by combination of broom and / or air vacuum sweepers.

D. Velocity Reduction

City approved BMPs for velocity reduction are as follows:

1. Velocity Reduction – Reduce the velocity of stormwater runoff to prevent erosion.
   a) Outlet Protection
   b) Energy Dissipator

E. General Site Management

City approved BMPs for site management are as follows:

1. Construction Waste Handling – Prevent the contamination of storm water runoff by wastes through proper waste management.
   a) Solid Waste
   b) Sanitary Waste
   c) Concrete Waste
   d) Hazardous Waste
2. Materials Management – Prevent the contamination of storm water runoff by storage or handling of construction materials.

MUNICIPAL INSPECTION FORM

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

Inspector Name _____

Date____/____/_____Time_____AM / PM Type of Inspection: ☐ Routine ☐ Follow-up ☐ Complaint Investigation

A. Contact Information

Facility Name_____

Street Address_____ Mailing Address_____

_____ _____

Manager/Operator(s)_____

Telephone (□□□□□□) _____ - □□□□□□□□□□ ext._____ Fax (□□□□□□□) _____ - □□□□□□□□□□

Manager/Operator(s) Email:_____

Facility Personnel Present_____

B. Facility Site Information

Principal activity:_____

JURMP Classification_____

New JURMP Classification?_____

Does facility maintain SWPPP/BMP Plan? ☐ Yes ☐ No

If yes, what is the date of last SWPPP/BMP Plan revision?_____

If yes, does the SWPPP/BMP Plan include applicable minimum BMPs from the JURMP? (if no, describe in Section E) ☐ Yes ☐ No

If yes, does the SWPPP/BMP Plan include a current list of individuals Responsible for implementing BMPs at the site? ☐ Yes ☐ No

Does facility have a map/sketch of the site with flow lines and storm drains? ☐ Yes ☐ No

C. Initial Observations

Drainage basin: ☐ Alvarado ☐ University ☐ Spring Valley ☐ Lemon Grove ☐ Lake Murray

Nearest conveyances or water bodies: _____ Hydrologic Area: _____

Approximate distance to water bodies: ☐ □ 200 ft. ☐ 200 □ 1000 ft. ☐ 1000 ft.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by industrial or commercial activities: _____ square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

D. BMP Assessment

BMPs	N/A	Yes	No	Comments
D.1 General				
Is the site free of excessive litter and debris?				
Are discharge locations free of excessive sediment and debris?				
Are parking lots, sidewalks and streets free of excessive sediment and debris?				
Are roof downspouts directed away from areas of potential pollutants?				
Is wash water from pressure washing / hosing managed appropriately?				
Are employees trained in storm water management?				
Does the facility have a current log of employees who have participated in training?				
D.2 Landscaping				
Are adequate erosion prevention measures employed? (vegetation or physical stabilization)				
Are irrigation systems programmed to minimize over-watering and runoff?				
If reclaimed water is used for irrigation, is the site free of evidence of irrigation water entering the storm drain?				
Are stockpiles of soil or landscape waste covered when feasible and equipped to prevent runoff transport?				
Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs?				
D.3 Materials and Wastes				
Are adequate trash containers provided?				
Are adequate recycling containers provided?				
Is the trash/recycling area adequately covered (closed lids or permanent overhead cover)?				
Is the trash/recycling area free of litter and debris?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are outdoor materials that pose a threat to water quality stored appropriately (covered or in sealed containers)?				
Are outdoor storage containers properly labeled?				
Is there an accessible, appropriate spill response kit?				
Is there a written spill response plan? If so, please provide to inspector. (NA if no significant materials to spill)				
Are liquid storage containers/tanks equipped with secondary containment?				
Is secondary containment free of spills and rainwater?				
Are loading and unloading areas free of spills and debris?				
Is water from pools and/or fountains disposed of properly?				
D.4 Equipment and Vehicles				
Are exposed parking areas free of significant spills and leaks?				
Are vehicle maintenance activities conducted within contained areas when feasible (garage, canopy, work shop)?				

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

BMPs	N/A	Yes	No	Comments
Are equipment and vehicles inspected daily for leaks and repaired as necessary?				
Are storm drain inlets near vehicle-fueling areas protected from spills and leaks?				
Is vehicle washing preformed in a designated area where runoff does not enter the MS4?				
Are biodegradable soaps used when appropriate?				
D.5 Building Repair/Construction				
Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization)				
Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters)				
Are impervious areas free of debris and spills from painting, scraping, and/or sandblasting activities?				
D.6 Structural BMPs				
Are structural BMPs adequately maintained? (NA if no structural BMPs at facility)				
D.7 Non-Storm Water Management				
Is the site free of evidence of illicit connections and illegal discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				
D.8 Other				
Are there any other potential storm water pollution issues or concerns? If yes, explain below.				
E. ADDITIONAL COMMENTS (describe any additional deficiencies not represented above and/or notable BMP improvements)				

City of La Mesa
Storm Water Quality Inspection for Municipal Facilities

F. Corrective Action

Is corrective action needed? ☐ Yes ☐ No (If **BMP-related** corrective action is required, describe below.)

Operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax ☐ E-Mail

G. Violations

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described in Section F.

☐ Violation of City Ordinance(s):

- ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
  Description
- ☐ Illegal connection(s) to the storm drain system
  Location_____
- ☐ Littering
- ☐ Failure to properly implement required BMPs

☐ Other Violation_____

Specific action(s) required to correct the violation described above:

☐ Implement the recommended corrective actions listed in Section F.

Additional actions required:

H. Additional Recommended City Actions

Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff

Does this facility require a follow-up inspection? ☐ Yes ☐ No

INDUSTRIAL/COMMERCIAL INSPECTION FORM

CITY OF LA MESA
Storm Water Compliance Inspection for Industrial and Commercial Facilities (FY 09-10)

Inspector Name _____ Date_____Time_____

Type of Inspection: ☐Routine ☐Follow-up ☐Complaint

Result:☐Full Insp. ☐Could not Contact ☐Not Inventoried ☐Moved, Vacant ☐Moved, Replaced by_____ ☐Refused ☐Mobile ☐Duplicate of_____

A. CONTACT INFORMATION

Original	Changes
Business Name	Business Name
Street Address	Street Address ☐change
Responsible Person(s)_____	Responsible Person(s)_____
Title:_____	Title:_____
Business Telephone _____ext._____	Business Telephone _____ext._____
Business Fax _____	Business Fax _____

Home Based? ☐Yes ☐No Mobile Business? ☐Yes ☐No **APN**:_____

Is this facility located in a multi-suite complex? ☐Yes ☐No

Facility personnel present:_____

B. FACILITY SITE INFORMATION

Principal activity:_____

Assigned SIC code(s) _____ _____ _____ _____

Does SIC Code best represent principal activity: ☐Yes ☐No

Recommended change of SIC Code(s)?_____ _____ _____ _____

Existing SIC code(s) _____ _____ _____ _____

Status Update (if no longer active in City or does not need an inspection):☐Moved/Out of Business ☐Duplicate ☐Not Inventoried ☐Out of Jurisdiction

Does facility have a current business certificate? ☐Yes ☐No _____ Exp._____

Is facility subject to CA Statewide General Industrial Permit? ☐Mandatory ☐Conditional ☐No

Does facility have a Notice of Non-Applicability (NONA/NEC)? ☐Yes ☐No

Has facility filed a Notice of Intent (NOI) to obtain coverage? ☐Yes ☐No WDID: 9 37I0_____

Has facility filed a Notice Of Termination (NOT) for the WDID listed above? ☐Yes ☐No Approval date:_____ month/yr

Does facility maintain SWPPP or BMP Plan? ☐Yes ☐No

Does facility have a storm water monitoring program? ☐Yes ☐No

C. INITIAL OBSERVATIONS

Discharge points:

Approximate area covered by industrial or commercial activities:_____square feet

Approximate impervious surface of this area_____

Exposed areas of significant outdoor activity or storage? ☐Permanent ☐Occasional ☐No

D. BMP ASSESSMENT

BMPs	No Corrections Required		Corrections Required		Comments
	N/A	Fully Implemented	Partially Implemented	Not Implemented	
D.1 General					
Keep site free of litter, debris, and sediment using dry methods	☐	☐	☐	☐	
Keep storm drains on site free of litter and debris	☐	☐	☐	☐	
Keep outdoor areas free of spills and leaks	☐	☐	☐	☐	
Collect water from pressure washing or hosing and dispose of appropriately	☐	☐	☐	☐	☐Unknown Performed by:
Direct roof downspouts away from areas of potential pollutants	☐	☐	☐	☐	
D.2 Landscaping					
Properly manage pesticides/fertilizer; use IPM when feasible	☐	☐	☐	☐	☐Unknown Landscaping Co:
Employ adequate erosion prevention measures (vegetation or physical stabilization)	☐	☐	☐	☐	
Eliminate over watering/over-irrigation	☐	☐	☐	☐	
Properly store stockpiles to prevent material transport	☐	☐	☐	☐	
D.3 Materials and Wastes					
Protect trash area from contact with storm water	☐	☐	☐	☐	
Keep trash area free of litter and debris, liquids, powders, sediment	☐	☐	☐	☐	
Keep grease bin and area surrounding grease bin free of grease stains/spills	☐	☐	☐	☐	
Do oil-recycling/grease bins have overhead coverage?	☐	☐	☐	☐	
Adequately cover materials stored outside	☐	☐	☐	☐	
Prevent run-on from contacting materials stored outdoors	☐	☐	☐	☐	
Provide an accessible, functional spill response kit	☐	☐	☐	☐	
Equip liquid storage containers with spill containment	☐	☐	☐	☐	
Keep spill containment free of spills and rainwater	☐	☐	☐	☐	
Properly store and dispose of hazardous materials	☐	☐	☐	☐	
Keep loading and unloading areas, including drains, free of debris	☐	☐	☐	☐	
Dispose of water generated by processing activities appropriately	☐	☐	☐	☐	
Dispose of pool, spa, fountain, and filter backwash water properly	☐	☐	☐	☐	☐Unknown Performed by:
Clean floor mats in locations that do not drain to street or storm drain system	☐	☐	☐	☐	

BMPs	No Corrections Required		Corrections Required		Comments
	N/A	Fully Implemented	Partially Implemented	Not Implemented	
D.4 Equipment, Vehicles, and Outdoor Activities					
Conduct outdoor activities within contained areas (garage, under canopy, work shop)	☐	☐	☐	☐	
Use drip pans to collect leaks/spills	☐	☐	☐	☐	
Provide materials (berm, mat, etc.) to protect storm drain inlets from spills and leaks	☐	☐	☐	☐	
Perform vehicle/equipment washing in a contained area where runoff does not enter the MS4	☐	☐	☐	☐	
D.5 Other					
Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff	☐	☐	☐	☐	
Identify and eliminate illicit connections and illegal discharges	☐	☐	☐	☐	

D.6 Additional Required Actions

D.7 Additional Questions	Comments/Results
Are there any potential air sources that could contribute to atmospheric deposition of pollutants?	☐ Painting ☐ Sandblasting ☐ Fuel Distribution ☐ Dust dispersion or mineral processing ☐ Metal smelting ☐ Metal plating or anodizing ☐ Chemical production or mixing ☐ Large fuel burning device ☐ Incinerator
Are there any treatment control BMPs on site?	☐ Filter insert ☐ Hydrodynamic separator ☐ Debris screen ☐ Sewer diversion ☐ Vegetated swale ☐ Vegetated filter strip ☐ Biofiltration ☐ Detention/sedimentation basin ☐ Containment and evaporation or reuse ☐ Filtration
Are treatment control BMPs regularly maintained?	☐ Yes ☐ No ☐ Unknown ☐ N/A
What is the approximate percentage of the site that drains to the treatment control BMPs?	☐ N/A
Do major potential pollutant sources drain to treatment BMP(s)?	☐ All ☐ Some ☐ None ☐ N/A
If any illicit connections and/or illegal discharges were identified have the appropriate authorities been notified?	☐ Yes ☐ No ☐ N/A
If any illicit connections and/or illegal discharges were identified, were they eliminated during the site visit?	☐ Yes ☐ No ☐ N/A
Were any non IC/ID related corrective actions implemented during the site visit?	☐ Yes ☐ No ☐ N/A
Were any educational materials distributed?	NOI ☐ NONA/NEC ☐

E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

- ☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional notes and/or actions required: _____

_____

_____

F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions and Re-inspection Required.** Please refer to sections D.1-D.6, E, and F of this form.

☐ No Corrective Actions Required at this time.

G. RECOMMENDED CITY ACTIONS

ASSESSMENT

Level of knowledge regarding stormwater issues:	☐1	☐2	☐3	☐4	☐5
Level of cleanliness, BMP implementation, orderliness of site:	☐1	☐2	☐3	☐4	☐5

Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Site Name:_____

Pollutant	PDP	Sources Needing More BMPs							Recommended BMPs (check if applicable)			
		Trash Area	Material Storage	Prkng Lot	Load/ Unload	Land-scape	Veh/Eqp Maint	Exposed Work Area	Emp. Training	House-keeping	Minor Struct.	Major Struct.
Sediments	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Nutrients	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Aluminum	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Iron	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Heavy Metals	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Check if evidence indicates specific metals may have significant PDPs: ☐Copper ☐Cadmium ☐Lead ☐Zinc ☐Mercury												
Organic Compounds	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Check if evidence indicates there may be historical soil contamination associated with any of the following: ☐PCBs ☐PAHs ☐Chlordane ☐DDT												
Trash & Debris	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Oxygen Demanding	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Oil & Grease	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Bacteria & Viruses	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Pesticides	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Check if evidence indicates the following are used on site: ☐Diazinon ☐Chlorpyrifos												
Acid/Base (pH effects)	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐
Others (list):	0	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐	☐

- RW 303(d) Receiving water impairments, as listed in the most recent 303(d) list
- WS COC High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
- PDP pollutant discharge potential.
- Emp. Training employee training activities focused on storm water pollution prevention
- Housekeeping standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
- Minor Struct. minor structural BMPs that do not require building permits, such as covering with tarps or building berms
- Major Struct. major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results exceed the EPA benchmark by an order of magnitude or more

CITY OF LA MESA

SUPPLEMENTAL WATERSHED ASSESSMENT QUESTIONNAIRE AND INSPECTION

Business Name _____ Date:_____

Watershed (circle one): ---

Questions for Facility Contact Person

When water (from rain, sprinklers, etc.) leaves your site where does it go? ☐ Treatment Plant/Sewer ☐ Storm Drain System ☐ A Water Body (any) ☐ Don't Know/Unsure

Runoff leaving your site eventually reaches what water body (more than one can be checked)? ☐ San Diego Bay ☐ Chollas Creek ☐ Pacific Ocean ☐ San Diego River ☐ Mission Bay ☐ Don't Know/Unsure

What is your impression of the water quality/condition of the downstream water body? ☐ Good ☐ Fair ☐ Poor ☐ Don't Know

In general, what do you think are the main areas or activities at local businesses that could contribute to pollution of runoff? ☐ Washing Activities ☐ Washing Activities Done by Mobile Businesses ☐ Material Storage ☐ Material Processing ☐ Landscaping ☐ Repair Services ☐ Illegal Dumping ☐ Trash Area ☐ Don't Know/Unsure ☐ Other

Other than today's inspection, have you received any information or education about what your business should do to prevent pollution from entering the environment? ☐ Yes ☐ No

Observations

Was evidence of any non-storm water discharge (including allowable discharges) observed? ☐ Significant ☐ Minimal ☐ No

If irrigation system is present, which sprinkler head types are present (check all that apply)? ☐ Spray ☐ Rotor ☐ Microspray ☐ Drip ☐ Bubblers ☐ Water by hand ☐ Other ☐ NA

Approximate percentage of site's total pervious area that is landscaped: _____ %

Attitude toward compliance with storm water regulations: ☐ Receptive ☐ Neutral ☐ Resistant

Overall Source Ranking (for Watershed Pollutants of Concern)

☐ Significant ☐ Not Significant

LA MESA FOCUS NEWSLETTERS

CITY OF LA MESA
JEWEL of the HILLS

FOCUS

A Newsletter for the Citizens of La Mesa • August 2011

City to Distribute New Safety Handbook

The City has published a new community "Safety Handbook" as part of our ongoing efforts to provide valuable information to our citizens. The handbook contains important information on crime prevention, personal safety, emergency preparedness, and other topics. Development of the handbook is a joint project of the Police Dept. Crime Prevention Unit and the Fire Dept. The cost of publication is made possible by private donations and funds collected by the Police Dept. through asset seizure programs that target subjects involved in drug trafficking. No General Funds were required for this project.

The City is making plans to provide a copy of the handbook to each household and small business in La Mesa through distribution events beginning in mid August. Distribution will be done by volunteers walking assigned areas of the City delivering copies of the Handbook to houses, condos, apartments, and businesses. If you are interested in participating in one of more of the distribution events, contact the Police Department at 667.7514 to be placed on an interest list. Further information will be provided to you as distribution dates are confirmed. This is a great way to get to know your neighborhood better or explore areas of La Mesa you aren't familiar with while helping the City save money.

EVENTS CALENDAR

Aug 25 ..... General Plan – Housing Workshop
Aug 27 ..... Household Haz Waste Collection
Sep 5 ..... Labor Day – City offices closed
Sep 24 ..... Kids Care Fest
Oct 8 ..... Sustain La Mesa Festival
Oct 13 ..... Intergenerational Games
Oct 15 ..... Household Haz Waste Collection
Oct 22 ..... Park Appreciation Day

Pravada, located on Fletcher Parkway, is one of La Mesa's newest multi-family additions to available housing units in our community.

PLANNING FOR THE FUTURE OF HOUSING IN LA MESA

Workshop Planned for August 25

A new General Plan Housing Element is underway for the City of La Mesa. The Housing Element is the only element of the General Plan that is mandated to be updated every eight years. A primary goal of the Housing Element is to provide housing for the population growth forecasted for the next eight year planning period. The City must show adequate capacity within available sites with appropriate zoning to construct La Mesa's share of the units needed to house the future population. SANDAG predicts that La Mesa will need 1,700 housing units to support an anticipated population increase of approximately 2,800 people.

The majority of La Mesa's future growth in housing stock will be located around trolley stops and along the major transit corridors such as University Avenue, El Cajon Boulevard, and La Mesa Boulevard. These and other housing policy issues will be topics of a workshop on the Housing Element update, which will take place on Thursday, August 25 at 6:00 pm in the La Mesa Community Center, 4975 Memorial Drive. Anyone with an interest in the future of housing in La Mesa is encouraged to attend.

Participating in community workshops is just one of the ways you can make a positive contribution to your community.

ATTEND THE WORKSHOP ON AUG 25
Learn more about the General Plan Housing Element and take part in planning for La Mesa's future.

GRANT TO INCREASE RECYCLING OPPORTUNITIES FOR RESIDENTS IN MULTIFAMILY HOUSING

The City of La Mesa has received a grant from the California Department of Resources Recycling and Recovery to improve recycling opportunities for apartment and condominium complexes. Under the grant, eligible properties will receive space-saving reusable bags for separating recyclables in each unit, as well as aluminum can crushers. Properties will also be able to get indoor/outdoor recycling receptacles for use in common areas. The program is entirely grant funded so there is no cost to participate.

The goal of the grant is to increase recycling opportunities for multifamily residences in La Mesa. Program notices inviting participation will be mailed directly to property owners and managers in the coming months. For more information about the program or to be placed on the multifamily participation list, please contact the Department of Public Works Environmental Services Division at 667.1338 or by email at envirosvcs@ci.la-mesa.ca.us.

Cool Spots In & Around La Mesa

La Mesa residents who may be at risk from extreme heat can seek relief during the hot summer months at these La Mesa locations: Call sites directly for hours of operation:

Christian Science Reading Room
8370 La Mesa Blvd.
463.8470

La Mesa Adult Enrichment Center
8450 La Mesa Blvd.
464.0505

La Mesa Library
8074 Allison Ave.
469.2151

FREE Household Hazardous Waste and Electronic Waste Disposal

UPCOMING COLLECTIONS: **August 27 and October 15**

Household Hazardous Waste (HHW) collection events are available to City of La Mesa residents by appointment only at the EDCO facility, 8184 Commercial St., La Mesa. Please email appointment requests to lmhhw@edcodisposal.com or call EDCO at 287.5696 x4270. Be sure to provide your name, address, and phone number.

E-waste (electronic waste) is also accepted at the EDCO Station recycling buyback center during business hours, Monday through Saturday, without an appointment. Visit edcodisposal.com for more information.

To request additional information about the HHW program email envirosvcs@ci.la-mesa.ca.us or call the Environmental Services Division of the Public Works Department at 667.1338. For a complete HHW list or other information visit cityoflamesa.com/hhw.

LET'S CELEBRATE

10th Annual Kids Care Fest

Saturday, September 24 • 9:00 am – 2:00 pm

Briercrest Park and Grossmont Healthcare District
9001 Wakarusa Street

Fun FREE event for kids and the whole family

health info • fun zone • children's fingerprinting
health screenings • fire safety trailer • meet Fire & Police

In partnership between the City of La Mesa, Grossmont Healthcare District, and La Mesa Park & Recreation Foundation

Details coming soon on the City website or grossmonthealthcare.org

SAVE THE DATE *(and the Earth)*!

2011 "Sustain La Mesa" Environmental Festival

Saturday, October 8 • Harry Griffen Park

This year's festival will have more than 40 booths and exhibits as well as expert speakers and activities for all ages. Also featured will be the winners of the "Our Planet, Our Home" K-12 Environmental Literacy and Art Contest. The contest will have 16 winners over four different age categories and is open to all students from Kindergarten through 12th grade. Complete information about the festival and contest is available at cityoflamesa.com/SustainLaMesa.

This event is free for everyone. Watch the City website for additional details as they become available.

ADULT SOFTBALL

(Ages 18 and up)

Leagues forming later this year.
Watch for details on the City website or leave your contact information at 667.1172 #6

Serving the Cities of El Cajon, La Mesa and Lemon Grove

www.heartlandfire.org

Fire season is quickly approaching; do you know what to do in a Fire?

Over 350,000 home fires occur every year in the United States and more than 2,500 people a year die in these home fires. Odds are it will happen to you or someone you know. Here are a few tips on fire safety and prevention:

- Smoke alarms save lives. Install a smoke alarm outside each sleeping area and on each additional level of your home. If people sleep with doors closed, install smoke alarms inside sleeping areas, too.
  - Use the test button to check each smoke alarm once a month. When necessary, replace batteries immediately.
  - Replace all batteries at least once a year.
- Consider having one or more working fire extinguishers in your home.
- Consider installing an automatic fire sprinkler system in your home.
  - If you have a reported fire in your home, the risk of dying decreases by about 80% when sprinklers are present.
  - People in homes with sprinklers are protected against significant property loss—sprinklers reduce the average property loss by 71% per fire.
- Determine at least two ways to escape from every room of your home. Consider escape ladders for sleeping areas on the second or third floor. Learn how to use them and store them near the window.
- Select a location outside your home where everyone would meet after escaping. Practice your escape plan at least twice a year.
- Once you are out, stay out! Call the fire department from a neighbor's home.
- If you see smoke or fire in your first escape route, use your second way out. If you must exit through smoke, crawl low under the smoke to your exit. If you are escaping through a closed door, feel the door before opening it. If it is warm, use your second way out.
- If smoke, heat, or flames block your exit routes, stay in the room with the door closed.
  - If possible, stuff wet cloths around the door cracks and vents.
  - Signal for help using a bright-colored cloth at the window.
  - If there is a telephone in the room, call the fire department and tell them where you are.
- If your clothes catch on fire, you should – Stop, drop, and roll - until the fire is extinguished. Running only makes the fire burn faster.

To escape a fire, you should:

- Check closed doors for heat before you open them. If you are escaping through a closed door, use the back of your hand to feel the top of the door, the doorknob, and the crack between the door and door frame before you open it. Never use the palm of your hand or fingers to test for heat - burning those areas could impair your ability to escape a fire (i.e., ladders and crawling).

  HOT DOOR

  Do not open. Escape through a window. If you cannot escape, hang a white or light-colored sheet or bright cloth outside the window, alerting firefighters to your presence.

  COOL DOOR

  Open slowly and ensure fire and/or smoke is not blocking your escape route. If your escape route is blocked, shut the door immediately and use an alternate escape route, such as a window. If clear, leave immediately through the door and close it behind you. Be prepared to crawl. Smoke and heat rise. The air is clearer and cooler near the floor.
- Crawl low under any smoke to your exit - heavy smoke and poisonous gases collect first along the ceiling.
- Close doors behind you as you escape to delay the spread of the fire.

Your recovery from the emergency may greatly depend on your level of preparedness before the emergency happens. Take time now to prepare, visit heartlandfire.org, readysandiego.org, theredguidetorecovery.com or sdarc.org for preparedness tips and to download the "Wildfire Preparedness Guide."

Intergenerational GAMES

Thursday, October 13
9:30 am – Noon

La Mesa Middle School

This FREE fun filled half-day event pairs active older adults with local students in grades 4 through 6 in a circuit of physical activity games and knowledge challenges. Focus is on non-competitive fun activities that encourage lifelong health and fitness.

Active adults age 55+ and La Mesa/ Spring Valley students in grades 4 through 6 are encouraged to sign up. It's a great way to get kids active during the fall school break. Sponsorships are available. Registration forms can be downloaded from the City website or call the Community Center office at 667.1300 or the Adult Enrichment Center at 667.1322 for more information.

VISIT THE PUBLIC SAFETY BOOTH AT OKTOBERFEST

Friday, September 30 – Sunday, October 2

The La Mesa Police Department will be at Oktoberfest! Stop by our booth at La Mesa Boulevard and Acacia Avenue to learn more about Neighborhood Watch and discuss other crime prevention measures or concerns. A representative from Heartland Fire & Rescue will also be present to provide information on creating an emergency preparedness plan for your family. Don't miss out! Mark your calendar today.

The Sandwich Generation:
Who's Filling the Transportation Gap?

Did you know that more families are joining the "sandwich generation" - juggling jobs, children, and caring for aging parents? Are you a member of the Sandwich Generation?

Ask yourself these questions:

1. Do I have aging parents and children who need care?
2. Do I have aging parents, adult children, or grandchildren?
3. Do I have an aging friend or neighbor?
4. Do I belong to an organization that has aging members?

If you answered yes to at least one of the questions then you are a member of the Sandwich Generation. The Sandwich Generation is defined as an age group that is simultaneously caring for parents and children. The Pew Research Center reports that 1 out of every 8 Americans between the age of 40 to 60 is raising a child and providing care for a parent, while the U.S. Census Bureau reports 46% of households include an adult over 60.

Those statistics are mirrored as many juggle work, family, and social involvement while also providing care for an aging family member or friend. With most medical, personal care, and business appointments scheduled during the workday, members of the Sandwich Generation often are faced with tough choices. Do they provide transportation or do they miss all or part of their work day? MetLife Mature Market Institute reports American businesses can lose as much as $34 billion each year due to employees' need to care for loved ones 50 years of age or older.

The next time you or someone you know finds that they are trying to fill the transportation gap, call Rides4Neighbors. Our transportation assistance program provides rides for older adults age 60+ and adults with disabilities. The program offers eligible participants several service options: trained volunteer drivers who use their own vehicles to provide rides; a discount taxi scrip program; a weekly shopping shuttle; wheelchair accessible van transport if needed. And for active adults interested in maintaining their independence Travel San Diego is an exciting opportunity to learn all about public transportation. This small group class is designed for individuals aged 60+ and combines moderate walking and learning to use public transportation. Call Rides4Neighbors at 667.1321 for an application.

Sun Valley Golf Course

5080 Memorial Drive

7:00 am to sunset, 7 days a week

Adults: $10 for 9 holes, $14 for 18 holes

Students*: $7 for 9 holes, $10 for 18 holes

*(*includes college with valid student ID)*

CLINICS, LESSONS, AND SPECIAL PROGRAM ARE AVAILABLE

For details go to sunvalleygolfclub.com or call 466.6102

La Mesa Neighborhood Watch Program

You and your neighbors can make a difference in your community! A Neighborhood Watch group forges bonds among residents and provides a forum to address area specific concerns with La Mesa Police Department personnel. Here are some important reasons to start a Neighborhood Watch group:

- Develop neighborhood cohesion.
- Improve home security.
- Address particular, immediate crime problems.
- Become educated about circumstances in the community that might contribute to crime.
- Develop long-range solutions to prevent future crimes.

Start or join a Neighborhood Watch today! Here is how:

STEP 1: Call the Crime Prevention Specialist at 667.7545 for tips and information.

STEP 2: Speak with your neighbors and encourage their participation.

STEP 3: Pick a date, time, and location for the meeting.

STEP 4: Schedule the meeting with the Crime Prevention Specialist.

STEP 5: Publicize the meeting! Email, knock on doors, or drop off flyers.

At the first meeting you will discuss:

- Incidents of crime occurring in your neighborhood.
- How to identify and report suspicious activity.
- Crime prevention measures to protect your family and your home.
- How to maintain an active Neighborhood Watch group.
- Emergency preparedness and Neighborhood Watch.
- Crime related issues that are important to you.

The La Mesa Police Department is proud of our excellent working relationship with the community.

Thank you for taking an active role in making your La Mesa neighborhood a wonderful place to live.

I&I and You

Reducing Sewer Inflow and Infiltration

"I&I" is short for a big problem many communities face; sewer Inflow and Infiltration. Inflow occurs when rainwater is misdirected into the sanitary sewer system instead of storm drains. Infiltration occurs when ground water seeps into the sanitary sewer system through cracks or leaks in sewer pipes. The cracks or leaks may be caused by age related deterioration, loose joints, damage, or root infiltration.

So why is I&I such a problem? During rainstorms, rain water can enter the sanitary sewer through I&I sources and consume a large portion of the sanitary sewer system. Overloaded sewer pipes can result in service interruptions, flooded households, and sewage spills. Ignored I&I results in excessive flows in the sewers and into the wastewater treatment plant. This becomes a very costly problem for all of us.

What can I do to help?

- Inspect rain gutters on your house and make sure the downspout is not connected to the sanitary sewer. Rainwater should be directed to your lawn and/or the storm drain.
- Inspect sump pump connections and area/yard drains to ensure they are not connected to the sanitary sewer.
- Inspect your sewer cleanout to ensure the cap is tightly closed and that the cleanout pipe has not been damaged (such as by a lawn mower). Replace missing caps so rainwater cannot get into the sewer system.
- Avoid planting trees and shrubs over or near sewer lines. Roots can enter and damage sewer piping. Replacement of sewer pipes can be a huge expense to private property owners.
- Contact a plumber for periodic inspections for sewer pipe cracks, separated joints, or sags.

The City is constantly working to identify I&I problem areas by a variety of methods including sewer flow metering, smoke testing, and video inspection of the sewer pipes within the City's sewer mains. Problem sewer pipes are repaired, replaced, or rehabilitated to eliminate I&I. Together we can make difference.

Please share this information with your family, friends, and neighbors. For more information contact the City's Engineering Department 667.1166.

Say "No" To Runoff. Stop Over Watering!

On an average sunny day in La Mesa you would be hard pressed not to find at least a few residences with their sprinklers running and causing overspray, often the source of water running down the street. If you think to yourself, "What a water waster," you would be right! With the type of soil found in La Mesa, it doesn't take much moisture on the ground before water starts running off your property. This runoff is not only a waste of our most precious commodity; but also a waste of your hard earned money.

Follow these tips to help eliminate over irrigation:

- Monitor the amount of time it takes for runoff to begin to occur on your property.
- Design irrigation systems with control devices, sensors, or shut-off switches to address malfunctions.
- Don't irrigate non-planted areas.
- Regularly inspect your irrigation system for potential problems.
- Consider drip irrigation to save water and prevent runoff.
- Adjust irrigation rates according to seasons and weather conditions.
- Irrigate in the early morning, the most efficient time for watering with minimal evaporation.

You may not be aware that Helix Water District has several programs to help single-family homeowners conserve water. Residents are eligible to apply for irrigation controller rebates worth up to $200. For more information, call 466.0585, visit www.hwd.com/conserv or email conserve@helixwater.org.

Please share this information with family, friends, and neighbors. For more information contact the City's Storm Water Hotline 667.1134.

PARDON OUR APPEARANCE

Update to Citywide Street Resurfacing and Sidewalk Improvements

Preparation work is well underway to pave the streets of La Mesa. Sidewalk improvements have begun along Bancroft Drive between Spice Street and Johnson Drive. Once the Bancroft Drive portion of the project is completed, work will move to Waite Drive and Murray Hill Road, connecting the existing sidewalk on Murray Hill Road to High Street.

The first phase of undergrounding overhead utility lines has begun on Normal Avenue near Lowell Street and continues to move steadily toward Windsor Drive.

Portions of the following streets will be affected by resurfacing:

- Center Street
- Guild Street
- Commercial Street
- Center Drive
- Marengo Avenue
- Dallas Street
- La Mesa Boulevard
- Bancroft Drive
- Waite Drive
- Yale Avenue
- Orien Avenue
- Lowell Street
- Normal Avenue
- Parks Avenue
- Dale Avenue
- Lee Avenue

The resurfacing process will grind out approximately two inches of existing asphalt and replace it with new asphalt to provide these streets with many more years of service life.

New pedestrian ramps at street corners are also being installed in preparation for the resurfacing project.

Notices and door hangers are being distributed to affected residences and businesses. If you have questions please contact the number on the notice or call Project Manager Dirk Epperson at 667.1152. Thank you for your patience while the City completes these important infrastructure improvements.

PARK APPRECIATION DAY

Saturday, October 22
8:00 am to 12:00 pm

La Mesa's Parks are Our City's Jewels, Help Make Them Shine!

For individuals – Bring your own gloves, rakes, or trowels to your favorite park. Parents must accompany children under age 18 unless with a previously registered and supervised large group.

Signed waivers are required for all participants – download from the City website and bring with you to the park.

Have a large group? We can help you find a project your members can participate in together. Give us a call at 667.1300.

Volunteers help spruce up their favorite parks during 2010 Park Appreciation Day.

Council Actions

April 12, 2011

Adopted a resolution approving the amendment to the Memorandum of Understanding with the San Diego Association of Governments (SANDAG) to provide advanced funding using the TransNet Commercial Paper Program for improvements to city streets.

Adopted a resolution authorizing execution of an agreement with the San Diego Unified School District for the use of the La Mesa Municipal Pool.

April 26, 2011

Adopted a resolution approving the Mitigated Negative Declaration for the La Mesa Sewer Repair and Replacement in Maintenance Zones 2 and 3 as required by the State Revolving Fund Financial Assistance Application.

Adopted a resolution authorizing the City of La Mesa to apply to the State Water Resources Control Board for the State Revolving Fund Financial Assistance.

Adopted a resolution adopting the San Diego Association of Governments (SANDAG) annual fee update to the Regional Transportation Congestion Improvement Program (RTCIP) Development Impact Fee to comply with the requirements of SANDAG Commission Ordinance 04-01 and the TransNet Extension Ordinance and Expenditure Plan.

Adopted a resolution declaring there were weeds, rubbish and refuse existing upon certain streets, sidewalks and private property in the City and opened the Weed Abatement Program for 2011.

Adopted the Fee Schedule for Fiscal Year 2011-2012

May 10, 2011

Ratified the Design Review Board's approval of DRB-09-21 (Associated Investors and Developers) – for a proposed 12-unit residential development at 8659-61, 8673-8675, and 8677 Lemon Avenue.

Adopted a resolution adopting the City of La Mesa Fiscal Year 2011/2012 Annual Plan for Community Development Block Grant and HOME-funded activities.

Adopted a resolution authorizing execution of an amendment to a professional services agreement with KTU+A for work related to the Safe Routes to Transit project under the Communities Putting Prevention to Work, Active Community Transportation Grant Program.

Adopted a resolution in support of Assembly Bill 1022 (Fletcher) regarding the expanded community notification provisions pertaining to registered sex offenders.

Adopted a resolution adopting the California Uniform Public Construction Cost Accounting Act Procedures.

Adopted a resolution adopting the Multi-Jurisdictional Hazard Mitigation Plan.

May 24, 2011

Adopted a resolution authorizing reapplication for a Playful City USA designation in 2011 as part of the City's continuing Wellness Initiative.

Adopted a resolution authorizing a professional services agreement with Atkins North America Inc. for consulting services related to environmental review of the Collier Park Master Plan.

Adopted an Ordinance adding Chapter 2.40 to the La Mesa Municipal Code to adopt alternative procedures for bidding pursuant to the Uniform Public Construction Cost Accounting Act.

Authorized the issuance of a Special Event Permit and street closures for the La Mesa Village Merchants' Association Back to the 50's Car Show and adopted a resolution temporarily closing portions of Palm Avenue and Third Street during the duration of the event.

June 14, 2011

Ratified the Design Review Board's approval of DRB-10-01 (Grossmont Healthcare District) – for a proposed diagnostic and treatment building and power plant facility at the Grossmont Medical Campus at 5555 Grossmont Center Drive.

Adopted a resolution accepting a Highway Safety Improvement Program Grant and appropriating funds for the construction of traffic signal improvements at the intersection of University Avenue and Harbinson Avenue (Marian Street).

Adopted a resolution accepting a Highway Safety Improvement Program Grant and appropriating funds for the construction of traffic signal improvements at the intersection of University Avenue and Massachusetts Avenue.

Adopted a resolution authorizing execution of a lease agreement with the Challenge Center for use of the building known as Sunset Gym at 5540 Lake Park Way.

Adopted a resolution authorizing a grant application for Proposition 84 – Statewide Park Development and Community Revitalization Program of 2008 for Collier Park construction.

Adopted a resolution accepting a grant from the California Department of Alcoholic Beverage Control Grant Assistance Program and approved the addition of the grant funds to Fiscal Year 2011-2012 Budget.

Adopted the preliminary Biennial Budget for 2011-2013.

Adopted a resolution adopting the appropriations limit for fiscal year ending June 30, 2012, and the annual adjustment factors used to calculate the appropriations limit.

Adopted a resolution supporting findings and appropriation of funds for the recommended Park In-Lieu and Impact Fee Projects.

June 28, 2011

Ratified the Design Review Board's approval of DRB 11-02 (AT&T) – a proposed wireless communications facility at 4690 Palm Avenue.

Ratified the Design Review Board's approval of DRB-11-09 (8277 La Mesa Boulevard LLC) – for proposed exterior alterations to a commercial retail building at 8277 La Mesa Boulevard.

Adopted a resolution approving the 2011-2012 Memorandum of Understanding between the City of La Mesa and the La Mesa City Employees' Association.

Adopted a resolution approving the 2011-2012 Memorandum of Understanding between the City of La Mesa and the La Mesa Police Officers' Association.

Adopted a resolution authorizing the acceptance of the Fiscal Year 2011/2012 San Diego Service Authority for Freeway Emergencies (SAFE) Motorist Aid and Safety Grant of $23,489.00 for personal protective clothing.

Adopted a resolution authorizing a grant proposal for Healthy WorksSM School and Community Gardens Program to lead a pilot project to plan a joint use garden with Helix Charter High School.

Authorized Fire Department staff to proceed with the Weed Abatement Program to reduce fire hazards.

LA MESA FOCUS

City News & Events

Welcome to the first issue of the redesigned La Mesa FOCUS Newsletter. Based on community input, each issue of the FOCUS will be shorter in length, will focus on one subject matter, and will be published more frequently. We hope you find the new look and format more interesting and easier to read. In addition, the FOCUS will be available in a presentation format on Cox Cable channel 24 and AT&T U-verse channel 99. View programming schedule at www.cityoflamesa.com/GovChannel

La Mesa Celebrates **100 Years of Governing**

This year, the city is honoring the Centennial by hosting a Town Hall meeting on February 7 from 6:30 to 8:30 p.m. The meeting will be held at the La Mesa Community Center, 4975 Memorial Drive. In addition to the opportunity to learn about city services such as Neighborhood Watch, Emergency Preparedness, Safe Routes to Schools, planning efforts such as the General Plan Update and Park Master Plan, members of the public can ask the City Council questions or express concerns about their city. Residents will also find out how to become involved in the city's year long Centennial celebration.

La Mesa Blvd between Third and Fourth Streets, Credit: La Mesa Historical Society

The Town Hall meeting is a part of the City Council's strategic planning process that includes gathering input from citizens, reviewing city financial data, goals, and action plans at their annual workshop. These tools are used to determine the city's biennium budget.

2012 Centennial General Plan Update

In honor of La Mesa's 100th birthday, the City's General Plan will be updated and available for review in Spring 2012. Go to www.cityoflamesa.com/NotifyMe to sign up to be notified when the 2012 Draft General Plan Update becomes available. A General Plan is intended to provide comprehensive, long-term direction by establishing locally important goals and policies.

The City of La Mesa adopted its first General Plan in 1965. It has been amended and updated periodically as state law has changed and as local needs have changed. A comprehensive update of the General Plan was last adopted by the City Council on March 12, 1996 and the Housing Element was last updated in 2005.

The General Plan update strengthens policies that preserve single-family neighborhoods while promoting in-fill development in commercial areas and along transit corridors in La Mesa. The Project will align the City's General Plan with regional goals and new State legislation that has been adopted since 1996.

The next step in the approval process for the General Plan Update is the preparation of an Environmental Impact Report (EIR). The EIR process allows for public review of the draft plan and its environmental consequences. The EIR process begins in 2012 and will take 12-18 months to complete. Once the EIR is complete, public hearings before the La Mesa Planning Commission and City Council will be held to adopt the updated 2012 General Plan.

The draft plan was completed by city staff with the help of consultants and funding with grants from the Kaiser Foundation and SANDAG.

Watch La Mesa's Government Access Channel

Council Meetings: 2nd Tuesday, 4 p.m.; 4th Tuesday, 6 p.m.

Residential Crime Prevention, Merchants Crime Prevention, Click It or Ticket!, Sustain La Mesa: Mondays/Wednesdays, 7 – 8 p.m.; Saturdays/Sundays, 3 – 4 p.m.

Bulletin Board: Mondays/Wednesdays/Fridays, 7 – 8 a.m.; Saturdays/Sundays, 4 – 5 p.m.

Programming is available on Cox Cable channel 24 within city limits and AT&T U-verse channel 99 within San Diego Region. View complete broadcasting schedule on City's Website.

New Initiatives in the 2012 General Plan Update include:

- The Global Warming Solutions Act of 2006 (AB 32)
- The Sustainable Communities and Climate Protection Act (SB 375)
- California Complete Streets legislation (AB 1358)
- Consistency with the Regional Comprehensive Plan (RCP), Sustainable Communities Strategy (SCS), and Regional Transportation Plan (RTP) adopted by the San Diego Association of Governments (SANDAG)
- Inclusion of the City's Hazard Mitigation Plan
- Health & Wellness Element

With a 20-year planning horizon, the General Plan update will plan for approximately 7,800 new people, 1,800 new housing units, and 1,200 new jobs based on SANDAG's regional growth forecast for La Mesa:

- 2010 La Mesa population 58,150
- 2030 La Mesa population 65,984 (13% increase)
- 2050 La Mesa population 77,780 (33% increase)

La Mesa Recycles!

The City currently has recycling programs to target waste streams that would otherwise be disposed of in our region's landfills. These diverted materials are given second lives through recycling programs such as EDCO's commingled recycling and the City's construction and demolition debris recycling requirement. La Mesa's recycling program has diverted 32,000 tons of material, a 43% reduction since 2004. According to statewide figures from the California Department of Resource Recycling and Recovery, 32 percent of that remaining waste sent to landfills is organic. Composting makes sense!

NEW BACKYARD COMPOSTING BINS AVAILABLE

Discount for La Mesa Residents!

The City of La Mesa is offering discounts to residents to purchase backyard compost bins for $30 in a partnership with Dixieline ProBuild. To qualify you must live in the incorporated City limits. Residents may request a coupon from the City that they can redeem at the La Mesa Dixieline ProBuild store (while supplies last). The coupon is worth $40 off $69.99 retail value of the bin.

The City uses funds collected through its existing recycling programs to reimburse the store for the cost difference. This program does not apply to businesses or multifamily property owners, although they are encouraged to purchase composters and participate in recycling of organic waste.

Interested residents may access our "Guide to Backyard Composting" and the coupon request form at **cityoflamesa.com/composting** or at City Hall. Composting classes are offered by the Water Conservation Garden and EDCO. Questions? Contact the Environmental Services Division at **envirosvcs@ci.la-mesa.ca.us** or **667.1338**.

Parks are a great place to celebrate special occasions!

Whether you're planning a wedding, birthday party, corporate event or family get-together, park use permits are required for groups of 25 or more, and for special use such as astrojumps. No alcoholic beverages are allowed without a special permit. Make your reservation today at **rsvp4parks@ci.la-mesa.ca.us** or **667.1307**.

NEW Enhanced Online Enrollment for Recreation Classes & Camps

Convenient – Secure – Guaranteed Class Choice

Community Services staff is available to help assist you with online enrollment at **667.1300** and/or email at **community@ci.la-mesa.ca.us** Monday through Thursday 7:30 am to 5:30 pm and alternate Fridays to 4:30 pm. Please note program instructors will no longer be accepting enrollment in class, therefore early enrollment is encouraged since there are a minimum number of participants required to hold class. Where enrollment is low, we may need to cancel the course one week prior to the start date.

Follow us on Twitter **@LaMesaCommunity**. We post relevant community services information and highlights from events and programs, in addition to fun contests and prize giveaways.

Get Out and Play!

Summer is just around the corner, and that means summer camps, enrichment classes, and youth aquatic classes are being offered. Enrollment starts March 1st for day camps and May 1st for summer activities. View activities schedules online at **cityoflamesa.com/classes**. Click on the orange "Enroll Online" button for online enrollment.

Fundraising for the La Mesa Centennial Flag Day Parade... For Today and Tomorrow

The Flag Day Parade is organized by volunteers and supported financially by community individuals, organizations and businesses. In honor of our Centennial the fundraising goal is $25,000 ($15,000 for the 2012 Parade and $10,000 to create a future parade endowment). We hope you will become one of the sponsoring partners of our Centennial Flag Day Parade. For more info, call **667.1333**.

April 2012

Important Information About Your Sewer Bill

Effective July 1 the City will discontinue bimonthly sewer billing and bill annually on property tax bills. This change does not affect the rate at which sewer charges are calculated. Charges will still be calculated for each property using winter water consumption from the previous five years and will be recalculated each year on July 1.

If you own property in La Mesa you are responsible for sewer charges incurred at that property. These charges will appear on the annual property tax bill you receive from the County Assessor-Tax Collector's office as a fixed charge special assessment. If you operate a business or rent a single-family home, condominium, apartment or commercial/industrial space in the City of La Mesa but do not own the property, you will not receive a sewer bill after July 1. Sewer charges will be billed to the property owner on the annual property tax bill.

Customers who pay property taxes through an impound account may need to adjust their monthly payment to cover the sewer service charges. The average annual single-family sewer charge is currently $400 a year. These charges are not tax-deductible on your income tax return and should not be used to reduce your tax burden.

WHY THE CHANGE?

La Mesa has shared billing systems with Helix Water District for the past 20 years. Helix Water District is changing their billing system and will no longer be able to support the City of La Mesa billing function. The City examined various options for sewer billing and found that placement of charges on the property tax bill was the most cost effective solution.
The billing change will result in a substantial reduction in processing and mailing costs. La Mesa currently processes about 13,700 sewer bills every other month.

QUESTIONS?

If you have questions about the sewer billing changes, visit our website at **cityoflamesa.com/Sewer** or call **961.2848**.

- Have moved recently
- Changed your name
- Wish to change your political affiliation
- Will be at least 18 years of age on or before the next election

Postcard registration forms are available at the following locations:

- Registrar of Voters Main Office
- All City Clerk Offices
- Department of Motor Vehicles
- U.S. Postal Services
- Public Libraries

Call the Registrar of Voters main office at **858.565.5800** or visit their website at **sdvote.com** for more information on voter registration.

CONSTRUCTION ACTIVITY UPDATE

The City of La Mesa is currently in construction on various projects throughout the City. The following is a status update on some of these projects:

COLLECTOR STREET RESURFACING PROJECT

TC Construction was selected to pave several collector streets throughout the City. The remaining streets to be paved are Commercial St., Center St. (from Jackson Dr. to Center Dr.), Center Dr., Guild St., La Mesa Blvd. (from Grossmont Blvd. to I-8), Bancroft Dr. (from south City limit to Grossmont Blvd.). These are scheduled to be completed by the end of May. These streets will be paved at night. There will be detours and street closures during construction. Please refer to public notices for details, including: flashing sign boards, door hangers, and press releases.

OLD POLICE STATION DEMOLITION PROJECT

Anton's Service, Inc. was selected to demolish the old police station. The hazardous materials, including asbestos and lead, were abated by Casper Construction prior to the demolition work. The demolition is moving along and is scheduled to be completed by the end of April.

Demolition of old La Mesa Police station.

City News & Events

May 2012

National Police Week

National Police Week recognizes the service and sacrifice of U.S. law enforcement and pays special recognition to those law enforcement officers who have lost their lives in the line of duty for the safety and protection of others. Several local, state, and national peace officer memorial services occur each year to commemorate National Police Week.

This year's ceremonies will include a candlelight vigil at the San Diego County Law Enforcement Memorial on Tuesday, May 1 at 8:00 pm and a memorial ceremony on Wednesday, May 2 at 12:00 pm. The San Diego Law Enforcement Memorial is located on the west lawn of the County Administration Building at 1600 Pacific Highway. The California state memorial will take place at the capital building in Sacramento on May 7. The national memorial will be held in Washington, D.C. on May 15.

Each of these ceremonies are meant to be a time to remember and honor the officers who have fallen in the line-of-duty the preceding year, recognizing the sacrifice of those loved and left behind.

Weed Abatement Season Is Coming

It's that time of year when the annual vegetation growth from the winter rains begins to die. This can create a nuisance and often a fire hazard.

La Mesa conducts a citywide Weed Abatement program each year to identify properties that have dead vegetation, weeds, dry grass, and debris. This year the city has contracted with Fire Prevention Services, Inc. to conduct inspections and follow up on reported complaints.

Residents are encouraged to inspect their properties and remove any dry weeds, fallen tree limbs, trash, or other nuisances. You may have to clear your property more than once during the year to keep it in compliance. Remember, it is your responsibility to keep your property maintained year round.

For more information regarding the Weed Abatement Program and how to make sure your property is safe, visit **heartlandfire.org** and click on the Fire Prevention tab. You can also call Fire Prevention Services, Inc.'s 24-hour weed abatement line at **866.779.3774** ext. **304** to report a fire hazard and/or public nuisance.

Want to make a difference in your community?

VOLUNTEER FOR A CITY BOARD, COMMISSION, OR COMMITTEE

The City encourages citizen participation in municipal government and welcomes your interest in serving on a board, commission or committee. These groups provide valuable public input into government and assist in the decision making process.

Recruitment is currently open for appointments on City boards, commissions, and committees. Serving in an advisory capacity, each group has specific roles and responsibilities. Most groups meet once a month for a couple of hours. Additional information and application forms are available on the City website, by visiting the City Clerk's office at City Hall, 8130 Allison Avenue, or by calling the Clerk's office at **667.1120**.

Applications must be submitted to the City Clerk's office no later than 5:30 pm June 7 to be included in the interview process, tentatively scheduled for 6:30 pm on June 26. The interview and selection process for the Youth Advisory Commission occurs in September.

Styrofoam™ can now be recycled in your blue bin

You can now put polystyrene (Styrofoam™) with other recyclables in your blue EDCO collection bin! Packaging and clean food containers can be turned into new products like picture frames, interior molding, garden pots, and auto accessories. Packing peanuts are not included in this program. For more information visit **cityoflamesa.com/recycling**.

May is Drowning Prevention Month

Drowning is a leading cause of injury-related death among children under the age of five and each year near drowning accidents result in lifelong disabilities. The month of May has been identified as Drowning Prevention Month to raise awareness of the issue and remind parents and caregivers to be sure children are safe in and around the water. Learn-to-swim classes are a good place to start. Enroll now for summer swim programs on the City website or call **667-1494** for information.

CONSTRUCTION ACTIVITY UPDATE

Annual Street Maintenance Project

The City's Annual Street Maintenance Project is anticipated to start in June and extend through August. In preparation of the project, the City completed other related work such as tree and sidewalk maintenance and ADA upgrades. The Street Maintenance project primarily includes crack sealing, slurry coating and restriping of selected streets. This year's project will focus on streets in the northeast area of the City. Please refer to the City's website at **cityoflamesa.com** for additional street maintenance information.

La Mesa Continues its Centennial Celebration at the Flag Day Parade

On Saturday, June 2 downtown La Mesa Village will dress up in red, white, and blue to celebrate 100 years and A Salute to Old Glory! at the La Mesa Centennial Flag Day Parade. Spectators are encouraged to dress in patriotic attire and enjoy the free Centennial events. Be advised that there will be many temporary road closures. For the safety and enjoyment of everyone, please adhere to these closures. Following is a line up of the activities.

9:00 am – Pre parade concerts

Listen to La Mesa Middle School Band at La Mesa Boulevard and Palm Avenue or East County Youth Symphony at La Mesa Boulevard and Nebo Drive.

10:00 am – Centennial Parade marches through downtown La Mesa Village

Spectators will enjoy marching bands led by the United States Marine Corps Band, floats, military vehicles, active and retired war heroes, equestrian units, service clubs, and youth groups. The Grand Marshal is Helix Charter High School CIF Division II State Football Champions. The La Mesa Centennial Flag Day Parade is sponsored by: Drew Ford, Barona Resort & Casino, SDG&E, Flood Masters, La Mesa Welfare Association, Lee & Jo Ann Knutson, Montezuma Land Co. LLC, Pamela J. Wagner, Shannon O Dunn, Viejas Tribal Government, and Walmart.

11:00 am – Community Picnic

The La Mesa Chamber of Commerce, Viejas Band of Kumeyaay Indians, Golden Acorn Casino & Travel Center, and Starbucks are sponsoring a picnic on Palm Avenue between La Mesa Boulevard and Allison Avenue until 1:00 pm or while supplies last.

12:00 pm – Community Photo

Help us recreate the 1923 community photo (shown below) at La Mesa Boulevard and Palm Avenue The photo will be available for sale on SmugMug.com, Password: 100 Continued Page 2

La Mesa Continues its Centennial Celebration at the Flag Day Parade Continued from Page 1

All Day – Amazing Geocache Challenge Begins

The La Mesa Centennial Amazing Geocache Challenge kicks off at the parade. Team up with friends and family for this outdoor adventure! Geocaches (containers) will be hidden throughout the city at local parks, attractions, and historical landmarks. Each hidden treasure will reveal interesting historical facts and a challenge question. You'll receive a set of coordinates, to which you'll navigate using your own handheld GPS device or GPS-enabled smart phone. Join the Amazing Geocache Challenge and celebrate the La Mesa Centennial!

Visit the La Mesa Centennial and La Mesa Historical Society booth at the parade for information about La Mesa's history, the Amazing Geocache Challenge, and Centennial commemorative items. For more information about these and other Centennial events, visit the official La Mesa Centennial website at **cityoflamesa100.com**.

Outdoor Cooking Safety & Awareness

Everybody loves an outdoor barbeque. However, outdoor cooking can also lead to tragedy when carelessness causes serious burns. Heartland Fire & Rescue offers the following safety checklist to use when cooking outdoors.

- When lighting a grill, the safest fire starters are chemicals in cake form or a charcoal electric starter.
- Never add fire starter after you have started your barbeque. The heat from the coals could ignite the stream of liquid and burn back into the can, causing it to explode in your hands. To speed a slow fire, tuck dry kindling under charcoal.

- Make sure the barbeque grill is level and steady and keep a container of water nearby.
- After cooking, soak the coals in water. Dispose of charcoal in a metal container with a tight fitting lid. Many brush fires start because hot coals, thought to be cool, were dumped in leaves.
- Barbeque grills should never be brought inside a house, tent, or recreational vehicle, because of the danger of carbon monoxide poisoning in sealed or confined areas.
- Keep small children away from the barbeque.
- Damp or wet charcoal should be immediately disposed of, as it can spontaneously combust.

For more information about Outdoor Cooking and other safety tips, visit **heartlandfire.org** and click on the Fire Prevention tab.

FREE Paper Shredding Event

Don't discard – shred your household documents in a quick and easy way by bringing them to La Mesa's EDCO Station, 8184 Commercial Street.

Saturday, June 23
9:00 am - Noon

- Limit 2 boxes per La Mesa household
- Staples ok
- Shredding will be done onsite
- No appointment necessary

This City event is made possible through the generous support of the EDCO Disposal Corporation. Questions can be directed to **667.1167**.

CONSTRUCTION ACTIVITY UPDATE

Annual Slurry Seal

American Asphalt South will be slurry sealing many of the streets within Maintenance Zone 3 located in the northeast area of the city. Prior to slurry sealing, trees were trimmed and concrete sidewalk maintenance was performed.
For a complete list of streets, go to: **cityoflamesa.com/2012SlurrySeal**. Call 667.1166 with questions.

Normal Avenue Utility Undergrounding

Work will continue on Normal Ave. for installation of new cables for utility service in recently placed underground conduits.

Maintenance Zone 3 Map

SUNDAYS AT SIX CONCERT SERIES

The Sundays at Six summer concert program is a series of free concerts held in the beautiful outdoor amphitheater at Harry Griffen Park. As the name implies, concerts are held on Sunday evenings beginning June 10 at 6:00 pm. In honor of La Mesa's Centennial celebration the concert run has been expanded to 10 concerts – one for each decade. The concert lineup is available at cityoflamesa100.com. Choose your favorite era or gather friends and family and attend them all.

City of La Mesa
Storm Water Pollution Prevention
Tips for Outdoor Vendors

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying storm water runoff into receiving water bodies, such as creeks, lakes and oceans. Unlike the sewer system, storm water runoff entering the storm drain system is not treated. Harmful pollutants, as listed below, can be transported during non-storm water discharges such as hosing down side walks or equipment. These types of pollutants are harmful to the environment and negatively impact water quality, aquatic animal and plant life as well as our quality of life. Non-storm water discharges are prohibited and in violation of the City Ordinance. A list of common pollutants and pollution prevention tips are provided below.

Pollutants of Concern

1. Sediment
2. Fertilizers
3. Metals
4. Detergents
5. Pesticides
6. Organic Compounds (solvents)
7. Trash and Debris
8. Oil and Grease
9. Bacteria

Good House Keeping

- Dry sweep exterior paved areas. **Do not use a hose or water!** Place debris in dumpster and keep dumpster lid closed.
- If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer system (sink or toilet). Wash water is not allowed to enter the storm drain.

Outdoor Material and Equipment Management

- Store material under covered areas.
- Place liquid material in secondary containment to ensure spills are contained.
- Ensure that frying oil is contained and managed properly without dropping/leaking on to the pavement.
- If using frying oil, ensure that you purchase absorbent material (absorbent pads) to address cleanup of potential oil spills.
- Inspect/fix equipment to ensure no leaks.
- Do not wash equipment at the event!

Waste Management

- Place trash in dumpsters with lids always closed.
- Cleanup leaks/spills immediately and place waste material into the dumpster

Should you require clarification or additional information on storm water pollution prevention, please contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.2

OVER IRRIGATION FACT SHEET

City of La Mesa
Storm Water Pollution Prevention
Over-Irrigation

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

With La Mesa's clay soils, it doesn't take much to moisten the ground before water starts running off your property to the curb, down the street and into the storm drain. Runoff from over-irrigation may transport pollutants such as sediment, pesticides, fertilizers, pet waste, bacteria, and automobile fluids. These pollutants enter our local creeks and streams and discharge into the ocean.

Over-irrigation is not prohibited; however, the following measures are recommended.

1. Over-irrigation runoff shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Irrigate to meet site-specific conditions to prevent over-watering.
3. Ensure that your irrigation system has control devices, sensors or shut-off switches to address malfunctions.
4. Place or group plants with similar water needs within the same area.
5. Don't irrigate non-planted areas.
6. Inspect your irrigation system regularly for potential problems
7. Consider drip irrigation to save water and prevent over-irrigation and runoff.
8. Adjust irrigation rates according to seasons, weather conditions and the soil's ability to absorb water. Instead of watering for 15-minutes straight, break up the session into 5-minute intervals, allowing water to soak in before the next application.
9. Irrigate in the early morning; it's the most efficient time to water plants with minimal evaporation.
10. Refrain from irrigation during hot, windy periods of the day. Do not let water run out into the street.

Do the right thing, stay in compliance and protect our environment. For more information contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.3

CHOLLAS CREEK TMDL FACT SHEET

Chollas Creek TMDL Fact Sheet

What are the Chollas Creek TMDLs?
In 2003 and 2007, Total Maximum Daily Load (TMDL) allocations for the pesticide diazinon and for heavy metals (copper, lead, and zinc), respectively, were adopted by the Regional Water Quality Control Board (a State Regulatory Agency) for Chollas Creek. The regulations establish strict numeric limits on the amounts of heavy metals and diazinon that can be present in urban runoff. Southwestern La Mesa, roughly bounded by El Cajon Boulevard to the north and Spring Street to the east (see map), eventually drains to Chollas Creek and is subject to these requirements. Businesses within this area are impacted by these new requirements. The City is monitoring water quality near your business to identify and eliminate sources of these pollutants to comply with new State regulations. The following activities/sources contribute to the discharge of heavy metals and diazinon.

Heavy metals are commonly associated with industrial waste, uncontained storage of certain metal products or materials (such as galvanized steel), cutting and grinding activities, atmospheric deposition, metal smelting or plating, and automobile tires and brakes.
Diazinon is a pesticide associated with landscaping activities. It has been banned for use and is no longer available at retail outlets. Diazinon acquired prior to the ban should be disposed of in accordance with state and federal regulations.

What is the City of La Mesa doing about these TMDLs?
The City's many efforts to protect water quality and comply with State regulations include regularly sweeping its streets and cleaning out its storm drain system, inspecting businesses and construction sites, and applying strict water pollution control standards to new development projects.

What do these TMDLs mean for my business?
The City's Municipal Code requires that businesses take measures to ensure that urban runoff (water that leaves your business and enters storm drains) is not contaminated with pollutants. Chapter 7.18 of the Municipal Code requires businesses to implement measures including those listed below. Taking these actions will help meet TMDL requirements.

- Eliminate non-storm water discharges, such as hosing off property and allowing the water to leave the site, dumping liquids into a storm drain, and runoff from excessive irrigation.
- Cover and contain metal products or materials that may contain heavy metals where feasible. Examples of such materials include galvanized metal, brake pads, tires, and metal recycling bins.
- Conduct metal cutting, grinding, welding, automotive or equipment repair, and similar activities in indoor, contained areas where feasible.
- Regularly sweep paved areas of your site to keep them clean and dispose of debris appropriately.
- Do not use any product containing diazinon. Contact County of San Diego Hazmat for instructions on proper disposal (619-338-2231).
- Store all pesticides and fertilizers in covered and contained areas. Consider alternative, non-chemical pest control methods.
- Do not apply pesticides before storms and eliminate overspray of pesticides onto paved surfaces.

If you observe illegal dumping into a storm drain, please report it to the City at 619-667-1134.

ATTACHMENT 8.4

RESIDENTIAL PREVENTING URBAN RUNOFF POLLUTION BROCHURE

Sanitary Sewer vs. Storm Drain System

The water that drains down a sink or toilet in a home or business flows to the sanitary sewer and is treated by the City of San Diego at a wastewater treatment plant.

The storm drain system, on the other hand, is designed to carry rainwater from City streets and driveways to prevent flooding. This water does not receive any treatment. It flows directly to creeks and rivers – terminating at the Pacific Ocean!

Unfortunately, as rainfall flows over the ground it picks up debris and pollutants and deposits them into our watersheds.

Preventing Urban Runoff Pollution

A Guide for Residents

Urban storm water runoff is the **largest contributor** to **watershed pollution** in San Diego County.

The City of La Mesa's Storm Water Ordinance Requires the implementation of **Best Management Practices** (BMPs) to prevent urban runoff pollution.

The City monitors activities within the City's jurisdiction and may take enforcement measures to ensure the prevention of urban runoff pollution.

Pollutants of Concern

As rainfall flows over the ground, it picks up a variety of pollutants and deposits them into our watersheds. The following pollutants are commonly transported in the storm drain system and have been found to degrade water quality.

- Sediments
- Fertilizers
- Metals
- Detergents
- Pesticides
- Organic Compounds (solvents)
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

The following Best Management Practices (BMPs) are required to be used in residential areas to reduce urban runoff pollution in our streams and waterways. To do your part in protecting our water quality, please implement the following BMPs, where applicable or checked by the City inspector.

Maintenance & Good Housekeeping

- ❑ Regularly, dry sweep exterior paved areas. **Do Not use a hose!** Place debris in the dumpsters.
- ❑ If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer (sink or toilet).
- ❑ Water used for cleaning exterior surfaces must be contained and disposed of into the sanitary sewer in compliance with local regulations. Wash water is not allowed to enter the storm drain or leave the property.
- ❑ Regularly inspect and maintain storm drain inlets.

Landscaping

- ❑ Only irrigate during early morning or late evening to avoid evaporation.
- ❑ Aim sprinklers to avoid watering other areas.
- ❑ Time sprinklers to avoid over watering and causing runoff.
- ❑ Minimize pesticide, herbicide and fertilizer use, which are harmful to animals downstream.
- ❑ Hand pull weeds instead of using herbicides.
- ❑ Do not use pesticides that eliminate beneficial insects (i.e., Integrated Pest Management).

Outdoor Material Storage

- ❑ Store all material indoors or under a covered area not exposed to rain. Include secondary containment for liquid material.
- ❑ Have a spill response kit available to clean up potential spills such as kitty litter or other absorbents.
- ❑ Keep material storage areas free from rainwater accumulation.
- ❑ Keep lids closed on all outdoor storage containers and ensure containers are labeled.

Waste Management

- ❑ Keep all outdoor garbage and dumpster areas free of trash, sediment and debris.
- ❑ Keep lids closed on dumpsters and trash cans and never wash down dumpsters.
- ❑ Fix any leaks in garbage cans or dumpsters.
- ❑ Schedule regular waste pick-up.

Vehicle /Equipment Maintenance

- ❑ Perform all vehicle maintenance indoors when possible.
- ❑ Use drip-pans to collect fluids from leaky vehicles.
- ❑ Clean up spills immediately using kitty litter or other absorbents. Properly dispose of used absorbents.

Vehicle /Equipment Washing

- ❑ Wash vehicles at a commercial car wash when possible. (Commercial car washes drain to the sanitary sewer and not to the storm drain).
- ❑ Wash vehicles over a pervious (absorbent) surface such as dirt, gravel or grass to prevent runoff.
- ❑ Minimize the use of soaps and water while washing.
- ❑ Protect storm drains or curb inlets and then collect all wash water by vacuum. Recycle or dispose of wash water via the sanitary sewer system.
- ❑ Drain excess wash water to the sanitary sewer (sink or toilet), not to storm drains.

Loading Areas & Operations

- ❑ Load and unload in designated areas.
- ❑ Regularly dry sweep loading and unloading areas.
- ❑ If possible, cover loading areas.
- ❑ Divert storm water away from all loading and unloading areas.
- ❑ Check shipments and trucks for leaks and spills.
- ❑ Cleanup spills/leaks immediately and dispose of properly.
- ❑ If you must use water for cleaning, use a mop and bucket and dispose of wash water into the sanitary sewer.
- ❑ Major cleaning of exterior surfaces must include capturing all wash water and disposing of it into the sanitary sewer in compliance with local regulations. Wash water should not be allowed to enter the street gutter or storm drains.

City of La Mesa
Storm Water Pollution Prevention
Pools & Spas

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

Discharging of pool or spa water is not prohibited; however, the following measures are required.

1. Water shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Pool water must be dechlorinated
3. Water pH acceptable range from 7 to 8
4. No algae present in water
5. Water shall not contain chemicals to counteract the chlorine
6. Water does not contain hydrogen peroxide based products
7. Controlled discharge eliminating potential for erosion

Chlorine

Test pool or spa water for chlorine prior to discharge. Chlorine naturally dissipates overtime and if pool or spa water is left 3 to 5 days, it will become dechlorinated. Pool water needs to be drained before it turns green. Draining pool water gradually over landscaped areas will help prevent erosion problems.

Pool Filters

Pool filters should be cleaned over landscaped areas or anything that will absorb the discharge. Material may be collected over a filter cloth and disposed of in the trash. Filter backwash must be discharged into the sewer system with a pH of 5 to 12.5.

Pool Construction

Material must be contained and disposed of appropriately. Waste generated from plaster, gunite, cement, sediment, and other construction materials is prohibited from entering the storm drain system.

Do the Right Thing, Stay in Compliance and Protect Our Environment. For more information, contact the City's Storm Water Hotline (619) 667-1134.

ATTACHMENT 8.6

INTEGRATED PEST MANAGEMENT CARDS

Ants

Ants are one of the most prevalent pests in California. Although ants are annoying when they come indoors, they can be beneficial by feeding on fleas, termites, and other pests in the garden. While spraying chemicals inside the house may seem effective, it won't prevent more ants from entering your home, which is essential for control because most ants nest outside. Focus management efforts on excluding ants from buildings or valuable plants.

Make your house less attractive to ants:

- Caulk cracks and crevices that provide entry inside.
- Store attractive food in closed containers.
- Clean up grease and spills.
- Look for and remove indoor nesting sites, such as inside potted plants.
- Ant-proof kitchen garbage pails with sticky barriers such as petroleum jelly under the lip and pet dishes by placing them in a moat of water.
- Remove sweet food sources next to your house such as aphid-infested bushes and ripened fruit on trees.

When ants invade your house, take these steps:

- Sponge invaders with soapy water as soon as they enter.
- Plug up ant entryways with caulk or petroleum jelly.
- Remove infested potted plants.
- Clean up food sources.
- Rely on baits to control the ant colony.
- Indoor sprays are not usually necessary.

How and why baits work best:

When using bait, place it along ant trails and at nest openings. Worker ants will be attracted to bait and take it back to the nest where the entire colony, including queens, may be killed. The bait must be slow-acting so workers won't be killed before they get back to the nest. It may take several weeks for results to be evident. Just killing workers foraging in your home or garden does little to control the colony, because as few as one percent of a colony's foraging worker ants are able to provide sufficient food to support nestbound queens and larvae. Baits in bait stations or ant stakes are easiest to use and safest for the environment.

(actual size)

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

It's the water that connects us!

Aphids

Almost every plant has one or more aphid species that occasionally feeds on it, but low to moderate numbers of aphids are usually not damaging in gardens or on landscape trees. Although aphids can curl leaves and produce sticky honeydew, they rarely kill plants and can often be washed off with water. When aphid numbers get high, natural enemies frequently feed on them, eliminating the need for pesticides. Insecticidal soaps and oils are less toxic pesticides that can be used when treatment is necessary.

Aphids are common in your garden because:

- Aphids like lush new growth. Don't over fertilize. Use organic fertilizers or slow-release products.
- Aphids build up on flowering plums, roses, tulip trees, crape myrtles, apples, and many vegetables. Expect aphids when you grow these plants.
- Ants protect aphids from their natural enemies. Keep ants off plants to get more benefit from these beneficial insects.

To reduce aphids:

- Prune out infested leaves and stems.
- Knock aphid populations off plants by shaking or spraying with a strong stream of water.
- Protect seedlings with covers or aluminum soil mulches.
- Wait for hot weather; most aphids are heat-intolerant and will be gone by mid-June.

Protect aphids' natural enemies:

- Lady beetles, both adults and larvae
- Lacewings
- Syrphid fly larvae
- Soldier beetles
- Parasitic mini-wasps that turn aphids into crusty mummies (See reverse for insect drawings.)

Natural enemies of aphids such as lady beetles and lacewings will come into your garden naturally when aphids are abundant. Protect these good bugs by avoiding the use of insecticides that may be toxic to a broad variety of insects.

If insecticides seem necessary, use the safest products:

- Nonchemical pest control methods should be used first to manage aphid populations. However, if you feel insecticides are necessary, choose less toxic products.
- Insecticidal oils and soaps are the safest products. When properly used, these materials solve most pest problems.
- Oils and soaps work by smothering aphids, so application must be thorough. Don't apply to drought-stressed plants or when it is very hot. A few plants are sensitive to these products.
- Insecticidal soaps, soap-pyrethrum mixtures, or neem oils are often applied on vegetables or small bushes like roses.
- Narrow range oils, like parafinic, supreme or superior oils, are appropriate for larger trees.
- Oils and soaps don't kill aphids hidden within curled leaves. Prune these out. Systemic insecticides can kill hidden aphids, but they are much more toxic and not registered for use on garden vegetables or fruit trees.

aphid

It's the water that connects us!

Cockroaches

HEALTHY GARDEN HEALTHY HOME

Cockroaches thrive in warm environments that provide food, water, and shelter. Roaches hide in cracks, crawl spaces, and other dark places during the day and come out at night to feed. Pesticide sprays alone will not control roaches and are not usually required. Baits provide better control. You must integrate several strategies to make your home a less roach-friendly environment. Thoroughness is essential for effective control.

Identify your cockroach species first:

- Effective management options vary according to species.
- Cockroach traps provide an easy way to catch roaches for identification.
- Control practices for outdoor invaders (American, oriental roaches) and indoor residents (brownbanded and German roaches) differ.
- For help with identification go to www.ipm.ucdavis.edu.

Remove food and water sources:

- Even tiny crumbs or liquids in cracks provide good food sources.
- Store food in sealed containers.
- Keep trash in containers with tight lids.
- Eliminate plumbing leaks.
- Vacuum cracks and crevices and clean floors and counters daily.

Remove roach hiding places:

- Seal cracks and other openings to prevent invaders from the outside.
- Seal cracks in false bottoms of cupboards and other indoor hiding places.
- Seal or clean up other areas where you find roaches or their egg cases hiding.
- Remove old newspapers, boxes, and other clutter in kitchens and bathrooms.
- The oriental cockroach hides outdoors under ivy and other shelter. Check to see if you have this roach and remove outdoor hiding places or bait.

Use traps to identify and track cockroach populations:

- Cockroach traps are available in hardware stores.
- Place traps on the floor around edges of walls, in cupboards and other places where you think roaches are foraging. Place bait stations at locations where you trap roaches.
- Check traps daily.
- Sticky traps with pheromones may provide some control of German cockroaches.

Using chemicals to control cockroaches:

- Avoid use of foggers, bombs, or aerosol sprays — they just disperse populations.
- Boric acid powder blown into cracks, crevices, hollow walls, under refrigerators, or other undisturbed hiding places is very effective (allow 7 days or more for an effect to be seen).
- Bait stations containing boric acid, abamectin, fipronil, or hydramethylnon placed near hiding places can be effective if other food sources are removed (allow 7 days or more for an effect to be seen). Replace stations as needed as long as roaches are being caught.
- Insecticide sprays alone do not give long-term control. They are not necessary if other methods such as baits and boric acid powder are combined along with cleanup and removal of hiding places.
- Contact a professional pest control operator for very serious infestations, but be sure they use an integrated program as described above.

German cockroach nymph

German cockroach adult

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

It's the water that connects us!

Earwigs

HEALTHY GARDEN HEALTHY HOME

While their prominent tail-end pincers may look ferocious, earwigs are not harmful to people. Earwigs may seriously damage seedling vegetables and chew holes in annual flowers, soft fruit, and corn silks, but earwigs also play a beneficial role by feeding on aphids and other insects. Nocturnal in habit, earwigs feed at night and hide during the day in dark, cool, moist places in the yard or within flowers or vegetables. To manage earwigs, reduce hiding places and moisture, and employ a vigilant trapping program.

Should you be concerned about earwigs in your garden?

- Yes, if you are growing vegetables, herbaceous flowering plants, sweet corn, or plants with soft fruits like strawberries and apricots.
- No, if your garden is primarily lawn, trees, and woody ornamentals or native plants.

Reduce outdoor hiding places:

- Eliminate dense undergrowth of vines, ground cover and weeds around vegetable and flower gardens.
- Prune away fruit tree suckers.
- Remove leaves, boards, boxes, trash, and other debris from planting areas.
- Move flower pots and other garden objects and structures that can harbor earwigs.
- Check plastic or organic mulches and remove them to limit earwig numbers.

Trap earwigs until they are gone!

- Trap earwigs with rolled newspaper, bamboo tubes, or short pieces of hose. Place these traps on the soil near plants just before dark, and shake accumulated earwigs out into a pail of soapy water in the morning. A low-sided can filled with oil and a drop of bacon grease or fish oil also makes a good trap. Daily trapping will reduce earwig populations to tolerable levels.

Other ways to reduce earwig problems:

- Drip irrigate where possible to reduce surface moisture.
- Keep earwigs out of stone fruit trees with a band of sticky substance like Tanglefoot, around the trunk, and harvest fruit as soon as it ripens.
- Insecticides should rarely be needed.

Inside the home:

Earwigs may seek refuge indoors when conditions outside are too dry, hot, or cold. Large accumulations of earwigs can be annoying but present no health hazards. When earwigs invade your home follow these steps:

- Sweep or vacuum up invading earwigs.
- Seal up cracks or other entry points.
- Remove debris from gutters and around entryways.
- Keep water and moisture away from structures.
- Replace white outdoor lights with yellow ones, which are less attractive to earwigs.
- Indoor application of pesticides is not recommended.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Fleas

Fleas are particularly annoying to people and pets, especially during spring and early summer when their numbers tend to increase dramatically. The common flea in California is the cat flea. Despite its name, it attacks both dogs and cats and will also bite humans. To keep fleas out of your home, control fleas on your pet and regularly clean pet sleeping areas.

On the pet:

Recently, a number of very effective and safe new products for flea control on the pet have become available. Remember to supplement pet treatments with regular cleaning of your home and periodic combing with a pet flea comb to detect new infestations.

- Spot-on formulations are applied to the animal's coat, providing flea control for 1 to 3 months. Available from veterinarians or over-the-counter.
- Systemic flea control products, available from vets, are given as a pill or food additive. While they do not kill adult fleas, they prevent reproduction.
- Flea collars containing insect growth regulators (IGRs) give protection for up to 6 months on dogs and up to a year on cats. Be sure to choose collars containing methoprene or pyriproxyfen.
- Flea shampoos and soaps, powders and dusts, spray-on liquids, and dips are less effective and more hazardous to pets, people, and the environment than the three types of products above.

In the yard:

Outdoor treatment is rarely needed, but if your pet regularly sleeps outside and flea numbers are high, these areas can be treated with a spray containing pyriproxyfen. If possible, open sleeping areas to sunlight by removing low hanging vegetation. Immature fleas are unlikely to survive in areas with exposure to sunlight.

Inside the home:

Whether or not you are aware of fleas in your home, regularly vacuum and launder areas where your pet rests to avoid flea buildup. If you have a major flea problem, treat your pet with one of the options on the front of this card and follow the steps below.

- Locate heavily infested areas (usually areas where the pet rests) and concentrate treatment there.
- Wash throw rugs and pet bedding.
- Vacuum upholstered furniture, cleaning under cushions and in crevices.
- Vacuum carpets, especially beneath furniture.
- Use a hand sprayer or aerosol to treat all carpets and unwashable upholstered furniture with an insecticide that contains an IGR (methoprene or pyriproxyfen). This treatment kills larvae but not pupae, so fleas may continue to emerge for up to 2 weeks.
- Over the next 2 weeks vacuum regularly to remove adult fleas that emerge from pupae. Do not reapply pesticides.
- Seal vacuum bags and discard them so fleas don't escape.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Gardening with Good Bugs

HEALTHY GARDEN HEALTHY HOME

Most gardens contain far more types of good bugs,or beneficial insects, than pest insects. Beneficial insects and other organisms that kill pest insects are called natural enemies. In any pest management or plant care program, it is important to encourage these natural enemies by avoiding pesticides that kill them. You can also encourage beneficial insects by choosing plants that provide them with pollen, nectar, and shelter and keeping ants out of pest-infested plants. Learn to identify good bugs, both in their adult forms and immature (larval) stages.

Common good bugs found in California gardens include:

- Lady beetles: Both adults and larvae consume aphids.
- Lacewings: Lacewing larvae feed on many insect pests; adults are often seen around lights.
- Syrphid flies: Syrphid fly larvae consume aphids; adults hover around flowers.
- Parasitic mini-wasps: Many species of tiny wasps lay their eggs in pests like aphids or caterpillars; their hatching larvae consume the pest and kill it.
- Spiders: All spiders feed on insects or other arthropods and are beneficial in the garden.

(See reverse for drawings of good bugs mentioned above.)

What is Integrated Pest Management?

Integrated pest management (IPM) uses environmentally sound, yet effective, ways to keep pests from annoying you or damaging plants. IPM programs usually combine several pest control methods for long- term prevention and management of pest problems without harming you, your family, or the environment — IPM also reduces pollution in California waterways. Successful IPM begins with correct identification of the pest. Only then can selection of the appropriate IPM methods and materials be made.

Preferred IPM methods include:

- Planting pest-resistant or well-adapted plant varieties like native plants.
- Discouraging pests by modifying the way you design, irrigate, fertilize, and manage your garden.
- Altering the garden or home environment to deprive pests of the food, water, shelter or other requirements they need to thrive.
- Keeping pests out of the home and garden using barriers, screens, and caulking.
- Squashing, trapping, washing off or pruning out pests.
- Relying on good bugs in your garden to eat pests, thereby eliminating the need for insecticides that may end up in our waterways.

Turning to pesticides:

- Only use pesticides when non-chemical controls are ineffective and pests are reaching intolerable levels.
- Use pesticides in combination with the methods described above.
- Choose pesticides carefully so that the least toxic, most effective material is used to protect human health and the environment.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Head Lice

HEALTHY GARDEN HEALTHY HOME

Head lice can infest anybody, but children are prone to infestations because they play closely and share items that come in contact with the head like hats, headphones, and combs. Head lice are not known to transmit any infectious diseases; they are more of a nuisance than a health risk. Children with head lice, however, are generally not allowed to attend school as long as nits are found in their hair.

Head lice facts:

- Head lice cannot hop, fly, or jump; they crawl. Lice spread only through direct contact with an infested object or person.
- Head lice spend their entire life in head hair and can only survive off a human head for about 1 or 2 days.
- A newly hatched louse must ingest blood within minutes of birth to survive.
- Head lice cannot live on family pets.
- Nits (eggs) that are more than 1 1/4 inch from the scalp probably are dead or have already hatched.

What to look for:

- Intense scratching on the back of the head or neck.
- Tiny white eggs (nits) glued to hair near the scalp.
- Small, rapidly crawling flat insects.

Four steps necessary to manage an infestation of head lice:

1 Use a head louse shampoo if you observe active lice or viable eggs.

- Avoid shampoo products containing lindane, which are available by prescription only. Pyrethrin and permethrin are safer, more effective, and less polluting to wastewater than lindane. Not all eggs will be killed.
- To avoid insecticides entirely, use soap shampoos that contain coconut or olive oils. Most soap shampoos kill all stages of the louse except the egg. Because they are not as effective as products containing pesticides, you must be sure to comb and repeat these shampoos four times at 3-day intervals. Successive shampooing kills newly hatched lice.

2 Remove nits from the head by combing with a specially designed nit comb.

- This step is the key to successful control. Repeat daily as long as you find live lice or nits within 1¦4 inch of the scalp. Use a metal comb specially designed for removing head lice and their eggs. Combs sold with head lice shampoos are not generally effective. Infested hair can also be cut out with small safety scissors.

3 Remove lice and nits from the household.

- Wash clothing and bedding of the infested person in hot water (at least 140°F) and dry in a hot dryer or have them dry cleaned. Place other items (earphones, bike helmets) in plastic and put in a freezer that is 5°F or lower for at least 10 hours. Clean any object that might have come in contact with the infested person's head (stuffed animals, car seats). Vacuum carpets and upholstery. Pesticide sprays are not recommended.

4 Check heads and remove nits daily until infestation is gone. Follow with weekly head checks to detect reinfestation.

Lawn Insects

HEALTHY GARDEN HEALTHY HOME

Contrary to popular belief, insects are not a common cause of residential lawn damage in California. Poor lawn care, especially improper watering and planting inappropriate grass species, are more likely causes of unhealthy or dying lawns. Disease-causing agents, excess orinappropriate use of chemicals such as fertilizer and herbicides, or dog urine also produce lawn damage resembling that of insects. Many insects in the lawn are beneficial. Never apply an insecticide unless a damaging level of a known insect pest is confirmed. Insecticides are only effective if applied at the right time and in the right manner. Some insecticides may kill good bugs too.

How do you know if insects are causing damage?

- Brown spots in lawns can be caused by over- or under-irrigation, plant disease, improper use of chemicals, or dog urine as well as insects.
- Confirm presence of insects before applying an insecticide. For grubs, dig around roots, for other insects perform a drench test. (See reverse.)

Keep your lawn healthy by:

- Planting grass species that do well in your area
- Irrigating deeply and infrequently
- Doing routine maintenance on sprinkler heads
- Applying only 3 to 6 pounds of actual nitrogen per 1000 square feet per year when fertilizing
- Aerating your lawn annually; remove thatch if it exceeds 1/2 inch
- Cutting only one-third to one-half of grass height at each mowing and keeping lawnmower blades sharp

See the UC Guide to Healthy Lawns at www.ipm.ucdavis.edu

If a damaging level of insects is confirmed, do the following:

- Choose an insecticide based on the pest you're targeting.
- Find out which insecticide ingredients target specific lawn insects:
  - *Bacillus thuringiensis* (Bt) kills only caterpillars, including cutworms, lawn moths, and skippers.
  - Insect-attacking nematodes control caterpillars or grubs.
  - Azadirachtin controls cutworms, armyworms, and larvae of lawn moths.
  - Imidacloprid is effective against young lawn grubs.
  - Pyrethroids (e.g., cyfluthrin, bifenthrin) are broadly toxic insecticides that kill chinch bugs, lawn moths, and cutworms, but also kill beneficial insects and should be avoided.
- Get help from UC Cooperative Extension.

HOW TO PERFORM A DRENCH TEST

- Mix 3–4 tablespoons of dishwashing liquid to 2 gallons of water.
- Evenly apply the 2 gallons to 1 square yard of your lawn.
- Monitor the area for 10 minutes and count the number of armyworms, cutworms, or lawn moth larvae that rise to the surface.
- Treat the area only if insect numbers exceed 5 armyworms or cutworms or 15 lawn moths per square yard.

Safe Use & Disposal of Pesticides

HEALTHY GARDEN HEALTHY HOME

Pesticides are designed to be toxic to the pests they target — insects, weeds, and other unwanted home and garden invaders. Always read pesticide product labels carefully and follow all directions on proper use, storage, and disposal of empty pesticide containers. Product labels are your main source of information on how to use a product safely and legally. They include guidelines needed to protect you, your family, and pets. The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For the site nearest you in San Diego County call 1-877-713-2784 .

If you must use pesticides, follow these tips to reduce pesticide effects on your local waterways:

- Identify your pest problem and choose the least toxic pesticide that targets your pest and achieves the results you want. If you need help identifying the least toxic pest control method, contact your University of California Cooperative Extension office.
- Determine the right amount of pesticide to purchase. Purchasing exactly the amount you need for the application eliminates the need for storing unused pesticides.
- Use spot treatments whenever possible.

Outdoors

- Avoid overwatering after applying pesticides. Never let pesticide runoff flow into storm drains.
- Do not apply pesticides outdoors when rain is forecast or when it is windy.
- Avoid applying pesticides on paved areas.

Indoors

- Avoid applying pesticides in or near floor drains or sinks.
- Avoid applying pesticides on areas that will be washed or mopped with water, or where food is prepared or stored.

When using and storing pesticides take these precautions:

- Always wear a long-sleeved shirt, pants, and eye protection, and other equipment suggested on the label.
- Store products tightly capped in a locked cabinet out of reach from children and pets.
- Always keep pesticides in their original container.
- Know where to call for help in an emergency!

Pesticide disposal:

- If you cannot use up your pesticides, fertilizers, and weed killers, give them to a friend who may need them.
- Sewage treatment plants are not designed to treat for certain toxic pesticides like diazinon and chlorpyrifos — dumping pesticides into the stormdrain or down the sink is never an option.
- The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For household pesticide disposal information for San Diego County, call 877-713-2784.

Finding active ingredients on a pesticide label:

Pesticide labels are required by law to show the active ingredient and its percentage. Minimize or avoid the use of products that contain diazinon and chlorpyrifos – these materials are polluting our waterways. Always read the label before you buy!

Active Ingredient
Chlorpyrifos 4.38%
Inactive Ingredients 95.62%
KEEP OUT OF REACH OF CHILDREN
CAUTION See back panel booklet for additional precautionary statements.
NET CONTENTS 32 FL OZ (1 QT) 946mL

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Snails & Slugs

HEALTHY GARDEN HEALTHY HOME

Snails and slugs rank among our most despised garden pests. These slimy mollusks emerge from hiding at night and chew holes in leaves and flowers of many succulent garden plants and fruit. Slugs and snails are similar in structure and biology, except slugs lack the snails' external spiral shell. Management requires a vigilant and integrated approach that includes eliminating moisture and hiding spots, trapping, barriers, and handpicking. Baits can be helpful, but by themselves, don't provide adequate control in gardens that contain plenty of shelter, food, and moisture.

How do you know snails and slugs are causing damage?

- You may not observe these pests at first because they feed at night and hide during the day. Go out at night or early morning to view them in action.
- Other pests can cause holes in leaves, flowers, and fruit. Look for the shiny, slimy trails slugs and snails leave behind.

What must be done to reduce snails and slugs?

- Remove daytime hiding places — ivy, weedy areas, debris, or boards.
- Regularly remove snails from shelters you cannot eliminate such as low ledges on fences, undersides of decks, meter boxes.
- Place traps in your garden and dispose of trapped snails and slugs daily.
- Reduce moist surfaces by switching to drip irrigation or sprinkling in the morning rather than later in the day.
- Consider snail-proof plants such as impatiens, geraniums, begonias, lantana, nasturtiums, and many plants with stiff leaves and highly scented foliage like sage, rosemary,and lavender.

How can I manage snails and slugs without using pesticides?

- Make sure the garden is mollusk-free before planting. Then erect a copper barrier around it. Use a 4- to 6-inch-wide band of copper, buried an inch below the soil and bent over at the top or attach it around the edge of a raised bed.
- Place your garden in the sunniest spot possible. Remove garden objects or adjacent plants or ground cover that may serve as shady shelter. Reduce moist surfaces as much as possible.
- Build a trap using a 12"x15" board raised off the ground by 1-inch runners. As the mollusks collect under the board, scrape them off and destroy them daily.

What about baits?

- Baits will not be very effective unless you also remove shelter, food, and moisture.
- Metaldehyde baits are especially poisonous to dogs and birds. Metaldehyde also loses its effectiveness rapidly in sunlight and after rain or irrigation.
- Iron phosphate baits are safe for use around dogs, children, and wildlife.
- Irrigate before applying bait and apply in evening on warm days when mollusks are active.
- Scatter bait around sprinklers and in moist and protected areas where snails and slugs travel.

snails

slug

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Spiders

HEALTHY GARDEN HEALTHY HOME

Spiders are mostly beneficial because they feed on pest insects. However, many people think that all spiders are dangerous and aggressive. In California, the main spider capable of causing serious injury is the black widow, which generally remains outdoors and out of sight. Spiders seen out in the open during the day are unlikely to bite people. Focus pest management efforts on removing webs and hiding places. Pesticides are not generally recommended.

What to know about spiders:

- In California, the main spider capable of causing serious injury is the black widow:
  - The poisonous black widow spider is commonly found outdoors, in sheltered, dry, undisturbed areas such as wood piles.
  - Female black widows have shiny black bodies with a red hourglass marking on the underside.
  - Only large female black widows can injure people.

  Anyone bitten by a black widow spider should remain calm and seek medical advice, or call California's Poison Control Center at 1-800-8-POISON (1-800-876-4766).
- The brown recluse spider does not live in California.
- The jaws of most spiders are too small to bite humans.
- Some other spiders bite when trapped in clothing, but the reaction is usually no more severe than itching or a bee sting. See www.ipm.ucdavis.edu for more information about these spiders.

To prevent spiders from entering your house, take these steps:

- Seal home foundation cracks and other access holes.
- Inspect window and door screens for good seals that keep out spiders and the insects they prey on.
- Keep areas around home foundations free of clutter.

Manage spiders using these tips:

- Indoors, regular housecleaning provides adequate spider control.
- Vacuum up the spider and its web.
- Prevent clutter buildup that can provide hiding places.
- Remove spider webs from the exterior of the house with a broom or high pressure hose.
- Indoors, squash spiders or capture them in a jar and release them outdoors.

When removing spiders, don't overlook the fact that spiders eat a large number and variety of nuisance and pest insects. Spiders also have natural enemies — wasps, other spiders, birds, reptiles, and others — that sometimes keep them from becoming too numerous.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm

University of California Cooperative Extension

It's the water that connects us!

Termites

Because of the serious damage they can cause to wooden structures, termites are among the pests most feared by homeowners. However, swarms of flying termites do not always mean your building is infested. A careful inspection of the structure is required to confirm an infestation. People also frequently mistake swarms of flying ants for termites. If you suspect that your house is infested, call a professional. Do-it-yourself sprays cannot be relied on to reduce a damaging infestation. Common termites in California are the subterranean termites that build nests in soil, dampwood termites that nest in moist wood and soil, and drywood termites that nest above ground in dry wood. Management of each termite species is different.

Distinguish flying ants from termites:

- Check the antennae, wings and waist to confirm that pest insects are termites. (Please refer to ant vs. termite drawing on back.)

Design your building to keep termites out:

- Keep a 12-inch barrier of smooth concrete, sand, or other material between the soil surface and substructure wood beneath a building.
- Choose termite-resistant wood for fences or other structures that must contact soil.
- Remove wood piles, untreated fence posts, and buried scrap wood near structures.
- Provide adequate ventilation to substructures and keep them dry.
- Immediately repair foundation cracks.

If termites are invading your home:

- Destroy shelter tubes that subterranean termites build between soil and wood structures.
- If dampwood termite nests are accessible, remove infested wood and eliminate excess moisture.
- Drywood termites can be controlled with heat, freezing, electricity, microwaves, fumigation, or spot treatments of chemicals.
- For any infestation, contact a professional for help. Pesticides licensed only for use by a pest control operator are usually necessary to control subterranean and dampwood infestations.

Using pesticides for termite control:

- Pesticides may be injected into the soil by professional applicators through drilling or rodding. Special procedures must be followed to prevent contamination of ground or surface water.
- For soil injections, ask your applicator to use a product other than chlorpyrifos. Newer types of products such as fipronil and chloronicotinyls are safer for your health and the environment.
- Baits can be effective in some cases, but may take several months to control the problem and must be followed up with constant monitoring.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm

Giant Whitefly

HEALTHY GARDEN HEALTHY HOME

Giant whiteflies can cover a beautiful plant with white fuzzy wax and sticky honeydew, turning it into an unsightly mess. First discovered in San Diego County in October 1992, this whitefly has spread northward into other areas of California. Since its introduction into San Diego, giant whitefly has spread rapidly northward along the coast. Although affected plants may be weakened, they rarely die. To manage giant whitefly, wash plants off with water and encourage natural enemies.

What plants are affected?

- Many ornamentals including hibiscus, giant bird of paradise, begonia, Xylosma.
- Fruit trees including citrus, avocado, mulberry and banana.

Look for these damage symptoms on affected plants:

- Long, white, waxy filaments produced by the whitefly give the leaf surface a bearded appearance. These hairlike strands may be mistaken for a fungal infection.
- Large amounts of sticky honeydew excreted by the whitefly as it feeds on plant sap.
- Black sooty mold growing on the honeydew.

How to recognize the whitefly:

- Adults are small (3/16") and white with light brown markings on wings and usually found in groups on undersides of leaves.
- Nymphs are yellowish, small, oval, have no legs and don't move.

To reduce problems, use an integrated program that includes:

- Removing infested leaves.
- Washing giant whiteflies off leaves with a strong stream of water.
- Planting species less susceptible to giant whitefly.
- Avoiding insecticides that injure natural enemies, such as lacewings, lady beetles, syrphid flies, and parasitic wasps.

What about insecticides?

- **Don't use insecticides if beneficial insects, including parasites and predators, are present in the area.**
- **To confirm the presence of parasitic wasps, use a magnifying glass to look for parasite exit holes on giant whitefly nymphs or darkened nymphs as indicated in drawings below.**
- **If you do choose to use an insecticide, select least toxic products such as insecticidal soaps or oils. Remember to follow label directions and spray the undersides of the leaves where whitefly colonies are found.**

(adult)  (actual size) I

Examine whitefly colonies for grayish-black or yellow nymphs with exit holes (a), or darkened nymphs (b), or healthy nymphs (c).

Use NON-CHEMICAL methods & LEAST TOXIC pesticides. WHY? Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes, and oceans.

Learn more about San Diego regional water quality at www.ThinkBlueSD.org & www.ProjectCleanWater.org.
For more pest information, visit the University of California IPM Web site at **www.ipm.ucdavis.edu**. or contact the UCCE Master Gardeners at (858) 694-2860, Mon-Fri, 9 am to 3 pm.

ATTACHMENT 8.7

SAN DIEGO RIVER AND SAN DIEGO BAY FACT SHEETS

San Diego River Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego River and the San Diego Bay. Your business or facility is located within the San Diego River Watershed.

San Diego River Watershed

The San Diego River Watershed is comprised of 443 square miles. It extends from the mountains near Julian to the Pacific Ocean. Portions of the watershed fall within the cities of El Cajon, Poway, San Diego, Santee, several unincorporated areas, and the City of La Mesa. Primary tributaries to the San Diego River include Boulder Creek, Conejos Creek, Los Coches Creek, San Vicente Creek, and Forester Creek. Alvarado Creek in La Mesa is also tributary to the San Diego River. Alvarado Creek flows into the San Diego River and ultimately into the Pacific Ocean between South Mission Beach and Ocean Beach near Dog Beach.

Pollutants of concern listed in the 2002 Clean Water Act Section 303(d) List Of Water Quality for the lower San Diego River Watershed include fecal coliform (sewage/urban runoff), low dissolved oxygen (decay of organic matter), total dissolved solids (industrial waste/chemical spills), and phosphorus (phosphate based detergents). Between 1996 and 1999, coliform bacteria more than doubled due to urban runoff and sewage.

Other pollutants of concern not listed above include pesticides such as Diazinon and Chlorpyrifos (commercial, agricultural, and residential application), Total Suspended Solids/Turbidity (suspended sediment/solids, construction, sewage, eutrophication), Copper and Zinc (industrial waste or automobiles), and pH/Phosphate (industrial waste, automobiles, sewage, fertilizers, eutrophication, hardening/concrete of creeks).

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

What Can You Do?

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Store materials properly to ensure it is not exposed to storm water. Do not over-irrigate your landscape. If you observe illegal dumping into a storm drain, you should call the City's storm water pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.

San Diego Bay Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego Bay and the San Diego River. Your business or facility is located within the San Diego Bay Watershed.

San Diego Bay Watershed

The San Diego Bay Watershed is comprised of 415 square miles. It extends from the Laguna Mountains to San Diego Bay. The watershed falls within the cities of La Mesa, Chula Vista, Coronado, Imperial Beach, Lemon Grove, National City, San Diego, and unincorporated areas of the County. Approximately 4 square miles in the southern portion of the City of La Mesa is part of this watershed. The major discharge sources to San Diego Bay include Sweetwater River, Otay River, Chollas Creek, Paleta Creek, Paradise Creek, and Switzer Creek.

Three drainage basins in the City of La Mesa are part of the San Diego Bay Watershed. Runoff from the Spring Valley Basin flows to the Sweetwater River. Runoff from the University Channel and Lemon Grove Basin contribute to Chollas Creek. The aforementioned creek and river flow into San Diego Bay.

Pollutants of concern associated with the watershed include diazinon, copper and zinc, fecal coliform, turbidity, and total suspended solids. The sources of these pollutants are a result of residential, agriculture or commercial pesticide application, automobiles and industrial waste, sewer spills, encampments, wildlife, erosion, suspended sediment, and fertilizers. Pollutants of concern for Chollas Creek in particular include metals such as copper, lead, zinc, cadmium, and coliform bacteria.

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

What Can You Do?

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Moreover, store materials properly to ensure it is not exposed to storm water and do not over-irrigate your landscape. If you observe storm water pollution or illegal dumping into a storm drain, you should call the City's Storm Water Pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.

DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On March 29, 2024, I served the:

- **Current Mailing List dated March 28, 2024**
- **Notice of Waiver of Procedural Requirements, Extension Request Approval, and Postponement of Hearing issued March 29, 2024**
- **Claimants' Comments on the Draft Proposed Decision and Parameters and Guidelines (Volumes 1-14) filed February 20, 2024**

  San Diego Regional Water Quality Control Board Order No. R9-2007-0001, Permit CAS0108758, Parts D.3.a.(3)(b)(iii), D.5.a.(1), D.5.a.(2), D.5.b.(1)(a), D.5.b.(1)(b)(iii-vi), D.5.b.(1)(c), D.5.b.(1)(d), D.5.b.(2), D.5.b.(3), E.2.f., E.2.g., F.1., F.2., F.3., I.1., I.2., I.5., J.3.a.(3)(c)(iv)-(viii), (x)-(xv), the first sentence of L.1. as it applies to the newly mandated activities, and L.1.a.(3)-(6), 07-TC-09-R County of San Diego, Cites of Carlsbad, Del Mar, Imperial Beach, Lemon Grove, Poway, San Marcos, Santee, Solana Beach, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, San Diego, and Vista, Claimants

by making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on March 29, 2024 at Sacramento, California.

City of Lemon Grove

Jurisdictional Urban Runoff
Management Plan
Annual Report

FY 2006 – 2007
January 2008 Report

The City of
LEMON GROVE
BEST CLIMATE ON EARTH
Incorporated in 1977

Executive Summary

The City's sixth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-02, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments, the City implemented various methods to further assist in long-term effectiveness assessments. The methods have only been utilized for one full reporting period, so annual comparisons of data are unavailable until next reporting period.

Through a collaborative workgroup process with the Copermittees, we have significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In FY 2005-06, the City continues its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation

strategy for construction sites and development proposals. During FY 2004-05, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2006-07. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2006-07, the City made large steps forward in the implementation of a city-wide GIS program. The City also evaluated its street sweeping contract and hired a new street sweeping company. The newly implemented Code Enforcement program continues to improve in efficiency and effectiveness. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report. The City also awaits with anxiety and trepidation the issuance of the new permit to further develop its program and compliance standards.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a portion of the program; requiring the City's strapped General Fund to finance this increasingly expensive program. This issue will be addressed more fully in Section 12.2 of this report.

Section 1.0 Introduction

Lemon Grove's sixth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-01, "Permit") represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2006 through June 30, 2007). We are confident that the report demonstrates success in building a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City also participated in a joint SUSMP training session with the City of El Cajon. The training was targeted toward those employees who deal directly with SUSMP implementation, the Planning and Engineering Departments. The City improved its outreach material to developers and contractors. The new information includes several checklists that detail exactly what is required on the site plans and in the stormwater management documents. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a city-wide GIS program. The City will begin initial phases of implementation during fiscal year 2008-2009. These early efforts include base data entry and updating the existing layers with current technology. However, all implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operational organization.

At the jurisdictional level, we have taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. This reporting period, we focused on construction sites and SUSMP processes. We continued to improve the assessment tools through inspection databases and the plan check process. We continue to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. During this reporting period, it was discovered that the City's existing tracking system for building permits and code enforcement, HdL, might be a viable option for water quality personnel. It might be possible to tie water quality concerns into the existing framework. The City is working with an HdL representative to further explore the possibilities. Though the tools are

often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

We believe the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Increased construction site inspections to a twice weekly frequency
- Use of community events for public outreach
- Improved code enforcement process for water quality
- Continue outreach to restaurant community
- Continue outreach to automotive facilities
- Targeted outreach to residents (ie: Pool Cleaning and Pet Waste)

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 4.0 discusses every program element related to the City's commercial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2006-07. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. We look forward to continued progress in future years.

Section 2.0 Municipal Component

This section describes actions taken by the City during the FY 2006-07 reporting period to prevent polluted runoff from its municipal facilities.

2.1 Municipal Facility Activities

The City of Lemon Grove owns and operates a wide variety of fixed facilities and an extensive system of roads, municipal separate storm sewers (MS4s), and sanitary sewers.

City personnel implements site-specific Best Management Practices (BMPs) to prevent and reduce pollutants in facility runoff. Since BMPs are tailored to the unique activities conducted at each City facility, the remainder of this section is organized according to facility type. For each facility type, information is presented as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Facility Inspections

2.1.1 Priority Sources

Nearly 65.5 miles of roads, streets, and highways are maintained by the City. The City is not responsible for maintaining roadways that are managed by other agencies or jurisdictions, or are privately owned. All City-maintained roads are routinely inspected annually, and more frequently upon request. Needed repairs are noted and performed as appropriate to ensure safety and riding quality for the traveling public. Roadway maintenance typically involves concrete and asphalt repair, drain inlet cleaning, litter removal, and street sweeping. Other BMPs, as listed in JURMP 2.4, are implemented as required.

2.1.1.1 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for the City-maintained road system. BMPs applicable to roads, streets, and highways have been reviewed, and remain unchanged. Below is a brief listing of some of those BMPs:

- Vegetation Control
- Proper Material Storage and Coverage
- Concrete Maintenance Methods for Wash-outs
- Designated Vehicle Maintenance Area
- Vehicle Washing Area
- Employee Training

2.1.1.2 BMP Implementation

Details regarding specific road maintenance activities conducted during this reporting period are provided below. It should be noted that other road maintenance BMPs not described here were identified in JURMP 2.4 and are implemented as necessary.

Street and Facility Sweeping

The Department of Public Works (DPW) Streets Division insures that City-maintained roads and facilities at the following frequencies and locations:

- Curbed Streets (Broadway, Buena Vista Ave., Massachusetts Ave., and School Lane) – weekly
- All Other Curbed Streets – biweekly
- Non-Curbed Streets – monthly
- Center Islands and Medians – monthly
- Parking Lots and Alleys (Broadway Business Lot and Lester Ave. Alley) – weekly
- All Other Parking Lots and Alleys – monthly

The City considers sweeping to be an extremely effective BMP in that it prevents accumulated material from entering the stormdrain conveyance system. To quantify its sweeping activity, DPW Streets Division crews record the length of streets swept and the amount of debris collected on a month-by-month basis. The City swept approximately 80 miles during FY 2006-07 and collected 169.75 tons of debris. The City swept approximately 75 miles during FY 2005-06 and collected 109.88 tons of debris. These figures include the regular sweeping of roads, specialty or requested road sweeps and corporate yards.

The City swept 100% of public maintained curbs and gutters both reporting periods. The City is responsible for 65.5 miles of roadway in Lemon Grove. The extra mileage swept is due to parking lots and special request sweeping on private streets. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

During this reporting cycle, the City began the bid process for a new street sweeping contractor, utilizing Cannon Pacific in the interim. The new contract will take effect at the beginning of 2008 under Day and Night Street Sweeping.

2.1.1.3 Road Inspections

All City roads are inspected annually or more frequently upon request, and needed repairs noted and preformed as appropriate to ensure safety and riding quality for the traveling public. During this reporting period, all City roads were inspected prior to and during the rainy season. Based on these results,

maintenance crews evaluated potential stormwater impacts and identified the need for cleaning, maintenance, and future upgrades. Conveyance system and road right-of-way cleaning conducted as a result of these inspections is described in section 2.1.2.3 below, and street sweeping in section 2.1.1.2 above.

2.1.2 Municipal Separate Storm Sewer System (MS4)

The City maintains the publicly owned portions of the MS4 within its boundaries. The City's MS4 inventory consists of culverts, channels, ditches, pipes and related flood control structures.

2.1.2.1 Priority Sources

All City roads, streets, and highways are designated as high priority municipal sources. The Public Works Yard is also designated as high priority because of pollutant potential. See Table 2.1 which details the City's priority municipal sources.

Table 2.1 – High Priority Municipal Facilities

Facility	Address	Basis for Designation	Receiving Water
Roads, streets, highways, and parking facilities	Throughout City	Specified in Order 2001-01	Chollas Creek and Sweetwater River
Flood management projects and flood control devices	Throughout City	Specified in Order 2001-01	Chollas Creek and Sweetwater River
Public Works Yard	2873 Skyline Dr.	Specified in Order 2001-01 and has potential to discharge pollutants of concern.	Chollas Creek

2.1.2.2 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for City-maintained MS4 facilities. BMPs applicable to the City-maintained MS4 have been reviewed, and remain unchanged.

2.1.2.3 BMP Implementation

Further detail about specific MS4 maintenance activities conducted during this reporting period is provided below. Other BMPs identified in JURMP 2.4, but not described here, are implemented as required.

Conveyance System Cleaning

During this reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only six conveyances

and 60 catch basins were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,625 pounds from the catch basins, conveyances, and roads. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.

During the previous reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Six conveyances were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,625 pounds from the catch basins, conveyances, and roads. The amount of debris removed during FY 06-07 was significantly less than in previous reporting periods. DPW attributes a more effective street sweeping program and the implementation of Trident Curb Screens in several high trash areas of the City.

The City continues to locate and log new catch basins on an annual basis. The City plans to have a completed log sometime within the next permit cycle. Attachment A-1 contains the initial mapping of the City's major drainage pipes.

Storm Drain Stenciling

The City began implementing a new drain label program. Instead of painting stencils, the City began using drain labels that are more permanent and longer lasting by using thermoplastic labels. They are heat set onto the concrete any place around the drain and will last a minimum of 10 years. They are also fade, graffiti and tamper resistant. As of the end of the 2004-05 reporting period, the City had placed labels on approximately 30 drains on Broadway, a main through-way for the City and commuters. The City then placed an additional 30 labels on various inlets throughout the City with a focus on major streets first, during 2005-06. The City maintained this program in 2006-07, but installing an additional 30 labels on drains throughout the City, covering major streets first. The City plans to purchase approximately 30 each fiscal year until all the drains on public maintained streets are labeled. In the meantime, the City continues to let "I Love a Clean San Diego" stencil drains that are un-marked or have worn-out stencils.

The City continues to require developers to mark any new drains in connection with development or redevelopment. The City encourages them to use concrete wet stamps or thermoplastic labels for longevity on private streets and requires either if the street will be maintained by the City. See Attachment A-2 for a picture of the thermoplastic labels and the concrete wet stamp.

During FY 2006-07, the City installed six test Trident Curb Screens in various locations including a residential site, a school route site, and high traffic sites. The City wished to test their durability and usefulness in conjunction with the new

street sweeping program. Insufficient data is available at this time to begin judging their effectiveness, but informal visual inspections show a decrease of trash in the catch basins and the trash is curb side making it easier for the street sweeper to pick up.

2.1.2.4 MS4 Inspections

The Streets Division conducts annual field investigations in order to inspect the City-maintained MS4 to identify the need for cleaning, maintenance, potential illicit connections and illegal discharges (IC/IDs), and to assess the structural integrity of facilities. As reported above, the City inspected forty-three road segments, sixteen conveyance facilities, and 190 catch basins during this reporting period.

2.1.3 Sanitary Sewer System

The Sanitation District manages and maintains a collection system of 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. San Diego and La Mesa share sewer space with Lemon Grove. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space; San Diego uses 986.20 EDU.

2.1.3.1 Priority Sources

The City operates no high priority waste water facilities within its boundaries.

]2.1.3.2 BMP Requirements

JURMP 2.5 details minimum BMP requirements for all sanitary sewer system lines. BMPs applicable to sanitary sewer system facilities have been reviewed, and remain unchanged.

2.1.3.3 BMP Implementation

Control of Sanitary Sewer Overflow Events

DPW staff responds to sanitary sewer overflows (SSOs) according to protocol established in RWQCB Order 96-04, the current Waste Discharge Requirements and Water Quality Order 2006-0003. During FY 2006-07, the City had zero SSOs. The last spill on record took place in the third quarter of FY 2004-05 and was directly related to vandalism issues experienced earlier during that period.

Limiting Infiltration from the Sanitary Sewer System to the MS4

As a proactive means of preventing or limiting infiltration from the sanitary sewer system to the MS4, the City conducts aggressive inspection and maintenance

programs for both systems. City personnel are instructed to investigate locations exhibiting sewer-related discharge or odor during MS4 inspections (further discussed in section 2.1.2.3 above). No instances of infiltration were noted during this reporting period. Sanitary sewer system inspections are also conducted on scheduled intervals to ensure the functionality and structural integrity of the system. These are described further below. The camera/video truck was purchased and utilized during this reporting period.

2.1.3.4 Inspections

Sanitary Sewer System Inspections

The City regularly inspects its sanitary sewer system to ensure functionality and structural integrity. Towards the end of reporting period 2004-05, the City began cleaning and inspecting public sewer lines in-house. During this reporting period, all public sewer lines were cleaned and maintained in-house.

Table 2.2
Sanitary Sewer Services

	Total FY 2005-06	Total FY 2006-07
Cleaned	**298,043***	**331,369***
Root Cut	**18,370***	**20,927***

*represented in feet

2.1.4 Corporate Yards and Fleet Maintenance Facilities

The City's municipal facilities inventory includes one facility classified as a corporate yard and fleet maintenance facility. These facilities are classified as high priority, due to the potential pollutants stored on-site.

2.1.4.1 Priority Sources

Fleet Maintenance Facility

DPW operates one fleet maintenance facility that provides maintenance, repair and fueling to forty-five vehicles from all City departments. The maintenance is co-located with the DPW headquarters and is listed as the Public Works Yard on the inventory. The facility is considered a high priority threat to water quality due to the presence of hazardous materials, automotive fluids, and fuels on-site.

2.1.4.2 BMP Requirements

JURMP 2.4 defines all minimum BMP requirements at the DPW-maintained corporate yard. BMPs applicable to DPW-maintained corporate yards have been reviewed, and remain unchanged.

2.1.4.3 BMP Implementation

Fleet personnel always implement BMPs under the guidance of the facility's Fleet Manager. In addition to a periodic schedule of ground maintenance and housekeeping, the facility maintains an inventory of spill kits, absorbent, fiber rolls, and storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: vehicle and equipment repair, hazardous waste storage, vehicle washing, re-fueling, etc.

As in previous reporting periods, BMP implementation at the corporate yard and fleet maintenance facilities was verified and evaluated during routine facility inspections. Where inspectors noted a lack of BMPs or ineffective results, employees were required to implement corrective actions immediately.

2.1.4.4 Inspections

Fleet Maintenance Facilities

Though Fleet Managers are responsible for applying and maintaining BMPs on a daily basis, the Water Quality Coordinator conducted an annual inspection to verify implementation during this reporting period. The only notable infractions were an open dumpster at City Hall and a degraded straw wattle at the Public Works Yard. City staff has noticed a marked improvement in the maintenance of good housekeeping BMPs at City facilities. Water Quality staff believes this is due in part to frequent informal inspections and increased staff training, as well as the formal annual inspection.

2.1.5 Parks and Recreation Facilities

2.1.5.1 Priority Sources

The Department of Recreation Services (DRS) manages stormwater discharges from seven park sites. Included among these are local and regional parks, park buildings (including the community center), historical sites and open spaces. In the inventory submitted with the City's JURMP, all parks are considered medium priority. See Table 2.2 for a detailed description of park areas.

Table 2.2 – Medium Priority Municipal Facilities

Facility	Address	Basis for Designation	Receiving Water
Berry Street Park	7101 Mt. Vernon St.	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek
Fireman's Park	School Lane and Central	Park facility may generate minor pollutants associated with green wastes, pesticides, and	Chollas Creek

		fertilizers. Not adjacent to any receiving waters.	
Kunkel Park	8171 Lemon Grove Way	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Sweetwater River
Monterey Heights Park	Canton and Glencoe	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek
Lemon Grove Park	Washington and Alton	Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters.	Chollas Creek

2.1.5.2 BMP Requirements

JURMP 2.4.2 defines all minimum BMP requirements for City parks and recreation facilites.

2.1.5.3 BMP Implementation

Because parks vary widely in both size and function, it is difficult to generalize about BMP implementation. All park personnel are instructed to implement BMPs at all times. In addition to a periodic schedule of ground maintenance and housekeeping, most facilities maintain an inventory of spill kits, absorbent, and miscellaneous storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: material and waste storage, fueling, septic tank maintenance, etc. A complete list of facility-specific BMPs can be found in JURMP 2.4.2.

DRS has also endeavored to make the implementation of pollution prevention BMPs a priority at park facilities. Unless otherwise noted, these practices were implemented at all facilities in the DRS inventory. They include:

- The storage of used construction materials outside for future projects is being eliminated. The site that contained materials during the last reporting period is now empty of City materials. The City has plans to fence and lock the site to prevent the illegal dumping of large waste items like furniture. The fencing should be accomplished within the next two reporting periods.
- The prohibition on washing City vehicles and equipment on-site has continued to be enforced. All washing occurs off-site at appropriate locations. The majority of vehicle repair and maintenance is performed by Bob-Brown Automotive on University Ave. By having vehicle maintenance performed off-site, the City drastically decreases the number of pollutants stored at the Corporate Yard. The City is continuing to look into the possibility of in-sourcing oil-changes to allow for the use of re-refined oil. The City is currently searching for a closed loop system that would supply

the oil and then take the used oil back for further recycling. The City has not been able to locate a closed loop system. The City has postponed the implementation of re-refined oil in City vehicles until the warranty on the new fire engine expires. If the City uses re-refined oil in the new engine it will nullify the repair and maintenance warranty. The inclusion of the fire vehicles is integral to the implementation of a re-refined oil program. Without the inclusion of the fire vehicles, the City would not be able to purchase the oil in the quantities sufficient to encounter fiscal savings. The City plans to renew its efforts to establish re-refined oil after the warranty expiration in reporting period 2009-10. Maintenance on the fire engines is preformed off-site through Grossmont High School District.

- The City uses pesticides and insecticides on a very minimal basis, only when a problem is persistent and can be dealt with no other way.
- All City parks maintain recycling facilities.
- The use of drought resistant plants is encouraged. See Section 2.2.2 for further information on the plants used in the City.
- The City installed 1 additional doggie bag dispenser at the Lemon Grove Civic Center and maintained a distribution of approximately 650 bags at the existing 4 locations in City parks.

2.1.5.4 Inspections

The City's Water Quality Coordinator conducts annual stormwater inspections to verify appropriate BMP implementation at all of its parks, regardless of priority classification. All observed deficiencies were noted and scheduled for correction. Many of the deficiencies noted during FY 2006-07 involved a lack of on-site spill prevention materials (i.e. spill kits, drip pans for vehicles, etc.) or trash and debris. All deficiencies were promptly addressed. See Attachment A-3 a copy of the facility inspection report.

2.1.6 Other Municipal Facilities

The City operates and maintains several additional facilities not captured by the categories outlined above. These include office buildings, a sheriff station, and a fire station. The Fire Department re-joined the City in July of 2004. All repairs, maintenance, and equipment storage is performed in a covered and completely enclosed garage/bay area with locked doors. All hazardous materials are stored in locked self-contained areas inside the bay area and labeled appropriately. Nothing hazardous is stored outside or un-locked.

2.1.6.1 Priority Sources

Offices

The City maintains four business offices and two public safety offices including the new fire station, which previously housed the Department of Public Works

and Recreation Services. No new offices have been added during this reporting period, see list below. The Sheriff Station is connected to City Hall, therefore they are categorized together under City Hall, which is listed as a medium priority threat, as most activities are conducted in enclosed areas.

- City Hall and Sheriff's Department – 3232 Main St.
- Fire Department – 7853 Central Ave.
- City Hall Annex (Department of Recreation Services) – 3225 Olive St.
- Community Center – 3146 School Lane
- Department of Public Works – 2873 Skyline Dr.

Vacant Land and Excess Right-of-Way

The City owns one vacant property at:

- 6949 Central Ave.

This site will be considered medium priority due to the minimal on-site activity and lack of impervious surface.

2.1.6.2 BMP Requirements

All BMP requirements for the facilities discussed in 2.1.6.1 above are covered in JURMP 2.4. These BMPs have been reviewed and remain unchanged.

2.1.6.3 BMP Implementation

BMP implementation at facilities classified as miscellaneous is overseen as applicable by DPW, DRS, or facility personnel. Procedural requirements and staff training protocol are specific to each department, but in all cases are sufficient to ensure stormwater compliance at these facilities.

2.1.6.4 Inspections

Each facility identified in 2.1.6.1 was inspected at least once during FY 2006-07 to verify compliance with minimum BMP requirements. The main infraction was an open dumpster lid at City Hall, which has since been corrected and is checked by staff on a regular basis. The drip irrigation system installed in the landscaping at the front of City Hall during the previous reporting period has cut down significantly on run-off from the site. See Attachment A-3 for a copy of the facility inspection report.

2.2 Management of Pesticides, Herbicides, and Fertilizers

The City of Lemon Grove's Grounds staff uses only herbicides and algecides. The City's pest control contractor is Knott's Pest Control. Knott's Pest Control meets all BMPs for pesticide application found in JURMP 2.4.

2.2.1 BMP Implementation

The following BMPs, described further in JURMP Appendix 2.2.1, were implemented by DPW for the application of herbicides, algecides, and occasionally pesticides; although as mentioned above Knott's Pest Control handles the majority of the City's pest control needs.

- Safer Alternative Products
- Good Housekeeping Practices and Material Storage
- Vehicle and Equipment Washing and Cleaning
- Illegal Dumping Control
- Pollution Prevention

2.2.2 Use of Drought Resistant Vegetation

Grounds division of Public Works attempts to use drought resistant plants throughout the City's landscaping. Common variations of these plants used throughout the City are lavender, sage, oleanders, natal plum, rosemary, and pyracantha. The use of drought resistant vegetation allows for drip irrigation, which greatly decreases the amount of water used and limits the amount of potential runoff from sprinkler systems. A drip irrigation system also allows soils to absorb nutrients from fertilizers and compost preventing them from washing into the drains with irrigation water, a common residential pollutant problem that will be further discussed in Section 5.0.

2.2.3 Schedules for Irrigation and Chemical Applications

Weather conditions are always considered prior to outdoor pesticide applications. Depending on the formulation and characteristics of the pesticide to be applied, an application may be postponed or allowed to proceed prior to, or during, a rain event. This is because the Grounds division applies pre-emergent herbicides as part of its vegetation management program. Pre-emergent herbicides benefit from a gentle rain that soaks the pesticide into the soil where germinating seeds are killed; getting these types of herbicide to the root zone also controls existing young vegetation. The application of contact herbicides, on the other hand, is not permitted if precipitation is likely. These materials tend to wash off plant surfaces and contribute to water quality degradation.

2.2.4 Collection and Disposal of Pesticides

When available the City purchases herbicides in recyclable bulk containers. By reducing the volume and variety of herbicides, the department is able to maintain a minimal inventory of pest related chemicals.

As a general rule, emptied pesticide containers are triple rinsed and the rinse water is put in with the application solution. Containers are then disposed of in accordance with local regulations.

2.3 Employee Training

The City is committed to increasing the awareness of its employees regarding urban runoff issues, and effecting positive behavioral changes to protect water quality. To this end, two types of stormwater and water quality education are provided to employees.

- Basic Awareness Education; and
- Focused Employee Training

2.3.1 Basic Awareness Education

The goals of this element are to promote responsible behavior at home and work, and to encourage employees to act as the City's "eyes and ears." As described in section 2.4 of the City's JURMP, the City's goal is to provide some level of basic awareness education to all employees annually.

2.3.1.1 City Newsletter

The City has continued the Environmental Page in its biannual Newsletter. Each issue contains oil recycling sites and household hazardous waste information. The Fall 2006 edition contained an article on eco-friendly holiday practices, lawn care and a clean up event. The edition also featured the standard used oil information and e-waste guide. The Spring 2007 edition featured information on the Creek to Bay Clean-Up event, personal tips for cleaner beaches and water, household hazardous waste, and used oil recycling. In this edition the City increased the environmental section to a two page spread to provide more in-depth information.

The Newsletter, which is produced by City staff, is distributed to the residents and businesses of Lemon Grove, as well as City employees. Because of the public and internal distributions, City staff is kept abreast of the current issues and knows what information is being given to the public. See Attachment A-4 for copies of the Newsletter articles discussed in this section.

2.3.1.2 Informal Staff Training

Water Quality staff continues the informal educational e-mail program. At least twice a month, staff sends a City-wide e-mail with new water quality information. The e-mails contain anything that has to do with water quality and pollution prevention. New sites such as www.bewaterwise.com or new articles from the BC's California Water News (a Brown and Caldwell daily e-mail newsletter) are

shared with all City staff members. Water Quality staff has discovered that this method, although informal, provides a positive transfer of new information, up coming events, and technological advances in the water quality field. Water quality remains a primary focus for all staff through these small constant reminders and updates. It also provides staff an opportunity for internal dialogue without trying to schedule large scale meetings or trainings. The e-mails have been received favorably and will continue in future reporting periods.

Water Quality staff participated in weekly inter-departmental meetings with City planning, code enforcement, engineering and fire personnel. Current development projects, code updates, enforcement concerns, and construction site details are discussed. The meetings have provided water quality staff with the opportunity to regularly update the former mentioned department staff on concerns and changes in the water quality program. The constant re-enforcement ensures that water quality remains an issue of primary concern for the development sector of City staff.

2.3.2 Focused Employee Training

2.3.2.1 Bi-Annual Public Works Staff Training

Each fall and spring, water quality staff participates in one of the public works safety trainings. Staff provided updates on new concerns and regulations, as well as obtaining the concerns of the public works staff. This year's training focused on the developing new permit and the changes it would bring for DPW staff. Water quality staff continues to provide DPW staff with informational brochures on used oil recycling and pet waste to utilize in educating the public further on these common infractions. The regular exchanging of information has been beneficial to all staff members involved. Water quality staff believes the continued involvement has increased public awareness as well due to the readily available information and more knowledgeable public works staff. Both staffs look forward to continuing the exchange of ideas and information.

2.4 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Municipal Component in FY 2006-07. It consists of three primary elements: 1) a narrative assessment, 2) a discussion of the City's success in meeting specific quantifiable targets, and 3) a discussion of issues related to the spatial and geographic variability of program data.

2.4.1 Narrative Assessment

The City made a number of important improvements to its municipal activities programs in FY 2006-07. In spite of the large number of individual activities and programs comprising the City's Municipal Component, continued progress and

improvement was made in all areas. In particular, another year of experience in implementing BMPs at City facilities has translated to a more complete integration of stormwater mandates into standard operating procedures. City crews also continued to pound the pavement throughout the community, collecting greater amounts of debris from our streets and MS4 than they ever have before. City crews are also better educated on the water quality program and can provide more information to residents themselves. They are also more knowledge about illegal practices and many issues have been dealt without code enforcement involvement.

The City is continuing to gather GIS information. The City purchased new aerial photographs of the city limits, as well as Lidar graphs. The City is currently investigating survey equipment and GIS programs. The City currently has ArcView 3.2 with minimal mapping and levels. The City is investigating upgrades versus new systems. The City plans to have a functioning GIS system in place within the next five to eight years depending on budgetary constraints. The City has evaluated several different options for its GIS system and has performed an initial needs assessment. A needs assessment for GIS implementation was performed during this reporting period. The initial stages of implementation will involve base data and updates for the existing layers based on current technology.

Staff training continues to develop and change based on staff's needs and new incoming information. The City focused this reporting period on SUSMP specific training because of the audit and a need to improve the SUSMP review process. Staff also discovered that employees were more favorable towards specialized trainings due to the repeated generic trainings of the past two reporting periods. Water Quality staff plans to rotate specialized and generic trainings every few years. This will allow the limited Water Quality staff to provide optimal trainings regardless of the topic. The rotation also allows City staff a chance to receive more in-depth training in a field that directly relates to their daily tasks.

2.4.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

The City is beginning to track activity targets and establish long-term goals for the water quality program. Below is a listing of the targets for this reporting period:

Target 1
Provide More Targeted Staff Training
100% complete

Target 2
Improve and provide permanent labels for local stormdrains
45% complete (on-going process)

Target 3
Improve catch basin inventory
75% complete (on-going process)

Target 4
Obtain educational decals for the DPW tailgates
50% complete

Target 5
Bring sewer system maintenance in-house full time
100% complete (both the camera truck and the vactor truck are now in house and being utilized full-time)

Target 6
Increase information available through the Newsletter
85% complete (more education is always needed)

Level 2 Outcomes: Changes in Knowledge/Awareness

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

Level 3 Outcomes: Behavioral Change/BMP Implementation

The City did not characterize or track specific measure related to behavioral changes as part of its Municipal Component in FY 2005-06. The need for the identification and assessment of such measures is being considered for the next reporting period. The City is currently working on connecting BMP

implementation to load reductions and program effectiveness. The City feels that despite the lack of official tracking, progress is being made and behaviors are changing. Staff's efforts to maintain the closed dumpster lid are evidence of the change in behavior, as well as the installation of the drip irrigation at City Hall. All City trucks are now equipped with sand bags and gravel bags to contain any emergency run-off problems, until other assistance arrives. The bags are also available to the residents in case of drainage problems.

Level 4 Outcomes: Load Reduction Estimation

As stated above the City of Lemon Grove is working on a connection between BMP implementation and Levels 4 – 6. Some program data can be used to make fairly straightforward estimates. The Municipal Component lends itself to this process easily as the City is already required to keep extensive records of daily activities. The process is also facilitated by centralized data collection. However, the process is in its infancy with a more complete picture projected for future reporting periods. As reported in Section 2.1.2, the City's street sweeping and MS4 maintenance activities resulted in the diversion or removal of a combined 1,625 pounds of debris from the MS4 this year. Unlike other waste streams likely to be only partially introduced or conveyed to the MS4, the entire amount of these totals is assumed to be a load reduction.

Table 2.4 - of Load Reduction Calculations for Municipal Activities

Activity	Amount Collected	Adjustment Factor	Estimated Load Reduction
Street Sweeping	169.75 tons	None	169.75 tons
MS4 Cleaning	1,625 pounds (.8125 tons)	None	1,625 pounds (.8125) tons
			Total 170.5628 tons

Level 5 & 6 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between municipal sources and water quality outcomes. The City will continue to explore these relationships. The City is attempting to connect BMP implementation to load reductions and eventually receiving water quality. The theory is that with the proper BMPs in place, a certain percentage of load reduction is expected, load reductions equal lower pollutant levels which lead to improved water quality.

2.4.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any municipal program data during this reporting period.

Section 3.0 Industrial Component

This section describes actions taken by the City during FY 2006-07 to minimize discharges from industrial facilities and their impact on receiving water quality and other environmental resources. The City continues to implement a number of complementary and inter-related program activities, including the following:

- Maintaining a watershed-based inventory of industrial sources
- Requiring BMP implementation through ordinance and permit
- Encouraging BMP implementation through notification and outreach
- Monitoring compliance through inspection and enforcement

3.1 Priority Industrial Sources

For its January 2006 JURMP Annual Report, the City identified nine high priority industrial sites in its borders. Since a single repository of facility data does not exist, the City relies on other data sources as well as field reconnaissance, to modify its inventory. The City uses the annual industrial/commercial inspections by DMax Engineering (DMax) and the State Water Resources Control Board (SWRCB) Notice of Intent (NOI) database to keep its list of industrial facilities up to date. The City also uses the data collected annually by DMax during their facility inspections to update its high priority listing. Because the City does not experience large quantities of new development, the list remains fairly stable from year to year. The City updated its city-wide business and development database. This reporting period was spent training staff and learning to utilize the new system. No statistics are available from the updated system due to the short time in use.

3.1.1 Additions to the Industrial Inventory

There were no facilities that were recommended for addition to the City's high priority category during this reporting period.

3.1.2 Deletions from the Industrial Inventory

DMax discovered no facilities during FY 2006-07 to be deleted from the inventory.

3.1.3 Updated Industrial Inventory

The City's updated industrial inventory currently consists of 27 facilities. This number includes the above new high priority facilities, because all were listed as medium priority industrial prior to this reporting cycle. Table 3.1 provides a summary of the types of sources contained within the inventory.

Table 3.1 - Summary of High Priority Industrial Sources

Industrial Activity	Number of Facilities in Lemon Grove	Revised High Priority Category Facilities
Waste Disposal and Recycling	1	
Equipment/Transportation	3	2
Metalwork	2	3
Building Supplies and Woodworking	3	2
Industrial Paper		1
Contractor, Special Trade		1
Specialty Hardware, Drapery		1
Total	**9**	**10**
	Total Facilities	**19**

3.2 BMP Requirements

3.2.1 BMP Requirements for Industrial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of industrial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 3.4.1. The City's tiered approach to establishing BMP requirements addresses all regulated industrial activities; broad standards apply to all types of industrial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP also provides specific BMPs based on business type as well as the general ones previously discussed (waste disposal, metal work, etc.).

3.2.2 Pollution Prevention Requirements for Industrial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's industrial program, the City views pollution prevention as part of BMP implementation. The JURMP in Section 3.1 discusses the City's pollution prevention goals with respect to industrial facilities. The City feels that if BMPs are implemented, that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

3.3 BMP Implementation

3.3.1 City Strategy for Ensuring BMP Implementation

As described in section 4.0 (Commercial Component), the City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites*

to the RWQCB on October 16, 2003. As noted for commercial sources, the City's strategy for ensuring BMP implementation at industrial facilities builds on this framework, as well as activities it is already conducting.

The City has also contracted with DMax to inspect all industrial and high priority commercial facilities within the City. As these documents are rather extensive, a copy may be obtained upon request. Attachment B-1 contains the forms used by D-Max to evaluate the facilities. A list of the inspected facilities can be found in Attachment B-2. Currently the City has limited Code Enforcement capabilities and only one full time Water Quality Program Coordinator. Budget constraints limit the growth of these fields, however City staff is hoping to improve and increase the Code Enforcement department as the budget allows. This would allow for easier, timely follow-up on facility violations, as well as creating a consequences-for-violations policy. A new code enforcement process for water quality violations is currently being implemented by the City for use with non-compliant construction sites and illegal discharges. The City is planning to expand the process to include non-compliant industries and commercial facilities, especially with reference to monitoring and testing. First the City must first pass an ordinance pertaining to testing requirements; then the code enforcement policy can include them for regulation and penalty assessment.

The City created a stormwater fee for businesses and residents. The City has explored different billing criteria based on the experiences of other cities. The City explored solid waste services as a possible billing mechanisim. The fee was standard for residential but differentiated based on facility/business dumpster size and frequency of pick-up. The fee allowed the City to recoup some of its water quality expenditures, but would also increase public awareness and participation. People and facilities are more likely to implement BMPs if a regular reminder of their importance is provided.
During late FY 2004-05, the City developed a fee based on trash removal services. The City believed a correlation existed between the amount of trash a site produced and the site's potential for pollution contribution. However the constraints of Proposition 218 made the fee vulnerable, therefore the City decided to re-vamp the fee structure to prevent any complications. The fee is no longer based on trash services for commercial facilities, but is attached to existing City fees for licenses and permits. A flat fee remains in effect for residents based on solid waste fees. The combined commercial and residential fees only cover one third of the cost of the City's stormwater program. The percentage is expected to lower with increased costs incurred by the issuance of the new MS4 permit, however they do not compensate for increased requirements and new programs. The already strained General Fund will continue to bear the brunt of the program's cost. With the vote failure in Encinitas, a coastal city, the inland cities have little hope of passing a stormwater fee without Proposition 218 exemption.

3.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of the Copermittee program is to assist businesses in selecting appropriate combinations of BMPs that address their unique circumstances, activities, and discharge potential. While the City has existing BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options are standard elements of the City's program planning process.

A need exists to ensure regional consistency between Copermittee efforts. For instance, regional collaboration is beneficial in disseminating regionally consistent information to businesses, and for sharing information about practices that are working and those that are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so will seek to provide an understandable and regionally consistent message to the businesses it regulates. The City also participates in a San Diego Bay Watershed workgroup that explores topics pertinent to the entire watershed. These topics include BMP implementation and strategies for ensuring effectiveness. Effective education is key to ensuring BMP implementation. The City participates in both the County's Green Business meetings and the Copermittee's Outreach and Education Workgroup. The groups collaborate and share ideas and solutions. The City feels its participation in these venues is valuable in developing an effective and well-rounded program. Collaboration also ensures consistent messages to area businesses. The businesses know what to expect if they re-locate to another area of the County. Where applicable, the City will advocate the use of the January 2003 Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

3.3.1.2 Outreach and Notification

Although compliance inspections are the cornerstone of the City's industrial facilities regulatory program, education is key to ensuring effective implementation by facility operators. The City is working to improve its outreach to the industrial facilities within the city-limits. All the industrial facilities are inspected annually by DMax. The results of the inspections are not received until after the end of the reporting period, therefore any improvements and follow-up are representative of the previous year's inspections.

The City is also working to improve its notification system. Staff is working to expand its database to contain all previous and present violators. The database will contain the number of violations, the type of violations, contact information, and notification information. The database will allow the City to track repeat

offenders and establish a better code enforcement policy. By tracking violation type, the City can better target its outreach efforts, making them more effective educational tools.

The City is currently working to alter the emphasis of its outreach. The current focus is on “don’ts”; the City is attempting to turn that around and make the focus “what to do.” The City believes that many violations continue because businesses and developers are not aware of alternative methods. If the focus of the outreach becomes “what can be done”, people have an alternative behavior, not just a change in knowledge. As stated above, for industrial facilities and construction, CASQA has very comprehensive BMP handbooks, which provide a variety of treatment methods based on activities and pollutants. Informing facilities of resources is a very simple example of positive outreach that provides people with behavior alternatives. Repetition is also key in an effective outreach program. The more often facilities are notified, the harder it is to claim ignorance.

3.3.1.3 Compliance and Enforcement

The City continues to use routine inspections as its primary means of compliance certification for industrial facilities. All industrial and high priority commercial facilities in Lemon Grove are inspected by DMax. The reports are available for viewing, but as they are rather extensive are not included in this report.

The City sent no code enforcement letters during this reporting period to local industrial facilities. No complaints or investigations were needed at local facilities. The City is working on responding to the suggestions based on the inspection results. The final report was not received until after the end of the reporting period, but the City is working to schedule second inspections at several facilities and sending educational information to several others. The educational materials explain the NONA/NEC possibilities and what is required of each facility. Attachment B-3 contains a copy of the education packet now available for distribution.

3.3.2 Outreach to Industrial Businesses in FY 06-07

The City provided outreach to the industrial sector through several avenues in FY 05-06. Specific activities are described below.

3.3.2.1 Outreach Events Targeting Industrial Audiences

During this reporting period the City did not perform any outreach events that targeted Industrial audiences directly. However, through the inspection process, all industrial facilities are reached in some manner with water quality information. Each facility receives a copy of their inspection complete with recommendations for improvements. In future years the City plans to up-grade its industrial

outreach. The following is a list of the activities the City wishes to implement in future reporting periods:

- Workshops on water sampling (a number of facilities are in violation on this aspect)
- A general information sheet about compliance with the General Industrial Permit and the Permit affecting the local jurisdiction
- Workshops on dry-cleaning methods for spills and general good house-keeping practices

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Outreach at public events such as the Winter Bonfire and Spring Festival

3.3.2.2 BMP and Pollution Prevention Resources

Providing business representatives with useful sources of BMP information is a major focus of the City's stormwater program, and is emphasized in other regulatory programs as well. In this respect, particular stress is placed on pollution prevention practices.

The City's Pollution Prevention Program continued to promote pollution prevention practices among local businesses and the public during this reporting period. Stormwater and urban runoff messages are incorporated into all pollution prevention literature and program content. Through this program, the City continues to pursue partnerships, which provide important opportunities to integrate industrial stormwater program elements into existing programs, materials and avenues of distribution.

3.3.2.3 Outreach During the Inspection Process

Personal communication through the inspection process is perhaps the most effective means of imparting useful BMP information to industrial operators. As described below, DMax conducted twenty-four industrial facility inspections during this reporting period. During these inspections, DMax provided detailed compliance information for facility operators. Direct communication through the inspection process, augmented by various other outreach tools, will continue to be the City's primary means of outreach to industrial businesses.

3.4 Compliance and Enforcement

In addition to educating business owners and operators, the City contracts with DMax to conduct routine inspections and responds to business-related complaints to verify and enforce compliance with stormwater requirements. In all instances, enforcement is pursued as necessary to return violators to compliance.

3.4.1 Inspection of Industrial Facilities

DMax inspected twenty-four industrial facilities during this reporting period. One hundred percent of the City's industrial facilities were inspected including low and medium level facilities.

Each industrial inspection consists of observable behavior and asked questions. The first portion of the inspection details facility and site information. The general information includes all required codes and classification information. The inspections found an additional ten high priority sites during this reporting period. They are listed above in Section 3.1.1. All of the new sites were formerly listed as medium priority and have now been up-graded to high priority due to new activity on site and proximity to Chollas Creek.

The inspection also includes a section detailing the BMPs in use, both observed and discussed. The final portion details recommended improvements and possible City action. The majority of compliance actions that were recommended dealt with the up-graded high priority facilities and the need for them to file NOIs or NONA/NECs and create monitoring programs. The facilities will be re-inspected and the necessary paperwork followed-up with during the next reporting cycle. The City has already contacted several of the facilities and is working with them to ensure they are in compliance with the Permit.

3.4.2 Complaint Investigations Involving Industrial Facilities

To the knowledge of City staff, no complaints were filed against Lemon Grove industrial facilities during FY 2006-07.

3.4.3 Enforcement of Violations at Industrial Facilities

During FY 2006-07, all enforcement activities consisted of detailed notification by letter and a new code enforcement policy. See Attachment B-4 for the flow chart demonstrating the new policy. The City sent BMP housekeeping information to all the industrial facilities listed in the previous reporting period as having improper or poor BMP implementation. The City is currently working to ensure the upkeep of BMPs at its industrial facilities. The City's primary focus during the next reporting cycle will be collaborating with the industrial facilities to ensure

complete compliance with water quality standards and pollution prevention efforts.

3.4.4 Reporting of Non-Compliant Sites

The City did not have a situation requiring it to report any non-compliant sites to the RWQCB over the course of this reporting period.

3.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Industrial Component in FY 2006-07.

3.5.1 Narrative Assessment

In FY 2006-07, the City continued a revamping of its notification system. An initial step in this re-designing was the contracting of DMax in 2002 to perform annual inspections of all industrial and commercial facilities in Lemon Grove. However, the staff position has lacked consistency on a year to year basis and keeping a yearly account of facilities in violation has been difficult. The City has a record of all notices, but no database to assist in analyzing the information. The City has begun to establish a data base to chronicle notifications. A database will facilitate later effectiveness assessments by allowing the City to analyze past violations by type and frequency. If a decrease in violations or in BMP violations is evident, then levels of effectiveness are easier to assess. A continual record of violations will also enable the City to focus its education and outreach to fit the specific needs of the industrial community in Lemon Grove.

The City implemented a new database for tracking industrial facilities within the City's boundaries. The City is still inputting past data to bring the system up to date to allow for tracking. Each facility will have a file that contains past inspection data and compliance issues. DMax focused on updating the current business facility to ensure accurate database information. This was how the ten new facilities were located and re-evaluated for correct prioritization.
The City believes its current program is in compliance but can be further developed to make it an outstanding and effective program. The City is aware that the need to assess effectiveness is of high importance. Therefore, the City worked cooperatively with other Copermittees to develop a comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*, submitted to the RWQCB on October 16, 2003). It is through the use of this framework that the City hopes to improve and further develop its existing program. The City is moving towards a more BMP based program. The City believes that BMPs are the backbone of an effective program. Through proper implementation, BMPs present an excellent measuring medium. Once the BMP is in place, the prevented pollutant load can be assessed.

In 2004, the Stormwater program came under new management. The City combined its Public Works Department and its Engineering Department. In August 2004, the City hired a new Water Quality Program Analyst. The yearly turn-over in the stormwater position has made it difficult for the program to develop and grow. However, the City is working on making certain elements standard, so that a basis is present from which growth can occur regardless of who is running the program. Combining the above mentioned departments facilitates the collection of stormwater data. Public Works personnel are the front-line, so to speak for City stormwater maintenance. By having them in the same department as the Stormwater manager, it will be easier to assess and improve collection methods and data.

No specific management practices or BMPs relating to industrial facilities or activities were identified as being ineffective during this reporting period.

3.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

Level 1 Outcomes: Success in Meeting Activity-Based Targets

Target 1
Begin database for tracking non-compliant facilities
50% complete (the database needs more back data entries to be accurate)

Target 2
Update JURMP industrial list through DMax
100% complete

Target 3
Provide educational material to those facilities eligible for NONA or NEC
100% complete

Target 4
Create annual activity specific informational mailer
30% complete

Level 2 Outcomes: Changes in Knowledge / Awareness

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

Level 3 Outcomes: Behavioral Change / BMP Implementation

A new aspect of the 2005 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention measures and the NPDES Storm Water Program were rated "Level 5". Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a "Level 4" rating. "Level 3" rating indicated an individual who answered three questions correctly, "Level 2" indicated one or two correctly answered questions, and a "Level 1" rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- "Level 5": All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- "Level 4": BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business' activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- "Level 3": BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- "Level 2": Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- "Level 1": A violation of one or more of the City's Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2005 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

Table 3.2 Program Scores for FY 2006-07

	Knowledge Assessment *	**BMP Assessment**
Average Rating	2.6	3.5
Median Rating	3	3
# of "Level 5" Ratings	6	25
# of "Level 4" Ratings	28	34
# of "Level 3" Ratings	30	49
# of "Level 2" Ratings	22	12
# of "Level 1" Ratings	33	4

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

Table 3.3 Program Scores for FY 2005-06

	Knowledge Assessment *	BMP Assessment
Average Rating	2.39	3.33
Median Rating	2	3
# of "Level 5" Ratings	0	14
# of "Level 4" Ratings	9	26
# of "Level 3" Ratings	34	30
# of "Level 2" Ratings	26	11
# of "Level 1" Ratings	18	7

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.

Level 4 Outcomes: Load Reduction Estimation

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2005-06. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

Level 5 Outcomes: Discharge and Receiving Water Quality

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

3.5.3 Spatial and Geographic Analysis

The stormwater runoff in the City of Lemon Grove drains to two waterways that eventually end in the San Diego Bay; Chollas Creek and Sweetwater River. See Attachment B-5 for drainage zones.

Section 4.0 Commercial Component

This section describes actions taken by the City during FY 2006-07 to minimize discharges from commercial businesses and their impact on receiving water quality and other environmental resources. The City implements a number of complementary and inter-related commercial program activities, including the following:

- Maintaining an inventory of commercial businesses (Section 4.1)
- Requiring BMP implementation through ordinance and permit (Section 4.2)
- Encouraging BMP implementation through notification and outreach (Section 4.3); and,
- Verifying compliance through inspection and enforcement (Section 4.4).

Inspections of commercial facilities are performed by DMax in the same manner as industrial facility inspections. See Section 3.4.1 for a detailed description of the inspection process.

4.1 Priority Commercial Sources

As required under Permit section F.3.c.(2), the City maintains and annually updates a city-wide inventory of high priority commercial sources as a basis for its outreach and regulatory programs. This inventory currently includes 139 individual sources. Table 4.1 summarizes the commercial inventory by business type and indicates the sources of information used to compile data for each type.

Table 4.1 - Summary of High Priority Commercial Sources

Commercial Activity	Number of Facilities in Lemon Grove
Automobile Dealers/Rentals	18
Automobile Supply Stores	9
Automobile Repair/Paint	9
Automobile System and Tire Repair	56
Automobile Cleaning/Washing	3
Gas Stations	7
Eating/Drinking Establishments	60
Landscaping, includes lawn care	9
Nurseries and Greenhouses	1
Pest Control	3
Equipment Repair/Maintenance/Cleaning	3
Metalwork	6
Masonry	4
Parking Lots and Storage	3
Carpet/Building Cleaning	21
Pool and Fountain Cleaning	3
Total	**215**

As Table 4.1 suggests, the City has yet to locate a single, centralized source of commercial facility information. Several of the facilities with commercial SIC codes are high priority industrial due to their proximity to Chollas Creek, a 303d listed water. This explains the discrepancy between the above number and the commercial inventory number. While the City remains hopeful that improved sources of facility data and information can be identified, in the meantime it must continue to rely on existing data sources such as permit databases, the Yellow Pages and field reconnaissance.

The City is implementing an updated version of its existing database in the next reporting period. The new format will be more complete and allow for better tracking of renewals and new licenses. The City also utilized the annual inspections performed by DMax to assist in updating its database. DMax notified the City of any business that failed to verify current licensing with the City. The update was complete in mid FY 2006-07, with the remainder of the year spent training staff and learning to utilize the updates. The new system did not identify any new business types. The existing numbers were considered accurate for this reporting period. Water quality staff is also currently exploring options for integrating water quality related data into the current business license program, HdL. It is the same program utilized for building permits and code violations and would be an excellent integrated tracking system if it is capable. Staff is working for a representative to further explore this option.

4.2 BMP Requirements for Commercial Businesses

4.2.1 BMP Requirements for Commercial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of commercial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 4.3.1. The City's tiered approach to establishing BMP requirements addresses all regulated commercial activities regardless of priority categorization; broad standards apply to all types of commercial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP does provide specific BMPs based on business activity as well as the general ones previously discussed (eating/drinking establishments, auto repair, nurseries, etc).

4.2.2 Pollution Prevention Requirements for Commercial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's commercial program, the City views pollution prevention as part of BMP implementation. The JURMP in section 4.1 discusses the City's pollution prevention goals with respect to commercial dischargers. The City feels that if BMPs are implemented properly that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

4.3 BMP Implementation at Commercial Sites

The City has developed and implemented a comprehensive strategy for ensuring BMP implementation "on the ground" at high priority commercial businesses subject to its oversight. This section describes progress during FY 2006-07 as well as an updated strategy for ensuring effective BMP implementation in the future.

4.3.1 City Strategy for Ensuring BMP Implementation

On October 16, 2003, the City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs* at commercial and Industrial Sites to the RWQCB. This framework lays out a comprehensive set of options that Copermittees should consider in developing and updating their commercial source programs. The following description of the City's strategy builds on this framework, as well as activities it has already conducted during this and previous reporting periods. The final decision to utilize and/or emphasize specific elements will be determined as part of the City's ongoing program implementation and evaluation process.

4.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of Copermittee programs is to assist commercial facilities in selecting appropriate combinations of BMPs that address unique circumstances, activities, and discharge potential. While the City has already established extensive BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options is a standard element of the City's program planning process.

A need also exists to ensure regional consistency in Copermittee efforts. For instance, regional collaboration is beneficial in disseminating consistent information to businesses, and for sharing information about which practices are working and which practices are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so, will seek to provide an understandable and regionally consistent message to the businesses it regulates. Several fact sheets are being developed for distribution to commercial businesses, several in conjunction with the County's Green Business program. The intent is to create regionally consistent material that explains the implementation of required BMPs for different types of facilities and activities. Where applicable, the City will also advocate the use of the Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

4.3.1.2 Outreach and Notification

Several types of outreach and notification activities can be effective in ensuring that business operators have been adequately informed of their compliance obligations and provided useful information on how to meet them. As shown below, the City intends to utilize each of the following types of outreach to varying degrees as part of its outreach and notification process:

- Printed Materials
- Direct Mailings (including e-mail)
- Workshops and seminars
- Websites and hotlines
- Industry associations

The degree to which any of these tools are used will vary by specific program area, as well as the interest level of regulated parties. For instance, workshops and seminars will generally be made available upon request, but the City may specifically target certain sectors it considers to be in need of extra attention. Outreach will also play a proportionally larger role in the City's approach to businesses not subject to an active inspection process. Community groups and community outreach events can also play a useful role in reaching some types of commercial businesses. The City intends to increase its emphasis in this area on a continual basis. Three public events that lend themselves to information distribution are the Fire Department Open House held in October, the Winter Bonfire held in December, and the Spring Festival held in April or May.
