**Notes:**

SIC – Standard Industrial Classification Code

Potential Pollutants – Potential pollutants that may be generated by the facility. A facility can be identified as having more than one pollutant. Potential pollutants for each facility are determined by category if no inspection information is available.

Tributary to 303(d) – The facility is tributary to a waterbody listed in the Clean Water Act Section 303(d) list of impaired waterbodies

Generating Pollutants Tributary to 303(d) Listed – The facility is tributary to 303(d) listed receiving water and has potential to generate pollutants for which the water body is impaired

TTWQ – Threat to Water Quality

| 80 | 3/1/2012 | Storm Water Hotline | 7566 Malorey St | Residential | Report of spray painting furniture on the sidewalk. | No evidence of discharge was noted. Complaint appears unfounded. | N/A |
| 81 | 3/8/2012 | Code Compliance | 4667 Judson Way | Residential | Report of car detailing on-site. | Compliance letter issued to property owner advising him/her of storm water regulations. | Compliance Letter |
| 82 | 3/12/2012 | Request Tracker | Highfield Ave and Garfield St | Residential/ Construction | Report of material storage on property. | Homeowner was advised of storm water regulations and communicated them to contractor. Clean up verified. | N/A |
| 83 | 3/12/2012 | Public Works Service Request | Allison Ave | Residential | Report of gutter grate that needs to be secured. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 84 | 3/15/2012 | Public Works Service Request | Lemon Ave | Residential | Report of debris in storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 85 | 3/19/2012 | Public Works Service Request | Palm Ave | Residential | Report of storm drain overflow. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 86 | 3/19/2012 | Public Works Service Request | Merritt Blvd | Residential | Report of flooding caused by clogged storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |

## Appendix B (Continued)
## Complaint Log

| # | Date Received | Complaint Origin | Responsible Party/ Location of Problem | Responsible Party Type | Issue/Problem | Response | Enforcement Type/ Educational Material Distributed |
|---|---|---|---|---|---|---|---|
| 87 | 3/22/2012 | Public Works Service Request | Baltimore Dr | Residential | Report of storm drain lines to be CCTV'd. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 88 | 3/22/2012 | Public Works | 5424 Wellsley St | Construction | Report of dirt in street and gutter from construction. | Contractor advised of storm water regulations and implemented appropriate BMPs. | N/A |
| 89 | 3/25/2012 | Storm Water Hotline | 6150 Horton Dr | Residential | Report of car leaking antifreeze. | Compliance letter issued to resident advising him/her of storm water regulations. | Compliance Letter, Written Warning |
| 90 | 3/29/2012 | Public Works Service Request | Wakarusa St | Residential | Report of three missing manhole covers. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 91 | 4/2/2012 | Request Tracker | 5577 Lake Murray Dr | Commercial | Report of discharge of contaminated rain water to storm drain. | Store management was advised of storm water regulations. Inspection priority of facility has been increased to "high" which will result in consistent storm water inspections. | N/A |
| 92 | 4/3/2012 | Request Tracker | 4580 73rd St | Residential | Report of low lying gutter with stagnant water. | Contacted homeowner and explained that the issue was forwarded to the City Engineer for assessment. | N/A |
| 93 | 4/9/2012 | Public Works Service Request | Harris St | Residential | Report of stagnant water caused by clogged storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 94 | 4/12/2012 | Public Works Service Request | Boulevard Dr | Residential | Report of dirt around storm drain inlet. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 95 | 4/12/2012 | Public Works Service Request | La Mesa Blvd | Residential | Report of hazardous road condition due to bent curb. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 96 | 4/16/2012 | Storm Water Hotline | 4197 E. Arietta Cir | Residential | Report of exposed rubble and concrete. | Property owner was advised of storm water regulations and acknowledged that dirt pile would be covered. | N/A |

## Appendix B (Continued)
## Complaint Log

| # | Date Received | Complaint Origin | Responsible Party/ Location of Problem | Responsible Party Type | Issue/Problem | Response | Enforcement Type/ Educational Material Distributed |
|---|---|---|---|---|---|---|---|
| 97 | 4/16/2012 | Storm Water Hotline | 4390 Gordon Way | Residential | Report of Styrofoam on property and in storm drain. | Written warning issued to the property owner advising him/her of storm water regulations and necessary clean up. | Written Warning |
| 98 | 4/17/2012 | Public Works Service Request | Primrose Dr | Residential | Report of storm drain clogged with debris. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 99 | 4/18/2012 | Public Works Service Request | Lovell Ln | Residential | Report of abandoned inlet. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 100 | 4/23/2012 | Storm Water Hotline | 7747 Normal Ave | Residential | Report of scooter stuck in storm drain. | Scooter removed from storm drain. | N/A |
| 101 | 4/24/2012 | Storm Water Hotline | 7640 El Cajon Blvd | Commercial | Report of auto shop spraying down shop area. | Business owner was advised of storm water regulations and issued an NOV | Notice of Violation |
| 102 | 4/28/2012 | Storm Water Hotline | 8044 El Capitan Dr | Residential | Report of resident washing equipment, paint, and gas into the storm drain. | Resident was advised of the storm water regulations and associated fines for non-compliance. | N/A |
| 103 | 4/28/2012 | Public Works Service Request | Veemac Ave | Residential | Report of grate in storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 104 | 4/28/2012 | Storm Water Hotline | 5051 Jackson Dr | Commercial | Report of runoff from pipe at car wash. | Business management was advised of storm water regulations. Most of the discharge is groundwater, but they committed to making modifications to reduce the runoff. | Photos of the issue |
| 105 | 5/15/2012 | Storm Water Hotline | 5770 Kelton Dr | Residential | Report of car oil discharge to street. | Homeowner was advised of storm water regulations. Absorbent was applied as needed and disposed of properly. | Written Warning |
| 106 | 5/18/2012 | Public Works Service Request | Dallas St | Residential | Report of debris in storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 107 | 5/21/2012 | Public Works Service Request | Moisan Way | Residential | Report of street hole. | PW evaluated and cleaned/maintained as applicable. | N/A |

## Appendix B (Continued)
## Complaint Log

| # | Date Received | Complaint Origin | Responsible Party/ Location of Problem | Responsible Party Type | Issue/Problem | Response | Enforcement Type/ Educational Material Distributed |
|---|---|---|---|---|---|---|---|
| 108 | 5/24/2012 | Storm Water Hotline | 4614 4th St | Residential | Report of sewage smell. | NOV issued to homeowner to fix immediately. Clean up and maintenance by plumber verified. | Notice of Violation |
| 109 | 5/24/2012 | Public Works | 7205 Colony Rd | Residential | Report of yard drain connections to sewer system. | Lateral replacement verified. | N/A |
| 110 | 5/20/2012 | Storm Water Hotline | Alvarado Rd at 70th St | Utility | Report of mineral oil spill due to car accident. | All mineral oil was contained by the SDGE contractor crew. No discharge reached the storm drain. | N/A |
| 111 | 5/31/2012 | Storm Water Hotline | 4417 Parks Ave | Residential | Report of auto repairs done by a tenant on-site. | No storm water issues were observed during the site visit. Compliance letter issued to the property owner advising him/her of storm water regulations. | Compliance Letter |
| 112 | 6/5/2012 | Storm Water Hotline | 6350 Kimi Ln | Residential | Report of leaves being blown onto property. | Determined to be a private property concern. | N/A |
| 113 | 6/5/2012 | RWQCB | 5770 Marengo Ln | Residential | Report of illegal fill dumped along rear of property. | Site was immediately covered with Visqueen. Property owner obtained proper permits for retaining wall. Final erosion control check will be conducted upon completion. | Notice of Violation |
| 114 | 6/5/2012 | Storm Water Hotline | 8787 Alpine Dr @ Mission Bell | Residential | Report of sewer lateral overflow. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 115 | 6/6/2012 | Public Works Service Request | 70th St | Residential | Report of degraded storm drain full of debris. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 116 | 6/13/2012 | Public Works Service Request | Lemon Ave | Residential | Report of erosion caused by storm drain outlet pipe. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 117 | 6/14/2012 | Public Works Service Request | 70th St | Residential | Report of skateboard in storm drain. | PW evaluated and cleaned/maintained as applicable. | N/A |

## Appendix B (Continued)
## Complaint Log

| # | Date Received | Complaint Origin | Responsible Party/ Location of Problem | Responsible Party Type | Issue/Problem | Response | Enforcement Type/ Educational Material Distributed |
|---|---|---|---|---|---|---|---|
| 118 | 6/19/2012 | Public Works Service Request | Lake Park Way | Residential | Report of storm drain bars that need to be secured. | PW evaluated and cleaned/maintained as applicable. | N/A |
| 119 | 6/22/2012 | Public Works Service Request | Riviera Dr | Residential | Report of missing manhole cover. | PW evaluated and cleaned/maintained as applicable. | N/A |

# APPENDIX C

**Appendix C**
**JURMP Annual Report Requirements Checklist**

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| i. A description of any amendments to the General Plan, the environmental review process, development project approval processes, or development project requirements. | 2.2, 2.3 |
| ii. Confirmation that all development projects were required to undergo the Copermittee's urban runoff approval process and meet the applicable project requirements, including a description of how this information was tracked. | 2.4.4.2 |
| iii. A listing of the development projects to which SUSMP requirements were applied. | 2.4.4.2 |
| iv. Confirmation that all applicable SUSMP BMP requirements were applied to all priority development projects, including a description of how this information was tracked. | 2.4.4.2 |
| v. At least one example of a priority development project that was conditioned to meet SUSMP requirements and a description of the required BMPs. | 2.4.4.2 |
| vi. A listing of the priority development projects which were allowed to implement treatment control BMPs with low removal efficiency rankings, including the feasibility analyses which were conducted to exhibit that more effective BMPs were infeasible. | 2.4.4.2 |
| vii. An updated treatment control BMP inventory. | Appendix A.1 |
| viii. The number of treatment control BMPs inspected, including a summary of inspection results and findings. | 2.4.4.3, Table 2-1 and 2-2 |
| ix. A description of the annual verification of operation and maintenance of treatment control BMPs, including a summary of verification results and findings. | 2.4.4.3 |
| x. Confirmation that BMP verification was conducted for all priority development projects prior to occupancy, including a description of how this information was tracked. | 2.4.4.2 |
| xi. A listing of any projects which received a SUSMP waiver. | 2.4.4.2 |
| xii. A description of implementation of any SUSMP waiver mitigation program. | 2.4.4.2 |
| xiii. A description of Hydromodification Management Plan (HMP) development collaboration and participation. | 2.4.4.2 |
| xiv. A listing of development projects required to meet HMP requirements, including a description of hydrologic control measures implemented. | 2.4.4.2 |
| xv. A listing of priority development projects not required to meet HMP requirements, including a description of why the projects were found to be exempt from the requirements. | 2.4.4.2 |

## Development Planning Component

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(a)** | **Location in Report** |
|---|---|
| xvi. A listing of development projects disturbing 50 acres or more, including information on whether Interim Hydromodification Criteria were met by each of the projects, together with a description of hydrologic control measures implemented for each applicable project. | 2.4.4.2 |
| xvii. The number of violations and enforcement actions (including types) taken for development projects, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 2.4.4.3, Table 2-2 |
| xviii. A description of notable activities conducted to manage urban runoff from development projects. | Throughout Section |

## Construction

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(b)** | **Location in Report** |
|---|---|
| i. Confirmation that all construction sites were required to undergo the Copermittee's construction urban runoff approval process and meet the applicable construction requirements, including a description of how this information was tracked. | 3.5 |
| ii. Confirmation that a regularly updated construction site inventory was maintained, including a description of how the inventory was managed. | 3.2 |
| iii. A description of modifications made to the construction and grading ordinances and approval processes. | 3.3 |
| iv. Confirmation that the designated BMPs were implemented, or required to be implemented, for all construction sites. | 3.5 |
| v. Confirmation that a maximum disturbed area for grading was applied to all applicable construction sites. | 3.5 |
| vi. A listing of all construction sites with conditions requiring advanced treatment, together with confirmation that advanced treatment was required at such construction sites. | 3.5 |
| vii. For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspections conducted during the dry season, and the total number of inspections conducted for all sites. | 3.5, Appendix A.2 |
| viii. A description of the general results of the inspections. | 3.5 |
| ix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 3.5 |
| x. The number of violations and enforcement actions (including types) taken for construction sites, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 3.5 Table 3-1 |
| xi. A description of notable activities conducted to manage urban runoff from construction sites. | Throughout Section |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| i. Any updates to the municipal inventory and prioritization. | Appendix A.3 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for municipal areas and activities, as well as special events. | 4.2.4, 4.3.4, 4.4.4, 4.5.4, 4.6.4, 4.7.4 |
| iii. A description of inspections and maintenance conducted for municipal treatment controls. | 4.4.3, 4.4.4, 2.4 |
| iv. Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned. | 4.4 Table 4-2 |
| v. Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned. | 4.4 Table 4-2 |
| vi. Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned. | 4.4 Table 4-2 |
| vii. Amount of waste and litter (tons) removed from catch basins, inlets, the MS4, and open channels, by category. | 4.4 Table 4-2 |
| viii. Identification of any MS4 facility found to require inspection less than annually following two years of inspection, including justification for the finding. | N/A for 2011/2012 |
| ix. Confirmation that the designated BMPs for pesticides, herbicides, and fertilizers were implemented, or required to be implemented, for municipal areas and activities. | 4.2.3 |
| x. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating the highest volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3 Table 4-1 |
| xi. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating moderate volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4 Table 4-1 |
| xii. Identification of the total distance of curb-miles of improved roads, streets, and highways identified as consistently generating low volumes of trash and/or debris, as well as the frequency of sweeping conducted for such roads, streets, and highways. | 4.3.4 Table 4-1 |

## Municipal

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(c)** | **Location in Report** |
|---|---|
| xiii. Identification of the total distance of curb-miles swept. | 4.3.4<br>Table 4-1 |
| xiv. Identification of the number of municipal parking lots, the number of municipal parking lots swept, and the frequency of sweeping. | 4.3<br>Table 4-1 |
| xv. Amount of material (tons) collected from street and parking lot sweeping. | 4.3<br>Table 4-1 |
| xvi. A description of efforts implemented to prevent and eliminate infiltration from the sanitary sewer to the MS4 | 4.5.4 |
| xvii. Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections. | 4.2.4, 4.3.4,<br>Table 4-4 |
| xviii. A description of the general results of the inspections. | Table 4-4 |
| xix. Confirmation that the inspections conducted addressed all the required inspection steps to determine full compliance. | 4.2.4 |
| xx. The number of violations and enforcement actions (including types) taken for municipal areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 4.2.4,<br>Table 4-4 |
| xxi. A description of notable activities conducted to manage urban runoff from municipal areas and activities. | Throughout Section |

## Industrial and Commercial

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(d)** | **Location in Report** |
|---|---|
| i. Any updates to the industrial and commercial inventory. | 5.2.2 (stationary), 5.3.2 (mobile), Appendix A.4 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for industrial and commercial sites/sources. | 5.2.3, 5.2.4, 5.3.3, 5.3.4 |
| iii. A description of efforts taken to notify owners/operators of industrial and commercial sites/sources of BMP requirements, including mobile businesses. | 5.2.4, 5.3.4 |
| iv. Identification of the total number of industrial and commercial sites/sources inventoried and the total number inspected. | 5.2.2, 5.3.2; 5.2.4, 5.3.4; Table 5-1 |
| v. Justification and rationale for why the industrial and commercial sites/sources inspected were chosen for inspection. | 5.2.4 |
| vi. Confirmation that all inspections conducted addressed all the required inspection steps to determine full compliance. | 5.2.4 |
| vii. Identification of the number of third party inspections conducted. | N/A (5.2.4 ) |
| viii. Identification of efforts conducted to verify third party inspection effectiveness. | N/A (5.2.4 ) |
| ix. A description of efforts implemented to address mobile businesses. | 5.3.4 |
| x. The number of violations and enforcement actions (including types) taken for industrial and commercial sites/sources, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 5.2.4, 5.3.4 |
| xi. A description of steps taken to identify non-filers and a list of non-filers (under the General Industrial Permit) identified by the Copermittees. | 5.2.4 |
| xii. A description of notable activities conducted to manage urban runoff from industrial and commercial sites/sources. | Throughout Section |

## Residential

| **Permit Annual Reporting Requirement—Section J.3.a.(3).(e)** | **Location in Report** |
|---|---|
| i. Identification of the high threat to water quality residential areas and activities that were focused on. | 6.2 |
| ii. Confirmation that the designated BMPs were implemented, or required to be implemented, for residential areas and activities. | 6.4 |
| iii. A description of efforts implemented to facilitate proper management and disposal of used oil and other household hazardous materials. | 6.4 |
| iv. Types and amounts of household hazardous wastes collected, if applicable. | 6.4 |
| v. A description of any evaluation of methods used for oversight of residential areas and activities, as well as any findings of the evaluation. | 6.4 (see discussion in JURMP) |
| vi. The number of violations and enforcement actions (including types) taken for residential areas and activities, including information on any necessary follow-up actions taken. The discussion should exhibit that compliance has been achieved, or describe actions that are being taken to achieve compliance. | 6.4 |
| vii. A description of collaboration efforts taken to develop and implement the Regional Residential Education Program. | 6.4 |
| viii. A description of notable activities conducted to manage urban runoff from residential areas and activities. | Throughout Section |

## IDDE*

| Permit Annual Reporting Requirement—Section J.3.a.(3).(f) | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the 2011/2012Annual Report, will be submitted to the RWQCB no later than December 15, 2012. | |

## IDDE—Additional Dry Weather Monitoring Program Requirements*

| Permit Annual Reporting Requirement—Attachment B and Receiving Waters Monitoring and Reporting Program No. R9-2007-0001, Section II.B.3.c,d | Location in Report |
|---|---|
| * Section 7, the Illicit Discharge Detection and Elimination component, of the 2011/2012 Annual Report, will be submitted to the RWQCB no later than December 15, 2012. | |

## Education

| Permit Annual Reporting Requirement—Section J.3.a.(3).(g) | Location in Report |
|---|---|
| i. A description of education efforts conducted for each target community. | 8.3 |
| ii. A description of how education efforts targeted underserved target audiences, high-risk behaviors, and "allowable" behaviors and discharges. | 8.3 |
| iii. A description of education efforts conducted for municipal departments and personnel. | 8.2 |
| iv. A description of education efforts conducted for the new development and construction communities. | 8.3 |
| v. A description of jurisdictional education efforts conducted for residents, the general public, and school children. | 8.3 |

## Public Participation

| Permit Annual Reporting Requirement—Section J.3.a.(3).(h) | Location in Report |
|---|---|
| i. A description of public participation efforts conducted. | 9.2 and 9.3 |

## Effectiveness Assessment

| Permit Annual Reporting Requirement—Section J.3.a.(3).(i) | Location in Report |
|---|---|
| i. An assessment of the effectiveness of the Jurisdictional Urban Runoff Management Program which meets all requirements of section I.1 of this Order. | 11 |

## Fiscal Analysis

| Permit Annual Reporting Requirement—Section J.3.a.(3).(j) | Location in Report |
|---|---|
| i. A fiscal analysis of the Copermittee's urban runoff management programs which meets all requirements of section G of this Order. (For 2007-2008, the requirements that apply are essentially the same as those found in Order No. 2001-01) | 10 |

## Special Investigations

| Permit Annual Reporting Requirement—Section J.3.a.(3).(k) | Location in Report |
|---|---|
| i. A description of any special investigations conducted. | 12 |

## Non-Emergency Firefighting

| Permit Annual Reporting Requirement—Section J.3.a.(3).(l) | Location in Report |
|---|---|
| i. A description of efforts conducted to reduce pollutant discharges from non-emergency fire fighting flows. | 4.2.3, 13 |

## JURMP Revisions

| Permit Annual Reporting Requirement—Section J.3.a.(3).(m) | Location in Report |
|---|---|
| i. A description of any proposed revisions to the JURMP. | 14 and each program component section |

# The City of La Mesa Storm Water Best Management Practices Manual – Part II

LA MESA LOCAL STANDARD URBAN STORM WATER MITIGATION PLAN (LOCAL SUSMP)
Adopted 2002
Updated January 2011

This page intentionally left blank.

# Table of Contents

GLOSSARY

HOW TO USE THE STORM WATER BEST MANAGEMENT PRACTICES MANUAL ..... 1

► Plan Ahead to Avoid the Three Most Common Mistakes ..... 2

CHAPTER 1. POLICIES AND PROCEDURES ..... 3

Background ..... 3

Legal Framework ..... 4

A Low Impact Development Design Procedure ..... 5

Requirements for All Development Projects ..... 5

Priority Development Projects ..... 6
► New Development ..... 6
► Previously Developed Sites ..... 6
► The "50% Rule" for Previously Developed Projects ..... 7
► Pollutant Generating Projects Which Disturb One Acre or More of Land ..... 7

Project Review and Permitting Process ..... 7

Compliance Process at a Glance ..... 10
► Additional Notes on Compliance ..... 10

Phased Projects ..... 11

New Subdivisions ..... 11

Compliance with Flow-Control Requirements ..... 13
► HMP Applicability Requirements ..... 13
► Flow Control Performance Criteria ..... 20

Waivers from Numeric Sizing Criteria ..... 31

CHAPTER 2. CONCEPTS AND CRITERIA ..... 32

Water-Quality Regulations ..... 33
► Maximum Extent Practicable ..... 34
► Best Management Practices ..... 34

Pollutants of Concern ..... 34

► Grouping of Potential Pollutants of Concern ..... 34
► Identifying Pollutants of Concern Based on Land Uses ..... 36
► Watersheds with Special Pollutant Concerns ..... 36

Selection of Permanent Source Control BMPs ..... 39

Selection of Storm Water Treatment Facilities ..... 39

Hydrology for NPDES Compliance ..... 42
► Imperviousness ..... 42
► Low Impact Development Requirements ..... 43
► Sizing Requirements for Storm Water Treatment Facilities ..... 43
► Flow-Control (Hydromodification Management) ..... 44

Criteria for Infiltration Devices ..... 44
► Most LID Features and Facilities Are Not Infiltration Devices ..... 45

CHAPTER 3. PREPARING YOUR PROJECT SUBMITTAL ..... 47

Step by Step ..... 50

Step 1: Assemble Needed Information ..... 50

Step 2: Identify Constraints & Opportunities ..... 52

Step 3: Prepare and Document Your LID Design ..... 52

Step 4. Specify Source Control BMPs ..... 53
► Identify Pollutant Sources ..... 54
► Note Locations on Submittal Drawing ..... 54
► Prepare a Table and Narrative ..... 54
► Identify Operational Source Control BMPs ..... 54

Step 5: Storm Water Facility Maintenance ..... 55

Step 6: Complete Your Project Submittal ..... 55
► Coordination with Site, Architectural, and Landscaping Plans ..... 55
► Construction Plan SUSMP checklist ..... 56
► Certification ..... 57
► Example Project Submittal Outline and Contents ..... 58
► Specific Project Considerations ..... 59

CHAPTER 4. LOW IMPACT DEVELOPMENT DESIGN GUIDE ..... 60

Analyze Your Project for LID ..... 61
► Optimize the Site Layout ..... 62
► Use Pervious Surfaces ..... 64
► Disperse Runoff to Adjacent Pervious Areas ..... 64
► Direct Runoff to Integrated Management Practices ..... 64

Develop and Document Your Drainage Design ..... 66
► Step 1: Delineate Drainage Management Areas ..... 66

► Step 2: Classify DMAs and Determine Runoff Factors ..... 67
► Step 3: Tabulate Drainage Management Areas ..... 70
► Step 4: Select and Lay Out IMPs on Site Plan ..... 71
► Step 5: Review Sizing for Each IMP ..... 71
► Step 6: Calculate Minimum Area and Volume of Each IMP ..... 72
► Step 7: Determine If Available Space for IMP Is Adequate ..... 82
► Step 8: Complete Your Summary Report ..... 83

Specify Preliminary Design Details ..... 84

Alternatives to Integrated LID Design ..... 85
► Design of Alternative Treatment Facilities ..... 85
► Treatment Facilities for Special Circumstances ..... 88

CHAPTER 5. OPERATION & MAINTENANCE OF STORM WATER FACILITIES ..... 89

Stage 1: Ownership and Responsibility ..... 90
► Private Ownership and Maintenance ..... 91
► Transfer to Public Ownership ..... 91

Stage 2: General Maintenance Requirements ..... 92

Stage 3: Detailed Maintenance Plan ..... 92
► Your Detailed Maintenance Plan: Step by Step ..... 93
► Step 1: Designate Responsible Individuals ..... 93
► Step 2: Summarize Drainage and BMPs ..... 94
► Step 3: Document Facilities "As Built" ..... 94
► Step 4: Prepare Maintenance Plans for Each Facility ..... 94
► Step 5: Compile Maintenance Plan ..... 95
► Step 6: Updates ..... 97

Stage 4: Interim Maintenance ..... 97

Stage 5: Transfer Responsibility ..... 97

Stage 6: Operation & Maintenance Verification ..... 97

CHAPTER 6. CONSTRUCTION BMP REQUIREMENTS AND PERFORMANCE STANDARDS ..... 99

Construction Storm Water BMP Requirements ..... 99
► Step 1: Determine Applicable Storm Water BMP Requirements ..... 101
► Step 2: Prepare & Submit Appropriate Plans ..... 101
► Step 3: Determine Adequacy of Proposed Plans ..... 102
► Step 4: Assure Implementation & Maintenance of Requirements ..... 102

Construction Storm Water BMP Performance Standards ..... 103
► 1. Minimum Construction BMP Requirements ..... 103
► 2. Site Management Requirements ..... 105
► 3. Performance Standards ..... 106
► 4. Seasonal Requirements ..... 107
► 5. Advanced Treatment Requirements ..... 110
► 6. Additional Controls for Construction Sites ..... 110

Implementation and Maintenance of Requirements ..... 110

# Appendices

APPENDIX A STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST ..... 112

APPENDIX B LOW IMPACT DEVELOPMENT (LID) INTEGRATED MANAGEMENT PRACTICES (IMP) DESIGN SHEETS ..... 118

APPENDIX C POLLUTANT SOURCES / SOURCE CONTROL CHECKLIST ..... 145

APPENDIX D SWPPP AND CSWMP GUIDELINES ..... 157

APPENDIX E EXAMPLE CONSTRUCTION BEST MANAGEMENT PRACTICES ..... 160

APPENDIX F BIBLIOGRAPHY AND SUGGESTED RESOURCES ..... 163

APPENDIX G SPCBMPP WORKSHEET ..... 165

APPENDIX H HYDROMODIFICATION MANAGEMENT PLAN ..... 168

# Glossary

**Advanced Treatment**

Using mechanical or chemical means to flocculate and remove suspended **sediment** from runoff from construction sites prior to discharge.

**Attached Residential Development**

Any development that provides residential units that share an interior/exterior wall. This category includes, but is not limited to: dormitories, condominiums, and apartments.

**Automotive Repair Shop**

A facility that is categorized in any one of the following **Standard Industrial Classification (SIC)** codes: 5013, 5014, 5541, 7532-7534, or 7536-7539.

**Best Management Practice (BMP)**

Any procedure or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs also include treatment requirements, operating procedures and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. This manual groups storm water BMPs into the following categories: (1) Construction Storm Water BMPs, which are practices, procedures, devices or materials used to prevent the transport and introduction of pollutants both on and from a project during construction; and (2) Permanent Storm Water BMPs, which are the **Low Impact Development** design features, **source control** features, and **treatment control BMP**s that become a permanent part of a project site.

**California Association of Stormwater Quality Association (CASQA)**

Publisher of the California Stormwater Best Management Practices Handbooks, available at www.cabmphandbooks.com. Successor to the Storm Water Quality Task Force (SWQTF).

**California BMP Method**

A method for determining the required volume of storm water treatment facilities. Described in Section 5.5.1 of the California Stormwater Best Management Practice Manual (New Development) (CASQA, 2003).

**Commercial Development**

Commercial development is defined as any development on private land that is not for heavy industrial or residential uses. The category includes, but is not limited to, hospitals; laboratories and other medical facilities; educational institutions; recreational facilities; municipal facilities; commercial nurseries; multi-apartment buildings; car wash facilities; mini-malls and other business complexes; shopping malls; hotels; office buildings; public warehouses; automotive dealerships; commercial airfields; and other light industrial facilities. Any development on private land that is not exclusively industrial or residential uses. The **Priority Development Project** category is defined as commercial developments resulting in the disturbance of one acre or more of land.

**Conditions of Approval (COAs)**

Requirements a municipality may adopt for a project in connection with a discretionary action (e.g., adoption of an EIR or negative declaration or issuance of a use permit). COAs may include features to be incorporated into the final plans for the project and may also specify uses, activities, and operational measures that must be observed over the life of the project.

| | |
|---|---|
| **Construction Storm Water Management Plan (CSWMP)** | A CSWMP is the document prepared and submitted to meet the City of La Mesa's construction BMP requirements for a project that causes land disturbance of less than one acre. |
| **Continuous Simulation Modeling** | A method of hydrological analysis in which a set of rainfall data (typically hourly for 30 years or more) is used as input, and runoff rates are calculated on the same time step. The output is then analyzed statistically for the purposes of comparing runoff patterns under different conditions (for example, pre- and post-development-project). |
| **Copermittees** | See **Dischargers**. |
| **Detached Residential Development** | Any development that provides freestanding residential units. This category includes, but is not limited to: detached homes, such as single-family homes and detached condominiums. |
| **Detention** | The practice of holding storm water runoff in ponds, vaults, within berms, or in depressed areas and letting it discharge slowly to the storm drain system. See definitions of **infiltration** and **retention**. |
| **Direct Discharge** | Connection of project site runoff to an exempt receiving water body, which could include an exempt river reach, reservoir or lagoon. To qualify as a direct discharge, the discharge elevation from the project site outfall must be below the elevations detailed in the HMP Applicability section of this BMP Manual. |
| **Direct Infiltration** | Infiltration via methods or devices, such as dry wells or infiltration trenches, designed to bypass unsaturated surface soils and transmit runoff directly to groundwater. |
| **Directly Connected Impervious Area** | Any **impervious surface** which drains into a catch basin, area drain, or other conveyance structure without first allowing flow across pervious areas (e.g. lawns). |
| **Dischargers** | The agencies named in the **storm water NPDES permit** (see definition): the County of San Diego; the Cities of Carlsbad, El Cajon, La Mesa, Poway, Solana Beach, Chula Vista, Encinitas, Lemon Grove, San Diego, Vista, Coronado, Escondido, National City, San Marcos, Del Mar, Imperial Beach, Oceanside, and Santee; the San Diego Unified Port District, and the San Diego County Regional Airport Authority. |
| **Drainage Management Areas** | Areas delineated on a map of the development site showing how drainage is detained, dispersed, or directed to **Integrated Management Practices**. There are four types of Drainage Management Areas, and specific criteria apply to each type of area. See Chapter 4. |
| **Drawdown time** | The time required for a storm water detention or infiltration facility to drain and return to the dry-weather condition. For detention facilities, drawdown time is a function of basin volume and outlet orifice size. For infiltration facilities, drawdown time is a function of basin volume and infiltration rate. |

Areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); water bodies designated with the RARE beneficial use by the State Water Resources Control Board (Water Quality Control Plan for the San Diego Basin (1994) and amendments); areas designated as preserves or their equivalent under the Multi Species Conservation Program within the Cities and County of San Diego; and any other equivalent environmentally sensitive areas which have been identified by the City of La Mesa.

**Environmentally Sensitive Areas**

This **Priority Development Project** category includes all development and redevelopment located within or directly adjacent to or discharging directly to an environmentally sensitive area (where discharges from the development or redevelopment will enter receiving waters within the environmentally sensitive area), which either creates 2,500 square feet of impervious surface on a proposed project site or increases the area of imperviousness of a proposed project site to 10 percent or more of its naturally occurring condition. "Directly adjacent" means situated within 200 feet of the Environmentally Sensitive Area (ESA). "Discharging directly to "means outflow from a drainage conveyance system that is composed entirely of flows from the subject development or redevelopment site, and not commingled with flows from adjacent lands.

**Flow Control**

Control of runoff rates and durations as required by the Hydromodification Management Plan.

**Head**

In hydraulics, energy represented as a difference in elevation. In slow-flowing open systems, the difference in water surface elevation, e.g., between an inlet and outlet.

**Higher-Rate Biofilter**

A biofilter with a design surface loading rate higher than the 5 inches per hour rate specified in this document for bioretention facilities and planter boxes.

**Hillside**

Lands that have a natural gradient of 25 percent (4 feet of horizontal distance for every 1 foot of vertical distance) or greater and a minimum elevation differential of 50 feet, or a natural gradient of 200 percent (1 foot of horizontal distance for every 2 feet of vertical distance) or greater and a minimum elevation differential of 10 feet.

**Hillside Development Greater Than 5,000 Square Feet**

This **Priority Development Project** category includes any development which creates 5,000 square feet of **impervious surface** which is located in an area with known erosive soil conditions, where the development will grade any natural slope that is 25 percent or greater.

**Hydrograph**

Runoff flow rate plotted as a function of time.

**Hydromodification**

The change in the natural hydrologic processes and runoff characteristics (i.e. interception, infiltration, overland flow, interflow, and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and changes in sediment transport. In addition, alteration of stream and river channels, installation of dams and water impoundments, and excessive stream bank and shoreline erosion are also considered hydromodification, due to their disruption of natural watershed hydrologic processes.

| | |
|---|---|
| **Hydromodification Management Plan (HMP)** | A Plan implemented by the **dischargers** so that post-project runoff shall not exceed estimated pre-project rates and/or durations, where increased runoff would result in increased potential for erosion or other adverse impacts to beneficial uses. Also see definition for **flow control**. Specifically, Final HMP refers to the most recent Hydromodification Management Plan developed for San Diego County jurisdictions and approved by the San Diego RWQCB. |
| **Hydrologic Soil Group** | Classification of soils by the Natural Resources Conservation Service (NRCS) into A, B, C, and D groups according to infiltration capacity. |
| **Industrial Development** | Industrial facilities include those defined at 40 CFR 122.26(b)(14), including those subject to the General Industrial Permit or other individual NPDES permit, operating and closed landfills, facilities subject to SARA Title III, and hazardous waste treatment, disposal, storage and recovery facilities. Examples of industrial facilities includes manufacturing plants, food processing plants, metal working facilities, printing plants, and fleet storage areas (bus, truck, etc.). The **Priority Development Project** category includes development of heavy industry resulting in the disturbance of one acre or more of land. |
| **Impervious surface** | Any material that prevents or substantially reduces infiltration of water into the soil. See discussion of imperviousness in Chapter Two. |
| **Infeasible** | As applied to best management practices, impossible to implement because of technical constraints specific to the site. |
| **Infiltration** | Seepage of runoff into soils underlying the site. See definition of **retention.** |
| **Infiltration Device** | Any structure, such as a dry well, that is designed to infiltrate storm water into the subsurface and, as designed, bypasses the natural groundwater protection afforded by surface or near-surface soil. See definition for **direct infiltration**. |
| **Integrated Management Practice (IMP)** | A facility **(BMP)** that provides small-scale treatment, retention, and/or detention and is integrated into site layout, landscaping, and drainage design. See **Low Impact Development.** |
| **Integrated Pest Management (IPM)** | An approach to pest management that relies on information about the life cycles of pests and their interaction with the environment. Pest control methods are applied with the most economical means and with the least possible hazard to people, property, and the environment. |
| **Jurisdictional Urban Runoff Management Plan (JURMP)** | A written description of the specific jurisdictional urban runoff management measures and programs that the City of La Mesa implements to comply with the **storm water NPDES permit** and ensure pollutant discharges are reduced to the MEP and do not cause or contribute to a violation of water quality standards. See **Storm Water Pollution Prevention Program.** |
| **Lead Agency** | The public agency that has the principal responsibility for carrying out or approving a project. (CEQA Guidelines §15367). |

| | |
|---|---|
| **Low Impact Development** | An integrated site design methodology that uses small-scale detention and retention (Integrated Management Practices, or **IMPs**) to mimic pre-existing site hydrological conditions. |
| **Maximum Extent Practicable (MEP)** | Standard, established by the 1987 amendments to the Clean Water Act, for the implementation of municipal **storm water pollution prevention programs** (see definition). According to the Act, municipal storm water NPDES permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." |
| **National Pollutant Discharge Elimination System (NPDES)** | As part of the 1972 Clean Water Act, Congress established the NPDES permitting system to regulate the discharge of pollutants from municipal sanitary sewers and industries. The NPDES was expanded in 1987 to incorporate permits for storm water discharges as well. |
| **Natural Drainage** | A natural swale or topographic depression which gathers and/or conveys runoff to a permanent or intermittent watercourse or waterbody. |
| **New Development** | Land disturbing activities; surface grading for structural development, including construction or installation of a building or structure, the creation of **impervious surfaces**; and land subdivision. |
| **Numeric Criteria** | Sizing requirements for storm water treatment facilities established in Provision D.1.d.(6)(c) of the San Diego RWQCB's storm water NPDES permit. |
| **Operation and Maintenance (O&M)** | Refers to requirements in the **Storm Water NPDES Permit** to inspect treatment BMPs and implement preventative and corrective maintenance in perpetuity. See Chapter Five. |
| **Parking Lot** | A land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce. This **Priority Development Project** category includes parking lots 5,000 square feet or more or with 15 or more parking spaces and potentially exposed to urban runoff. |
| **Permeable Pavements** | Pavements for roadways, sidewalks, or plazas that are designed to infiltrate a portion of rainfall, including pervious concrete, pervious asphalt, unit-pavers-on-sand, and crushed gravel. |
| **Pollutant Generating Development Project** | Generally all projects which include **impervious surfaces** and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. |
| **Post Construction Water Quality Technical Report (PCWQTR)** | A PCWQTR is the **Project Submittal** of a **Priority Development Project** to demonstrate compliance. |

**Priority Development Project** A project subject to SUSMP requirements. Defined in **Storm water NPDES Permit** Provision D.1.d.(1). See Appendix A.

**Project Area** The entire project area comprises all areas to be altered or developed by the project, plus any additional areas that drain on to areas to be altered or developed.

**Projects Discharging to Receiving Waters within Environmentally Sensitive Areas** All development and significant redevelopment that would create 2,500 square feet of **impervious surfaces** or increase the area of imperviousness of a project site to 10% or more of its naturally occurring condition, and either (1) discharge urban runoff to a receiving water within or directly adjacent (where any portion of the project footprint is located within 200 feet of the **environmentally sensitive area**) to an environmentally sensitive area or (2) discharge to a receiving water within an environmentally sensitive area without mixing with flows from adjacent lands (where the **project footprint** is located more than 200 feet from the environmentally sensitive area).

**Project Footprint** The limits of all grading and ground disturbance, including landscaping, associated with a project.

**Project Submittal** Documents submitted to the City of La Mesa in connection with an application for development approval and demonstrating compliance with Storm Water NPDES Permit requirements for the project. Priority Development Projects submit a **Post Construction Water Quality Technical Report** and all other projects submit a **Standard Post Construction BMP Plan**.

**Proprietary** A proprietary device is one marketed under legal right of the manufacturer.

**Receiving Waters** Surface bodies of water, which directly or indirectly receive discharges from urban runoff conveyance systems, including naturally occurring wetlands, streams (perennial, intermittent, and ephemeral [exhibiting bed, bank, and ordinary high water mark]), creeks, rivers, reservoirs, lakes, lagoons, estuaries, harbors, bays and the Pacific Ocean. La Mesa will determine the definition for wetlands and the limits thereof for the purposes of this definition as protective as the United States Environmental Protection Agency. Constructed wetlands are not considered wetlands under this definition, unless the wetlands were constructed as mitigation for habitat loss. Other constructed **BMP**s are not considered receiving waters under this definition, unless the BMP was originally constructed in receiving waters. Construction of treatment control BMPs in "Receiving Waters" is prohibited and therefore may not be used to satisfy **SUSMP** requirements.

**Redevelopment** The creation, addition, and or replacement of **impervious surface** on an already developed site. Examples include the expansion of a building footprint, road widening, the addition to or replacement of a structure, and creation or addition of impervious surfaces.

Replacement of impervious surfaces includes any activity that is not part of a routine maintenance activity where impervious material(s) are removed, exposing underlying soil during construction. Redevelopment does not include trenching and resurfacing associated with utility work; resurfacing and reconfiguring surface parking lots and existing roadways; new sidewalk construction, pedestrian ramps, or bike lane on existing roads; and routine replacement of damaged pavement, such as pothole repair.

| | |
|---|---|
| **Rational Method** | A method of calculating runoff flows based on rainfall intensity, tributary area, and a factor representing the proportion of rainfall that runs off. |
| **Regional (or Watershed) Storm Water Treatment Facility** | A facility that treats runoff from more than one project or parcel. |
| **Regional Water Quality Control Board (Regional Water Board or RWQCB)** | California RWQCBs are responsible for implementing pollution control provisions of the Clean Water Act and California Water Code within their jurisdiction. There are nine California RWQCBs. |
| **Residential Development** | Any development on private land that provides living accommodations for one or more persons, including but not limited to: single-family homes, multi-family homes, condominiums, and apartments. This **Priority Development Category** is defined as housing subdivisions resulting in the disturbance of one acre or more of land or comprised of 10 or more dwelling units. |
| **Residential Development of 10 Units or More** | Any development that provides 10 or more residential units. Residential units can be attached or detached. |
| **Restaurant** | "Restaurant" means a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (**SIC** code 5812), where the land area for development is greater than 5,000 square feet. Restaurants where land development is less than 5,000 square feet shall meet all **SUSMP** requirements except for structural treatment BMP, numeric sizing criteria requirement, and hydromodification requirement. |
| **Retail Gasoline Outlets (RGOs)** | This **Priority Development Project** category includes RGOs that meet the following criteria: (a) 5,000 square feet or more, or (b) a projected average daily traffic (ADT) of 100 or more vehicles per day. |
| **Retention** | The practice of holding storm water in ponds or basins, or within berms or depressed areas, and allowing it to slowly infiltrate into underlying soils. Some portion will evaporate. See definitions for **infiltration** and **detention**. |
| **Sediment** | Soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organism survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth. |
| **Self-retaining area** | An area designed to retain runoff. Self-retaining areas may include graded depressions with landscaping or pervious pavements and may also include tributary impervious areas up to a 2:1 impervious-to-pervious ratio. |
| **Self-treating area** | A natural, landscaped, or turf area drains directly off site or to the public storm drain system. |

| | |
|---|---|
| **Significant Redevelopment** | **Redevelopment** that would create or add or replace at least 5,000 square feet of **impervious surfaces** on an already developed site that falls under one or more priority development project categories. When redevelopment results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design. If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design. |
| **Source Control** | Land use or site planning practices, or structural or nonstructural measures that aim to prevent urban runoff pollution by reducing the potential for contamination at the source of pollution. Source control BMPs minimize the contact between pollutants and urban runoff. |
| **Standard Industrial Classification (SIC)** | A Federal government system for classifying industries by 4-digit code. It is being supplanted by the North American Industrial Classification System but SIC codes are still referenced by the Regional Water Board in identifying development sites subject to regulation under the NPDES permit. Information and an SIC search function are available at http://www.bls.gov/bls/NAICS.htm |
| **Standard Post Construction BMP Plan (SPCBMPP)** | A SPCBMPP is the **Project Submittal** to demonstrate compliance for a project subject to only standard permanent BMP requirements. |
| **Storm Water Conveyance System** | Private and public drainage facilities by which storm water may be conveyed to Receiving Waters, such as: natural drainages, roads, streets, constructed channels, aqueducts, storm drains, pipes, street gutters, or catch basins. |
| **Storm Water NPDES Permit** | A permit issued by a **Regional Water Quality Control Board** (see definition) to local government agencies (**Dischargers**) placing provisions on allowable discharges of municipal storm water to waters of the state. |
| **Storm Water Pollution Prevention Plan (SWPPP)** | A plan providing for temporary measures to control sediment and other pollutants during construction as required by the statewide storm water NPDES permit for construction activities. A SWPPP is required for projects causing land disturbance of one acre or more. |
| **Storm Water Pollution Prevention Program** | A comprehensive program of activities designed to minimize the quantity of pollutants entering storm drains. See **Jurisdictional Urban Runoff Management Plan.** |
| **Standard Urban Storm Water Mitigation Plan (SUSMP)** | Refers to various documents prepared in connection with implementation of the storm water **NPDES permit** mandate to control pollutants from new development and redevelopment. Each **discharger** will adapt the **model countywide SUSMP** to create a local SUSMP for their respective jurisdiction. Applicants for development project approvals will use the local SUSMP to prepare a submittal for each **Priority Development Project** they propose. |

| | |
|---|---|
| **Streets, Roads, Highways, and Freeways** | This **Priority Development Project** category includes any paved surface that is 5,000 square feet or greater used for the transportation of automobiles, trucks, motorcycles, and other vehicles. For the purposes of SUSMP requirements, Streets, Roads, Highways and Freeways do not include trenching and resurfacing associated with utility work; applying asphalt overlay to existing pavement; new sidewalk, pedestrian ramps, or bike lane construction on existing roads; and replacement of damaged pavement. |
| **Treatment** | Removal of pollutants from runoff, typically by filtration or settling. |
| **Treatment Control (Structural) BMP** | Any engineered system designed and constructed to remove pollutants from urban runoff. Pollutant removal is achieved by simple gravity settling of particulate pollutants, filtration, biological uptake, media adsorption, or any other physical, biological, or chemical process. |
| **Water Board** | See **Regional Water Quality Control Board.** |
| **Water Quality Volume (WQV)** | For storm water treatment facilities that depend on detention to work, the volume of water that must be detained to achieve maximum extent practicable pollutant removal. This volume of water must be detained for a specified **drawdown time**. |

# How to Use the Storm Water Best Management Practices Manual

*Review Chapters 1 and 2 to get a general understanding of the requirements. Then follow step-by-step instructions in Chapter 3 to prepare your Project Submittal.*

THIS Storm Water Best Management Practices Manual (BMP Manual) will help you ensure your project complies with both the Local Standard Urban Storm Water Mitigation Plan (SUSMP) requirements and the Construction BMP requirements of the City of La Mesa (City). Most applicants will require the assistance of a qualified civil engineer, architect, and/or landscape architect. Because every project is different, you should begin by checking specific requirements with municipal staff.

To use the BMP Manual, note that Construction BMPs are temporary measures to control sediment and other pollutants during construction, while SUSMP requirements apply to the development process during all stages of design, construction, completion, use, and maintenance in perpetuity. Start by completing Appendix A to find out how storm water quality requirements apply to your project.

To meet post-construction SUSMP requirements, see chapters one through five of the BMP Manual. To comply with construction BMP requirements, skip ahead to Chapter Six.

**Chapter One** provides an overview of the process of planning, design, construction, operation, and maintenance leading to compliance with post-construction SUSMP requirements.

If there are terms and issues you find confusing, try finding answers in the glossary or in **Chapter Two**. Chapter Two provides background on key storm water concepts and water quality regulations, including design criteria.

Then proceed to **Chapter Three** and follow the step-by-step guidance to prepare a Project Submittal for your site.

**Chapter Four**, the Low Impact Development Design Guide, includes design procedures, calculation procedures, and instructions for presenting your design and calculations in your Project Submittal.

In **Chapter Five** you'll find a detailed description of the process for ensuring operation and maintenance of your storm water facilities over the life of the project. The chapter includes step-by-step instructions for preparing a Storm Water Facilities Operation and Maintenance Plan.

The City of La Mesa's specific construction BMP requirements and performance standards are included in **Chapter Six**.

Throughout each Chapter, you'll find references and resources to help you understand the regulations, complete your Project Submittal, and design storm water control measures for your project.

**Construction-Phase Controls**

Your Project Submittal for SUSMP compliance is a separate document from the Storm Water Pollution Prevention Plan (SWPPP). A SWPPP provides for temporary measures to control sediment and other pollutants during construction at sites that disturb one acre or more. See Chapter 6 of this BMP manual for more information on SWPPPs.

The most recent, updated version of the BMP Manual is on the City website. The on-line BMP Manual is in Adobe Acrobat format. If you are reading the Acrobat version on a computer with an internet connection, you can use hyperlinks to navigate the document and to access various references. The hyperlinks are throughout the text, as well as in "References and Resources" sections within chapters and in "Bibliography and Suggested Resources" in Appendix F. Some of these links (URLs) may be outdated. In that case, try entering portions of the title or other keywords into a web search engine.

### ► PLAN AHEAD TO AVOID THE THREE MOST COMMON MISTAKES

The most common (and costly) errors made by applicants for development approvals with respect to storm water quality compliance are:

1. Not planning for compliance early enough. You should think about your strategy for storm water quality compliance before completing a conceptual site design or sketching a layout of subdivision lots (Chapter 3).

2. Assuming proprietary storm water treatment facilities will be adequate for compliance. Most aren't (Chapter 2).

3. Not planning for periodic inspections and maintenance of treatment and flow-control facilities. Consider who will own and who will maintain the facilities in perpetuity and how they will obtain access, and identify which arrangements are acceptable to the City of La Mesa (Chapter 5).

Chapter 1

# Policies and Procedures

*Determine if your development project must comply with storm water quality requirements, and review the steps to compliance.*

## Background

Urban runoff discharged from municipal storm water conveyance systems has been identified by local, regional, and national research programs as one of the principal causes of water quality problems in most urban areas. The City of La Mesa's storm water conveyance system, which collects runoff from our streets, rooftops, driveways, parking lots, and other impervious areas, flows directly to our rivers, beaches, and bays without receiving treatment (our storm water conveyance system is separate from our sanitary sewer system). Urban runoff potentially contains a host of pollutants like trash and debris, bacteria and viruses, oil and grease, sediments, nutrients, metals, and toxic chemicals. These contaminants can adversely affect receiving and coastal waters, associated wildlife, and public health. Urban runoff pollution is not only a problem during rainy seasons, but also year-round due to many types of urban water use that discharge runoff (dry weather flow) to the storm water conveyance system.

Land development and construction activities significantly alter drainage patterns and contribute pollutants to urban runoff primarily through erosion and removal or change of existing natural vegetation during construction, and the creation of new impervious surfaces, such as parking lots, which often permanently contribute pollutants throughout the "use" of the project site. When homes, work places, recreational areas, roads, parking lots, and structures are built, new impervious areas are built- creating the potential for an impact to water quality. The natural landscape's ability to infiltrate and cleanse storm water and urban runoff is "capped" by the impervious surfaces. As impervious surfaces increase, water that normally would have percolated into the soil now flows over the land surface directly to downstream wetlands, creeks, and eventually the Pacific Ocean. Accordingly, increases in impervious cover can increase the frequency and intensity of storm water flows. Second, new impervious surfaces often become a source of pollutants associated with development, such as automotive fluids, cleaning solvents, toxic or hazardous chemicals, detergents, sediment, metals, pesticides, oil and grease, and food wastes. These pollutants, which are often temporarily captured on impervious surfaces, are

transported to the storm water conveyance system by storm water and urban runoff. The pollutants flow untreated through the storm water conveyance system and ultimately into our creeks, rivers, beaches, and bays. With the growing concerns of urban runoff and storm water pollution, local, state, and federal agencies devised regulations requiring development planning and construction controls to treat storm water-related pollution from new development projects before it reaches any receiving waters.

On January 24th, 2007, the Regional Board issued Order No. R9-2007-0001, hereinafter referred to as "Municipal Permit." This Municipal Permit replaces the previous municipal permit, RWQCB Order No. 2001-01. The City has updated parts I and II of its BMP Manual to reflect the updated requirements of the current Municipal Permit. The primary objectives of the updated BMP Manual are to (1) Effectively prohibit non-storm water discharges; and (2) Reduce the discharge of pollutants from storm water conveyance systems to the MEP both during construction and throughout the use of a developed site. To maximize the use of LID practices as a means of reducing storm water runoff, Order No. R9-2007-0001 further required that the City define minimum LID and other BMP requirements in a document called the Model Standard Urban Storm Water Mitigation Plan (Model SUSMP), which was approved by the Regional Board on March 25, 2009. The permanent BMP requirements within the Model SUSMP were updated to comply with the current Municipal Permit, and these changes are included in this BMP Manual.

## Legal Framework

The requirement to implement storm water BMP requirements for development projects is based on Section 402 (p) of the Clean Water Act. The Federal Clean Water Act amendments of 1987 established a framework for regulating storm water discharges from municipal, industrial, and construction activities under the NPDES program. Under the Federal Clean Water Act, municipalities throughout the nation are issued a Municipal NPDES Permit. The primary goal of the Municipal Permit is to stop polluted discharges from entering the storm water conveyance system and local receiving and coastal waters.

In California, the State Water Resources Control Board (SWRCB), through the nine Regional Boards, administers the NPDES storm water municipal permitting program. Based on the San Diego Municipal Permit issued by the San Diego Regional Board, the City is required to develop and implement construction and permanent storm water BMPs addressing pollution from new development projects.

In order to comply with the conditions of Order No. 2001-01, the City of La Mesa adopted the City of La Mesa Watercourse Protection, Storm Water Management and Discharge Control Ordinance ("Storm Water Ordinance") codified in Chapter 7.18 of the La Mesa Municipal Code. These ordinances have been updated as necessary to comply with the current Municipal Permit. This manual is an uncodified ordinance adopted by reference as Part II of the City of La Mesa Storm Water Best Practices Manual. The current Municipal Permit requires the City to categorize and prioritize land uses in order to establish effective BMPs. The City's current Storm Water Ordinance authorizes the City Engineer to establish Best Management Practices

(BMPs), including permanent improvements, for all types of land uses. This manual provides instructions on the City's construction phase and permanent BMP requirements, based on the most recent Model SUSMP, for development projects in the City of La Mesa.

The City Engineer may establish alternative BMPs. The allowable use of alternative BMPs at a specific site shall be determined at the sole discretion of the City Engineer. The City Engineer may establish BMPs for a specific site or activity if necessary to reduce Pollutants to the MEP or to comply with an order of the San Diego Regional Water Board. The City Engineer may also establish additional BMPs for a specific site if the City Engineer determines that the BMPs implemented at the site have not reduced the pollutants to the MEP.

## A Low Impact Development Design Procedure

The San Diego Regional Water Board reissued a municipal storm water NPDES permit to the municipal **Copermittees** in January 2007. The permit updates and expands storm water requirements for new developments and redevelopments. Storm water treatment requirements have been made more stringent, minimum standards for **Low Impact Development** (LID) have been added, and the Copermittees are required to develop and implement criteria for the control of runoff peaks and durations from development sites.

To assist the land development community, streamline project reviews, and maximize cost-effective environmental benefits, the Copermittees have developed a unified LID design procedure, which has been adapted for use by the City of La Mesa. This design procedure integrates site planning and design measures with engineered, small-scale **Integrated Management Practices** (IMPs) such as bioretention. By following the procedure, applicants can develop a single integrated design which complies with the complex and overlapping NPDES permit LID requirements, storm water treatment requirements, and flow-control (hydromodification management) requirements.

The design approach is detailed in Chapter 4. General instructions for preparing a complete Project Submittal are in Chapter 3, and project-specific submittal requirements are available from municipal staff.

Applicants may choose not to use this design procedure, in which case they will need to demonstrate, in their submittal, compliance with applicable LID criteria, storm water treatment criteria, and flow-control criteria. These criteria are described in Chapter 2 and in the NPDES permit.

## Requirements for All Development Projects

All development projects must include control measures to reduce the discharge of storm water pollutants to the maximum extent practicable.

Standard permanent storm water requirements, even for projects that are not "Priority Development Projects," include:

- Implementation of source control BMPs as listed in Appendix C.
- Inclusion of feasible LID features that conserve natural features, set back development from natural water bodies, minimize imperviousness, maximize infiltration, direct runoff to landscaping, and retain and slow runoff.
- Submittal of proof of a mechanism under which on-going long-term maintenance of all structural post-construction BMPs will be conducted.
- Compliance with requirements for construction-phase controls on sediment and other pollutants as described in Chapter 6.

Projects (requiring either discretionary actions or construction permits), subject to only standard permanent BMP requirements need to prepare a Standard Post Construction BMP Plan (SPCBMPP). See Appendix G for specific SPCBMPP requirements. Analysis of the project's anticipated pollutants of concern must also be included with the project submittal. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type. Municipal staff may also require additional controls appropriate to the project, which may include storm water treatment controls. LID treatment controls such as infiltration or bioretention are preferred. See "Selection of Treatment Facilities" on page 39.

## Priority Development Projects

The NPDES permit requires more specific criteria be applied to Priority Development Projects. Projects (requiring either discretionary actions or construction permits), subject to the priority development project permanent BMP requirements must complete all of the analyses and incorporate all of the applicable BMP requirements in chapters 2 through 5 of this BMP Manual. This includes the LID and source control BMPs, and treatment control BMP requirements.

Projects subject to priority development project requirements must prepare and submit a Post Construction Water Quality Technical Report (PCWQTR) in accordance with Chapter 3 of this BMP Manual. Applicants must incorporate all necessary permanent BMPs into the project plans prior to submittal, regardless of project type.

### ► NEW DEVELOPMENT

Projects on previously undeveloped land are Priority Development Projects if they are in one or more of the categories listed in Appendix A. If a project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to Priority Project requirements. Note some thresholds are defined by square footage of impervious area created; others by the total area of the development.

### ► PREVIOUSLY DEVELOPED SITES

Projects on previously developed sites ("**redevelopment** projects") are Priority Development Projects if they create, add, or replace 5,000 square feet or more of impervious surface and also are in one of the categories listed in Appendix A.

Municipal staff may choose to designate projects not within the categories in Appendix A as Priority Development Projects, based on potential impacts to storm water quality.

#### ► THE "50% RULE" FOR PREVIOUSLY DEVELOPED PROJECTS

Projects on previously developed sites may also need to retrofit drainage of **all** impervious areas of the **entire** site. For sites creating or replacing more than 5,000 square feet of impervious area:

- If the new project results in an increase of, or replacement of, 50% or more of the previously existing impervious surface, and the existing development was not subject to SUSMP requirements, then the entire project must be included in the treatment measure design.
- If less than 50% of the previously impervious surface is to be affected, only that portion must be included in the treatment measure design.

If a new Development Project feature such as a parking lot falls into a Priority Development Project category, then the entire project footprint is subject to SUSMP requirements.

Projects limited to interior remodels, routine maintenance or repair, roof or exterior surface replacement, resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, or bike lanes on existing roads and routine replacement of damaged pavement such as pothole repair are not subject to treatment requirements. However, other requirements, including incorporation of appropriate source controls, still apply.

#### ► POLLUTANT GENERATING PROJECTS WHICH DISTURB ONE ACRE OR MORE OF LAND

Projects that generate pollutants at levels greater than background levels and disturb one acre or more of land are considered Priority Development Projects. In most cases linear pathway projects that are for infrequent vehicle use (such as emergency or maintenance access) or for pedestrian or bicycle use are not considered pollutant generating above background levels if they are built with pervious surfaces or if they allow runoff to sheet flow to surrounding pervious surfaces.

## Project Review and Permitting Process

The City of La Mesa's Watercourse Protection, Storm Water Management and Discharge Control Ordinance requires that all new development and redevelopment activities comply with the storm water pollution prevention requirements in Chapter 7.18 of the La Mesa Municipal Code, and Parts I and II of the City Of La Mesa Best Management Practices Manual. Applicants must also comply with the grading regulations in Chapter 14.05 of the Municipal Code. These storm water pollution prevention requirements, which are described in detail in this BMP Manual are site specific and vary based on the project's potential impact on receiving water quality.

The flow chart in Figure 1-1, "Review Process for Discretionary Actions" demonstrates how storm water requirements are incorporated into projects requiring subdivision approvals,

development permits or other discretionary actions. For information on the construction permit and review process, see Chapter 6 of this BMP Manual. The steps below in "Compliance Process at a Glance" describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 1-1. Review Process for Discretionary Actions

The following figure provides an overview of the project review process for projects that require a discretionary action by the City of La Mesa. Discretionary actions include land use plan amendments, re-zonings, subdivisions, planned development permits, conditional use permits, site development permits, variances, neighborhood development permits, and neighborhood use permits.

## Compliance Process at a Glance

For the applicant for development project approval, storm water compliance follows these general steps:

1. Discuss requirements during a pre-application meeting with municipal staff.
2. Determine applicable storm water BMP requirements by completing the "Storm Water Requirements Applicability Checklist" in Appendix A prior to submittal.
3. Review the instructions in this BMP manual before you prepare your tentative map, preliminary site plan, drainage plan, and landscaping plan.
4. Prepare your Project Submittal, which is typically made with your application for development approvals (entitlements).
5. Prepare a draft Storm Water Facility Operation and Maintenance Plan and include it with your Project Submittal.
6. Under the authority of the City Engineer, Engineering staff will review the Project Submittal with Storm Water Facility Operation and Maintenance Plan for compliance with the applicable storm water requirements contained in this manual.
7. Create your detailed project design, incorporating the features described in your Project Submittal.
8. In a table on your construction plans, list each storm water compliance feature and facility and the plan sheet where it appears.
9. Maintain storm water facilities during construction and following construction.
10. The owner must periodically verify storm water facilities are properly maintained.

Preparation of a complete and detailed Project Submittal is the key to cost-effective storm water compliance and expeditious review of your project. Additional notes about these steps are provided below. Instructions for preparing your Project Submittal are in Chapter 3.

### ► ADDITIONAL NOTES ON COMPLIANCE

*Storm Water Requirements Applicability Checklist.* Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. (Note: this form must be completed for all permit applications, even if previous approvals exist. Projects requesting additional construction permits or discretionary approvals, even though previous permits and/or approvals have been obtained, will be required to comply with the storm water requirements in this document). This checklist must be

completed, signed by the responsible party for the project, and submitted with your permit application. Applicants may also verify the project's storm water BMP requirements through a single discipline preliminary review of the project. The project design must include all required permanent BMPs (as determined from the Storm Water Requirements Applicability Checklist in Appendix A), prior to deeming the application package complete.

*Determining Adequacy of Proposed Plans.* The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs.

## Phased Projects

When determining whether SUSMP requirements apply, a "project" should be defined consistent with California Environmental Quality Act (CEQA) definitions of "project." That is, the "project" is the whole of an action which has the potential for adding or replacing or resulting in the addition or replacement of roofs, pavement, or other impervious surfaces and thereby resulting in increased flows and storm water pollutants. "Whole of an action" means the project may not be segmented or piecemealed into small parts if the effect is to reduce the quantity of impervious area for any part to below the SUSMP thresholds.

Municipal staff may require, as part of an application for approval of a phased development project, a conceptual or master Project Submittal which describes and illustrates, in broad outline, how the drainage for the project will comply with the SUSMP requirements. The level of detail in the conceptual or master Project Submittal should be consistent with the scope and level of detail of the development approval being considered. The conceptual or master Project Submittal should specify that a more detailed Project Submittal for each later phase or portion of the project will be submitted with subsequent applications for discretionary approvals.

Note these minimum standards for SUSMP applicability are for the purpose of ensuring a consistent minimum level or "floor" for implementation consistent with the requirements of the NPDES permit. The City Engineer reserves the right to choose a more expansive interpretation of the NPDES permit's applicability and may also choose to apply source control, treatment, and flow-control requirements to projects that would be exempt under these minimum standards.

## New Subdivisions

If a tentative map approval would potentially entitle future owners to construct new or replaced impervious area which, in aggregate, could exceed one of the SUSMP thresholds (Appendix A), then the applicant must take steps to ensure SUSMP requirements can and will be implemented as the subdivision is built out.

If the tentative map application does not include plans for site improvements, the applicant should nevertheless identify the type, size, location, and final ownership of storm water treatment and flow-control facilities adequate to serve common private roadways and any other common areas, and to also manage runoff from an expected reasonable estimate of the square footage of future roofs, driveways, and other impervious surfaces on each individual lot. The City Engineer may condition approval of the map on implementation of storm water treatment and other SUSMP measures when construction occurs on the individual lots. At the City Engineer's discretion, this condition may be enforced by a grant deed of development rights or by a development agreement.

If the City Engineer deems it necessary, the future impervious area of one or more lots may be limited by a deed restriction. This might be necessary when a project is exempted from one or all SUSMP provisions because the total impervious area is below a threshold, or to ensure runoff from impervious areas added after the project is approved does not overload a storm water treatment and flow-control facility.

The City Engineer may require subdivision maps to dedicate an "open space easement, as defined by Government Code Section 51075," to suitably restrict the future building of structures at each storm water facility location if necessary.

In general, in new subdivisions **storm water treatment, infiltration, or flow-control facilities should not be located on individual single-family residential lots**, particularly when those facilities manage runoff from other lots, from streets, or from common areas. A better alternative is to locate storm water facilities on one or more separate, jointly owned parcels.

After consulting with local planning staff, applicants for subdivision approvals will propose one of the following four options, depending on project characteristics and local policies:

1. Show the number of parcels and the total impervious area to be created on all parcels could not, in the future, exceed any of the thresholds in Appendix A.

2. Show that, for each and every lot, the intended use can be achieved with a design which disperses runoff from roofs, driveways, streets, and other impervious areas to self-retaining pervious areas, using the criteria in Chapter 4.

3. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and commit to constructing the facilities prior to transferring the lots.

4. Prepare improvement plans showing drainage to treatment and/or flow-control facilities designed in accordance with this BMP manual, and provide appropriate legal instruments to ensure the proposed facilities will be constructed and maintained by subsequent owners.

For the option selected, municipal staff will determine the appropriate conditions of approval, easements, deed restrictions, or other legal instruments necessary to assure future compliance.

## Compliance with Flow-Control Requirements

Priority Development Projects (Appendix A) must be designed so that runoff rates and durations are controlled to maintain or reduce pre-project downstream erosion conditions and protect stream habitat. The following text regarding HMP applicability requirements is based on the HMP document, provided in Appendix H. Additionally, the City has prepared an FAQ document related to hydromodification management, which is available on the City's website at www.cityoflamesa.com/stormwater under the "Development Requirements" tab.

### ► HMP APPLICABILITY REQUIREMENTS

To determine if a proposed project must implement hydromodification controls, refer to the HMP Decision Matrix in Figure 1-2. The HMP Decision Matrix can be used for all projects. For redevelopment projects, flow controls would only be required if the redevelopment project increases impervious area or peak flow rates as compared to pre-project conditions.

It should be noted that all Priority Development Projects will be subject to the Permit's LID and water quality treatment requirements even if hydromodification flow controls are not required.

As noted in Figure 1-2, projects may be exempt from HMP criteria under the following conditions.

- If the project is not a Priority Development Project.
- If the proposed project does not increase the impervious area or peak flows to any discharge location without flow mitigation.
- If the proposed project discharges runoff directly to an exempt receiving water such as the Pacific Ocean, San Diego Bay, an exempt river reach, an exempt reservoir, or a tidally-influenced area.
- If the proposed project discharges to a stabilized conveyance system that extends to the Pacific Ocean, San Diego Bay, a tidally-influenced area, an exempt river reach or reservoir.
- If the contributing watershed area to which the project discharges has an impervious area percentage greater than 70 percent.
- If an urban infill project discharges to an existing hardened or rehabilitated conveyance system that extends beyond the "domain of analysis," the potential for cumulative impacts in the watershed are low, and the ultimate receiving channel has a Low susceptibility to erosion as defined in the SCCWRP channel assessment tool.

If the proposed project decreases the pre-project impervious area and peak flows to each discharge location, without flow mitigation, then a flow-duration analysis is implicitly not required. If continuous simulation flow-frequency and flow duration curves were developed for

such a scenario, the unmitigated post-project flows and durations would be less as compared to pre-project curves.

Proposed exemptions for projects discharging runoff directly to the Pacific Ocean, San Diego Bay or to hardened conveyance systems which transport runoff directly to the Pacific Ocean or San Diego Bay are referred to the 2007 Municipal Permit. Per the Permit, hardened conveyance systems can include existing concrete channels, storm drain systems, etc.

FIGURE 1-2. HMP Applicability Determination

The Municipal Permit also contains language to support exemptions for projects located in highly urbanized areas where the impervious percentage exceeds 70 percent (as calculated for the sub-watershed between the project outfall downstream to the exempt receiving water).

- Figure 1-2, Node 1 – Hydromodification mitigation measures are only required if the proposed project is a Priority Development Project.

- Figure 1-2, Node 2 – Properly designed energy dissipation systems are required for all project outfalls to unlined channels. Such systems should be designed in accordance with the County of San Diego's Drainage Design Manual to ensure downstream channel protection from concentrated outfalls.

- Figure 1-2, Nodes 3 and 4 – Projects may be exempt from hydromodification criteria if the proposed project reduces the pre-project impervious area and if unmitigated post-project outflows (outflows without detention routing) to each outlet location are less as compared to the pre-project condition. The pre and post-project hydrologic analysis should be conducted for the 2 and 10-year design storms and follow single-event methodology set forth in the San Diego Hydrology Manual. This scenario may apply to redevelopment projects in particular.

- Figure 1-2, Node 5 – Potential exemptions may be granted for projects discharging runoff directly to an exempt receiving water, such as the Pacific Ocean, San Diego Bay, an exempt river system (detailed in Table 1-2), or an exempt reservoir system (detailed in Table 1-2). To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the 10-year floodplain elevation for a river exemption or below the typical water surface level in a reservoir system. The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of exempt river or reservoir systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and exempt river or reservoir water surface elevation.

- Figure 1-2, Node 6 – For projects discharging runoff directly to a tidally-influenced lagoon, potential exemptions may also be granted. To qualify for this exemption, projects must discharge runoff at an elevation, to be determined by the City, below the typical water surface level in the lagoon system (such as the mean high tide elevation). The City may grant, on a case-by-case basis, additional exemptions for projects discharging runoff in the immediate vicinity of lagoon systems provided that a stabilized, natural conveyance (non-hardened) is provided between the project discharge location and typical lagoon water surface elevation. Exemptions related to runoff discharging directly to tidally-influenced areas were drafted based upon precedent set in the Santa Clara HMP. Regarding the potential exemption, additional analysis would be required to assess the effects of the freshwater / saltwater balance and the resultant effects on lagoon-system biology. This assessment, which would be required by other permitting processes such as the Army Corps of Engineers, California Department of Fish and Game, etc., must be provided by a certified biologist or other specialist as approved by the City. Such discharges would include an energy dissipation system

(riprap, etc.) designed to mitigate 100-year outlet velocities based upon a free outfall condition. Such a design would be protective of the channel bed and bank from an erosion standpoint.

- Figure 1-2, Nodes 7 and 8 – For projects discharging runoff directly to a hardened conveyance or rehabilitated stream system that extends to exempt receiving waters detailed in Node 5, potential exemptions from hydromodification criteria may be granted. Such hardened or rehabilitated systems could include existing storm drain systems, existing concrete channels, or stable engineered unlined channels. To qualify for this exemption, the existing hardened or rehabilitated conveyance system must continue uninterrupted to the exempt system. In other words, the hardened or rehabilitated conveyance system cannot discharge to an unlined, non-engineered channel segment prior to discharge to the exempt system. Additionally, the project proponent must demonstrate that the hardened or rehabilitated conveyance system has capacity to convey the 10-year ultimate condition flow through the conveyance system. The 10-year flow should be calculated based upon single-event hydrologic criteria as detailed in the San Diego County Hydrology Manual.

- Figure 1-2, Node 9 – As allowed per the Municipal Permit, projects discharging runoff to a highly urbanized watershed (defined as an existing, pre-project impervious percentage greater than 70 percent) may be eligible for an exemption from hydromodification criteria.

  Watershed impervious area calculations for this potential exemption will be measured between the project site discharge location and the connection to a downstream exempt receiving conveyance system, such as the Pacific Ocean, San Diego Bay, or an exempt river system. If a tributary area connects with the main line drainage path between the project site and the exempt system, then the entire watershed area contributing to the tributary shall be included in the calculation. Initial review of County land use indicates that this exemption will likely only apply in a limited number of urbanized coastal areas.

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual and detailed below or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

- Figure 1-2, Nodes 10 through 13 – For urban infill projects discharging runoff to an existing hardened or rehabilitated conveyance system, potential limited exemptions from hydromodification criteria may apply where the existing impervious area percentage in the watershed exceeds 40 percent. For the potential exemption application, the domain of analysis must be determined and the existing hardened or rehabilitated conveyance system must extend beyond the downstream terminus of the domain of analysis. The hardened or rehabilitated conveyance system must discharge to a receiving channel with a Low potential for channel susceptibility for this exemption to be granted (channel susceptibility determined using SCCWRP tool). Finally, continuous simulation sensitivity analysis shows that an exemption could only be granted if the potential future development impacts in the watershed would increase the watershed's impervious area percentage by less than 3 percent (as compared to the existing condition in the year 2010). If the potential future cumulative impacts in the watershed could increase the impervious area percentage by more than 3 percent (as compared to existing condition), then no exemption could be granted based on this item. Watershed impervious area calculations for this potential exemption, in which a project discharges to a watershed with an existing impervious areas greater than 40 percent, will be measured upstream from the outfall of the urban conveyance system (to a non-concrete, non-riprap-lined or non-engineered channel) to the contributing watershed boundary (the entire watershed contributing to the discharge outfall).

  Percent imperviousness will be calculated based on an area-weighted average of impervious areas associated with commercial, industrial, single-family residential, multi-family residential, open space, and other miscellaneous areas (schools, churches, etc.) representative for the watershed. Representative percent imperviousness values for each land use type may correspond to values recommended in Table 3-1 of the County of San Diego's Hydrology Manual or by more specific representative percent impervious calculations (using GIS, etc.), which are often required to represent impervious area percentages for park, school and church sites.

Exemptions related to runoff discharging directly to certain river reaches were initially based upon the majority Technical Advisory Committee (TAC) opinion that such river reaches were depositional (aggrading) and that the effects of cumulative watershed impacts to these reaches is minimal. Subsequent justifications for the river reach exemptions were the result of a flow duration curve analysis for the San Diego River

Potential river reaches that would be exempt from hydromodification criteria include only those reaches for which the contributing drainage area exceeds 100 square miles and which have a 100-year design flow in excess of 20,000 cfs. For reference, proposed Caltrans HMP criteria allows for river/creek exemptions for drainage areas of only 10 square miles.

Per recommendations from members of the TAC, San Diego river systems meeting the drainage area and peak flow criteria are typically aggrading (depositional) and have very wide floodplain areas when in the natural condition. In all cases, river reaches meeting the drainage area and peak flow criteria are located downstream of large reservoir systems which effectively block outflows for most storm events. In addition, the river systems meeting these criteria typically have very low gradients. The combination of low gradients, significant peak flow attenuation, and wide floodplain areas translate to a low potential for channel erosion at the upper limit of the proposed geomorphic flow range (10-year flow event).

All exempt river reaches, which are presented in Table 1-1, have drainage areas in excess of 100 square miles and 100-year flow rates in excess of 20,000 cfs. In addition, all proposed river reaches are subject to significant upstream reservoir flow regulation, have wide floodplain or stabilized channel areas, and low gradients. This combination of factors, in association with field observations and years of historical perspective from the TAC members, justifies exemptions for direct discharges to the exempt river reaches provided that properly sized energy dissipation is provided at the outfall location.

TABLE 1-1. Summary of Exempt River Reaches in San Diego County

| River | Downstream Limit | Upstream Limit |
|---|---|---|
| Otay River | Outfall to San Diego Bay | Lower Otay Reservoir Dam |
| San Diego River | Outfall to Pacific Ocean | Confluence with San Vicente Creek |
| San Dieguito River | Outfall to Pacific Ocean | Lake Hodges Dam |
| San Luis Rey River | Outfall to Pacific Ocean | Upstream river limit of Basin Plan subwatershed 903.1 upstream of Bonsall and near Interstate 15 |
| Sweetwater River | Outfall to San Diego Bay | Sweetwater Reservoir Dam |

Table 1-2 provides a summary of exempt reservoirs in San Diego County. Large reservoirs can be exempt systems from a hydromodification standpoint since reservoir storm water inflow velocities are naturally mitigated by the significant tailwater condition in the reservoir. HMP exemptions would only be granted for projects discharging runoff directly to the exempt reservoirs. The City will define "direct discharge" based on the project site conditions. To qualify for the potential exemption, the outlet elevation must be at or below either the normal operating water surface elevation or the reservoir spillway elevation and properly designed energy dissipation must be provided.

TABLE 1-2. Summary of Exempt Reservoirs in San Diego County

| Reservoir | Watershed |
|---|---|
| Barrett Lake | Tijuana River |
| El Capitain Reservoir | San Diego River |
| Lake Dixon | Escondido Creek |
| Lake Heneshaw | San Luis Rey River |
| Lake Hodges | San Dieguito River |
| Lake Jennings | San Diego River |
| Lake Murray | San Diego River |
| Lake Poway | San Dieguito River |
| Lake San Marcos | San Marcos Creek |
| Lake Wohlford | Escondido Creek |
| Loveland Reservoir | Sweetwater River |
| Lower Otay Reservoir | Otay River |
| Miramar Lake | Los Penasquitos Creek |
| San Vicente Reservoir | San Diego River |
| Sweetwater Reservoir | Sweetwater River |
| Upper Otay Reservoir | Otay River |

The final exemption category focuses on small urban infill projects where the potential for future cumulative watershed impacts is minimal.

Urban infill projects may be exempt from HMP criteria if:

1. The potential future development impacts within the sub-watershed, as measured from the entire sub-watershed area draining to the existing conveyance system outfall, would not increase the composite impervious area percentage of the sub-watershed by more than 3 percent

2. The project discharges runoff to an existing hardened or rehabilitated conveyance system (storm drain, concrete channel, or engineered vegetated channel) that extends beyond the Domain of Analysis determined for the project site, and

3. The stabilized conveyance system eventually discharges to a channel with a Low susceptibility to erosion, as designed by the SCCWRP channel assessment tool.

### ► FLOW CONTROL PERFORMANCE CRITERIA

Figures 1-2 and 1-3, which are part of the HMP Decision Matrix, detail how lower flow thresholds would be determined for a project site. Figures 1-4 and 1-5, which detail the SCCWRP lateral and vertical channel susceptibility requirements, complete the HMP Decision Matrix.

The project applicant must first determine whether field investigations will be conducted pursuant to the SCCWRP channel screening tools. If the screening tools are not completed for a proposed project, then the site must mitigate peak flows and durations based on a pre-project condition lower flow threshold of $0.1Q_2$. While a project applicant would be held to the $0.1Q_2$ standard if channel screening tools and assessments are not conducted, less restrictive standards are possible for more erosion-resistant receiving channel sections if the screening tools are completed and the SCCWRP method indicates either a Medium or Low susceptibility to channel erosion .

In such a scenario, the project applicant would also use the critical shear stress calculator to assist in determination of the predicted lower flow threshold. The SCCWRP screening tools and critical shear stress calculator work in concert to determine the lower flow threshold for a given site. Lower flow limits determined by the calculator have been grouped into one of three thresholds – $0.1Q_2$, $0.3Q_2$ or $0.5Q_2$. "Low" susceptibilities from the SCCWRP tool generally correspond to the $0.5Q_2$ threshold, "Medium" susceptibilities generally correspond to the $0.3Q_2$ threshold, and "High" susceptibilities generally correspond to the $0.1Q_2$ threshold. The SCCWRP channel screening tools are required to identify channel conditions not considered by the critical shear stress calculator, which focuses on channel material and cross section. Conversely, the SCCWRP channel screening tools considers other channel conditions including channel braiding, mass wasting, and proximity to the erosion threshold. In cases where the critical shear stress calculator and the SCCWRP screening tools return divergent values, then the most conservative value shall be used as the lower flow threshold for the analysis.

Low-Impact Development (LID) and extended detention facilities are required to meet peak flow and duration controls as follows:

4. For flow rates ranging from 10 percent, 30 percent or 50 percent of the pre-project 2-year runoff event ($0.1Q_2$, $0.3Q_2$, or $0.5Q_2$) to the pre-project 10-year runoff event (Q10), the post-project discharge rates and durations shall not deviate above the pre-project rates and durations by more than 10 percent over and more than 10 percent of the length of the flow duration curve. The specific lower flow threshold will depend on results from the SCCWRP channel screening study and the critical flow calculator.

5. For flow rates ranging from the lower flow threshold to $Q_5$, the post-project peak flows shall not exceed pre-project peak flows. For flow rates from $Q_5$ to $Q_{10}$, post-project peak flows may exceed pre-project flows by up to 10 percent for a 1-year frequency interval. For example, post-project flows could exceed pre-project flows by up to 10 percent for the interval from $Q_9$ to $Q_{10}$ or from $Q_{5.5}$ to $Q_{6.5}$, but not from $Q_8$ to $Q_{10}$.

This HMP recommends the use of LID facilities to satisfy both 85th percentile water quality treatment as well as HMP flow control criteria. Detailed standards for LID implementation have been developed. These standards are provided in the City of La Mesa BMP Manual Part II.

The following methods may be used to meet mitigation requirements.

- Install BMPs that meet design requirements to control runoff from new impervious areas. BMPs including bioretention basins, vegetated swales, planter boxes, extended detention basins, etc. shall be designed pursuant to standard sizing and specification criteria detailed in the City of La Mesa BMP Manual Part II and the HMP/LID Sizing Calculator to ensure compliance with hydromodification criteria.

- Use of the automated sizing calculator (San Diego Sizing Calculator) that will allow project applicants to select and size LID treatment devices or flow control basins. The tool, akin to the sizing calculator developed for compliance with the Contra Costa HMP, uses pre-calculated sizing factors to determine required footprint sizes for flow control BMPs. Continuous simulation hydrologic analyses are currently being developed to determine the sizing factors for various flow control options and development scenarios. The Sizing Calculator also includes an automated pond sizing tool to assist in the design of extended detention facilities for mitigation of hydromodification effects. Because of the Sizing Calculator's ease of implementation, and since hydromodification BMPs can also serve as treatment BMPs, it is anticipated that most project applicants will choose this option instead of seeking compliance through site-specific continuous simulation model preparation. The HMP/LID Sizing Calculator is an implementation tool, which is currently under development by the consultant team and will be completed by the time final HMP criteria go into effect.

- Prepare continuous simulation hydrologic models and compare the pre-project and mitigated post-project runoff peaks and durations (with hydromodification flow controls) until compliance to flow control standards can be demonstrated. The project applicant will be required to quantify the long-term pre- and post-project runoff response from the site and establish runoff routing and stage-storage-discharge relationships for the planned flow control devices. Public domain software such as HSPF, HEC-HMS and SWMM can be used for preparation of a continuous simulation hydrologic analysis.

- Points of compliance must be selected to conduct the comparisons of pre-project and post-project flows and durations. Generally, points of compliance are selected at locations along the project boundary where concentrated flows discharge from the project site. If a point of compliance is selected downstream of the project boundary, then the City should be consulted in advance of the hydromodification analysis. For projects which convey offsite runoff through the site, it is assumed that the offsite runoff would be separated from site runoff. If this is not the case, then the City should be consulted to further refine the points of compliance for the site (an interior project site point of compliance could be required in such a scenario).

FIGURE 1-3. Mitigation Criteria and Implementation (Part 1)

- Figure 1-3, Node 1 – If the project applicant chooses to complete SCCWRP channel screening tools, then the applicant moves to Figures 1-4 and 1-5 to assess the vertical and lateral susceptibility of the receiving channel systems. Depending on the results of the SCCWRP screening tools and critical flow calculator, it is possible that lower flow thresholds in excess of $0.1Q_2$ may be used. If the project applicant chooses not to complete the SCCWRP channel assessment, then the applicant proceeds with Figure 1-3 of the Decision Matrix.

- Figure 1-3, Node 2 – If the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers), then consultation with a geotechnical engineer is required (Box 3). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 4.

- Figure 1-3, Node 3 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-3, Node 4 – In this scenario, the SCCWRP channel assessment was not conducted. Therefore, the project applicant would be held to the $0.1Q_2$ lower flow threshold. LID and extended detention facilities must be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to $Q_{10}$.

- Figure 1-3, Node 5 - The Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-4. Mitigation Criteria and Implementation (Part 2)

- Figure 1-4, Node 1 – Use of Figure 1-4 assumes that the project applicant conducted the SCCWRP channel assessment. Box 1 would begin following completion of both the lateral and vertical susceptibility flow charts depicted in Figures 1-4 and 1-5. Box 1 is a decision box asking if the project's LID or BMP approach accounts for the infiltration of runoff to native surrounding soils (below amended soil layers). If the answer is Yes, then consultation with a geotechnical engineer is required (Box 2). If the project mitigation approach does not account for infiltration of runoff, then the applicant would proceed to Box 3.

- Figure 1-4, Node 2 – A geotechnical engineer should determine the allowable infiltration rates to be used for the design of each LID or BMP facility. The geotechnical assessment should also identify potential portions of the project which are feasible for infiltration of runoff.

- Figure 1-4, Node 3 – Pursuant to criteria detailed in HMP Section 5.2, the Domain of Analysis is determined downstream and upstream of the project site. This determination is used to ascertain the required reach length for data collection (channel bed and bank material, channel cross section data, etc.) required for the critical flow calculator (see Box 4).

- Figure 1-4, Node 4 – Pursuant to criteria detailed in HMP Section 5.1.4, the project applicant would run the critical shear stress calculator to determine if the recommended critical flow threshold should be $0.1Q_2$, $0.3Q_2$, or $0.5Q_2$. This result will be compared to the result from the SCCWRP screening analysis (Box 5) to determine the final lower flow threshold for the project.

- Figure 1-4, Node 5 – Pursuant to criteria detailed in HMP Appendix B, the project applicant would determine both the lateral and vertical channel susceptibility rating per guidelines set forth by SCCWRP. If the lateral and vertical tools returned divergent results, then the more conservative result would be used. SCCWRP susceptibility ratings include "High," "Medium" and "Low."

- Figure 1-4, Node 6 – A project applicant would arrive at Box 6 if the SCCWRP channel susceptibility rating was determined to be "High." This decision box inquires as to whether stream rehabilitation measures such as grade control and channel widening will be used as a mitigation measure instead of flow control. It should be noted that stream rehabilitation options are only allowed if the existing receiving channel susceptibility is considered to be "High."

- Figure 1-4, Node 7 – Stream rehabilitation measures are only allowed if the proposed mitigation project extends to a downstream exempt system (such as an exempt river system). If the mitigation measure did not extend to an exempt system, then the potential for cumulative watershed impacts would be more pronounced.

- Figure 1-4, Node 8 – If stream rehabilitation measures are allowed, then guidelines outlined in Section 6.3 of the HMP should be followed to design the in-stream mitigation approach.

- Figure 1-4, Node 9 - A project applicant would arrive at Box 9 if the SCCWRP channel susceptibility rating was determined to be "Medium." If the result from the critical shear stress calculator is also "Medium" (or $0.3Q_2$), then the lower flow threshold would be $0.3Q_2$ (Box 11). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10).

- Figure 1-4, Node 10 – For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "High" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.1Q_2$ to $Q_{10}$.

- Figure 1-4, Node 11 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Medium" susceptibility to erosion, LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.3Q_2$ to $Q_{10}$.

- Figure 1-4, Node 12 - A project applicant would arrive at Box 12 if the SCCWRP channel susceptibility rating was determined to be "Low." If the result from the critical shear stress calculator is also "Low" (or $0.5Q_2$), then the lower flow threshold would be $0.5Q_2$ (Box 16 – note potential waiver in Box 13). If the result from the critical shear stress calculator is "High" (or $0.1Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.1Q_2$ (Box 10). If the result from the critical flow calculator is "Medium" (or $0.3Q_2$), then the more conservative value would be used and the lower flow threshold would be $0.3Q_2$ (Box 11).

- Figure 1-4, Node 13 – In some limited situations, namely small developments in rural or lightly developed areas, an allowance for a minimum outlet orifice size may be granted when the receiving channel susceptibility is "Low." This criteria may potentially be used for project footprints less than 5 acres. If the project footprint is greater than 5 acres, then the allowance may not be granted and the applicant would proceed to Box 16.

- Figure 1-4, Node 14 – The potential allowance discussed in Box 13 could only be granted if the ultimate potential impervious area in the sub-watershed is less than 10 percent. If there is potential for the sub-watershed impervious area to exceed 10 percent, then the minimum orifice size criteria may not be granted.

- Figure 1-4, Node 15 – If Boxes 12, 13, and 14 are satisfied, then mitigation facilities may be designed using a 3-inch minimum outlet orifice size.

- Figure 1-4, Node 16 - For stream reaches determined by either the critical flow calculator or the SCCWRP screening tools to have a "Low" susceptibility to erosion – and for projects where the minimum outlet orifice criteria does not apply - LID and extended detention flow control facilities should be sized so that the mitigated post project flows and durations do not exceed pre-project flows and durations for the geomorphically-significant flow range of $0.5Q_2$ to $Q_{10}$.

- Figure 1-4, Node 17 – For all hydromodification mitigation designs, the Decision Matrix includes language regarding a drawdown time requirements so that standards set forth by the City of La Mesa are met. As a side note, the drawdown requirement would be applied to underground vaults in addition to extended detention basins and the surface ponding areas of LID facilities. Proper maintenance of hydromodification mitigation facilities is essential to guard against potential vector issues as well potential safety issues resulting from long-term standing water. If mitigation facility outlets clog, then runoff will bypass the system and potentially result in additional erosion problems downstream of a site. The City of La Mesa drawdown time requirement is 72 hours.

FIGURE 1-5. SCCWRP Vertical Susceptibility

FIGURE 1-6. Lateral Channel Susceptibility

**Grandfathering.** Projects with lawful approval prior to January 14, 2011 (such as a development agreement, vested tentative map, or a building or grading permit), may not have to meet the hydromodification management requirements. Verify with municipal staff.

## Waivers from Numeric Sizing Criteria

The NPDES permit allows for a project to be waived from numeric sizing criteria for storm water treatment only if all available treatment facilities have been considered and found **infeasible**. Municipal staff must inform the Water Board within 5 days of granting a waiver. Other SUSMP requirements—including site designs to minimize imperviousness and source control BMPs—will still apply.

Experience has shown implementation of LID facilities, as described in Chapter 4, is feasible on nearly all development sites. However, the use of LID to retrofit existing drainage systems, to manage runoff from sites smaller than one acre in pedestrian-oriented developments, or to manage runoff from widened portions of roadways, sometimes presents special challenges. In these special situations, applicants should see the discussion of "Selection of Storm Water Treatment Facilities" in Chapter 2 and evaluate the options described on page 41 in order (depending on the specific characteristics of the project and as determined by the City Engineer). All the options listed meet the numeric sizing criteria in the NPDES permit.

If infeasibility of all these options can be established, the City Engineer may determine eligibility of the project for a waiver.

Chapter 2

# Concepts and Criteria

*Technical background and explanations of policies and design requirements*

The Regional Water Board reissued a municipal storm water NPDES permit to San Diego County, its 18 cities, the San Diego Unified Port District, and the San Diego Regional Airport Authority in January 2007. The permit mandates a comprehensive program to prevent storm water pollution. That program now includes street sweeping, maintenance of storm drains, business inspections, public outreach, construction site inspections, monitoring, and studies of stream and ocean health, and control of runoff pollutants from new developments and redevelopments.

Permit Provision D.1.d. requires the City of La Mesa to regulate projects in specific categories (Appendix A) to:

1. Reduce discharges of pollutants to the maximum extent practicable.
2. Prevent runoff discharges from causing or contributing to a violation of water quality standards.

The City of La Mesa, along with the other Copermittees, have created a Low Impact Development (LID) design procedure (Chapter 4) that ensures consistent and thorough implementation of the Regional Water Board's requirements. This chapter explains the technical background of the LID approach and how it was derived.

The previous permit, issued in 2001, included a requirement to control the post-development peak storm water runoff rates and velocities to maintain or reduce pre-development downstream erosion and protect stream habitat. The 2007 permit includes, in addition to this ongoing requirement, a new requirement to develop a hydromodification management plan (HMP) to identify and define a methodology and performance criteria to ensure flow rates and durations do not exceed pre-project runoff where increased runoff could cause erosion or other significant adverse impacts to beneficial uses.

As required by the NPDES permit, the City of La Mesa has adopted final hydromodification criteria. See Chapter One.

## Water-Quality Regulations

Provision D.1 requires the City of La Mesa to condition development approvals on incorporation of specified storm water controls.

Provision D.1 requires applicable new developments and redevelopments:

- Design the site to conserve natural areas, existing trees and vegetation and soils, to maintain natural drainage patterns, to minimize imperviousness, to detain runoff, and to infiltrate runoff where feasible
- Cover or control sources of storm water pollutants
- Treat runoff prior to discharge. Provision E.10 states: "Urban runoff treatment and/or mitigation must occur prior to the discharge of urban runoff into a receiving water. Federal regulations at 40 CFR 131.10(a) state that in no case shall a state adopt waste transport or waste assimilation as a designated use for any waters of the U.S."
- Ensure runoff does not exceed pre-project peaks and durations where increases could affect downstream habitat or other beneficial uses
- Maintain treatment and flow-control facilities

The City of La Mesa maintains a database to track approved installations of treatment facilities and to verify facilities are maintained. The City's annual report to the Regional Water Board includes a list of development projects subject to SUSMP conditions and descriptions of those projects that:

- Received a waiver from SUSMP criteria; or
- Used hydrologic controls used to meet HMP requirements, including a description of the controls.

The City of La Mesa must also report the number of violations and enforcement actions taken upon development projects. The City of La Mesa's programs are subject to audit by the Regional Water Board.

The City of La Mesa—not the Regional Water Board or its staff—is charged with ensuring development projects comply with the D.1 requirements. Regional Water Board staff sometimes review storm water controls and hydromodification impacts in connection with applications for Clean Water Act Section 401 water-quality certification, which is required for projects that involve work, such as dredging or placement of fill, within streams, creeks, or other waters of the US.

### ► MAXIMUM EXTENT PRACTICABLE

Clean Water Act Section 402(p)(3)(iii) sets the standard for storm water controls as "maximum extent practicable," but doesn't define that term. As implemented, "maximum extent practicable" is ever-changing and varies with conditions.

Many storm water controls, including LID facilities, have proven to be practicable in most site development projects. To achieve fair and effective implementation, criteria, and guidance, requirements for controls must be detailed and specific—while also offering the right amount of flexibility or exceptions for special cases. The NPDES permit includes various standards, including hydrologic criteria, which have been found to comprise "maximum extent practicable." This BMP Manual is to be continuously improved and refined based on the experience of municipal planners and engineers, with input from land developers and development professionals. By following the BMP Manual, applicants can ensure their project design meets "maximum extent practicable."

### ► BEST MANAGEMENT PRACTICES

Clean Water Act Section 402(p) and USEPA regulations (40 CFR 122.26) specify a municipal program of "management practices" to control storm water pollutants. **Best Management Practice (BMP)** refers to any kind of procedure, activity, or device designed to minimize the quantity of pollutants that enter the storm drain system. BMPs are typically used in place of assigning numeric effluent limits. The criteria for source control BMPs and treatment and flow-control facilities are crafted to fulfill "maximum extent practicable."

To minimize confusion, this guidebook refers to "facilities," "features," or "controls" to be incorporated into development projects. All of these are BMPs.

## Pollutants of Concern

NPDES Permit Provision D.1.d.(3) requires the City of La Mesa to develop and implement a procedure for pollutants of concern to be identified for each Priority Development Project.

Documentation of the approach to identifying pollutants of concern and selecting BMPs and facilities follows.

### ► GROUPING OF POTENTIAL POLLUTANTS OF CONCERN

Urban runoff from a developed site has the potential to contribute pollutants, including oil and grease, suspended solids, metals, gasoline, pesticides, and pathogens to the storm water conveyance system and receiving waters. For the purposes of identifying pollutants of concern and associated storm water BMPs, pollutants are grouped in nine general categories as follows:

- **Sediments** are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms

survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

- **Nutrients** are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

- **Metals** are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary sources of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

- **Organic compounds** are carbon-based. Commercially available or naturally occurring organic compounds are found in pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

- **Trash** (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfide.

- **Oxygen-Demanding Substances** includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-

demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

- Primary sources of **oil and grease** are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

- **Bacteria and Viruses** are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. Also, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

- **Pesticides** (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

### ► IDENTIFYING POLLUTANTS OF CONCERN BASED ON LAND USES

Table 2-1 associates pollutants with the categories of Priority Development Projects. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern.

### ► WATERSHEDS WITH SPECIAL POLLUTANT CONCERNS

Receiving water conditions may require specialized attention. The three conditions to consider include:

- Ocean waters designated as an "Area of Special Biological Significance" (ASBS)
- 303(d) listed waters; and
- Waters with established TMDLs.

TABLE 2-1. Anticipated and Potential Pollutants Generated by Land Use Type.

| | General Pollutant Categories | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Land Use Type | Sediment | Nutrients | Heavy Metals | Organic Compounds | Trash & Debris | Oxygen Demanding Substances | Oil & Grease | Bacteria & Viruses | Pesticides |
| Detached Residential Development | X | X | | | X | X | X | X | X |
| Attached Residential Development | X | X | | | X | P(1) | P(2) | P | X |
| Commercial Development | P(1) | P(1) | X | P(2) | X | P(5) | X | P(3) | P(5) |
| Heavy Industry | X | | X | X | X | X | X | | |
| Automotive Repair Shops | | | X | X(4)(5) | X | | X | | |
| Restaurants | | | | | X | X | X | X | P(1) |
| Hillside Development >5,000 ft² | X | X | | | X | X | X | | X |
| Parking Lots | P(1) | P(1) | X | | X | P(1) | X | | P(1) |
| Retail Gasoline Outlets | | | X | X | X | X | X | | |
| Streets, Highways & Freeways | X | P(1) | X | X(4) | X | P(5) | X | X | P(1) |

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

The State Water Resources Control Board's California Ocean Plan identifies thirty-four locations along the California coast as **Areas of Special Biological Significance (ASBS)**. Currently, there are no ASBS downstream of the City of La Mesa. See Table 2-2 for a list of applicable downstream water bodies. Please note that while runoff from the City drains to these water bodies, the actual water bodies are not located within the City itself.

TABLE 2-2. City of La Mesa Drainage Basins.

| Drainage Basin | Percent of City of La Mesa Area | Receiving Waterbody | Hydrologic Subarea | Watershed |
|---|---|---|---|---|
| Alvarado | 51 | San Diego River | 907.11 | San Diego River |
| Lake Murray | 1 | Lake Murray | | |
| University | 28 | Chollas Creek | 908.22 | San Diego Bay |
| Lemon Grove | 6 | | | |
| Spring Valley | 14 | Sweetwater River | 909.12 | |

The NPDES Permit identifies several receiving waters as impaired for constituents or water quality effects pursuant to **Section 303(d)** of the Clean Water Act. Placement of a water onto the list requires the Regional Board to make further analysis of the impairment and development of total maximum daily loads (TMDLs) for addressing the impairment. The 303(d) listing in itself does not demand that a project proponent select BMPs on the basis of the impairment; however, the project proponent should be cognizant of the impairment and the future implications a TMDL might have upon the proposed land use. The San Diego River, Chollas Creek, and Lake Murray, all of which are on the 2010 CWA Section 303(d) list, are located downstream of the City of La Mesa. The San Diego River is impaired for *Enterococcus*, fecal coliform, low dissolved oxygen, nitrogen, phosphorus, total dissolved solids (TDS), and toxicity. Chollas Creek is impaired for indicator bacteria, copper, diazinon, lead, zinc, phosphorus, total nitrogen as N, and trash. Lake Murray, which drains a very small portion of the City, is 303(d) listed for nitrogen and pH.

Check the website below for the most current 303(d) listings.
http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

Once a TMDL is established it may impose conditions on development either through an implementation plan and schedule for the listed water, or through special conditions required of the City of La Mesa affected by the numeric criteria of the TMDL. At this time, several 303(d) listings in San Diego County are at various stages of TMDL development with only four TMDLs having been adopted by the Regional Board. However, there are approximately 190 pending TMDLs in the county.

Applicable current and pending **TMDLs** in the La Mesa area include:

- Adopted TMDL for diazinon for Chollas Creek;

- Adopted TMDL for copper, lead, and zinc for Chollas Creek,
- Adopted TMDL for indicator bacteria for twenty beaches and creeks in the San Diego Region.
- Pending TMDL for sediment toxicity for the mouth of Chollas Creek,

The applicant should meet with municipal staff to determine if any project characteristics or watershed characteristics affect selection and design of BMPs. Except in rare circumstances, the use of the LID Design Guide (Chapter 4) and the Storm Water Pollutant Sources/Source Control Checklist (Appendix C) will ensure your project complies with all storm water requirements.

## Selection of Permanent Source Control BMPs

Based on identification of potential pollutants of concern associated with various types of facilities, the City of La Mesa has developed a Storm Water Pollutant Sources/Source Control Checklist (Appendix C) of "maximum extent practicable" source controls associated with each facility type. This approach ensures appropriate BMPs are applied to potential sources of each pollutant of concern.

## Selection of Storm Water Treatment Facilities

Table 2-3, below, categorizes pollutants of concern related to fate and pathways.

Table 2-4, below, includes a general comparison of how various types of treatment facilities perform for each group of pollutants.

TABLE 2-3. Grouping of Potential Pollutants of Concern by Fate During Storm Water Treatment

| Pollutant | Coarse Sediment and Trash | Pollutants that tend to associate with fine particles during treatment | Pollutants that tend to be dissolved following treatment |
|---|---|---|---|
| **Sediment** | X | X | |
| **Nutrients** | | X | X |
| **Heavy Metals** | | X | |
| **Organic Compounds** | | X | |
| **Trash & Debris** | X | | |
| **Oxygen Demanding** | | X | |
| **Bacteria** | | X | |
| **Oil & Grease** | | X | |
| **Pesticides** | | X | |

TABLE 2-4. Groups of Pollutants and Relative Effectiveness of Treatment Facilities

| **Pollutants of Concern** | Bioretention Facilities (LID) | Settling Basins (Dry Ponds) | Wet Ponds and Constructed Wetlands | Infiltration Facilities or Practices (LID) | Media Filters | Higher-rate biofilters* | Higher-rate media filters* | Trash Racks & Hydro -dynamic Devices | Vegetated Swales |
|---|---|---|---|---|---|---|---|---|---|
| **Coarse Sediment and Trash** | High | High | High | High | High | High | High | High | High |
| **Pollutants that tend to associate with fine particles during treatment** | High | High | High | High | High | Medium | Medium | Low | Medium |
| **Pollutants that tend to be dissolved following treatment** | Medium | Low | Medium | High | Low | Low | Low | Low | Low |

*See page 41 for a discussion of selection of treatment facilities in special situations.

Based on this analysis, the City of La Mesa has determined that the following types of facilities are appropriate for treatment of runoff potentially containing most pollutants of concern. These types of facilities can be used for storm water treatment and hydromodification flow control for all land uses in all watersheds, except where site-specific constraints make them infeasible.

- Infiltration facilities or practices, including dry wells, infiltration trenches, infiltration basins, and other facilities that infiltrate runoff to native soils (sized to detain and infiltrate a volume equivalent to the 85$^{th}$ percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

- Bioretention facilities and media filters that detain storm water and filter it slowly through soil or sand (sized with a surface area at least 0.04 times the effectively impervious tributary area for water quality treatment – a larger sizing factor is required to provide hydromodification control).

- Extended detention basins, wet ponds, and wetlands or other facilities using settling (sized to detain a volume equivalent to runoff from the tributary area generated by the 85$^{th}$ percentile 24-hour water quality runoff event – greater capacity required to provide hydromodification flow control).

The recommended design procedure in Chapter 4 integrates LID practices—optimizing the site design, using pervious surfaces, and dispersing of runoff to adjacent pervious areas—with the use of infiltration facilities, detention basins, and bioretention facilities to meet NPDES permit LID requirements, treatment requirements, and flow-control requirements in a cost-effective, unified design.

Oil/water separators ("water quality inlets"), storm drain inlet filters, and hydrodynamic separators, including vortex separators and continuous deflection separators ("CDS units"), are

less effective means of storm water treatment, although they may be used in series with more effective facilities.

Underground vaults typically lack the detention time required for settling of fine particles associated with storm water pollutants. They also require frequent maintenance and may retain stagnant water, potentially providing harborage for mosquitoes. Because vaults may be "out of sight, out of mind," experience shows that the required maintenance may not occur.

Lack of space, in itself, is not a suitable justification for using a less-effective treatment on a development site, because the uses of the site and the site design can be altered as needed to accommodate bioretention facilities or planter boxes. In most cases, these effective facilities can be fit into required landscaping setbacks, easements, or other unbuildable areas.

Where possible, drainage to inlets, and drainage away from overflows and underdrains, should be by gravity. Where site topography makes it infeasible to accommodate gravity-fed facilities in the project design, the design flow may be captured in a vault or sump and pumped via force main to an effective facility.

The following situations sometimes present special challenges:

- Portions of sites which are not being developed or redeveloped, but which must be retrofit to meet treatment requirements in accordance with Provision D.1.d.(1)(a) which states in part: "Where redevelopment results in an increase of, or replacement of, more than fifty percent of the impervious surface of a previously existing development, the numeric sizing criteria applies to the entire development."

- Sites smaller than one acre approved for development or redevelopment as part of a municipality's stated objective to preserve or enhance a pedestrian-oriented "smart-growth" type of urban design.

- Roadway widening projects.

In these special situations, the following types of facilities should each be evaluated in priority order (depending on the specific characteristics of the site and as determined by the municipal storm water coordinator) until a feasible design is found.

1. Bioretention areas or planter boxes fed by gravity.

2. Capture of the design flow in a vault or sump and pumping to bioretention areas or planter boxes.

3. A subsurface sand or media filter with a maximum design surface loading rate of 5 inches per hour and a minimum media depth of 18 inches. The sand surface must be made accessible for periodic inspection and maintenance (for example, via a removable grating).

4. A higher-rate surface biofilter, such as a tree-pit-style unit. The grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units.

5. A higher-rate vault-based filtration unit (for example, vaults with replaceable cartridge filters filled with inorganic media).

**Proprietary Devices**
Many currently available proprietary devices do not meet City of La Mesa requirements when used alone for storm water treatment. Consult with municipal staff before proposing these devices.

Many proprietary storm water treatment devices are currently marketed, and new brands will be introduced. Applicants and applicants' engineers and design professionals should review with municipal staff any proposals for using proprietary devices for storm water treatment before they commence work on preliminary site layout, drainage plans, grading plans, or landscape plans.

## Hydrology for NPDES Compliance

### ► IMPERVIOUSNESS

Schueler (1995) proposed **imperviousness** as a "unifying theme" for the efforts of planners, engineers, landscape architects, scientists, and local officials concerned with urban watershed protection. Schueler argued (1) that imperviousness is a useful indicator linking urban land development to the degradation of aquatic ecosystems, and (2) imperviousness can be quantified, managed, and controlled during land development.

Imperviousness has long been understood as the key variable in urban hydrology. Peak runoff flow and total runoff volume from small urban catchments is usually calculated as a function of the ratio of impervious area to total area **(rational method)**. The ratio correlates to the runoff factor, usually designated "C". Increased flows resulting from urban development tend to increase the frequency of small-scale flooding downstream.

Imperviousness links urban land development to degradation of aquatic ecosystems in two ways.

First, the combination of paved surfaces and piped runoff efficiently collects urban pollutants and transports them, in suspended or dissolved form, to surface waters. These pollutants may originate as airborne dust, be washed from the atmosphere during rains, or may be generated by automobiles and outdoor work activities.

Second, increased peak flows and runoff durations typically cause erosion of stream banks and beds, transport of fine sediments, and disruption of aquatic habitat. Measures taken to control stream erosion, such as hardening banks with riprap or concrete, may permanently eliminate habitat. By reducing infiltration to groundwater, imperviousness may also reduce dry-weather stream flows.

Imperviousness has two major components: rooftops and transportation (including streets, highways, and parking areas). The transportation component is usually larger and is more likely to be **directly connected** to the storm drain system.

The effects of imperviousness can be mitigated by disconnecting impervious areas from the drainage system and by encouraging detention and retention of runoff near the point where it is generated. Detention and retention reduce peak flows and volumes and allow pollutants to settle out or adhere to soils before they can be transported downstream.

### ► LOW IMPACT DEVELOPMENT REQUIREMENTS

The NPDES permit requires LID be used on all projects to minimize directly connected impervious area and promote infiltration. For Priority Development Projects, the minimum standards are:

- Drain a portion of impervious areas into pervious areas, if any.
- Design and construct pervious areas, if any, to effectively receive and infiltrate runoff from impervious areas, taking into account soil conditions, slope, and other pertinent factors.
- Construct a portion of paved areas with low traffic and appropriate soil conditions with permeable surfaces.

The LID design procedure in Chapter 4 incorporates these requirements into an integrated design which meets sizing requirements for storm water treatment facilities and flow-control (hydromodification management) requirements.

### ► SIZING REQUIREMENTS FOR STORM WATER TREATMENT FACILITIES

The guidance in Chapter 4 was crafted to ensure LID facilities comply with the NPDES permit's hydraulic sizing requirements for storm water treatment facilities and flow-control facilities. The technical background follows.

Most runoff is produced by frequent storms of small or moderate intensity and duration. Treatment facilities are designed to treat smaller storms and the first flush of larger storms—approximately 80% of average annual runoff.

The NPDES permit identifies two types of treatment facilities—volume-based and flow-based.

**Volume-based facilities** must be designed to infiltrate, filter, or treat the volume of runoff produced from a 24-hour 85$^{th}$ percentile storm event as determined from the County of San Diego's 85$^{th}$ Percentile Precipitation Isopluvial Map. As shown on the map, rainfall depths vary from about 0.55" to 1.55".

For **flow-based** facilities, the NPDES permit specifies the rational method be used to determine flow. The rational method uses the equation

$Q = CiA$, where

$Q$ = flow

$C$ = weighted runoff factor between 0 and 1

i = rainfall intensity

A = area

The permit identifies two alternatives for calculating rainfall intensity:

1. the 85th percentile rainfall intensity times two, or
2. 0.2 inches per hour.

It is typically found that both methods yield similar results. The 0.2 inches per hour rainfall intensity should be used for sizing flow-based treatment facilities.

The 0.2 inches per hour criterion is the basis for a **consistent countywide sizing factor** for bioretention facilities when used for storm water treatment only (i.e., not for flow control). The factor is based on maintaining a minimum percolation rate of 5 inches per hour through the engineered soil mix. The sizing factor is the ratio of the design intensity of rainfall on tributary impervious surfaces (0.2 inches/hour) to the design percolation rate in the facility (5 inches/hour), or **0.04** (dimensionless).

#### ► FLOW-CONTROL (HYDROMODIFICATION MANAGEMENT)

The NPDES permit specifies for applicable projects:

> … post-project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations.

Refer to Appendix H to review the final Hydromodification Management Plan (HMP) developed by the San Diego Copermittees and approved by the RWQCB in July 2010. A summary of the applicability criteria from the HMP document is provided in Chapter 1 of this BMP Manual.

## Criteria for Infiltration Devices

The NPDES permit restricts the design and location of "infiltration devices" that, as designed, may bypass filtration through surface soils before reaching groundwater. These devices include:

- Infiltration basins.
- Infiltration trenches (includes French drains).
- Unlined retention basins (i.e., basins with no outlets).

- Unlined or open-bottomed vaults or boxes installed below grade (dry wells).

Infiltration devices may not be used in:

- Areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway);
- Automotive repair shops;
- Car washes;
- Fleet storage areas (bus, truck, etc.);
- Nurseries;
- Other areas with pollutant sources that could pose a threat to groundwater, as designated by the City of La Mesa.

The vertical distance from the base of any infiltration device to the seasonal high groundwater mark shall be at least 10 feet. Infiltration devices shall be located a minimum of 100 feet horizontally from any known water supply wells.

In addition, infiltration devices are not recommended where:

- The infiltration device would receive drainage from areas where chemicals are used or stored, where vehicles or equipment are washed, or where refuse or wastes are handled.
- Surface soils or groundwater are polluted.
- The facility could receive sediment-laden runoff from disturbed areas or unstable slopes.
- Increased soil moisture could affect the stability of slopes of foundations.
- Soils are insufficiently permeable to allow the device to drain within 72 hours.

**► MOST LID FEATURES AND FACILITIES ARE NOT INFILTRATION DEVICES**

Self-treating and self-retaining areas, pervious pavements, bioretention facilities, and planter boxes are not considered to be infiltration devices.

Bioretention facilities work by percolating runoff through 18 inches or more of engineered soil. This removes most pollutants before the runoff is allowed to seep into native soils below. Further pollutant removal typically occurs in the unsaturated (vadose) zone before moisture reaches groundwater.

Where there is concern about the effects of increased soil moisture on slopes or foundations, an impermeable barrier may be added so the facility is "flow through" and all treated runoff is underdrained away from the facility. See the design sheets for Bioretention Facilities and Flow-Through Planters in Appendix B.

Chapter 3

# Preparing Your Project Submittal

*Step-by-step assistance to demonstrate compliance.*

Your Project Submittal will demonstrate your project complies with all applicable requirements in the storm water NPDES permit—to minimize imperviousness, retain or detain storm water, slow runoff rates, incorporate required source controls, treat storm water prior to discharge, control runoff rates and durations, and provide for operation and maintenance of treatment and flow-control facilities.

**Submittal requirements vary from jurisdiction to jurisdiction. See below for the specific requirements of the City of La Mesa.**

Typically, your Project Submittal must be coordinated with your application for discretionary approvals and must have sufficient detail to ensure the storm water design, site plan, and landscaping plan are congruent.

A complete and thorough Project Submittal will facilitate quicker review and fewer cycles of review. The City of La Mesa requires a submittal for every applicable project. The procedures outlined in this chapter are preferred by the City of La Mesa; any other approaches to meeting the requirements of this BMP Manual must be shown by the project proponent to be defensibly equivalent or better. Review and approval of water quality documents by City of La Mesa staff will be most efficient when proponents follow the methodology and direction outlined in this Chapter.

In order to meet SUSMP requirements, your submittal will be a Standard Post Construction BMP Plan (SPCBMPP) or a Post Construction Water Quality Technical Report (PCWQTR), depending on the outcome of the "Storm Water Requirements Applicability Checklist" in Appendix A. If you need to prepare a SPCBMPP, see Appendix G for appropriate guidance. If your project is a Priority Development Project, you will need to prepare a PCWQTR as directed in this chapter. **Municipal staff may use a review checklist** such as the following example to evaluate your Project Submittal:

## EXAMPLE PROJECT SUBMITTAL CHECKLIST

### SUBMITTAL COMPONENT REQUIREMENTS FOR PRIORITY DEVELOPMENT PROJECTS

- ❒ Completed "Storm Water Requirements Applicability Checklist" (Appendix A)
- ❒ Vicinity Map
- ❒ Site Map (See below for contents of Exhibit.)
- ❒ PCWQTR (See below for contents of Report.)
- ❒ Drainage Study (with Hydromodification, if applicable)

### CONTENTS OF EXHIBIT (SITE MAP)

Show all of the following on drawings:

- ❒ Show entire property on one map. Use key map if multiple sheets are necessary. (Step 1 in the following step-by-step instructions)
- ❒ Existing natural hydrologic features (depressions, watercourses, floodplains, relatively undisturbed areas) and significant natural resources. (Step 1)
- ❒ Areas of potential soil erosion on the property and downstream of the project. (Step 1)
- ❒ Soil types and depth to groundwater. (Step 1)
- ❒ Existing and proposed site drainage network and connections to drainage off-site, including surface conveyances, private storm drain systems, and municipal storm drain inlets. (Step 3)
- ❒ Proposed design features and surface treatments used to minimize imperviousness. (Step 3)
- ❒ Entire site divided into separate drainage areas, with each area identified as self-treating, self-retaining (zero-discharge), draining to a self-retaining area, or draining to an IMP. (Step 3)
- ❒ For each drainage area, types of impervious area proposed (roof, plaza/sidewalk, and streets/parking) and area of each. (Step 3)
- ❒ Proposed locations and sizes of treatment or flow-control facilities. (Step 3)
- ❒ Potential pollutant source areas, including refuse areas, outdoor work and storage areas, etc. listed in Appendix C and corresponding required source controls. (Step 4)

### CONTENTS OF REPORT

Include all of the following in your PCWQTR:

- ❒ Table of Contents
- ❒ Identification of the watershed(s), downstream waterbodies, waterbody impairments, and pollutants of concern (Step 1)
- ❒ Narrative analysis or description of site features and conditions that constrain, or provide opportunities for, storm water control. (Step 2)
- ❒ If the project is exempt from HMP requirements, a discussion must be included demonstrating which exemption is being claimed and why the project qualifies (Step 2).

- ❒ Demonstrate how hydromodification requirements are met, including calculations justifying determination of lower flow thresholds and the sizing of LID or extended detention facilities to provide for hydromodification flow control. Field investigation results and continuous simulation results should also be included where applicable (Step 3).
- ❒ Narrative description of site design characteristics that protect natural resources. (Step 3)
- ❒ Narrative description and/or tabulation of site design characteristics, building features, and pavement selections that reduce imperviousness of the site. (Step 3)
- ❒ Basis for selection of each proposed engineered LID IMP or alternative treatment facility. (Step 3)
- ❒ Tabulation of proposed pervious and impervious area, showing self-treating areas, self-retaining areas, and areas tributary to each treatment or flow-control facility. (Step 3)
- ❒ Preliminary designs, including calculations, for each infiltration, treatment, or flow-control facility. Elevations should show sufficient hydraulic head for each. (Step 3)
- ❒ A table of identified pollutant sources and for each source, the source control measure(s) used to reduce pollutants to the maximum extent practicable. See worksheet in Appendix C. (Step 4)
- ❒ General maintenance requirements for infiltration, treatment, and flow-control facilities (Step 5)
- ❒ Means by which facility maintenance will be financed and implemented in perpetuity. (Step 5)
- ❒ Statement accepting responsibility for operation & maintenance of facilities (Step 5).
- ❒ Identification of any conflicts with codes or requirements or other anticipated obstacles to implementing the proposed facilities in the submittal (Step 6).
- ❒ Construction Plan SUSMP Checklist (Step 6).
- ❒ Certification by a registered civil engineer (Step 6).

## Step by Step

**Suggested coordination with site and landscape design**

Plan and design your storm water controls integrally with the site planning and landscaping for your project. It's best to start with general project requirements and preliminary site design concepts, then prepare the detailed site design, landscape design, and storm water control design simultaneously. **This will help ensure that your site plan, landscape plan, and Project Submittal are congruent.**

**Begin with general project requirements and program.**

The following step-by-step procedure should optimize your design by identifying the best opportunities for storm water controls **early in the design process.**

The recommended steps are:

**Sketch conceptual site layout, building locations, and circulation.**

1. Assemble needed information.
2. Identify site opportunities and constraints.
3. Follow the LID design guidance in Chapter 4 to analyze your project for LID and to develop and document your drainage design.
4. Specify source controls using the sources/source control checklist in Appendix C.
5. Plan for ongoing maintenance of treatment and flow-control facilities.
6. Complete the Project Submittal.

**Revise site layout, building locations, and circulation to accommodate LID design. Develop land-scaping plan.**

**Submit Site Plan, Landscape Plan, and SUSMP Submittal**

Municipal staff may recommend you prepare and submit a preliminary site design prior to formally applying for planning and zoning approvals. Your preliminary site design should incorporate a conceptual plan for site drainage, including self-treating and self-retaining areas and the location and approximate sizes of any treatment facilities. This additional up-front design effort will save time and avoid potential delays later in the review process.

## Step 1: Assemble Needed Information

To select types and locations of treatment facilities, the designer needs to know the following site characteristics:

- **Existing natural hydrologic features** and natural resources, including any contiguous natural areas, wetlands, watercourses, seeps, or springs.

- **Existing site topography**, including contours of any slopes of 4% or steeper, general direction of surface drainage, local high or low points or depressions, any outcrops or other significant geologic features.
- **Zoning**, including requirements for **setbacks** and **open space**.
- **Public Works Standards** or other local codes governing minimum street widths, sidewalk construction, allowable pavement types, and drainage. These codes may conflict with Low Impact Development objectives to minimize imperviousness and to maintain or restore natural site hydrology.
- Soil types (including **hydrologic soil groups**) and depth to groundwater, which may determine whether infiltration is a feasible option for managing site runoff. Depending on site location and characteristics, and on the selection of treatment and flow-control facilities, site-specific information (e.g. from boring logs or geotechnical studies) may be required.
- **Existing site drainage.** For undeveloped sites, this should be obtained by inspecting the site and examining topographic maps and survey data. For previously developed sites, site drainage and connection to the municipal storm drain system can be located from site inspection, municipal storm drain maps, and plans for previous development.
- Existing **vegetative cover** and **impervious areas**, if any.
- **Watershed(s)** in which the project area is located.
- **Applicable hydromodification management requirements** for the project, or evidence for any exemptions from requirements based on the Final HMP. Note that field investigation is typically required for projects subject to hydromodification management requirements.
- **Pollutants of Concern** in receiving waters. For each of the proposed project discharge points, identify the receiving water(s), including hydrologic unit basin number(s), as identified in the most recent version of the Water Quality Control Plan for the San Diego Basin[1], prepared by the San Diego Regional Water Quality Control Board. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies[2]. List any and all pollutants for which the receiving waters are impaired. Use Table 2-1 of this BMP Manual to list anticipated pollutants based on land use.

---

[1] Go to: http://www.waterboards.ca.gov/sandiego/water_issues/programs/303d_list/index.shtml

[2] Under Section 303(d) of the 1972 Clean Water Act, states, territories, and authorized tribes are required to develop a list of water quality limited segments. These waters on the list do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. Go to: http://www.swrcb.ca.gov/rwqcb9/water_issues/programs/303d_list/index.shtml. San Diego is in Region 9.

**References and Resources**

- *Site Planning for Urban Stream Protection* (Schueler 1995).
- *Start at the Source* (BASMAA 1999), p. 36

## Step 2: Identify Constraints & Opportunities

Review the information collected in Step 1. Identify the principal constraints on site design and selection of treatment and flow-control facilities as well as opportunities to reduce imperviousness and incorporate facilities into the site and landscape design. For example, **constraints** might include impermeable soils, high groundwater, groundwater pollution or contaminated soils, steep slopes, geotechnical instability, high-intensity land use, heavy pedestrian or vehicular traffic, restricted right-of-way, or safety concerns. **Opportunities** might include existing natural areas, low areas, oddly configured or otherwise unbuildable parcels, easements and landscape amenities including open space and buffers (which can double as locations for bioretention facilities), and differences in elevation (which can provide hydraulic head). Note storm water treatment facilities should not be located within protected riparian areas.

Prepare a brief **narrative** describing site opportunities and constraints. This narrative will help you as you proceed with LID design and explain your design decisions to others.

## Step 3: Prepare and Document Your LID Design

Use the Low Impact Development Design Guide (Chapter 4) to analyze your project for LID, design and document drainage, and specify preliminary design details for integrated management practices. **Follow the detailed instructions in Chapter 4 to ensure your project complies with NPDES permit LID requirements (Provision D.1.d.(4)) and storm water treatment requirements in Provision D.1.d.(6)).** The LID Design Guide has been designed so that hydromodification management requirements are also met via this unified design procedure. Chapter 4 includes calculation procedures and formats for presenting your calculations.

As shown in the example checklist (page 48), your Project Submittal may need to include a drawing showing:

- The entire site divided into separate drainage management areas (DMAs), with each area identified as one of the following: self-treating, self-retaining, draining to a self-retaining area, or draining to an IMP. Each area should be clearly marked with a unique identifier.
- For each drainage area, the types of impervious area proposed, and the area of each.
- Proposed locations and sizes of treatment facilities. Each facility should be clearly marked with a unique identifier.

**Compliance**

The design criteria for DMAs in Chapter 4 ensure the required volume of flow from all developed portions of the project, including landscaped areas, is infiltrated, filtered, or treated (Provision D.1.d.(6)(a).

Your Project Submittal may need to include:

- Tabulation of proposed self-treating areas, self-retaining areas, areas draining to self-retaining areas, and areas draining to IMPs, and the corresponding IMPs identified on the Exhibit.
- Calculations, in the format shown in Chapter 4, showing the minimum square footage required and proposed square footage for each IMP.
- Preliminary designs for each IMP. The design sheets and accompanying drawings in Appendix B may be used or adapted for this purpose.

The following may also be required, or may be advisable to assist the reviewer to understand your design:

- A narrative overview of your design and how your design decisions optimize the site layout, use pervious surfaces, disperse runoff from impervious surfaces, and drain impervious surfaces to engineered IMPs. See Chapter 4.
- A narrative briefly describing each **drainage management area** (DMA), its drainage, and where drainage will be directed.
- A narrative briefly describing each IMP. Include any special characteristics or features distinct from the design sheets in Appendix B.

**References and Resources**

  *Low Impact Development Technical Guidance Manual for Puget Sound* (Puget Sound Action Team, 2005)
- *LID for Big Box Retailers* (Low Impact Development Center, 2006)

## Step 4. Specify Source Control BMPs

Some everyday activities – such as trash recycling/disposal and washing vehicles and equipment – generate pollutants that tend to find their way into storm drains. These pollutants can be minimized by applying **source control BMPs**.

Source control BMPs include **permanent**, structural features that must be incorporated into your project plans and **operational** BMPs, such as regular sweeping and "housekeeping," that must be implemented by the site's occupant or user. The maximum extent practicable standard typically requires both types of BMPs. In general, operational BMPs cannot be substituted for a feasible and effective permanent BMP.

**Use the following procedure** to specify source control BMPs for your site:

### ► IDENTIFY POLLUTANT SOURCES

Review the first column in the **Pollutant Sources/Source Control Checklist** (Appendix C). Check off the potential sources of pollutants that apply to your site.

### ► NOTE LOCATIONS ON SUBMITTAL DRAWING

Note the corresponding requirements listed in Column 2 of the Pollutant Sources/Source Control Checklist (Appendix C). Show the location of each pollutant source and each permanent source control BMP in your submittal drawing.

### ► PREPARE A TABLE AND NARRATIVE

Check off the corresponding requirements listed in Column 3 in the Pollutant Sources/Source Control Checklist (Appendix C). Now, create a table using the format in Table 3-1. In the left column, list each potential source on your site (from Appendix C, Column 1). In the middle column, list the corresponding **permanent, structural BMPs** (from Columns 2 and 3, Appendix C) used to prevent pollutants from entering runoff. Accompany this table with a narrative that explains any special features, materials, or methods of construction that will be used to implement these permanent, structural BMPs.

### ► IDENTIFY OPERATIONAL SOURCE CONTROL BMPS

TABLE 3-1. Format for Table of Permanent and Operational Source Control Measures.

| *Potential source of runoff pollutants* | *Permanent source control BMPs* | *Operational source control BMPs* |
|---|---|---|
| | | |
| | | |

To complete your table, refer once again to the Pollutant Sources/Source Control Checklist (Appendix C, Column 4). List in the right column of your table the operational BMPs that should be implemented as long as the anticipated activities continue at the site. The same BMPs may also be required as a condition of a use permit or other revocable discretionary approval for use of the site.

**References and Resources**

- Appendix C: Storm Water Pollutant Sources/Source Control Checklist
- RWQCB Order R9-2007-0001, Provision D.1.d.(5)
- *Start at the Source*, Section 6.7: Details, Outdoor Work Areas
- *California Stormwater Industrial/Commercial Best Management Practice Handbook*
- *Urban Runoff Quality Management* (WEF/ASCE, 1998) Chapter 4: Source Controls

## Step 5: Storm Water Facility Maintenance

As required by NPDES Permit Provision D.1.c.(5), projects that include permanent BMPs shall be conditioned to require submittal of proof of a mechanism under which ongoing long-term maintenance of storm water treatment and flow-control facilities will be conducted, satisfactory to the City Engineer. The City of La Mesa requires the following items be included in your Project Submittal:

1. A means to finance and implement facility maintenance in perpetuity.
2. Acceptance of responsibility for maintenance from the time the facilities are constructed until responsibility for operation and maintenance is legally transferred. A warranty covering a period following construction may also be required.
3. An outline of general maintenance requirements for the treatment and flow-control facilities you have selected.

The City Engineer may also require that you prepare and submit a detailed plan that sets forth a maintenance schedule for each of the treatment and flow-control facilities built on your site.

Details of these requirements, and instructions for preparing a detailed operation and maintenance plan, are in Chapter 5.

**References and Resources**

- *Chapter 5*
- Operation, Maintenance, and Management of Stormwater Management Systems (Watershed Management Institute, 1997)

## Step 6: Complete Your Project Submittal

City staff may provide specific instructions for the content and format of your Project Submittal. Your Project Submittal should document the information gathered and decisions made in Steps 1-5. A clear, complete, well-organized Project Submittal will make it possible to confirm your design meets the minimum requirements of the NPDES permit, the City of La Mesa Storm Water Ordinance Municipal Code Chapter 7.18, and this BMP manual.

### ► COORDINATION WITH SITE, ARCHITECTURAL, AND LANDSCAPING PLANS

Before completing your Project Submittal, ensure your storm water control design is fully coordinated with the site plan, grading plan, and landscaping plan being proposed for the site.

Information submitted and presentations to design review committees, planning commissions, and other decision-making bodies must incorporate relevant aspects of the storm water design. In particular, ensure:

- Curb elevations, elevations, grade breaks, and other features of the drainage design are consistent with the delineation of DMAs.

- The top edge (overflow) of each bioretention facility is level all around its perimeter—this is particularly important in parking lot medians.
- The resulting grading and drainage design is consistent with the design for parking and circulation.
- Bioretention facilities and other IMPs do not create conflicts with pedestrian access between parking and building entrances.
- Vaults and utility boxes can be accommodated outside bioretention facilities and will not be placed within bioretention facilities.
- The visual impact of storm water facilities, including planter boxes at building foundations and any terracing or retaining walls required for the storm water control design, is shown in renderings and other architectural drawings.
- Landscaping plans, including planting plans, show locations of bioretention facilities, and the plant requirements are consistent with the engineered soils and conditions in the bioretention facilities.
- Renderings and representation of street views incorporate any storm water facilities located in street-side buffers and setbacks

### ► CONSTRUCTION PLAN SUSMP CHECKLIST

When you submit construction plans for City review and approval, the reviewer will compare that submittal with your earlier Project Submittal. By creating a Construction Plan SUSMP Checklist for your project, you can facilitate the reviewer's comparison and speed review of your project.

TABLE 3-2. Format for Construction Plan SUSMP Checklist.

| *SUSMP Page #* | *BMP Description* | *See Plan Sheet #s* |
|---|---|---|
| | | |
| | | |

Here's how:

4. Create a table similar to Table 3-2. Number and list each measure or BMP you have specified in your Project Submittal in Columns 1 and 2 of the table. Leave Column 3 blank. Incorporate the table into your Project Submittal.

5. When you submit construction plans, **duplicate the table** (by photocopy or electronically). Now fill in Column 3, identifying the plan sheets where the BMPs are shown. List all plan sheets on which the BMP appears. Submit the updated table with your construction plans.

Note that the updated table—or Construction Plan SUSMP Checklist—is **only a reference tool** to facilitate comparison of the construction plans to your Project Submittal. City Engineering staff can advise you regarding the process required to propose changes to your approved Project Submittal.

### ► CERTIFICATION

Your Project Submittal shall be certified by a registered civil engineer.

The certification should state: "The selection, sizing, and preliminary design of storm water treatment and other control measures in this plan meet the requirements of Regional Water Quality Control Board Order R9-2007-0001 and subsequent amendments."

### ► EXAMPLE PROJECT SUBMITTAL OUTLINE AND CONTENTS

**Check with City Engineering staff** for requirements specific to your project.

I. Project Setting

- A. Project Name, Location, Description of project activities
- B. Vicinity Map
- C. Existing site features and conditions
- D. Opportunities and constraints for storm water control
- E. Watershed(s), receiving water bodies, and water body impairments
- F. Pollutants of concern based on land use and downstream water body impairments
- G. Impacts to hydrologic regime

II. Low Impact Development Design Strategies

- A. Optimization of site layout
  - (1) Limitation of development envelope
  - (2) Preservation of natural drainage features
  - (3) Setbacks from creeks, wetlands, and riparian habitats
  - (4) Minimization of imperviousness
  - (5) Using drainage as a design element
- B. Use of permeable pavements
- C. Dispersal of runoff to pervious areas
- D. Use of Integrated Management Practices

III. Hydromodification Analysis

- A. Hydromodification Applicability
- B. Flow Control Performance Criteria

IV. Documentation of Drainage Design

- A. Drainage Management Areas
  - (1) Tabulation

(2) Descriptions

B. Integrated Management Practices

(1) Tabulation and Sizing Calculations

(2) Descriptions

V. Source Control Measures

A. Description of site activities and potential sources of pollutants

B. Table showing sources, permanent source controls, and operational source controls

VI. Facility Maintenance Requirements

A. Ownership and responsibility for maintenance in perpetuity.

(1) Commitment to execute any necessary agreements.

(2) Statement accepting responsibility for operation and maintenance of facilities until that responsibility is formally transferred.

B. Summary of maintenance requirements for each storm water facility.

VII. Construction Plan SUSMP Checklist

VIII. Certifications

IX. Attachment: SUSMP Exhibit (Site Map) clearly showing:

A. Entire property

B. Nearby water bodies and municipal storm drain inlets

C. Private storm drain systems

D. Drainage Management Areas

E. Integrated Management Practices

F. Source control measures and potential sources of pollutants

G. Any other proposed BMPs

### ► SPECIFIC PROJECT CONSIDERATIONS

Your submittal will reflect the unique character of your own project and should meet the requirements identified in this BMP manual. City Engineering staff can assist you to determine how specific requirements apply to your project.

Chapter 4

# Low Impact Development Design Guide

*Guidance for designing and documenting your LID site drainage, storm water treatment facilities, and flow-control facilities*

Follow the Low Impact Development (LID) design in this BMP manual to achieve compliance with the storm water treatment requirements as well as the LID requirements in the storm water NPDES permit. The City of La Mesa encourages the use of the design and documentation strategies outlined in this chapter. While other approaches may be used, they must be defensibly shown by the project proponent to meet or exceed the low impact development standards in this BMP Manual.

This will require careful documentation of:

- Pervious and impervious areas in the planned project.
- Drainage from each of these areas.
- Locations, sizes, and types of proposed treatment facilities.

Your Project Submittal must include calculations showing the site drainage and proposed LID treatment facilities meet the criteria in this BMP Manual.

This Low Impact Development Design Guide will help you:

- **Analyze your project** and identify and select options for implementing LID techniques to meet runoff treatment requirements—and flow-control requirements, if they apply.
- **Design and document drainage** for the whole site and document how that design meets this BMP Manual's storm water treatment criteria.
- **Specify preliminary design details** and integrate your LID drainage design with your paving and landscaping design.

Alternatives to LID design are discussed in the final section of this chapter.

## Analyze Your Project for LID

Conceptually, there are four LID strategies for managing runoff from buildings and paving:

1. **Optimize the site layout** by preserving natural drainage features and designing buildings and circulation to minimize the amount of roofs and paving.

2. **Use pervious surfaces** such as turf, gravel, or pervious pavement—or use surfaces that retain rainfall, such as vegetated roofs. All drainage from these surfaces is considered to be "self-retained" (a detailed definition corresponding to this concept is on page 67). No further management of runoff is necessary. An emergency overflow should be provided for extreme events.

3. **Disperse runoff** from impervious surfaces on to adjacent pervious surfaces (e.g., direct a roof downspout to disperse runoff onto a lawn).

4. Drain impervious surfaces to engineered **Integrated Management Practices** (IMPs), such as bioretention facilities, planter boxes, cisterns, or dry wells. IMPs infiltrate runoff to groundwater and/or percolate runoff through engineered soil and allow it to drain away slowly. Depending on site conditions and local regulations, it may be possible to harvest and reuse rainwater in conjunction with IMPs.

A combination of two or more strategies may work best for your project. With forethought in design, the four strategies can provide multiple, complementary benefits to your development. Pervious surfaces reduce heat island effects and temperature extremes. Landscaping improves air quality, creates a better place to live or work, and upgrades value for rental or sale. Retaining natural hydrology helps preserve and enhance the natural character of the area. LID drainage design can also conserve water and reduce the need for drainage infrastructure.

Table 4-1 includes ideas for applying LID strategies to site conditions and types of development.

TABLE 4-1. Ideas for Runoff Management

| Site Features and Design Objectives | Vegetated Roof | Self-retaining Areas | Pervious Pavement | Bioretention Facility | Flow-through Planter | Dry Well | Cistern with bioretention |
|---|---|---|---|---|---|---|---|
| Clayey native soils | ✓ | | | ✓ | ✓ | | ✓ |
| Permeable native soils | ✓ | | ✓ | ✓ | ✓ | ✓ | |
| Very steep slopes | ✓ | | | | ✓ | | |
| Shallow groundwater | ✓ | | | | ✓ | | |

### ► OPTIMIZE THE SITE LAYOUT

To minimize storm water-related impacts, apply the following design principles to the layout of newly developed and redeveloped sites.

**Conserve natural areas, soils, and vegetation.** Define the development envelope and protected areas, identifying areas that are most suitable for development and areas that should be left undisturbed. Use the following guideline to determine the least sensitive areas of the site, in order of increasing sensitivity:

1. Areas devoid of vegetation, including previously graded areas and agricultural fields.
2. Areas of non-native vegetation, disturbed habitats, and eucalyptus woodlands where receiving waters are not present.
3. Areas of chamise or mixed chaparral, and non-native grasslands.
4. Areas containing coastal scrub communities.
5. All other upland communities.
6. Occupied habitat of sensitive species and all wetlands.

Within each of the previous categories, hillside areas should be considered more sensitive than flatter areas.

**Coordination**
Chapter One includes a presentation of how review of your project's site design and landscape design is coordinated with review for compliance with storm water NPDES requirements.

Where possible, conform the site layout along natural landforms, avoid excessive grading and disturbance of vegetation and soils, and replicate the site's natural drainage patterns. Set back development from creeks, wetlands, and riparian habitats. Preserve significant trees, especially native trees and shrubs, and identify locations for planting additional native or drought tolerant trees and large shrubs. Concentrate development on portions of the site with less permeable soils, and preserve areas that can promote infiltration.

For all types of development, **limit overall coverage** of paving and roofs. Where allowed by La Mesa zoning and design standards—and provided public safety and a walkable environment are not compromised—this can be accomplished by designing compact, taller structures, narrower and shorter streets and sidewalks, smaller parking lots (fewer stalls, smaller stalls, and more efficient lanes), and indoor or underground parking. Examine site layout and circulation patterns and identify areas where landscaping can be substituted for pavement.

**Detain and retain runoff throughout the site.** On flatter sites, it typically works best to intersperse landscaped areas and IMPs among the buildings and paving. On hillside sites, drainage from upper areas may be collected in conventional catch basins and piped to landscaped areas and IMPs in lower areas.

**Use drainage as a design element.** Use depressed landscape areas, vegetated buffers, and bioretention areas as amenities and focal points within the site and landscape design. Bioretention areas can be almost any shape and should be located at low points. Bioretention areas shaped as swales can detain and treat low runoff flows and also convey higher flows.

### ► USE PERVIOUS SURFACES

**Consider a vegetated roof.** Although not yet widely used in California, vegetated or "green" roofs are growing in popularity. Potential benefits include longer roof life, lower heating and cooling costs, and better sound insulation, in addition to air quality and water quality benefits. For SUSMP compliance purposes, vegetated roofs are considered not to produce increased runoff or runoff pollutants (i.e., any runoff from a vegetated roof requires no further treatment or detention). For more information on vegetated roofs, see www.greenroofs.org.

**Consider permeable pavements and surface treatments.** Inventory paved areas on your preliminary site plan. Identify where permeable pavements, such as crushed aggregate, turf block, unit pavers, pervious concrete, or pervious asphalt could be substituted for impervious concrete or asphalt paving.

### ► DISPERSE RUNOFF TO ADJACENT PERVIOUS AREAS

Look for opportunities to direct runoff from impervious areas to adjacent landscaping. The design, including slopes and soils, must reflect a reasonable expectation that an inch of rainfall will soak into the soil and produce no runoff. For example, a lawn or garden depressed 3-4" below surrounding walkways or driveways provides a simple but functional landscape design element.

For sites subject to storm water treatment requirements only, a 2:1 maximum ratio of impervious to pervious area is acceptable. Be sure soils will drain adequately.

Under some circumstances, it may be allowable to direct runoff from impervious areas to pervious pavement (for example, from roof downspouts to a parking lot paved with crushed aggregate or turf block). The pore volume of pavement and base course must be sufficient to retain an inch of rainfall, including runoff from the tributary area. The slopes and soils must be compatible with infiltrating that volume without producing runoff.

### ► DIRECT RUNOFF TO INTEGRATED MANAGEMENT PRACTICES

Design criteria have been developed for the following IMPs:

- **Bioretention facilities**, which can be configured as swales, free-form areas, or planters to integrate with your landscape design.
- **Flow-through planters**, which can be used near building foundations and other locations where infiltration to native soils is not desired.
- **Dry wells** and other infiltration facilities, which can be used only where soils are permeable.
- **Cisterns or vaults**, in combination with a bioretention facility.

See the design sheets in Appendix B.

It may be possible to create a site-specific design that uses cisterns to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Such a design could expand the multiple benefits of LID to include water conservation. Keep in mind:

- Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8 below. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse.

- Storage of water for longer than minimum standards set forth by the City of La Mesa (72 hours) creates the potential for mosquito harborage. Cisterns and vaults must be designed to prevent entry by mosquitoes.

- Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

Some references and resources for water harvesting appear at the end of this chapter.

Finding the right location for treatment facilities on your site involves a careful and creative integration of several factors:

- To make the most efficient use of the site and to maximize aesthetic value, **integrate IMPs with site landscaping**. Zoning codes may require landscape setbacks or buffers, or may specify that a minimum portion of the site be landscaped. It may be possible to locate some or all of your site's treatment and flow-control facilities within this same area, or within utility easements or other non-buildable areas.

- Planter boxes and bioretention areas must be **level or nearly level** all the way around. Bioretention areas configured as swales may be gently sloped in the linear direction, but opposite sides must be at the same elevation.

- For effective, low-maintenance operation, **locate facilities so drainage into and out of the device is by gravity flow.** Pumped systems are feasible, but are expensive, require more maintenance, are prone to untimely failure, and can cause mosquito control problems.

- If the property is being subdivided now or in the future, the facility should be in a **common, accessible area.** In particular, avoid locating facilities on private residential lots. Even if the facility will serve only one site owner or operator, make sure the facility is located for ready access by inspectors from the City of La Mesa and local vector control agency.

- The facility must be accessible to equipment needed for its maintenance. **Access requirements for maintenance** will vary with the type of facility selected. Planter

boxes and bioretention areas will typically need access for the same types of equipment used for landscape maintenance.

To complete your analysis, include in your Project Submittal a brief **narrative** documenting the site layout and site design decisions you made. This will provide background and context for how your design meets the quantitative LID design criteria.

## Develop and Document Your Drainage Design

The **design documentation procedure** begins with careful delineation of pervious areas and impervious areas (including roofs) throughout the site. The procedure accounts for how runoff from each delineated area is managed. For areas draining to IMPs, the procedure ensures each IMP is appropriately sized.

The procedure results in a space-efficient, cost-efficient LID design for meeting SUSMP requirements on most residential and commercial/industrial developments. The procedure arranges documentation of drainage design and IMP sizing in a consistent format for presentation and review.

This procedure is intended to facilitate, not substitute for, creative interplay among site design, landscape design, and drainage design. **Several iterations may be needed** to optimize your drainage design as well as aesthetics, circulation, and use of available area for your site.

You should be able to complete the needed calculations using only the project's site development plan.

### ► STEP 1: DELINEATE DRAINAGE MANAGEMENT AREAS

This is the key first step. You must divide the **entire project area** into individual, discrete Drainage Management Areas (DMAs). Typically, lines delineating DMAs follow grade breaks and roof ridge lines. The Exhibit, tables, text, and calculations in your Project Submittal will illustrate, describe, and account for runoff from each of these areas.

Use separate DMAs for each surface type (e.g., landscaping, pervious paving, or roofs). Each DMA must be assigned a single hydrologic soil group. Assign each DMA an identification number and determine its size in square feet.

### ► STEP 2: CLASSIFY DMAS AND DETERMINE RUNOFF FACTORS

Next, determine how drainage from each DMA will be handled. Each DMA will be one of the following four types:

1. Self-treating areas.
2. Self-retaining areas (also called "zero-discharge" areas).
3. Areas that drain to self-retaining areas.
4. Areas that drain to IMPs.

**Self-treating areas** are landscaped or turf areas that do not drain to IMPs, but rather drain directly off site or to the storm drain system. Examples include upslope undeveloped areas which are ditched and drained around a development and grassed slopes which drain off-site to a street or storm drain. In general, self-treating areas include no impervious areas, unless the impervious area is very small (5 percent or less) in relationship to the receiving pervious area and slopes are gentle enough to ensure runoff will be absorbed into the vegetation and soil. Criteria for self-treating areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

**Rationale**

Pollutants in rainfall and windblown dust will tend to become entrained in the vegetation and soils of landscaped areas, so no additional treatment is needed. It is assumed the self-treating landscaped areas will produce runoff less than or equal to the pre-project site condition.

FIGURE 4-1. Self-treating areas are entirely pervious and drain directly off-site or to the storm drain system.

**Self-retaining areas** are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that a one-inch rainfall event would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Specify slopes, if any, toward the center of the pervious area. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

Criteria for self-retaining areas are in the design sheet "Self Treating and Self-Retaining Areas" in Appendix B.

FIGURE 4-2. Self-retaining areas. Berm or depress the grade to retain at least an inch of rainfall and set inlets of any area drains at least 3 inches above low point to allow ponding.

**Areas draining to self-retaining areas.** Runoff from impervious or partially pervious areas can be managed by routing it to self-retaining pervious areas. For example, roof downspouts can be directed to lawns, and driveways can be sloped toward landscaped areas. The maximum ratio is 2 parts impervious area for every 1 part pervious area.

FIGURE 4-3. Relationship of impervious to pervious area for self-retaining areas.
Ratio: ***pervious ≥ ½ impervious***

The drainage from the impervious area must be directed to and dispersed within the pervious area, and the entire area must be designed to retain an inch of rainfall without flowing off-site. For example, if the maximum ratio of 2 parts impervious area into 1 part pervious area is used, then the pervious area must absorb 3 inches of water over its surface before over-flowing to an off-site drain.

A partially pervious area may be drained to a self-retaining area. For example, a driveway composed of unit pavers may drain to an adjacent lawn. In this case, the maximum ratios are:

(Runoff factor) x (tributary area) ≤ 2 x (self-retaining area) *Equation 4-1*

Use the runoff factors in Table 4-2.

Prolonged ponding is a potential problem at higher impervious/pervious ratios. In your design, ensure that the pervious area soils can handle the additional run-on and are sufficiently well-drained.

Under some circumstances, pervious pavement (e.g., crushed stone, pervious asphalt or pervious concrete) can be self-retaining. Adjacent roofs or impervious pavement may drain on to the pervious pavement in the same maximum ratios as described above.

To design a pervious pavement to be a self-treating area, ensure:

- The gravel base course is a minimum of four or more inches deep.
- The base course is not to be underdrained.
- A qualified engineer has been consulted regarding infiltration rates, pavement stability, and suitability for the intended traffic.

**Runoff from self-treating and self-retaining areas does not require any further treatment or flow control.**

TABLE 4-2. Example Runoff Factors for Surfaces Draining to IMPs.

| Surface | Factor |
|---|---|
| Roofs | 1.0 |
| Concrete | 1.0 |
| Pervious Concrete | 0.1 |
| Porous Asphalt | 0.1 |
| Grouted Unit Pavers | 1.0 |
| Solid Unit Pavers on granular base, min. 3/16 inch joint space | 0.2 |
| Crushed Aggregate | 0.1 |
| Turfblock | 0.1 |
| Amended, mulched soil | 0.1 |
| Landscape | 0.1 |

**Areas draining to IMPs** are multiplied by a sizing factor to calculate the required size of the IMP. On most densely developed sites—such as commercial and mixed-use developments and small-lot residential subdivisions—most DMAs will drain to IMPs.

More than one drainage area can drain to the same IMP. However, because the minimum IMP sizes are determined by ratio to drainage area size, a drainage area may not drain to more than one IMP. See Figures 4-4 and 4-5.

FIGURE 4-4. More than one Drainage Management Area can drain to a single IMP.

FIGURE 4-5. One Drainage Management Area cannot drain to more than one IMP. Use a grade break to divide the DMA.

Where possible, design site drainage so **only impervious roofs and pavement** drain to IMPs. This yields a simpler, more efficient design and also helps protect IMPs from becoming clogged by sediment.

If it is necessary to include turf, landscaping, or pervious pavements within the area draining to an IMP, list each surface as a separate DMA. A runoff factor (similar to a "C" factor used in the rational method) is applied to account for the reduction in the quantity of runoff. For example, when a turf or landscaped drainage management area drains to an IMP, the resulting increment in IMP size is:

$$\Delta \text{ (Area)} = \text{(pervious area)} \times \text{(runoff factor)} \times \text{(sizing factor)}.$$

Use the runoff factors in Table 4-2.

### ► STEP 3: TABULATE DRAINAGE MANAGEMENT AREAS

- Tabulate self-treating areas in the format shown in Table 4-3.
- Tabulate self-retaining areas in the format shown in Table 4-4.
- Tabulate areas draining to self-retaining areas in the format shown in Table 4-5. Check to be sure the total product of (square feet of tributary area × runoff factor) for all DMAs draining to a receiving self-retaining area is no greater than a 2:1 ratio to the square footage of the receiving self-retaining area itself.

- Compile a list of DMAs draining to IMPs. Proceed to Step 4 to check the sizing of the IMPs.

TABLE 4-3. Format for Tabulating Self-Treating Areas

| DMA Name | Area (square feet) |
|---|---|
| | |

TABLE 4-4. Format for Tabulating Self-Retaining Areas

| DMA Name | Area (square feet) |

| | |

TABLE 4-5. Format for Tabulating Areas Draining to Self-Retaining Areas

| DMA Name | Area (square feet) | Post-project surface type | Runoff factor | Receiving self-retaining DMA | Receiving self-retaining DMA Area (square feet) |
|---|---|---|---|---|---|
| | | | | | |

### ► STEP 4: SELECT AND LAY OUT IMPS ON SITE PLAN

Select from the list of IMPs in Table 4-6. Illustrations, designs, and design criteria for the IMPs are in the "IMP Design Details and Criteria" at the end of this chapter.

Once you have laid out the IMPs, calculate the square footage you have set aside on your site plan for each IMP.

### ► STEP 5: REVIEW SIZING FOR EACH IMP

For each of the IMPs, use the appropriate "water quality only" sizing from Table 4-6. Sizing factors for integrated facilities that provide both water quality treatment and hydromodification flow control may be obtained using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H).

TABLE 4-6. "Water Quality Only" Sizing Factors

| | |
|---|---|
| Bioretention Facilities | Sizing Factor for Area = 0.04 |
| Flow-through Planters | Sizing Factor for Area = 0.04 |
| Dry Well or Infiltration Basin | See Step 6 to Calculate Min. Volume |
| Cistern/Vault with Bioretention | See Step 6 to Calculate Min. Volume of Cistern or Vault; then use 0.04 to calculate minimum size of bioretention area |

$Q_{10}$ = 10-year pre-project flow rate based upon partial duration analysis of long-term hourly rainfall records

A = Surface area sizing factor

$V_1$ = Surface volume sizing factor

$V_2$ = Subsurface volume sizing factor

Note: The Oceanside Rain Gauge was selected for use in La Mesa based on rain basin analysis performed by the consultant team for the San Diego regional Storm Water Co-permitees. The analysis took into account average annual rainfall, proximity, elevation, and data availability.

### ► STEP 6: CALCULATE MINIMUM AREA AND VOLUME OF EACH IMP

The minimum area of bioretention facilities and flow-through planters is found by summing up the contributions of each tributary DMA and multiplying by the adjusted sizing factor for the IMP. Note that if the IMP is designed to provide hydromodification flow control, then sizing factors from the using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used in lieu of the "water quality only" sizing factors presented in Table 4-6.

*Equation 4-7*

$$Min.\,IMP\,Area = \sum \begin{pmatrix} DMA & DMA \\ Square & \times Runoff \\ Footage & Factor \end{pmatrix} \times \begin{pmatrix} IMP \\ Sizing \\ Factor \end{pmatrix}$$

Use the format of Table 4-12 to present the calculations of the required minimum area and volumes for **bioretention areas** and **planter boxes**:

TABLE 4-12. Format for Presenting Calculations of Minimum IMP Areas for Bioretention Areas and Planter Boxes.

| DMA Name | DMA Area (square feet) | Post-project surface type | DMA Runoff factor | DMA Area × runoff factor | Soil Type: | IMP Name | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | |
| | | | | | IMP Sizing factor (WQ only) | | Minimum Area | Proposed Area | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | | | | | |
| | | | *Total* | | *0.04* | | | | *IMP Area* |

To size **dry wells**, **infiltration basins**, or **infiltration trenches for the "water quality only" treatment option**, use the following procedure:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the minimum unit volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the facility. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the minimum unit volume.

*Equation 4-8*

$$Volume = [Tributary\ Area] \times [weighted\ runoff\ \ factor] \times [unit\ volume]$$

4. Select a facility depth.
5. Determine the required facility area. Dry wells may be designed as an open vault or with rock fill. If rock fill is used, assume a porosity of 40%.
6. Ensure the facility can infiltrate the entire volume within 72 hours, or the minimum drawdown time determined by the City.

To size a **cistern or vault in series with a bioretention facility (criteria below for "water quality**:

1. Use Equation 4-12 to calculate the required cistern or vault volume.
2. Design a discharge orifice for a drawdown time of 24 hours.
3. Determine the maximum discharge from the orifice.
4. The minimum area of the bioretention facility must treat this flow based on a percolation rate of 5" per hour through the engineered soil.

If a facility is designed to provide both water quality treatment and hydromodification flow control, using the BMP Sizing Calculator, BMP sizing factor tables, or other methods outlined in Chapter 1 of this document or in the Final HMP (Appendix H) may be used to determine the appropriate sizing factors for the IMP design.

#### ► STEP 7: DETERMINE IF AVAILABLE SPACE FOR IMP IS ADEQUATE

Sizing and configuring IMPs may be an iterative process. After computing the minimum IMP area using Steps 1 – 6, review the site plan to determine if the reserved IMP area is sufficient. If so, the planned IMPs will meet the SUSMP sizing requirements. If not, revise the plan accordingly. Revisions may include:

- Reducing the overall imperviousness of the project site.
- Changing the grading and drainage to redirect some runoff toward other IMPs which may have excess capacity.
- Making tributary landscaped DMAs self-treating or self-retaining.
- Expanding IMP surface area.

### ► STEP 8: COMPLETE YOUR SUMMARY REPORT

Present your IMP sizing calculations in tabular form. Adapt the following format as appropriate to your project. Coordinate your presentation of DMAs and calculation of minimum IMP sizes with the Project Submittal drawing (labeled to show delineation of DMAs and locations of IMPs). It is also helpful to incorporate a brief description of each DMA and each IMP.

Sum the total area of all DMAs and IMPs listed and show it is equal to the total project area. This step may include adjusting the square footage of some DMAs to account for area used for IMPs.

*Format:*

Project Name:

Project Location:

APN or Subdivision Number:

Total Project Area (square feet):

Mean Annual Precipitation at Project Site:

I. Self-treating areas:

| DMA Name | Area (square feet) |
|---|---|
| | |

II. Self-retaining areas:

| DMA Name | Area (square feet) |
|---|---|
| | |

III. Areas draining to self-retaining areas:

| DMA Name | Post-project surface type | Runoff factor | Area (square feet) | Receiving self-retaining DMA | Receiving self-retaining DMA Area (square feet) |
|---|---|---|---|---|---|
| | | | | | |

IV. Areas draining to IMPs (repeat for each IMP):

| DMA Name | DMA Area (square feet) | Post-project surface type | DMA Runoff factor | DMA Area × runoff factor | Soil Type: | IMP Name | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | | |
| | | | | | | | | | |
| | | | | | IMP Sizing factor | | Minimum Area or Volume | Proposed Area or Volume | |
| | | | | | | | | | |
| | | | | *Total* | | | | | *IMP Area* |

## Specify Preliminary Design Details

In your Project Submittal, describe your IMPs in sufficient detail to demonstrate the area, volume, and other criteria of each can be met within the constraints of the site.

Ensure these details are consistent with preliminary site plans, landscaping plans, and architectural plans submitted with your application for planning and zoning approvals.

Appendix B includes design sheets for:

- Self-treating and self-retaining areas
- Pervious pavements
- Bioretention facilities
- Flow-through planter
- Dry wells and infiltration basins
- Cistern or vault with bioretention facility

These design sheets include recommended configurations and details, and example applications, for these IMPs. **The information in these design sheets must be adapted and applied to the**

**conditions specific to the development project such as unstable slopes or the lack of available head. Designated municipal staff have final review and approval authority over the project design.**

Keep in mind that proper and functional design of the IMP is the responsibility of the applicant. Effective operation of the IMP throughout the project's lifetime will be the responsibility of the property owner.

## Alternatives to Integrated LID Design

If you believe design of features and facilities as described above is infeasible for your development site, consult with Engineering staff before preparing an alternative design for storm water treatment, flow control, and LID compliance.

For all alternative designs, the applicant must prepare a complete Project Submittal, including a drawing showing the entire site divided into discrete Drainage Management Areas, text and tables showing how drainage is routed from each DMA to a treatment facility, and calculations demonstrating that the design achieves the applicable design criteria for each storm water treatment facility. Alternative treatment facilities are limited to the circumstances and selection criteria identified beginning on page 39. The Project Submittal must also show how the project meets the minimum LID criteria (page 43) and ensures runoff rates, durations, and velocities are controlled to maintain or reduce downstream erosion conditions and protect stream habitat (NPDES Permit Provision D.1.d.(10)).

### ► DESIGN OF ALTERNATIVE TREATMENT FACILITIES

Here are criteria and design considerations for some alternative treatment facilities, also known as treatment control BMPs:

**Sand Filters.** To ensure effectiveness is not compromised by compacting or clogging of the filter surface, sand filters must be maintained frequently.

The following criteria apply to sand filters:

- Calculate the design flow using the rational method with an intensity of 0.2"/hour and the "C" factors for "treatment only" from Table 4-2.
- To determine the required filter surface area, divide the design flow by an allowable design surface loading rate of 5"/hour.
- The minimum depth of filter media is 18". The media should be washed sand, with gradation similar to that specified for fine aggregate in ASTM C-33.
- The entire filter area must be accessible for easy maintenance without the need to enter a confined space.

A typical filter design includes a gravel drain layer and a perforated pipe underdrain. Filter fabric may be used to prevent the filter media from entering the gravel layer.

The design should not include any permanent pool or other standing water. Instead of including a pretreatment basin, consider the following features in the area tributary to the filter to reduce the potential for filter clogging:

- Limit the size of the Drainage Management Area.
- Include only impervious areas in the DMA.
- Stabilize slopes and eliminate sources of sediment in the DMA.
- Provide screens for trash and leaves at storm drain inlets (if allowed by the City of La Mesa).

For additional design considerations and details, see *Design of Stormwater Filtering Systems* by Richard A. Claytor and Thomas R. Schueler, The Center for Watershed Protection, 1996, and *California Stormwater BMP Handbooks* Fact Sheet TC-40, Media Filter.

Sand filters do not provide adequate hydromodification flow controls.

**Extended ("Dry") Detention Basins.** The required detention volume for water quality treatment is based on the 85$^{th}$ percentile 24-hour storm depth. The steps to calculate the required detention volume are:

1. Use the County of San Diego's 85th Percentile Isopluvial Map to determine the unit basin volume.
2. Determine the weighted runoff factor ("C" factor) for the area tributary to the basin. The factors in Table 4-2 may be used.
3. Multiply the weighted runoff factor times the tributary area times the unit basin volume.

For maximum effectiveness the basin should not be sized substantially larger than this volume. If the basin is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the basin meets peak flow and flow duration criteria.

For design considerations and details, see the *California Stormwater Best Management Practice Handbooks*, Fact Sheet TC-22, "Extended Detention Basins." The basin outlet should be designed for a 24-hour drawdown time.

As noted in Fact Sheet TC-22, "dry" detention basins may not be practicable for drainage areas less than 5 acres. The potential for mosquito harborage is a concern. In the design, do not create any areas that will hold standing water for 72 hours or more, the maximum drawdown time as determined by the City of La Mesa.

**"Wet" Detention Ponds and Constructed Wetlands.** The required water quality detention volume is determined as with a "dry" detention basin. If the pond is to be used for hydromodification flow control, then the BMP Sizing Calculator pond sizer or a continuous simulation model must be used to prove the pond meets peak flow and flow duration criteria. Before proceeding with design, contact the local mosquito control agency to coordinate the design and plan ongoing inspection and maintenance of the facility for mosquito control. For design considerations and details, see the *California Stormwater Best Management Practices Handbooks*, Fact Sheet TC-20, "Wet Ponds," and Fact Sheet TC-21, "Constructed Wetlands."

**Vegetated Swales.** Design recommendations for conventional vegetated swales are in the *California Stormwater Best Management Practices Handbooks*. The conventional swale design uses available on-site soils and does not include an underdrain system. Where soils are clayey, there is little infiltration. Treatment occurs as runoff flows through grass or other vegetation before exiting at the downstream end. Recommended detention times are on the order of 10 minutes. It should be noted that such designs likely would not provide the required hydromodification flow control.

Conventional vegetated swales may be used to meet NPDES permit treatment requirements and LID requirements (see page 39). The following should be incorporated in the design:

- Determine the weighted runoff factor ("C" factor) for the area tributary to the swale. The factors in Table 4-2 may be used.
- Calculate the design flow by multiplying the weighted runoff factor times the tributary area times either (1) 0.2 inches of rainfall per hour, or (2) twice the 85$^{th}$ percentile hourly rainfall intensity.
- When sizing the swale, use a value of 0.25 for Manning's "n".
- Ensure that all flow enters the swale near its highest point and that no flow short-circuits treatment by entering the swale along its length.
- The swale should be a minimum 100 feet in length.
- Longitudinal slopes should not exceed 2.5%; on flatter slopes, incorporate measures to avoid prolonged surface ponding.

Consider using linear-shaped bioretention areas in place of conventional vegetated swales because:

- Conventional swale design has resulted in standing water and associated nuisances.
- Conventional swales often don't obtain even the design residence time because of the length required and because proper design requires runoff enter the swale at the upstream end rather than at various locations along its length, and
- Bioretention areas provide a more flexible drainage design, more effective practicable treatment, and more effective flow control within the same footprint.

In the western part of San Diego County (west of the Pacific Ocean drainage divide), rock swales would not generally provide adequate water quality treatment. In the eastern portion of the County, rock swales could potentially be used as part of the water quality treatment design given the prevalence of high-infiltration sandy soils and the harsh climatic conditions which prevent vegetation establishment. Implementation of rock swales would require approval from the City. The design of vegetated strips, potentially allowed by the City on a case-by-case basis, should follow Caltrans design guidance.

### ► TREATMENT FACILITIES FOR SPECIAL CIRCUMSTANCES

Higher-rate surface filters and vault-based proprietary filters can only be used in the circumstances described beginning on page 39 and when sand filters, extended "dry" detention basins, and "wet" detention ponds or constructed wetlands have been found infeasible.

For surface filters, the grading and drainage design should minimize the area draining to each unit and maximize the number of discrete drainage areas and units. Proprietary facilities should be installed consistent with the manufacturer's instructions. It should be noted that such designs likely would not provide the required hydromodification flow control.

Chapter 5

# Operation & Maintenance of Storm Water Facilities

*How to prepare a customized Storm Water Maintenance Plan for the treatment BMPs on your site.*

The storm water NPDES Permit requires the City of La Mesa to verify all treatment and flow-control facilities are adequately maintained. Note that treatment facilities include both LID IMPs and treatment control BMPs. Facilities you install as part of your project will be verified for effectiveness and proper performance. The City of La Mesa may also verify the ongoing function of storm water management features that are not treatment or flow control facilities, such as permeable pavements and limitations on impervious area.

Operation and maintenance of storm water facilities is a six-stage process:

1. Determine **who will own** the facility and be responsible for the maintenance of treatment facilities. Identify the means by which ongoing maintenance will be assured (for example, a maintenance agreement that runs with the land).

2. Identify typical maintenance requirements, and allow for these requirements in your project planning and preliminary design.

3. Prepare a **maintenance plan** for the site incorporating detailed requirements for **each treatment and flow-control facility**.

4. **Maintain** the facilities from the time they are constructed until ownership and maintenance responsibility is formally transferred.

5. **Formally transfer** operation and maintenance **responsibility** to the site owner or occupant. A warranty, secured by a bond, or other financial instrument, may be required to secure against lack of performance due to flaws in design or construction.

6. Maintain the facilities in perpetuity and comply with self-inspection, reporting, and verification requirements.

See the schedule for these stages in Table 5-1.

## Stage 1: Ownership and Responsibility

You must specify a means to **ensure maintenance** of treatment and flow-control facilities **in perpetuity.**

Depending on the intended use of your site, this will require one or more of the following:

- Project proponent agreement to maintain storm water BMPs: The City may enter into a contract with the project proponent obliging the project proponent to maintain, repair, and replace the storm water BMP as necessary into perpetuity. Security may be required.

- Assessment districts: The City may approve an Assessment District or other funding mechanism proposed by the project proponent to provide funds for storm water BMP maintenance, repair, and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

- Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City may assure storm water BMP maintenance, repair, and replacement through conditions in the lease.

- Public entity maintenance: The City may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the permanent treatment BMP. Unless acceptable to the City, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City may seek protection from liability by appropriate releases and indemnities. The City shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The City must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

The City may accept alternative maintenance mechanisms if such mechanisms are as protective as those listed above.

Ownership and maintenance responsibility for treatment and flow-control facilities should be discussed at the **beginning of project planning**, typically at the pre-application meeting for

planning and zoning review. Experience has shown provisions to finance and implement maintenance of treatment and flow-control facilities can be a major stumbling block to project approval, particularly for **small residential subdivisions**. (See "New Subdivisions" in Chapter 1.)

### ► PRIVATE OWNERSHIP AND MAINTENANCE

The City of La Mesa requires—as a condition of project approval—that a maintenance agreement be executed.

TABLE 5-1. Schedule for Planning Operation and Maintenance of Storm Water Treatment BMPs

| *Stage* | *Description* | *Schedule* |
|---|---|---|
| 1 | Determine facility ownership and maintenance responsibility | Discuss with planning staff at pre-application meeting |
| 2 | Identify typical maintenance requirements | In initial submittal, coordinate with planning & zoning application |
| 3 | Develop detailed operation and maintenance plan | Provided with Project Submittal, and updated as necessary if any information changes prior to Stage 5. |
| 4 | Interim operation and maintenance of facilities | During and following construction including warranty period |
| 5 | Formal transfer of operation & maintenance responsibility | On sale and transfer of property or permanent occupancy |
| 6 | Ongoing maintenance and compliance with inspection & reporting requirements | In perpetuity |

These agreements could provide that the City of La Mesa may collect a management and/or inspection fee established by a standard fee schedule, as applicable. In addition, the agreement may provide that, if the property owner fails to maintain the storm water facility, the City may enter the property, restore the storm water facility to good working order, and obtain reimbursement, including administrative costs, from the property owner.

### ► TRANSFER TO PUBLIC OWNERSHIP

The City of La Mesa may sometimes choose to have a treatment and flow-control facility deeded to the public, in fee or as an easement, and maintain the facility as part of the municipal storm drain system. The City may recoup the costs of maintenance through a special tax, assessment district, or similar mechanism.

Locating an IMP in a public right-of-way or easement creates an additional design constraint—along with hydraulic grade, aesthetics, landscaping, and circulation. However, because sites typically drain to the street, it may be possible to locate a bioretention swale parallel with the edge of the parcel. The facility may complement, or substitute for, an underground storm drain system.

Even if the facility is to be transferred to the City of La Mesa after construction is complete, it is still the responsibility of the builder to identify general operation and maintenance requirements, prepare a detailed operation and maintenance plan, and to maintain the facility until that responsibility is formally transferred.

## Stage 2: General Maintenance Requirements

Include in your Project Submittal a general description of anticipated facility maintenance requirements. This will help ensure that:

- Ongoing costs of maintenance have been considered in your facility selection and design.
- Site and landscaping plans provide for access for inspections and by maintenance equipment.
- Landscaping plans incorporate irrigation requirements for facility plantings.
- Initial maintenance and replacement of facility plantings is incorporated into landscaping contracts and guarantees.

Fact sheets available on the Project Clean Water web page describe general maintenance requirements for the types of storm water facilities featured in the LID Design Guide (Chapter 4). You can use this information to specify general maintenance requirements in your Project Submittal.

Maintenance fact sheets for conventional storm water facilities are available in the California Stormwater BMP Handbooks.

## Stage 3: Detailed Maintenance Plan

Prepare a detailed maintenance plan and submit it as required by the City of La Mesa. A detailed maintenance plan must be included with the initial Project Submittal; however the maintenance plan may later be updated to incorporate solutions to any problems or changes that occurred during project construction.

Your detailed maintenance plan should be kept on-site for use by maintenance personnel and during site inspections. It is also recommended that a copy of your initial Project Submittal be kept onsite as a reference.

### ► YOUR DETAILED MAINTENANCE PLAN: STEP BY STEP

The following step-by-step guidance will help you prepare your detailed maintenance plan.

Preparation of the plan will require familiarity with your storm water facilities as they have been or will be constructed and a fair amount of "thinking through" plans for their operation and maintenance.

### ► STEP 1: DESIGNATE RESPONSIBLE INDIVIDUALS

To begin creating your detailed maintenance plan, designate and identify:

- The individual who will have direct responsibility for the maintenance of storm water controls. This individual should be the designated contact with City inspectors and should sign self-inspection reports and any correspondence with the City of La Mesa regarding verification inspections.
- Employees or contractors who will report to the designated contact and are responsible for carrying out BMP operation and maintenance.
- The corporate officer authorized to negotiate and execute any contracts that might be necessary for future changes to operation and maintenance or to implement remedial measures if problems occur.
- Your designated respondent to problems, such as clogged drains or broken irrigation mains, that would require immediate response should they occur during off-hours.

**Updated contact information must be provided to the City of La Mesa immediately whenever a property is sold and whenever designated individuals or contractors change.**

Draw or sketch an **organization chart** to show the relationships of authority and responsibility between the individuals responsible for maintenance. This need not be elaborate, particularly for smaller organizations.

Describe how **funding for BMP operation and maintenance** will be assured, including sources of funds, budget category for expenditures, process for establishing the annual maintenance budget, and process for obtaining authority should unexpected expenditures for major corrective maintenance be required.

Describe how your organization will accommodate initial **training** of staff or contractors regarding the purpose, mode of operation, and maintenance requirements for the storm water facilities on your site. Also, describe how your organization will ensure ongoing training as needed and in response to staff changes.

### ► STEP 2: SUMMARIZE DRAINAGE AND BMPS

Incorporate the following information from your Project Submittal into your maintenance plan:

- Figures delineating and designating pervious and impervious areas.
- Figures showing locations of storm water facilities on the site.
- Tables of pervious and impervious areas served by each facility.

Review the Project Submittal narrative, if any, that describes each facility and its tributary drainage area and update the text to incorporate any changes that may have occurred during planning and zoning review, building permit review, or construction. Incorporate the updated text into your maintenance plan.

### ► STEP 3: DOCUMENT FACILITIES "AS BUILT"

Include the following information from final construction drawings:

- Plans, elevations, and details of all facilities. Annotate if necessary with designations used in the initial Project Submittal.
- Design information or calculations submitted in the detailed design phase (i.e., not included in the initial Project Submittal.)
- Specifications of construction for facilities, including sand or soil, compaction, pipe materials and bedding.

In the maintenance plan, note field changes to design drawings, including changes to any of the following:

- Location and layouts of inflow piping, flow splitter boxes, and piping to off-site discharge
- Depths and layering of soil, sand, or gravel
- Placement of filter fabric or geotextiles
- Changes or substitutions in soil or other materials.
- Natural soils encountered (e.g., sand or clay lenses)

### ► STEP 4: PREPARE MAINTENANCE PLANS FOR EACH FACILITY

Prepare a maintenance plan, schedule, and inspection checklists (routine, annual, and after major storms) for each facility. Plans and schedules for two or more similar facilities on the same site may be combined.

Use the following resources to prepare your customized maintenance plan, schedule, and checklists.

- Specific information noted in Steps 2 and 3, above.
- Other input from the facility designer, municipal staff, or other sources.
- Operation and Maintenance Fact Sheets (available on the Project Clean Water website).

Note any particular characteristics or circumstances that could require attention in the future, and include any troubleshooting advice.

Also include manufacturer's data, operating manuals, and maintenance requirements for any:

- Pumps or other mechanical equipment.
- Proprietary devices used as BMPs.

Manufacturers' publications should be referenced in the text (including models and serial numbers where available). Copies of the manufacturers' publications should be included as an attachment in the back of your maintenance plan or as a separate document.

### ► STEP 5: COMPILE MAINTENANCE PLAN

The following general outline is provided as an example.

I. Inspection and Maintenance Log

II. Updates, Revisions and Errata

III. Introduction

A. Narrative overview describing the site; drainage areas, routing, and discharge points; and treatment facilities.

IV. Responsibility for Maintenance

A. General

(1) Name and contact information for responsible individual(s).

(2) Organization chart or charts showing organization of the maintenance function and location within the overall organization.

(3) Reference to Operation and Maintenance Agreement (if any). A copy of the agreement should be attached.

(4) Maintenance Funding

(1) Sources of funds for maintenance

(2) Budget category or line item

(3) Description of procedure and process for ensuring adequate funding for maintenance

B. Staff Training Program

C. Records

D. Safety

V. Summary of Drainage Areas and Storm Water Facilities

A. Drainage Areas

(1) Drawings showing pervious and impervious areas (copied or adapted from initial Project Submittal).

(2) Designation and description of each drainage area and how flow is routed to the corresponding facility.

B. Treatment and Flow-Control Facilities

(1) Drawings showing location and type of each facility

(2) General description of each facility (Consider a table if more than two facilities)

(1) Area drained and routing of discharge.

(2) Facility type and size

VI. Facility Documentation

A. "As-built" drawings of each facility (design drawings in the draft Plan)

B. Manufacturer's data, manuals, and maintenance requirements for pumps, mechanical or electrical equipment, and proprietary facilities (include a "placeholder" in the draft plan for information not yet available).

C. Specific operation and maintenance concerns and troubleshooting

VII. Maintenance Schedule or Matrix

A. Maintenance Schedule for each facility with specific requirements for:

(1) Routine inspection and maintenance

(2) Annual inspection and maintenance

(3) Inspection and maintenance after major storms

B. Service Agreement Information

Assemble and make copies of your maintenance plan. One copy must be submitted to the City of La Mesa, and at least one copy kept on-site. Here are some suggestions for formatting the maintenance plan:

- Format plans to 8½" x 11" to facilitate duplication, filing, and handling.
- Include the revision date in the footer on each page.
- Scan graphics and incorporate with text into a single electronic file. Keep the electronic file backed-up so that copies of the maintenance plan can be made if the hard copy is lost or damaged.

**► STEP 6: UPDATES**

Your maintenance plan will be **a living document**.

Operation and maintenance personnel may change; mechanical equipment may be replaced, and additional maintenance procedures may be needed. Throughout these changes, the maintenance plan must be kept up-to-date.

Updates may be transmitted to the City of La Mesa at any time. However, at a minimum, updates to the maintenance plan must be reported with the annual submittal of the "BMP Inspection & Maintenance Verification Form," or equivalent, to the City.

## Stage 4: Interim Maintenance

Applicants will typically be required to warranty storm water facilities against lack of performance due to flaws in design or construction. The warranty may need to be secured by a bond or other financial instrument.

## Stage 5: Transfer Responsibility

As part of the detailed maintenance plan, note the expected date when responsibility for operation and maintenance will be transferred. Notify the City of La Mesa when this transfer of responsibility takes place.

## Stage 6: Operation & Maintenance Verification

The City of La Mesa implements an operation and maintenance verification program, including periodic site inspections.

Contact municipal staff to determine the frequency of inspections, whether self-inspections are allowed, and applicable fees, if any.

Chapter 6

# Construction BMP Requirements and Performance Standards

*Guideline to meeting construction BMP requirements in the SWPPP or CSWMP for your site.*

The storm water NPDES Permit requires the City of La Mesa to regulate construction activities within the City in order to reduce construction site discharges of pollutants from the MS4 to the maximum extent practicable and to prevent construction site discharges from the MS4 from causing or contributing to a violation of water quality standards.

Compliance with the City of La Mesa's construction BMP requirements is a four-step process:

1. Determine the applicable storm water requirements for your site.
2. Prepare and submit the appropriate plans.
3. Determine the adequacy of the plans proposed.
4. Assure implementation and maintenance of the requirements.

These steps are described below in greater detail.

## Construction Storm Water BMP Requirements

The flow chart in Figure 6-1, "Construction Permit Review & Approval Process" describes how storm water requirements are incorporated into projects during the construction permit review process. The steps below describe the elements of the plan review and permitting processes for storm water best management practice (BMP) requirements.

FIGURE 6-1. Construction Permit Review and Approval Process

The following figure provides an overview of the project review process for projects that require a construction permit from the City of La Mesa. Construction permits include building permits, grading permits, demolition permits, and encroachment permits.

### ► STEP 1: DETERMINE APPLICABLE STORM WATER BMP REQUIREMENTS

Prior to submittal, applicants must complete the "Storm Water Requirements Applicability Checklist" in Appendix A, to determine if their project is subject to construction and/or permanent storm water best management practice (BMP) requirements. Projects subject to the construction storm water best management practices requirements must comply with the standards included in this BMP Manual, as appropriate depending on the site conditions, season, and project design, and construction methods. Each project must be given a priority ranking (high, medium, or low) for the construction phase (see Appendix A). The prioritization will determine the inspection frequency by the City but will not change the construction BMP requirements. Refer to Step 2: "Prepare & Submit Appropriate Plans," for guidance in navigating through this BMP Manual to ensure construction BMP performance standards are met.

### ► STEP 2: PREPARE & SUBMIT APPROPRIATE PLANS

This BMP Manual describes the construction site management requirements that contractors must comply with. In addition, the next section of this chapter ("Construction Storm Water BMP Performance Standards") lists the performance standards that construction sites must meet, and provides a list of required erosion control, sediment control, and materials management BMPs for reference. Additionally, each project must determine if they are subject to s requirements and be given a priority of high, medium or low (see Appendix A).

*Construction Projects Over 1 Acre.* Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." If a project disturbs 1 acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by this chapter, in accordance with the current State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). Consistent with the State General Construction Permit, the City will require that <u>both</u> erosion and sediment control BMPs be installed and maintained for all applicable projects in addition to good housekeeping and site and materials management. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Additionally, each project determined to be subject to the City's advanced treatment requirements (see Appendix A) will need to include details on how the site plans to meet these requirements in the SWPPP and/or erosion control plan. Appendix D provides general guidelines for preparation of a SWPPP as well as a more detailed checklist to meet the requirements.

*Construction Projects Under 1 Acre.* Those projects that have been determined to require construction BMPs in Step 1 must identify the construction BMPs to be implemented in accordance with the performance standards in the next section of this chapter, "Construction Storm Water BMP Performance Standards." For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all

construction BMP requirements required in this chapter, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

After preparing plans and supporting documents according to the requirements in this BMP Manual, submit plans to the Department of Public Works/Engineering for review (See Step 3).

### ► STEP 3: DETERMINE ADEQUACY OF PROPOSED PLANS

Under the authority of the City Engineer, Engineering staff will review submitted plans for compliance with the applicable storm water requirements contained in this BMP Manual. The City Engineer may approve proposed alternatives to the BMP requirements in this manual if they are determined to be applicable and equally effective. Additional analysis or information may be required to enable staff to determine the adequacy of proposed BMPs. After all storm water requirements have been approved by the City Engineer, proceed to Step 4 to assure implementation and maintenance of the approved BMPs through permit conditions, plan notes, and if necessary, maintenance agreements.

### ► STEP 4: ASSURE IMPLEMENTATION & MAINTENANCE OF REQUIREMENTS

Applicants must provide assurances that permanent storm water BMPs will be constructed and permanently maintained throughout the use of a developed site, and that construction BMPs will be implemented and maintained until construction is complete. The summaries below describe how construction and permanent BMP requirements must be assured during both discretionary actions and construction permit review processes. After the City Engineer has approved all construction and/or permanent BMPs, refer to the final section of this chapter, "Implementation and Maintenance of Requirements," to determine how construction and permanent BMP implementation and maintenance will be assured.

*Discretionary Action.* For any discretionary action, permanent storm water requirements shall be incorporated into the project design and be shown on the plans. In addition, project shall be conditioned to execute a maintenance agreement for ongoing permanent BMP maintenance, satisfactory to the City Engineer, prior to the issuance of any construction permits. This requirement shall be noted on the plans for the discretionary action. If the project will be required to provide construction BMPs, the permit/approval shall include the "Standard Construction BMP Implementation and Maintenance Condition" listed in "Implementation and Maintenance of Requirements" at the end of this chapter.

*Construction Permits.* For projects requiring construction permits, construction and permanent BMP requirements shall be incorporated into the project design and shown on the plans prior to the issuance of any permits. The project applicant shall execute a permanent BMP maintenance agreement, satisfactory to the City Engineer, prior to issuance of any construction permits. Construction maintenance requirements and the specific permanent BMP maintenance procedures shall be noted on the plans. Any construction BMP requirements that cannot be shown graphically must be noted on the plans.

# Construction Storm Water BMP Performance Standards

Those projects that have been determined to require construction BMPs in Steps 1 and 2 of this chapter must identify the construction BMPs to be implemented in accordance with the performance standards in this section. The construction BMPs must be identified in a Storm Water Pollution Prevention Plan or Construction Storm Water Management Plan (CSWMP) for projects disturbing more than or less than 1 acre, respectively. Because all projects require BMPs during construction, those projects that disturb less than 1 acre are required to have a Construction Storm Water Management Plan (CSWMP) which identifies the pollution prevention measures that will be taken. These plans must be prepared in accordance with the guidelines in Appendix D.

### ► 1. MINIMUM CONSTRUCTION BMP REQUIREMENTS

The City has developed a set of minimum BMPs that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to select, install, and maintain general site management, soil stabilization and erosion prevention, and sediment containment BMPs to reduce, retain, and manage pollutant discharges to the MEP. Table 6-1 outlines the minimum construction BMPs required by the City along with the corresponding current fact sheets obtained from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003), where applicable. Additional information on the BMPs included in Table 6-1 can be found in the City of La Mesa Jurisdictional Urban Runoff Management Plan (JURMP), the Model Construction Program for San Diego Copermittees, the City of Los Angeles "Reference Guide for Stormwater Best Management Practices," and the California Stormwater Quality Association (CASQA) BMP Handbook for Construction.

It is the responsibility of the property owner or his/her designee to select, install and maintain appropriate BMPs that meet the City's minimum BMP requirements outlined in Table 6-1 below. BMPs must be installed in accordance with an industry recommended standard or in accordance with the requirements of the State General Construction Permit.

TABLE 6-1. Minimum Required BMPs for Construction

| BMP Type | Minimum Required BMP(s) | Corresponding Caltrans Fact sheet |
|---|---|---|
| General Site Management | | |
| Project Planning | Preserve natural hydrologic features where feasible | - |
| | Preserve riparian buffers and corridors where feasible | - |
| | Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction | - |
| | Minimize exposure time of disturbed soil areas | SS-1 |
| | Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible | SS-1 |
| | Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible | SS-1 |

| BMP Type | Minimum Required BMP(s) | Corresponding Caltrans Fact sheet |
|---|---|---|
| | Educate construction site employees and subcontractors on minimum BMP requirements | - |
| Pollution Prevention | Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities:<br>- Cleaning<br>- Fueling<br>- Maintenance | <br><br><br>NS-8<br>NS-9<br>NS-10 |
| | Prevent the contamination of storm water from construction materials through proper management of the following types of activities:<br>- Material Delivery and Storage<br>- Material Use<br>- Stockpile Management[1]<br>- Spill Prevention and Control | <br><br><br>WM-1<br>WM-2<br>WM-3<br>WM-4 |
| | Prevent the contamination of storm water by wastes through proper management of the following types of wastes:<br>- Solid Waste<br>- Hazardous Waste<br>- Contaminated Soil<br>- Concrete<br>- Sanitary Waste<br>- Liquid | <br>WM-5<br>WM-6<br>WM-7<br>WM-8<br>WM-9<br>WM-10 |
| | Prevent the contamination of storm water through proper management of the follow activities:<br>- Water Conservation Practices<br>- Dewatering Operations<br>- Paving and Grinding<br>- Potable Water/Irrigation and Flushing | <br><br>NS-1<br>NS-2<br>NS-3<br>NS-7 |
| Erosion Prevention and Sediment Containment | | |
| Soil Stabilization and Erosion Prevention | Preserve existing vegetation where feasible | SS-2 |
| | Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing one or more of the following BMPs:<br>- Hydraulic Mulch<br>- Hydroseeding<br>- Soil Binders<br>- Straw Mulch<br>- Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats<br>- Wood Mulch<br>- Earth Dikes/Drainage Swales | <br><br><br>SS-3<br>SS-4<br>SS-5<br>SS-6<br>SS-7<br><br>SS-8<br>SS-9 |
| | Reduce the velocity of storm water by using one or more of the following:<br>- Outlet Protection/Velocity Dissipation<br>- Slope Drains | <br><br>SS-10<br>SS-11 |
| | Establish permanent re-vegetation or landscaping as early as feasible | SS-1 |

| BMP Type | Minimum Required BMP(s) | Corresponding Caltrans Fact sheet |
|---|---|---|
| Sediment Containment | Protect the Perimeter of the site or exposed area from sediment discharge using one or more of the following:<br>- Silt Fence<br>- Gravel Bag Berm<br>- Fiber Rolls | <br><br>SC-1<br>SC-6<br>SC-5 |
| | Capture sediments in channeled storm water by using one or more of the following:<br>- De-silting Basin[3]<br>- Storm Drain Inlet Protection<br>- Sediment Trap<br>- Gravel Bag Barrier | <br><br>SC-2<br>SC-10<br>SC-3<br>SC-8 |
| | Prevent sediment from being tracked off-site by using one or more of the following:<br>- Stabilized Construction Entrance<br>- Construction Road Stabilization<br>- Entrance/Exit Tire Wash<br>- Street Sweeping | <br><br>TC-1<br>TC-2<br>TC-3<br>SC-7 |

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans. If the project is one acre or greater the de-silting basin must be designed in accordance with the current State General Construction Permit.

### ► 2. SITE MANAGEMENT REQUIREMENTS

Construction is a dynamic operation where changes are expected. Storm water BMPs for construction sites are usually temporary measures that require frequent maintenance to maintain their effectiveness and may require relocation, revision, and re-installation, particularly as project grading progresses. Therefore, owner/contractor self- inspections are required. They shall be performed by the owner's/contractor's Qualified Contact Person specifically trained in storm water pollution prevention site management and storm water BMPs, including the installation and maintenance of sediment and erosion control measures. Additional qualified persons may assist with the inspection activities under the direction of the Qualified Contact Person. A Qualified Contact Person is required for all sites during both wet and dry weather conditions.

There are four primary purposes of the self-inspections conducted by owners and contractors:

- To ensure that the owners/contractors take full responsibility for managing storm water pollution caused by their activities.
- To ensure that storm water BMPs are properly documented and implemented and are functioning effectively.
- To identify maintenance (e.g., sediment removal) and repair needs.

- To ensure that the project proponents implement their storm water management plans.

A self-inspection checklist, noting date, time, conditions and inspection date, must be kept on-site and made available for inspection, if requested (note: the State General Construction Permit has additional inspection requirements that must be met to comply with the permit). Self-inspections must be performed by a Qualified Contact Person according to the following schedule:

- Daily forecasting at all times
- At 24-hour intervals during extended rainfall events
- Daily evaluations as earth moving/grading is being conducted during the wet season
- Weekly (every 7 days) in the dry season as earth moving/grading is progressing

Storm water pollution prevention site management requirements include:

A. A qualified person who is trained and competent in the use of BMPs shall be on site daily, although not necessarily full time, to evaluate the conditions of the site with respect to storm water pollution prevention. This qualified contact person shall represent the contractor/ owner on storm water issues.

B. The qualified person shall implement the conditions of the Storm Water Pollution Prevention Plan, contract documents, and/or local ordinances with respect to erosion and sediment control and other waste management regulations.

C. The qualified person is responsible for monitoring the weather and implementation of any emergency plans as needed. The weather shall be monitored on a 5-day forecast plan and a full BMP protection plan shall be activated when there is a 40% chance of rain.

D. The qualified person is responsible for overseeing any site grading and operations and evaluating the effectiveness of the BMPs. This person shall modify the BMPs as necessary to keep the dynamics of the site in compliance. This person or other qualified persons are responsible for checking the BMPs routinely for maintenance and documenting the BMPs being implemented.

### ► 3. PERFORMANCE STANDARDS

Construction The City Engineer will evaluate the adequacy of the owner's/contractor's site management for storm water pollution prevention, inclusive of BMP implementation, on construction sites based on performance standards for storm water BMPs. Poor BMP practices shall be challenged. Performance standards shall include:

A. No measurable increase of pollution (including sediment) in runoff from the site.

B. No slope erosion.

C. Water velocity moving offsite must not be greater than pre-construction levels.

A site will be considered inactive if construction activities have ceased for a period of 7 or more consecutive calendar days. At any time of year, an inactive site must be fully protected from erosion and discharges of sediment. It is also the owner's/contractor's responsibility at both active and inactive sites to implement a plan to address all potential non-storm water discharges.

Regardless of any inspections conducted by the City, property owners or contractors are required to prevent any construction-related materials, wastes, spills, or residues from entering a storm water conveyance system and to apply for coverage under the State General Construction Permit as applicable for the site.

### ► 4. SEASONAL REQUIREMENTS

BMP requirements differ between the wet season (Oct. 1 – Apr. 30) and the dry season (May 1 – Sept. 30), the type of the project and topography of the site, as described below.

A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

A. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)

B. Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).

C. Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).

D. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

E. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.

F. The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).

G. Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

H. The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.

I. A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.

J. Properly protected, designated storage areas are required for materials and wastes.

K. All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.

L. Remnant trash and debris shall be removed and/or properly stored/disposed of daily.

M. Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.

N. Materials for spill control/containment must be stockpiled onsite.

O. Non-storm water discharges must be eliminated or controlled to the MEP.

P. Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

Q. Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.

R. Adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.

S. All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.

T. Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

### ► 5. ADVANCED TREATMENT REQUIREMENTS

The City requires advanced treatment methods to be employed at construction sites determined to be an exceptional threat to water quality (see Appendix A). Advanced treatment involves using mechanical or chemical means to flocculate and remove suspended sediment from construction site runoff. Projects required to implement advanced treatment must comply with the following:

1. Treatment effluent water quality shall meet or exceed the water quality objectives for sediment, turbidity, and any other parameter deemed necessary by the City Engineer as listed in the Water Quality Control Plan for the San Diego Basin (9) for inland surface waters and lagoons and estuaries for the appropriate hydrologic unit.

2. Applicant shall provide design, operations and maintenance schedule, monitoring plan, certification of training of staff to the satisfaction of the City Engineer.

### ► 6. ADDITIONAL CONTROLS FOR CONSTRUCTION SITES

The Municipal Permit requires implementation of additional controls for construction sites tributary to 303(d) listed water body segments impaired for sediment or within, adjacent to, or discharging directly to coastal lagoons or other receiving waters within ESAs. Additional requirements for theses site will be determined on a site-by-site basis at the discretion of the City Engineer.

## Implementation and Maintenance of Requirements

*Discretionary Actions.* Projects seeking discretionary approvals are not required to graphically demonstrate any construction BMP requirements on the project plans. Instead, the discretionary action shall include the following standard condition, which shall also be noted on the plans:

> "The Permittee or designee shall incorporate any construction best management practices (BMPs) necessary to comply with the grading regulations in Chapter 14.05 of the La Mesa Municipal Code, into the construction plans and/or specifications, satisfactory to the City Engineer, prior to the issuance of any construction permits."

*Construction Permits for Projects Under 1 Acre.* Projects proposing to disturb less than 1 acre during construction shall include construction BMP requirements, where possible, on the plans. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted on, or stapled to, the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be

graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

*Construction Permits for Projects Over 1 Acre.* Projects proposing to disturb more than 1 acre during construction shall include all construction BMPs in a Storm Water Pollution Prevention Plan, prepared in accordance with Appendix D. The construction BMPs shall also be shown on the plans, where possible. Any remaining construction BMPs that cannot be shown graphically on the plans shall be either noted or stapled to the plans and made a condition of the permit. The project's construction priority ranking (see Appendix A) must also be noted on the construction plans. Applicants proposing projects that include permanent BMPs must prepare (if not already prepared as part of a previous permit or approval), and execute a maintenance agreement, prepared satisfactory to the City, following the program described in Chapter 5 of this BMP Manual prior to the issuance of any construction permits. The permanent BMPs shall be graphically shown on the plans, where possible, and made a condition of the project's permit/approval. The permanent BMP's operation and maintenance requirements (O & M plan discussed in Chapter 5 of this BMP Manual) shall also be noted on the plans and made a condition of the project's permit/approval.

# Storm Water Requirements Applicability Checklist

## STORM WATER PROJECT DATA SHEET

**PROJECT DATA:**

Owner's Name & Phone No: _____

Address: _____ Permit No: _____

Project: _____ Date Applied: _____

**PROJECT SITE DATA:**

1. Area of the lot/parcel = _____ sf
2. Existing impervious area (roof/building foot print) = _____ sf
3. Existing impervious area (driveway, parking, walkway, hardscape etc.) = _____ sf
4. Impervious area after development (roof/building foot print) = _____ sf
5. Impervious area after development (driveway, parking, walkway, hardscape, etc.) = _____ sf
6. Total area to be disturbed = _____ sf
7. Storm water runoff based on Hydrology Study:

Existing runoff = _____ cfs, Post construction runoff = _____ cfs

8. Identify if the runoff from the site discharges to the public street or storm drain or open channel, detention or retention basin: _____
9. Watershed (Check One): San Diego River _____ San Diego Bay _____

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete the Storm Water Requirements Applicability Checklist

Notes:

- Items 1 through 9 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.

A Hydrology report may be required.

## STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

### SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS:

| | YES | NO |
|---|---|---|
| 1. Is the project a new development? | ☐ | ☐ |
| 2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 $ft^2$ of impervious surface?* | ☐ | ☐ |
| ** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".* | | |

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes," Complete Part A Below.

**PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.**

| ***DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY DEVELOPMENT PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL PART II? (SEE GLOSSARY)**** | YES | NO |
|---|---|---|
| 1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units? | ☐ | ☐ |
| 2. Commercial development resulting in the disturbance of one acre or more of land? | ☐ | ☐ |
| 3. Industrial development resulting in the disturbance of one acre or more of land? | ☐ | ☐ |
| 4. Automotive repair shop? | ☐ | ☐ |
| 5. Restaurant greater than 5,000 square feet? | ☐ | ☐ |
| 6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface? | ☐ | ☐ |
| 7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition? | ☐ | ☐ |
| 8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff? | ☐ | ☐ |
| 9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater? | ☐ | ☐ |
| 10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day | ☐ | ☐ |
| 11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. | ☐ | ☐ |
| **** Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.*** | | |

| |
|---|
| *Limited Exclusion*: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met. |

If all answers to Part A are "No", continue to Part B.

**PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.**

| DOES THE PROJECT PROPOSE: | YES | NO |
|---|---|---|
| 1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks? | ☐ | ☐ |
| 2. New pervious landscape areas and irrigation systems? | ☐ | ☐ |
| 3. Permanent structures within 100 feet of any natural water body? | ☐ | ☐ |
| 4. Trash storage areas? | ☐ | ☐ |
| 5. Liquid or solid material loading and unloading areas? | ☐ | ☐ |
| 6. Vehicle or equipment fueling, washing, or maintenance areas? | ☐ | ☐ |
| 7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (except construction)? | ☐ | ☐ |
| 8. Commercial/ industrial waste handling or storage, excluding typical office or household waste? | ☐ | ☐ |
| 9. Any grading or ground disturbance during construction? | ☐ | ☐ |
| 10. Any new storm drains, or alteration to existing storm drains? | ☐ | ☐ |
| **To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.shtml.* | | |

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the BMP Manual. All Priority Development Projects are also subject to hydromodification management requirements (unless an exemption applies) as discussed in the City's Storm Water BMP Manual Part II and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's Storm Water BMP Manual Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

| | | | | | | |
|---|---|---|---|---|---|---|
| **Required submittals, Section 1:** | **PCWQTR** | ☐ | **SPCBMPP** | ☐ | **Hydromodification** | ☐ |

## SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS:

### PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.

| WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION? | YES | NO |
|---|---|---|
| 1. Does the project propose grading or soil disturbance of one acre or more? | ☐ | ☐ |
| 2. Does the project propose any grading or soil disturbance? | ☐ | ☐ |
| 3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas? | ☐ | ☐ |
| 4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)? | ☐ | ☐ |

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide NPDES General Permit for Storm Water Discharges Associated with Construction Activities (General Construction Permit) and the City's Construction Storm Water BMP Performance Standards. To enroll in the General Construction Permit, see the website at www.waterboards.ca.gov/water_issues/programs/stormwater/construction.shtml. A Storm Water Pollution Prevention Plan (SWPPP), a Notice of Intent (NOI), and other documents must be submitted electronically. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards. A Construction Storm Water Management Plan (CSWMP) must be prepared, and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to complete Parts D and E of this form, and neither a SWPPP nor CSWMP is required.

### PART D: DETERMINE ADVANCED TREATMENT SUBJECTIVITY

| WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION? | YES | NO |
|---|---|---|
| 1. Is the project located within, adjacent to, or is a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity? | ☐ | ☐ |
| 2. Will the project disturb more than five acres, including all phases of the development? | ☐ | ☐ |
| If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below. | | |
| 3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water? | ☐ | ☐ |
| 4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors $k_f$ greater than or equal to 0.4? | ☐ | ☐ |

***If all answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the Storm Water BMP Manual Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer.***

| **Required submittals, Section 2:** | **SWPPP, NOI** ☐ | **CSWMP** ☐ | **Advanced Treatment** ☐ |
|---|---|---|---|

**PART E: DETERMINE CONSTRUCTION SITE PRIORITY**

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

According to the attached flow chart, this project has the following threat to water quality priority:

☐ **High** ☐ **Medium** ☐ **Low**

[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]

Completed By: _____

Name, Address & Phone

Appendix

B

# Low Impact Development (LID) Integrated Management Practice (IMP) Design Sheets

# Self-Treating and Self-Retaining Areas

**Best Uses**

- Heavily landscaped sites

**Advantages**

- No maintenance verification requirement
- Complements site landscaping

**Limitations**

- Requires substantial square footage
- Grading requirements must be coordinated with landscape design

## ► CRITERIA

Rainfall on self-treating areas infiltrates or—during intense storms— drains directly off-site or to the storm drain system.

Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. During intense storms, runoff may drain off-site, to the storm drain system, or to IMPs.

LID design seeks to manage runoff from roofs and paving so effects on water quality and hydrology are minimized. Runoff from landscaping, however, does not need to be managed the same way.

Runoff from landscaping can be managed by creating self-treating and self-retaining areas.

**Self-treating areas** are natural, landscaped, or turf areas that drain directly off site or to the storm drain system. Examples include upslope undeveloped areas that are ditched and drained around a development and grassed slopes that drain offsite to a street or storm drain. Self-treating areas may not drain on to adjacent paved areas.

Where a landscaped area is upslope from or surrounded by paved areas, a **self-retaining area** (also called a zero-discharge area) may be created. Self-retaining areas are designed to retain the first one inch of rainfall without producing any runoff. The technique works best on flat, heavily landscaped sites. It may be used on mild slopes if there is a reasonable expectation that the first inch of rainfall would produce no runoff.

To create self-retaining turf and landscape areas in flat areas or on terraced slopes, berm the area or depress the grade into a concave cross-section so that these areas will retain the first inch of rainfall. Inlets of area drains, if any, should be set 3 inches above the low point to allow ponding.

**Areas draining to self retaining areas.** Drainage from roofs and paving can be directed to self-retaining areas and allowed to infiltrate into the soil. The maximum allowable ratio is 2 parts impervious: 1 part pervious.

The self-retaining area must be bermed or depressed to retain an inch of rainfall including the flow from the tributary impervious area.

## ► DETAILS

Drainage from self-treating areas must flow to off-site streets or storm drains without flowing on to paved areas.

Pavement within a self-treating area cannot exceed 5% of the total area.

In self-retaining areas, overflows and area drain inlets should be set high enough to ensure ponding over the entire surface of the self-retaining area.

Set overflows and area drain inlets high enough to ensure ponding (3" deep) over the surface of the self-retaining area.

Self–retaining areas should be designed to promote even distribution of ponded runoff over the area.

Leave enough reveal (from pavement down to landscaped surface) to accommodate buildup of turf or mulch.

## ► APPLICATIONS

Lawn or landscaped areas adjacent to streets can be considered self-treating areas.

Self-retaining areas can be created by depressing lawn and landscape below surrounding sidewalks and plazas.

Runoff from walkways or driveways in parks and park-like areas can sheet-flow to self-retaining areas.

Roof leaders can be connected to self-retaining areas by piping beneath plazas and walkways. If necessary, a "bubble-up" can be used.

Connecting a roof leader to a self-retaining area. The head from the eave height makes it possible to route roof drainage some distance away from the building.

Self-retaining areas can be created by terracing mild slopes. The elevation difference promotes subsurface drainage.

Mild slopes can be terraced to create self-retaining areas.

### ► DESIGN CHECKLIST FOR SELF-TREATING AREAS

- ❒ The self-treating area is at least 95% lawn or landscaping (not more than 5% impervious).
- ❒ Re-graded or re-landscaped areas have amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Runoff from the self-treating area does not enter an IMP or another drainage management area, but goes directly to the storm drain system.

### ► DESIGN CHECKLIST FOR SELF-RETAINING AREAS

- ❒ Area is bermed all the way around or graded concave.

- ❒ Slopes do not exceed 4%.
- ❒ Entire area is lawn, landscaping, or pervious pavement (see criteria in Chapter 4).
- ❒ Area has amended soils, vegetation, and irrigation as may be required to maintain soil stability and permeability.
- ❒ Any area drain inlets are at least 3 inches above surrounding grade.

### ► DESIGN CHECKLIST FOR AREAS DRAINING TO SELF-RETAINING AREAS

- ❒ Ratio of tributary impervious area to self-retaining area is not greater than 2:1.
- ❒ Roof leaders collect runoff and route it to the self-retaining area.
- ❒ Paved areas are sloped so drainage is routed to the self-retaining area.
- ❒ Inlets are designed to protect against erosion and distribute runoff across the area.

# Pervious Pavements

**► CRITERIA**

Impervious roadways, driveways, and parking lots account for much of the hydrologic impact of land development. In contrast, pervious pavements allow rainfall to collect in a gravel or sand base course and infiltrate into native soil.

Pervious pavements are designed to transmit rainfall through the surface to storage in a base course. For example, a 4-inch-deep base course provides approximately 1.6 inches of storage. Runoff stored in the base course infiltrates to native soils over time. Except in the case of solid pavers, the surface course provides additional storage.

Areas with the following pervious pavements may be regarded as "self-treating" and require no additional treatment or flow control if they drain off-site (not to an IMP).

- Pervious concrete
- Porous asphalt
- Crushed aggregate (gravel)
- Open pavers with grass or plantings
- Open pavers with gravel
- Artificial turf

Areas with these pervious pavements can also be **self-retaining areas** and may receive runoff from impervious areas if they are bermed or depressed to retain the first one inch of rainfall, including runoff from the tributary impervious area.

Solid unit pavers—such as bricks, stone blocks, or precast concrete shapes—are considered to reduce runoff compared to impervious pavement, when the unit pavers are set in sand or gravel with d" gaps between the pavers. Joints must be filled with an open-graded aggregate free of fines.

**Best Uses**

- Areas with permeable native soils
- Low-traffic areas
- Where aesthetic quality can justify higher cost

**Advantages**

- No maintenance verification requirement
- Variety of surface treatments can complement landscape design

**Limitations**

- Initial cost
- Placement requires specially trained crews
- Geotechnical concerns, especially in clay soils
- Concerns about pavement strength and surface integrity
- Some municipalities do not allow in public right of way

When draining pervious pavements to an IMP, use the runoff factors in Table 4-2.

### ► DETAILS

Permeable pavements can be used in clay soils; however, special design considerations, including an increased depth of base course, typically apply and will increase the cost of this option. Geotechnical fabric between the base course and underlying clay soil is recommended.

Pavement strength and durability typically determines the required depth of base course. If underdrains are used, the outlet elevation must be a minimum of 3 inches above the bottom elevation of the base course.

Pervious concrete and porous asphalt must be installed by crews with special training and tools. Industry associations maintain lists of qualified contractors.

Parking lots with crushed aggregate or unit pavers may require signs or bollards to organize parking.

### ► DESIGN CHECKLIST FOR PERVIOUS PAVEMENTS

- ❒ No erodible areas drain on to pavement.
- ❒ Subgrade is uniform. Compaction is minimal.
- ❒ Reservoir base course is of open-graded crushed stone. Base depth is adequate to retain rainfall and support design loads.
- ❒ If a subdrain is provided, outlet elevation is a minimum of 3 inches above bottom of base course.
- ❒ Subgrade is uniform and slopes are not so steep that subgrade is prone to erosion.
- ❒ Rigid edge is provided to retain granular pavements and unit pavers.
- ❒ Solid unit pavers are installed with open gaps filled with open-graded aggregate free of fines.
- ❒ Permeable pavements are installed by industry-certified professionals according to vendor's recommendations.
- ❒ Selection and location of pavements incorporates Americans with Disabilities Act requirements, site aesthetics, and uses.

# Bioretention Facilities

Bioretention facility configured for treatment-only requirements. Bioretention facilities can rectangular, linear, or nearly any shape.

Bioretention detains runoff in a surface reservoir, filters it through plant roots and a biologically active soil mix, and then infiltrates it into the ground. Where native soils are less permeable, an underdrain conveys treated runoff to storm drain or surface drainage.

Bioretention facilities can be configured in nearly any shape. When configured as linear **swales**, they can convey high flows while percolating and treating lower flows.

Bioretention facilities can be configured as in-ground or above-ground planter boxes, with the bottom open to allow infiltration to native soils underneath. Bioretention basins must be hydrologically connected with the underlying soil. Any Bioretention basin which is completely lined and sealed shall be sized as a Flow Through Planter.

**Best Uses**

- Commercial areas
- Residential subdivisions
- Industrial developments
- Roadways
- Parking lots
- Fit in setbacks, medians, and other landscaped areas

**Advantages**

- Can be any shape
- Low maintenance
- Can be landscaped

**Limitations**

- Require 4% of tributary impervious square footage
- Typically requires 3-4 feet of head
- Irrigation typically required

## ► CRITERIA

For development projects subject only to runoff treatment requirements, the following criteria apply:

| Parameter | Criterion |
|---|---|
| Soil mix depth | 18 inches minimum |

| Parameter | Criterion |
|---|---|
| Soil mix minimum percolation rate | 5 inches per hour minimum sustained (10 inches per hour initial rate recommended) |
| Soil mix surface area | 0.04 times tributary impervious area (or equivalent) |
| Surface reservoir depth | 6 inches minimum; may be sloped to 4 inches where adjoining walkways. |
| Underdrain | Required in Group "C" and "D" soils. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point. |

## ► DETAILS

**Plan.** On the surface, a bioretention facility should be one level, shallow basin—or a series of basins. As runoff enters each basin, it should flood and fill throughout before runoff overflows to the outlet or to the next downstream basin. This will help prevent movement of surface mulch and soil mix.

Use check dams for linear bioretention facilities (swales) on a slope.

In a linear swale, check dams should be placed so that the lip of each dam is at least as high as the toe of the next upstream dam. A similar principle applies to bioretention facilities built as terraced roadway shoulders.

**Inlets.** Paved areas draining to the facility should be graded, and inlets should be placed, so that runoff remains as sheet flow or as dispersed as possible. Curb cuts should be wide (12" is recommended) to avoid clogging with leaves or debris. Allow for a minimum reveal of 4"-6" between the inlet and soil mix elevations to ensure turf or mulch buildup does not block the

inlet. In addition, place an apron of stone or concrete, a foot square or larger, inside each inlet to prevent vegetation from growing up and blocking the inlet.

Recommended design details for bioretention facility inlets (see text).

Where runoff is collected in pipes or gutters and conveyed to the facility, protect the landscaping from high-velocity flows with energy-dissipating rocks. In larger installations, provide cobble-lined channels to better distribute flows throughout the facility.

Upturned pipe outlets can be used to dissipate energy when runoff is piped from roofs and upgradient paved areas.

**Soil mix.** The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

**Storage and drainage layer.** "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" washed pea gravel be substituted at the top of the crushed rock gravel layers. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer or the gravel drainage layer from the native soil.

**Underdrains.** No underdrain is required where native soils beneath the facility are Hydrologic Soil Group A or B. For treatment-only facilities where native soils are Group C or D, a perforated pipe must be bedded in the gravel layer and must terminate at a storm drain or other approved discharge point.

**Outlets.** In treatment-only facilities, outlets must be set high enough to ensure the surface reservoir fills and the entire surface area of soil mix is flooded before the outlet elevation is reached. In swales, this can be achieved with appropriately placed check dams.

The outlet should be designed to exclude floating mulch and debris.

**Vaults, utility boxes, and light standards.** It is best to locate utilities outside the bioretention facility—in adjacent walkways or in a separate area set aside for this purpose. If utility structures are to be placed within the facility, the locations should be anticipated and adjustments made to ensure the minimum bioretention surface area and volumes are achieved. Leaving the final locations to each individual utility can produce a haphazard, unaesthetic appearance and make the bioretention facility more difficult to maintain.

**Emergency overflow.** The site grading plan should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

**Trees.** Bioretention areas can accommodate small or large trees. There is no need to subtract the area taken up by roots from the effective area of the facility. Extensive tree roots maintain soil permeability and help retain runoff. Normal maintenance of a bioretention facility should not affect tree lifespan.

The bioretention facility can be integrated with a tree pit of the required depth and filled with structural soil. If a root barrier is used, it can be located to allow tree roots to spread throughout the bioretention facility while protecting adjacent pavement. Locations and planting elevations should be selected to avoid blocking the facility's inlets and outlets.

Bioretention facility configured as a tree well.
The root barrier is optional.

## ► APPLICATIONS

**Multi-purpose landscaped areas.** Bioretention facilities are easily adapted to serve multiple purposes. The loamy sand soil mix will support turf or a plant palette suitable to the location and a well-drained soil.

Example landscape treatments:

- Lawn with sloped transition to adjacent landscaping.
- Swale in setback area
- Swale in parking median
- Lawn with hardscaped edge treatment
- Decorative garden with formal or informal plantings
- Traffic island with low-maintenance landscaping
- Raised planter with seating
- Bioretention on a terraced slope

Bioretention facility configured as a recessed decorative lawn with hardscaped edge.

Bioretention facility configured and planted as a lawn/ play area.

**Residential subdivisions.** Some subdivisions are designed to drain roofs and driveways to the streets (in the conventional manner) and then drain the streets to bioretention areas, with one bioretention area for each 1 to 6 lots, depending on subdivision layout and topography.

If allowed by the local jurisdiction, bioretention areas can be placed on a separate, dedicated parcel with joint ownership.

Bioretention facility receiving drainage from individual lots and the street in a residential subdivision.

**Sloped sites.** Bioretention facilities must be constructed as a basin, or series of basins, with the circumference of each basin set level. It may be necessary to add curbs or low retaining walls.

Bioretention facility configured as a parking median.
Note use of bollards in place of curbs, eliminating the need for curb cuts.

**Design Checklist for Bioretention**

- ❒ Volume or depth of surface reservoir meets or exceeds minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term percolation rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ Perforated pipe underdrain bedded in "Class 2 perm" with connection and sufficient head to storm drain or discharge point (except in "A" or "B" soils).
- ❒ No filter fabric.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Bioretention area is designed as a basin (level edges) or a series of basins, and grading plan is consistent with these elevations. If facility is designed as a swale, check dams are set so the lip of each dam is at least as high as the toe of the next upstream dam.
- ❒ Inlets are 12" wide, have 4"-6" reveal and an apron or other provision to prevent blockage when vegetation grows in, and energy dissipation as needed.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.
- ❒ Vaults, utility boxes, and light standards are located outside the minimum soil mix surface area.
- ❒ When excavating, avoid smearing of the soils on bottom and side slopes. Minimize compaction of native soils and "rip" soils if clayey and/or compacted. Protect the area from construction site runoff.

## Bioretention Facility Outlet Detail - A

# Flow-through Planter

Portland 2004 Stormwater Manual

**Best Uses**

- Management of roof runoff
- Next to buildings
- Dense urban areas
- Where infiltration is not desired

**Advantages**

- Can be used next to structures
- Versatile
- Can be any shape
- Low maintenance

**Limitations**

- Can be used for flow-control only on sites with "C" and "D" soils
- Requires underdrain
- Requires 3-4 feet of head

Flow-through planters treat and detain runoff without allowing seepage into the underlying soil. They can be used next to buildings and on slopes where stability might be affected by adding soil moisture.

Flow-through planters typically receive runoff via downspouts leading from the roofs of adjacent buildings. However, they can also be set in-ground and receive sheet flow from adjacent paved areas.

Pollutants are removed as runoff passes through the soil layer and is collected in an underlying layer of gravel or drain rock. A perforated-pipe underdrain is typically connected to a storm drain or other discharge point. An overflow inlet conveys flows which exceed the capacity of the planter.

## ► CRITERIA

**Treatment only.** For development projects subject only to runoff treatment requirements, the following criteria apply:

| Parameter | Criterion |
|---|---|
| Soil mix depth | 18 inches minimum |
| Soil mix minimum percolation rate | 5 inches per hour minimum sustained (10 inches per hour initial rate recommended) |

| Parameter | Criterion |
|---|---|
| Soil mix surface area | 0.04 times tributary impervious area (or equivalent) |
| Surface reservoir depth | 6" minimum; may be sloped to 4" where adjoining walkways. |
| Underdrain | Typically used. Perforated pipe embedded in gravel ("Class 2 permeable" recommended), connected to storm drain or other accepted discharge point. |

## ► DETAILS

**Configuration.** The planter must be level. To avoid standing water in the subsurface layer, set the perforated pipe underdrain and orifice as nearly flush with the planter bottom as possible.

**Inlets.** Protect plantings from high-velocity flows by adding rocks or other energy-dissipating structures at downspouts and other inlets.

**Soil mix.** The required soil mix is similar to a loamy sand. It must maintain a minimum percolation rate of 5" per hour throughout the life of the facility, and it must be suitable for maintaining plant life. Typically, on-site soils will not be suitable due to clay content.

**Gravel storage and drainage layer.** "Class 2 permeable," Caltrans specification 68-1.025, is recommended. Open-graded crushed rock, washed, may be used, but requires 4"-6" of washed pea gravel be substituted at the top of the crushed rock layer. **Do not use filter fabric** to separate the soil mix from the gravel drainage layer.

**Emergency overflow.** The planter design and installation should anticipate extreme events and potential clogging of the overflow and route emergency overflows safely.

## ► APPLICATIONS

**Adjacent to buildings.** Flow-through planters may be located adjacent to buildings, where the planter vegetation can soften the visual effect of the building wall. A setback with a raised planter box may be appropriate even in some neo-traditional pedestrian-oriented urban streetscapes.

**At plaza level.** Flow-through planters have been successfully incorporated into podium-style developments, with the planters placed on the plaza level and receiving runoff from the tower roofs above. Runoff from the plaza level is typically managed separately by additional flow-through planters or bioretention facilities located at street level.

**Steep slopes.** Flow-through planters provide a means to detain and treat runoff on slopes that cannot accept infiltration from a bioretention facility. The planter can be built into the slope similar to a retaining wall. The design should consider the need to access the planter for

periodic maintenance. Flows from the planter underdrain and overflow must be directed in accordance with local requirements. It is sometimes possible to disperse these flows to the downgradient hillside.

Flow-through planter on the plaza level of a podium-style development.

Flow-through planter built into a hillside. Flows from the underdrain and overflow must be directed in accordance with local requirements.

**Design Checklist for Flow-through Planter**

- ❒ Reservoir depth is 4-6" minimum.
- ❒ 18" depth "loamy sand" soil mix with minimum long-term infiltration rate of 5"/hour.
- ❒ Area of soil mix meets or exceeds minimum.
- ❒ "Class 2 perm" drainage layer.
- ❒ No filter fabric.
- ❒ Perforated pipe underdrain with outlet located flush or nearly flush with planter bottom. Connection with sufficient head to storm drain or discharge point.
- ❒ Underdrain has a clean-out port consisting of a vertical, rigid, non-perforated PVC pipe, with a minimum diameter of 6 inches and a watertight cap.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Location and footprint of facility are shown on site plan and landscaping plan.
- ❒ Planter is set level.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Plantings are suitable to the climate and a well-drained soil.
- ❒ Irrigation system with connection to water supply.

## NOTES:

1. FLOW-THROUGH PLANTER SHALL BE SIZED TO MEET CCCWP CRITERIA FOR TREATMENT AND/OR FLOW CONTROL.
2. MINIMUM SURFACE AREA OF PLANTER IS 4% OF TRIBUTARY IMPERVIOUS AREA FOR TREATMENT ONLY DESIGN. FOR FLOW CONTROL AND TREATMENT, REFER TO CCCWP SIZING TOOL CRITERIA.
3. SHAPE OF PLANTER CAN VARY TO MEET PROJECT DESIGN REQUIREMENTS AND LOCATION.
4. CLASS 2 PERMEABLE MATERIAL
5. DOWNSPOUTS/INLET PIPES REQUIRE ENERGY DISSIPATION.
6. USE COUNTY APPROVED ADDITIVE MIXTURE FOR WATERPROOFING CONCRETE.
7. PLANTINGS: SEE CCCWP RECOMMENDED PLANT LIST AND GUIDELINES.
8. PLANTER DESIGN MAY REQUIRE STRUCTURAL ENGINEERING DESIGN.
9. AREA = W x L (ABOVE). EXCLUDES AREA OF VAULT

P:\Projects\San Diego County\133904 - SDCo Hydromod Management Plan\CAD\ES\CCCCP_FlowThruPlanter.dwg 6-09-08 08:58:44 PM estiles

**Flow-Through Planter Detail**

**PLAN**
N.T.S.

## NOTES:

1. HOT-DIP GALVANIZE ENTIRE FRAME ASSEMBLY AFTER FABRICATION AND AFTER HOLES HAVE BEEN DRILLED.
2. FOR WATERTIGHT CONNECTION, INSTALL $\frac{1}{8}$" TO $\frac{1}{4}$" THICK X 2" WIDE CONTINUOUS 30 DUROMETER NEOPRENE GASKET, ALL AROUND VAULT FRAME.

**SECTION**
N.T.S.

## GENERAL OUTLET DETAIL NOTES:

1. OUTFALL PIPE SHALL BE SIZED TO CONVEY DESIGN STORM PER CCCWP DESIGN CRITERIA.
2. GRATE SHALL BE MOUNTED USING STAINLESS STEEL HARDWARE AND PROVIDED WITH HINGED AND LOCKABLE OR BOLTABLE ACCESS PANELS.
3. GRATE SHALL BE STAINLESS STEEL, ALUMINUM OR STEEL. STEEL GRATES SHALL BE HOT DIP GALVANIZED AND MAY BE HOT POWDER PAINTED AFTER GALVANIZING.
4. GRATE SHALL BE DESIGNED SUCH THAT THE DIAGONAL DIMENSION OF EACH OPENING IS SMALLER THAN THE DIAMETER OF THE OUTLET PIPE.
5. STRUCTURAL DESIGN OF GRATE SHALL BE BASED ON FULL HYDROSTATIC HEAD WITH ZERO HEAD DOWNSTREAM OF GRATE.

# Flow-Through Planter Outlet Detail

# Dry Wells and Infiltration Basins

The typical dry well is a prefabricated structure, such as an open-bottomed vault or box, placed in an excavation or boring. The vault may be empty, which provides maximum space efficiency, or may be filled in rock.

An infiltration basin has the same functional components—a volume to store runoff and sufficient area to infiltrate that volume into the native soil—but is open rather than covered.

Note: Small diameter deep drilled storm water dry wells are not included in this sheet. These shall be considered "Alternative BMPs" and shall be sized per flow or volume based requirements.

**Best Uses**

- Alternative to bioretention in areas with permeable soils

**Advantages**

- Compact footprint
- Can be installed in paved areas

**Limitations**

- Can be used only on sites with "A" and "B" soils
- Requires minimum of 10' from bottom of facility to seasonal high groundwater
- Not suitable for drainage from some industrial areas or arterial roads
- Must be maintained to prevent clogging.

## ► CRITERIA

Dry wells and infiltration basins must be designed with the minimum volume calculated by Equation 4-8 using a unit volume based on the County of San Diego's 85$^{th}$ Percentile Isopluvial Map.

Consult with the local jurisdiction engineer regarding the need to verify soil permeability and other site conditions are suitable for dry wells and infiltration basins. Some proposed criteria are on Page 5-12 of Caltrans' 2004 *BMP Retrofit Pilot Study Final Report* (CTSW-RT-01-050).

The infiltration rate and infiltrative area must be sufficient to drain a full facility within 72 hours.

## ► DETAILS

Dry wells should be sited to allow for the potential future need for removal and replacement.

In locations where native soils are coarser than a medium sand, the area directly beneath the facility should be over-excavated by two feet and backfilled with sand as a groundwater protection measure.

**Design Checklist for Dry Well**

- ❒ Volume and infiltrative area meet or exceed minimum.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.
- ❒ Depth from bottom of the facility to seasonally high groundwater elevation is ≥10'.
- ❒ Areas tributary to the facility do not include automotive repair shops; car washes; fleet storage areas (Bus, truck, etc.); nurseries, or other uses that may present an exceptional threat to groundwater quality.
- ❒ Underlying soils are in Hydrologic Soil Group A or B. Infiltration rate is sufficient to ensure a full basin will drain completely within 72 hours. Soil infiltration rate has been confirmed.
- ❒ Set back from structures 10' or as recommended by structural or geotechnical engineer.

# Cistern or Vault with Bioretention Facility

A cistern or vault in series with a bioretention facility can meet treatment requirements where space is limited. In this configuration, the cistern or vault is equipped with a flow-control orifice and the bioretention facility is sized to treat a trickle outflow from the cistern or vault.

**Best Uses**

- In series with a bioretention facility to meet treatment requirement in limited space.
- Management of roof runoff
- Dense urban areas

**Advantages**

- Storage volume can be in any configuration

**Limitations**

- Somewhat complex to design, build, and operate
- Requires head for both cistern and bioretention facility

## ► CRITERIA

**Cistern or Vault.** The cistern or vault must detain the volume calculated by Equation 4-8 and must include an orifice or other device designed for a 24-hour drawdown time.

**Bioretention facility.** See the design sheet for bioretention facilities. The area of the bioretention facility must be sized to treat the maximum discharge flow, assuming a percolation rate of 5" per hour through the engineered soil.

**Use with sand filter.** A cistern or vault in series with a sand filter can meet treatment requirements. See the discussion of treatment facility selection in Chapter 2 and the design guidance for sand filters in Chapter 4.

## ► DETAILS

**Flow-control orifice.** The cistern or vault must be equipped with an orifice plate or other device to limit flow to the bioretention area.

**Preventing mosquito harborage.** Cisterns and vaults should be designed to drain completely, leaving no standing water. Drains should be located flush with the bottom of the cistern. Alternatively—or in addition—all entry and exit points, should be provided with traps or sealed or screened to prevent mosquito entry. Note mosquitoes can enter through openings $^{1}/_{16}$" or larger and will fly for many feet through pipes as small as ¼".

**Exclude debris.** Provide leaf guards and/or screens to prevent debris from accumulating in the cistern.

**Ensure access for maintenance.** Design the cistern or vault to allow for cleanout. Avoid creating the need for maintenance workers to enter a confined space. Ensure the outlet orifice can be easily accessed for cleaning and maintenance.

## ► APPLICATIONS

**Shallow ponding on a flat roof.** The "cistern" storage volume can be designed in any configuration, including simply storing rainfall on the roof where it falls and draining it away slowly. See the County of San Diego's 85$^{th}$ percentile isopluvial diagrams for required average depths.

**Cistern attached to a building and draining to a planter.** This arrangement allows a planter box to be constructed with a smaller area.

**Vault with pumped discharge to bioretention facility**. In this arrangement, runoff from a parking lot and/or building roofs can be captured and detained underground and then pumped to a bioretention facility on the surface. Alternatively, treatment can be accomplished with a sand filter. See the discussion of selection of storm water treatment facilities in Chapter 2.

**Water harvesting or gray water reuse**. It may be possible to create a site-specific design that uses cisterns or vaults to achieve storm water flow control, storm water treatment, and rainwater reuse for irrigation or indoor uses (**water harvesting**). Facilities must meet criteria for capturing and treating the volume specified by Equation 4-8. This volume must be allowed to empty within 24 hours so runoff from additional storms, which may follow, is also captured and treated. Additional volume may be required if the system also stores runoff for longer periods for reuse. Indoor uses of non-potable water may be restricted or prohibited. Check with municipal staff.

**Design Checklist for Cistern or Vault**

- ❒ Volume meets or exceeds minimum.
- ❒ Outlet with orifice or other flow-control device restricts flow and is designed to provide a 24-hour drawdown time.
- ❒ Outlet is piped to a bioretention facility designed to treat the maximum discharge from the cistern orifice.
- ❒ Cistern or vault is designed to drain completely and/or sealed to prevent mosquito harborage.
- ❒ Design provides for exclusion of debris and accessibility for maintenance.
- ❒ Overflow connected to a downstream storm drain or approved discharge point.
- ❒ Emergency spillage will be safely conveyed overland.

NOTES:
1. DESIGNER SHALL ACCOUNT FOR AND ACCOMODATE FOR POSSIBLE OVERFLOW.
2. OVERFLOW OUTLET CAPACITY SHALL EQUAL OR EXCEED POTENTIAL RUNOFF VOLUME AND RATE.
3. CISTERN PROVIDES FLOW CONTROL ONLY. USE IN COMBINATION WITH TREATMENT IMP.
4. PROVIDE ACCESS FOR CLEAN OUT OF OUTLET ORIFICE. SEE FLOW-THROUGH PLANTER OUTLET DETAIL.
5. PREVENT MOSQUITO BREEDING BY SEALING OR SCREENING ALL OPENINGS TO THE WATER SURFACE AND/OR ENSURE COMPLETE DRAINAGE.

# Storm Water Pollutant Sources/ Source Control Checklist

**How to use this worksheet (also see instructions in Step 4 of Chapter 3 of this BMP Manual):**

1. Review Column 1 and identify which of these potential sources of storm water pollutants apply to your site. Check each box that applies.

2. Review Column 2 and incorporate all of the corresponding applicable BMPs in your Project-Specific SUSMP drawings.

3. Review Columns 3 and 4 and incorporate all of the corresponding applicable permanent controls and operational BMPs in a table in your Project-Specific SUSMP. Use the format shown in Table 3-1 in Step 4 of Chapter 3 of this BMP Manual. Describe your specific BMPs in an accompanying narrative, and explain any special conditions or situations that required omitting BMPs or substituting alternatives.

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on SUSMP Drawings** | **3**<br>**Permanent Controls—List in SUSMP Table and Narrative** | **4**<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **A.** On-site storm drain inlets | ❑ Locations of inlets. | ❑ Mark all inlets with the words "No Dumping! Flows to Bay" or similar. | ❑ Maintain and periodically repaint or replace inlet markings.<br>❑ Provide storm water pollution prevention information to new site owners, lessees, or operators.<br>❑ See applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com<br>❑ Include the following in lease agreements: "Tenant shall not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains." |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| 1<br>Potential Sources of Runoff Pollutants | 2<br>Permanent Controls—Show on SUSMP Drawings | 3<br>Permanent Controls—List in SUSMP Table and Narrative | 4<br>Operational BMPs—Include in SUSMP Table and Narrative |
| ❑ **B.** Interior floor drains and elevator shaft sump pumps | | ❑ State that interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer. | ❑ Inspect and maintain drains to prevent blockages and overflow. |
| ❑ **C.** Interior parking garages | | ❑ State that parking garage floor drains will be plumbed to the sanitary sewer. | ❑ Inspect and maintain drains to prevent blockages and overflow. |
| ❑ **D1.** Need for future indoor & structural pest control | | ❑ Note building design features that discourage entry of pests. | ❑ Provide Integrated Pest Management information to owners, lessees, and operators. |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on SUSMP Drawings** | **3**<br>**Permanent Controls—List in SUSMP Table and Narrative** | **4**<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **D2.** Landscape/ Outdoor Pesticide Use | ❑ Show locations of native trees or areas of shrubs and ground cover to be undisturbed and retained.<br><br>❑ Show self-retaining landscape areas, if any.<br><br>❑ Show storm water treatment facilities. | State that final landscape plans will accomplish all of the following.<br><br>❑ Preserve existing native trees, shrubs, and ground cover to the maximum extent possible.<br><br>❑ Design landscaping to minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to storm water pollution.<br><br>❑ Where landscaped areas are used to retain or detain storm water, specify plants that are tolerant of saturated soil conditions.<br><br>❑ Consider using pest-resistant plants, especially adjacent to hardscape.<br><br>❑ To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions. | ❑ Maintain landscaping using minimum or no pesticides.<br><br>❑ See applicable operational BMPs in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com<br><br>❑ Provide IPM information to new owners, lessees, and operators. |
| ❑ **E.** Pools, spas, ponds, decorative fountains, and other water features. | ❑ Show location of water feature, nearest landscaped areas, and nearest storm drains. | ❑ Describe how water removed from the water feature would drain to nearby landscaping or be dechlorinated before discharge in accordance with City requirements. | ❑ See applicable operational BMPs in Fact Sheet SC-72, "Fountain and Pool Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on SUSMP Drawings** | **3**<br>**Permanent Controls—List in SUSMP Table and Narrative** | **4**<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **F.** Food service | ❑ For restaurants, grocery stores, and other food service operations, show location (indoors or in a covered area outdoors) of a floor sink or other area for cleaning floor mats, containers, and equipment.<br><br>❑ On the drawing, show a note that this drain will be connected to a grease interceptor before discharging to the sanitary sewer. | ❑ Describe the location and features of the designated cleaning area.<br><br>❑ Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated. | ❑ |
| ❑ **G.** Refuse areas | ❑ Show where site refuse and recycled materials will be handled and stored for pickup. See local municipal requirements for sizes and other details of refuse areas.<br><br>❑ If dumpsters or other receptacles are outdoors, show how the designated area will be covered, graded, and paved to prevent run-on and show locations of berms to prevent runoff from the area.<br><br>❑ Any drains from dumpsters, compactors, and tallow bin areas shall be connected to a grease removal device before discharge to sanitary sewer. | ❑ State how site refuse will be handled and provide supporting detail to what is shown on plans.<br><br>❑ State that signs will be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar. | ❑ State how the following will be implemented:<br><br>Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "no hazardous materials" signs. Inspect and pick up litter daily and clean up spills immediately. Keep spill control materials available on-site. See Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| **1**<br>**Potential Sources of Runoff Pollutants** | **2**<br>**Permanent Controls—Show on SUSMP Drawings** | **3**<br>**Permanent Controls—List in SUSMP Table and Narrative** | **4**<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **H.** Industrial processes. | ❑ Show process area. | ❑ If industrial processes are to be located on site, state: "All process activities to be performed indoors. No processes to drain to exterior or to storm drain system." | ❑ See Fact Sheet SC-10, "Non-Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| ❑ **I.** Outdoor storage of equipment or materials. (See rows J and K for source control measures for vehicle cleaning, repair, and maintenance.) | ❑ Show any outdoor storage areas, including how materials will be covered. Show how areas will be graded and bermed to prevent run-on or run-off from area.<br><br>❑ Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults.<br><br>❑ Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site. | ❑ Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.<br><br>Where appropriate, reference documentation of compliance with the requirements of local Hazardous Materials Programs for:<br><br>▪ Hazardous Waste Generation<br>▪ Hazardous Materials Release Response and Inventory<br>▪ California Accidental Release (CalARP)<br>▪ Aboveground Storage Tank<br>▪ Uniform Fire Code Article 80 Section 103(b) & (c) 1991<br>▪ Underground Storage Tank | ❑ See the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC-33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|

| ❑ **J.** Vehicle and Equipment Cleaning | ❑ Show on drawings as appropriate:<br><br>(1) Commercial/industrial facilities having vehicle /equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses.<br><br>(2) Multi-dwelling complexes shall have a paved, bermed, and covered car wash area (unless car washing is prohibited on-site and hoses are provided with an automatic shut-off to discourage such use).<br><br>(3) Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer.<br><br>(4) Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed. | ❑ If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced. | Describe operational measures to implement the following (if applicable):<br><br>❑ Wash water from vehicle and equipment washing operations shall not be discharged to the storm drain system.<br><br>❑ See Fact Sheet SC-21, "Vehicle and Equipment Cleaning," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on SUSMP Drawings** | 3<br>**Permanent Controls—List in SUSMP Table and Narrative** | 4<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **K.** Vehicle/Equipment Repair and Maintenance | ❑ Accommodate all vehicle equipment repair and maintenance indoors. Or designate an outdoor work area and design the area to prevent run-on and runoff of storm water.<br><br>❑ Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.<br><br>❑ Add a note on the plans that states either (1) there are no floor drains, or (2) floor drains are connected to wastewater pretreatment systems prior to discharge to the sanitary sewer and an industrial waste discharge permit will be obtained. | ❑ State that no vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area.<br><br>❑ State that there are no floor drains or if there are floor drains, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements.<br><br>❑ State that there are no tanks, containers or sinks to be used for parts cleaning or rinsing or, if there are, note the agency from which an industrial waste discharge permit will be obtained and that the design meets that agency's requirements. | In the SUSMP report, note that all of the following restrictions apply to use the site:<br><br>❑ No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinse water from parts cleaning into storm drains.<br><br>❑ No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately.<br><br>❑ No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment. |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on SUSMP Drawings** | 3<br>**Permanent Controls—List in SUSMP Table and Narrative** | 4<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **L.** Fuel Dispensing Areas | ❑ Fueling areas[3] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: a) graded at the minimum slope necessary to prevent ponding; and b) separated from the rest of the site by a grade break that prevents run-on of storm water to the maximum extent practicable.<br><br>❑ Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1].] The canopy [or cover] shall not drain onto the fueling area. | | ❑ The property owner shall dry sweep the fueling area routinely.<br><br>❑ See the Business Guide Sheet, "Automotive Service—Service Stations" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

[3] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on SUSMP Drawings** | 3<br>**Permanent Controls—List in SUSMP Table and Narrative** | 4<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **M.** Loading Docks | ❑ Show a preliminary design for the loading dock area, including roofing and drainage. Loading docks shall be covered and/or graded to minimize run-on to and runoff from the loading area. Roof downspouts shall be positioned to direct storm water away from the loading area. Water from loading dock areas should be drained to the sanitary sewer where feasible. Direct connections to storm drains from depressed loading docks are prohibited.<br><br>❑ Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation.<br><br>Provide a roof overhang over the loading area or install door skirts (cowling) at each bay that enclose the end of the trailer.<br><br>❑ | | ❑ Move loaded and unloaded items indoors as soon as possible.<br><br>❑ See Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |

| ❑ **N.** Fire Sprinkler Test Water | | ❑ Provide a means to drain fire sprinkler test water to the sanitary sewer. | ❑ See the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com |
| **O.** Miscellaneous Drain or Wash Water<br>❑ Boiler drain lines<br>❑ Condensate drain lines<br>❑ Rooftop equipment<br>❑ Drainage sumps<br>❑ Roofing, gutters, and trim. | | ❑ Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system.<br>❑ Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.<br>❑ Rooftop mounted equipment with potential to produce pollutants shall be roofed and/or have secondary containment.<br>❑ Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water.<br>❑ Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff. | |

| IF THESE SOURCES WILL BE ON THE PROJECT SITE ... | ... THEN YOUR STORMWATER CONTROL PLAN SHOULD INCLUDE THESE SOURCE CONTROL BMPs | | |
|---|---|---|---|
| 1<br>**Potential Sources of Runoff Pollutants** | 2<br>**Permanent Controls—Show on SUSMP Drawings** | 3<br>**Permanent Controls—List in SUSMP Table and Narrative** | 4<br>**Operational BMPs—Include in SUSMP Table and Narrative** |
| ❑ **P.** Plazas, sidewalks, and parking lots. | | | ❑ Plazas, sidewalks, and parking lots shall be swept regularly to prevent the accumulation of litter and debris. Debris from pressure washing shall be collected to prevent entry into the storm drain system. Wash water containing any cleaning agent or degreaser shall be collected and discharged to the sanitary sewer and not discharged to a storm drain. |

Appendix

D

# SWPPP and CSWMP Guidelines

## STORM WATER POLLUTION PREVENTION PLAN/CONSTRUCTION STORM WATER MANAGEMENT PLAN GUIDELINES

At a minimum, the Storm Water Pollution Prevention Plan (SWPPP) or Construction Storm Water Management Plan (CSWMP) whichever is required, must cover the areas listed below.

If a project disturbs 1-acre or more, the applicant must provide a Storm Water Pollution Prevention Plan (SWPPP), which identifies all construction BMP requirements required by Chapter Six, in accordance with the State General Permit for Storm Water Discharges Associated with Construction Activity (State General Construction Permit). The SWPPP must be kept on site and made available upon request of a representative of the City. Additionally, the State General Construction Permit has a requirement for a sampling and monitoring program to be implemented. Projects that are also required to obtain a general construction National Pollutant Discharge Elimination System (NPDES) Permit are encouraged to visit the State Water Resource Control Board's website for permit application instructions, NOI and NOT forms and guidance in preparing a Storm Water Pollution Prevention Plan (go to: http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml).

For projects that disturb less than 1-acre and are determined to have a potential to impact water quality during construction, the applicant must provide a Construction Storm Water Management Plan (CSWMP), which identifies all construction BMP requirements required by Chapter Six, with the project submittal. The CSWMP shall depict the BMPs to be implemented during construction to reduce/eliminate discharges of pollutants to the storm drain conveyance system. The CSWMP shall include but not be limited to erosion and sediment control BMPs, good housekeeping measures and site and materials management.

Planning and Organization

- Identify the pollution prevention team members who will maintain and implement the SWPPP/CSWMP.
- If applicable, incorporate or reference the appropriate elements of other regulatory requirements.

Site Map

Features displayed on the map must include:

- An outline of the entire property
- Drainage areas on the property and direction of flow
- Areas of soil erosion
- Nearby water bodies and municipal storm drain inlets
- Location of storm water conveyance systems (ditches, inlets, storm drains, etc.)
- Location of existing storm water controls (oil/ water separators, sumps, etc.)
- Location of "impervious" areas- paved areas, buildings, covered areas
- Locations where materials are directly exposed to storm water
- Locations where toxic or hazardous materials have spilled in the past
- Location of building and activity areas (e.g. fueling islands, garages, waste container area, wash racks, hazardous material storage areas, etc.)

List of Significant Materials

List materials stored and handled at the site. Include the location and typical quantities.

Description of Potential Pollutant Sources

- Provide a narrative description of the site's activities and list the potential pollutant sources and the

potential pollutants that could be discharged in storm water discharges from each activity.

- List non-storm water discharges including the source, quantity, frequency, and characteristics of the discharges and drainage area.

Assessment of Potential Sources

Describe which activities are likely to be sources of pollution in storm water and which pollutants are likely to be present in storm water discharges.

Best Management Practices

Describe the BMPs that will be implemented at the site for each potential pollutant and its source.

Appendix

E

# Example Construction Best Management Practices

## A. Erosion Control

Physical stabilization BMPs, vegetation stabilization BMPs, or both, will be required to prevent erosion and sediment runoff from exposed graded areas. BMPs for physical and vegetation stabilization include:

1) Physical Stabilization

a) Geotextiles
b) Mats
c) Fiber blankets
d) Hydraulic mulch, Bonded Fiber Matrix
e) Sprayed on binders
f) Mulch on flat areas
g) Other material approved by the City Engineer for use in specific circumstances

If physical stabilization is selected, materials must be appropriate to the circumstances in which they are deployed, and sufficient material must be deployed.

2) Vegetation Stabilization

h) Preservation of existing vegetation
i) Established interim vegetation (via Hydroseed, seeded mats, etc.)
j) Established permanent landscaping

If vegetation stabilization is selected, the stabilizing vegetation must be installed, irrigated and established (uniform vegetative coverage with 70% coverage established) prior to October 1. In the event stabilizing vegetation has not been established by October 1, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.

## B. Sediment Control

1) Perimeter protection. Protect the perimeter of the site or exposed area from sediment ingress/discharge in sheet flows using:

k) Silt fencing
l) Gravel bag barriers
m) Fiber rolls

2) Resource protection. Protect Environmentally Sensitive Areas and watercourses from sediment in sheet flows by using**:**

a) Silt fencing
b) Gravel bag barriers
c) Fiber rolls

3) Sediment Capture. Capture sediments in channeled storm water by using:

a) Storm-drain inlet protection measures
b) De-silting basins (Designed in accordance with an industry standard such as Caltrans, California Storm water BMP manual etc. If the project is 5 acres or greater the desilting basin(s) must be designed in accordance with the State General Construction Permit, Order DWQ 99-08.)

4) Velocity Reduction. Reduce the velocity of storm water by using:

a) Outlet protection (energy dissipater)
b) Equalization basins
c) Check dams

5) Off-site Sediment Tracking. Prevent sediment from being tracked off-site by using:

a) Stabilized construction entrances/exits
b) Construction road stabilization
c) Tracking control (i.e., corrugated steel panels, wheel washes)
d) Dust control

**C. Materials Management**

6) Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

a) Solid
b) Sanitary
c) Concrete
d) Hazardous
e) Equipment – related wastes
f) Stock piles (protection from wind and rain)

7) Prevent the contamination of storm water by construction materials by:

a) Covering and/or providing secondary containment of storage areas
b) Taking adequate precautions when handling materials.

# SPCBMPP Worksheet

CITY OF LA MESA
JEWEL of the HILLS

# Standard Post-Construction BMP Plan

Standard Permanent Storm Water BMPs

Project Name: _____ Project Address: _____
Person completing form: _____Telephone number: (____)____-_____
Signature: _____ Date: ____/_____/_____

The following planning, design, and post-construction BMPs are required for all land development and redevelopment projects in the City of La Mesa. All BMPs listed below shall be selected and implemented where applicable and feasible.

List pollutants of concern: _____

**Each selected BMP must be shown on the applicable plan(s) for the project.**

| Required BMPs | Check if Selected | If the BMP is not selected, explain why below (attach additional pages if necessary). |
|---|---|---|
| **1. BMPs for permanent control of erosion from slopes.** | | |
| a. Convey runoff safely from the tops of slopes | | |
| b. Vegetate slopes with native or drought tolerant vegetation | | |
| c. Other (describe): | | |
| **2. BMPs to control flows, velocity and erosion.** Flow control and downstream erosion protection measures shall prevent any significant increase in downstream erosion as a result of the new development, but shall not prevent flows needed to sustain downstream riparian habitats or wetlands. | | |
| a. Minimize disturbances to Natural Drainages | | |
| b. Stabilize permanent channel crossings | | |
| c. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels | | |
| d. Provide buffer zones for natural water bodies | | |
| e. Other (describe): | | |
| **3. Low Impact Development (LID) and site design BMPs.** | | |
| a. Conserve natural areas, soils, and vegetation where feasible | | |
| b. Construct walkways, trails, patios. overflow parking lots, alleys, and other low-traffic areas with permeable surfaces | | |
| c. Construct impervious surfaces to minimum widths necessary | | |
| d. Use natural drainage systems | | |
| e. Minimize soil compaction in areas that will remain pervious after development | | |

| Required BMPs | Check if Selected | If the BMP is not selected, explain why below (attach additional pages if necessary). |
|---|---|---|
| f. Drain runoff from impervious roofs into adjacent landscaping | | |
| g. Drain runoff from impervious sidewalks and/or walkways into adjacent landscaping | | |
| h. Drain runoff from impervious parking lots into adjacent landscaping | | |
| i. Drain runoff from other impervious areas into adjacent landscaping | | |
| j. Other (describe): | | |
| **4. Storm drain stenciling and signage** | | |
| **5. BMPs for outdoor materials storage and exposed work areas,** to reduce pollution introduction. | | |
| a. Provide overhead coverage for outdoor storage or work areas | | |
| b. Divert storm water run-on away from outdoor storage or work areas | | |
| **6. BMPs for trash storage areas,** to reduce pollution introduction. Store trash containers on an impervious surface in a screened or walled area designed to prevent run-on from flowing through the trash area, and provide a roof or awning to prevent direct contact with rain. | | |
| **7. BMPs for irrigation systems and landscape design**, to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential developments) | | |
| a. Use rain shutoff devices | | |
| b. Design irrigation system to each landscape area's water requirements | | |
| c. Use flow reducers | | |
| d. Other (describe): | | |
| **8. Structural BMPs**[1] to treat and/or to infiltrate storm water where a development project would otherwise cause or contribute to a violation of water quality standards in receiving waters. | | |

[1] Off-site structural BMPs may be used for treatment and infiltration necessary to meet water quality standards only if the conveyance of run-off to those facilities prior to treatment will not cause or contribute to an exceedance of water quality standards or deprive wetlands or riparian habitats of needed flows. Offsite facilities shall not substitute for the use of any on-site source control BMPs required by the manual. When an infiltration BMP is used, related BMPs set out in the manual (including but not limited to siting constraints), to protect present uses of ground water and future uses of that ground water as currently designated in the applicable RWQCB Basin Plan. (Discharges to infiltration BMPs may also require an RWQCB permit and additional state requirements may also be applicable to these discharges.)

***City Use Only***

**If Structural BMPs are proposed, a maintenance agreement is required. Has a maintenance agreement for this project been submitted? □ Yes □ No □ NA**

**Approved □ Yes □ No**

# ATTACHMENT 2.2

# UPDATED APPENDIX 'A' STORM WATER REQUIREMENTS CHECKLIST

# APPENDIX 'A' – STORM WATER REQUIREMENTS AND PROJECT DATA SHEET

**PUBLIC WORKS DEPARTMENT / ENGINEERING DIVISION**
**8130 Allison Avenue, La Mesa, CA 91942**
**Phone: 619.667.1166 • Fax: 619.667.1380**

**PROJECT DATA:**

**Owner's Name & Phone No:** _____

**Address:** _____ **Permit No:** _____

**Project:** _____ **Date Applied:** _____

**PROJECT SITE DATA:**

1. Total area of the lot/parcel = _____ sf
2. Existing impervious area = _____ sf
3. Impervious area after development = _____ sf
4. Total area to be disturbed = _____ sf
5. Identify if the runoff from the site discharged to the public street or storm drain or open channel, detention or retention basin: Choose One
6. Watershed (Check One): San Diego River Watershed ☐ San Diego Bay Watershed ☐

---

a. Total disturbed area includes impervious area, construction material storage, staging area, graded slopes, new slopes and landscape areas.

b. The information shall be shown on the site/grading plans.

c. Complete Storm Water Requirements Applicability Checklist.

Notes:

- Items 1 through 6 shall be shown on the site development plan/grading plan.
- The applicant may be required to submit SWPPP or CSWMP, and PCWQTR or SPCBMPP depending on the "Priority" as stated below.
- A Hydrology report may be required.

**STORM WATER REQUIREMENTS APPLICABILITY CHECKLIST**

Complete Sections 1 and 2 of the checklist to determine which permanent best management practices (BMPs) and which construction BMPs are required for your project for storm water. *This form must be completed and submitted with your permit application.*

**SECTION 1. PERMANENT STORM WATER BMP REQUIREMENTS**:

| | Yes | No |
|---|---|---|
| 1. Is the project a new development? | ☐ | ☐ |
| 2. Is the project a significant redevelopment that adds/replaces/creates at least 5,000 $ft^2$ of impervious surface?* | ☐ | ☐ |
| * *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for an expanded definition of "significant redevelopment".* | | |

If both of the above answers are "No", go to Part B. If either of the above answers is "Yes", complete Part A below.

**PART A: DETERMINE PRIORITY DEVELOPMENT PROJECT PERMANENT STORM WATER BMP REQUIREMENTS.**

| ***DOES THE PROJECT MEET THE DEFINITION OF ONE OR MORE OF THE PRIORITY PROJECT CATEGORIES AS DEFINED IN LA MESA'S BMP MANUAL, PART II? (SEE GLOSSARY)**** | Yes | No |
|---|---|---|
| 1. Residential development resulting in the disturbance of one acre or more of land or comprised of 10 or more attached or detached dwelling units? | ☐ | ☐ |
| 2. Commercial development resulting in the disturbance of one acre or more of land? | ☐ | ☐ |
| 3. Industrial development resulting in the disturbance of one acre or more of land? | ☐ | ☐ |
| 4. Automotive repair shop? | ☐ | ☐ |
| 5. Restaurant greater than 5,000 square feet? | ☐ | ☐ |
| 6. Steep (slope of 25% or more) hillside development that will create greater than 5,000 square feet of impervious surface? | ☐ | ☐ |
| 7. Project located within or directly adjacent to (within 200 feet) or directly discharging to an Environmentally Sensitive Area (ESA) and creates at least 2,500 square feet of impervious area or increases impervious area to 10% or more of its naturally occurring condition? | ☐ | ☐ |
| 8. "Parking lot" greater than or equal to 5,000 square feet or with at least 15 parking spaces, and potentially exposed to urban runoff? | ☐ | ☐ |
| 9. "Streets, roads, highways, and freeways" that would create a new paved surface that is 5,000 square feet or greater? | ☐ | ☐ |
| 10. "Retail Gasoline Outlets" either 5,000 square feet or greater or with a projected "Average Daily Traffic" of 100 or more vehicles per day | ☐ | ☐ |
| 11. All other pollutant generating Development Projects that result in the disturbance of one acre or more of land. Generally all projects which include impervious surfaces and/or introduce landscaping that requires routine use of fertilizers and pesticides are considered pollutant generating above background levels. | ☐ | ☐ |
| ***** *Refer to the Glossary in La Mesa's Storm Water BMP Manual Part II for expanded definitions of the priority development project categories.* | | |

*Limited Exclusion*: Trenching and resurfacing work associated with utility projects, such as resurfacing and reconfiguring surface parking lots and existing roadways, new sidewalk construction, pedestrian ramps, bike lanes on existing roads, and routine replacement of damaged pavement, such as pothole repair, are not considered priority development projects. Linear pathway projects that are for infrequent vehicle use, such as emergency or maintenance access, or for pedestrian or bicycle use, are not considered pollutant generating above background levels if they are built with pervious surfaces or if they sheet flow to surrounding pervious surfaces. Parking lots, buildings and other structures associated with utility projects are priority development projects if one or more of the criteria in Part A are met.

If all answers to Part A are "No", continue to Part B.

**PART B: DETERMINE STANDARD PERMANENT STORM WATER REQUIREMENTS.**

| ***DOES THE PROJECT PROPOSE:*** | **Yes** | **No** |
|---|---|---|
| 1. New impervious areas such as rooftops, roads, parking lots, driveways, paths and sidewalks? | ☐ | ☐ |
| 2. New pervious landscape areas and irrigation systems? | ☐ | ☐ |
| 3. Permanent structures within 100 feet of any natural water body? | ☐ | ☐ |
| 4. Trash storage areas? | ☐ | ☐ |
| 5. Liquid or solid material loading and unloading areas? | ☐ | ☐ |
| 6. Vehicle or equipment fueling, washing, or maintenance areas? | ☐ | ☐ |
| 7. Require a General NPDES Permit for storm water discharges associated with industrial activities* (Except construction)? | ☐ | ☐ |
| 8. Commercial/ industrial waste handling or storage, excluding typical office or household waste? | ☐ | ☐ |
| 9. Any grading or ground disturbance during construction? | ☐ | ☐ |
| 10. Any new storm drains, or alteration to existing storm drains? | ☐ | ☐ |
| **To find out if your project is required to obtain an individual General NPDES Permit for Storm Water Discharges Associated with Industrial Activities, visit the State Water Resources Control Board web site at, www.swrcb.ca.gov/water_issues/programs/stormwater/industrial.shtml* | | |

If any of the answers provided in Section 1, Part A are "Yes," the project is subject to the "Priority Development Project Permanent Storm Water BMP Requirements". A Post Construction Water Quality Technical Report (PCWQTR) shall be submitted; the requirements of the City's Storm Water BMP Manual Part II must be satisfied. In particular, see Chapters 1 through 5 of the *Storm Water BMP Manual*. All Priority Development Project are also subject to the Hydromodification Management Requirements as discussed in the City's *Storm Water BMP Manual, Part II*, and must demonstrate compliance.

If all answers provided in Section 1, Part A are "No," and any answers to Part B are "Yes," the project is only subject to the Standard Permanent Storm Water BMP Requirements and shall submit a Standard Post-Construction BMP Plan (SPCBMPP). In particular, see Appendix G of the City's *Storm Water BMP Manual*, Part II.

If every question in Part A and B is answered "No," the project is exempt from permanent storm water requirements.

| Required submittals, Section 1: | ☐ | PCWQTR | ☐ | SPCBMPP | ☐ | Hydromodification |
|---|---|---|---|---|---|---|

**SECTION 2. CONSTRUCTION STORM WATER BMP REQUIREMENTS**:

**PART C: DETERMINE CONSTRUCTION PHASE STORM WATER REQUIREMENTS.**

| ***WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?*** | **Yes** | **No** |
|---|---|---|
| 1. Does the project proposed grading or soil disturbance over one acre? | ☐ | ☐ |
| 2. Does the project propose any grading or soil disturbance? | ☐ | ☐ |
| 3. Would storm water or urban runoff have the potential to contact any portion of the construction area, including washing and staging areas? | ☐ | ☐ |
| 4. Would the project use any construction materials that could negatively affect water quality if discharged from the site (such as paints, solvents, concrete and stucco)? | ☐ | ☐ |

If the answer to question 1 of Part C is answered "Yes," your project is subject to California's statewide General NPDES Permit for Storm Water Discharges Associated with Construction Activities and the City's Construction Storm Water BMP Performance Standards. A Storm Water Pollution Prevention Plan (SWPPP) and Notice of Intent to enroll in the General Construction Permit must be prepared. Parts D and E of this form must also be completed.

If the answer to question 1 is "No," but the answer to any of the remaining questions is "Yes," your project is subject to Construction Storm Water BMP Performance Standards and a Construction Storm Water Management Plan (CSWMP) must be prepared and Part E of this form must be completed.

If every question in Part C is answered "No," you do not need to completed Parts D and E of this form and neither a SWPPP nor a CSWMP is required.

**PART D: DETERMINE ADVANCE TREATMENT SUBJECTIVITY**

| **WOULD THE PROJECT MEET ANY OF THESE CRITERIA DURING CONSTRUCTION?** | **Yes** | **No** |
|---|---|---|
| 1. Is the project located within, adjacent to, or a portion of the site within 200 feet of waters listed on the CWA Section 303(d) list of Water Quality Limited Segments as impaired for sedimentation or turbidity? | ☐ | ☐ |
| 2. Will the project disturb more than five acres, including all phases of the development? | ☐ | ☐ |
| If the answers to 1 and 2 are both "yes", please answer questions 3 and 4 below. | | |
| 3. Will the project disturbed slopes steeper than 4:1 (horizontal: vertical) and higher than 10 feet that drain toward the 303(d) listed receiving water? | ☐ | ☐ |
| 4. Does the project contain a predominance of soils with USDA-NRCS Erosion factors $k_f$ greater than or equal to 0.4? | ☐ | ☐ |

If <u>all</u> answers to part D are "yes", the project is subject to the City's advanced treatment requirements for construction. Advanced treatment requirements are detailed in Chapter 6 of the *Storm Water BMP Manual,* Part II. Note that even if the above criteria do not apply, advanced treatment may be required at the discretion of the City Engineer based.

| <u>Required submittals, Section 2</u>: | ☐ | SWPPP, NOI | ☐ | CSWMP | ☐ | Advanced Treatment |
|---|---|---|---|---|---|---|

**PART E: DETERMINE CONSTRUCTION SITE PRIORITY**

In accordance with the Municipal Permit, each construction site with construction storm water BMP requirements must be designated with a priority: high, medium or low. This prioritization must be completed with this form, noted on the plans and included in the SWPPP or CSWMP. See the attached flow chart for guidance on determining the construction prioritization. The City Engineer may adjust the priority of the projects both before and during construction.

* Sites with a low or medium threat to water quality priority can be given a higher threat prioritization at the discretion of City staff based on additional factors, such as project type and non-storm water discharge potential.

Note: High soil erosion potential and significant slope are determined at the discretion of City staff.

According to the attached flow chart this project has the following threat to water quality priority:

☐ A) High Priority ☐ B) Medium Priority ☐ C) Low Priority

*[Note: The construction priority DOES NOT change construction BMP requirements that apply to projects; all construction BMP requirements must be identified on a case-by-case basis. The construction priority DOES affect the frequency of inspections that will be conducted by the City.]*

## STORM WATER POLLUTION PREVENTION, DISCHARGE & EROSION CONTROL

Under the regulations that govern grading and construction activities in the (City of La Mesa Municipal Code Sections 7.18. and 14.05) property owners and permit holders are required to control erosion and storm water pollution by incorporating erosion and storm water pollution prevention Best Management Practices (BMPs) into all construction projects. Property owners and employed contractors are responsible for adhering the City's Construction BMP Standards including installing as needed:

- Sediment Control BMPs
- Erosion Control BMPs
- Materials Management BMPs
- Tracking Control BMPs

Additional information related Construction BMPs can be obtained at the Engineering Counter at City Hall, or at **www.cityoflamesa.com/stormwater**.

City inspectors will be inspecting your project periodically to ensure that required BMPs are installed correctly onsite. Property owners and the contractors are responsible for ensuring that the site is in compliance. The City will issue a Notice of Violation to both the contractor and owner for occurrences of non-compliance. Repeated violators may be subject to an administrative citation penalty.

*I/We the owner/agent agree to follow Construction Best Management Practices and perform construction accordingly. We, the owners also agree to comply with City Storm Water Pollution Prevention Ordinance and permit the city employees to enter our property at any time to inspect for compliance with the ordinance/municipal code sections listed above.*

## RELATIONSHIP BETWEEN PERFORMANCE STANDARDS, SITE MANAGEMENT REQUIREMENTS AND BMPs

Site management requirements and BMPs are the tools necessary to achieve compliance with the performance standards. When properly implemented, monitored and maintained, the site management requirements and BMPs will function as a system to prevent pollutants (including sediment) from leaving the site.

The City of La Mesa is committed to protecting the public interest and the environment from pollutants in site runoff. We are asking for your support and cooperation in making sure that all construction sites comply with these standards.

Your cooperation will enable all of us to share the benefits of a cleaner environment without the expense of enforcement actions.

GENERAL The owner/contractor shall notify the City ***at least 48 hrs*** prior to commencement of any type of grading and/or construction activities. Erosion control plans shall be required in conjunction with the grading plans in the event the site is exposed to erosion during the period between November 1 and April 15.

Erosion control measures shall include, but not be limited to the following;

1. All building pads shall be diked and the dikes maintained to prevent water from flowing from the pad until the streets and driveways are paved and water can flow from the pads without causing erosion; drainage facilities shall be constructed to the satisfaction of the City Engineer that will allow water to drain from the pad without causing erosion.
2. The tops of all slopes shall be diked or trenched to prevent water from flowing over the crests of slopes.
3. As soon as cuts or embankments are completed, but no later than November 1, all cut and fill slopes shall be stabilized with a hydro mulch mixture or an equal treatment approved by the City Engineer. Between November 1 and April 30, approved slope protection measures shall proceed immediately behind the exposure of cut slopes and/or the creation of embankment slopes.
4. An irrigation system shall be installed not later than May 15 following the planting of the slopes.
5. Gravel bag check dams shall be placed in a manner approved by the City Engineer in unpaved streets with gradients in excess of 2% and or in other graded or excavated areas as required by the City Engineer. The location and details of the sand bags shall be shown on the plans, if required.
6. Catch basins, desilting basins and storm drain systems shall be installed to the satisfaction of the City Engineer.
7. At or near every point where concentrated flow leaves the development, a desilting basin and an energy dissipater may be required to be constructed to remove silt from the water and release the water at a non-erosive velocity.
8. The owner/contractor shall maintain the plantings and erosion control measures described above. The owner/contractor shall remove all soil intercepted by the sand bags, catch basins and desilting basins and keep these facilities clean and free of silt and sand as directed by the City Engineer. The owner/contractor shall repair any eroded slopes as directed by the geotechnical engineer.
9. The City of La Mesa reserves the right to provide emergency temporary erosion control measures during, if the owner/Contractor fails to provide such controlling measures, and charge double the expenses plus overhead to the owner/contractor.

## PERFORMANCE STANDARDS

- No measurable sediment pollution in runoff from the site.
- Rills or gullies on slopes shall not be greater than 3" wide or deep and must be repaired as soon as it is safe to do so.
- The velocity **of water leaving the site must not be greater than pre-construction levels.**

Property owners are responsible for meeting the performance standards described above. These performance standards cannot be achieved without proper site management and effective BMPs.

## SITE MANAGEMENT REQUIREMENTS

All construction sites must implement BMPs in accordance with the City's dry and wet season requirements, which are detailed below.

### A. Dry Season Requirements (May 1 through September 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.
- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.
- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.

### B. Rainy Season Requirements (October 1 through April 30) include but are not limited to:

- All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads, and slopes. (Slopes greater than 33.3% or 3:1 vertical vs. horizontal may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement)
- Adequate perimeter protection BMPs must be installed and maintained to comply with performance standards (above).
- Adequate sediment containment BMPs must be installed and maintained to comply with performance standards (above).
- Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.
- At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and to prevent sediment discharges must be stored on the site. Areas that have already been protected from erosion using physical stabilization or vegetation stabilization BMPS are not considered to be "exposed" for purposes of this requirement.
- The owner/contractor must have an approved "weather triggered" action plan and have the ability to deploy standby BMPs as needed to completely protect the exposed portions of the site within 24 hours of prediction of a storm event (a forecasted 40% chance of rain).
- Deployment of physical or vegetation erosion control BMPs must commence as soon as grading and/or excavation is completed for any portion of the site. The project proponent may not continue to rely on the ability to deploy standby BMP materials to prevent erosion of graded areas that have been completed.

- The amount of cleared or graded areas left exposed at any given time is limited to 17 acres or to the alternate maximum area approved by the City in writing.
- A washout area shall be designated and maintained for materials such as concrete, stucco, paint, caulking, sealants, drywall plaster, etc.
- Properly protected, designated storage areas are required for materials and wastes.
- All stockpiles of materials and wastes should be covered when materials are not being actively added or removed.
- Remnant trash and debris shall be removed and/or properly stored/disposed of daily.
- Storage, service, cleaning, and maintenance areas for vehicles and equipment shall be identified and protected accordingly.
- Materials for spill control/containment must be stockpiled onsite.
- Non-storm water discharges must be eliminated or controlled to the MEP.
- Erosion control BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- Perimeter protection and sediment containment BMPs must be upgraded if necessary to provide sufficient protection for storms likely to occur during the rainy season.
- Adequate soil stabilization and erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a selected BMP fails, it must be repaired, improved, or replaced with an acceptable alternate as soon as it is safe to do so.

- All vegetation erosion prevention BMPs must be established prior to the rainy season to be considered as a BMP.
- Standby erosion and sediment control BMPs must be able to protect all exposed soil areas. A disturbed area that is not completed but that is not being actively graded must be fully protected from erosion if left for seven or more calendar days. The ability to deploy standby BMP materials is not sufficient for these areas.

## BEST MANAGEMENT PRACTICES

Every construction site within the City's jurisdiction is required to select, install, and maintain construction BMPs to reduce, retain, and manage pollutant discharges to the maximum extent practicable. The BMPs listed below are required by the City where applicable. The corresponding Caltrans fact sheet for the listed BMPs is indicated in parenthesis. These fact sheets are obtainable from the Caltrans Storm Water Quality Handbooks Construction Site BMP Manual (2003) and provide additional details on how to implement the BMP.

Please check all BMPs below that are applicable and feasible for the construction that will be implemented and maintained for the length of construction.

- ☐ Preserve natural hydrologic features where feasible
- ☐ Preserve riparian buffers and corridors where feasible
- ☐ Minimize areas that are cleared and graded to only the portion of the site that is necessary for construction
- ☐ Minimize exposure time of disturbed soil areas
- ☐ Minimize grading during the wet season and correlate grading with seasonal dry weather periods to the extent feasible
- ☐ Temporarily stabilize and reseed disturbed soil areas as rapidly as feasible
- ☐ Preserve existing vegetation where feasible (SS-2)
- ☐ Establish permanent re-vegetation or landscaping as early as feasible

Prevent the contamination of storm water from vehicles and equipment through proper management of the following types of activities:

- ☐ Cleaning (NS-8)
- ☐ Fueling (NS-9)
- ☐ Maintenance (NS-10)

Prevent the contamination of storm water from construction materials through proper management of the following types of activities:

- ☐ Material Delivery and Storage (WM-1)
- ☐ Material Use (WM-2)
- ☐ Stockpile Management1 (WM-3)
- ☐ Spill Prevention and Control (WM-4)

Prevent the contamination of storm water by wastes through proper management of the following types of wastes:

- ☐ Solid Waste (WM-5)
- ☐ Hazardous Waste (WM-6)
- ☐ Contaminated Soil (WM-7)
- ☐ Concrete (WM-8)
- ☐ Sanitary Waste (WM-9)
- ☐ Liquid (WM-10)

Prevent the contamination of storm water through proper management of the follow activities:

- ☐ Water Conservation Practices (NS-1)
- ☐ Dewatering Operations (NS-2)
- ☐ Paving and Grinding (NS-3)
- ☐ Potable Water/Irrigation and Flushing (NS-7)

Prevent erosion and sediment runoff from exposed graded areas through physical stabilization and/or vegetation stabilization[2] by implementing <u>one or more</u> of the following BMPs:

- ☐ Hydraulic Mulch (SS-3)
- ☐ Hydroseeding (SS-4)
- ☐ Soil Binders (SS-5)
- ☐ Straw Mulch (SS-6)
- ☐ Geotextiles, Plastic Covers, and Erosion Control Blankets/Mats (SS-7)
- ☐ Wood Mulch (SS-8)
- ☐ Earth Dikes/Drainage Swales (SS-9)

Reduce the velocity of storm water by using <u>one or more</u> of the following:

- ☐ Outlet Protection/Velocity Dissipation (SS-10)
- ☐ Slope Drains (SS-11)

Protect the Perimeter of the site or exposed area from sediment discharge using <u>one or more</u> of the following:

- ☐ Silt Fence (SC-1)
- ☐ Gravel Bag Berm (SC-6)
- ☐ Fiber Rolls (SC-5)

Capture sediments in channeled storm water by using <u>one or more</u> of the following:

- ☐ De-silting Basin3 (SC-2)
- ☐ Storm Drain Inlet Protection (SC-10)
- ☐ Sediment Trap (SC-3)
- ☐ Gravel Bag Barrier (SC-8)

Prevent sediment from being tracked off-site by using <u>one or more</u> of the following:

- ☐ Stabilized Construction Entrance (TC-1)
- ☐ Construction Road Stabilization (TC-2)
- ☐ Entrance/Exit Tire Wash (TC-3)
- ☐ Street Sweeping (SC-7)

Notes on above BMPs:

1. Stockpiles should be fully covered when materials are not being added or removed.
2. Vegetation stabilization BMPs must be installed, irrigated, and established (uniform vegetative coverage with 70% coverage established) prior to October 1st. In the event stabilizing vegetation has not been established by October 1st, other forms of physical stabilization must be employed to prevent erosion until the stabilizing vegetation is established.
3. De-silting basins must be designed in accordance with industry standards such as Caltrans.

It is the responsibility of the property owner and permit holder to select, install and maintain appropriate BMPs. BMPs must be installed in accordance with an industry standard (e.g., Caltrans or California Storm water BMP Handbook).

At a minimum, the City requires that at least one of the BMPs listed in each category (A-E) below be installed and

maintained for all grading projects.

**A. Erosion Control**

Physical Stabilization BMPs, Hydraulic Stabilization BMPs, Vegetation Stabilization BMPs or a combination thereof, will be required to prevent erosion from exposed slopes. The City will not accept tracking, mulch, non-watered hydroseed or jute netting as a means to protect exposed slopes from erosion.

City approved BMPs for erosion control are as follows:

1. Physical Stabilization
   a) Geotextiles
   b) Straw or Coconut Blankets
2. Hydraulic Stabilization
   a) Bonded Fiber Matrix
3. Vegetation Stabilization
   a) Established interim vegetation (e.g., hydroseed)
   b) Established permanent landscaping

If vegetation stabilization (planting, hydroseeding) is selected for erosion control, the vegetative cover must be established by October 1st. If, in the opinion of the City Official, the vegetative cover is not established by October 1st, additional hydraulic or physical erosion control BMPs will be required.

**B. Sediment Control**

City approved BMPs for sediment control are as follows:

1. Perimeter Protection – Protect the perimeter of the site or disturbed area from sediment discharge.
   a) Silt Fencing
   b) Gravel Bags
   c) Straw Wattles
2. Resource Protection – Protect environmentally sensitive areas and watercourses from sediment.
   a) Silt Fencing
   b) Gravel Bags
   c) Straw Wattles

Private streets & paved area shall be swept by combination of broom and / or air vacuum sweepers.

**C. Offsite Sediment Control**

City approved BMPs for offsite sediment tracking control are as follows:

1. Offsite Sediment Tracking – Prevent sediment from being tracked offsite.
   a) Stabilized Construction Entrance
   b) Entrance/Exit Tire Wash
   c) Entrance/Exit Inspection and Cleaning Facility
   d) Streets shall be swept by combination of broom and / or air vacuum sweepers.

**D. Velocity Reduction**

City approved BMPs for velocity reduction are as follows:

1. Velocity Reduction – Reduce the velocity of stormwater runoff to prevent erosion.
   a) Outlet Protection
   b) Energy Dissipator

**E. General Site Management**

City approved BMPs for site management are as follows:

1. Construction Waste Handling – Prevent the contamination of storm water runoff by wastes through proper waste management.
   a) Solid Waste
   b) Sanitary Waste
   c) Concrete Waste
   d) Hazardous Waste
2. Materials Management – Prevent the contamination of storm water runoff by storage or handling of construction materials.

# MUNICIPAL INSPECTION FORM

# City of La Mesa
## Storm Water Quality Inspection for Municipal Facilities

Inspector Name _____

Date____/____/_____Time_____AM / PM  Type of Inspection: ☐ Routine ☐ Follow-up ☐ Complaint Investigation

## A. Contact Information

Facility Name_____

Street Address_____ Mailing Address_____

_____ _____

Manager/Operator(s)_____

Telephone (□□□□□□) _____ - □□□□□□□□□□ ext._____ Fax (□□□□□□□) _____ - □□□□□□□□□□

Manager/Operator(s) Email:_____

Facility Personnel Present_____

## B. Facility Site Information

Principal activity:_____

JURMP Classification_____

New JURMP Classification?_____

Does facility maintain SWPPP/BMP Plan? ☐ Yes ☐ No

If yes, what is the date of last SWPPP/BMP Plan revision?_____

If yes, does the SWPPP/BMP Plan include applicable minimum BMPs from the JURMP? (if no, describe in Section E) ☐ Yes ☐ No

If yes, does the SWPPP/BMP Plan include a current list of individuals Responsible for implementing BMPs at the site? ☐ Yes ☐ No

Does facility have a map/sketch of the site with flow lines and storm drains? ☐ Yes ☐ No

## C. Initial Observations

Drainage basin: ☐ Alvarado ☐ University ☐ Spring Valley ☐ Lemon Grove ☐ Lake Murray

Nearest conveyances or water bodies: _____ Hydrologic Area: _____

Approximate distance to water bodies: ☐ □ 200 ft. ☐ 200 □ 1000 ft. ☐ 1000 ft.

Sensitivity of receiving waters: ☐ Sensitive (ESA, 303(d), or other) ☐ Non-sensitive

Discharge points along perimeter: _____

_____

Discharge observed: ☐ Yes ☐ No

If yes, describe: _____

Approximate area covered by industrial or commercial activities: _____ square feet

Approximate □ impervious surface of this area_____□

Exposed areas of intensive outdoor activity: _____

# City of La Mesa
## Storm Water Quality Inspection for Municipal Facilities

### D. BMP Assessment

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| **D.1 General** | | | | |
| Is the site free of excessive litter and debris? | | | | |
| Are discharge locations free of excessive sediment and debris? | | | | |
| Are parking lots, sidewalks and streets free of excessive sediment and debris? | | | | |
| Are roof downspouts directed away from areas of potential pollutants? | | | | |
| Is wash water from pressure washing / hosing managed appropriately? | | | | |
| Are employees trained in storm water management? | | | | |
| Does the facility have a current log of employees who have participated in training? | | | | |
| **D.2 Landscaping** | | | | |
| Are adequate erosion prevention measures employed? (vegetation or physical stabilization) | | | | |
| Are irrigation systems programmed to minimize over-watering and runoff? | | | | |
| If reclaimed water is used for irrigation, is the site free of evidence of irrigation water entering the storm drain? | | | | |
| Are stockpiles of soil or landscape waste covered when feasible and equipped to prevent runoff transport? | | | | |
| Are pesticides, herbicides, and fertilizers managed in accordance with the JURMP BMPs? | | | | |
| **D.3 Materials and Wastes** | | | | |
| Are adequate trash containers provided? | | | | |
| Are adequate recycling containers provided? | | | | |
| Is the trash/recycling area adequately covered (closed lids or permanent overhead cover)? | | | | |
| Is the trash/recycling area free of litter and debris? | | | | |
| Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing? | | | | |
| Are outdoor materials that pose a threat to water quality stored appropriately (covered or in sealed containers)? | | | | |
| Are outdoor storage containers properly labeled? | | | | |
| Is there an accessible, appropriate spill response kit? | | | | |
| Is there a written spill response plan? If so, please provide to inspector. (NA if no significant materials to spill) | | | | |
| Are liquid storage containers/tanks equipped with secondary containment? | | | | |
| Is secondary containment free of spills and rainwater? | | | | |
| Are loading and unloading areas free of spills and debris? | | | | |
| Is water from pools and/or fountains disposed of properly? | | | | |
| **D.4 Equipment and Vehicles** | | | | |
| Are exposed parking areas free of significant spills and leaks? | | | | |
| Are vehicle maintenance activities conducted within contained areas when feasible (garage, canopy, work shop)? | | | | |

# City of La Mesa
## Storm Water Quality Inspection for Municipal Facilities

| BMPs | N/A | Yes | No | Comments |
|---|---|---|---|---|
| Are equipment and vehicles inspected daily for leaks and repaired as necessary? | | | | |
| Are storm drain inlets near vehicle-fueling areas protected from spills and leaks? | | | | |
| Is vehicle washing preformed in a designated area where runoff does not enter the MS4? | | | | |
| Are biodegradable soaps used when appropriate? | | | | |
| **D.5 Building Repair/Construction** | | | | |
| Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization) | | | | |
| Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters) | | | | |
| Are impervious areas free of debris and spills from painting, scraping, and/or sandblasting activities? | | | | |
| **D.6 Structural BMPs** | | | | |
| Are structural BMPs adequately maintained? (NA if no structural BMPs at facility) | | | | |
| **D.7 Non-Storm Water Management** | | | | |
| Is the site free of evidence of illicit connections and illegal discharges? | | | | |
| Is the site free of evidence of unauthorized releases to storm drains? | | | | |
| If not, have the appropriate authorities been notified? | | | | |
| **D.8 Other** | | | | |
| Are there any other potential storm water pollution issues or concerns? If yes, explain below. | | | | |
| **E. ADDITIONAL COMMENTS** (describe any additional deficiencies not represented above and/or notable BMP improvements) | | | | |

# City of La Mesa
## Storm Water Quality Inspection for Municipal Facilities

### F. Corrective Action

Is corrective action needed? ☐ Yes ☐ No (If **BMP-related** corrective action is required, describe below.)

Operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax ☐ E-Mail

### G. Violations

☐ No violations have been noted at this time

☐ No violations have been noted, but recommend taking corrective action described in Section F.

☐ Violation of City Ordinance(s):

- ☐ Illegal discharge(s) of pollutants to the storm drain system or to receiving waters
  Description
- ☐ Illegal connection(s) to the storm drain system
  Location_____
- ☐ Littering
- ☐ Failure to properly implement required BMPs

☐ Other Violation_____

**Specific action(s) required to correct the violation described above:**

☐ Implement the recommended corrective actions listed in Section F.

Additional actions required:

### H. Additional Recommended City Actions

Recommended City Actions listed at the time of inspection are subject to change based on later review by office staff

**Does this facility require a follow-up inspection?** ☐ Yes ☐ No

**Assessment**

| | | | | | |
|---|---|---|---|---|---|
| Level of knowledge regarding storm water issues: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |
| Level of cleanliness, BMP implementation, orderliness of site: | ☐ 1 | ☐ 2 | ☐ 3 | ☐ 4 | ☐ 5 |

| **D.2 Landscaping** | | | | | |
| Properly manage pesticides/fertilizer; use IPM when feasible | ☐ | ☐ | ☐ | ☐ | ☐Unknown<br>Landscaping Co: |
| Employ adequate erosion prevention measures (vegetation or physical stabilization) | ☐ | ☐ | ☐ | ☐ | |
| Eliminate over watering/over-irrigation | ☐ | ☐ | ☐ | ☐ | |
| Properly store stockpiles to prevent material transport | ☐ | ☐ | ☐ | ☐ | |
| **D.3 Materials and Wastes** | | | | | |
| Protect trash area from contact with storm water | ☐ | ☐ | ☐ | ☐ | |
| Keep trash area free of litter and debris, liquids, powders, sediment | ☐ | ☐ | ☐ | ☐ | |
| Keep grease bin and area surrounding grease bin free of grease stains/spills | ☐ | ☐ | ☐ | ☐ | |
| Do oil-recycling/grease bins have overhead coverage? | ☐ | ☐ | ☐ | ☐ | |
| Adequately cover materials stored outside | ☐ | ☐ | ☐ | ☐ | |
| Prevent run-on from contacting materials stored outdoors | ☐ | ☐ | ☐ | ☐ | |
| Provide an accessible, functional spill response kit | ☐ | ☐ | ☐ | ☐ | |
| Equip liquid storage containers with spill containment | ☐ | ☐ | ☐ | ☐ | |
| Keep spill containment free of spills and rainwater | ☐ | ☐ | ☐ | ☐ | |
| Properly store and dispose of hazardous materials | ☐ | ☐ | ☐ | ☐ | |
| Keep loading and unloading areas, including drains, free of debris | ☐ | ☐ | ☐ | ☐ | |
| Dispose of water generated by processing activities appropriately | ☐ | ☐ | ☐ | ☐ | |
| Dispose of pool, spa, fountain, and filter backwash water properly | ☐ | ☐ | ☐ | ☐ | ☐Unknown<br>Performed by: |
| Clean floor mats in locations that do not drain to street or storm drain system | ☐ | ☐ | ☐ | ☐ | |

| BMPs | No Corrections Required | | Corrections Required | | Comments |
|---|---|---|---|---|---|
| | N/A | Fully Implemented | Partially Implemented | Not Implemented | |
| **D.4 Equipment, Vehicles, and Outdoor Activities** | | | | | |
| Conduct outdoor activities within contained areas (garage, under canopy, work shop) | ☐ | ☐ | ☐ | ☐ | |
| Use drip pans to collect leaks/spills | ☐ | ☐ | ☐ | ☐ | |
| Provide materials (berm, mat, etc.) to protect storm drain inlets from spills and leaks | ☐ | ☐ | ☐ | ☐ | |
| Perform vehicle/equipment washing in a contained area where runoff does not enter the MS4 | ☐ | ☐ | ☐ | ☐ | |
| **D.5 Other** | | | | | |
| Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff | ☐ | ☐ | ☐ | ☐ | |
| Identify and eliminate illicit connections and illegal discharges | ☐ | ☐ | ☐ | ☐ | |

**D.6 Additional Required Actions**

| D.7 Additional Questions | Comments/Results |
|---|---|
| Are there any potential air sources that could contribute to atmospheric deposition of pollutants? | ☐ Painting ☐ Sandblasting ☐ Fuel Distribution ☐ Dust dispersion or mineral processing ☐ Metal smelting ☐ Metal plating or anodizing ☐ Chemical production or mixing ☐ Large fuel burning device ☐ Incinerator |
| Are there any treatment control BMPs on site? | ☐ Filter insert ☐ Hydrodynamic separator ☐ Debris screen ☐ Sewer diversion ☐ Vegetated swale ☐ Vegetated filter strip ☐ Biofiltration ☐ Detention/sedimentation basin ☐ Containment and evaporation or reuse ☐ Filtration |
| Are treatment control BMPs regularly maintained? | ☐ Yes ☐ No ☐ Unknown ☐ N/A |
| What is the approximate percentage of the site that drains to the treatment control BMPs? | ☐ N/A |
| Do major potential pollutant sources drain to treatment BMP(s)? | ☐ All ☐ Some ☐ None ☐ N/A |
| If any illicit connections and/or illegal discharges were identified have the appropriate authorities been notified? | ☐ Yes ☐ No ☐ N/A |
| If any illicit connections and/or illegal discharges were identified, were they eliminated during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any non IC/ID related corrective actions implemented during the site visit? | ☐ Yes ☐ No ☐ N/A |
| Were any educational materials distributed? | NOI ☐ NONA/NEC ☐ |

## E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

**SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE:**

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit; see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

- ☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP); see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

*Additional notes and/or actions required*: _____

_____

_____

## F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions and Re-inspection Required.** Please refer to sections D.1-D.6, E, and F of this form.

☐ No Corrective Actions Required at this time.

## G. RECOMMENDED CITY ACTIONS

**ASSESSMENT**

| | | | | | |
|---|---|---|---|---|---|
| Level of knowledge regarding stormwater issues: | ☐1 | ☐2 | ☐3 | ☐4 | ☐5 |
| Level of cleanliness, BMP implementation, orderliness of site: | ☐1 | ☐2 | ☐3 | ☐4 | ☐5 |

Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

## POLLUTANT DISCHARGE POTENTIAL ASSESSMENT

Site Name:_____

| Pollutant | PDP | Sources Needing More BMPs | | | | | | | Recommended BMPs (check if applicable) | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Trash Area | Material Storage | Prkng Lot | Load/ Unload | Land-scape | Veh/Eqp Maint | Exposed Work Area | Emp. Training | House-keeping | Minor Struct. | Major Struct. |
| Sediments | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Nutrients | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |

| Check if evidence indicates specific metals may have significant PDPs: ☐Copper ☐Cadmium ☐Lead ☐Zinc ☐Mercury | | | | | | | | | | | | |
| Organic Compounds | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Check if evidence indicates there may be historical soil contamination associated with any of the following: ☐PCBs ☐PAHs ☐Chlordane ☐DDT | | | | | | | | | | | | |
| Trash & Debris | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Oxygen Demanding | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Oil & Grease | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Bacteria & Viruses | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Pesticides | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Check if evidence indicates the following are used on site: ☐Diazinon ☐Chlorpyrifos | | | | | | | | | | | | |
| Acid/Base (pH effects) | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |
| Others (list): | 0 | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ | ☐ |

- RW 303(d) Receiving water impairments, as listed in the most recent 303(d) list
- WS COC High priority watershed constituents of concern (COC), as listed in the most recent WURMP Annual Report
- PDP pollutant discharge potential.
- Emp. Training employee training activities focused on storm water pollution prevention
- Housekeeping standard good housekeeping BMPs, such as sweeping, regular trash pickup, etc.
- Minor Struct. minor structural BMPs that do not require building permits, such as covering with tarps or building berms
- Major Struct. major structural BMPs that require a building permit or are especially expensive, such as detention basins, oil/water separators, grease interceptors, overhead coverage for storage areas, etc.

### Criteria

0 - no appreciable quantity observed on site
1 - very small potential for pollutant discharge; monitoring results are well below the EPA benchmark
2 - Small potential for pollutant discharge; monitoring results are close to the EPA benchmark but still below it
3 - Moderate potential for pollutant discharge; monitoring results are at or slightly above the EPA benchmark
4 - Large potential for pollutant discharge; monitoring results above the EPA benchmark but are within an order of magnitude
5 - Severe potential for pollutant discharge; monitoring results exceed the EPA benchmark by an order of magnitude or more

## SUPPLEMENTAL WATERSHED ASSESSMENT QUESTIONNAIRE AND INSPECTION

Business Name _____ Date:_____

Watershed (circle one): ---

**Questions for Facility Contact Person**

When water (from rain, sprinklers, etc.) leaves your site where does it go? ☐ Treatment Plant/Sewer ☐ Storm Drain System ☐ A Water Body (any) ☐ Don't Know/Unsure

Runoff leaving your site eventually reaches what water body (more than one can be checked)? ☐ San Diego Bay ☐ Chollas Creek ☐ Pacific Ocean ☐ San Diego River ☐ Mission Bay ☐ Don't Know/Unsure

What is your impression of the water quality/condition of the downstream water body? ☐ Good ☐ Fair ☐ Poor ☐ Don't Know

In general, what do you think are the main areas or activities at local businesses that could contribute to pollution of runoff? ☐ Washing Activities ☐ Washing Activities Done by Mobile Businesses ☐ Material Storage ☐ Material Processing ☐ Landscaping ☐ Repair Services ☐ Illegal Dumping ☐ Trash Area ☐ Don't Know/Unsure ☐ Other

Other than today's inspection, have you received any information or education about what your business should do to prevent pollution from entering the environment? ☐ Yes ☐ No

**Observations**

Was evidence of any non-storm water discharge (including allowable discharges) observed? ☐ Significant ☐ Minimal ☐ No

If irrigation system is present, which sprinkler head types are present (check all that apply)? ☐ Spray ☐ Rotor ☐ Microspray ☐ Drip ☐ Bubblers ☐ Water by hand ☐ Other ☐ NA

Approximate percentage of site's total pervious area that is landscaped: _____ %

Attitude toward compliance with storm water regulations: ☐ Receptive ☐ Neutral ☐ Resistant

**Overall Source Ranking (for Watershed Pollutants of Concern)**

☐ Significant ☐ Not Significant

A Newsletter for the Citizens of La Mesa • August 2011

## City to Distribute New Safety Handbook

The City has published a new community "Safety Handbook" as part of our ongoing efforts to provide valuable information to our citizens. The handbook contains important information on crime prevention, personal safety, emergency preparedness, and other topics. Development of the handbook is a joint project of the Police Dept. Crime Prevention Unit and the Fire Dept. The cost of publication is made possible by private donations and funds collected by the Police Dept. through asset seizure programs that target subjects involved in drug trafficking. No General Funds were required for this project.

The City is making plans to provide a copy of the handbook to each household and small business in La Mesa through distribution events beginning in mid August. Distribution will be done by volunteers walking assigned areas of the City delivering copies of the Handbook to houses, condos, apartments, and businesses. If you are interested in participating in one of more of the distribution events, contact the Police Department at 667.7514 to be placed on an interest list. Further information will be provided to you as distribution dates are confirmed. This is a great way to get to know your neighborhood better or explore areas of La Mesa you aren't familiar with while helping the City save money.

## EVENTS CALENDAR

Aug 25 ..... General Plan – Housing Workshop
Aug 27 ..... Household Haz Waste Collection
Sep 5 ..... Labor Day – City offices closed
Sep 24 ..... Kids Care Fest
Oct 8 ..... Sustain La Mesa Festival
Oct 13 ..... Intergenerational Games
Oct 15 ..... Household Haz Waste Collection
Oct 22 ..... Park Appreciation Day

*Pravada, located on Fletcher Parkway, is one of La Mesa's newest multi-family additions to available housing units in our community.*

# PLANNING FOR THE FUTURE OF HOUSING IN LA MESA

## Workshop Planned for August 25

A new General Plan Housing Element is underway for the City of La Mesa. The Housing Element is the only element of the General Plan that is mandated to be updated every eight years. A primary goal of the Housing Element is to provide housing for the population growth forecasted for the next eight year planning period. The City must show adequate capacity within available sites with appropriate zoning to construct La Mesa's share of the units needed to house the future population. SANDAG predicts that La Mesa will need 1,700 housing units to support an anticipated population increase of approximately 2,800 people.

The majority of La Mesa's future growth in housing stock will be located around trolley stops and along the major transit corridors such as University Avenue, El Cajon Boulevard, and La Mesa Boulevard. These and other housing policy issues will be topics of a workshop on the Housing Element update, which will take place on Thursday, August 25 at 6:00 pm in the La Mesa Community Center, 4975 Memorial Drive. Anyone with an interest in the future of housing in La Mesa is encouraged to attend.

*Participating in community workshops is just one of the ways you can make a positive contribution to your community.*

**ATTEND THE WORKSHOP ON AUG 25**
**Learn more about the General Plan Housing Element and take part in planning for La Mesa's future.**

# GRANT TO INCREASE RECYCLING OPPORTUNITIES FOR RESIDENTS IN MULTIFAMILY HOUSING

The City of La Mesa has received a grant from the California Department of Resources Recycling and Recovery to improve recycling opportunities for apartment and condominium complexes. Under the grant, eligible properties will receive space-saving reusable bags for separating recyclables in each unit, as well as aluminum can crushers. Properties will also be able to get indoor/outdoor recycling receptacles for use in common areas. The program is entirely grant funded so there is no cost to participate.

The goal of the grant is to increase recycling opportunities for multifamily residences in La Mesa. Program notices inviting participation will be mailed directly to property owners and managers in the coming months. For more information about the program or to be placed on the multifamily participation list, please contact the Department of Public Works Environmental Services Division at 667.1338 or by email at envirosvcs@ci.la-mesa.ca.us.

## Cool Spots In & Around La Mesa

La Mesa residents who may be at risk from extreme heat can seek relief during the hot summer months at these La Mesa locations: Call sites directly for hours of operation:

**Christian Science Reading Room**
8370 La Mesa Blvd.
463.8470

**La Mesa Adult Enrichment Center**
8450 La Mesa Blvd.
464.0505

**La Mesa Library**
8074 Allison Ave.
469.2151

# FREE Household Hazardous Waste and Electronic Waste Disposal

UPCOMING COLLECTIONS: **August 27 and October 15**

Household Hazardous Waste (HHW) collection events are available to City of La Mesa residents by appointment only at the EDCO facility, 8184 Commercial St., La Mesa. Please email appointment requests to lmhhw@edcodisposal.com or call EDCO at 287.5696 x4270. Be sure to provide your name, address, and phone number.

E-waste (electronic waste) is also accepted at the EDCO Station recycling buyback center during business hours, Monday through Saturday, without an appointment. Visit edcodisposal.com for more information.

To request additional information about the HHW program email envirosvcs@ci.la-mesa.ca.us or call the Environmental Services Division of the Public Works Department at 667.1338. For a complete HHW list or other information visit cityoflamesa.com/hhw.

# LET'S CELEBRATE

## 10th Annual Kids Care Fest

**Saturday, September 24 • 9:00 am – 2:00 pm**

**Briercrest Park and Grossmont Healthcare District**
**9001 Wakarusa Street**

### Fun FREE event for kids and the whole family

**health info • fun zone • children's fingerprinting**
**health screenings • fire safety trailer • meet Fire & Police**

**In partnership between the City of La Mesa, Grossmont Healthcare District, and La Mesa Park & Recreation Foundation**

**Details coming soon on the City website or grossmonthealthcare.org**

# SAVE THE DATE *(and the Earth)*!

## 2011 "Sustain La Mesa" Environmental Festival

Saturday, October 8 • Harry Griffen Park

This year's festival will have more than 40 booths and exhibits as well as expert speakers and activities for all ages. Also featured will be the winners of the "Our Planet, Our Home" K-12 Environmental Literacy and Art Contest. The contest will have 16 winners over four different age categories and is open to all students from Kindergarten through 12th grade. Complete information about the festival and contest is available at cityoflamesa.com/SustainLaMesa.

This event is free for everyone. Watch the City website for additional details as they become available.

# ADULT SOFTBALL

**(Ages 18 and up)**

**Leagues forming later this year.**
**Watch for details on the City website or leave your contact information at 667.1172 #6**

*Serving the Cities of El Cajon, La Mesa and Lemon Grove*

**www.heartlandfire.org**

# Fire season is quickly approaching; do you know what to do in a Fire?

Over 350,000 home fires occur every year in the United States and more than 2,500 people a year die in these home fires. Odds are it will happen to you or someone you know. Here are a few tips on fire safety and prevention:

- Smoke alarms save lives. Install a smoke alarm outside each sleeping area and on each additional level of your home. If people sleep with doors closed, install smoke alarms inside sleeping areas, too.
  - Use the test button to check each smoke alarm once a month. When necessary, replace batteries immediately.
  - Replace all batteries at least once a year.
- Consider having one or more working fire extinguishers in your home.
- Consider installing an automatic fire sprinkler system in your home.
  - If you have a reported fire in your home, the risk of dying decreases by about 80% when sprinklers are present.
  - People in homes with sprinklers are protected against significant property loss—sprinklers reduce the average property loss by 71% per fire.
- Determine at least two ways to escape from every room of your home. Consider escape ladders for sleeping areas on the second or third floor. Learn how to use them and store them near the window.
- Select a location outside your home where everyone would meet after escaping. Practice your escape plan at least twice a year.
- Once you are out, stay out! Call the fire department from a neighbor's home.
- If you see smoke or fire in your first escape route, use your second way out. If you must exit through smoke, crawl low under the smoke to your exit. If you are escaping through a closed door, feel the door before opening it. If it is warm, use your second way out.
- If smoke, heat, or flames block your exit routes, stay in the room with the door closed.
  - If possible, stuff wet cloths around the door cracks and vents.
  - Signal for help using a bright-colored cloth at the window.
  - If there is a telephone in the room, call the fire department and tell them where you are.
- If your clothes catch on fire, you should – Stop, drop, and roll - until the fire is extinguished. Running only makes the fire burn faster.

To escape a fire, you should:

- Check closed doors for heat before you open them. If you are escaping through a closed door, use the back of your hand to feel the top of the door, the doorknob, and the crack between the door and door frame before you open it. Never use the palm of your hand or fingers to test for heat - burning those areas could impair your ability to escape a fire (i.e., ladders and crawling).

  HOT DOOR

  Do not open. Escape through a window. If you cannot escape, hang a white or light-colored sheet or bright cloth outside the window, alerting firefighters to your presence.

  COOL DOOR

  Open slowly and ensure fire and/or smoke is not blocking your escape route. If your escape route is blocked, shut the door immediately and use an alternate escape route, such as a window. If clear, leave immediately through the door and close it behind you. Be prepared to crawl. Smoke and heat rise. The air is clearer and cooler near the floor.
- Crawl low under any smoke to your exit - heavy smoke and poisonous gases collect first along the ceiling.
- Close doors behind you as you escape to delay the spread of the fire.

Your recovery from the emergency may greatly depend on your level of preparedness before the emergency happens. Take time now to prepare, visit heartlandfire.org, readysandiego.org, theredguidetorecovery.com or sdarc.org for preparedness tips and to download the "Wildfire Preparedness Guide."

# Intergenerational GAMES

## Thursday, October 13
## 9:30 am – Noon

*La Mesa Middle School*

This FREE fun filled half-day event pairs active older adults with local students in grades 4 through 6 in a circuit of physical activity games and knowledge challenges. Focus is on non-competitive fun activities that encourage lifelong health and fitness.

Active adults age 55+ and La Mesa/ Spring Valley students in grades 4 through 6 are encouraged to sign up. It's a great way to get kids active during the fall school break. Sponsorships are available. Registration forms can be downloaded from the City website or call the Community Center office at 667.1300 or the Adult Enrichment Center at 667.1322 for more information.

## VISIT THE PUBLIC SAFETY BOOTH AT OKTOBERFEST

## Friday, September 30 – Sunday, October 2

The La Mesa Police Department will be at Oktoberfest! Stop by our booth at La Mesa Boulevard and Acacia Avenue to learn more about Neighborhood Watch and discuss other crime prevention measures or concerns. A representative from Heartland Fire & Rescue will also be present to provide information on creating an emergency preparedness plan for your family. Don't miss out! Mark your calendar today.

# The Sandwich Generation:
## Who's Filling the Transportation Gap?

Did you know that more families are joining the "sandwich generation" - juggling jobs, children, and caring for aging parents? Are you a member of the Sandwich Generation?

**Ask yourself these questions:**

1. Do I have aging parents and children who need care?
2. Do I have aging parents, adult children, or grandchildren?
3. Do I have an aging friend or neighbor?
4. Do I belong to an organization that has aging members?

If you answered yes to at least one of the questions then you are a member of the Sandwich Generation. The Sandwich Generation is defined as an age group that is simultaneously caring for parents and children. The Pew Research Center reports that 1 out of every 8 Americans between the age of 40 to 60 is raising a child and providing care for a parent, while the U.S. Census Bureau reports 46% of households include an adult over 60.

Those statistics are mirrored as many juggle work, family, and social involvement while also providing care for an aging family member or friend. With most medical, personal care, and business appointments scheduled during the workday, members of the Sandwich Generation often are faced with tough choices. Do they provide transportation or do they miss all or part of their work day? MetLife Mature Market Institute reports American businesses can lose as much as $34 billion each year due to employees' need to care for loved ones 50 years of age or older.

The next time you or someone you know finds that they are trying to fill the transportation gap, call Rides4Neighbors. Our transportation assistance program provides rides for older adults age 60+ and adults with disabilities. The program offers eligible participants several service options: trained volunteer drivers who use their own vehicles to provide rides; a discount taxi scrip program; a weekly shopping shuttle; wheelchair accessible van transport if needed. And for active adults interested in maintaining their independence Travel San Diego is an exciting opportunity to learn all about public transportation. This small group class is designed for individuals aged 60+ and combines moderate walking and learning to use public transportation. Call Rides4Neighbors at 667.1321 for an application.

# Sun Valley Golf Course

**5080 Memorial Drive**

**7:00 am to sunset, 7 days a week**

**Adults: $10 for 9 holes, $14 for 18 holes**

**Students*: $7 for 9 holes, $10 for 18 holes**

*(*includes college with valid student ID)*

**CLINICS, LESSONS, AND SPECIAL PROGRAM ARE AVAILABLE**

**For details go to sunvalleygolfclub.com or call 466.6102**

# La Mesa Neighborhood Watch Program

**You and your neighbors can make a difference in your community!** A Neighborhood Watch group forges bonds among residents and provides a forum to address area specific concerns with La Mesa Police Department personnel. Here are some important reasons to start a Neighborhood Watch group:

- Develop neighborhood cohesion.
- Improve home security.
- Address particular, immediate crime problems.
- Become educated about circumstances in the community that might contribute to crime.
- Develop long-range solutions to prevent future crimes.

## Start or join a Neighborhood Watch today! Here is how:

**STEP 1: Call the Crime Prevention Specialist at 667.7545 for tips and information.**

**STEP 2: Speak with your neighbors and encourage their participation.**

**STEP 3: Pick a date, time, and location for the meeting.**

**STEP 4: Schedule the meeting with the Crime Prevention Specialist.**

**STEP 5: Publicize the meeting! Email, knock on doors, or drop off flyers.**

At the first meeting you will discuss:

- Incidents of crime occurring in your neighborhood.
- How to identify and report suspicious activity.
- Crime prevention measures to protect your family and your home.
- How to maintain an active Neighborhood Watch group.
- Emergency preparedness and Neighborhood Watch.
- Crime related issues that are important to you.

***The La Mesa Police Department is proud of our excellent working relationship with the community.***

***Thank you for taking an active role in making your La Mesa neighborhood a wonderful place to live.***

# I&I and You

## Reducing Sewer Inflow and Infiltration

"I&I" is short for a big problem many communities face; sewer Inflow and Infiltration. Inflow occurs when rainwater is misdirected into the sanitary sewer system instead of storm drains. Infiltration occurs when ground water seeps into the sanitary sewer system through cracks or leaks in sewer pipes. The cracks or leaks may be caused by age related deterioration, loose joints, damage, or root infiltration.

So why is I&I such a problem? During rainstorms, rain water can enter the sanitary sewer through I&I sources and consume a large portion of the sanitary sewer system. Overloaded sewer pipes can result in service interruptions, flooded households, and sewage spills. Ignored I&I results in excessive flows in the sewers and into the wastewater treatment plant. This becomes a very costly problem for all of us.

### What can I do to help?

- Inspect rain gutters on your house and make sure the downspout is not connected to the sanitary sewer. Rainwater should be directed to your lawn and/or the storm drain.
- Inspect sump pump connections and area/yard drains to ensure they are not connected to the sanitary sewer.
- Inspect your sewer cleanout to ensure the cap is tightly closed and that the cleanout pipe has not been damaged (such as by a lawn mower). Replace missing caps so rainwater cannot get into the sewer system.
- Avoid planting trees and shrubs over or near sewer lines. Roots can enter and damage sewer piping. Replacement of sewer pipes can be a huge expense to private property owners.
- Contact a plumber for periodic inspections for sewer pipe cracks, separated joints, or sags.

The City is constantly working to identify I&I problem areas by a variety of methods including sewer flow metering, smoke testing, and video inspection of the sewer pipes within the City's sewer mains. Problem sewer pipes are repaired, replaced, or rehabilitated to eliminate I&I. Together we can make difference.

Please share this information with your family, friends, and neighbors. For more information contact the City's Engineering Department 667.1166.

# Say "No" To Runoff. Stop Over Watering!

On an average sunny day in La Mesa you would be hard pressed not to find at least a few residences with their sprinklers running and causing overspray, often the source of water running down the street. If you think to yourself, "What a water waster," you would be right! With the type of soil found in La Mesa, it doesn't take much moisture on the ground before water starts running off your property. This runoff is not only a waste of our most precious commodity; but also a waste of your hard earned money.

### Follow these tips to help eliminate over irrigation:

- Monitor the amount of time it takes for runoff to begin to occur on your property.
- Design irrigation systems with control devices, sensors, or shut-off switches to address malfunctions.
- Don't irrigate non-planted areas.
- Regularly inspect your irrigation system for potential problems.
- Consider drip irrigation to save water and prevent runoff.
- Adjust irrigation rates according to seasons and weather conditions.
- Irrigate in the early morning, the most efficient time for watering with minimal evaporation.

You may not be aware that Helix Water District has several programs to help single-family homeowners conserve water. Residents are eligible to apply for irrigation controller rebates worth up to $200. For more information, call 466.0585, visit www.hwd.com/conserv or email conserve@helixwater.org.

Please share this information with family, friends, and neighbors. For more information contact the City's Storm Water Hotline 667.1134.

# PARDON OUR APPEARANCE

## Update to Citywide Street Resurfacing and Sidewalk Improvements

Preparation work is well underway to pave the streets of La Mesa. Sidewalk improvements have begun along Bancroft Drive between Spice Street and Johnson Drive. Once the Bancroft Drive portion of the project is completed, work will move to Waite Drive and Murray Hill Road, connecting the existing sidewalk on Murray Hill Road to High Street.

The first phase of undergrounding overhead utility lines has begun on Normal Avenue near Lowell Street and continues to move steadily toward Windsor Drive.

Portions of the following streets will be affected by resurfacing:

- Center Street
- Guild Street
- Commercial Street
- Center Drive
- Marengo Avenue
- Dallas Street
- La Mesa Boulevard
- Bancroft Drive
- Waite Drive
- Yale Avenue
- Orien Avenue
- Lowell Street
- Normal Avenue
- Parks Avenue
- Dale Avenue
- Lee Avenue

The resurfacing process will grind out approximately two inches of existing asphalt and replace it with new asphalt to provide these streets with many more years of service life.

New pedestrian ramps at street corners are also being installed in preparation for the resurfacing project.

Notices and door hangers are being distributed to affected residences and businesses. If you have questions please contact the number on the notice or call Project Manager Dirk Epperson at 667.1152. Thank you for your patience while the City completes these important infrastructure improvements.

# PARK APPRECIATION DAY

## Saturday, October 22
## 8:00 am to 12:00 pm

**La Mesa's Parks are Our City's Jewels, Help Make Them Shine!**

For individuals – Bring your own gloves, rakes, or trowels to your favorite park. Parents must accompany children under age 18 unless with a previously registered and supervised large group.

Signed waivers are required for all participants – download from the City website and bring with you to the park.

Have a large group? We can help you find a project your members can participate in together. Give us a call at 667.1300.

*Volunteers help spruce up their favorite parks during 2010 Park Appreciation Day.*

# Council Actions

**April 12, 2011**

Adopted a resolution approving the amendment to the Memorandum of Understanding with the San Diego Association of Governments (SANDAG) to provide advanced funding using the TransNet Commercial Paper Program for improvements to city streets.

Adopted a resolution authorizing execution of an agreement with the San Diego Unified School District for the use of the La Mesa Municipal Pool.

**April 26, 2011**

Adopted a resolution approving the Mitigated Negative Declaration for the La Mesa Sewer Repair and Replacement in Maintenance Zones 2 and 3 as required by the State Revolving Fund Financial Assistance Application.

Adopted a resolution authorizing the City of La Mesa to apply to the State Water Resources Control Board for the State Revolving Fund Financial Assistance.

Adopted a resolution adopting the San Diego Association of Governments (SANDAG) annual fee update to the Regional Transportation Congestion Improvement Program (RTCIP) Development Impact Fee to comply with the requirements of SANDAG Commission Ordinance 04-01 and the TransNet Extension Ordinance and Expenditure Plan.

Adopted a resolution declaring there were weeds, rubbish and refuse existing upon certain streets, sidewalks and private property in the City and opened the Weed Abatement Program for 2011.

Adopted the Fee Schedule for Fiscal Year 2011-2012

**May 10, 2011**

Ratified the Design Review Board's approval of DRB-09-21 (Associated Investors and Developers) – for a proposed 12-unit residential development at 8659-61, 8673-8675, and 8677 Lemon Avenue.

Adopted a resolution adopting the City of La Mesa Fiscal Year 2011/2012 Annual Plan for Community Development Block Grant and HOME-funded activities.

Adopted a resolution authorizing execution of an amendment to a professional services agreement with KTU+A for work related to the Safe Routes to Transit project under the Communities Putting Prevention to Work, Active Community Transportation Grant Program.

Adopted a resolution in support of Assembly Bill 1022 (Fletcher) regarding the expanded community notification provisions pertaining to registered sex offenders.

Adopted a resolution adopting the California Uniform Public Construction Cost Accounting Act Procedures.

Adopted a resolution adopting the Multi-Jurisdictional Hazard Mitigation Plan.

**May 24, 2011**

Adopted a resolution authorizing reapplication for a Playful City USA designation in 2011 as part of the City's continuing Wellness Initiative.

Adopted a resolution authorizing a professional services agreement with Atkins North America Inc. for consulting services related to environmental review of the Collier Park Master Plan.

Adopted an Ordinance adding Chapter 2.40 to the La Mesa Municipal Code to adopt alternative procedures for bidding pursuant to the Uniform Public Construction Cost Accounting Act.

Authorized the issuance of a Special Event Permit and street closures for the La Mesa Village Merchants' Association Back to the 50's Car Show and adopted a resolution temporarily closing portions of Palm Avenue and Third Street during the duration of the event.

**June 14, 2011**

Ratified the Design Review Board's approval of DRB-10-01 (Grossmont Healthcare District) – for a proposed diagnostic and treatment building and power plant facility at the Grossmont Medical Campus at 5555 Grossmont Center Drive.

Adopted a resolution accepting a Highway Safety Improvement Program Grant and appropriating funds for the construction of traffic signal improvements at the intersection of University Avenue and Harbinson Avenue (Marian Street).

Adopted a resolution accepting a Highway Safety Improvement Program Grant and appropriating funds for the construction of traffic signal improvements at the intersection of University Avenue and Massachusetts Avenue.

Adopted a resolution authorizing execution of a lease agreement with the Challenge Center for use of the building known as Sunset Gym at 5540 Lake Park Way.

Adopted a resolution authorizing a grant application for Proposition 84 – Statewide Park Development and Community Revitalization Program of 2008 for Collier Park construction.

Adopted a resolution accepting a grant from the California Department of Alcoholic Beverage Control Grant Assistance Program and approved the addition of the grant funds to Fiscal Year 2011-2012 Budget.

Adopted the preliminary Biennial Budget for 2011-2013.

Adopted a resolution adopting the appropriations limit for fiscal year ending June 30, 2012, and the annual adjustment factors used to calculate the appropriations limit.

Adopted a resolution supporting findings and appropriation of funds for the recommended Park In-Lieu and Impact Fee Projects.

**June 28, 2011**

Ratified the Design Review Board's approval of DRB 11-02 (AT&T) – a proposed wireless communications facility at 4690 Palm Avenue.

Ratified the Design Review Board's approval of DRB-11-09 (8277 La Mesa Boulevard LLC) – for proposed exterior alterations to a commercial retail building at 8277 La Mesa Boulevard.

Adopted a resolution approving the 2011-2012 Memorandum of Understanding between the City of La Mesa and the La Mesa City Employees' Association.

Adopted a resolution approving the 2011-2012 Memorandum of Understanding between the City of La Mesa and the La Mesa Police Officers' Association.

Adopted a resolution authorizing the acceptance of the Fiscal Year 2011/2012 San Diego Service Authority for Freeway Emergencies (SAFE) Motorist Aid and Safety Grant of $23,489.00 for personal protective clothing.

Adopted a resolution authorizing a grant proposal for Healthy WorksSM School and Community Gardens Program to lead a pilot project to plan a joint use garden with Helix Charter High School.

Authorized Fire Department staff to proceed with the Weed Abatement Program to reduce fire hazards.

# LA MESA FOCUS

*City News & Events*

Welcome to the first issue of the redesigned La Mesa FOCUS Newsletter. Based on community input, each issue of the FOCUS will be shorter in length, will focus on one subject matter, and will be published more frequently. We hope you find the new look and format more interesting and easier to read. In addition, the FOCUS will be available in a presentation format on Cox Cable channel 24 and AT&T U-verse channel 99. View programming schedule at www.cityoflamesa.com/GovChannel

## La Mesa Celebrates **100 Years of Governing**

This year, the city is honoring the Centennial by hosting a Town Hall meeting on February 7 from 6:30 to 8:30 p.m. The meeting will be held at the La Mesa Community Center, 4975 Memorial Drive. In addition to the opportunity to learn about city services such as Neighborhood Watch, Emergency Preparedness, Safe Routes to Schools, planning efforts such as the General Plan Update and Park Master Plan, members of the public can ask the City Council questions or express concerns about their city. Residents will also find out how to become involved in the city's year long Centennial celebration.

La Mesa Blvd between Third and Fourth Streets, Credit: La Mesa Historical Society

The Town Hall meeting is a part of the City Council's strategic planning process that includes gathering input from citizens, reviewing city financial data, goals, and action plans at their annual workshop. These tools are used to determine the city's biennium budget.

## Calendar of Events

**Jan 28**
Household Hazardous Waste Collection

**Feb 7**

# 2012 Centennial General Plan Update

In honor of La Mesa's 100th birthday, the City's General Plan will be updated and available for review in Spring 2012. Go to www.cityoflamesa.com/NotifyMe to sign up to be notified when the 2012 Draft General Plan Update becomes available. A General Plan is intended to provide comprehensive, long-term direction by establishing locally important goals and policies.

The City of La Mesa adopted its first General Plan in 1965. It has been amended and updated periodically as state law has changed and as local needs have changed. A comprehensive update of the General Plan was last adopted by the City Council on March 12, 1996 and the Housing Element was last updated in 2005.

The General Plan update strengthens policies that preserve single-family neighborhoods while promoting in-fill development in commercial areas and along transit corridors in La Mesa. The Project will align the City's General Plan with regional goals and new State legislation that has been adopted since 1996.

The next step in the approval process for the General Plan Update is the preparation of an Environmental Impact Report (EIR). The EIR process allows for public review of the draft plan and its environmental consequences. The EIR process begins in 2012 and will take 12-18 months to complete. Once the EIR is complete, public hearings before the La Mesa Planning Commission and City Council will be held to adopt the updated 2012 General Plan.

The draft plan was completed by city staff with the help of consultants and funding with grants from the Kaiser Foundation and SANDAG.

## Watch La Mesa's Government Access Channel

**Council Meetings:** 2nd Tuesday, 4 p.m.; 4th Tuesday, 6 p.m.

**Residential Crime Prevention, Merchants Crime Prevention, Click It or Ticket!, Sustain La Mesa:** Mondays/Wednesdays, 7 – 8 p.m.; Saturdays/Sundays, 3 – 4 p.m.

**Bulletin Board:** Mondays/Wednesdays/Fridays, 7 – 8 a.m.; Saturdays/Sundays, 4 – 5 p.m.

Programming is available on Cox Cable channel 24 within city limits and AT&T U-verse channel 99 within San Diego Region. View complete broadcasting schedule on City's Website.

New Initiatives in the 2012 General Plan Update include:

- The Global Warming Solutions Act of 2006 (AB 32)
- The Sustainable Communities and Climate Protection Act (SB 375)
- California Complete Streets legislation (AB 1358)
- Consistency with the Regional Comprehensive Plan (RCP), Sustainable Communities Strategy (SCS), and Regional Transportation Plan (RTP) adopted by the San Diego Association of Governments (SANDAG)
- Inclusion of the City's Hazard Mitigation Plan
- Health & Wellness Element

---

With a 20-year planning horizon, the General Plan update will plan for approximately 7,800 new people, 1,800 new housing units, and 1,200 new jobs based on SANDAG's regional growth forecast for La Mesa:

- 2010 La Mesa population 58,150
- 2030 La Mesa population 65,984 (13% increase)
- 2050 La Mesa population 77,780 (33% increase)

# LA MESA FOCUS

## City News & Events

March 2012

## La Mesa Recycles!

The City currently has recycling programs to target waste streams that would otherwise be disposed of in our region's landfills. These diverted materials are given second lives through recycling programs such as EDCO's commingled recycling and the City's construction and demolition debris recycling requirement. La Mesa's recycling program has diverted 32,000 tons of material, a 43% reduction since 2004. According to statewide figures from the California Department of Resource Recycling and Recovery, 32 percent of that remaining waste sent to landfills is organic. Composting makes sense!

## NEW BACKYARD COMPOSTING BINS AVAILABLE

### Discount for La Mesa Residents!

The City of La Mesa is offering discounts to residents to purchase backyard compost bins for $30 in a partnership with Dixieline ProBuild. To qualify you must live in the incorporated City limits. Residents may request a coupon from the City that they can redeem at the La Mesa Dixieline ProBuild store (while supplies last). The coupon is worth $40 off $69.99 retail value of the bin.

The City uses funds collected through its existing recycling programs to reimburse the store for the cost difference. This program does not apply to businesses or multifamily property owners, although they are encouraged to purchase composters and participate in recycling of organic waste.

Interested residents may access our "Guide to Backyard Composting" and the coupon request form at **cityoflamesa.com/composting** or at City Hall. Composting classes are offered by the Water Conservation Garden and EDCO. Questions? Contact the Environmental Services Division at **envirosvcs@ci.la-mesa.ca.us** or **667.1338**.

## Parks are a great place to celebrate special occasions!

Whether you're planning a wedding, birthday party, corporate event or family get-together, park use permits are required for groups of 25 or more, and for special use such as astrojumps. No alcoholic beverages are allowed without a special permit. Make your reservation today at **rsvp4parks@ci.la-mesa.ca.us** or **667.1307**.

## Calendar of Events

**March 2, 16, 30**
City Hall Closed

**March 2, 6 pm**
Miss La Mesa Pageants
Sonrise Church, Santee

**March 3, all day**
La Mesa Kiwanis Soap Box Derby - Junior High Drive

**March 17, 10 am**
La Mesa 1912: A City is Born Historical Series - Grossmont Healthcare District

**March 24, 9 am – 1 pm**
Household Hazardous Waste Collection - EDCO Station

**March 31, 9 am – 4 pm**
La Mesa Garden Tour
Begins at Briercrest Park

# NEW Enhanced Online Enrollment for Recreation Classes & Camps

# Convenient – Secure – Guaranteed Class Choice

Community Services staff is available to help assist you with online enrollment at **667.1300** and/or email at **community@ci.la-mesa.ca.us** Monday through Thursday 7:30 am to 5:30 pm and alternate Fridays to 4:30 pm. Please note program instructors will no longer be accepting enrollment in class, therefore early enrollment is encouraged since there are a minimum number of participants required to hold class. Where enrollment is low, we may need to cancel the course one week prior to the start date.

Follow us on Twitter **@LaMesaCommunity**. We post relevant community services information and highlights from events and programs, in addition to fun contests and prize giveaways.

## Get Out and Play!

Summer is just around the corner, and that means summer camps, enrichment classes, and youth aquatic classes are being offered. Enrollment starts March 1st for day camps and May 1st for summer activities. View activities schedules online at **cityoflamesa.com/classes**. Click on the orange "Enroll Online" button for online enrollment.

## Fundraising for the La Mesa Centennial Flag Day Parade... For Today and Tomorrow

The Flag Day Parade is organized by volunteers and supported financially by community individuals, organizations and businesses. In honor of our Centennial the fundraising goal is $25,000 ($15,000 for the 2012 Parade and $10,000 to create a future parade endowment). We hope you will become one of the sponsoring partners of our Centennial Flag Day Parade. For more info, call **667.1333**.

April 2012

## Important Information About Your Sewer Bill

Effective July 1 the City will discontinue bimonthly sewer billing and bill annually on property tax bills. This change does not affect the rate at which sewer charges are calculated. Charges will still be calculated for each property using winter water consumption from the previous five years and will be recalculated each year on July 1.

If you own property in La Mesa you are responsible for sewer charges incurred at that property. These charges will appear on the annual property tax bill you receive from the County Assessor-Tax Collector's office as a fixed charge special assessment. If you operate a business or rent a single-family home, condominium, apartment or commercial/industrial space in the City of La Mesa but do not own the property, you will not receive a sewer bill after July 1. Sewer charges will be billed to the property owner on the annual property tax bill.

Customers who pay property taxes through an impound account may need to adjust their monthly payment to cover the sewer service charges. The average annual single-family sewer charge is currently $400 a year. These charges are not tax-deductible on your income tax return and should not be used to reduce your tax burden.

### WHY THE CHANGE?

La Mesa has shared billing systems with Helix Water District for the past 20 years. Helix Water District is changing their billing system and will no longer be able to support the City of La Mesa billing function. The City examined various options for sewer billing and found that placement of charges on the property tax bill was the most cost effective solution.
The billing change will result in a substantial reduction in processing and mailing costs. La Mesa currently processes about 13,700 sewer bills every other month.

### QUESTIONS?

If you have questions about the sewer billing changes, visit our website at **cityoflamesa.com/Sewer** or call **961.2848**.

### ANNUAL CREEK TO BAY CLEANUP

Saturday, April 28 • 9:00 am to 12 pm

**TWO LOCATIONS IN LA MESA:**

- Alvarado Channel meeting across the street from 7601 Alvarado Rd.
- University Channel meeting at Schaffer Ambulance 7285 University Ave.

For more information and to sign up visit **creektobay.org**.

**5100 MEMORIAL DRIVE**

Free swim lessons. Water safety/CPR presentations. Water Polo, lifeguard, and Fire Dept demonstrations. Swim with a Navy SEAL. Fun for the whole family!

## Voter Registration Deadline

**MONDAY, MAY 21 FOR THE CALIFORNIA PRIMARY ELECTION ON JUNE 5**

Your Vote Counts!

The last day to register to vote in the June Primary is Monday, May 21. You will need to register to vote if you:

- Have moved recently
- Changed your name
- Wish to change your political affiliation
- Will be at least 18 years of age on or before the next election

Postcard registration forms are available at the following locations:

- Registrar of Voters Main Office
- All City Clerk Offices
- Department of Motor Vehicles
- U.S. Postal Services
- Public Libraries

Call the Registrar of Voters main office at **858.565.5800** or visit their website at **sdvote.com** for more information on voter registration.

## CONSTRUCTION ACTIVITY UPDATE

The City of La Mesa is currently in construction on various projects throughout the City. The following is a status update on some of these projects:

### COLLECTOR STREET RESURFACING PROJECT

TC Construction was selected to pave several collector streets throughout the City. The remaining streets to be paved are Commercial St., Center St. (from Jackson Dr. to Center Dr.), Center Dr., Guild St., La Mesa Blvd. (from Grossmont Blvd. to I-8), Bancroft Dr. (from south City limit to Grossmont Blvd.). These are scheduled to be completed by the end of May. These streets will be paved at night. There will be detours and street closures during construction. Please refer to public notices for details, including: flashing sign boards, door hangers, and press releases.

### OLD POLICE STATION DEMOLITION PROJECT

Anton's Service, Inc. was selected to demolish the old police station. The hazardous materials, including asbestos and lead, were abated by Casper Construction prior to the demolition work. The demolition is moving along and is scheduled to be completed by the end of April.

May 2012

## National Police Week

National Police Week recognizes the service and sacrifice of U.S. law enforcement and pays special recognition to those law enforcement officers who have lost their lives in the line of duty for the safety and protection of others. Several local, state, and national peace officer memorial services occur each year to commemorate National Police Week.

This year's ceremonies will include a candlelight vigil at the San Diego County Law Enforcement Memorial on Tuesday, May 1 at 8:00 pm and a memorial ceremony on Wednesday, May 2 at 12:00 pm. The San Diego Law Enforcement Memorial is located on the west lawn of the County Administration Building at 1600 Pacific Highway. The California state memorial will take place at the capital building in Sacramento on May 7. The national memorial will be held in Washington, D.C. on May 15.

Each of these ceremonies are meant to be a time to remember and honor the officers who have fallen in the line-of-duty the preceding year, recognizing the sacrifice of those loved and left behind.

## Weed Abatement Season Is Coming

It's that time of year when the annual vegetation growth from the winter rains begins to die. This can create a nuisance and often a fire hazard.

La Mesa conducts a citywide Weed Abatement program each year to identify properties that have dead vegetation, weeds, dry grass, and debris. This year the city has contracted with Fire Prevention Services, Inc. to conduct inspections and follow up on reported complaints.

Residents are encouraged to inspect their properties and remove any dry weeds, fallen tree limbs, trash, or other nuisances. You may have to clear your property more than once during the year to keep it in compliance. Remember, it is your responsibility to keep your property maintained year round.

For more information regarding the Weed Abatement Program and how to make sure your property is safe, visit **heartlandfire.org** and click on the Fire Prevention tab. You can also call Fire Prevention Services, Inc.'s 24-hour weed abatement line at **866.779.3774** ext. **304** to report a fire hazard and/or public nuisance.

## Calendar of Events

# Want to make a difference in your community?

## VOLUNTEER FOR A CITY BOARD, COMMISSION, OR COMMITTEE

The City encourages citizen participation in municipal government and welcomes your interest in serving on a board, commission or committee. These groups provide valuable public input into government and assist in the decision making process.

Recruitment is currently open for appointments on City boards, commissions, and committees. Serving in an advisory capacity, each group has specific roles and responsibilities. Most groups meet once a month for a couple of hours. Additional information and application forms are available on the City website, by visiting the City Clerk's office at City Hall, 8130 Allison Avenue, or by calling the Clerk's office at **667.1120**.

Applications must be submitted to the City Clerk's office no later than 5:30 pm June 7 to be included in the interview process, tentatively scheduled for 6:30 pm on June 26. The interview and selection process for the Youth Advisory Commission occurs in September.

## Styrofoam™ can now be recycled in your blue bin

You can now put polystyrene (Styrofoam™) with other recyclables in your blue EDCO collection bin! Packaging and clean food containers can be turned into new products like picture frames, interior molding, garden pots, and auto accessories. Packing peanuts are not included in this program. For more information visit **cityoflamesa.com/recycling**.

## May is Drowning Prevention Month

Drowning is a leading cause of injury-related death among children under the age of five and each year near drowning accidents result in lifelong disabilities. The month of May has been identified as Drowning Prevention Month to raise awareness of the issue and remind parents and caregivers to be sure children are safe in and around the water. Learn-to-swim classes are a good place to start. Enroll now for summer swim programs on the City website or call **667-1494** for information.

## CONSTRUCTION ACTIVITY UPDATE

**Annual Street Maintenance Project**

The City's Annual Street Maintenance Project is anticipated to start in June and extend through August. In preparation of the project, the City completed other related work such as tree and sidewalk maintenance and ADA upgrades. The Street Maintenance project primarily includes crack sealing, slurry coating and restriping of selected streets. This year's project will focus on streets in the northeast area of the City. Please refer to the City's website at **cityoflamesa.com** for additional street maintenance information.

**Annual Street Maintinence**

## ADULT SOFTBALL

**Coed and Men's Leagues (18 years and older)**

For registration info leave your name and daytime telephone number at 667.1172 and select option #6. The last day to register new teams for fall is July 18. Season play begins the week of August 13.

**Thursday: Coed 6:00 – 9:00 pm**

**Friday: Men's 6:00 – 10:00 pm**

**Kuhlken Baseball Field**

## La Mesa Continues its Centennial Celebration at the Flag Day Parade

On Saturday, June 2 downtown La Mesa Village will dress up in red, white, and blue to celebrate 100 years and A Salute to Old Glory! at the La Mesa Centennial Flag Day Parade. Spectators are encouraged to dress in patriotic attire and enjoy the free Centennial events. Be advised that there will be many temporary road closures. For the safety and enjoyment of everyone, please adhere to these closures. Following is a line up of the activities.

### 9:00 am – Pre parade concerts

Listen to La Mesa Middle School Band at La Mesa Boulevard and Palm Avenue or East County Youth Symphony at La Mesa Boulevard and Nebo Drive.

### 10:00 am – Centennial Parade marches through downtown La Mesa Village

Spectators will enjoy marching bands led by the United States Marine Corps Band, floats, military vehicles, active and retired war heroes, equestrian units, service clubs, and youth groups. The Grand Marshal is Helix Charter High School CIF Division II State Football Champions. The La Mesa Centennial Flag Day Parade is sponsored by: Drew Ford, Barona Resort & Casino, SDG&E, Flood Masters, La Mesa Welfare Association, Lee & Jo Ann Knutson, Montezuma Land Co. LLC, Pamela J. Wagner, Shannon O Dunn, Viejas Tribal Government, and Walmart.

### 11:00 am – Community Picnic

The La Mesa Chamber of Commerce, Viejas Band of Kumeyaay Indians, Golden Acorn Casino & Travel Center, and Starbucks are sponsoring a picnic on Palm Avenue between La Mesa Boulevard and Allison Avenue until 1:00 pm or while supplies last.

### 12:00 pm – Community Photo

Help us recreate the 1923 community photo (shown below) at La Mesa Boulevard and Palm Avenue The photo will be available for sale on SmugMug.com, Password: 100 Continued Page 2

# La Mesa Continues its Centennial Celebration at the Flag Day Parade Continued from Page 1

### All Day – Amazing Geocache Challenge Begins

The La Mesa Centennial Amazing Geocache Challenge kicks off at the parade. Team up with friends and family for this outdoor adventure! Geocaches (containers) will be hidden throughout the city at local parks, attractions, and historical landmarks. Each hidden treasure will reveal interesting historical facts and a challenge question. You'll receive a set of coordinates, to which you'll navigate using your own handheld GPS device or GPS-enabled smart phone. Join the Amazing Geocache Challenge and celebrate the La Mesa Centennial!

Visit the La Mesa Centennial and La Mesa Historical Society booth at the parade for information about La Mesa's history, the Amazing Geocache Challenge, and Centennial commemorative items. For more information about these and other Centennial events, visit the official La Mesa Centennial website at **cityoflamesa100.com**.

## Outdoor Cooking Safety & Awareness

Everybody loves an outdoor barbeque. However, outdoor cooking can also lead to tragedy when carelessness causes serious burns. Heartland Fire & Rescue offers the following safety checklist to use when cooking outdoors.

- When lighting a grill, the safest fire starters are chemicals in cake form or a charcoal electric starter.
- Never add fire starter after you have started your barbeque. The heat from the coals could ignite the stream of liquid and burn back into the can, causing it to explode in your hands. To speed a slow fire, tuck dry kindling under charcoal.

- Make sure the barbeque grill is level and steady and keep a container of water nearby.
- After cooking, soak the coals in water. Dispose of charcoal in a metal container with a tight fitting lid. Many brush fires start because hot coals, thought to be cool, were dumped in leaves.
- Barbeque grills should never be brought inside a house, tent, or recreational vehicle, because of the danger of carbon monoxide poisoning in sealed or confined areas.
- Keep small children away from the barbeque.
- Damp or wet charcoal should be immediately disposed of, as it can spontaneously combust.

For more information about Outdoor Cooking and other safety tips, visit **heartlandfire.org** and click on the Fire Prevention tab.

## FREE Paper Shredding Event

Don't discard – shred your household documents in a quick and easy way by bringing them to La Mesa's EDCO Station, 8184 Commercial Street.

**Saturday, June 23**
**9:00 am - Noon**

- Limit 2 boxes per La Mesa household
- Staples ok
- Shredding will be done onsite
- No appointment necessary

This City event is made possible through the generous support of the EDCO Disposal Corporation. Questions can be directed to **667.1167**.

## CONSTRUCTION ACTIVITY UPDATE

### Annual Slurry Seal

American Asphalt South will be slurry sealing many of the streets within Maintenance Zone 3 located in the northeast area of the city. Prior to slurry sealing, trees were trimmed and concrete sidewalk maintenance was performed.
For a complete list of streets, go to: **cityoflamesa.com/2012SlurrySeal**. Call 667.1166 with questions.

### Normal Avenue Utility Undergrounding

Work will continue on Normal Ave. for installation of new cables for utility service in recently placed underground conduits.

Maintenance Zone 3 Map

## SUNDAYS AT SIX CONCERT SERIES

The Sundays at Six summer concert program is a series of free concerts held in the beautiful outdoor amphitheater at Harry Griffen Park. As the name implies, concerts are held on Sunday evenings beginning June 10 at 6:00 pm. In honor of La Mesa's Centennial celebration the concert run has been expanded to 10 concerts – one for each decade. The concert lineup is available at cityoflamesa100.com. Choose your favorite era or gather friends and family and attend them all.

# City of La Mesa
# Storm Water Pollution Prevention
## *Tips for Outdoor Vendors*

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying storm water runoff into receiving water bodies, such as creeks, lakes and oceans. Unlike the sewer system, storm water runoff entering the storm drain system is not treated. Harmful pollutants, as listed below, can be transported during non-storm water discharges such as hosing down side walks or equipment. These types of pollutants are harmful to the environment and negatively impact water quality, aquatic animal and plant life as well as our quality of life. Non-storm water discharges are prohibited and in violation of the City Ordinance. A list of common pollutants and pollution prevention tips are provided below.

**Pollutants of Concern**

1. Sediment
2. Fertilizers
3. Metals
4. Detergents
5. Pesticides
6. Organic Compounds (solvents)
7. Trash and Debris
8. Oil and Grease
9. Bacteria

**Good House Keeping**

- Dry sweep exterior paved areas. **Do not use a hose or water!** Place debris in dumpster and keep dumpster lid closed.
- If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer system (sink or toilet). Wash water is not allowed to enter the storm drain.

**Outdoor Material and Equipment Management**

- Store material under covered areas.
- Place liquid material in secondary containment to ensure spills are contained.
- Ensure that frying oil is contained and managed properly without dropping/leaking on to the pavement.
- If using frying oil, ensure that you purchase absorbent material (absorbent pads) to address cleanup of potential oil spills.
- Inspect/fix equipment to ensure no leaks.
- Do not wash equipment at the event!

**Waste Management**

- Place trash in dumpsters with lids always closed.
- Cleanup leaks/spills immediately and place waste material into the dumpster

*Should you require clarification or additional information on storm water pollution prevention, please contact the City's Storm Water Hotline (619) 667-1134.*

# ATTACHMENT 8.2

# OVER IRRIGATION FACT SHEET

# City of La Mesa
# Storm Water Pollution Prevention
# Over-Irrigation

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

With La Mesa's clay soils, it doesn't take much to moisten the ground before water starts running off your property to the curb, down the street and into the storm drain. Runoff from over-irrigation may transport pollutants such as sediment, pesticides, fertilizers, pet waste, bacteria, and automobile fluids. These pollutants enter our local creeks and streams and discharge into the ocean.

Over-irrigation is not prohibited; however, the following measures are recommended.

1. Over-irrigation runoff shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Irrigate to meet site-specific conditions to prevent over-watering.
3. Ensure that your irrigation system has control devices, sensors or shut-off switches to address malfunctions.
4. Place or group plants with similar water needs within the same area.
5. Don't irrigate non-planted areas.
6. Inspect your irrigation system regularly for potential problems
7. Consider drip irrigation to save water and prevent over-irrigation and runoff.
8. Adjust irrigation rates according to seasons, weather conditions and the soil's ability to absorb water. Instead of watering for 15-minutes straight, break up the session into 5-minute intervals, allowing water to soak in before the next application.
9. Irrigate in the early morning; it's the most efficient time to water plants with minimal evaporation.
10. Refrain from irrigation during hot, windy periods of the day. Do not let water run out into the street.

Do the right thing, stay in compliance and protect our environment. For more information contact the City's Storm Water Hotline (619) 667-1134.

# ATTACHMENT 8.3

# CHOLLAS CREEK TMDL FACT SHEET

# Chollas Creek TMDL Fact Sheet

**What are the Chollas Creek TMDLs?**
In 2003 and 2007, Total Maximum Daily Load (TMDL) allocations for the pesticide diazinon and for heavy metals (copper, lead, and zinc), respectively, were adopted by the Regional Water Quality Control Board (a State Regulatory Agency) for Chollas Creek. The regulations establish strict numeric limits on the amounts of heavy metals and diazinon that can be present in urban runoff. Southwestern La Mesa, roughly bounded by El Cajon Boulevard to the north and Spring Street to the east (see map), eventually drains to Chollas Creek and is subject to these requirements. Businesses within this area are impacted by these new requirements. The City is monitoring water quality near your business to identify and eliminate sources of these pollutants to comply with new State regulations. The following activities/sources contribute to the discharge of heavy metals and diazinon.

**Heavy metals** are commonly associated with industrial waste, uncontained storage of certain metal products or materials (such as galvanized steel), cutting and grinding activities, atmospheric deposition, metal smelting or plating, and automobile tires and brakes.
**Diazinon** is a pesticide associated with landscaping activities. It has been banned for use and is no longer available at retail outlets. Diazinon acquired prior to the ban should be disposed of in accordance with state and federal regulations.

**What is the City of La Mesa doing about these TMDLs?**
The City's many efforts to protect water quality and comply with State regulations include regularly sweeping its streets and cleaning out its storm drain system, inspecting businesses and construction sites, and applying strict water pollution control standards to new development projects.

**What do these TMDLs mean for my business?**
The City's Municipal Code requires that businesses take measures to ensure that urban runoff (water that leaves your business and enters storm drains) is not contaminated with pollutants. Chapter 7.18 of the Municipal Code requires businesses to implement measures including those listed below. Taking these actions will help meet TMDL requirements.

- Eliminate non-storm water discharges, such as hosing off property and allowing the water to leave the site, dumping liquids into a storm drain, and runoff from excessive irrigation.
- Cover and contain metal products or materials that may contain heavy metals where feasible. Examples of such materials include galvanized metal, brake pads, tires, and metal recycling bins.
- Conduct metal cutting, grinding, welding, automotive or equipment repair, and similar activities in indoor, contained areas where feasible.
- Regularly sweep paved areas of your site to keep them clean and dispose of debris appropriately.
- Do not use any product containing diazinon. Contact County of San Diego Hazmat for instructions on proper disposal (619-338-2231).
- Store all pesticides and fertilizers in covered and contained areas. Consider alternative, non-chemical pest control methods.
- Do not apply pesticides before storms and eliminate overspray of pesticides onto paved surfaces.

If you observe illegal dumping into a storm drain, please report it to the City at 619-667-1134.

# ATTACHMENT 8.4

# RESIDENTIAL PREVENTING URBAN RUNOFF POLLUTION BROCHURE

## Sanitary Sewer vs. Storm Drain System

The water that drains down a sink or toilet in a home or business flows to the sanitary sewer and is treated by the City of San Diego at a wastewater treatment plant.

The storm drain system, on the other hand, is designed to carry rainwater from City streets and driveways to prevent flooding. This water does not receive any treatment. It flows directly to creeks and rivers – terminating at the Pacific Ocean!

Unfortunately, as rainfall flows over the ground it picks up debris and pollutants and deposits them into our watersheds.

# Preventing Urban Runoff Pollution

## A Guide for Residents

Urban storm water runoff is the **largest contributor** to **watershed pollution** in San Diego County.

The City of La Mesa's Storm Water Ordinance Requires the implementation of **Best Management Practices** (BMPs) to prevent urban runoff pollution.

The City monitors activities within the City's jurisdiction and may take enforcement measures to ensure the prevention of urban runoff pollution.

## Pollutants of Concern

As rainfall flows over the ground, it picks up a variety of pollutants and deposits them into our watersheds. The following pollutants are commonly transported in the storm drain system and have been found to degrade water quality.

- Sediments
- Fertilizers
- Metals
- Detergents
- Pesticides
- Organic Compounds (solvents)
- Trash and Debris
- Oil and Grease
- Bacteria and Viruses

The following Best Management Practices (BMPs) are required to be used in residential areas to reduce urban runoff pollution in our streams and waterways. To do your part in protecting our water quality, please implement the following BMPs, where applicable or checked by the City inspector.

## Maintenance & Good Housekeeping

- ❑ Regularly, dry sweep exterior paved areas. **Do Not use a hose!** Place debris in the dumpsters.
- ❑ If you must use water for cleaning, use a mop and bucket. Dispose of wash water into the sanitary sewer (sink or toilet).
- ❑ Water used for cleaning exterior surfaces must be contained and disposed of into the sanitary sewer in compliance with local regulations. Wash water is not allowed to enter the storm drain or leave the property.
- ❑ Regularly inspect and maintain storm drain inlets.

## Landscaping

- ❑ Only irrigate during early morning or late evening to avoid evaporation.
- ❑ Aim sprinklers to avoid watering other areas.
- ❑ Time sprinklers to avoid over watering and causing runoff.
- ❑ Minimize pesticide, herbicide and fertilizer use, which are harmful to animals downstream.
- ❑ Hand pull weeds instead of using herbicides.
- ❑ Do not use pesticides that eliminate beneficial insects (i.e., Integrated Pest Management).

## Outdoor Material Storage

- ❑ Store all material indoors or under a covered area not exposed to rain. Include secondary containment for liquid material.
- ❑ Have a spill response kit available to clean up potential spills such as kitty litter or other absorbents.
- ❑ Keep material storage areas free from rainwater accumulation.
- ❑ Keep lids closed on all outdoor storage containers and ensure containers are labeled.

## Waste Management

- ❑ Keep all outdoor garbage and dumpster areas free of trash, sediment and debris.
- ❑ Keep lids closed on dumpsters and trash cans and never wash down dumpsters.
- ❑ Fix any leaks in garbage cans or dumpsters.
- ❑ Schedule regular waste pick-up.

## Vehicle /Equipment Maintenance

- ❑ Perform all vehicle maintenance indoors when possible.
- ❑ Use drip-pans to collect fluids from leaky vehicles.
- ❑ Clean up spills immediately using kitty litter or other absorbents. Properly dispose of used absorbents.

## Vehicle /Equipment Washing

- ❑ Wash vehicles at a commercial car wash when possible. (Commercial car washes drain to the sanitary sewer and not to the storm drain).
- ❑ Wash vehicles over a pervious (absorbent) surface such as dirt, gravel or grass to prevent runoff.
- ❑ Minimize the use of soaps and water while washing.
- ❑ Protect storm drains or curb inlets and then collect all wash water by vacuum. Recycle or dispose of wash water via the sanitary sewer system.
- ❑ Drain excess wash water to the sanitary sewer (sink or toilet), not to storm drains.

## Loading Areas & Operations

- ❑ Load and unload in designated areas.
- ❑ Regularly dry sweep loading and unloading areas.
- ❑ If possible, cover loading areas.
- ❑ Divert storm water away from all loading and unloading areas.
- ❑ Check shipments and trucks for leaks and spills.
- ❑ Cleanup spills/leaks immediately and dispose of properly.
- ❑ If you must use water for cleaning, use a mop and bucket and dispose of wash water into the sanitary sewer.
- ❑ Major cleaning of exterior surfaces must include capturing all wash water and disposing of it into the sanitary sewer in compliance with local regulations. Wash water should not be allowed to enter the street gutter or storm drains.

# City of La Mesa
# Storm Water Pollution Prevention
## *Pools & Spas*

You may not be aware that in Southern California, the sewer system and storm drain system are separate. Storm drain inlets are commonly found along curbs with the intent of transporting or conveying runoff to the nearest receiving water body, such as creeks, lakes and oceans. Unlike the sewer system, runoff entering the storm drain system is not treated but directly discharged into a receiving water body. Pollutants ultimately impact water quality, aquatic animal and plant life as well as our quality of life. Releasing pollutants into the storm water system is a violation of our City Ordinance.

Discharging of pool or spa water is not prohibited; however, the following measures are required.

1. Water shall not carry or transport sediment, leaf debris, and other pollutants into the storm drain inlets.
2. Pool water must be dechlorinated
3. Water pH acceptable range from 7 to 8
4. No algae present in water
5. Water shall not contain chemicals to counteract the chlorine
6. Water does not contain hydrogen peroxide based products
7. Controlled discharge eliminating potential for erosion

**Chlorine**

Test pool or spa water for chlorine prior to discharge. Chlorine naturally dissipates overtime and if pool or spa water is left 3 to 5 days, it will become dechlorinated. Pool water needs to be drained before it turns green. Draining pool water gradually over landscaped areas will help prevent erosion problems.

**Pool Filters**

Pool filters should be cleaned over landscaped areas or anything that will absorb the discharge. Material may be collected over a filter cloth and disposed of in the trash. Filter backwash must be discharged into the sewer system with a pH of 5 to 12.5.

**Pool Construction**

Material must be contained and disposed of appropriately. Waste generated from plaster, gunite, cement, sediment, and other construction materials is prohibited from entering the storm drain system.

Do the Right Thing, Stay in Compliance and Protect Our Environment. For more information, contact the City's Storm Water Hotline (619) 667-1134.

# ATTACHMENT 8.6

# INTEGRATED PEST MANAGEMENT CARDS

# Ants

**Ants are one of the most prevalent pests in California.** Although ants are annoying when they come indoors, they can be beneficial by feeding on fleas, termites, and other pests in the garden. While spraying chemicals inside the house may seem effective, it won't prevent more ants from entering your home, which is essential for control because most ants nest outside. Focus management efforts on excluding ants from buildings or valuable plants.

## Make your house less attractive to ants:

- Caulk cracks and crevices that provide entry inside.
- Store attractive food in closed containers.
- Clean up grease and spills.
- Look for and remove indoor nesting sites, such as inside potted plants.
- Ant-proof kitchen garbage pails with sticky barriers such as petroleum jelly under the lip and pet dishes by placing them in a moat of water.
- Remove sweet food sources next to your house such as aphid-infested bushes and ripened fruit on trees.

## When ants invade your house, take these steps:

- Sponge invaders with soapy water as soon as they enter.
- Plug up ant entryways with caulk or petroleum jelly.
- Remove infested potted plants.
- Clean up food sources.
- Rely on baits to control the ant colony.
- Indoor sprays are not usually necessary.

## How and why baits work best:

**When using bait, place it along ant trails and at nest openings.** Worker ants will be attracted to bait and take it back to the nest where the entire colony, including queens, may be killed. The bait must be slow-acting so workers won't be killed before they get back to the nest. It may take several weeks for results to be evident. Just killing workers foraging in your home or garden does little to control the colony, because as few as one percent of a colony's foraging worker ants are able to provide sufficient food to support nestbound queens and larvae. Baits in bait stations or ant stakes are easiest to use and safest for the environment.

(actual size)

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon-Fri, 9 am to 3 pm*

UNIVERSITY of CALIFORNIA

MASTER GARDENER ASSOCIATION SAN DIEGO COUNTY

It's the water that connects us!

# Aphids

**Almost every plant has one or more aphid species that occasionally feeds on it, but low to moderate numbers of aphids are usually not damaging in gardens or on landscape trees.** Although aphids can curl leaves and produce sticky honeydew, they rarely kill plants and can often be washed off with water. When aphid numbers get high, natural enemies frequently feed on them, eliminating the need for pesticides. Insecticidal soaps and oils are less toxic pesticides that can be used when treatment is necessary.

## Aphids are common in your garden because:

- Aphids like lush new growth. Don't over fertilize. Use organic fertilizers or slow-release products.
- Aphids build up on flowering plums, roses, tulip trees, crape myrtles, apples, and many vegetables. Expect aphids when you grow these plants.
- Ants protect aphids from their natural enemies. Keep ants off plants to get more benefit from these beneficial insects.

## To reduce aphids:

- Prune out infested leaves and stems.
- Knock aphid populations off plants by shaking or spraying with a strong stream of water.
- Protect seedlings with covers or aluminum soil mulches.
- Wait for hot weather; most aphids are heat-intolerant and will be gone by mid-June.

## Protect aphids' natural enemies:

- Lady beetles, both adults and larvae
- Lacewings
- Syrphid fly larvae
- Soldier beetles
- Parasitic mini-wasps that turn aphids into crusty mummies (See reverse for insect drawings.)

Natural enemies of aphids such as lady beetles and lacewings will come into your garden naturally when aphids are abundant. Protect these good bugs by avoiding the use of insecticides that may be toxic to a broad variety of insects.

## If insecticides seem necessary, use the safest products:

- Nonchemical pest control methods should be used first to manage aphid populations. However, if you feel insecticides are necessary, choose less toxic products.
- Insecticidal oils and soaps are the safest products. When properly used, these materials solve most pest problems.
- Oils and soaps work by smothering aphids, so application must be thorough. Don't apply to drought-stressed plants or when it is very hot. A few plants are sensitive to these products.
- Insecticidal soaps, soap-pyrethrum mixtures, or neem oils are often applied on vegetables or small bushes like roses.
- Narrow range oils, like parafinic, supreme or superior oils, are appropriate for larger trees.
- Oils and soaps don't kill aphids hidden within curled leaves. Prune these out. Systemic insecticides can kill hidden aphids, but they are much more toxic and not registered for use on garden vegetables or fruit trees.

# Cockroaches

HEALTHY GARDEN HEALTHY HOME

**Cockroaches thrive in warm environments that provide food, water, and shelter.** Roaches hide in cracks, crawl spaces, and other dark places during the day and come out at night to feed. Pesticide sprays alone will not control roaches and are not usually required. Baits provide better control. You must integrate several strategies to make your home a less roach-friendly environment. Thoroughness is essential for effective control.

## Identify your cockroach species first:

- Effective management options vary according to species.
- Cockroach traps provide an easy way to catch roaches for identification.
- Control practices for outdoor invaders (American, oriental roaches) and indoor residents (brownbanded and German roaches) differ.
- For help with identification go to www.ipm.ucdavis.edu.

## Remove food and water sources:

- Even tiny crumbs or liquids in cracks provide good food sources.
- Store food in sealed containers.
- Keep trash in containers with tight lids.
- Eliminate plumbing leaks.
- Vacuum cracks and crevices and clean floors and counters daily.

## Remove roach hiding places:

- Seal cracks and other openings to prevent invaders from the outside.
- Seal cracks in false bottoms of cupboards and other indoor hiding places.
- Seal or clean up other areas where you find roaches or their egg cases hiding.
- Remove old newspapers, boxes, and other clutter in kitchens and bathrooms.
- The oriental cockroach hides outdoors under ivy and other shelter. Check to see if you have this roach and remove outdoor hiding places or bait.

## Use traps to identify and track cockroach populations:

- Cockroach traps are available in hardware stores.
- Place traps on the floor around edges of walls, in cupboards and other places where you think roaches are foraging. Place bait stations at locations where you trap roaches.
- Check traps daily.
- Sticky traps with pheromones may provide some control of German cockroaches.

## Using chemicals to control cockroaches:

- Avoid use of foggers, bombs, or aerosol sprays — they just disperse populations.
- Boric acid powder blown into cracks, crevices, hollow walls, under refrigerators, or other undisturbed hiding places is very effective (allow 7 days or more for an effect to be seen).
- Bait stations containing boric acid, abamectin, fipronil, or hydramethylnon placed near hiding places can be effective if other food sources are removed (allow 7 days or more for an effect to be seen). Replace stations as needed as long as roaches are being caught.
- Insecticide sprays alone do not give long-term control. They are not necessary if other methods such as baits and boric acid powder are combined along with cleanup and removal of hiding places.
- Contact a professional pest control operator for very serious infestations, but be sure they use an integrated program as described above.

# Earwigs

HEALTHY GARDEN HEALTHY HOME

**While their prominent tail-end pincers may look ferocious, earwigs are not harmful to people.** Earwigs may seriously damage seedling vegetables and chew holes in annual flowers, soft fruit, and corn silks, but earwigs also play a beneficial role by feeding on aphids and other insects. Nocturnal in habit, earwigs feed at night and hide during the day in dark, cool, moist places in the yard or within flowers or vegetables. To manage earwigs, reduce hiding places and moisture, and employ a vigilant trapping program.

## Should you be concerned about earwigs in your garden?

- Yes, if you are growing vegetables, herbaceous flowering plants, sweet corn, or plants with soft fruits like strawberries and apricots.
- No, if your garden is primarily lawn, trees, and woody ornamentals or native plants.

## Reduce outdoor hiding places:

- Eliminate dense undergrowth of vines, ground cover and weeds around vegetable and flower gardens.
- Prune away fruit tree suckers.
- Remove leaves, boards, boxes, trash, and other debris from planting areas.
- Move flower pots and other garden objects and structures that can harbor earwigs.
- Check plastic or organic mulches and remove them to limit earwig numbers.

## Trap earwigs until they are gone!

- Trap earwigs with rolled newspaper, bamboo tubes, or short pieces of hose. Place these traps on the soil near plants just before dark, and shake accumulated earwigs out into a pail of soapy water in the morning. A low-sided can filled with oil and a drop of bacon grease or fish oil also makes a good trap. Daily trapping will reduce earwig populations to tolerable levels.

## Other ways to reduce earwig problems:

- Drip irrigate where possible to reduce surface moisture.
- Keep earwigs out of stone fruit trees with a band of sticky substance like Tanglefoot, around the trunk, and harvest fruit as soon as it ripens.
- Insecticides should rarely be needed.

## Inside the home:

Earwigs may seek refuge indoors when conditions outside are too dry, hot, or cold. Large accumulations of earwigs can be annoying but present no health hazards. When earwigs invade your home follow these steps:

- Sweep or vacuum up invading earwigs.
- Seal up cracks or other entry points.
- Remove debris from gutters and around entryways.
- Keep water and moisture away from structures.
- Replace white outdoor lights with yellow ones, which are less attractive to earwigs.
- Indoor application of pesticides is not recommended.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org.*
*For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

UC IPM
University of California Cooperative Extension

ANR University of California

Master Gardener Association San Diego County

It's the water that connects us!

# Fleas

**Fleas are particularly annoying to people and pets, especially during spring and early summer when their numbers tend to increase dramatically.** The common flea in California is the cat flea. Despite its name, it attacks both dogs and cats and will also bite humans. To keep fleas out of your home, control fleas on your pet and regularly clean pet sleeping areas.

## On the pet:

Recently, a number of very effective and safe new products for flea control on the pet have become available. Remember to supplement pet treatments with regular cleaning of your home and periodic combing with a pet flea comb to detect new infestations.

- Spot-on formulations are applied to the animal's coat, providing flea control for 1 to 3 months. Available from veterinarians or over-the-counter.
- Systemic flea control products, available from vets, are given as a pill or food additive. While they do not kill adult fleas, they prevent reproduction.
- Flea collars containing insect growth regulators (IGRs) give protection for up to 6 months on dogs and up to a year on cats. Be sure to choose collars containing methoprene or pyriproxyfen.
- Flea shampoos and soaps, powders and dusts, spray-on liquids, and dips are less effective and more hazardous to pets, people, and the environment than the three types of products above.

## In the yard:

Outdoor treatment is rarely needed, but if your pet regularly sleeps outside and flea numbers are high, these areas can be treated with a spray containing pyriproxyfen. If possible, open sleeping areas to sunlight by removing low hanging vegetation. Immature fleas are unlikely to survive in areas with exposure to sunlight.

## Inside the home:

Whether or not you are aware of fleas in your home, regularly vacuum and launder areas where your pet rests to avoid flea buildup. If you have a major flea problem, treat your pet with one of the options on the front of this card and follow the steps below.

- Locate heavily infested areas (usually areas where the pet rests) and concentrate treatment there.
- Wash throw rugs and pet bedding.
- Vacuum upholstered furniture, cleaning under cushions and in crevices.
- Vacuum carpets, especially beneath furniture.
- Use a hand sprayer or aerosol to treat all carpets and unwashable upholstered furniture with an insecticide that contains an IGR (methoprene or pyriproxyfen). This treatment kills larvae but not pupae, so fleas may continue to emerge for up to 2 weeks.
- Over the next 2 weeks vacuum regularly to remove adult fleas that emerge from pupae. Do not reapply pesticides.
- Seal vacuum bags and discard them so fleas don't escape.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Gardening with Good Bugs

HEALTHY GARDEN HEALTHY HOME

**Most gardens contain far more types of good bugs,or beneficial insects, than pest insects.** Beneficial insects and other organisms that kill pest insects are called natural enemies. In any pest management or plant care program, it is important to encourage these natural enemies by avoiding pesticides that kill them. You can also encourage beneficial insects by choosing plants that provide them with pollen, nectar, and shelter and keeping ants out of pest-infested plants. Learn to identify good bugs, both in their adult forms and immature (larval) stages.

## Common good bugs found in California gardens include:

- Lady beetles: Both adults and larvae consume aphids.
- Lacewings: Lacewing larvae feed on many insect pests; adults are often seen around lights.
- Syrphid flies: Syrphid fly larvae consume aphids; adults hover around flowers.
- Parasitic mini-wasps: Many species of tiny wasps lay their eggs in pests like aphids or caterpillars; their hatching larvae consume the pest and kill it.
- Spiders: All spiders feed on insects or other arthropods and are beneficial in the garden.

*(See reverse for drawings of good bugs mentioned above.)*

## What is Integrated Pest Management?

Integrated pest management (IPM) uses environmentally sound, yet effective, ways to keep pests from annoying you or damaging plants. IPM programs usually combine several pest control methods for long- term prevention and management of pest problems without harming you, your family, or the environment — IPM also reduces pollution in California waterways. Successful IPM begins with correct identification of the pest. Only then can selection of the appropriate IPM methods and materials be made.

## Preferred IPM methods include:

- Planting pest-resistant or well-adapted plant varieties like native plants.
- Discouraging pests by modifying the way you design, irrigate, fertilize, and manage your garden.
- Altering the garden or home environment to deprive pests of the food, water, shelter or other requirements they need to thrive.
- Keeping pests out of the home and garden using barriers, screens, and caulking.
- Squashing, trapping, washing off or pruning out pests.
- Relying on good bugs in your garden to eat pests, thereby eliminating the need for insecticides that may end up in our waterways.

## Turning to pesticides:

- Only use pesticides when non-chemical controls are ineffective and pests are reaching intolerable levels.
- Use pesticides in combination with the methods described above.
- Choose pesticides carefully so that the least toxic, most effective material is used to protect human health and the environment.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Head Lice

HEALTHY GARDEN HEALTHY HOME

**Head lice can infest anybody, but children are prone to infestations because they play closely and share items that come in contact with the head like hats, headphones, and combs.** Head lice are not known to transmit any infectious diseases; they are more of a nuisance than a health risk. Children with head lice, however, are generally not allowed to attend school as long as nits are found in their hair.

## Head lice facts:

- Head lice cannot hop, fly, or jump; they crawl. Lice spread only through direct contact with an infested object or person.
- Head lice spend their entire life in head hair and can only survive off a human head for about 1 or 2 days.
- A newly hatched louse must ingest blood within minutes of birth to survive.
- Head lice cannot live on family pets.
- Nits (eggs) that are more than 1 1/4 inch from the scalp probably are dead or have already hatched.

## What to look for:

- Intense scratching on the back of the head or neck.
- Tiny white eggs (nits) glued to hair near the scalp.
- Small, rapidly crawling flat insects.

## Four steps necessary to manage an infestation of head lice:

1 Use a head louse shampoo if you observe active lice or viable eggs.

- Avoid shampoo products containing lindane, which are available by prescription only. Pyrethrin and permethrin are safer, more effective, and less polluting to wastewater than lindane. Not all eggs will be killed.
- To avoid insecticides entirely, use soap shampoos that contain coconut or olive oils. Most soap shampoos kill all stages of the louse except the egg. Because they are not as effective as products containing pesticides, you must be sure to comb and repeat these shampoos four times at 3-day intervals. Successive shampooing kills newly hatched lice.

2 Remove nits from the head by combing with a specially designed nit comb.

- This step is the key to successful control. Repeat daily as long as you find live lice or nits within 1¦4 inch of the scalp. Use a metal comb specially designed for removing head lice and their eggs. Combs sold with head lice shampoos are not generally effective. Infested hair can also be cut out with small safety scissors.

3 Remove lice and nits from the household.

- Wash clothing and bedding of the infested person in hot water (at least 140°F) and dry in a hot dryer or have them dry cleaned. Place other items (earphones, bike helmets) in plastic and put in a freezer that is 5°F or lower for at least 10 hours. Clean any object that might have come in contact with the infested person's head (stuffed animals, car seats). Vacuum carpets and upholstery. Pesticide sprays are not recommended.

4 Check heads and remove nits daily until infestation is gone. Follow with weekly head checks to detect reinfestation.

For more information see Pest Notes: Head Lice, available at Cooperative Extension offices and at www.ipm.ucdavis.edu

# Lawn Insects

HEALTHY GARDEN HEALTHY HOME

**Contrary to popular belief, insects are not a common cause of residential lawn damage in California.** Poor lawn care, especially improper watering and planting inappropriate grass species, are more likely causes of unhealthy or dying lawns. Disease-causing agents, excess orinappropriate use of chemicals such as fertilizer and herbicides, or dog urine also produce lawn damage resembling that of insects. Many insects in the lawn are beneficial. Never apply an insecticide unless a damaging level of a known insect pest is confirmed. Insecticides are only effective if applied at the right time and in the right manner. Some insecticides may kill good bugs too.

## How do you know if insects are causing damage?

- Brown spots in lawns can be caused by over- or under-irrigation, plant disease, improper use of chemicals, or dog urine as well as insects.
- Confirm presence of insects before applying an insecticide. For grubs, dig around roots, for other insects perform a drench test. (See reverse.)

## Keep your lawn healthy by:

- Planting grass species that do well in your area
- Irrigating deeply and infrequently
- Doing routine maintenance on sprinkler heads
- Applying only 3 to 6 pounds of actual nitrogen per 1000 square feet per year when fertilizing
- Aerating your lawn annually; remove thatch if it exceeds 1/2 inch
- Cutting only one-third to one-half of grass height at each mowing and keeping lawnmower blades sharp

See the UC Guide to Healthy Lawns at www.ipm.ucdavis.edu

## If a damaging level of insects is confirmed, do the following:

- Choose an insecticide based on the pest you're targeting.
- Find out which insecticide ingredients target specific lawn insects:
  - *Bacillus thuringiensis* (Bt) kills only caterpillars, including cutworms, lawn moths, and skippers.
  - Insect-attacking nematodes control caterpillars or grubs.
  - Azadirachtin controls cutworms, armyworms, and larvae of lawn moths.
  - Imidacloprid is effective against young lawn grubs.
  - Pyrethroids (e.g., cyfluthrin, bifenthrin) are broadly toxic insecticides that kill chinch bugs, lawn moths, and cutworms, but also kill beneficial insects and should be avoided.
- Get help from UC Cooperative Extension.

### HOW TO PERFORM A DRENCH TEST

- Mix 3–4 tablespoons of dishwashing liquid to 2 gallons of water.
- Evenly apply the 2 gallons to 1 square yard of your lawn.
- Monitor the area for 10 minutes and count the number of armyworms, cutworms, or lawn moth larvae that rise to the surface.
- Treat the area only if insect numbers exceed 5 armyworms or cutworms or 15 lawn moths per square yard.

# Safe Use & Disposal of Pesticides

HEALTHY GARDEN HEALTHY HOME

**Pesticides are designed to be toxic to the pests they target — insects, weeds, and other unwanted home and garden invaders.** Always read pesticide product labels carefully and follow all directions on proper use, storage, and disposal of empty pesticide containers. Product labels are your main source of information on how to use a product safely and legally. They include guidelines needed to protect you, your family, and pets. The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For the site nearest you in San Diego County call 1-877-713-2784 .

## If you must use pesticides, follow these tips to reduce pesticide effects on your local waterways:

- Identify your pest problem and choose the least toxic pesticide that targets your pest and achieves the results you want. If you need help identifying the least toxic pest control method, contact your University of California Cooperative Extension office.
- Determine the right amount of pesticide to purchase. Purchasing exactly the amount you need for the application eliminates the need for storing unused pesticides.
- Use spot treatments whenever possible.

### Outdoors

- Avoid overwatering after applying pesticides. Never let pesticide runoff flow into storm drains.
- Do not apply pesticides outdoors when rain is forecast or when it is windy.
- Avoid applying pesticides on paved areas.

### Indoors

- Avoid applying pesticides in or near floor drains or sinks.
- Avoid applying pesticides on areas that will be washed or mopped with water, or where food is prepared or stored.

## When using and storing pesticides take these precautions:

- Always wear a long-sleeved shirt, pants, and eye protection, and other equipment suggested on the label.
- Store products tightly capped in a locked cabinet out of reach from children and pets.
- Always keep pesticides in their original container.
- Know where to call for help in an emergency!

## Pesticide disposal:

- If you cannot use up your pesticides, fertilizers, and weed killers, give them to a friend who may need them.
- Sewage treatment plants are not designed to treat for certain toxic pesticides like diazinon and chlorpyrifos — dumping pesticides into the stormdrain or down the sink is never an option.
- The only allowable way to dispose of unused pesticides is through a household hazardous waste collection site. For household pesticide disposal information for San Diego County, call 877-713-2784.

## Finding active ingredients on a pesticide label:

Pesticide labels are required by law to show the active ingredient and its percentage. Minimize or avoid the use of products that contain diazinon and chlorpyrifos – these materials are polluting our waterways. Always read the label before you buy!

Active Ingredient
Chlorpyrifos ..... 4.38%
Inactive Ingredients ..... 95.62%
KEEP OUT OF REACH OF CHILDREN
CAUTION See back panel booklet for additional precautionary statements.
NET CONTENTS 32 FL OZ (1 QT) 946mL

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Snails & Slugs

HEALTHY GARDEN HEALTHY HOME

**Snails and slugs rank among our most despised garden pests.** These slimy mollusks emerge from hiding at night and chew holes in leaves and flowers of many succulent garden plants and fruit. Slugs and snails are similar in structure and biology, except slugs lack the snails' external spiral shell. Management requires a vigilant and integrated approach that includes eliminating moisture and hiding spots, trapping, barriers, and handpicking. Baits can be helpful, but by themselves, don't provide adequate control in gardens that contain plenty of shelter, food, and moisture.

## How do you know snails and slugs are causing damage?

- You may not observe these pests at first because they feed at night and hide during the day. Go out at night or early morning to view them in action.
- Other pests can cause holes in leaves, flowers, and fruit. Look for the shiny, slimy trails slugs and snails leave behind.

## What must be done to reduce snails and slugs?

- Remove daytime hiding places — ivy, weedy areas, debris, or boards.
- Regularly remove snails from shelters you cannot eliminate such as low ledges on fences, undersides of decks, meter boxes.
- Place traps in your garden and dispose of trapped snails and slugs daily.
- Reduce moist surfaces by switching to drip irrigation or sprinkling in the morning rather than later in the day.
- Consider snail-proof plants such as impatiens, geraniums, begonias, lantana, nasturtiums, and many plants with stiff leaves and highly scented foliage like sage, rosemary,and lavender.

## How can I manage snails and slugs without using pesticides?

- Make sure the garden is mollusk-free before planting. Then erect a copper barrier around it. Use a 4- to 6-inch-wide band of copper, buried an inch below the soil and bent over at the top or attach it around the edge of a raised bed.
- Place your garden in the sunniest spot possible. Remove garden objects or adjacent plants or ground cover that may serve as shady shelter. Reduce moist surfaces as much as possible.
- Build a trap using a 12"x15" board raised off the ground by 1-inch runners. As the mollusks collect under the board, scrape them off and destroy them daily.

## What about baits?

- Baits will not be very effective unless you also remove shelter, food, and moisture.
- Metaldehyde baits are especially poisonous to dogs and birds. Metaldehyde also loses its effectiveness rapidly in sunlight and after rain or irrigation.
- Iron phosphate baits are safe for use around dogs, children, and wildlife.
- Irrigate before applying bait and apply in evening on warm days when mollusks are active.
- Scatter bait around sprinklers and in moist and protected areas where snails and slugs travel.

snails

slug

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Spiders

HEALTHY GARDEN HEALTHY HOME

**Spiders are mostly beneficial because they feed on pest insects.** However, many people think that all spiders are dangerous and aggressive. In California, the main spider capable of causing serious injury is the black widow, which generally remains outdoors and out of sight. Spiders seen out in the open during the day are unlikely to bite people. Focus pest management efforts on removing webs and hiding places. Pesticides are not generally recommended.

## What to know about spiders:

- In California, the main spider capable of causing serious injury is the black widow:
  - The poisonous black widow spider is commonly found outdoors, in sheltered, dry, undisturbed areas such as wood piles.
  - Female black widows have shiny black bodies with a red hourglass marking on the underside.
  - Only large female black widows can injure people.

  Anyone bitten by a black widow spider should remain calm and seek medical advice, or call California's Poison Control Center at 1-800-8-POISON (1-800-876-4766).
- The brown recluse spider does not live in California.
- The jaws of most spiders are too small to bite humans.
- Some other spiders bite when trapped in clothing, but the reaction is usually no more severe than itching or a bee sting. See www.ipm.ucdavis.edu for more information about these spiders.

## To prevent spiders from entering your house, take these steps:

- Seal home foundation cracks and other access holes.
- Inspect window and door screens for good seals that keep out spiders and the insects they prey on.
- Keep areas around home foundations free of clutter.

## Manage spiders using these tips:

- Indoors, regular housecleaning provides adequate spider control.
- Vacuum up the spider and its web.
- Prevent clutter buildup that can provide hiding places.
- Remove spider webs from the exterior of the house with a broom or high pressure hose.
- Indoors, squash spiders or capture them in a jar and release them outdoors.

When removing spiders, don't overlook the fact that spiders eat a large number and variety of nuisance and pest insects. Spiders also have natural enemies — wasps, other spiders, birds, reptiles, and others — that sometimes keep them from becoming too numerous.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

University of California Cooperative Extension

It's the water that connects us!

# Termites

**Because of the serious damage they can cause to wooden structures, termites are among the pests most feared by homeowners.** However, swarms of flying termites do not always mean your building is infested. A careful inspection of the structure is required to confirm an infestation. People also frequently mistake swarms of flying ants for termites. If you suspect that your house is infested, call a professional. Do-it-yourself sprays cannot be relied on to reduce a damaging infestation. Common termites in California are the subterranean termites that build nests in soil, dampwood termites that nest in moist wood and soil, and drywood termites that nest above ground in dry wood. Management of each termite species is different.

## Distinguish flying ants from termites:

- Check the antennae, wings and waist to confirm that pest insects are termites. (Please refer to ant vs. termite drawing on back.)

## Design your building to keep termites out:

- Keep a 12-inch barrier of smooth concrete, sand, or other material between the soil surface and substructure wood beneath a building.
- Choose termite-resistant wood for fences or other structures that must contact soil.
- Remove wood piles, untreated fence posts, and buried scrap wood near structures.
- Provide adequate ventilation to substructures and keep them dry.
- Immediately repair foundation cracks.

## If termites are invading your home:

- Destroy shelter tubes that subterranean termites build between soil and wood structures.
- If dampwood termite nests are accessible, remove infested wood and eliminate excess moisture.
- Drywood termites can be controlled with heat, freezing, electricity, microwaves, fumigation, or spot treatments of chemicals.
- For any infestation, contact a professional for help. Pesticides licensed only for use by a pest control operator are usually necessary to control subterranean and dampwood infestations.

## Using pesticides for termite control:

- Pesticides may be injected into the soil by professional applicators through drilling or rodding. Special procedures must be followed to prevent contamination of ground or surface water.
- For soil injections, ask your applicator to use a product other than chlorpyrifos. Newer types of products such as fipronil and chloronicotinyls are safer for your health and the environment.
- Baits can be effective in some cases, but may take several months to control the problem and must be followed up with constant monitoring.

*Use **NON-CHEMICAL** methods & **LEAST TOXIC** pesticides. **WHY?** Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes and oceans.*

*Learn more about San Diego regional water quality at: www.ThinkBlueSD.org & www.ProjectCleanWater.org. For more pest information visit the University of California IPM website at: www.ipm.ucdavis.edu or the UCCE Master Gardeners at: (858) 694-2860, Mon - Fri, 9 am to 3 pm*

# Giant Whitefly

HEALTHY GARDEN HEALTHY HOME

**Giant whiteflies can cover a beautiful plant with white fuzzy wax and sticky honeydew, turning it into an unsightly mess.** First discovered in San Diego County in October 1992, this whitefly has spread northward into other areas of California. Since its introduction into San Diego, giant whitefly has spread rapidly northward along the coast. Although affected plants may be weakened, they rarely die. To manage giant whitefly, wash plants off with water and encourage natural enemies.

## What plants are affected?

- Many ornamentals including hibiscus, giant bird of paradise, begonia, Xylosma.
- Fruit trees including citrus, avocado, mulberry and banana.

## Look for these damage symptoms on affected plants:

- Long, white, waxy filaments produced by the whitefly give the leaf surface a bearded appearance. These hairlike strands may be mistaken for a fungal infection.
- Large amounts of sticky honeydew excreted by the whitefly as it feeds on plant sap.
- Black sooty mold growing on the honeydew.

## How to recognize the whitefly:

- Adults are small (3/16") and white with light brown markings on wings and usually found in groups on undersides of leaves.
- Nymphs are yellowish, small, oval, have no legs and don't move.

## To reduce problems, use an integrated program that includes:

- Removing infested leaves.
- Washing giant whiteflies off leaves with a strong stream of water.
- Planting species less susceptible to giant whitefly.
- Avoiding insecticides that injure natural enemies, such as lacewings, lady beetles, syrphid flies, and parasitic wasps.

## What about insecticides?

- **Don't use insecticides if beneficial insects, including parasites and predators, are present in the area.**
- **To confirm the presence of parasitic wasps, use a magnifying glass to look for parasite exit holes on giant whitefly nymphs or darkened nymphs as indicated in drawings below.**
- **If you do choose to use an insecticide, select least toxic products such as insecticidal soaps or oils. Remember to follow label directions and spray the undersides of the leaves where whitefly colonies are found.**

(adult)  (actual size) I

Examine whitefly colonies for grayish-black or yellow nymphs with exit holes (a), or darkened nymphs (b), or healthy nymphs (c).

**Use NON-CHEMICAL methods & LEAST TOXIC pesticides. WHY? Runoff from around your home and garden carries water containing pesticides that pollute our streams, rivers, lakes, and oceans.**

Learn more about San Diego regional water quality at www.ThinkBlueSD.org & www.ProjectCleanWater.org.
For more pest information, visit the University of California IPM Web site at **www.ipm.ucdavis.edu**. or contact the UCCE Master Gardeners at (858) 694-2860, Mon-Fri, 9 am to 3 pm.

# ATTACHMENT 8.7

# SAN DIEGO RIVER AND SAN DIEGO BAY FACT SHEETS

# San Diego River Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego River and the San Diego Bay. Your business or facility is located within the San Diego River Watershed.

**San Diego River Watershed**

The San Diego River Watershed is comprised of 443 square miles. It extends from the mountains near Julian to the Pacific Ocean. Portions of the watershed fall within the cities of El Cajon, Poway, San Diego, Santee, several unincorporated areas, and the City of La Mesa. Primary tributaries to the San Diego River include Boulder Creek, Conejos Creek, Los Coches Creek, San Vicente Creek, and Forester Creek. Alvarado Creek in La Mesa is also tributary to the San Diego River. Alvarado Creek flows into the San Diego River and ultimately into the Pacific Ocean between South Mission Beach and Ocean Beach near Dog Beach.

Pollutants of concern listed in the 2002 Clean Water Act Section 303(d) List Of Water Quality for the lower San Diego River Watershed include fecal coliform (sewage/urban runoff), low dissolved oxygen (decay of organic matter), total dissolved solids (industrial waste/chemical spills), and phosphorus (phosphate based detergents). Between 1996 and 1999, coliform bacteria more than doubled due to urban runoff and sewage.

Other pollutants of concern not listed above include pesticides such as Diazinon and Chlorpyrifos (commercial, agricultural, and residential application), Total Suspended Solids/Turbidity (suspended sediment/solids, construction, sewage, eutrophication), Copper and Zinc (industrial waste or automobiles), and pH/Phosphate (industrial waste, automobiles, sewage, fertilizers, eutrophication, hardening/concrete of creeks).

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

**What Can You Do?**

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Store materials properly to ensure it is not exposed to storm water. Do not over-irrigate your landscape. If you observe illegal dumping into a storm drain, you should call the City's storm water pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

***Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.***

# San Diego Bay Watershed Fact Sheet

What is a watershed? A watershed consists of all land and waterways that drain into the same body of water. There are 11 watersheds within San Diego County. Drainage from La Mesa flows through two of these watersheds: the San Diego Bay and the San Diego River. Your business or facility is located within the San Diego Bay Watershed.

**San Diego Bay Watershed**

The San Diego Bay Watershed is comprised of 415 square miles. It extends from the Laguna Mountains to San Diego Bay. The watershed falls within the cities of La Mesa, Chula Vista, Coronado, Imperial Beach, Lemon Grove, National City, San Diego, and unincorporated areas of the County. Approximately 4 square miles in the southern portion of the City of La Mesa is part of this watershed. The major discharge sources to San Diego Bay include Sweetwater River, Otay River, Chollas Creek, Paleta Creek, Paradise Creek, and Switzer Creek.

Three drainage basins in the City of La Mesa are part of the San Diego Bay Watershed. Runoff from the Spring Valley Basin flows to the Sweetwater River. Runoff from the University Channel and Lemon Grove Basin contribute to Chollas Creek. The aforementioned creek and river flow into San Diego Bay.

Pollutants of concern associated with the watershed include diazinon, copper and zinc, fecal coliform, turbidity, and total suspended solids. The sources of these pollutants are a result of residential, agriculture or commercial pesticide application, automobiles and industrial waste, sewer spills, encampments, wildlife, erosion, suspended sediment, and fertilizers. Pollutants of concern for Chollas Creek in particular include metals such as copper, lead, zinc, cadmium, and coliform bacteria.

Ensuring that urban runoff is not contaminated with pollutants as a result of your business activities is an integral component in preserving the quality of life in San Diego County. It is your responsibility to help prevent these pollutants from entering the watershed in order to protect the environment and safe guard the natural resources. Introducing pollutants into the environment as a result of your business activities may contribute to beach closures and limit other recreational activities.

**What Can You Do?**

Remember, the only water that should enter the storm drain is rainwater. Do not hose down your property to ensure pollutants such as sediment, oil and grease, fertilizers, herbicides and pesticides, surfactants (soap), metals, trash, and other debris are not inadvertently flushed into the storm drain contributing to gross contamination of urban runoff. Moreover, store materials properly to ensure it is not exposed to storm water and do not over-irrigate your landscape. If you observe storm water pollution or illegal dumping into a storm drain, you should call the City's Storm Water Pollution prevention hotline at (619) 667-1134 to report the incident or visit the City's Website *www.cityoflamesa.com/Departments/PublicWorks/NPDES.htm*.

***Good housekeeping and pollution prevention equates to improved water quality, and a cleaner environment equates to a better quality of life for everyone.***

## DECLARATION OF SERVICE BY EMAIL

I, the undersigned, declare as follows:

I am a resident of the County of Sacramento and I am over the age of 18 years, and not a party to the within action. My place of employment is 980 Ninth Street, Suite 300, Sacramento, California 95814.

On March 29, 2024, I served the:

- **Current Mailing List dated March 28, 2024**
- **Notice of Waiver of Procedural Requirements, Extension Request Approval, and Postponement of Hearing issued March 29, 2024**
- **Claimants' Comments on the Draft Proposed Decision and Parameters and Guidelines (Volumes 1-14) filed February 20, 2024**

  *San Diego Regional Water Quality Control Board Order No. R9-2007-0001, Permit CAS0108758, Parts D.3.a.(3)(b)(iii), D.5.a.(1), D.5.a.(2), D.5.b.(1)(a), D.5.b.(1)(b)(iii-vi), D.5.b.(1)(c), D.5.b.(1)(d), D.5.b.(2), D.5.b.(3), E.2.f., E.2.g., F.1., F.2., F.3., I.1., I.2., I.5., J.3.a.(3)(c)(iv)-(viii), (x)-(xv), the first sentence of L.1. as it applies to the newly mandated activities, and L.1.a.(3)-(6)*, 07-TC-09-R County of San Diego, Cites of Carlsbad, Del Mar, Imperial Beach, Lemon Grove, Poway, San Marcos, Santee, Solana Beach, Chula Vista, Coronado, Del Mar, El Cajon, Encinitas, Escondido, Imperial Beach, La Mesa, Lemon Grove, National City, Oceanside, San Diego, and Vista, Claimants

by making it available on the Commission's website and providing notice of how to locate it to the email addresses provided on the attached mailing list.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct, and that this declaration was executed on March 29, 2024 at Sacramento, California.

# City of Lemon Grove

Jurisdictional Urban Runoff
Management Plan
Annual Report

FY 2006 – 2007
January 2008 Report

The City of
LEMON GROVE
BEST CLIMATE ON EARTH
Incorporated in 1977

## Executive Summary

The City's sixth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-02, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments, the City implemented various methods to further assist in long-term effectiveness assessments. The methods have only been utilized for one full reporting period, so annual comparisons of data are unavailable until next reporting period.

Through a collaborative workgroup process with the Copermittees, we have significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In FY 2005-06, the City continues its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation

strategy for construction sites and development proposals. During FY 2004-05, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2006-07. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2006-07, the City made large steps forward in the implementation of a city-wide GIS program. The City also evaluated its street sweeping contract and hired a new street sweeping company. The newly implemented Code Enforcement program continues to improve in efficiency and effectiveness. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report. The City also awaits with anxiety and trepidation the issuance of the new permit to further develop its program and compliance standards.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a portion of the program; requiring the City's strapped General Fund to finance this increasingly expensive program. This issue will be addressed more fully in Section 12.2 of this report.

## Section 1.0 Introduction

Lemon Grove's sixth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-01, "Permit") represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2006 through June 30, 2007). We are confident that the report demonstrates success in building a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City also participated in a joint SUSMP training session with the City of El Cajon. The training was targeted toward those employees who deal directly with SUSMP implementation, the Planning and Engineering Departments. The City improved its outreach material to developers and contractors. The new information includes several checklists that detail exactly what is required on the site plans and in the stormwater management documents. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a city-wide GIS program. The City will begin initial phases of implementation during fiscal year 2008-2009. These early efforts include base data entry and updating the existing layers with current technology. However, all implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operational organization.

At the jurisdictional level, we have taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. This reporting period, we focused on construction sites and SUSMP processes. We continued to improve the assessment tools through inspection databases and the plan check process. We continue to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. During this reporting period, it was discovered that the City's existing tracking system for building permits and code enforcement, HdL, might be a viable option for water quality personnel. It might be possible to tie water quality concerns into the existing framework. The City is working with an HdL representative to further explore the possibilities. Though the tools are

often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

We believe the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Increased construction site inspections to a twice weekly frequency
- Use of community events for public outreach
- Improved code enforcement process for water quality
- Continue outreach to restaurant community
- Continue outreach to automotive facilities
- Targeted outreach to residents (ie: Pool Cleaning and Pet Waste)

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 4.0 discusses every program element related to the City's commercial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2006-07. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. We look forward to continued progress in future years.

## Section 2.0 Municipal Component

This section describes actions taken by the City during the FY 2006-07 reporting period to prevent polluted runoff from its municipal facilities.

## 2.1 Municipal Facility Activities

The City of Lemon Grove owns and operates a wide variety of fixed facilities and an extensive system of roads, municipal separate storm sewers (MS4s), and sanitary sewers.

City personnel implements site-specific Best Management Practices (BMPs) to prevent and reduce pollutants in facility runoff. Since BMPs are tailored to the unique activities conducted at each City facility, the remainder of this section is organized according to facility type. For each facility type, information is presented as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Facility Inspections

### 2.1.1 Priority Sources

Nearly 65.5 miles of roads, streets, and highways are maintained by the City. The City is not responsible for maintaining roadways that are managed by other agencies or jurisdictions, or are privately owned. All City-maintained roads are routinely inspected annually, and more frequently upon request. Needed repairs are noted and performed as appropriate to ensure safety and riding quality for the traveling public. Roadway maintenance typically involves concrete and asphalt repair, drain inlet cleaning, litter removal, and street sweeping. Other BMPs, as listed in JURMP 2.4, are implemented as required.

#### 2.1.1.1 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for the City-maintained road system. BMPs applicable to roads, streets, and highways have been reviewed, and remain unchanged. Below is a brief listing of some of those BMPs:

- Vegetation Control
- Proper Material Storage and Coverage
- Concrete Maintenance Methods for Wash-outs
- Designated Vehicle Maintenance Area
- Vehicle Washing Area
- Employee Training

### 2.1.1.2 BMP Implementation

Details regarding specific road maintenance activities conducted during this reporting period are provided below. It should be noted that other road maintenance BMPs not described here were identified in JURMP 2.4 and are implemented as necessary.

*Street and Facility Sweeping*

The Department of Public Works (DPW) Streets Division insures that City-maintained roads and facilities at the following frequencies and locations:

- Curbed Streets (Broadway, Buena Vista Ave., Massachusetts Ave., and School Lane) – weekly
- All Other Curbed Streets – biweekly
- Non-Curbed Streets – monthly
- Center Islands and Medians – monthly
- Parking Lots and Alleys (Broadway Business Lot and Lester Ave. Alley) – weekly
- All Other Parking Lots and Alleys – monthly

The City considers sweeping to be an extremely effective BMP in that it prevents accumulated material from entering the stormdrain conveyance system. To quantify its sweeping activity, DPW Streets Division crews record the length of streets swept and the amount of debris collected on a month-by-month basis. The City swept approximately 80 miles during FY 2006-07 and collected 169.75 tons of debris. The City swept approximately 75 miles during FY 2005-06 and collected 109.88 tons of debris. These figures include the regular sweeping of roads, specialty or requested road sweeps and corporate yards.

The City swept 100% of public maintained curbs and gutters both reporting periods. The City is responsible for 65.5 miles of roadway in Lemon Grove. The extra mileage swept is due to parking lots and special request sweeping on private streets. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

During this reporting cycle, the City began the bid process for a new street sweeping contractor, utilizing Cannon Pacific in the interim. The new contract will take effect at the beginning of 2008 under Day and Night Street Sweeping.

### 2.1.1.3 Road Inspections

All City roads are inspected annually or more frequently upon request, and needed repairs noted and preformed as appropriate to ensure safety and riding quality for the traveling public. During this reporting period, all City roads were inspected prior to and during the rainy season. Based on these results,

maintenance crews evaluated potential stormwater impacts and identified the need for cleaning, maintenance, and future upgrades. Conveyance system and road right-of-way cleaning conducted as a result of these inspections is described in section 2.1.2.3 below, and street sweeping in section 2.1.1.2 above.

### 2.1.2 Municipal Separate Storm Sewer System (MS4)

The City maintains the publicly owned portions of the MS4 within its boundaries. The City's MS4 inventory consists of culverts, channels, ditches, pipes and related flood control structures.

#### 2.1.2.1 Priority Sources

All City roads, streets, and highways are designated as high priority municipal sources. The Public Works Yard is also designated as high priority because of pollutant potential. See Table 2.1 which details the City's priority municipal sources.

**Table 2.1 – High Priority Municipal Facilities**

| Facility | Address | Basis for Designation | Receiving Water |
|---|---|---|---|
| Roads, streets, highways, and parking facilities | Throughout City | Specified in Order 2001-01 | Chollas Creek and Sweetwater River |
| Flood management projects and flood control devices | Throughout City | Specified in Order 2001-01 | Chollas Creek and Sweetwater River |
| Public Works Yard | 2873 Skyline Dr. | Specified in Order 2001-01 and has potential to discharge pollutants of concern. | Chollas Creek |

#### 2.1.2.2 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for City-maintained MS4 facilities. BMPs applicable to the City-maintained MS4 have been reviewed, and remain unchanged.

#### 2.1.2.3 BMP Implementation

Further detail about specific MS4 maintenance activities conducted during this reporting period is provided below. Other BMPs identified in JURMP 2.4, but not described here, are implemented as required.

*Conveyance System Cleaning*

During this reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only six conveyances

and 60 catch basins were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,625 pounds from the catch basins, conveyances, and roads. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.

During the previous reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Six conveyances were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,625 pounds from the catch basins, conveyances, and roads. The amount of debris removed during FY 06-07 was significantly less than in previous reporting periods. DPW attributes a more effective street sweeping program and the implementation of Trident Curb Screens in several high trash areas of the City.

The City continues to locate and log new catch basins on an annual basis. The City plans to have a completed log sometime within the next permit cycle. Attachment A-1 contains the initial mapping of the City's major drainage pipes.

*Storm Drain Stenciling*

The City began implementing a new drain label program. Instead of painting stencils, the City began using drain labels that are more permanent and longer lasting by using thermoplastic labels. They are heat set onto the concrete any place around the drain and will last a minimum of 10 years. They are also fade, graffiti and tamper resistant. As of the end of the 2004-05 reporting period, the City had placed labels on approximately 30 drains on Broadway, a main through-way for the City and commuters. The City then placed an additional 30 labels on various inlets throughout the City with a focus on major streets first, during 2005-06. The City maintained this program in 2006-07, but installing an additional 30 labels on drains throughout the City, covering major streets first. The City plans to purchase approximately 30 each fiscal year until all the drains on public maintained streets are labeled. In the meantime, the City continues to let "I Love a Clean San Diego" stencil drains that are un-marked or have worn-out stencils.

The City continues to require developers to mark any new drains in connection with development or redevelopment. The City encourages them to use concrete wet stamps or thermoplastic labels for longevity on private streets and requires either if the street will be maintained by the City. See Attachment A-2 for a picture of the thermoplastic labels and the concrete wet stamp.

During FY 2006-07, the City installed six test Trident Curb Screens in various locations including a residential site, a school route site, and high traffic sites. The City wished to test their durability and usefulness in conjunction with the new

street sweeping program. Insufficient data is available at this time to begin judging their effectiveness, but informal visual inspections show a decrease of trash in the catch basins and the trash is curb side making it easier for the street sweeper to pick up.

2.1.2.4 MS4 Inspections

The Streets Division conducts annual field investigations in order to inspect the City-maintained MS4 to identify the need for cleaning, maintenance, potential illicit connections and illegal discharges (IC/IDs), and to assess the structural integrity of facilities. As reported above, the City inspected forty-three road segments, sixteen conveyance facilities, and 190 catch basins during this reporting period.

### 2.1.3 Sanitary Sewer System

The Sanitation District manages and maintains a collection system of 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. San Diego and La Mesa share sewer space with Lemon Grove. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space; San Diego uses 986.20 EDU.

2.1.3.1 Priority Sources

The City operates no high priority waste water facilities within its boundaries.

]2.1.3.2 BMP Requirements

JURMP 2.5 details minimum BMP requirements for all sanitary sewer system lines. BMPs applicable to sanitary sewer system facilities have been reviewed, and remain unchanged.

2.1.3.3 BMP Implementation

*Control of Sanitary Sewer Overflow Events*

DPW staff responds to sanitary sewer overflows (SSOs) according to protocol established in RWQCB Order 96-04, the current Waste Discharge Requirements and Water Quality Order 2006-0003. During FY 2006-07, the City had zero SSOs. The last spill on record took place in the third quarter of FY 2004-05 and was directly related to vandalism issues experienced earlier during that period.

*Limiting Infiltration from the Sanitary Sewer System to the MS4*

As a proactive means of preventing or limiting infiltration from the sanitary sewer system to the MS4, the City conducts aggressive inspection and maintenance

programs for both systems. City personnel are instructed to investigate locations exhibiting sewer-related discharge or odor during MS4 inspections (further discussed in section 2.1.2.3 above). No instances of infiltration were noted during this reporting period. Sanitary sewer system inspections are also conducted on scheduled intervals to ensure the functionality and structural integrity of the system. These are described further below. The camera/video truck was purchased and utilized during this reporting period.

2.1.3.4 Inspections

*Sanitary Sewer System Inspections*

The City regularly inspects its sanitary sewer system to ensure functionality and structural integrity. Towards the end of reporting period 2004-05, the City began cleaning and inspecting public sewer lines in-house. During this reporting period, all public sewer lines were cleaned and maintained in-house.

**Table 2.2**
**Sanitary Sewer Services**

| | Total FY 2005-06 | Total FY 2006-07 |
|---|---|---|
| **Cleaned** | **298,043*** | **331,369*** |
| **Root Cut** | **18,370*** | **20,927*** |

*represented in feet

### 2.1.4 Corporate Yards and Fleet Maintenance Facilities

The City's municipal facilities inventory includes one facility classified as a corporate yard and fleet maintenance facility. These facilities are classified as high priority, due to the potential pollutants stored on-site.

2.1.4.1 Priority Sources

*Fleet Maintenance Facility*

DPW operates one fleet maintenance facility that provides maintenance, repair and fueling to forty-five vehicles from all City departments. The maintenance is co-located with the DPW headquarters and is listed as the Public Works Yard on the inventory. The facility is considered a high priority threat to water quality due to the presence of hazardous materials, automotive fluids, and fuels on-site.

2.1.4.2 BMP Requirements

JURMP 2.4 defines all minimum BMP requirements at the DPW-maintained corporate yard. BMPs applicable to DPW-maintained corporate yards have been reviewed, and remain unchanged.

2.1.4.3 BMP Implementation

Fleet personnel always implement BMPs under the guidance of the facility's Fleet Manager. In addition to a periodic schedule of ground maintenance and housekeeping, the facility maintains an inventory of spill kits, absorbent, fiber rolls, and storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: vehicle and equipment repair, hazardous waste storage, vehicle washing, re-fueling, etc.

As in previous reporting periods, BMP implementation at the corporate yard and fleet maintenance facilities was verified and evaluated during routine facility inspections. Where inspectors noted a lack of BMPs or ineffective results, employees were required to implement corrective actions immediately.

2.1.4.4 Inspections

*Fleet Maintenance Facilities*

Though Fleet Managers are responsible for applying and maintaining BMPs on a daily basis, the Water Quality Coordinator conducted an annual inspection to verify implementation during this reporting period. The only notable infractions were an open dumpster at City Hall and a degraded straw wattle at the Public Works Yard. City staff has noticed a marked improvement in the maintenance of good housekeeping BMPs at City facilities. Water Quality staff believes this is due in part to frequent informal inspections and increased staff training, as well as the formal annual inspection.

### 2.1.5 Parks and Recreation Facilities

2.1.5.1 Priority Sources

The Department of Recreation Services (DRS) manages stormwater discharges from seven park sites. Included among these are local and regional parks, park buildings (including the community center), historical sites and open spaces. In the inventory submitted with the City's JURMP, all parks are considered medium priority. See Table 2.2 for a detailed description of park areas.

**Table 2.2 – Medium Priority Municipal Facilities**

| Facility | Address | Basis for Designation | Receiving Water |
|---|---|---|---|
| Berry Street Park | 7101 Mt. Vernon St. | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |
| Fireman's Park | School Lane and Central | Park facility may generate minor pollutants associated with green wastes, pesticides, and | Chollas Creek |

| | | | |
|---|---|---|---|
| | | fertilizers. Not adjacent to any receiving waters. | |
| Kunkel Park | 8171 Lemon Grove Way | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Sweetwater River |
| Monterey Heights Park | Canton and Glencoe | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |
| Lemon Grove Park | Washington and Alton | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |

#### 2.1.5.2 BMP Requirements

JURMP 2.4.2 defines all minimum BMP requirements for City parks and recreation facilites.

#### 2.1.5.3 BMP Implementation

Because parks vary widely in both size and function, it is difficult to generalize about BMP implementation. All park personnel are instructed to implement BMPs at all times. In addition to a periodic schedule of ground maintenance and housekeeping, most facilities maintain an inventory of spill kits, absorbent, and miscellaneous storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: material and waste storage, fueling, septic tank maintenance, etc. A complete list of facility-specific BMPs can be found in JURMP 2.4.2.

DRS has also endeavored to make the implementation of pollution prevention BMPs a priority at park facilities. Unless otherwise noted, these practices were implemented at all facilities in the DRS inventory. They include:

- The storage of used construction materials outside for future projects is being eliminated. The site that contained materials during the last reporting period is now empty of City materials. The City has plans to fence and lock the site to prevent the illegal dumping of large waste items like furniture. The fencing should be accomplished within the next two reporting periods.
- The prohibition on washing City vehicles and equipment on-site has continued to be enforced. All washing occurs off-site at appropriate locations. The majority of vehicle repair and maintenance is performed by Bob-Brown Automotive on University Ave. By having vehicle maintenance performed off-site, the City drastically decreases the number of pollutants stored at the Corporate Yard. The City is continuing to look into the possibility of in-sourcing oil-changes to allow for the use of re-refined oil. The City is currently searching for a closed loop system that would supply

the oil and then take the used oil back for further recycling. The City has not been able to locate a closed loop system. The City has postponed the implementation of re-refined oil in City vehicles until the warranty on the new fire engine expires. If the City uses re-refined oil in the new engine it will nullify the repair and maintenance warranty. The inclusion of the fire vehicles is integral to the implementation of a re-refined oil program. Without the inclusion of the fire vehicles, the City would not be able to purchase the oil in the quantities sufficient to encounter fiscal savings. The City plans to renew its efforts to establish re-refined oil after the warranty expiration in reporting period 2009-10. Maintenance on the fire engines is preformed off-site through Grossmont High School District.

- The City uses pesticides and insecticides on a very minimal basis, only when a problem is persistent and can be dealt with no other way.
- All City parks maintain recycling facilities.
- The use of drought resistant plants is encouraged. See Section 2.2.2 for further information on the plants used in the City.
- The City installed 1 additional doggie bag dispenser at the Lemon Grove Civic Center and maintained a distribution of approximately 650 bags at the existing 4 locations in City parks.

2.1.5.4 Inspections

The City's Water Quality Coordinator conducts annual stormwater inspections to verify appropriate BMP implementation at all of its parks, regardless of priority classification. All observed deficiencies were noted and scheduled for correction. Many of the deficiencies noted during FY 2006-07 involved a lack of on-site spill prevention materials (i.e. spill kits, drip pans for vehicles, etc.) or trash and debris. All deficiencies were promptly addressed. See Attachment A-3 a copy of the facility inspection report.

### 2.1.6 Other Municipal Facilities

The City operates and maintains several additional facilities not captured by the categories outlined above. These include office buildings, a sheriff station, and a fire station. The Fire Department re-joined the City in July of 2004. All repairs, maintenance, and equipment storage is performed in a covered and completely enclosed garage/bay area with locked doors. All hazardous materials are stored in locked self-contained areas inside the bay area and labeled appropriately. Nothing hazardous is stored outside or un-locked.

2.1.6.1 Priority Sources

*Offices*

The City maintains four business offices and two public safety offices including the new fire station, which previously housed the Department of Public Works

and Recreation Services. No new offices have been added during this reporting period, see list below. The Sheriff Station is connected to City Hall, therefore they are categorized together under City Hall, which is listed as a medium priority threat, as most activities are conducted in enclosed areas.

- City Hall and Sheriff's Department – 3232 Main St.
- Fire Department – 7853 Central Ave.
- City Hall Annex (Department of Recreation Services) – 3225 Olive St.
- Community Center – 3146 School Lane
- Department of Public Works – 2873 Skyline Dr.

*Vacant Land and Excess Right-of-Way*

The City owns one vacant property at:

- 6949 Central Ave.

This site will be considered medium priority due to the minimal on-site activity and lack of impervious surface.

#### 2.1.6.2 BMP Requirements

All BMP requirements for the facilities discussed in 2.1.6.1 above are covered in JURMP 2.4. These BMPs have been reviewed and remain unchanged.

#### 2.1.6.3 BMP Implementation

BMP implementation at facilities classified as miscellaneous is overseen as applicable by DPW, DRS, or facility personnel. Procedural requirements and staff training protocol are specific to each department, but in all cases are sufficient to ensure stormwater compliance at these facilities.

#### 2.1.6.4 Inspections

Each facility identified in 2.1.6.1 was inspected at least once during FY 2006-07 to verify compliance with minimum BMP requirements. The main infraction was an open dumpster lid at City Hall, which has since been corrected and is checked by staff on a regular basis. The drip irrigation system installed in the landscaping at the front of City Hall during the previous reporting period has cut down significantly on run-off from the site. See Attachment A-3 for a copy of the facility inspection report.

## 2.2 Management of Pesticides, Herbicides, and Fertilizers

The City of Lemon Grove's Grounds staff uses only herbicides and algecides. The City's pest control contractor is Knott's Pest Control. Knott's Pest Control meets all BMPs for pesticide application found in JURMP 2.4.

### 2.2.1 BMP Implementation

The following BMPs, described further in JURMP Appendix 2.2.1, were implemented by DPW for the application of herbicides, algecides, and occasionally pesticides; although as mentioned above Knott's Pest Control handles the majority of the City's pest control needs.

- Safer Alternative Products
- Good Housekeeping Practices and Material Storage
- Vehicle and Equipment Washing and Cleaning
- Illegal Dumping Control
- Pollution Prevention

### 2.2.2 Use of Drought Resistant Vegetation

Grounds division of Public Works attempts to use drought resistant plants throughout the City's landscaping. Common variations of these plants used throughout the City are lavender, sage, oleanders, natal plum, rosemary, and pyracantha. The use of drought resistant vegetation allows for drip irrigation, which greatly decreases the amount of water used and limits the amount of potential runoff from sprinkler systems. A drip irrigation system also allows soils to absorb nutrients from fertilizers and compost preventing them from washing into the drains with irrigation water, a common residential pollutant problem that will be further discussed in Section 5.0.

### 2.2.3 Schedules for Irrigation and Chemical Applications

Weather conditions are always considered prior to outdoor pesticide applications. Depending on the formulation and characteristics of the pesticide to be applied, an application may be postponed or allowed to proceed prior to, or during, a rain event. This is because the Grounds division applies pre-emergent herbicides as part of its vegetation management program. Pre-emergent herbicides benefit from a gentle rain that soaks the pesticide into the soil where germinating seeds are killed; getting these types of herbicide to the root zone also controls existing young vegetation. The application of contact herbicides, on the other hand, is not permitted if precipitation is likely. These materials tend to wash off plant surfaces and contribute to water quality degradation.

### 2.2.4 Collection and Disposal of Pesticides

When available the City purchases herbicides in recyclable bulk containers. By reducing the volume and variety of herbicides, the department is able to maintain a minimal inventory of pest related chemicals.

As a general rule, emptied pesticide containers are triple rinsed and the rinse water is put in with the application solution. Containers are then disposed of in accordance with local regulations.

## 2.3 Employee Training

The City is committed to increasing the awareness of its employees regarding urban runoff issues, and effecting positive behavioral changes to protect water quality. To this end, two types of stormwater and water quality education are provided to employees.

- Basic Awareness Education; and
- Focused Employee Training

### 2.3.1 Basic Awareness Education

The goals of this element are to promote responsible behavior at home and work, and to encourage employees to act as the City's "eyes and ears." As described in section 2.4 of the City's JURMP, the City's goal is to provide some level of basic awareness education to all employees annually.

#### 2.3.1.1 City Newsletter

The City has continued the Environmental Page in its biannual Newsletter. Each issue contains oil recycling sites and household hazardous waste information. The Fall 2006 edition contained an article on eco-friendly holiday practices, lawn care and a clean up event. The edition also featured the standard used oil information and e-waste guide. The Spring 2007 edition featured information on the Creek to Bay Clean-Up event, personal tips for cleaner beaches and water, household hazardous waste, and used oil recycling. In this edition the City increased the environmental section to a two page spread to provide more in-depth information.

The Newsletter, which is produced by City staff, is distributed to the residents and businesses of Lemon Grove, as well as City employees. Because of the public and internal distributions, City staff is kept abreast of the current issues and knows what information is being given to the public. See Attachment A-4 for copies of the Newsletter articles discussed in this section.

#### 2.3.1.2 Informal Staff Training

Water Quality staff continues the informal educational e-mail program. At least twice a month, staff sends a City-wide e-mail with new water quality information. The e-mails contain anything that has to do with water quality and pollution prevention. New sites such as www.bewaterwise.com or new articles from the BC's California Water News (a Brown and Caldwell daily e-mail newsletter) are

shared with all City staff members. Water Quality staff has discovered that this method, although informal, provides a positive transfer of new information, up coming events, and technological advances in the water quality field. Water quality remains a primary focus for all staff through these small constant reminders and updates. It also provides staff an opportunity for internal dialogue without trying to schedule large scale meetings or trainings. The e-mails have been received favorably and will continue in future reporting periods.

Water Quality staff participated in weekly inter-departmental meetings with City planning, code enforcement, engineering and fire personnel. Current development projects, code updates, enforcement concerns, and construction site details are discussed. The meetings have provided water quality staff with the opportunity to regularly update the former mentioned department staff on concerns and changes in the water quality program. The constant re-enforcement ensures that water quality remains an issue of primary concern for the development sector of City staff.

### 2.3.2 Focused Employee Training

#### 2.3.2.1 Bi-Annual Public Works Staff Training

Each fall and spring, water quality staff participates in one of the public works safety trainings. Staff provided updates on new concerns and regulations, as well as obtaining the concerns of the public works staff. This year's training focused on the developing new permit and the changes it would bring for DPW staff. Water quality staff continues to provide DPW staff with informational brochures on used oil recycling and pet waste to utilize in educating the public further on these common infractions. The regular exchanging of information has been beneficial to all staff members involved. Water quality staff believes the continued involvement has increased public awareness as well due to the readily available information and more knowledgeable public works staff. Both staffs look forward to continuing the exchange of ideas and information.

## 2.4 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Municipal Component in FY 2006-07. It consists of three primary elements: 1) a narrative assessment, 2) a discussion of the City's success in meeting specific quantifiable targets, and 3) a discussion of issues related to the spatial and geographic variability of program data.

### 2.4.1 Narrative Assessment

The City made a number of important improvements to its municipal activities programs in FY 2006-07. In spite of the large number of individual activities and programs comprising the City's Municipal Component, continued progress and

improvement was made in all areas. In particular, another year of experience in implementing BMPs at City facilities has translated to a more complete integration of stormwater mandates into standard operating procedures. City crews also continued to pound the pavement throughout the community, collecting greater amounts of debris from our streets and MS4 than they ever have before. City crews are also better educated on the water quality program and can provide more information to residents themselves. They are also more knowledge about illegal practices and many issues have been dealt without code enforcement involvement.

The City is continuing to gather GIS information. The City purchased new aerial photographs of the city limits, as well as Lidar graphs. The City is currently investigating survey equipment and GIS programs. The City currently has ArcView 3.2 with minimal mapping and levels. The City is investigating upgrades versus new systems. The City plans to have a functioning GIS system in place within the next five to eight years depending on budgetary constraints. The City has evaluated several different options for its GIS system and has performed an initial needs assessment. A needs assessment for GIS implementation was performed during this reporting period. The initial stages of implementation will involve base data and updates for the existing layers based on current technology.

Staff training continues to develop and change based on staff's needs and new incoming information. The City focused this reporting period on SUSMP specific training because of the audit and a need to improve the SUSMP review process. Staff also discovered that employees were more favorable towards specialized trainings due to the repeated generic trainings of the past two reporting periods. Water Quality staff plans to rotate specialized and generic trainings every few years. This will allow the limited Water Quality staff to provide optimal trainings regardless of the topic. The rotation also allows City staff a chance to receive more in-depth training in a field that directly relates to their daily tasks.

### 2.4.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

The City is beginning to track activity targets and establish long-term goals for the water quality program. Below is a listing of the targets for this reporting period:

**Target 1**
Provide More Targeted Staff Training
100% complete

**Target 2**
Improve and provide permanent labels for local stormdrains
45% complete (on-going process)

**Target 3**
Improve catch basin inventory
75% complete (on-going process)

**Target 4**
Obtain educational decals for the DPW tailgates
50% complete

**Target 5**
Bring sewer system maintenance in-house full time
100% complete (both the camera truck and the vactor truck are now in house and being utilized full-time)

**Target 6**
Increase information available through the Newsletter
85% complete (more education is always needed)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measure related to behavioral changes as part of its Municipal Component in FY 2005-06. The need for the identification and assessment of such measures is being considered for the next reporting period. The City is currently working on connecting BMP

implementation to load reductions and program effectiveness. The City feels that despite the lack of official tracking, progress is being made and behaviors are changing. Staff's efforts to maintain the closed dumpster lid are evidence of the change in behavior, as well as the installation of the drip irrigation at City Hall. All City trucks are now equipped with sand bags and gravel bags to contain any emergency run-off problems, until other assistance arrives. The bags are also available to the residents in case of drainage problems.

*Level 4 Outcomes: Load Reduction Estimation*

As stated above the City of Lemon Grove is working on a connection between BMP implementation and Levels 4 – 6. Some program data can be used to make fairly straightforward estimates. The Municipal Component lends itself to this process easily as the City is already required to keep extensive records of daily activities. The process is also facilitated by centralized data collection. However, the process is in its infancy with a more complete picture projected for future reporting periods. As reported in Section 2.1.2, the City's street sweeping and MS4 maintenance activities resulted in the diversion or removal of a combined 1,625 pounds of debris from the MS4 this year. Unlike other waste streams likely to be only partially introduced or conveyed to the MS4, the entire amount of these totals is assumed to be a load reduction.

**Table 2.4 - of Load Reduction Calculations for Municipal Activities**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Street Sweeping | 169.75 tons | None | 169.75 tons |
| MS4 Cleaning | 1,625 pounds (.8125 tons) | None | 1,625 pounds (.8125) tons |
| | | | **Total 170.5628 tons** |

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between municipal sources and water quality outcomes. The City will continue to explore these relationships. The City is attempting to connect BMP implementation to load reductions and eventually receiving water quality. The theory is that with the proper BMPs in place, a certain percentage of load reduction is expected, load reductions equal lower pollutant levels which lead to improved water quality.

### 2.4.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any municipal program data during this reporting period.

## Section 3.0 Industrial Component

This section describes actions taken by the City during FY 2006-07 to minimize discharges from industrial facilities and their impact on receiving water quality and other environmental resources. The City continues to implement a number of complementary and inter-related program activities, including the following:

- Maintaining a watershed-based inventory of industrial sources
- Requiring BMP implementation through ordinance and permit
- Encouraging BMP implementation through notification and outreach
- Monitoring compliance through inspection and enforcement

## 3.1 Priority Industrial Sources

For its January 2006 JURMP Annual Report, the City identified nine high priority industrial sites in its borders. Since a single repository of facility data does not exist, the City relies on other data sources as well as field reconnaissance, to modify its inventory. The City uses the annual industrial/commercial inspections by DMax Engineering (DMax) and the State Water Resources Control Board (SWRCB) Notice of Intent (NOI) database to keep its list of industrial facilities up to date. The City also uses the data collected annually by DMax during their facility inspections to update its high priority listing. Because the City does not experience large quantities of new development, the list remains fairly stable from year to year. The City updated its city-wide business and development database. This reporting period was spent training staff and learning to utilize the new system. No statistics are available from the updated system due to the short time in use.

### 3.1.1 Additions to the Industrial Inventory

There were no facilities that were recommended for addition to the City's high priority category during this reporting period.

### 3.1.2 Deletions from the Industrial Inventory

DMax discovered no facilities during FY 2006-07 to be deleted from the inventory.

### 3.1.3 Updated Industrial Inventory

The City's updated industrial inventory currently consists of 27 facilities. This number includes the above new high priority facilities, because all were listed as medium priority industrial prior to this reporting cycle. Table 3.1 provides a summary of the types of sources contained within the inventory.

**Table 3.1 - Summary of High Priority Industrial Sources**

| Industrial Activity | Number of Facilities in Lemon Grove | Revised High Priority Category Facilities |
|---|---|---|
| Waste Disposal and Recycling | 1 | |
| Equipment/Transportation | 3 | 2 |
| Metalwork | 2 | 3 |
| Building Supplies and Woodworking | 3 | 2 |
| Industrial Paper | | 1 |
| Contractor, Special Trade | | 1 |
| Specialty Hardware, Drapery | | 1 |
| **Total** | **9** | **10** |
| | **Total Facilities** | **19** |

## 3.2 BMP Requirements

### 3.2.1 BMP Requirements for Industrial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of industrial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 3.4.1. The City's tiered approach to establishing BMP requirements addresses all regulated industrial activities; broad standards apply to all types of industrial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP also provides specific BMPs based on business type as well as the general ones previously discussed (waste disposal, metal work, etc.).

### 3.2.2 Pollution Prevention Requirements for Industrial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's industrial program, the City views pollution prevention as part of BMP implementation. The JURMP in Section 3.1 discusses the City's pollution prevention goals with respect to industrial facilities. The City feels that if BMPs are implemented, that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

## 3.3 BMP Implementation

### 3.3.1 City Strategy for Ensuring BMP Implementation

As described in section 4.0 (Commercial Component), the City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites*

to the RWQCB on October 16, 2003. As noted for commercial sources, the City's strategy for ensuring BMP implementation at industrial facilities builds on this framework, as well as activities it is already conducting.

The City has also contracted with DMax to inspect all industrial and high priority commercial facilities within the City. As these documents are rather extensive, a copy may be obtained upon request. Attachment B-1 contains the forms used by D-Max to evaluate the facilities. A list of the inspected facilities can be found in Attachment B-2. Currently the City has limited Code Enforcement capabilities and only one full time Water Quality Program Coordinator. Budget constraints limit the growth of these fields, however City staff is hoping to improve and increase the Code Enforcement department as the budget allows. This would allow for easier, timely follow-up on facility violations, as well as creating a consequences-for-violations policy. A new code enforcement process for water quality violations is currently being implemented by the City for use with non-compliant construction sites and illegal discharges. The City is planning to expand the process to include non-compliant industries and commercial facilities, especially with reference to monitoring and testing. First the City must first pass an ordinance pertaining to testing requirements; then the code enforcement policy can include them for regulation and penalty assessment.

The City created a stormwater fee for businesses and residents. The City has explored different billing criteria based on the experiences of other cities. The City explored solid waste services as a possible billing mechanisim. The fee was standard for residential but differentiated based on facility/business dumpster size and frequency of pick-up. The fee allowed the City to recoup some of its water quality expenditures, but would also increase public awareness and participation. People and facilities are more likely to implement BMPs if a regular reminder of their importance is provided.
During late FY 2004-05, the City developed a fee based on trash removal services. The City believed a correlation existed between the amount of trash a site produced and the site's potential for pollution contribution. However the constraints of Proposition 218 made the fee vulnerable, therefore the City decided to re-vamp the fee structure to prevent any complications. The fee is no longer based on trash services for commercial facilities, but is attached to existing City fees for licenses and permits. A flat fee remains in effect for residents based on solid waste fees. The combined commercial and residential fees only cover one third of the cost of the City's stormwater program. The percentage is expected to lower with increased costs incurred by the issuance of the new MS4 permit, however they do not compensate for increased requirements and new programs. The already strained General Fund will continue to bear the brunt of the program's cost. With the vote failure in Encinitas, a coastal city, the inland cities have little hope of passing a stormwater fee without Proposition 218 exemption.

#### 3.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of the Copermittee program is to assist businesses in selecting appropriate combinations of BMPs that address their unique circumstances, activities, and discharge potential. While the City has existing BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options are standard elements of the City's program planning process.

A need exists to ensure regional consistency between Copermittee efforts. For instance, regional collaboration is beneficial in disseminating regionally consistent information to businesses, and for sharing information about practices that are working and those that are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so will seek to provide an understandable and regionally consistent message to the businesses it regulates. The City also participates in a San Diego Bay Watershed workgroup that explores topics pertinent to the entire watershed. These topics include BMP implementation and strategies for ensuring effectiveness. Effective education is key to ensuring BMP implementation. The City participates in both the County's Green Business meetings and the Copermittee's Outreach and Education Workgroup. The groups collaborate and share ideas and solutions. The City feels its participation in these venues is valuable in developing an effective and well-rounded program. Collaboration also ensures consistent messages to area businesses. The businesses know what to expect if they re-locate to another area of the County. Where applicable, the City will advocate the use of the January 2003 Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

#### 3.3.1.2 Outreach and Notification

Although compliance inspections are the cornerstone of the City's industrial facilities regulatory program, education is key to ensuring effective implementation by facility operators. The City is working to improve its outreach to the industrial facilities within the city-limits. All the industrial facilities are inspected annually by DMax. The results of the inspections are not received until after the end of the reporting period, therefore any improvements and follow-up are representative of the previous year's inspections.

The City is also working to improve its notification system. Staff is working to expand its database to contain all previous and present violators. The database will contain the number of violations, the type of violations, contact information, and notification information. The database will allow the City to track repeat

offenders and establish a better code enforcement policy. By tracking violation type, the City can better target its outreach efforts, making them more effective educational tools.

The City is currently working to alter the emphasis of its outreach. The current focus is on “don’ts”; the City is attempting to turn that around and make the focus “what to do.” The City believes that many violations continue because businesses and developers are not aware of alternative methods. If the focus of the outreach becomes “what can be done”, people have an alternative behavior, not just a change in knowledge. As stated above, for industrial facilities and construction, CASQA has very comprehensive BMP handbooks, which provide a variety of treatment methods based on activities and pollutants. Informing facilities of resources is a very simple example of positive outreach that provides people with behavior alternatives. Repetition is also key in an effective outreach program. The more often facilities are notified, the harder it is to claim ignorance.

#### 3.3.1.3 Compliance and Enforcement

The City continues to use routine inspections as its primary means of compliance certification for industrial facilities. All industrial and high priority commercial facilities in Lemon Grove are inspected by DMax. The reports are available for viewing, but as they are rather extensive are not included in this report.

The City sent no code enforcement letters during this reporting period to local industrial facilities. No complaints or investigations were needed at local facilities. The City is working on responding to the suggestions based on the inspection results. The final report was not received until after the end of the reporting period, but the City is working to schedule second inspections at several facilities and sending educational information to several others. The educational materials explain the NONA/NEC possibilities and what is required of each facility. Attachment B-3 contains a copy of the education packet now available for distribution.

### 3.3.2 Outreach to Industrial Businesses in FY 06-07

The City provided outreach to the industrial sector through several avenues in FY 05-06. Specific activities are described below.

#### 3.3.2.1 Outreach Events Targeting Industrial Audiences

During this reporting period the City did not perform any outreach events that targeted Industrial audiences directly. However, through the inspection process, all industrial facilities are reached in some manner with water quality information. Each facility receives a copy of their inspection complete with recommendations for improvements. In future years the City plans to up-grade its industrial

outreach. The following is a list of the activities the City wishes to implement in future reporting periods:

- Workshops on water sampling (a number of facilities are in violation on this aspect)
- A general information sheet about compliance with the General Industrial Permit and the Permit affecting the local jurisdiction
- Workshops on dry-cleaning methods for spills and general good house-keeping practices

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Outreach at public events such as the Winter Bonfire and Spring Festival

#### 3.3.2.2 BMP and Pollution Prevention Resources

Providing business representatives with useful sources of BMP information is a major focus of the City's stormwater program, and is emphasized in other regulatory programs as well. In this respect, particular stress is placed on pollution prevention practices.

The City's Pollution Prevention Program continued to promote pollution prevention practices among local businesses and the public during this reporting period. Stormwater and urban runoff messages are incorporated into all pollution prevention literature and program content. Through this program, the City continues to pursue partnerships, which provide important opportunities to integrate industrial stormwater program elements into existing programs, materials and avenues of distribution.

#### 3.3.2.3 Outreach During the Inspection Process

Personal communication through the inspection process is perhaps the most effective means of imparting useful BMP information to industrial operators. As described below, DMax conducted twenty-four industrial facility inspections during this reporting period. During these inspections, DMax provided detailed compliance information for facility operators. Direct communication through the inspection process, augmented by various other outreach tools, will continue to be the City's primary means of outreach to industrial businesses.

## 3.4 Compliance and Enforcement

In addition to educating business owners and operators, the City contracts with DMax to conduct routine inspections and responds to business-related complaints to verify and enforce compliance with stormwater requirements. In all instances, enforcement is pursued as necessary to return violators to compliance.

### 3.4.1 Inspection of Industrial Facilities

DMax inspected twenty-four industrial facilities during this reporting period. One hundred percent of the City's industrial facilities were inspected including low and medium level facilities.

Each industrial inspection consists of observable behavior and asked questions. The first portion of the inspection details facility and site information. The general information includes all required codes and classification information. The inspections found an additional ten high priority sites during this reporting period. They are listed above in Section 3.1.1. All of the new sites were formerly listed as medium priority and have now been up-graded to high priority due to new activity on site and proximity to Chollas Creek.

The inspection also includes a section detailing the BMPs in use, both observed and discussed. The final portion details recommended improvements and possible City action. The majority of compliance actions that were recommended dealt with the up-graded high priority facilities and the need for them to file NOIs or NONA/NECs and create monitoring programs. The facilities will be re-inspected and the necessary paperwork followed-up with during the next reporting cycle. The City has already contacted several of the facilities and is working with them to ensure they are in compliance with the Permit.

### 3.4.2 Complaint Investigations Involving Industrial Facilities

To the knowledge of City staff, no complaints were filed against Lemon Grove industrial facilities during FY 2006-07.

### 3.4.3 Enforcement of Violations at Industrial Facilities

During FY 2006-07, all enforcement activities consisted of detailed notification by letter and a new code enforcement policy. See Attachment B-4 for the flow chart demonstrating the new policy. The City sent BMP housekeeping information to all the industrial facilities listed in the previous reporting period as having improper or poor BMP implementation. The City is currently working to ensure the upkeep of BMPs at its industrial facilities. The City's primary focus during the next reporting cycle will be collaborating with the industrial facilities to ensure

complete compliance with water quality standards and pollution prevention efforts.

### 3.4.4 Reporting of Non-Compliant Sites

The City did not have a situation requiring it to report any non-compliant sites to the RWQCB over the course of this reporting period.

## 3.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Industrial Component in FY 2006-07.

### 3.5.1 Narrative Assessment

In FY 2006-07, the City continued a revamping of its notification system. An initial step in this re-designing was the contracting of DMax in 2002 to perform annual inspections of all industrial and commercial facilities in Lemon Grove. However, the staff position has lacked consistency on a year to year basis and keeping a yearly account of facilities in violation has been difficult. The City has a record of all notices, but no database to assist in analyzing the information. The City has begun to establish a data base to chronicle notifications. A database will facilitate later effectiveness assessments by allowing the City to analyze past violations by type and frequency. If a decrease in violations or in BMP violations is evident, then levels of effectiveness are easier to assess. A continual record of violations will also enable the City to focus its education and outreach to fit the specific needs of the industrial community in Lemon Grove.

The City implemented a new database for tracking industrial facilities within the City's boundaries. The City is still inputting past data to bring the system up to date to allow for tracking. Each facility will have a file that contains past inspection data and compliance issues. DMax focused on updating the current business facility to ensure accurate database information. This was how the ten new facilities were located and re-evaluated for correct prioritization.
The City believes its current program is in compliance but can be further developed to make it an outstanding and effective program. The City is aware that the need to assess effectiveness is of high importance. Therefore, the City worked cooperatively with other Copermittees to develop a comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*, submitted to the RWQCB on October 16, 2003). It is through the use of this framework that the City hopes to improve and further develop its existing program. The City is moving towards a more BMP based program. The City believes that BMPs are the backbone of an effective program. Through proper implementation, BMPs present an excellent measuring medium. Once the BMP is in place, the prevented pollutant load can be assessed.

In 2004, the Stormwater program came under new management. The City combined its Public Works Department and its Engineering Department. In August 2004, the City hired a new Water Quality Program Analyst. The yearly turn-over in the stormwater position has made it difficult for the program to develop and grow. However, the City is working on making certain elements standard, so that a basis is present from which growth can occur regardless of who is running the program. Combining the above mentioned departments facilitates the collection of stormwater data. Public Works personnel are the front-line, so to speak for City stormwater maintenance. By having them in the same department as the Stormwater manager, it will be easier to assess and improve collection methods and data.

No specific management practices or BMPs relating to industrial facilities or activities were identified as being ineffective during this reporting period.

### 3.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Begin database for tracking non-compliant facilities
50% complete (the database needs more back data entries to be accurate)

**Target 2**
Update JURMP industrial list through DMax
100% complete

**Target 3**
Provide educational material to those facilities eligible for NONA or NEC
100% complete

**Target 4**
Create annual activity specific informational mailer
30% complete

*Level 2 Outcomes: Changes in Knowledge / Awareness*

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

*Level 3 Outcomes: Behavioral Change / BMP Implementation*

A new aspect of the 2005 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention measures and the NPDES Storm Water Program were rated "Level 5". Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a "Level 4" rating. "Level 3" rating indicated an individual who answered three questions correctly, "Level 2" indicated one or two correctly answered questions, and a "Level 1" rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- "Level 5": All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- "Level 4": BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business' activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- "Level 3": BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- "Level 2": Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- "Level 1": A violation of one or more of the City's Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2005 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

**Table 3.2 Program Scores for FY 2006-07**

| | **Knowledge Assessment *** | **BMP Assessment** |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |
| **Median Rating** | 3 | 3 |
| # of "Level 5" Ratings | 6 | 25 |
| # of "Level 4" Ratings | 28 | 34 |
| # of "Level 3" Ratings | 30 | 49 |
| # of "Level 2" Ratings | 22 | 12 |
| # of "Level 1" Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

**Table 3.3 Program Scores for FY 2005-06**

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of "Level 5" Ratings | 0 | 14 |
| # of "Level 4" Ratings | 9 | 26 |
| # of "Level 3" Ratings | 34 | 30 |
| # of "Level 2" Ratings | 26 | 11 |
| # of "Level 1" Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2005-06. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 3.5.3 Spatial and Geographic Analysis

The stormwater runoff in the City of Lemon Grove drains to two waterways that eventually end in the San Diego Bay; Chollas Creek and Sweetwater River. See Attachment B-5 for drainage zones.

## Section 4.0 Commercial Component

This section describes actions taken by the City during FY 2006-07 to minimize discharges from commercial businesses and their impact on receiving water quality and other environmental resources. The City implements a number of complementary and inter-related commercial program activities, including the following:

- Maintaining an inventory of commercial businesses (Section 4.1)
- Requiring BMP implementation through ordinance and permit (Section 4.2)
- Encouraging BMP implementation through notification and outreach (Section 4.3); and,
- Verifying compliance through inspection and enforcement (Section 4.4).

Inspections of commercial facilities are performed by DMax in the same manner as industrial facility inspections. See Section 3.4.1 for a detailed description of the inspection process.

### 4.1 Priority Commercial Sources

As required under Permit section F.3.c.(2), the City maintains and annually updates a city-wide inventory of high priority commercial sources as a basis for its outreach and regulatory programs. This inventory currently includes 139 individual sources. Table 4.1 summarizes the commercial inventory by business type and indicates the sources of information used to compile data for each type.

**Table 4.1 - Summary of High Priority Commercial Sources**

| Commercial Activity | Number of Facilities in Lemon Grove |
|---|---|
| Automobile Dealers/Rentals | 18 |
| Automobile Supply Stores | 9 |
| Automobile Repair/Paint | 9 |
| Automobile System and Tire Repair | 56 |
| Automobile Cleaning/Washing | 3 |
| Gas Stations | 7 |
| Eating/Drinking Establishments | 60 |
| Landscaping, includes lawn care | 9 |
| Nurseries and Greenhouses | 1 |
| Pest Control | 3 |
| Equipment Repair/Maintenance/Cleaning | 3 |
| Metalwork | 6 |
| Masonry | 4 |
| Parking Lots and Storage | 3 |
| Carpet/Building Cleaning | 21 |
| Pool and Fountain Cleaning | 3 |
| **Total** | **215** |

As Table 4.1 suggests, the City has yet to locate a single, centralized source of commercial facility information. Several of the facilities with commercial SIC codes are high priority industrial due to their proximity to Chollas Creek, a 303d listed water. This explains the discrepancy between the above number and the commercial inventory number. While the City remains hopeful that improved sources of facility data and information can be identified, in the meantime it must continue to rely on existing data sources such as permit databases, the Yellow Pages and field reconnaissance.

The City is implementing an updated version of its existing database in the next reporting period. The new format will be more complete and allow for better tracking of renewals and new licenses. The City also utilized the annual inspections performed by DMax to assist in updating its database. DMax notified the City of any business that failed to verify current licensing with the City. The update was complete in mid FY 2006-07, with the remainder of the year spent training staff and learning to utilize the updates. The new system did not identify any new business types. The existing numbers were considered accurate for this reporting period. Water quality staff is also currently exploring options for integrating water quality related data into the current business license program, HdL. It is the same program utilized for building permits and code violations and would be an excellent integrated tracking system if it is capable. Staff is working for a representative to further explore this option.

## 4.2 BMP Requirements for Commercial Businesses

### 4.2.1 BMP Requirements for Commercial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of commercial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 4.3.1. The City's tiered approach to establishing BMP requirements addresses all regulated commercial activities regardless of priority categorization; broad standards apply to all types of commercial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP does provide specific BMPs based on business activity as well as the general ones previously discussed (eating/drinking establishments, auto repair, nurseries, etc).

### 4.2.2 Pollution Prevention Requirements for Commercial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's commercial program, the City views pollution prevention as part of BMP implementation. The JURMP in section 4.1 discusses the City's pollution prevention goals with respect to commercial dischargers. The City feels that if BMPs are implemented properly that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

## 4.3 BMP Implementation at Commercial Sites

The City has developed and implemented a comprehensive strategy for ensuring BMP implementation "on the ground" at high priority commercial businesses subject to its oversight. This section describes progress during FY 2006-07 as well as an updated strategy for ensuring effective BMP implementation in the future.

### 4.3.1 City Strategy for Ensuring BMP Implementation

On October 16, 2003, the City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs* at commercial and Industrial Sites to the RWQCB. This framework lays out a comprehensive set of options that Copermittees should consider in developing and updating their commercial source programs. The following description of the City's strategy builds on this framework, as well as activities it has already conducted during this and previous reporting periods. The final decision to utilize and/or emphasize specific elements will be determined as part of the City's ongoing program implementation and evaluation process.

#### 4.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of Copermittee programs is to assist commercial facilities in selecting appropriate combinations of BMPs that address unique circumstances, activities, and discharge potential. While the City has already established extensive BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options is a standard element of the City's program planning process.

A need also exists to ensure regional consistency in Copermittee efforts. For instance, regional collaboration is beneficial in disseminating consistent information to businesses, and for sharing information about which practices are working and which practices are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so, will seek to provide an understandable and regionally consistent message to the businesses it regulates. Several fact sheets are being developed for distribution to commercial businesses, several in conjunction with the County's Green Business program. The intent is to create regionally consistent material that explains the implementation of required BMPs for different types of facilities and activities. Where applicable, the City will also advocate the use of the Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

#### 4.3.1.2 Outreach and Notification

Several types of outreach and notification activities can be effective in ensuring that business operators have been adequately informed of their compliance obligations and provided useful information on how to meet them. As shown below, the City intends to utilize each of the following types of outreach to varying degrees as part of its outreach and notification process:

- Printed Materials
- Direct Mailings (including e-mail)
- Workshops and seminars
- Websites and hotlines
- Industry associations

The degree to which any of these tools are used will vary by specific program area, as well as the interest level of regulated parties. For instance, workshops and seminars will generally be made available upon request, but the City may specifically target certain sectors it considers to be in need of extra attention. Outreach will also play a proportionally larger role in the City's approach to businesses not subject to an active inspection process. Community groups and community outreach events can also play a useful role in reaching some types of commercial businesses. The City intends to increase its emphasis in this area on a continual basis. Three public events that lend themselves to information distribution are the Fire Department Open House held in October, the Winter Bonfire held in December, and the Spring Festival held in April or May.

During this reporting period, the City provided a Water Quality booth at all three large scale City events. City personnel staffed both booths to answer any questions and to provide stormwater and pollution prevention educational materials. These materials included brochures on pool cleaning and draining, pet waste, oil recycling, healthy garden tips, Green Wrench guides, What's Cooking guides, and household hazardous waste disposal information. Between the three events, approximately 5000 residents, business owners, and visitors were exposed to the City's stormwater and pollution prevention program. The City again mailed educational material to one hundred percent of the restaurants within the City boundaries. The information contained a calendar of free workshops provided in collaboration with SDG&E (San Diego Gas and Electric).

The City continues to investigate the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local facilities. The needs assessment for the sanitation district showed a need for a FOG program and the City is working to develop a program that will serve the needs of the sanitation district and water quality.

#### 4.3.1.3 Compliance and Enforcement

The City intends to utilize routine inspections (including licensing and permitting as appropriate) as its primary means of compliance verification for stationary commercial sources. Inspection programs are currently in place for all high priority commercial facilities, and are described in further detail in section 4.4.1. The City utilizes DMax to conduct its facility inspections for commercial and industrial facilities. The City, in this reporting period, focused its inspections on eating/drinking establishments, automotive repair facilities, and repeat offenders from previous reporting periods. The City observed an improvement in compliance at the repeat offender sites. Many are making noticeable strides in compliance efforts and basic good housekeeping practices have improved in all facilities inspected. The City feels the improvements are due to increased, repeated education and better trained City personnel, who observe potential non-compliance early. The City had no commercial sites requiring violation notification during this reporting period.

### 4.3.2 Outreach to Commercial Businesses in FY 2006-07

The goal of the City's commercial outreach program is to promote effective BMP implementation by making commercial business operators aware of their regulatory obligations and by providing them useful information on how to comply. To this end, a variety of methods were utilized during this reporting period, including mass mail-outs, informational brochures and hand-outs, and direct interaction with employees during inspections and permit processing.

#### 4.3.2.1 Automotive Industry

During this reporting period, the City increased its outreach efforts to include the automotive industry within its boundaries. The City is aware that not only is this sector engaged in activities with a high potential to discharge pollutants, it is also large and highly visible to the community. The City met its goal of providing outreach at community events, like the Spring Festival, and Winter Bonfire. Section 4.3.1.2 provides the types of materials distributed at these events and the number of potential recipients. The materials included information on oil recycling, free oil funnels containing oil recycling site information, and Green Wrench guides in English and Spanish. The City also sponsored a Green Business workshop for automotive facilities within its boundaries and within the San Diego Bay Watershed. The workshop contained information on BMP implementation and water quality issues. Each participant received an educational video, a hydro-mop and bucket, and the EPA automotive BMP packet.

*Partnerships*

The County-chaired Green Business Group continues to make progress in developing a self-assessment program for small automotive businesses. The goal of the program is to recognize businesses that are in compliance with environmental regulations and that take extra steps to go beyond compliance in the areas of pollution prevention, energy, and water conservation, and solid waste reduction and recycling. The program is aligned with statewide green business standards and has already approached several businesses in San Diego County. To promote the use of "green" business practices, a public flyer was developed along with self-assessment checklists that are distributed by workgroup stakeholders during business inspections, trade association meetings, and at various community events. BMP information is included in the checklists and in the supporting materials provided to the businesses. These materials are all included as Attachment C and are available on the Workgroups website at www.projectcleanwater.org/html/wg_green_bus.html.

4.3.2.2 Eating and Drinking Establishments

The City has continued its outreach to this sector of its commercial community. The City is working to annually increase its activity specific outreach to an additional commercial or industrial sector. Automotive facilities and eating/drinking establishments are the two commercial sources that have received individual outreach materials. The City is aware that not only is this sector engaged in activities with a high potential to discharge pollutants, it is also large and highly visible to the community. The listing below shows the areas in which the City plans to increase its outreach efforts to eating and drinking establishments during the next two fiscal years.

- Basic Housekeeping workshop utilizing the *What's Cooking Guide*
- Mailer describing safe and effective grease disposal methods and dry-cleaning methods for spills (currently working with a consultant to evaluate the most effective way to implement a FOG program)
- Workshops on how to maintain health codes and improve water quality

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Continued use of the *What's Cooking Guide*
- Outreach at public events such as the Winter Bonfire and Spring Festival

The City mailed educational material to one hundred percent of the restaurants within the City boundaries. The information contained a calendar of free

workshops provided in collaboration with SDG&E (San Diego Gas and Electric). Several of the workshop topics focused on energy efficiency, fewer waste products and green business practices. The Outreach Workgroup collaborated with SDG&E to ensure that stormwater and pollution prevention are recurring themes in the majority of the presentations.

The City is also investigating the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local facilities. After receiving the results of the needs assessment, the City is working to establish a FOG program that will serve both the sanitation district and water quality.

*What's Cooking Guide*

The Copermittee Outreach Workgroup, chaired by County staff, developed *What's Cooking*, a stormwater BMP guide targeting eating and drinking establishments. The guide is designed for use by local businesses as both a source of activity-specific BMP information and as an employee-training tool. It presents a set of standard BMP requirements that are found in most jurisdictional ordinances, contains contact information for each jurisdiction in San Diego County, and includes supplemental pages to aid operators in documenting employee training.

The City will continue to utilize the *What's Cooking Guide* and will use it as the basis for future workshops for eating and drinking establishments.

*Partnerships*

The Green Business Technical Workgroup continues to make substantial progress in developing a self-assessment program for commercial businesses, including an element focusing on the food service industry. Supporting materials are included as Attachment C and are available on the Workgroup's website at www.projectcleanwater.org/html/wg_green_bus.html.

The City plans to utilize the Green Business Program more effectively during the next reporting period. The City hopes to collaborate with other jurisdictions in its watershed and region to offer programming to local businesses. This will allow the City and other jurisdictions to provide a consistent message through out the region. A consistent message will make it easier for citizens and City staff to enforce water quality and pollution prevention measures. Based on the attendance at the previous reporting period's workshops, the Green Business Program and its collaboration agencies are exploring other outreach options and

possible incentive programs for attendance at workshops. The City will continue to participate in the program and it's efforts.

The Green Business group is also working with other state agencies to create state wide standards for acquiring a Green Business certification. The City feels that by working closely with this group, that it will benefit from a uniform message and that its businesses will see the value in promoting green practices. Water quality and pollution prevention are high priority items for the certification process. Businesses with a Green Business certification should decrease the number of potential polluters within the City. The City is hoping to be able to offer incentives for the Green Businesses in the future and looks forward to continued collaboration and growth in this partnership.

## 4.4 Compliance and Enforcement

While educating business owners and operators is an important first step toward achieving compliance, the City also conducts programs to verify that stormwater BMPs are being implemented "on the ground." This includes both routine inspections of commercial facilities by DMax and response to complaints received via the Stormwater Hotline. When City staff observes a stormwater violation, appropriate actions are taken to ensure that businesses are returned to compliance with all BMP requirements and discharge prohibitions.

### 4.4.1 Inspection of Commercial Facilities

During this reporting period, DMax inspected 54 high priority commercial facilities on behalf of the City. As stated in section 4.3.1.3 above, the City focused on eating and drinking establishments, automotive facilities, and facilities with non-compliance comments from past inspections. Inspectors' primary function is to assess compliance with minimum BMP requirements, which are specific to the types of facilities and activities designated as high priority by the Permit. Each inspection is conducted in the presence of a facility operator who has the authority and responsibility to ensure the implementation of corrective actions should they be required. For more inspection data see Attachment B1.

### 4.4.2 Complaint Investigations Involving Commercial Sources

The City received no recorded commercial oriented complaints during this reporting period.

### 4.4.3 Enforcement of Violations at Commercial Businesses

The primary objective of the City's commercial enforcement program is to return violators to compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary, but generally include Verbal Warnings, Notices of Violation, and potentially fines.

The City began a trial code enforcement program for water quality during FY 2004-05. This program has continued to grow and will include a part time staff member with a water quality compliance focus during the next reporting period. The city can now issue escalating fines for water quality violators and will be able to conduct in-house inspections and community support. See Attachment B-4 for the flowchart detailing the code enforcement process. The City understands the need for immediate response on water quality compliance issues. However, this is the City's first water quality code enforcement program and it must be used with discretion. The City must also ensure that the municipal code contains the necessary ordinances to provide validation for code enforcement efforts.

### 4.4.4 Reporting of Non-Compliant Sites

The City's JURMP outlines standard operating procedures for reporting non-compliant facilities and sites to the RWQCB. The City did not have occasion to report any instances of significant non-compliance over the course of this reporting period.

## 4.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Commercial Component in FY 2006-07.

### 4.5.1 Narrative Assessment

In FY 2006-07, the City continued the improvements discussed in the previous annual report. DMax continues to inspect, on an annual basis, the majority of high priority commercial facilities. This year the City focused on automotive facilities, eating and drinking establishments, and repeat non-compliance facilities. DMax also provided the City with an updated facility inventory. The continued inspections of City facilities are beginning to show results. A change in behavior is evident in the increased number of BMPs found on site, the decrease in non-compliance issues, and the increased knowledge of the facility operator and/or manager. The City is continuing to set a precedent in its commercial community. Through the inspection program, facilities receive an annual reminder of water quality and pollution prevention in addition to any material provided by City staff or workshops attended. The inspections also set the stage for improved code enforcement measures and tracking data during future reporting cycles.

Although the City considers its existing commercial program to be both Permit-compliant and of a high quality, staff realizes the need for improved tracking to assist in obtaining load reduction data. The City believes that with the implementation of the proper BMPs in all businesses, load reduction numbers can be assessed. City staff also worked cooperatively with the Copermittees on several issues related to commercial activities. The first, the development of a

comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*), will provide guidance to City staff in future years as we continue to implement and refine our efforts. The second, the continued development and distribution of targeted BMP guides for the restaurants and automotive businesses (*What's Cooking and The Green Wrench* G*uide*), will promote regional consistency and serve as an important source of activity-based BMP guidance for two important industries.

No specific management practices or BMPs relating to commercial facilities or activities were identified as being ineffective during this reporting period.

### 4.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activitiy-Based Targets*

**Target 1**
Increased outreach at community events
100% complete

**Target 2**
Increased outreach to eating and drinking establishments
85% complete (more detailed outreach is still desired)

**Target 3**
Update the JURMP commercial listing through DMax
100% complete

**Target 4**
Increase outreach to automotive facilities
85% complete (more detailed outreach is still desired)

**Target 5**
Improve education through business license renewals and new business licenses 40% complete (still working on informational mailer to include in renewal notice, in-person staff interaction has increased when applicants renew at City Hall)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Commercial Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

A continued new aspect of the 2006 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention measures and the NPDES Storm Water Program were rated "Level 5". Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a "Level 4" rating. "Level 3" rating indicated an individual who answered three questions correctly, "Level 2" indicated one or two correctly answered questions, and a "Level 1" rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- "Level 5": All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- "Level 4": BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business' activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- "Level 3": BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- "Level 2": Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- "Level 1": A violation of one or more of the City's Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2006 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

**Table 4.2 Program Scores for FY 2006-07**

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |
| **Median Rating** | 3 | 3 |
| # of "Level 5" Ratings | 6 | 25 |
| # of "Level 4" Ratings | 28 | 34 |
| # of "Level 3" Ratings | 30 | 49 |
| # of "Level 2" Ratings | 22 | 12 |
| # of "Level 1" Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

**Table 4.3 Program Scores for FY 2005-06**

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of "Level 5" Ratings | 0 | 14 |
| # of "Level 4" Ratings | 9 | 26 |
| # of "Level 3" Ratings | 34 | 30 |
| # of "Level 2" Ratings | 26 | 11 |
| # of "Level 1" Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.
The DMax inspections have shown a need for improved outreach with commercial sources and facilities. Even though none of the facilities had "gross" violations, many lacked basic housekeeping BMPs, such as spill kits or open dumpster lids. The last time the commercial facilities were inspected was in 2002 presenting the City with a gap in data collecting. The City plans to continue yearly inspections from this point forward, creating a more in-depth data supply.

*Level 4 Outcomes: Load Reduction Estimation*

Because of the diversity of facility types and operations in the City's commercial source inventory, no attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of city efforts in FY 2004-05. In the future, the City will continually seek to develop valid methods for estimating load reductions from commercial facilities. To this end, a continued inspection presence will help to improve our understanding of potential reductions.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 4.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. However the Report of Waste Discharge (ROWD) contained an initial spatial analysis of commercial facilities within watershed boundaries. This information can be found in the ROWD document presented to the RWQCB.

## Section 5.0 Residential Component

The City implements a variety of programs to prevent and respond to discharges from residential areas. All of these programs are predicated on the assumption that knowledge and awareness are crucial to affecting and sustaining responsible behavior. Where possible, programs and activities are tailored to reflect the unique characteristics of the many areas of Lemon Grove.

## 5.1 Priority Residential Sources

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment D-1 contains a demographics chart for the population of Lemon Grove. As Attachment D-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

## 5.2 BMP Requirements

The JURMP document lays out minimum Best Management Practice (BMP) requirements corresponding to all identified categories of high priority residential sources.

### 5.2.1 Minimum BMP Requirements

As described in JURMP section 5.3, the City establishes basic BMPs for all manner of residential activity. Below is a list of the activities covered in JURMP section 5.3:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home and Garden Care
- Disposal of Household Hazardous Waste
- Disposal of Pet Waste
- Disposal of Green Waste

JURMP section 5.1 emphasizes the importance of pollution prevention, making it the basis for the BMPs described in each of the above listed activities.

### 5.2.2 Pollution Prevention Methods

The City encourages its residents to use pollution prevention BMPs through a variety of educational programs and activities. The core function of the City's

pollution prevention efforts is to promote the use of these practices by City residents, local businesses, and municipal employees. Pollution prevention concepts are also incorporated into virtually all of the City's literature on water quality.

Providing residents with useful sources of BMP and pollution prevention information is a major focus of the City's stormwater programs, but is emphasized in other regulatory programs as well.

## 5.3 BMP Implementation

The City takes a multi-faceted approach to ensuring that its residents implement required and recommended BMPs. Education remains the preferred approach, but environmentally responsible behavior can also be facilitated in other ways. For example, the City operates a Stormwater Hotline, making it easy for residents who see a potential water quality problem to communicate with City staff. We also provide and support a wide variety of recycling and hazardous waste disposal opportunities in conjunction with EDCO, the local waste disposal facility. The City also encourages public participation in clean-up events, anti-litter campaigns, and other community events. Each element of this approach is described further as follows:

- Outreach to Residents
- Outreach to Schools
- Reporting and Information Resources
- Recycling and Waste Collection Services
- Measurement of Awareness and Behavior

### 5.3.1 Outreach to Residents

The City implements an outreach program targeting the general residential public. Outreach typically includes a combination of regionally and locally focused activities, but this year staff focused on outreach in the schools.

The City did participate in several joint effort outreach activities with other Copermittees.

#### 5.3.1.1 Lemon Grove Clean-up (April 28-29, 2007)

The City held one collection day through EDCO and their facilities. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 28-29. See Attachment D-4 for a detailed break down of the HHW collected throughout the City. The City participated in several East County events targeted towards the collection and

proper disposal of e-waste (electronic waste). However the City does not have quantity information for these events.

5.3.1.3 Chollas Creek Clean-up Event

The City participated in "I Love a Clean San Diego's Creek to Bay Clean-up" event on April 28, 2006. The City had nineteen volunteers arrive to clean the Chollas Creek tributary at the Federal Blvd and McArthur intersection. This is common illegal dumping site and has been cleaned in past events. The volunteers removed 464 pounds of debris from the site and 464 pounds of recyclable material. See Attachment D-2 for a copy of the full report.

5.3.1.4 Printed Outreach

The City utilized three distinct forms of printed outreach during FY 2006-07. The first was distributed at the Winter Bonfire on December 1, 2006 and consisted of brochures on pet waste disposal, pool water disposal, oil recycling, general stormwater information, household hazardous waste (HHW) hotline information, promotional items containing oil recycling and HHW information and household BMP brochures. The second event took place on May 18, 2006, during the Spring Festival. City staff provided healthy gardening tip booklets, HHW information, E-Waste disposal information, oil recycling funnels with drop off locations printed on the sides (English and Spanish), pet waste brochures, pool water disposal brochures, general stormwater brochures, and the City Newsletter, which contained an article on proper fertilization and watering methods. The third event took place on October 14, 2006 during the Fire Department Open House event. Informational brochures on water quality, the stormwater program and household hazardous waster were available for visitors. Stormwater personnel were on hand to answer any questions and provide further information. See Attachment D-3 for examples of the brochures available at these events.

### 5.3.2 Outreach to Schools

School outreach remains a key component of the City's education strategy; however, the City chose to focus its outreach efforts in the commercial and land development areas of the program during this reporting cycle. Due to limited staff and fiscal difficulties, it is important that the City perform as efficiently and effectively as possible. This often requires the City to focus its efforts in a specific area, therefore no school programs were presented during this reporting period. The intent of school programs is to stimulate long-term behavioral change by alerting students to the importance of clean water and environmental responsibility.

The City plans in future reporting cycles to increase its educational outreach. The City firmly believes that long-term behavioral changes are possible,

especially with repetition like yearly presentations. The list below details a few of the areas the City would like to explore:

- Individual presentations to science classes
- Large school presentations in conjunction with other school programming like during pollution prevention week
- Encouraging student involvement in volunteer cleanup efforts
- Creating student specific cleanup events
- Encouraging involvement in larger environmental programs and opportunities like Arbor Day and Jiminy Cricket's Environmentality Challenge
- Improved internet links for students through the City website
- Create a listing of community service projects that are water quality specific for scout troops, school groups or other volunteer groups
- Material distribution at community events targeted at school aged children

The City believes that by increasing its community/school outreach, the general population will become better acquainted with water quality issues. Eventually the City will be able to tie awareness to effectiveness and then to load reductions. The City believes BMPs are the key link and that with increased awareness more residents will implement household BMPs on a daily basis. In theory, as long as the correct BMPs are in-place to the maximum extent practicable (MEP), pollutants of concern should no longer be entering the waterways. The City can then measure the amount of prevented pollution.

### 5.3.3 Reporting and Information Resources

The primary goal of the City's residential program is to ensure that the public has access to useful information about urban runoff and can easily report their complaints to City staff. The City has established a Stormwater Hotline and several public information brochures for these purposes.

#### 5.3.3.1 Stormwater Hotline (619-825-3810)

The City continued to operate its Stormwater Hotline during this reporting period. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to the stormwater staff for resolution and/or information. The hotline referred approximately four calls during FY 2006-07. The number is not exact because some calls are attributed to the hotline, even if they are received through other channels. Most of the complaints are resident to resident issues and can be handled through verbal channels. On occasion, the City delivers a written notification to a group of residents about a persistent problem. The calls were either unfounded or dealt with on a small scale with no code enforcement involvement. The most common type of call received involves

neighborly disputes on private property, therefore it is quite common that the City offers advice but no direct action is taken.

### 5.3.4 Recycling and Waste Collection Services

#### 5.3.4.1 Used Oil Collection

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.8 million gallons of used lubricating oil (ULO) recycled during 2003, which was 10 percent above the 83.1 million gallons collected in 2002. The ULO recycling rate for 2003 was 61 percent, which is a 24 percent increase when compared to ULO recycled in 2002."[1] Below are two charts that demonstrate this trend in increased recycling.

**Table 5.1 Oil Collected by Public Collection Programs** (in millions of gallons)

**Table 5.2 Oil Collected by Public Collection Programs** (in millions of gallons)

| | 94/95 | 95/96 | 96/97 | 97/98 | 98/99 | 99/00 | 00/01 | 01/02* | 02/03* |
|---|---|---|---|---|---|---|---|---|---|
| **Curbside** | 0.9 | 0.9 | 0.8 | 0.9 | 0.7 | 0.6 | 0.5 | 0.9 | .9 |
| **Form 303** | 0.6 | 0.7 | 1.0 | 0.8 | 0.9 | 1.1 | 0.9 | 1.0 | 1.0 |
| **Certified Centers** | 5.6 | 8.7 | 10.2 | 11.3 | 13.2 | 15.2 | 16.3 | 18.5 | 19.9 |
| **Total Oil** | 7.1 | 10.3 | 12.0 | 13.0 | 14.8 | 16.9 | 17.7 | 20.4 | |

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

[1] www.ciwmb.ca.gov/UsedOil/Facts.htm

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the three collection sites and the number for curb-side pick-up. See Attachment D-3 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment A-4 for copies of the Newsletter.

The three collection sites are:

- Auto Zone 7582 Broadway (oil only)
- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection. Table 5.3 shows how much oil each site collected during 2007.

**Table 5.3 - Oil Collection in Gallons per Site**

| Site | Gallons Collected in 2005 | Gallons Collected in 2006 | Gallons Collected in 2007 |
|---|---|---|---|
| EDCO | 1,690 | 2,710 | 2,830 |
| Auto Zone | 13,000* | 13,300* | 13, 000* |
| Kragen Auto Parts | 8,800* | 8,000* | 8, 100* |
| **Total** | 23,490 gallons | 24,010 gallons | 23,900 |
| **Increased Collection** | | **520 gallons** | **-110 gallons** |

*These numbers include in-house used oil, not just used oil from the public. They do not separate the two collections.

5.3.4.2 Solid Waste Recycling and Household Hazardous Waste Collection

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. Due to reporting errors, the calculations were not complete for this reporting period. During the next reporting period the City will supply our percentage of recycled material for this reporting period.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Honda is building a new facility in the City and performed demolition activities to

clear the site for development in December 2006. Honda estimated a 500 ton demolition load and recycled eighty-four percent of that load.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in four collection events for solid waste disposal. Two of the events were in cooperation with a Household Hazardous Waste grant through CIWMB and focused on the collection of e-waste. The other two are an annual Lemon Grove Clean-Up event further discussed above in Section 5.3.1.1.

The City's participation in the Household Hazardous Waste (HHW) grant facilitates the proper management and disposal of toxic materials and household hazardous wastes for residents of the City. The program was created to protect landfills, receiving waters, and the environment. The focus of the clean-up and collection events is to enable residents to safely dispose of their hazardous materials and bulky discards. See Attachment D-3 for examples of educational material provided to residents.

*HHW Collected*

During this reporting period; 19,175 pounds of waste were collected from 188 stops in the Lemon Grove area. This amount is cumulative for all door-to-door services collected through the HHW grant program. Each stop averaged 102 pounds of waste. See Attachment D-4 for a detailed break-down of individual source collections.

In future reporting periods, the City hopes to be able to present a trend analysis of HHW and solid waste collection. Currently the data is tracked by CIWMB and EDCO. If more information is required, either of these organizations is happy to supply further data.

### 5.3.5 Measurement of Awareness and Behavior

The Permit requires the City to assess how effective its educational efforts are in changing the knowledge and behavior of targeted audiences. This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2006-07.

5.3.5.1 Future Assessment Measures

During the current reporting period, the City utilized observation as the main form of awareness and behavior measurement. However in the future the City plans to incorporate the following measurement tools for the residential component:

- Surveys for school presentations
- Questionnaires for public outreach such as Lemon Grove community programs and the Winter Bonfire events
- Documented observations by City staff
- Year to year tracking of complaints and resolutions

## 5.4 Compliance and Enforcement

City investigation and follow-up on all complaints of a residential nature during this reporting period are described below.

### 5.4.1 Complaints Received

The City receives resident complaints on a regular basis both through the hotline and through the regular phone system. The majority of the calls can be handled through verbal interaction, the rest are investigated by City staff. Staff investigated several residential complaints during this reporting period; however the majority were unfounded or untraceable upstream. One incident however is detailed above in Section 5.3.3.1.

The challenge with residential complaints lies in the inability at times to confront the source of the pollutant. Often times the complaints are received after the illicit deed has been committed and the individual placing the complaint has limited knowledge of the source.

### 5.4.2 Investigation and Enforcement

The City had one residential event that required code enforcement involvement. These events are detailed above in section 5.3.3.1. The complaint was received through the hotline, therefore the details are presented in that section.

## 5.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2006-07.

### 5.5.1 Narrative Assessment

The City made a number of important improvements to its residential activities programs in FY 2006-07. This year, the City's outreach efforts to residents and

schools demonstrated a clear intention to expose a larger segment of the Lemon Grove population. The City is clearly thinking of long-term results with the increase in school programs. By presenting material at community events, such as the Spring Festival, the Winter Bonfire and the Fire Department Open House, the City can reach a large, diverse sector of the community. By increasing door-to-door communications, the City brought water quality into the home-life of Lemon Grove's residents.

The City provided a variety of waste collection and disposal services to its residents. Through education to increase awareness, and by making these services convenient, attendance at collection facilities and events rose considerably from previous years. This increased participation not only speaks to the quality of these programs, but is encouraging as an indicator of increased support for environmental programs in general.

Recognizing the need for increased measurability, the City plans to increase its evaluation efforts in respect to resident and student awareness. Section 5.3.5.1 details the areas in which the City plans to grow and further develop in coming years. The City believes feedback is a vital part of refining and possibly redirecting future efforts.

No specific management practices or BMPs relating to residential activities were identified as being ineffective during this reporting period.

### 5.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activitiy-Based Targets*

**Target 1**
Target outreach based on hotline calls
100% complete

**Target 2**
Continuted presence and outreach at community events
100% complete

**Target 3**
Larger variety of educational material available
75% complete

**Target 4**
Improved tracking of hotline calls
65% complete (a database was created near the end of the reporting period)

**Target 5**
Increase the information available on the City website
75% complete (a new and improved City website is being created and will contain more water quality information and links)

**Target 6**
Use of door hangers by DPW to notify residents of a potential issue
40% complete DPW staff now has the door hangers but data has not been collected on their effectiveness and no hotline calls were received based on distributed hangers

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Residential Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

As with knowledge and awareness above, the City recognizes a need for such measures in the Residential Sector. Section 5.3.5.1 describes the ways in which the City wishes to develop assessment instruments for knowledge, behavioral change and BMP implementation.

Response to residential complaints is perhaps the only currently utilized method that involves direct observation of residential behavior. The City anticipates that an increase in complaints demonstrates an increase in awareness of urban runoff issues and available reporting resources. Another indication of behavioral change is the participation of the public in activities that prevent waste from entering the City's MS4. In particular, increases in oil recycling totals and household hazardous waste collection (Section 5.3.3) indicate the engagement of residents in environmentally protective behaviors. The City will continue to

monitor these measures and to search for additional ways to assess changes in behavior among residents.

*Level 4 Outcomes: Load Reduction Estimation*

Current methods are not yet sophisticated enough to accurately gauge pollutant-loading reductions resulting from implementation of the City's residential program. This is simply due to the variety and scale of polluting behaviors associated with the residential population. However, certain existing data are helpful in making some initial estimates. As reported in Section 5.3.3, City recycling and waste collection programs diverted 23,900 gallons of used oil and 19,175 pounds of household hazardous waste from landfills and the storm drain system during this reporting period. Because only a small percentage of either of these waste streams would actually be illegally disposed, adjustment factors were applied to each to estimate load reductions. Both factors were selected in consultation with staff from each of these respective programs; neither is based on data of any sort. Both figures represent the experience and best professional judgment of staff. Load reduction estimates are shown in Table 5.5.

**Table 5.5 - Summary of Residential Load Reduction Calculations**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Used Oil Recycling | 23,900 gallons | 10% | 2,390 gallons |
| Household Hazardous Waste Collection | 19,175 pounds | 1% | 191 pounds |

Because of the diversity of residential activity types in the City, no further attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of implementing the City's regulatory oversight program in FY 2006-07. In the future, The City will continue to seek to develop valid methods for estimating load reductions from residential sources.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 5.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period.

## Section 6.0 Land-Use Planning Component

This section describes actions taken by the City during FY 2006-07 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

### 6.1 Assessment of Planning Process

During the current reporting period, City staff developed mechanisms in the planning process to provide improved water quality and watershed protection for new developments. The City is working to effectively integrate these principles and practices into the entire planning process. An important objective of the improvements is to develop land use goals and policies that will maintain a built environment compatible with, and sensitive to, the City's natural setting, while retaining the unique local character.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment E-1 shows the form that is presented to each applicant regardless of project size. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

### 6.2 Mapping Impervious Cover

Water quality data is the most definitive measure of determining the quality of our watersheds. However, because extensive data sets are not always readily available for the City's watershed, mapping impervious surface coverage can provide an important predictive tool to complement empirical methods. National research over the last decade has shown a significant correlation between impervious surface coverage and water quality. Development generally results in

an increase in both pollutant sources and impervious surfaces. In the Permit, it states, "Numerous studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving water quality. Significant declines in the biological integrity and physical habitat of streams and/or receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. (Developments of medium density single family homes range between twenty-five and sixty percent impervious)."[1] The increase in pollutant sources, (i.e. parking lots, buildings, rooftops, and streets) contributes to increased pollutant loads in stormwater runoff, while corresponding increases in impervious surfaces limit the land's natural ability to filter these pollutants. As a result, developed areas typically experience higher runoff volumes and lower runoff quality. The challenge presented to the Copermittees is the mandate to reduce harmful runoff (a product of development), while complying with the State mandate of increasing housing stock and creating affordable development projects.

Mapping impervious surface coverage helps land use professionals better predict watershed health and guide growth patterns to minimize the impacts of development on water quality. The City lacks the sophisticated equipment necessary to create a complete and accurate impervious surface map. However the City has made a good faith effort to determine on average how much impervious surface is present within its boundaries.

To determine the impervious surface of the commercial and industrial portion of the City, a survey of parking spaces was taken. To determine impervious surface amounts for the residential sector of the City, the City averaged each residence as having 2 parking spaces. Table 6.1 shows the results of this study and Attachment E-2 presents a partial breakdown of the parking survey taken. The full document is rather lengthy, but is available upon request.

**Table 6.1 - Results of Parking Space Study**

| Source | Total Number of Spaces | Acres covered by Impervious Surface |
|---|---|---|
| Churches | 1,510 | 5.62 |
| Apartments | 2,367 | 8.80 |
| Schools | 741 | 2.76 |
| Commercial and Industrial | 9,604 | 3.36 |
| Residential[2] | 17,444 | 64.87 |
| **Totals*** | **31,666** | **117.77** |

***** Totals are based on the average sized parking space, which is 18'x9' with a=162'

[1] California Regional Water Quality Control Board, San Diego Region. Order No. 2001-01; NPDES No. CAS0108758, p.2. retrieved from www.swrcb.ca.gov on May 30, 2004.
[2] Based on 8,722 housing units. Information from *2030 Cities/County Forecast*, available through www.sandag.org .

In the process of conducting the study, the City discovered some inconsistencies with parcel numbers and addresses. These inconsistencies are slowly being rectified based on need and time available.

The City hopes in future reporting years to utilize the study information in estimating load reductions.

## 6.3 Land Use Professionals Resources

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

## 6.4 Development Project Approval Process

As required by Permit Section F, the City has modified its discretionary land use permitting process to incorporate specific water quality requirements. The basic process is laid out in the City's General Plan, Chapter 17.28 *Procedure and Administration*. The Plan, itself, does not delineate for water quality; however the City includes water quality personnel in all development proposals.

The developer must submit all required documents at the beginning of the process. The project Stormwater Maintenance Plan (SWMP), Stormwater Pollution Prevention Plan (SWPPP) and/or Standard Urban Stormwater Mitigation Plan (SUSMP); plus the Hydrology Study are all due with the Site Plans for checking and approval from the on-set of the approval process. As stated in Section 6.1 above, this is to ensure a complete presentation for project approval by the Planning Commission.

The City has updated its checklists for developers to include water quality related lists. See Attachment E-3 for the final version of those lists. The City has received positive verbal feedback from the applicants who have utilized the new

checklists. The City also refers many applicants to the Lemon Grove SUSMP on our City website for further information about water quality guidelines. The Lemon Grove SUSMP can be found at the following web address:

- http://www.ci.lemon-grove.ca.us/clg/cityhall/Default.asp

During the current reporting period, the City reviewed eight potential SUSMP development projects with in the City limits. The following chart shows the development projects under review during this reporting period.

**Table 6.1 SUSMP Projects Under Review FY 2006-07**

| File Number | Project Name | Applicant | Description |
|---|---|---|---|
| TM 0047/PDP 04-02 | Center Hilltop Condos | Kevin Leon | Small multi-family housing unit |
| TPM 0042/0049 | Citrus Heights* | Carter Reese | 78 single family home development |
| TPM 0180 | Citron Court Condos | Community Collective | 12 condo units |
| TM 0057/PDP 07-005 | Mallard Village Condos | Thomas Fitzmaurice | 9 senior living condo units |
| TPM 0177 | 6505 MacArthur Dr. | Terrence Taylor | 3 lot single family subdivision |
| TM 0052/PDP 06-05 | Mc Manus Subdivision | Randall McManus | 9 lot single family subdivision |

*Project on hold due to desire to sell.

The City requires all major projects, determined to be significant contributors to post-construction pollutant loading, to file a SWMP. The document ensures that effective BMPs will be put in place to foster long-term water quality improvements. The requirements for a significant contributor are listed below:

- Residential development of 100 units or more.
- Residential development of 10 to 99 units.
- Commercial development greater than 100,000 square feet.
- Automotive repair shops.
- Restaurants.
- Hillside development greater than 5,000 square feet.

- Projects discharging to receiving waters within Environmentally Sensitive Areas
- Parking Lots greater than 5,000 square feet or with greater than 15 parking spaces and potentially exposed to urban runoff.
- Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater.

A *Preliminary Grading Plan* and the *Preliminary Hydrology/Drainage Study* are the technical basis for the SWMP; however, changes and refinements to the SWMP may be required as technical review of the application and completion of CEQA documentation continues. The complete SWMP must provide at least the following:

- A project description;
- An identification of water quality pollutants of concern and a proposed treatment volume base on the applicable design storm, site plans and adjacent land use, and soil characteristics;
- An identification of mitigation measures, including structural treatment BMPs, to protect water quality and prevent increases in downstream erosion to the maximum extent practicable;
- Agreements, easements, and licenses relating to proposed BMP construction, location, maintenance, or changes in drainage character;
- An identification of the beneficial uses of impacted receiving water bodies, including groundwater; and
- An identification of Section 303(d) impaired water bodies potentially impacted by the project.

The associated *Preliminary Grading Plan* and *Preliminary Hydrology/Drainage Study* must be prepared by a registered civil engineer with experience in fluvial geomorphology (drainage patterns). The *Preliminary Hydrology/Drainage Study* is, at a minimum, required to: 1) Characterize pre- and post-construction hydrology, both on-site and downstream, 2) Identify potential off-site discharges of stormwater and any increased potential for downstream erosion, and 3) Identify structural BMPs sufficient to address stormwater issues in compliance with the permit. To assist applicants through the permit application process, City staff has created a checklist for the development of Grading Plans, see Attachment E-5. The City uses the County's *Hydrology/Drainage Guide*, which can be found at www.sdcounty.ca.gov/dpw/watersheds/land_dev/drainage.html.

## 6.5 Environmental Review Process

JURMP 6.3 summarizes the revisions made to the City's environmental review process for new development and redevelopment projects to incorporate Permit requirements. The process outlined there continues to accurately reflect the

City's environmental review efforts. Attachment E-6 provides the checklist from CEQA that the City utilizes for its environmental review process.

## 6.6 New Development and Redevelopment Outreach

During this reporting period, the City used a variety of means to educate its customers about the potential impacts of development and redevelopment on water quality. These included direct staff interaction with the public and the development and distribution of informational checklists.

### 6.6.1 Interaction with City Staff

The City predominately utilizes staff time and the pre-application process to provide water quality information to developers and residents. Attachment E-1 provides the form required of all building and grading permits regardless of project size. Large development projects are rare in Lemon Grove. The City is approximately 3 miles square and is predominately existing residential development. To ensure that even the small projects are aware of water quality measures, the City requires a signed BMP checklist to be included with any permit application. The City has also created three checklists for any SUSMP redevelopment or new development project. These checklists are used by both City personnel to review SUSMP projects and by developers to ensure complete submittals. The checklists are included in Attachment E-3. The City uses the checklists and counter visits to provide as much education as possible to anyone interested in developing or building in the city limits of Lemon Grove. Face to face time with staff is the most effective way to reach the largest number of permit applicants because they must apply in person with their plans.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator also plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but makes approval faster once the formal submittal is made. The Planning Commission knows that all issues have been dealt with prior to their approval hearing and that City staff has ensured a minimal environmental impact.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable educational resource for both the City and the developers.

City staff meets with all new applicants in some way and eleven open permit applications equal at least eleven consultations within the current reporting period.

### 6.6.2 Informational Checklists

As discussed above and as seen in Attachments E-3, E-5, and E-6; the City provides all applicants with a variety of checklists pertaining to application requirements. These checklists represent a small portion of the application checklists available for applicants. City staff is always available for further clarification and the Lemon Grove SUSMP is available at the site listed in Section 6.4 above.

## 6.7 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Land Use Planning Component in FY 2006-07.

### 6.7.1 Narrative Assessment

Although new development projects approved during the reporting period included adequate BMPs to address stormwater discharges, the City recognized that project level planning tools were largely under-utilized as many projects relied mainly on structural treatment controls, which can be expensive, maintenance-intensive, and less effective than site-design controls. Staff recognizes that it is easier to preserve a project site's natural hydrology through site design, than to artificially control it through detention or retention. As the City increases its outreach efforts, it foresees an increase in awareness of water quality knowledge in developers and the public. By providing developers with as much information at the beginning of the application process, the City hopes to encourage creative designs that improve water quality while maintaining the environmental integrity of Lemon Grove.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven

to be ineffective. The City therefore does not currently recommend any changes to this program component.

### 6.7.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Improve checklists for project submittals for staff use
100%

**Target 2**
Create a database to track project reviews
75% complete (a database was created, but it needs to be re-vamped to accommodate multiple reviews of the same project in an efficient manner) This project is on hold due to implementation of a GIS system that would allow for integrated tracking.

**Target 3**
Create a working map of Waters of the State for use by City staff and developers
30% complete (data collection is slow due to limited staff numbers)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The primary goal of BMP implementation is to reduce the loading of pollutants to stormwater discharges. An important emphasis of annual program assessment is the estimation of loading reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important endpoint for City assessments. Table 6.2 below demonstrates the direction the City is moving towards for future reporting periods. In future reports, the Table below will provide an initial estimate of the effectiveness of the SWMP process and its ability to reduce the pollutant loadings of selected constituents of concern.

**Table 6.2 - Sample Table to Show Pollutant Loading Reduction Estimations**

| Constiuents of Concern | Loading Factor (lbs/ac/yr)[3] | Total Acreage | BMP Effectiveness Adjustment | Prevented Pollution |
|---|---|---|---|---|
| Total Copper | | | | |
| Total Nitrates | | | | |
| Total Cadmium | | | | |
| Total Arsenic | | | | |
| Total Suspended Solids | | | | |

SAMPLE

These estimates will provide a starting point for characterizing the benefits of implementing this program element, but are subject to a number of qualifications. First, load estimates assume that all projects are low-density, single-family residential developments. Second, project proponents have discretion in the selection of specific BMPs to meet the Maximum Extent Practicable (MEP) standard required of them. As such, individual projects employ a combination of BMPs, each with varying levels of effectiveness. The percentage adjustment is an estimate of the overall effectiveness of the measures based upon best professional judgment.

This project is being re-vamped due to new collaborations at the watershed level. It is the City's understanding that the new permit increases the emphasis on

[3] Source: Minton, Gary. *Stormwater Treatment – Biological, Chemical, and Engineering Principles.* 2002

watershed collaboration and evaluation of up-stream contributors. However the concept is similar, but focused on the type of business (initially automotive facilities), its likely pollutants and the relationship of those pollutants to certain BMP effectiveness. The members of the San Diego Bay Watershed group have already looked at their inspection requirements and are drafting improvements in the BMP compliance and efficiency areas. The City feels it is important to tackle the issue of load reduction on a regional basis to ensure the highest level of effectiveness. The City believes that a more regional and/or watershed approach will result in better, longer lasting water quality improvements.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 6.7.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. See Attachment E-7 for a City zoning map.

## Section 7.0 Construction Component

The City implements a variety of programs to prevent and respond to discharges from construction sources. All of these programs are predicated on the assumption that knowledge and awareness is key to effecting and sustaining responsible behavior, but that an active oversight and enforcement presence is also necessary for long-term success. This section describes actions taken by the City to regulate construction sources during the FY 2006-07. It includes the following general types of activity:

- Requiring BMP implementation through ordinance and permit (7.2);
- Encouraging BMP implementation through outreach (7.3); and
- Verifying compliance through inspection and enforcement (7.4).

### 7.1 Priority Construction Sources

The City maintains a construction permit database. The City currently lists 75 open construction permits. However, because sites are continually opening and closing, that number is not definitive at all times. The number also includes all private and public construction sites. The majority of the current construction permits are for low or medium priority projects.

The City completed eleven minor infrastructure improvement projects during FY 2006-07:

- El Prado
- La Corta
- Primera
- Ramon
- Plata
- Corte del Sur
- Patero
- Alberdi
- Buena Vista
- New Jersey
- Lemon Grove Avenue

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

The City continues to have only one high priority construction source at:

- St. John of the Cross Church and Preschool – this project is a multi-phase project but overall it qualifies. (This project was not active during this reporting period, but received approval for the final phase.)

The Honda site that participated in the demolition ordinance did not perform construction after during this reporting period. To assist in processing the demolition ordinance the City processed the demolition permit separate from the building permits. The building permits were under review during this reporting period.

## 7.2 BMP Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

### 7.2.1 BMP Requirements for Permitted Construction Sites

Prior to the adoption of this Permit, the City required implementation of sediment and erosion control BMPs. These controls continue today. During FY 2006-07, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

#### 7.2.1.2 BMP Requirements for Major Grading Permit Sites

Major grading permit applicants are required to submit a Storm Water Pollution Prevention Plan (SWPPP) Addendum to the Grading and/or Building Permit Application. The standards for SWPPP are closely related to those required for developers in the pre-approval process. The biggest difference is the focus during construction, not post-construction.

### 7.2.2 BMP Requirements for Public Construction Sites

All City-managed Capital Improvement Projects (CIPs), regardless of size, include contract specifications requiring the implementation of BMPs in compliance with the General Construction Permit even prior to this reporting period. Specific BMPs that are implemented on public construction projects were identified in JURMP 7.6 and match those required for private projects. These have not been updated.

### 7.2.3 Pollution Prevention Requirements

The City continues to encourage and, where appropriate, require the use of pollution prevention practices by construction site owners, developers, contractors, and other responsible parties. Specifically, pollution prevention practices are encouraged in all BMP implementation material. The City requires specific pollution prevention plans from any activity that disturbs more than five acres. These sites must also seek coverage under the General Construction Permit. The City believes that with proper and complete BMP implementation, pollution prevention is a natural consequence.

## 7.3 BMP Implementation

The City ensures that BMPs are implemented to the standards described in Section 7.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

### 7.3.1 Construction and Grading Approval Process

The Preliminary Grading Plan enables the City to better evaluate stormwater and drainage impacts on permitted sites The SWMP documents how dischargers will implement BMPs.

Although CIP projects do not require City Permits, their approval process is much the same as for private sites. These projects follow a process to ensure that BMPs are addressed at all phases. Starting at the project planning phase, projects are required to submit a SWMP. The SWMP refines the project by setting source controls, site design, and treatment control requirements. Once all the elements and concerns have been addressed at the planning level, the project moves into the design phase. During design, construction and post-construction BMPs are introduced into the plans. The plans are then circulated to the Water Quality Program Coordinator for review. At a minimum, this review is conducted when the project design is 30, 70, and 100 percent complete. These checks ensure that BMPs are adequately addressed in the plans and adjoining specifications are included.

### 7.3.2 Compliance Verification

Actual implementation of on-site and off-site BMPs is verified during site inspections. Inspections conducted during this reporting period are discussed in Section 7.4.1 below.

### 7.3.3 Construction and Development Industry Outreach

The City places a high priority on educating project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. It is difficult to send mailers or brochures to construction sites because individual job foreman rarely have an office. The City is looking into the possibility of offering training to job site personnel to further increase its educational outreach for construction sites. On the checklist required with each project seen in Attachment E-1, education and training are required BMPs. The City is exploring the possibility of making it a required BMP. Political ramifications must be further researched. Through its Annual Report, the City will keep Regional abreast of its efforts in this area. Until that time, the following educational efforts are currently in place.

Customers are offered a number of educational resources as they progress through the permit application and approval process, including interaction with field and counter staff (Building Inspectors, Planning Personnel and City Inspectors) and distribution of informational checklists and document examples.

#### 7.3.3.1 Interaction with City Staff

City staff (including building inspectors and counter staff) regularly interacts with permit applicants and other members of the public. Personal interaction provides an important opportunity to increase the level of stormwater awareness among City customers. A particularly important interaction takes places at the very beginning of the project. Each applicant seeking a building permit of any kind receives a checklist of required BMPs. This form is being revised for the next reporting period to improve clarity and to streamline the process. From the very beginning, applicants are forced to think of water quality issues. The form is a required part of the application. More information on the initial process is available in Section 6.6.

## 7.4 Compliance and Enforcement

Compliance and enforcement is an integral part of the City's efforts to address BMPs at the construction phase. Inspections are conducted on a daily basis throughout the City on various projects.

### 7.4.1 Inspection of Construction Sites

JURMP Section 7.7 provided a description of the City's construction site inspection process. The stormwater component of these inspections is intended to ensure that contractors, property owners, and developers implement an effective combination of BMPs to meet minimum water quality protection requirements. Inspection staff utilizes checklists to assist them in verifying appropriate BMP implementation at each site inspected, and shares with the owner/developer to increase awareness of stormwater requirements and assist them in complying. See Attachment F-1 for a copy of one such checklist. The City conducted 39 scheduled inspections of nine active constructions sites. The City also conducted an average of 3 informal inspections of these sites and potential sites weekly throughout the reporting period, providing approximately 144 inspections total during the reporting period. It should be cautioned that while average numbers of inspections are illustrative as a gross measure of program activity, they can also be misleading. As already mentioned, individual sites open and close throughout the reporting period, and significant differences also exist between these sites and their inspection records.

The City has also instituted the use of a construction inspection database to track construction site visits pertaining to water quality and pollution prevention issues. Attachment F-2 contains a print-out of the visits made to all active construction projects during the 2006-07 reporting period. City staff also performs a number of informal inspections by attending joint meetings on site with other staff members or visual inspections while out investigating complaints. City staff believes that a visible presence is an excellent deterrent to non-compliance. If the workers know the site is being observed on a regular basis, they are less likely to let BMP up-keep deteriorate.

The City has just begun to use the new tracking process for construction site inspections. The City records each inspection in a tracking database. The City, due to its small size, currently inspects all construction sites regardless of priority or size. The database also allows the City to track the number of building inspections performed at each site and ensures that each site is visited a minimum of three times. The City is currently with a representative to merge water quality data with the building permit program. This would create a centralized data source for all the businesses and building permits in the City. The building inspector's visits are tracked in a previously existing database managed by the Planning and Development Department. The City Inspector uses the new database for tracking inspections as well as a BMP checklist that each owner/developer signs and commits to uphold, see Attachment E-1. During all building inspections, water quality concerns are taken into consideration. If the inspector discovers a problem, the Water Quality Coordinator is called upon to make a separate inspection. At the completion of each project, the City requires a final inspection requiring signatures by any involved parties including building, engineering, sanitation, water quality, and

planning/development. Without the signatures, the project is not recorded and not deemed complete until all requirements are met. The City requires a water quality signature on all SUSMP projects. The City also requires all building and grading permits to comply with minimum BMPs through the use of a checklist and property owner signed confirmation of said BMPs.

The St. John's site that is listed as a high priority site continued as non-active during this reporting period; the Catholic Church was under investigation and all assets were frozen including construction expenditures. If the site had been active during this period, the frequency of inspections would comply with the Permit requirement found in Section F.2.g. It states that high priority sites will be inspected weekly during the rainy season, unless the Copermittee can justify to Regional that the site meets the listed exemption criteria.

### 7.4.2 Enforcement of Construction Sites

City inspectors enforce stormwater requirements according to protocols outlined in JURMP Section 7.8. The City's enforcement program is designed to educate the community, promote compliance with applicable laws and regulations, return violators to compliance in a timely manner, and penalize violators as appropriate.

The City utilizes written warnings, notices of violation, administrative citations, and stop-work orders to enforce applicable stormwater requirements on its construction projects. The City's code enforcement program was in place on a trial basis and has transitioned to permanent policy. The trial period allowed the City Council to see examples of the most common code enforcement violations and for the City to flush out any kinks with the policy. Attachment B-3 contains a copy of the flowchart for stormwater code enforcement efforts.

The policy allows the code enforcement process to be utilized making it easier to deal with any issues discovered while dry weather-testing or site inspecting. With the new code enforcement process in place, the City can deal with any stormwater violations in a more expedited manner than the previous system, which did not allow fines or recuperative costs to the violator. The City also hopes to hire a part-time code enforcement officer with a water quality focus during the next reporting period.

In severe cases of non-compliance, or in the event of significant discharges, it may be appropriate to deny or revoke a permit. As a final resort, the City may use civil and/or criminal court actions under the State Porter Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

### 7.4.3 Reporting of Non-Compliant Sites

The JURMP outlines standard operating procedures for reporting non-compliant sites to the Regional Water Quality Control Board. The City did not have occasion to report any non-compliant sites over the course of this reporting period.

## 7.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Construction Component in FY 2006-07.

### 7.5.1 Narrative Assessment

In FY 2006-07, the City continued to move its Construction Component forward in a number of important ways. Not only has the intensity of inspections grown, but an additional year of implementation has also allowed City staff and the regulated community to grow more accustomed to assimilating new stormwater regulations into their standard operating procedures. As familiarity and experience increase, the City expects compliance and oversight to improve commensurately.

The City hopes in future reporting periods to increase its outreach in this component. The City plans to host developer and contractor specific workshops dealing with water quality issues and compliance in future reporting periods.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

### 7.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Increase construction site inspections
100% complete

**Target 2**
Track construction site inspections
95% complete (the database continues to be in transition due to the potential for a centralized tracking source for a number of City programs)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 7.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

## Section 8.0 IC/ID Component

This section describes activities conducted during the FY 2006-07 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment. What follows is a summarized list of where each IC/ID program component is discussed in this Annual Report:

- Dry Weather Monitoring (Section 8.1)
- Spill Prevention and Response (Section 8.2)
- Public Reporting of IC/IDs, Complaint Investigations, and Enforcement (Sections 3.4, 4.4, 5.4, 8.3, 8.4)
- Used Oil and Toxic Materials Disposal (Section 5.3.3)
- Limiting Infiltration from the Sanitary Sewer to the MS4 (Sections 8.5 and 2.1.4)

### 8.1 Dry Weather Monitoring Program

This section provides and overview of the results of the City's 2006 Dry Weather Analytical and Field Screening Monitoring Program (Dry Weather Program), which is implemented by DMax. This section will provide a complete copy of DMax's findings and report.

### 8.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 153 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls four were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 4.4 and follow-up and enforcement for residential complaints is dealt with in Section 5.4.

## 8.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

## 8.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 5.3.

## 8.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 2.1.

## 8.6 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its IC/ID Component for FY 2006-07.

### 8.6.1 Narrative Assessment

In FY 2006-07, the City continued its Dry Weather Program through a contract with DMax Engineering. The City saw significant improvements in its site testing. This year's sampling was further increased the City's knowledge and awareness of its watershed and waterbodies. This is reflected in the specific recommendations contained in D-Max's report and findings.

The City also continues to attend the Regional Dry Weather Monitoring Workgroup to assist in watershed improvements together with other copermittees.

### 8.6.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

The City did not track activity targets during this reporting period. However, the City will remedy this problem during future reporting cycles. The City believes the program was dealt with effectively, but activity-based targets were not tracked.

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in

the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 8.6.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

## Section 9.0 Education Component

This section provides a brief overview of the City's educational efforts during FY 2006-07. Since education is such an integral part of the all JURMP components, outreach to specific audiences is discussed in greater detail alongside program descriptions in the Land Use, Industrial, Commercial, Residential, and Construction Sections. This integrative organization allows the reader to better understand the context in which education is conducted.

### 9.1 Overview of Education

City outreach efforts continued to be guided by the three objectives set out in JURMP Section 9.1: 1) configuration and purpose of municipal separate storm sewer systems and how pollutants can be released to them, 2) how urban runoff impacts local receiving waters [mainly Chollas Creek] and surrounding habitats, and 3) BMP solutions that are available for treating or controlling the various pollutants of concern. Specific tools and methods are adapted as appropriate to best convey meaningful information to the target audience. Methods emphasized during this reporting period include:

- Presentations and Workshops
- Direct Mailings
- Community Events
- Educational Material Distribution
- Hotline Resources
- Interaction with Staff

The City participated in four outreach events during FY 2006-07. (See Attachment G for a table detailing each of the events) An accounting of formal events, however, does not adequately convey the significant amount of outreach that takes place during permit processing, inspections, on websites, and via other means. For a discussion on each of these alternative forms of outreach, see sections 3.0 through 7.0 and all corresponding attachments. What follows are overviews and selected highlights from the City's major educational components.

#### 9.1.1 Outreach to Residents

The City implements an extensive outreach program targeting school children and other members of the general public. As the program continues to evolve, the content of the City's outreach will increasingly focus on those pollutants and activities identified by water quality analysis and other program data to be high priorities. Data from the City's Dry Weather Program (See Section 8) have been used to identify combinations of areas and pollutants that may warrant increased or more focused outreach. We hope to expand on this type of program feedback as data sets become larger and program components increasingly integrated in future years. The City conducted four residential outreach events during this

reporting period, as well as four public participation events. Section 5.3 details these events more extensively. School outreach is another major component of the City's education program. The intent is to stimulate long-term behavioral change by exposing students at a young age to the importance of clean water and environmental responsibility. Similar to how recycling behavior has been significantly modified by targeting school aged children. City staff strives to ensure that classroom presentations are memorable and interactive by incorporating hands-on activities such as watershed models. The previous year's Whale Tale grant was a one year program only, but the City hopes to develop it's own elementary education program during future reporting periods.

### 9.1.2 Outreach to Commercial and Industrial Businesses

The goal of the City's commercial and industrial outreach program is to promote effective BMP implementation by making business operators aware of their regulatory obligations and by providing them with useful information about how to comply. To this end, a variety of methods were utilized during this reporting period (i.e., direct mailings, outreach events, personal communications, educational materials).

Every industrial business and all the high priority commercial businesses on the City's inventory received facility-specific BMP guidance during inspections this reporting period.

It is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation.

Each reporting period, the City plans to increase outreach and improve communications with a new sector of the business and industrial community. Due to limited staff and fiscal limitations, the City must target and focus its program from year to year. However, no program will decrease once the outreach to a specific sector has been achieved. A consistent and constant message is instrumental in creating changes in behavior and increases in knowledge. Each year the City hopes to initiate a new focus area of increased outreach to provide in its annual report.

### 9.1.3 Outreach to the Construction Industry

The City places a high priority on education project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. Customers are offered a number of educational resources, the key one being regular interaction with knowledgeable City staff.

During this reporting period, the City increased its outreach to the developers and construction sites within the City. The City increased the number of inspections, both informal and formal. Water Quality personnel review all development plans that are presented to the City. The City requires all permit applicants to complete a construction BMP plan. Water Quality personnel also require a notation on all plans to verify the use of BMPs for the duration of the project. The City continues to use and further develop the information available to contractor and developers. Several checklists are available as well as other educational materials on BMPs, both pre- and post-construction. The City is working on making its stormwater information educational and easier to use for the construction and development sector. The City continues to believe that the increase in inspections confirms the importance and commitment to an effective water quality and pollution prevention program.

## Section 10.0 Public Participation

During FY 2006-07 the City continued to actively encourage stakeholder participation in the development and implementation of its Jurisdictional Runoff Management Program (JURMP) through various venues:

- Informational Resources
- Community Outreach Efforts
- Stormwater Copermittee Meetings

In addition to the activities described further below, the City continued to rely heavily on the interaction of staff with members of the public during their regular duties. As described below, the interaction of these staff with the public through various means (i.e., permitting, inspections, presentations, etc.) continued to provide an additional avenue for obtaining direct feedback from the City's customers.

## 10.1 Public Participation Venues

A key element of an effective public participation strategy is providing the public with easily accessible resources for obtaining water quality information and reporting complaints.

### 10.1.1 Hotlines

The City continued to operate its Stormwater Hotline at (619) 825-3810. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls received are promptly referred to the correct City staff. Complaint responses are handled in a timely manner. The focus is to gain compliance from the erring source, so a speedy response time is crucial. During this reporting period, the hotline received four calls pertaining specifically to water quality issues and approximately 153 pertaining to sewer issues. These numbers do not represent the number of calls that come through the main phone line and are water quality in nature. The City is working to create a tracking system for these calls.

**Table 10.1 – Comparison of Calls**

| Total Number of Calls | Number of Calls pertaining to Water Quality | Number of Calls with City Action |
|---|---|---|
| 153 | 4 | 0 |

### 10.1.2 Chollas Creek Clean-up Event

The City participated in I Love a Clean San Diego's Creek to Bay Clean-up event on April 28, 2007. The City had nineteen volunteers arrive to clean the intersection of Federal Blvd and McArthur. This location is a tributary of Chollas Creek and a common illegal dumping site. The volunteers removed 464 pounds of debris from the site and 428 pounds of recyclable materials. See Attachment D-2 for a copy of the full report for the entire event.

## 10.2 Stormwater Copermittees

### 10.2.1 Copermittee Meetings

The City continued to participate in a variety of Copermittee Meetings sponsored mostly by the County. Below is a listing of the Workgroups that the City actively participates in:

- BMP Effectiveness and Assessment Workgroup
- Permit Re-Issuance Workgroup
- San Diego Regional Management Committee
- Dry Weather Monitoring Workgroup
- Regional Monitoring Workgroup
- Report of Waste Discharge Workgroup
- Outreach Workgroup
- Green Business Program Meetings
- Watershed Workgroup (through Port of San Diego)

Each of these meetings occurs once a month on various days or bi-monthly in the case of the Management Committee. The yearly activities calendar of the former Water Quality Coordinator was lost when the computer was re-formatted for a new user, so dates are un-available for attendance records. However, each meeting was accompanied by a sign-in sheet supplied by the sponsor, typically the County. The County would have records of the City's participation in the above listed groups.

### 10.2.2 Collaborative Efforts with Copermittees

This section will highlight two particular collaborations that will be highly beneficial to Lemon Grove and the region.

*Chollas Creek Water Quality Protection and Habitat Enhancement Project*

The Chollas Creek Water Quality Protection and Habitat Enhancement Project (Chollas Creek MOU) is an agreement between the City of San Diego and the members of the Chollas Creek watershed. The City of San Diego applied for the Chollas Creek Grant to create a more comprehensive education plan for areas in

the Chollas Creek watershed. The Grant included regional educational materials and programs. The Grant provided for Chollas Creek clean-ups and restoration to native habitat in and around the stream-beds. The City benefited from the programs and educational material when they joined as a Grant partner. San Diego provided the in-kind money; they are asking the partners to provide in-kind services only. The in-kind services will be equal to roughly $10,000; no actual money is exchanged. The City assisted in educational material development, local programming for businesses and schools, and offered assistance at San Diego meetings pertaining to the grant. The Chollas Creek MOU went into effect in 2005. The City feels this collaboration is beneficial to the City of San Diego, to Lemon Grove, and the residents in both cities. Although this grant is complete, the City continues its education efforts in reference to Chollas Creek.

*County of San Diego Green Business Program*

The City increased its involvement with this program by offering an automotive workshop during this reporting period. The City looks forward to continuing these efforts and further improving its outreach to the local and regional business communities. This partnership has provided the City with valuable insight into local, state and federal regulations pertaining to pollution prevention and hazardous materials. In turn, the City has provided the program with an increased awareness of water quality programs and regulations.

## Section 11.0 Effectiveness Assessment

### 11.1 Introduction

This section provides an overview of the methods used in this report to assess the implementation and effectiveness of the City's JURMP for the period of July 1, 2006 through June 30, 2007. As with the programs themselves, the City's approaches to effectiveness assessment have evolved considerably during this period. An important aspect of these new and augmented programs is ensuring their measurability and their nexus to changes in discharge and receiving water quality. In particular, Permit sections F.7 and I.1.a.F.7 require that the City identify and report on measures to assess the effectiveness of JURMP implementation and identify strategies for assessing long-term program effectiveness.

The City is taking important steps toward the development of new and improved methods for conducting assessments, and in putting those methods into practice in this report. This section provides an overview of the approach that the City has taken to conduct its effectiveness assessment this year. However, the actual assessments are contained throughout the remainder of this report within their respective program components. Specifically, the following sections contain effectiveness assessment elements, each following a common organization described further in Section 11.2 below:

- 2.0 Municipal Component
- 3.0 Industrial Component
- 4.0 Commercial Component
- 5.0 Residential Component
- 6.0 Land Use Planning Component
- 7.0 Construction Component
- 8.0 Illicit Discharges Detection and Elimination Component

The scope and content of these assessments varies widely for each program element. However, in all cases, the City has included sections corresponding to each of the major effectiveness assessments elements described below.

### 11.2 Assessment Approach

The City and other Copermittees have in past years described a number of basic measures that can be relatively easily tracked and quantified. The City's objective is to go beyond those efforts by more closely scrutinizing existing measures with an eye toward a more complete understanding of their meaning and value to the effectiveness assessment process. From this, the City has also endeavored to identify where new or revised measures might be needed. Our starting point was the collaborative development of the document, *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management*

*Programs*, submitted to the RWQCB on October 16, 2003. This document represents the Copermittees' current thinking on how effectiveness assessment can best be approached now and in the future. More importantly, it procedes an important starting point for the evolution of more detailed and sophisticated strategies by the City and other Copermittees. The remainder of this section draws heavily on the content of that framework.

The City's approach to effectiveness assessment as reflected throughout this JURMP Annual Report, is organized according to three primary elements, each described below:

- Narrative Assessment
- Assessment of Specific Measures
- Spatial and Geographic Analysis

### 11.2.1 Narrative Assessment

In previous comments on the City's JURMP, RWQCB staff has indicated a desire for a more detailed discussion of successes, strengths and weaknesses, and outstanding program features. The narrative assessment addresses this concern by qualitatively describing major programmatic achievements from throughout the year. Other more specific and quantifiable measures are addressed in the remaining portions of the assessment.

Permit Section I.1.g also requires that the City identify in its JURMP Annual Report any management measures proven to be ineffective in reducing urban runoff pollutants and flow. Each narrative assessment section also includes the identification of any such measures identified in the reporting period.

### 11.2.2 Assessment of Specific Measures

This section provides a short overview of several of the key concepts and organizing principles of *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*. That document should be read in its entirety for a more complete understanding of the City's long-term effectiveness assessment strategy. Due to the length of the document, the City has not included it in this report. However, a copy is available on request.

Essential to increasing measurability is the establishment of clear and meaningful measures that can be tracked over this and future reporting periods. To establish such measures, it is crucial that the desired or targeted outcomes of any particular program activity be clearly identified and understood. Attachment I illustrates six basic levels or categories of outcome that can be employed for any of these six levels. The City's assessment intends to follow this basic model. Ultimately, the objective of the effectiveness assessment process is to identify measures at the highest level of the hierarchy possible. In doing so, knowledge

gaps between program activity and water quality outcomes can best be addressed. It is important to note, though, that a single measure will rarely provide a complete picture of any program area. Multiple measures will therefore usually be utilized for many program activities.

#### 11.2.2.1 Compliance with Activity-Based Permit Requirements (Level 1)

This level consists of activities that are prescribed by or established under the Permit (updating source inventories, training staff, conducting inspections, etc.). A fundamental feature of Permit-derived programs is the explicit establishment of specific activities that are assumed, but not proven, to be beneficial to water quality. While many of the assumptions underlying the establishment of required activities may be correct, there are currently few means of quantifying or establishing causal relationships that will make many of them more measurable. The City's long-term goal is to explore these assumptions in more depth; this year's report focuses on clearly defining the intended outcomes of these activities and identifying specific measures by which them can be accurately assessed.

#### 11.2.2.2 Changes in Knowledge/Awareness (Level 2)

The most immediate and basic outcome of many urban runoff program activities is a change in the knowledge, awareness, or attitudes of target audiences (learning that storm drains and sanitary sewers are separate systems, that everyday activities contribute to water pollution, etc.). Such changes are most often targeted through outreach or training programs. Not an end in themselves, these changes presumably form the basis of behavioral change, or BMP implementation.

#### 11.2.2.3 Behavioral Change/BMP Implementation (Level 3)

Building on increases in knowledge, the City's primary objective is to affect significant and lasting changes in the behavior of municipal employees, residents, and business representatives. Behavioral outcomes are usually expressed in terms of BMP implementation since this is the overriding objective of the City's programs. Since this is the level at which actions are actually taken, estimating or quantifying BMP implementation is a necessary component of a successful effectiveness assessment strategy. It is also necessary as a precursor to establishing load reductions. Several elements of this year's report include a discussion of BMP implementation.

#### 11.2.2.4 Load Reductions (Level 4)

The primary goal of BMP implementation is to reduce the loading pollutants to stormwater discharges. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. The primary purpose

of conducting a load reduction estimation exercise is to better understand the benefit of conducting high priority activities (i.e., to characterize the expected reduction in loading of contaminants to the MS4).

The City regards the estimation of load reductions as the key to its assessment process. By working to establish Level 4 outcomes for lower level activities, we hope to increasingly improve our understanding of the relationship of these activities to water quality improvement. Because these efforts are both difficult and speculative, and often require data and information not readily available, this year's assessment includes load reduction estimates in only a couple of areas. In future years, our understanding of the many assumptions that must be made to address existing uncertainties, and variables that affect any given measure, will improve as we document and study them. Our goal this year was simply to develop and test some basic approaches.

11.2.2.5 Changes in Discharge Quality (Level 5)

In many respects, changes in discharge quality are the most direct expression of successful program implementation. Measurable improving the quality of discharges both into and from the City's MS4s will therefore be an important targeted outcome. Establishing relationships between discharge quality and specific program components, however, is beyond the scope of this year's assessment.

11.2.2.6 Changes in Receiving Water Quality (Level 6)

The ultimate objective of the City's programs is the protection and improvement of water bodies receiving discharges from its MS4. Both discharge quality (level 5) and receiving water quality are addressed through the City's Dry Weather Program (Section 8) and the Copermittees' Receiving Water Monitoring Program (submitted under separate cover). Establishing relationships between receiving water quality and specific program components, however, is beyond the scope of this year's assessment.

### 11.2.3 Spatial and Geographic Analysis

Several sections of this year's report contain analyses of program data aimed at better understanding their spatial variability and its relevance to program implementation. The approaches utilized are simple and straightforward. Data is examined regionally, by watershed, and by community to identify potentially significant trends. For instance, clustering of a particular business type may warrant outreach efforts that are specifically focused in a watershed. The City hopes to develop more sophisticated methods of spatial and geographic analyses in the future. At the same time, it is important that our understanding of the potential uses of program data evolve concurrently. Any type of meaningful

analysis is limited by the amounts and quality of data that are available to support it.

During this reporting period, the City finished a preliminary needs assessment for the implementation of a city-wide GIS program. The needs assessment encouraged the City to update its existing base data and layers using modern technolory. The City hopes to have the initial phases up and running by FY 2007-08. The City sees GIS as a powerful compliance and collaboration tool that will make tracking and reporting more efficient and accurate. The full implementation of the GIS program is dependant on budgetary constraints in future reporting periods.

## Section 12.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

### 12.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 12.1.

**Table 12.1 – 2006/2007 Fiscal Analysis Summary**

Stormwater Cost Analysis
All costs covered in the General Fund.

| ACTIVITY | CURRENT YEARLY BUDGET | CURRENT BUDGET LOCATION |
|---|---|---|
| **STORM DRAINAGE CLEANING AND MAINTENANCE** | | |
| **Public Street and Parking Lot Sweeping** | | Streets |
| Streets | $30,000 | |
| Parking Lots | $2,000 | |
| *Public Street and Parking Lot Sweeping Total* | $32,000 | |
| | | |
| **Litter Removal** | | |
| Litter Removal | $13,000 | |
| *Litter Removal Total* | $13,000 | |
| | | |
| **Storm Drainage Cleaning** | | |
| Inlets | | |
| Inspection and Cleaning | $19,820 | |
| Fossil filter replacements | $1,400 | |
| *Inlets Subtotal* | $21,220 | |
| Basins and Channels | | |
| Inspection and Cleaning (Note 1) | $38,829 | |
| *Basins and Channels Subtotal* | $38,829 | |
| **Video Inspections** | | |
| Video Inspections (Note 1) | $50,000 | |
| *Video Inspection Subtotal* | $50,000 | |
| ***Storm Drainage Cleaning and Maintenance Total*** | **$155,049** | |
| | | |
| **STORM EVENT ACTIVITIES** | | |
| Sandbag stock piling and placement | $4,000 | |
| Patrols | $3,089 | |
| ***Storm Event Total*** | **$7,089** | |
| | | |
| **ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM** | | Engineering |

| | | Services |
|---|---|---|
| Dry Weather Testing | $20,000 | |
| Enforcement | $5,000 | |
| Administration/Supervision | $1,000 | |
| Stormwater HotlineComplaints | $2,000 | |
| ***Illicit/Illegal Enforcement Program Total*** | **$28,000** | |
| | | |
| **STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)** | | |
| Construction Related SWPPP | $2,000 | |
| Plan Review (including SUSMP's) | $15,000 | |
| Inspection | $3,000 | |
| *Construction Related SWPPP Subtotal* | $20,000 | |
| Municipal Facility SWPPP | | |
| SWPP Implementation, Inspection, and Maintenance of Municipal Facilities | $18,798 | Streets |
| *Municipal Facility SWPPP Subtotal* | $18,798 | |
| ***All SWPPP Activities Total*** | **$38,798** | |
| | | |
| **BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION** | | |
| Inspection of Industrial and Commercial Facilities | $50,000 | |
| Inspection of Municipal Facilities | $1,000 | |
| ***BMP Total*** | **$51,000** | |
| **MISCELLANEOUS ACTIVITIES** | | Engineering Services |
| Annual Reporting (JURMP) | $5,000 | |
| Administration (General) | $74,004 | |
| NPDES Permit Fee | $7,500 | |
| Public Education/Outreach | $5,000 | |
| ***Miscellaneous Activities Total*** | **$77,504** | |
| | | |
| | | |
| ***PROGRAM TOTALS*** | **$371,440** | |

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

## 12.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.

Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

## Section 13.0 Conclusions and Recommendations

The City's sixth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2001-01, "Permit") represents a full year of water quality activity and programming in the City of Lemon Grove. We are confident that the report demonstrates our success in building a program that meets and often exceeds Permit requirements. At this same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The programs described in this report to be significantly expanded and improved over previous years, as is evidenced by the numerous accomplishments described. City staff once again responded positively to the implementation challenges presented by the Permit; thanks to a sustained team effort, we continued to improve and augment our programs.

Moving forward, it is important to keep in mind that meaningful measurement is a necessary part of a successful program strategy. This year's report reflects more monitoring, more data, more assessment, and more deliberation on the part of City staff than ever. This speaks well of the City's program, but it is only a start, the stormwater puzzle will take many years to solve. The increased focus on measurability that is manifested in this report must remain a focus. In particular, the new and innovative approaches to effectiveness assessment that the City helped to pioneer must continue to actively evolve. The framework set out in the document *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* provides a great deal of useful direction, but success is not guaranteed. Staff will need to develop and embrace the detailed measures and measurement tools necessary to track and evaluate long-term success. Similarly, we will also need to continue looking for ways to improve and best utilize our monitoring programs so that they continue providing timely and useful information.

As in previous years, the City continued to demonstrate strong collaboration with other Copermittees throughout the reporting period. This is reflected in the quality and vision of the Copermittees' many collaboratively conducted activities. Such collaboration has become a hallmark of the Copermittees' programs and must continue to be. Future success will require no less collaboration.

This year's report is characterized by a higher integration of elements than in the past. Although the City's programs are implemented over numerous departments, the coordination and communications between those efforts has been commendable. Our experience over the past year has also shown htat we have many new challenges ahead of us. Many of the City's stormwater programs and activities are still in their infancy. Unlike many other regulatory programs, the way forward is neither easy nor straightforward. Meeting the challenges ahead of us will require continued diligence and good humor.

# City of Lemon Grove

## Jurisdictional Urban Runoff Management Plan Annual Report

FY 2007 – 2008
September 2008 Report

The City of

LEMON GROVE

BEST CLIMATE ON EARTH

Incorporated in 1977

## Executive Summary

The City's seventh Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In FY 2007-08, the City continues its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2007-08. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2007-08, the City continues to make significant steps toward the implementation of a City-wide GIS program, including a City-wide needs assessment performed by a contractor. The newly implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

## Section 1.0 Introduction

Lemon Grove's seventh annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2007 through June 30, 2008). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City believes in an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City hopes that in future reporting periods, some of these challenges can be met with cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City continued its outreach material to developers and contractors and increased the participation of water quality staff in preliminary development meetings. Water Quality staff has began active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a city-wide GIS program. The City is currently working on an implementation RFP for GIS services for the Engineering and Public Works Departments. These early efforts include base data entry and updating the existing layers with current technology. However, all implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. During this reporting period, it was

discovered that the City's existing tracking system for building permits and code enforcement, HdL, might be a viable option for water quality personnel. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- Continue outreach to restaurant community
- Continue outreach to automotive facilities
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 4.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2007-08. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

## Section 2.0 Municipal Component

This section describes actions taken by the City during the FY 2007-08 reporting period to prevent polluted runoff from its municipal facilities.

## 2.1 Municipal Facility Activities

The City of Lemon Grove owns and operates a wide variety of fixed facilities and an extensive system of roads, municipal separate storm sewers (MS4s), and sanitary sewers.

City personnel implements site-specific Best Management Practices (BMPs) to prevent and reduce pollutants in facility runoff. Since BMPs are tailored to the unique activities conducted at each City facility, the remainder of this section is organized according to facility type. For each facility type, information is presented as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Facility Inspections

### 2.1.1 Priority Sources

Nearly 65.5 miles of roads, streets, and highways are maintained by the City. The City is not responsible for maintaining roadways that are managed by other agencies or jurisdictions, or are privately owned. All City-maintained roads are routinely inspected annually, and more frequently upon request. Needed repairs are noted and performed as appropriate to ensure safety and riding quality for the traveling public. Roadway maintenance typically involves concrete and asphalt repair, drain inlet cleaning, litter removal, and street sweeping. Other BMPs, as listed in JURMP 2.4, are implemented as required.

#### 2.1.1.1 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for the City-maintained road system. BMPs applicable to roads, streets, and highways have been reviewed, and remain unchanged. Below is a brief listing of some of those BMPs:

- Vegetation Control
- Proper Material Storage and Coverage
- Concrete Maintenance Methods for Wash-outs
- Designated Vehicle Maintenance Area
- Vehicle Washing Area
- Employee Training

2.1.1.2 BMP Implementation

Details regarding specific road maintenance activities conducted during this reporting period are provided below. It should be noted that other road maintenance BMPs not described here were identified in JURMP 2.4 and are implemented as necessary.

*Street and Facility Sweeping*

The Department of Public Works (DPW) Streets Division insures that City-maintained roads and facilities are swept at the following frequencies and locations:

- Curbed Streets (Broadway, Buena Vista Ave., Massachusetts Ave., and School Lane) – weekly
- All Other Curbed Streets – biweekly
- Non-Curbed Streets – monthly
- Center Islands and Medians – monthly
- Parking Lots and Alleys (Broadway Business Lot and Lester Ave. Alley) – weekly
- All Other Parking Lots and Alleys – monthly

The City considers sweeping to be an extremely effective BMP in that it prevents accumulated material from entering the stormdrain conveyance system. To quantify its sweeping activity, DPW Streets Division crews record the length of streets swept and the amount of debris collected on a month-by-month basis. The City swept approximately 80 miles during FY 2007-08 and collected 169.75 tons of debris. The City swept approximately 80 miles during FY 2006-07 and collected 169.75 tons of debris. These figures include the regular sweeping of roads, specialty or requested road sweeps and corporate yards.

The City swept 100% of public maintained curbs and gutters both reporting periods. The City is responsible for 65.5 miles of roadway in Lemon Grove. The extra mileage swept is due to parking lots and special request sweeping on private streets. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

The City is now contracting street sweeping services with Day and Night Sweeping. Their contract followed the guidelines from the previous contractor for this reporting period. Sweeping frequencies are scheduled to increase over the next few reporting periods to double the current contract amount. This increase however is based on the current level and quality of the contractor's performance. If the contractor does not meet quality standards - based on citizen complaints and visual inspections - a new bid process will take place to replace them.

#### 2.1.1.3 Road Inspections

All City roads are inspected annually or more frequently upon request, and needed repairs noted and preformed as appropriate to ensure safety and riding quality for the traveling public. During this reporting period, all City roads were inspected prior to and during the rainy season. Based on these results, maintenance crews evaluated potential stormwater impacts and identified the need for cleaning, maintenance, and future upgrades. Conveyance system and road right-of-way cleaning conducted as a result of these inspections is described in section 2.1.2.3 below, and street sweeping in section 2.1.1.2 above.

### 2.1.2 Municipal Separate Storm Sewer System (MS4)

The City maintains the publicly owned portions of the MS4 within its boundaries. The City's MS4 inventory consists of culverts, channels, ditches, pipes and related flood control structures.

#### 2.1.2.1 Priority Sources

All City roads, streets, and highways are designated as high priority municipal sources. The Public Works Yard is also designated as high priority because of pollutant potential. See Table 2.1 which details the City's priority municipal sources.

**Table 2.1 – High Priority Municipal Facilities**

| Facility | Address | Basis for Designation | Receiving Water |
|---|---|---|---|
| Roads, streets, highways, and parking facilities | Throughout City | Specified in Order 2007-01 | Chollas Creek and Sweetwater River |
| Flood management projects and flood control devices | Throughout City | Specified in Order 2007-01 | Chollas Creek and Sweetwater River |
| Public Works Yard | 2873 Skyline Dr. | Specified in Order 2007-01 and has potential to discharge pollutants of concern. | Chollas Creek |

#### 2.1.2.2 BMP Requirements

JURMP 2.4 defines minimum BMP requirements for City-maintained MS4 facilities. BMPs applicable to the City-maintained MS4 have been reviewed, and remain unchanged.

### 2.1.2.3 BMP Implementation

Further detail about specific MS4 maintenance activities conducted during this reporting period is provided below. Other BMPs identified in JURMP 2.4, but not described here, are implemented as required.

*Conveyance System Cleaning*

During this reporting period, City staff inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only six conveyances and 60 catch basins were found to be in need of cleaning, and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,830 pounds from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those six conveyances, providing approximately another 1,800 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.

In the past few reporting periods, the DPW has noticed a slight decrease in the trash quantities found in and around conveyances. DPW attributes this to a more effective street sweeping program and the implementation of Trident Curb Screens in several high trash areas of the City. During FY 2007-08, the City also installed five Green Visions Solutions curb screens in high sediment areas. The screens were installed towards the end of the reporting period on a trial basis and the City is awaiting the rainy season to access their effectiveness in regards to sediment capture.

Attachment A-1 contains the initial mapping of the City's major drainage pipes.

*Storm Drain Stenciling*

The City began implementing a new drain label program. Instead of painting stencils, the City began using drain labels that are more permanent and longer lasting by using thermoplastic labels. They are heat set onto the concrete any place around the drain and will last a minimum of 10 years. They are also fade, graffiti and tamper resistant. As of the end of the 2004-05 reporting period, the City had placed labels on approximately 30 drains on Broadway, a main through-way for the City and commuters. The City then placed an additional 30 labels on various inlets throughout the City with a focus on major streets first, during 2005-06. The City maintained this program in 2007-08, by installing an additional 30 labels on drains throughout the City, covering major streets first; bringing the current total for labeled drains on primary streets to approximately 90. Soon the City will begin placing them on non-primary City maintained residential streets. The City plans to purchase approximately 30 each fiscal year until all the drains on public maintained streets are labeled. In the meantime, the City continues to

let “I Love a Clean San Diego” stencil drains that are un-marked or have worn-out stencils.
The City continues to require developers to mark any new drains in connection with development or redevelopment. The City encourages them to use concrete wet stamps or thermoplastic labels for longevity on private streets and requires either if the street will be maintained by the City. See Attachment A-2 for a picture of the thermoplastic labels and the concrete wet stamp.

During FY 2007-08, the City installed five test Green Vision Partner’s Curb Screens in various high sediment locations. The City wished to test their durability and usefulness in conjunction with the new street sweeping program. Insufficient data is available at this time to begin judging their effectiveness, but informal visual inspections show a decrease of trash in the catch basins and the trash is curb side making it easier for the street sweeper to pick up.

In the pervious reporting period, six Trident Curb Screens were located in various test sites throughout the City. These screens have so far proved durable and effective at preventing trash from entering the covered conveyances. DPW has noticed a considerable decrease in the need for cleaning at these locations. It is difficult to access the specific amount removed prior to entering a particular conveyance as the street sweeping contractor provides gross tons collected. However, informal visual inspections by the DPW crews verify that less trash is entering those conveyances protected by the Trident Curb Screens. As fiscal funds allow, the City will be installing more of these screens on primary roads and in high foot traffic locations, such as near schools and fast food restaurants.

#### 2.1.2.4 MS4 Inspections

The Streets Division conducts annual field investigations in order to inspect the City-maintained MS4 to identify the need for cleaning, maintenance, potential illicit connections and illegal discharges (IC/IDs), and to assess the structural integrity of facilities. As reported above, the City inspected forty-three road segments, sixteen conveyance facilities, and 190 catch basins during this reporting period.

### 2.1.3 Sanitary Sewer System

The Sanitation District manages and maintains a collection system of 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa’s sewer systems. San Diego and La Mesa share sewer space with Lemon Grove. La Mesa utilizes 728.60 EDU of Lemon Grove’s sewer space; San Diego uses 986.20 EDU.

#### 2.1.3.1 Priority Sources

The City operates no high priority waste water facilities within its boundaries.

]2.1.3.2 BMP Requirements

JURMP 2.5 details minimum BMP requirements for all sanitary sewer system lines. BMPs applicable to sanitary sewer system facilities have been reviewed, and remain unchanged.

2.1.3.3 BMP Implementation

*Control of Sanitary Sewer Overflow Events*

DPW staff responds to sanitary sewer overflows (SSOs) according to protocol established in RWQCB Order 96-04, the current Waste Discharge Requirements and Water Quality Order 2006-0003. During FY 2007-08, the City had 5 Category 2 private SSOs. None of the discharge reached the MS4 or receiving waters. The new Discharge requirements require the City to tract all reported spills even if the they are from private, which the City does not track or maintain.

*Limiting Infiltration from the Sanitary Sewer System to the MS4*

As a proactive means of preventing or limiting infiltration from the sanitary sewer system to the MS4, the City conducts aggressive inspection and maintenance programs for both systems. City personnel are instructed to investigate locations exhibiting sewer-related discharge or odor during MS4 inspections (further discussed in section 2.1.2.3 above). No instances of infiltration were noted during this reporting period. Sanitary sewer system inspections are also conducted on scheduled intervals to ensure the functionality and structural integrity of the system. These are described further below. The camera/video truck was purchased and utilized during this reporting period.

2.1.3.4 Inspections

*Sanitary Sewer System Inspections*

The City regularly inspects its sanitary sewer system to ensure functionality and structural integrity. Towards the end of reporting period 2004-05, the City began cleaning and inspecting public sewer lines in-house. During this reporting period, all public sewer lines were cleaned and maintained in-house.

**Table 2.2**
**Sanitary Sewer Services in Feet**

| | Total FY 2005-06 | Total FY 2006-07 | Total FY 2007-08 |
|---|---|---|---|
| **Cleaned** | **298,043** | **331,369** | **52,493** |
| **Root Cut** | **18,370** | **20,927** | **36,039** |

### 2.1.4 Corporate Yards and Fleet Maintenance Facilities

The City's municipal facilities inventory includes one facility classified as a corporate yard and fleet maintenance facility. These facilities are classified as high priority, due to the potential pollutants stored on-site.

#### 2.1.4.1 Priority Sources

*Fleet Maintenance Facility*

DPW operates one fleet maintenance facility that provides maintenance, repair and fueling to forty-five vehicles from all City departments. The maintenance is co-located with the DPW headquarters and is listed as the Public Works Yard on the inventory. The facility is considered a high priority threat to water quality due to the presence of hazardous materials, automotive fluids, and fuels on-site.

#### 2.1.4.2 BMP Requirements

JURMP 2.4 defines all minimum BMP requirements at the DPW-maintained corporate yard. BMPs applicable to DPW-maintained corporate yards have been reviewed, and remain unchanged.

#### 2.1.4.3 BMP Implementation

Fleet personnel always implement BMPs under the guidance of the facility's Fleet Manager. In addition to a periodic schedule of ground maintenance and housekeeping, the facility maintains an inventory of spill kits, absorbent, fiber rolls, and storm drain maintenance equipment. BMPs are also implemented to address particular activities of concern: vehicle and equipment repair, hazardous waste storage, vehicle washing, re-fueling, etc.

As in previous reporting periods, BMP implementation at the corporate yard and fleet maintenance facilities was verified and evaluated during routine facility inspections. Where inspectors noted a lack of BMPs or ineffective results, employees were required to implement corrective actions immediately.

#### 2.1.4.4 Inspections

*Fleet Maintenance Facilities*

Though Fleet Managers are responsible for applying and maintaining BMPs on a daily basis, the Water Quality Coordinator conducted an annual inspection to verify implementation during this reporting period. The only notable infractions were an open dumpster at City Hall and a degraded straw wattle at the Public Works Yard. City staff has noticed a marked improvement in the maintenance of good housekeeping BMPs at City facilities. Water Quality staff believes this is

due in part to frequent informal inspections and increased staff training, as well as the formal annual inspection.

### 2.1.5 Parks and Recreation Facilities

#### 2.1.5.1 Priority Sources

The Department of Recreation Services (DRS) manages stormwater discharges from seven park sites. Included among these are local and regional parks, park buildings (including the community center), historical sites and open spaces. In the inventory submitted with the City's JURMP, all parks are considered medium priority. See Table 2.2 for a detailed description of park areas.

**Table 2.2 – Other High Priority Municipal Facilities***

| Facility | Address | Basis for Designation | Receiving Water |
|---|---|---|---|
| Berry Street Park | 7101 Mt. Vernon St. | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |
| Fireman's Park | School Lane and Central | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |
| Kunkel Park | 8171 Lemon Grove Way | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Sweetwater River |
| Monterey Heights Park | Canton and Glencoe | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |
| Lemon Grove Park | Washington and Alton | Park facility may generate minor pollutants associated with green wastes, pesticides, and fertilizers. Not adjacent to any receiving waters. | Chollas Creek |

#### 2.1.5.2 BMP Requirements

JURMP 2.4.2 defines all minimum BMP requirements for City parks and recreation facilites.

#### 2.1.5.3 BMP Implementation

Because parks vary widely in both size and function, it is difficult to generalize about BMP implementation. All park personnel are instructed to implement BMPs at all times. In addition to a periodic schedule of ground maintenance and housekeeping, most facilities maintain an inventory of spill kits, absorbent, and miscellaneous storm drain maintenance equipment. BMPs are also implemented

to address particular activities of concern: material and waste storage, fueling, septic tank maintenance, etc. A complete list of facility-specific BMPs can be found in JURMP 2.4.2.

DRS has also endeavored to make the implementation of pollution prevention BMPs a priority at park facilities. Unless otherwise noted, these practices were implemented at all facilities in the DRS inventory. They include:

- The storage of used construction materials outside for future projects is being eliminated. The site that contained materials during the last reporting period is now empty of City materials. The City has plans to fence and lock the site to prevent the illegal dumping of large waste items like furniture. The fencing should be accomplished within the next two reporting periods.
- The prohibition on washing City vehicles and equipment on-site has continued to be enforced. All washing occurs off-site at appropriate locations. The majority of vehicle repair and maintenance is performed by Bob-Brown Automotive on University Ave. By having vehicle maintenance performed off-site, the City drastically decreases the number of pollutants stored at the Corporate Yard. The City is continuing to look into the possibility of in-sourcing oil-changes to allow for the use of re-refined oil. The City is currently searching for a closed loop system that would supply the oil and then take the used oil back for further recycling. The City has not been able to locate a closed loop system. The City has postponed the implementation of re-refined oil in City vehicles until the warranty on the new fire engine expires. If the City uses re-refined oil in the new engine it will nullify the repair and maintenance warranty. The inclusion of the fire vehicles is integral to the implementation of a re-refined oil program. Without the inclusion of the fire vehicles, the City would not be able to purchase the oil in the quantities sufficient to encounter fiscal savings. The City plans to renew its efforts to establish re-refined oil after the warranty expiration in reporting period 2009-10. Maintenance on the fire engines is preformed off-site through Grossmont High School District.
- The City uses pesticides and insecticides on a very minimal basis, only when a problem is persistent and can be dealt with no other way.
- All City parks maintain recycling facilities.
- The use of drought resistant plants is encouraged. See Section 2.2.2 for further information on the plants used in the City.
- The City installed 1 additional doggie bag dispenser at the Lemon Grove Civic Center and maintained a distribution of approximately 650 bags at the existing 4 locations in City parks.

2.1.5.4 Inspections

The City's Water Quality Coordinator conducts annual stormwater inspections to verify appropriate BMP implementation at all of its parks, regardless of priority classification. All observed deficiencies were noted and scheduled for correction. Many of the deficiencies noted during FY 2007-08 involved trash and debris. All deficiencies were promptly addressed. DPW Grounds crews inspect parks on a weekly basis for the removal trash and debris and for graffiti abatement. A repeat inspection after a clean-up day, showed a significant decrease in the visible trash and debris. The park parking lots are swept twice monthly to assist in removing trash and sediment on the impervious surface areas. See Attachment A-3 a copy of the facility inspection report.

### 2.1.6 Other Municipal Facilities

The City operates and maintains several additional facilities not captured by the categories outlined above. These include office buildings, a sheriff station, and a fire station. The Fire Department re-joined the City in July of 2004. All repairs, maintenance, and equipment storage is performed in a covered and completely enclosed garage/bay area with locked doors. All hazardous materials are stored in locked self-contained areas inside the bay area and labeled appropriately. Nothing hazardous is stored outside or un-locked.

2.1.6.1 Priority Sources

*Offices*

The City maintains four business offices and two public safety offices including the new fire station, which previously housed the Department of Public Works and Recreation Services. No new offices have been added during this reporting period, see list below. The Sheriff Station is connected to City Hall, therefore they are categorized together under City Hall, which is listed as a medium priority threat, as most activities are conducted in enclosed areas.

- City Hall and Sheriff's Department – 3232 Main St.
- Fire Department – 7853 Central Ave.
- City Hall Annex (Department of Recreation Services) – 3225 Olive St.
- Community Center – 3146 School Lane
- Department of Public Works – 2873 Skyline Dr.

*Vacant Land and Excess Right-of-Way*

The City owns one vacant property at:

- 6949 Central Ave.

This site will be considered medium priority due to the minimal on-site activity and lack of impervious surface.

2.1.6.2 BMP Requirements

All BMP requirements for the facilities discussed in 2.1.6.1 above are covered in JURMP 2.4. These BMPs have been reviewed and remain unchanged.

2.1.6.3 BMP Implementation

BMP implementation at facilities classified as miscellaneous is overseen as applicable by DPW, DRS, or facility personnel. Procedural requirements and staff training protocol are specific to each department, but in all cases are sufficient to ensure stormwater compliance at these facilities.

2.1.6.4 Inspections

Each facility identified in 2.1.6.1 was inspected at least once during FY 2007-08 to verify compliance with minimum BMP requirements. The main infraction was an open dumpster lid at City Hall, which has since been corrected and is checked by staff on a regular basis. The drip irrigation system installed in the landscaping at the front of City Hall during the previous reporting period has cut down significantly on run-off from the site. See Attachment A-3 for a copy of the facility inspection report.

## 2.2 Management of Pesticides, Herbicides, and Fertilizers

The City of Lemon Grove's Grounds staff uses only herbicides and algecides. The City's pest control contractor is Knott's Pest Control. Knott's Pest Control meets all BMPs for pesticide application found in JURMP 2.4.

### 2.2.1 BMP Implementation

The following BMPs, described further in JURMP Appendix 2.2.1, were implemented by DPW for the application of herbicides, algecides, and occasionally pesticides; although as mentioned above Knott's Pest Control handles the majority of the City's pest control needs.

- Safer Alternative Products
- Good Housekeeping Practices and Material Storage
- Vehicle and Equipment Washing and Cleaning
- Illegal Dumping Control
- Pollution Prevention

### 2.2.2 Use of Drought Resistant Vegetation

Grounds division of Public Works attempts to use drought resistant plants throughout the City's landscaping. Common variations of these plants used throughout the City are lavender, sage, oleanders, natal plum, rosemary, and pyracantha. The use of drought resistant vegetation allows for drip irrigation, which greatly decreases the amount of water used and limits the amount of potential runoff from sprinkler systems. A drip irrigation system also allows soils to absorb nutrients from fertilizers and compost preventing them from washing into the drains with irrigation water, a common residential pollutant problem that will be further discussed in Section 5.0.

### 2.2.3 Schedules for Irrigation and Chemical Applications

Weather conditions are always considered prior to outdoor pesticide applications. Depending on the formulation and characteristics of the pesticide to be applied, an application may be postponed or allowed to proceed prior to, or during, a rain event. This is because the Grounds division applies pre-emergent herbicides as part of its vegetation management program. Pre-emergent herbicides benefit from a gentle rain that soaks the pesticide into the soil where germinating seeds are killed; getting these types of herbicide to the root zone also controls existing young vegetation. The application of contact herbicides, on the other hand, is not permitted if precipitation is likely. These materials tend to wash off plant surfaces and contribute to water quality degradation.

### 2.2.4 Collection and Disposal of Pesticides

When available the City purchases herbicides in recyclable bulk containers. By reducing the volume and variety of herbicides, the department is able to maintain a minimal inventory of pest related chemicals.

As a general rule, emptied pesticide containers are triple rinsed and the rinse water is put in with the application solution. Containers are then disposed of in accordance with local regulations.

## 2.3 Employee Training

The City is committed to increasing the awareness of its employees regarding urban runoff issues, and effecting positive behavioral changes to protect water quality. To this end, two types of stormwater and water quality education are provided to employees.

- Basic Awareness Education; and
- Focused Employee Training

### 2.3.1 Basic Awareness Education

The goals of this element are to promote responsible behavior at home and work, and to encourage employees to act as the City's "eyes and ears." As described in section 2.4 of the City's JURMP, the City's goal is to provide some level of basic awareness education to all employees annually.

#### 2.3.1.1 City Newsletter

The City has continued the Environmental Page in its biannual Newsletter. Each issue contains oil recycling sites and household hazardous waste information. The Fall 2007 edition contained an article on Fats, Oils and Greases, proper disposal of prescription medications, and on rainy season homeowner BMPs for limiting pollution in the storm sewer system. The edition also featured the standard used oil information and e-waste guide. The Spring 2008 edition featured information on the Creek to Bay Clean-Up event, BMPs applicable to home improvement projects, the City's reusable shopping bag giveaway, a brief recycling survey, information on household hazardous waste, free shade trees, and used oil recycling.

The Newsletter, which is produced by City staff, is distributed to the residents and businesses of Lemon Grove, as well as City employees. Because of the public and internal distributions, City staff is kept abreast of the current issues and knows what information is being given to the public. See Attachment A-4 for copies of the Newsletter articles discussed in this section.

#### 2.3.1.2 Informal Staff Training

Water Quality staff continues the informal educational e-mail program. At least twice a month, staff sends a City-wide e-mail with new water quality information. The e-mails contain anything that has to do with water quality and pollution prevention. New sites such as www.bewaterwise.com or new articles from the BC's California Water News (a Brown and Caldwell daily e-mail newsletter) are shared with all City staff members. Water Quality staff has discovered that this method, although informal, provides a positive transfer of new information, up coming events, and technological advances in the water quality field. Water quality remains a primary focus for all staff through these small constant reminders and updates. It also provides staff an opportunity for internal dialogue without trying to schedule large scale meetings or trainings. The e-mails have been received favorably and will continue in future reporting periods.

Water Quality staff participated in weekly inter-departmental meetings with City planning, code enforcement, engineering and fire personnel. Current development projects, code updates, enforcement concerns, and construction site details are discussed. The meetings have provided water quality staff with the opportunity to regularly update the former mentioned department staff on

concerns and changes in the water quality program. The constant re-enforcement ensures that water quality remains an issue of primary concern for the development sector of City staff.

### 2.3.2 Focused Employee Training

#### 2.3.2.1 Bi-Annual Public Works Staff Training

Each fall and spring, water quality staff participates in one of the public works safety trainings. Staff provided updates on new concerns and regulations, as well as obtaining the concerns of the public works staff. This year's training focused on the developing new permit and the changes it would bring for DPW staff. Water quality staff continues to provide DPW staff with informational brochures on used oil recycling and pet waste to utilize in educating the public further on these common infractions. The regular exchanging of information has been beneficial to all staff members involved. Water quality staff believes the continued involvement has increased public awareness as well due to the readily available information and more knowledgeable public works staff. Both staffs look forward to continuing the exchange of ideas and information.

## 2.4 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Municipal Component in FY 2007-08. It consists of three primary elements: 1) a narrative assessment, 2) a discussion of the City's success in meeting specific quantifiable targets, and 3) a discussion of issues related to the spatial and geographic variability of program data.

### 2.4.1 Narrative Assessment

The City made a number of important improvements to its municipal activities programs in FY 2007-08. In spite of the large number of individual activities and programs comprising the City's Municipal Component, continued progress and improvement was made in all areas. In particular, another year of experience in implementing BMPs at City facilities has translated to a more complete integration of stormwater mandates into standard operating procedures. City crews also continued to pound the pavement throughout the community, collecting greater amounts of debris from our streets and MS4 than they ever have before. City crews are also better educated on the water quality program and can provide more information to residents themselves. They are also more knowledge about illegal practices and many issues have been dealt without code enforcement involvement.

The City is continuing to gather GIS information. The City purchased new aerial photographs of the city limits, as well as Lidar graphs. The City is currently investigating survey equipment and GIS programs. The City currently has

ArcView 3.2 with minimal mapping and levels. The City is investigating upgrades versus new systems. The City plans to have a functioning GIS system in place within the next five to eight years depending on budgetary constraints. The City has evaluated several different options for its GIS system and has performed an initial needs assessment. A needs assessment for GIS implementation was performed during this reporting period. The initial stages of implementation will involve base data and updates for the existing layers based on current technology.

Staff training continues to develop and change based on staff's needs and new incoming information. The City focused this reporting period on SUSMP specific training because of the audit and a need to improve the SUSMP review process. Staff also discovered that employees were more favorable towards specialized trainings due to the repeated generic trainings of the past two reporting periods. Water Quality staff plans to rotate specialized and generic trainings every few years. This will allow the limited Water Quality staff to provide optimal trainings regardless of the topic. The rotation also allows City staff a chance to receive more in-depth training in a field that directly relates to their daily tasks.

### 2.4.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

The City is beginning to track activity targets and establish long-term goals for the water quality program. Below is a listing of the targets for this reporting period:

**Target 1**
Provide More Targeted Staff Training
100% complete

**Target 2**
Improve and provide permanent labels for local stormdrains

50% complete (on-going process)

**Target 3**
Improve catch basin inventory
75% complete (on-going process)

**Target 4**
Obtain educational decals for the DPW tailgates (fiscal constraints temporarily delayed the purchase of the decals, should be in place during the next reporting period)
50% complete

**Target 6**
Increase information available through the Newsletter
85% complete (more education is always needed)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not track specific measures related to changes in knowledge or awareness. However during this reporting period, City staff showed an increased awareness of water quality issues by requesting specific, focused trainings. In discussions with water quality staff, they expressed a desire to learn more about specific segments of the water quality program like SUSMP requirements and processes.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measure related to behavioral changes as part of its Municipal Component in FY 2006-07. The need for the identification and assessment of such measures is being considered for the next reporting period. The City is currently working on connecting BMP implementation to load reductions and program effectiveness. The City feels that despite the lack of official tracking, progress is being made and behaviors are changing. Staff's efforts to maintain the closed dumpster lid are evidence of the change in behavior, as well as the installation of the drip irrigation at City Hall. All City trucks are now equipped with sand bags and gravel bags to contain any emergency run-off problems, until other assistance arrives. The bags are also available to the residents in case of drainage problems.

*Level 4 Outcomes: Load Reduction Estimation*

As stated above the City of Lemon Grove is working on a connection between BMP implementation and Levels 4 – 6. Some program data can be used to make fairly straightforward estimates. The Municipal Component lends itself to this process easily as the City is already required to keep extensive records of daily activities. The process is also facilitated by centralized data collection.

However, the process is in its infancy with a more complete picture projected for future reporting periods. As reported in Section 2.1.2, the City's street sweeping and MS4 maintenance activities resulted in the diversion or removal of a combined 3,360 pounds of debris from the MS4 this year. Unlike other waste streams likely to be only partially introduced or conveyed to the MS4, the entire amount of these totals is assumed to be a load reduction.

**Table 2.4 - of Load Reduction Calculations for Municipal Activities**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Street Sweeping | 169.75 tons | None | 169.75 tons |
| MS4 Cleaning | 3,360 pounds (1.815 tons) | None | 3,360 pounds (1.815) tons |
| | | | **Total 171.565 tons** |

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between municipal sources and water quality outcomes. The City will continue to explore these relationships. The City is attempting to connect BMP implementation to load reductions and eventually receiving water quality. The theory is that with the proper BMPs in place, a certain percentage of load reduction is expected, load reductions equal lower pollutant levels which lead to improved water quality.

### 2.4.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any municipal program data during this reporting period.

## Section 3.0 Industrial – Commercial Component

This section describes actions taken by the City during FY 2007-08 to minimize discharges from industrial and commercial facilities and their impact on receiving water quality and other environmental resources. The City continues to implement a number of complementary and inter-related program activities, including the following:

- Maintaining a watershed-based inventory of industrial sources
- Requiring BMP implementation through ordinance and permit
- Encouraging BMP implementation through notification and outreach
- Monitoring compliance through inspection and enforcement

### 3.1 Priority Industrial-Commercial Sources

For its FY 2007-08 JURMP Annual Report, the City identified nine high priority industrial sites in its borders. Since a single repository of facility data does not exist, the City relies on other data sources as well as field reconnaissance, to modify its inventory. The City uses the annual industrial/commercial inspections to verify BMP and good housekeeping standards in its business sector. During this reporting period the City brought its water quality inspections in-house with a new part time code enforcement/water quality inspector position. The City will be transitioning data and revamping the program over the next few reporting periods. This is not as difficult a process as it first appears, because the City does not experience large quantities of new development, the facility list remains fairly stable from year to year. The City updated its city-wide business and development database through information gathered in last year's and this year's reporting periods. This reporting period was spent training staff and learning to utilize the new system. No statistics are available from the updated system due to the short time in use.

As required under Permit section D.2.b, the City maintains and annually updates a city-wide inventory of high priority commercial sources as a basis for its outreach and regulatory programs. This inventory currently includes 139 individual sources. Table 3.1 summarizes the commercial inventory by business type and indicates the sources of information used to compile data for each type.

**Table 3.1 - Summary of High Priority Commercial Sources**

| Commercial Activity | Number of Facilities in Lemon Grove |
|---|---|
| Automobile Dealers/Rentals | 18 |
| Automobile Supply Stores | 9 |
| Automobile Repair/Paint | 9 |
| Automobile System and Tire Repair | 56 |
| Automobile Cleaning/Washing | 3 |
| Gas Stations | 7 |
| Eating/Drinking Establishments | 60 |

| | |
|---|---|
| Landscaping, includes lawn care | 9 |
| Nurseries and Greenhouses | 1 |
| Pest Control | 3 |
| Equipment Repair/Maintenance/Cleaning | 3 |
| Metalwork | 6 |
| Masonry | 4 |
| Parking Lots and Storage | 3 |
| Carpet/Building Cleaning | 21 |
| Pool and Fountain Cleaning | 3 |
| **Total** | **215** |

As Table 3.1 suggests, the City has yet to locate a single, centralized source of commercial facility information. Several of the facilities with commercial SIC codes are high priority industrial due to their proximity to Chollas Creek, a 303d listed water. This explains the discrepancy between the above number and the commercial inventory number. While the City remains hopeful that improved sources of facility data and information can be identified, in the meantime it must continue to rely on existing data sources such as permit databases, the Yellow Pages and field reconnaissance.

### 3.1.1 Additions to the Industrial Inventory

There were no facilities that were recommended for addition to the City's high priority category during this reporting period.

### 3.1.2 Deletions from the Industrial Inventory

The City discovered no facilities during FY 2007-08 to be deleted from the inventory.

### 3.1.3 Updated Industrial Inventory

The City's updated industrial inventory currently consists of 27 facilities. This number includes all industrial facilities within the City. Table 3.2 provides a summary of the types of sources contained within the facility inventory.

**Table 3.2 - Summary of High Priority Industrial Sources**

| Industrial Activity | Number of Facilities in Lemon Grove | Revised High Priority Category Facilities |
|---|---|---|
| Waste Disposal and Recycling | 1 | |
| Equipment/Transportation | 3 | 2 |
| Metalwork | 2 | 3 |
| Building Supplies and Woodworking | 3 | 2 |

| | | |
|---|---|---|
| Industrial Paper | | 1 |
| Contractor, Special Trade | | 1 |
| Specialty Hardware, Drapery | | 1 |
| **Total** | **9** | **10** |
| | **Total Facilities** | **19** |

## 3.2 BMP Requirements

### 3.2.1 BMP Requirements for Industrial Dischargers

The City's SUSMP and JURMP documents lay out a set of minimum BMPs required of industrial and commercial businesses in the City. A detailed discussion of these requirements was provided in JURMP section 3.4.1 and section 4.3.1, respectively. The City's tiered approach to establishing BMP requirements addresses all regulated industrial activities; broad standards apply to all types of industrial activity, and progressively tougher standards are imposed on high priority activities to reflect their greater risk to water quality. The JURMP also provides specific BMPs based on business type as well as the general ones previously discussed (waste disposal, metal work, etc.).

### 3.2.2 Pollution Prevention Requirements for Industrial Dischargers

In recognition of the important role that pollution plays in the long-term success of the City's industrial and commercial program, the City views pollution prevention as part of BMP implementation. The JURMP in Section 3.1 and 4.1 discusses the City's pollution prevention goals with respect to industrial facilities. The City feels that if BMPs are implemented, that pollution prevention is obtained to the maximum extent practicable (MEP). The section further discusses the importance of education and outreach for further pollution prevention.

## 3.3 BMP Implementation

### 3.3.1 City Strategy for Ensuring BMP Implementation

The City and other Copermittees submitted the document *A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites* to the RWQCB on October 16, 2003. As noted for commercial sources, the City's strategy for ensuring BMP implementation at industrial facilities builds on this framework, as well as activities it is already conducting.

The City previously contracted with D-Max for their inspection needs. However, during this reporting period, the City brought the inspections in-house. The new staff member is working from the questionnaires and forms created by D-Max to maintain consistency in data. Attachment B-1 contains the forms used by D-Max

and now City staff to evaluate the facilities. A list of the inspected facilities can be found in Attachment B-2. The new inspector is also a code enforcement officer. The City hopes the combined position will strengthen the inspection program and close any compliance gaps. However, budget constraints limit the growth of these fields, with the position remaining a split position until such time as the budget can handle two full time positions. Even so, the new split position allows for easier, timely follow-up on facility violations, as well as creating a consequences-for-violations policy. A new code enforcement process for water quality violations is currently being implemented by the City for use with non-compliant construction sites and illegal discharges. The City has expanded the process and municipal code to include non-compliant industrial and commercial facilities, except with reference to monitoring and testing. Due to budget constraints and staff's limitations, the monitoring and testing element will be added later as the budget allows. The water quality code enforcement language is now contained in the recently passed municipal code updates in response to new Permit due dates.

The City created a stormwater fee for businesses and residents. The City has explored different billing criteria based on the experiences of other cities. The City explored solid waste services as a possible billing mechanisim. The fee was standard for residential but differentiated based on facility/business dumpster size and frequency of pick-up. The fee allowed the City to recoup some of its water quality expenditures, but would also increase public awareness and participation. People and facilities are more likely to implement BMPs if a regular reminder of their importance is provided.

During late FY 2004-05, the City developed a fee based on trash removal services. The City believed a correlation existed between the amount of trash a site produced and the site's potential for pollution contribution. However the constraints of Proposition 218 made the fee vulnerable, therefore the City decided to re-vamp the fee structure to prevent any complications. The fee is no longer based on trash services for commercial facilities, but is attached to existing City fees for licenses and permits. A flat fee remains in effect for residents based on solid waste fees. The combined commercial and residential fees only cover one third of the cost of the City's stormwater program. The percentage is expected to lower with increased costs incurred by the issuance of the new MS4 permit, however they do not compensate for increased requirements and new programs. The already strained General Fund will continue to bear the brunt of the program's cost. With the vote failure in Encinitas, a coastal city, the inland cities have little hope of passing a stormwater fee without Proposition 218 exemption.

#### 3.3.1.1 BMP Selection and Application

As discussed in the framework document, the goal of the Copermittee program is to assist businesses in selecting appropriate combinations of BMPs that address their unique circumstances, activities, and discharge potential. While the City has existing BMP requirements in its JURMP document, BMP selection and application is an ongoing and iterative process that reflects a constantly evolving state of knowledge. As such, review and assessment of available options are standard elements of the City's program planning process.

A need exists to ensure regional consistency between Copermittee efforts. For instance, regional collaboration is beneficial in disseminating regionally consistent information to businesses, and for sharing information about practices that are working and those that are not. The Copermittees' BMP Workgroup provides a forum for exploring these and other key issues. The City will continue to participate in this venue, and in doing so will seek to provide an understandable and regionally consistent message to the businesses it regulates. The City also participates in a San Diego Bay Watershed workgroup that explores topics pertinent to the entire watershed. These topics include BMP implementation and strategies for ensuring effectiveness. Effective education is key to ensuring BMP implementation. The City participates in both the County's Green Business meetings and the Copermittee's Outreach and Education Workgroup. The groups collaborate and share ideas and solutions. The City feels its participation in these venues is valuable in developing an effective and well-rounded program. Collaboration also ensures consistent messages to area businesses. The businesses know what to expect if they re-locate to another area of the County. Where applicable, the City will advocate the use of the January 2003 Stormwater Best Management Practice Handbooks published by the California Stormwater Quality Association (CASQA). These handbooks provide detailed and up-to-date information on BMPs for both commercial and industrial activities.

#### 3.3.1.2 Outreach and Notification

Although compliance inspections are the cornerstone of the City's industrial facilities regulatory program, education is key to ensuring effective implementation by facility operators. The City is working to improve its outreach to the industrial and commercial facilities within the city-limits. Due to the City's decision to bring the inspections in-house, the results of the inspections were not received until after the end of the reporting period, therefore any improvements and follow-up are representative of the previous year's inspections.

Several types of outreach and notification activities can be effective in ensuring that business operators have been adequately informed of their compliance obligations and provided useful information on how to meet them. As shown

below, the City attempts to utilize each of the following types of outreach to varying degrees as part of its outreach and notification process:

- Printed Materials
- Direct Mailings (including e-mail)
- Workshops and seminars
- Websites and hotlines
- Direct contact
- Industry associations

The degree to which any of these tools are used will vary by specific program area, as well as the interest level of regulated parties. For instance, workshops and seminars will generally be made available upon request, but the City may specifically target certain sectors it considers to be in need of extra attention. Outreach will also play a proportionally larger role in the City's approach to businesses not subject to an active inspection process. Community groups and community outreach events can also play a useful role in reaching some types of commercial businesses. The City intends to increase its emphasis in this area on a continual basis. Three public events that lend themselves to information distribution are the Fire Department Open House held in October, the Winter Bonfire held in December, and the Spring Festival held in April or May.

The City is also working to improve its notification system. Staff is working to expand its database to contain all previous and present violators. The database will contain the number of violations, the type of violations, contact information, and notification information. The database will allow the City to track repeat offenders and establish a better code enforcement policy. By tracking violation type, the City can better target its outreach efforts, making them more effective educational tools.

The City is currently working to alter the emphasis of its outreach. The current focus is on "don'ts"; the City is attempting to turn that around and make the focus "what to do." The City believes that many violations continue because businesses and developers are not aware of alternative methods. If the focus of the outreach becomes "what can be done", people have an alternative behavior, not just a change in knowledge. As stated above, for industrial facilities and construction, CASQA has very comprehensive BMP handbooks, which provide a variety of treatment methods based on activities and pollutants. Informing facilities of resources is a very simple example of positive outreach that provides people with behavior alternatives. Repetition is also key in an effective outreach program. The more often facilities are notified, the harder it is to claim ignorance. The City continues to investigate the implementation of a FOG (Fats, Oils, and Grease) program in conjunction with the issuance of the new Wastewater Discharge Requirements order. City personnel received grease trap and inceptor inspection training at the end of the previous reporting period and hope in future reporting periods to begin grease trap and inceptor inspections at local

facilities. The needs assessment for the sanitation district showed a need for a FOG program and the City is working to develop a program that will serve the needs of the sanitation district and water quality.

3.3.1.3 Compliance and Enforcement

The City continues to use routine inspections as its primary means of compliance certification for industrial facilities. All industrial and high priority commercial facilities in Lemon Grove are now being performed by new in-house staff. The staff turn-over and development of new internal systems will be a slow process, but the City hopes to have a database, based on the one previously utilized and created by D-Max, up and running by the next reporting cycle. All required inspections were performed this year for both commercial and industrial facilities. Frequently found concerns were lack of good housekeeping training below the management level and poor spill control programs. The City has already begun follow-up investigations. The new staff person also functions as a code enforcement officer, so if continued violations are observed, the process for dealing with those violations is more streamlined and time efficient.

The City sent no code enforcement letters based on inspections during this reporting period to local industrial and commercial facilities. No complaints or investigations were needed at local facilities. The City is working on responding to the suggestions based on the inspection results for any follow-up visits. The final report was not received until after the end of the reporting period, but the City is working to schedule second inspections at several facilities and sending educational information to several others. The educational materials explain the NONA/NEC possibilities and what is required of each facility. Attachment B-3 contains a copy of the education packet now available for distribution.

### 3.3.2 Outreach to Industrial and Commercial Businesses in FY 2007-08

The City provided outreach to the industrial and commercial sector through several avenues in FY 2007-08. Specific activities are described below.

3.3.2.1 Outreach Events Targeting Industrial and Commercial Audiences

During this reporting period the City did not perform any outreach events that targeted Industrial audiences directly. However, through the inspection process, all industrial facilities are reached in some manner with water quality information. Each facility receives a copy of their inspection complete with recommendations for improvements. In future years the City plans to up-grade its industrial outreach. The following is a list of the activities the City wishes to implement in future reporting periods:

- Workshops on water sampling (a number of facilities are in violation on this aspect)

- A general information sheet about compliance with the General Industrial Permit and the Permit affecting the local jurisdiction
- Workshops on dry-cleaning methods for spills and general good house-keeping practices

Some activities that the City is currently engaged in will continue. A listing of these activities is below.

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Outreach at public events such as the Winter Bonfire and Spring Festival

The City continues to increase and develop its outreach to the automotive facilities and food and beverage facilities. Some of the tactics used during inspections include:

- Brochures and materials available at City Hall
- Personal interaction through licensing, permitting, and complaints
- Mass mailers to commercial businesses
- Continued use of the *What's Cooking Guide*
- Outreach at public events such as the Fire Station open house and the Winter Bonfire

The City also hopes that by bringing their inspections in-house, more detailed outreach will obtainable and pursueable. Simply having a staff person perform the inspections increases the level and quality of outreach. Violations can be dealt with in a speedy, consistent manner.

*Partnerships*

The County-chaired Green Business Group continues to make progress in developing a self-assessment program for small automotive businesses. The goal of the program is to recognize businesses that are in compliance with environmental regulations and that take extra steps to go beyond compliance in the areas of pollution prevention, energy, and water conservation, and solid waste reduction and recycling. The program is aligned with statewide green business standards and has already approached several businesses in San Diego County. To promote the use of "green" business practices, a public flyer was developed along with self-assessment checklists that are distributed by workgroup stakeholders during business inspections, trade association meetings, and at various community events. BMP information is included in the checklists and in the supporting materials provided to the businesses. These materials are all included as Attachment C and are available on the Workgroups website at www.projectcleanwater.org/html/wg_green_bus.html.

#### 3.3.2.2 BMP and Pollution Prevention Resources

Providing business representatives with useful sources of BMP information is a major focus of the City's stormwater program, and is emphasized in other regulatory programs as well. In this respect, particular stress is placed on pollution prevention practices.

The City's Pollution Prevention Program continued to promote pollution prevention practices among local businesses and the public during this reporting period. Stormwater and urban runoff messages are incorporated into all pollution prevention literature and program content. Through this program, the City continues to pursue partnerships, which provide important opportunities to integrate industrial stormwater program elements into existing programs, materials and avenues of distribution.

#### 3.3.2.3 Outreach During the Inspection Process

Personal communication through the inspection process is perhaps the most effective means of imparting useful BMP information to industrial operators. As described below, DMax conducted twenty-four industrial facility inspections during this reporting period. During these inspections, DMax provided detailed compliance information for facility operators. Direct communication through the inspection process, augmented by various other outreach tools, will continue to be the City's primary means of outreach to industrial businesses.

## 3.4 Compliance and Enforcement

In addition to educating business owners and operators, the City now provides in-house inspection services to conduct routine inspections and respond to business-related complaints to verify and enforce compliance with stormwater requirements. In all instances, enforcement is pursued as necessary to return violators to compliance.

### 3.4.1 Inspection of Industrial Facilities

The City inspected all twenty-seven industrial facilities during this reporting period. One hundred percent of the City's industrial facilities were inspected including low and medium level facilities.

Each industrial inspection consists of observable behavior and asked questions. The first portion of the inspection details facility and site information. The general information includes all required codes and classification information.

The inspection also includes a section detailing the BMPs in use, both observed and discussed. The final portion details recommended improvements and possible City action. The majority of compliance actions that were recommended

dealt with the up-graded high priority facilities and the need for them to file NOIs or NONA/NECs and create monitoring programs. The facilities will be re-inspected and the necessary paperwork followed-up with during the next reporting cycle. The City has already contacted several of the facilities and is working with them to ensure they are in compliance with the Permit.

During this reporting period, the City inspected 54 high priority commercial facilities. As stated in section 4.3.1.3 above, the City focused on eating and drinking establishments, automotive facilities, and facilities with non-compliance comments from past inspections. Inspectors' primary function is to assess compliance with minimum BMP requirements, which are specific to the types of facilities and activities designated as high priority by the Permit. Each inspection is conducted in the presence of a facility operator who has the authority and responsibility to ensure the implementation of corrective actions should they be required. For more inspection data see Attachment B1.

### 3.4.2 Complaint Investigations Involving Industrial Facilities

To the knowledge of City staff, no complaints were filed against Lemon Grove industrial facilities during FY 2007-08.

### 3.4.3 Enforcement of Violations at Industrial Facilities

During FY 2007-08, all enforcement activities consisted of detailed notification by letter and a new code enforcement policy. See Attachment B-4 for the flow chart demonstrating the new policy. The City sent BMP housekeeping information to all the industrial facilities listed in the previous reporting period as having improper or poor BMP implementation. The City is currently working to ensure the upkeep of BMPs at its industrial facilities. The City's primary focus during the next reporting cycle will be collaborating with the industrial facilities to ensure complete compliance with water quality standards and pollution prevention efforts.

### 3.4.4 Reporting of Non-Compliant Sites

The City did not have a situation requiring it to report any non-compliant sites to the RWQCB over the course of this reporting period.

## 3.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Industrial Component in FY 2007-08.

### 3.5.1 Narrative Assessment

In FY 2007-08, the City continued a revamping of its notification system. An initial step in this re-designing was the contracting of DMax in 2002 to perform annual inspections of all industrial and commercial facilities in Lemon Grove. However, the staff position has lacked consistency on a year to year basis and keeping a yearly account of facilities in violation has been difficult. The City has a record of all notices, but no database to assist in analyzing the information. During this reporting period, the City began to establish a data base to chronicle notifications as well as hiring in-house staff to perform facility inspections. A database will facilitate later effectiveness assessments by allowing the City to analyze past violations by type and frequency. If a decrease in violations or in BMP violations is evident, then levels of effectiveness are easier to assess. The new staff person is a split position being a part time code enforcement officer and a part time water quality inspector. The City hopes the combination will stream line any compliance issues and limit repeat violations. A continual record of violations will also enable the City to focus its education and outreach to fit the specific needs of the industrial community in Lemon Grove.

The City implemented a new database for tracking industrial and commercial facilities within the City's boundaries. The City is still inputting past data to bring the system up to date to allow for tracking and figuring out how to maintain consistency with the data gathered by D-Max. Each facility will have a file that contains past inspection data and compliance issues. DMax and the City have focused on updating the current business facility list to ensure accurate database information. This was how the ten new facilities were located and re-evaluated for correct prioritization during FY 2006-07.

The City believes its current program is in compliance but can be further developed to make it an outstanding and effective program. The City is aware that the need to assess effectiveness is of high importance. Therefore, the City worked cooperatively with other Copermittees to develop a comprehensive framework for reviewing and possibly revising existing programs (*A Framework for the Implementation of Best Management Practice [BMP] Programs at Commercial and Industrial Sites*, submitted to the RWQCB on October 16, 2003). It is through the use of this framework that the City hopes to improve and further develop its existing program. The City is moving towards a more BMP based program. The City believes that BMPs are the backbone of an effective program. Through proper implementation, BMPs present an excellent measuring medium. Once the BMP is in place, the prevented pollutant load can be assessed.

In 2004, the Stormwater program came under new management. The City combined its Public Works Department and its Engineering Department. In August 2004, the City hired a new Water Quality Program Analyst. The yearly turn-over in the stormwater position has made it difficult for the program to develop and grow. However, the City is working on making certain elements

standard, so that a basis is present from which growth can occur regardless of who is running the program. Combining the above mentioned departments facilitates the collection of stormwater data. Public Works personnel are the front-line, so to speak for City stormwater maintenance. By having them in the same department as the Stormwater manager, it will be easier to assess and improve collection methods and data.

No specific management practices or BMPs relating to industrial facilities or activities were identified as being ineffective during this reporting period.

### 3.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changed in Knowledge / Awareness
- Level 3: Behavioral Changes / BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Begin database for tracking non-compliant facilities
50% complete (the database needs more back data entries to be accurate)

**Target 2**
Update JURMP industrial and commercial list through the new inspection process
85% complete

**Target 3**
Provide educational material to those facilities eligible for NONA or NEC
100% complete

**Target 4**
Create annual activity specific informational mailer
30% complete

**Target 5**
Increased outreach at community events

100% complete

**Target 6**
Increased outreach to eating and drinking establishments
85% complete (more detailed outreach is still desired)

**Target 7**
Increase outreach to automotive facilities
85% complete (more detailed outreach is still desired)

**Target 8**
Improve education through business license renewals and new business licenses
40% complete (still working on informational mailer to include in renewal notice, in-person staff interaction has increased when applicants renew at City Hall)

*Level 2 Outcomes: Changes in Knowledge / Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Commercial Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change / BMP Implementation*

A new aspect of the 2005 Industrial and Commercial Inspection Program involved each inspected facility being assigned a rating to reflect the level of BMP implementation noted at the site, and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge. The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs, and were assigned based on how many of the following questions were answered correctly:

- What is storm water?
- What is the difference between the storm drain system and the sanitary sewer system?
- Where does storm water flow to?
- Is storm water treated prior to discharge?
- What are examples of pollutants?
- Is sediment a pollutant?
- Do you know what good housekeeping or best management practices are?
- Do you know what NPDES is or means?

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention

measures and the NPDES Storm Water Program were rated “Level 5”. Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a “Level 4” rating. “Level 3” rating indicated an individual who answered three questions correctly, “Level 2” indicated one or two correctly answered questions, and a “Level 1” rating indicated that the individual was not able to answer any of the questions correctly.

At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- “Level 5”: All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- “Level 4”: BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business’ activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- “Level 3”: BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- “Level 2”: Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open and oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- “Level 1”: A violation of one or more of the City’s Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs, and/or significant littering) was noted. BMP implementation was poor.

The table below provides a breakdown of information from the 2005 Industrial Inpsection Program stating the average and median ratings for BMP and knowledge assessements, as well as rating frequencies:

**Table 3.2 Program Scores for FY 2006-07 & 2007-08****

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |
| **Median Rating** | 3 | 3 |
| # of "Level 5" Ratings | 6 | 25 |
| # of "Level 4" Ratings | 28 | 34 |
| # of "Level 3" Ratings | 30 | 49 |
| # of "Level 2" Ratings | 22 | 12 |
| # of "Level 1" Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

**Table 3.3 Program Scores for FY 2005-06**

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of "Level 5" Ratings | 0 | 14 |
| # of "Level 4" Ratings | 9 | 26 |
| # of "Level 3" Ratings | 34 | 30 |
| # of "Level 2" Ratings | 26 | 11 |
| # of "Level 1" Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

As indicated by the assessment ratings breakdown, the overall knowledge and BMP implementation ratings were not particularly high. Knowledge assessment scores in particular were quite low. Sixteen percent of inspected facilities had BMP assessment scores of "5", indicated that no corrective action recommendations were necessary. This being the first year that this rating system was used, there is no prior standard with which to compare these ratings. It is anticipated that subsequent year's assessment ratings will increase as businesses receive more educational materials and become more familiar with the City's storm water program and what is expected of the businesses.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 3.5.3 Spatial and Geographic Analysis

The stormwater runoff in the City of Lemon Grove drains to two waterways that eventually end in the San Diego Bay; Chollas Creek and Sweetwater River. See Attachment B-5 for drainage zones.

## Section 4.0 Residential Component

The City implements a variety of programs to prevent and respond to discharges from residential areas. All of these programs are predicated on the assumption that knowledge and awareness are crucial to affecting and sustaining responsible behavior. Whenever possible, programs and activities are tailored to reflect the unique characteristics of the many areas of Lemon Grove and the diversity of its residents.

### 4.1 Priority Residential Sources

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment C-1 contains a demographics chart for the population of Lemon Grove. As Attachment C-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

### 4.2 BMP Requirements

The JURMP document lays out minimum Best Management Practice (BMP) requirements corresponding to all identified categories of high priority residential sources.

#### 4.2.1 Minimum BMP Requirements

As described in JURMP section 5.3, the City establishes basic BMPs for all manner of residential activity. Below is a list of the activities covered in JURMP section 5.3:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home and Garden Care
- Disposal of Household Hazardous Waste
- Disposal of Pet Waste
- Disposal of Green Waste

JURMP section 5.1 emphasizes the importance of pollution prevention, making it the basis for the BMPs described in each of the above listed activities.

### 4.2.2 Pollution Prevention Methods

The City encourages its residents to use pollution prevention BMPs through a variety of educational programs and activities. The core function of the City's pollution prevention efforts is to promote the use of these practices by City residents, local businesses, and municipal employees. Pollution prevention concepts are also incorporated into virtually all of the City's literature on water quality.

Providing residents with useful sources of BMP and pollution prevention information is a major focus of the City's stormwater programs, but is emphasized in other regulatory programs as well.

## 4.3 BMP Implementation

The City takes a multi-faceted approach to ensuring that its residents implement required and recommended BMPs. Education remains the preferred approach, but environmentally responsible behavior can also be facilitated in other ways. For example, the City operates a Stormwater Hotline, making it easy for residents who see a potential water quality problem to communicate with City staff. We also provide and support a wide variety of recycling and hazardous waste disposal opportunities in conjunction with EDCO, the local waste disposal facility. The City also encourages public participation in clean-up events, anti-litter campaigns, and other community events. Each element of this approach is described further as follows:

- Outreach to Residents
- Outreach to Schools
- Reporting and Information Resources
- Recycling and Waste Collection Services
- Measurement of Awareness and Behavior

### 4.3.1 Outreach to Residents

The City implements an outreach program targeting the general residential public. Outreach typically includes a combination of regionally and locally focused activities, but this year staff focused on outreach in the schools.

The City did participate in several joint effort outreach activities with other Copermittees.

#### 4.3.1.1 Lemon Grove Clean-up (April 26-27, 2008)

The City held one collection day through EDCO and their facilities. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The

event during this reporting period took place on April 26-27. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2007-08, as per the HHW program, are not due to the State regulating agency until October 1, 2008; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2008.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2007-08, the City held four e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2008.

#### 4.3.1.3 Chollas Creek Clean-up Event

The City participated in "I Love a Clean San Diego's Creek to Bay Clean-up" event on April 26, 2008. The City chose a new event site this year, a vacant lot adjacent to Palm Middle School in the Swetwater Watershed. Due to the high temperatures experienced that day, only four volunteers participated plus two City staff. The volunteers removed 132 pounds of debris from the site and 87 pounds of recyclable material. See Attachment C-2 for a copy of the full regional report.

#### 4.3.1.4 Printed Outreach

The City utilized three distinct forms of printed outreach during FY 2007-08. The first event was held at the Fire Station Open House and Pancake breakfast on October 13, 2007. The City provided a manned booth that contained HHW information, Creek to Bay Clean-up information, information for service project clean-up events, and the standard stormwater brochures pertaining to pools, over-irrigation, used oil and pet waste. The second event involved distribution of similar brochures and information at the Winter Bonfire on December 7, 2007 and included promotional give-aways pertaining to clean water and HHW. Due to public safety issues, the City is no longer sponsoring a City event in the Spring. Stormwater personnel were on hand at all events to answer any questions and provide further information. Water Quality staff also participated in the Regional outreach event at the San Diego County Fair on June 15 and June 29, 2008. Lemon Grove specific materials were available on those dates. See Attachment C-3 for examples of the brochures available at these events.

### 4.3.2 Outreach to Schools

School outreach remains a key component of the City's education strategy; however, the City chose to focus its outreach efforts in the commercial and land development areas of the program during this reporting cycle. Due to limited staff and fiscal difficulties, it is important that the City perform as efficiently and effectively as possible. This often requires the City to focus its efforts in a specific area, therefore no school programs were presented during this reporting period. The intent of school programs is to stimulate long-term behavioral change by alerting students to the importance of clean water and environmental responsibility.

The City plans in future reporting cycles to increase its educational outreach. The City firmly believes that long-term behavioral changes are possible, especially with repetition like yearly presentations. The list below details a few of the areas the City would like to explore:

- Individual presentations to science classes
- Large school presentations in conjunction with other school programming like during pollution prevention week
- Encouraging student involvement in volunteer cleanup efforts
- Creating student specific cleanup events
- Encouraging involvement in larger environmental programs and opportunities like Arbor Day and Jiminy Cricket's Environmentality Challenge
- Improved internet links for students through the City website
- Create a listing of community service projects that are water quality specific for scout troops, school groups or other volunteer groups
- Material distribution at community events targeted at school aged children

The City believes that by increasing its community/school outreach, the general population will become better acquainted with water quality issues. Eventually the City will be able to tie awareness to effectiveness and then to load reductions. The City believes BMPs are the key link and that with increased awareness more residents will implement household BMPs on a daily basis. In theory, as long as the correct BMPs are in-place to the maximum extent practicable (MEP), pollutants of concern should no longer be entering the waterways. The City can then measure the amount of prevented pollution.

### 4.3.3 Reporting and Information Resources

The primary goal of the City's residential program is to ensure that the public has access to useful information about urban runoff and can easily report their complaints to City staff. The City has established a Stormwater Hotline and several public information brochures for these purposes.

#### 4.3.3.1 Stormwater Hotline (619-825-3827)

The City continued to operate its Stormwater Hotline during this reporting period. The Hotline number is now a direct line to Water Quality Staff. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to the stormwater staff for resolution and/or information. The hotline referred approximately six calls during FY 2007-08. Occasionally the Hotline receives complaints that are not related to water quality and those are forwarded to the applicable departments. Most of the complaints are resident to resident issues and can be handled through verbal channels. On occasion, the City delivers a written notification to a group of residents about a persistent problem. The calls were either unfounded or dealt with on a small scale with no code enforcement involvement. The most common type of call received involves neighborly disputes on private property, therefore it is quite common that the City offers advice but no direct action is taken.

### 4.3.4 Recycling and Waste Collection Services

#### 4.3.4.1 Used Oil Collection

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

**Table 4.1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005** (Calendar Years)

**Table 4.2 Annual Oil Sales and Used Oil Recycling Rates** (in millions of gallons)

| | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Lubricating Oil Sales** | 141.2 | 140.8 | 136.2 | 137.5 | 142.1 | 150.0 | 154.3 | 163.6 | 168.0 | 150.2 | 150.5 | 153.5 |
| **Industrial Oil Sales** | 78.0 | 117.3 | 140.9 | 141.7 | 152.4 | 176.4 | 155.7 | 149.1 | 147.1 | 135.8 | 144.6 | 123.1 |
| **Total Oil Sales*** | 219.2 | 258.1 | 277.1 | 279.5 | 294.5 | 326.4 | 310.0 | 312.7 | 315.1 | 286.0 | 295.0 | 276.6 |
| **Lubricating Oil Recycled**** | 59.9 | 54.6 | 56.8 | 60.9 | 73.6 | 76.9 | 80.0 | 81.9 | 83.1 | 83.7 | 87.0 | 91.3 |
| **Industrial Oil Recycled**** | 16.7 | 19.5 | 20.8 | 19.3 | 11.6 | 10.4 | 7.9 | 15.5 | 17.5 | 32.4 | 32.5 | 31.4 |
| **Total Oil Recycled** | 76.6 | 74.1 | 77.6 | 80.2 | 85.2 | 87.3 | 87.9 | 97.4 | 100.6 | 116.1 | 119.4 | 122.7 |

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

**Table 4.3 Oil Collected by Public Collection Programs** (in millions of gallons)

**Table 4.4 Oil Collected by Public Collection Programs** (in millions of gallons)

| | 94/95 | 95/96 | 96/97 | 97/98 | 98/99 | 99/00 | 00/01 | 01/02* | 02/03* | 03/04 | 04/05 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Curbside** | 0.9 | 0.9 | 0.8 | 0.9 | 0.7 | 0.6 | 0.5 | 0.9 | .9 | 1.0 | 1.0 |
| **Form 303** | 0.6 | 0.7 | 1.0 | 0.8 | 0.9 | 1.1 | 0.9 | 1.0 | 1.0 | 1.0 | 1.0 |
| **Certified Centers** | 5.6 | 8.7 | 10.2 | 11.3 | 13.2 | 15.2 | 16.3 | 18.5 | 19.9 | 20.6 | 19.9 |
| **Total Oil** | 7.1 | 10.3 | 12.0 | 13.0 | 14.8 | 16.9 | 17.7 | 20.4 | 21.8 | 22.6 | 21.9 |

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the three collection sites and the number for curb-side pick-up. See Attachment C-3 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment A-4 for copies of the Newsletter.

The three collection sites are:

- Auto Zone 7582 Broadway (oil only)
- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

4.3.4.2 Solid Waste Recycling and Household Hazardous Waste Collection

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. Due to reporting errors, the calculations were not complete for this reporting period. During the next reporting period the City will supply our percentage of recycled material for this reporting period.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Citron Court is a new mixed use redevelopment project located at 7385 Broadway that began construction during this reporting period. According to their reports, their demolition site generated 108.2 tons of recyclable materials.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in six collection events for solid waste disposal. Four of the events were in cooperation with a Household Hazardous Waste grant through CIWMB and focused on the collection of e-waste. The other two are an annual Lemon Grove Clean-Up event further discussed above in Section 4.3.1.1.

The City's participation in the Household Hazardous Waste (HHW) grant facilitates the proper management and disposal of toxic materials and household hazardous wastes for residents of the City. The program was created to protect landfills, receiving waters, and the environment. The focus of the clean-up and collection events is to enable residents to safely dispose of their hazardous

materials and bulky discards. See Attachment C-3 for examples of educational material provided to residents.

*HHW Collected*

See section 4.3.1.1 above for information pertaining to the City's HHW program.

### 4.3.5 Measurement of Awareness and Behavior

The Permit requires the City to assess how effective its educational efforts are in changing the knowledge and behavior of targeted audiences. This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2007-08.

#### 4.3.5.1 Future Assessment Measures

During the current reporting period, the City utilized observation as the main form of awareness and behavior measurement. However in the future the City plans to incorporate the following measurement tools for the residential component:

- Surveys for school presentations
- Questionnaires for public outreach such as Lemon Grove community programs and the Winter Bonfire events
- Documented observations by City staff
- Year to year tracking of complaints and resolutions

## 4.4 Compliance and Enforcement

City investigation and follow-up on all complaints of a residential nature during this reporting period are described below.

### 4.4.1 Complaints Received

The City receives resident complaints on a regular basis both through the hotline and through the regular phone system. The majority of the calls can be handled through verbal interaction, the rest are investigated by City staff. Staff investigated several residential complaints during this reporting period; however the majority were unfounded or untraceable upstream. One incident however is detailed above in Section 4.3.3.1.

The challenge with residential complaints lies in the inability at times to confront the source of the pollutant. Often times the complaints are received after the illicit deed has been committed and the individual placing the complaint has limited knowledge of the source.

### 4.4.2 Investigation and Enforcement

The City had one residential event that required code enforcement involvement. These events are detailed above in section 4.3.3.1. The complaint was received through the hotline, therefore the details are presented in that section.

## 4.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Residential Component in FY 2007-08.

### 4.5.1 Narrative Assessment

The City made a number of important improvements to its residential activities programs in FY 2007-08. This year, the City's outreach efforts to residents and schools demonstrated a clear intention to expose a larger segment of the Lemon Grove population. The City is clearly thinking of long-term results with the increase in school programs. By presenting material at community events, such as the Spring Festival, the Winter Bonfire and the Fire Department Open House, the City can reach a large, diverse sector of the community. By increasing door-to-door communications, the City brought water quality into the home-life of Lemon Grove's residents.

The City provided a variety of waste collection and disposal services to its residents. Through education to increase awareness, and by making these services convenient, attendance at collection facilities and events rose considerably from previous years. This increased participation not only speaks to the quality of these programs, but is encouraging as an indicator of increased support for environmental programs in general.

Recognizing the need for increased measurability, the City plans to increase its evaluation efforts in respect to resident and student awareness. Section 5.3.5.1 details the areas in which the City plans to grow and further develop in coming years. The City believes feedback is a vital part of refining and possibly redirecting future efforts.

No specific management practices or BMPs relating to residential activities were identified as being ineffective during this reporting period.

### 4.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness

- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activitiy-Based Targets*

**Target 1**
Target outreach based on hotline calls
100% complete

**Target 2**
Continued presence and outreach at community events
100% complete

**Target 3**
Larger variety of educational material available
75% complete

**Target 4**
Improved tracking of hotline calls
65% complete (a database was created near the end of the reporting period)

**Target 5**
Increase the information available on the City website
75% complete (a new and improved City website is being created and will contain more water quality information and links)

**Target 6**
Use of door hangers by DPW to notify residents of a potential issue
40% complete DPW staff now has the door hangers but data has not been collected on their effectiveness and no hotline calls were received based on distributed hangers

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Residential Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

As with knowledge and awareness above, the City recognizes a need for such measures in the Residential Sector. Section 5.3.5.1 describes the ways in which the City wishes to develop assessment instruments for knowledge, behavioral change and BMP implementation.

Response to residential complaints is perhaps the only currently utilized method that involves direct observation of residential behavior. The City anticipates that an increase in complaints demonstrates an increase in awareness of urban runoff issues and available reporting resources. Another indication of behavioral change is the participation of the public in activities that prevent waste from entering the City's MS4. In particular, increases in oil recycling totals and household hazardous waste collection (Section 5.3.3) indicate the engagement of residents in environmentally protective behaviors. The City will continue to monitor these measures and to search for additional ways to assess changes in behavior among residents.

*Level 4 Outcomes: Load Reduction Estimation*

Current methods are not yet sophisticated enough to accurately gauge pollutant-loading reductions resulting from implementation of the City's residential program. This is simply due to the variety and scale of polluting behaviors associated with the residential population. However, certain existing data are helpful in making some initial estimates. As reported in Section 4.3.3, City recycling and waste collection programs diverted 25,600 gallons of used oil and as yet unobtained number of pounds of household hazardous waste from landfills and the storm drain system during this reporting period; as well as the 108.2 tons of recyclable demolition debris from the Citron Court site. Because only a small percentage of either of these waste streams would actually be illegally disposed, adjustment factors were applied to each to estimate load reductions. Both factors were selected in consultation with staff from each of these respective programs; neither is based on data of any sort. Both figures represent the experience and best professional judgment of staff. Load reduction estimates are shown in Table 4.5.

**Table 4.5 - Summary of Residential Load Reduction Calculations**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Used Oil Recycling | 25,600 gallons | 10% | 2,560 gallons |
| C&D Ordinance Recycling | 17,852 pounds | 1% | 179 pounds |

Because of the diversity of residential activity types in the City, no further attempt has been made this year to estimate reductions in pollutant loading that might be expected as a result of implementing the City's regulatory oversight program in

FY 2007-08. In the future, The City will continue to seek to develop valid methods for estimating load reductions from residential sources.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 4.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period.

## Section 5.0 Land-Use Planning Component

This section describes actions taken by the City during FY 2007-08 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

### 5.1 Assessment of Planning Process

During the current reporting period, City staff developed mechanisms in the planning process to provide improved water quality and watershed protection for new developments. The City is working to effectively integrate these principles and practices into the entire planning process. An important objective of the improvements is to develop land use goals and policies that will maintain a built environment compatible with, and sensitive to, the City's natural setting, while retaining the unique local character.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment D-1 shows the form that is presented to each applicant regardless of project size. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

### 5.2 Mapping Impervious Cover

Water quality data is the most definitive measure of determining the quality of our watersheds. However, because extensive data sets are not always readily available for the City's watershed, mapping impervious surface coverage can provide an important predictive tool to complement empirical methods. National research over the last decade has shown a significant correlation between impervious surface coverage and water quality. Development generally results in

an increase in both pollutant sources and impervious surfaces. In the Permit, it states, "Numerous studies have demonstrated a direct correlation between the degree of imperviousness of an area and the degradation of its receiving water quality. Significant declines in the biological integrity and physical habitat of streams and/or receiving waters have been found to occur with as little as a 10% conversion from natural to impervious surfaces. (Developments of medium density single family homes range between twenty-five and sixty percent impervious)."[1] The increase in pollutant sources, (i.e. parking lots, buildings, rooftops, and streets) contributes to increased pollutant loads in stormwater runoff, while corresponding increases in impervious surfaces limit the land's natural ability to filter these pollutants. As a result, developed areas typically experience higher runoff volumes and lower runoff quality. The challenge presented to the Copermittees in the mandate is to reduce harmful runoff (a product of development), while complying with the State mandate of increasing housing stock and creating affordable development projects.

Mapping impervious surface coverage helps land use professionals better predict watershed health and guide growth patterns to minimize the impacts of development on water quality. The City lacks the sophisticated equipment necessary to create a complete and accurate impervious surface map. However the City has made a good faith effort to determine on average how much impervious surface is present within its boundaries.

To determine the impervious surface of the commercial and industrial portion of the City, a survey of parking spaces was taken. To determine impervious surface amounts for the residential sector of the City, the City averaged each residence as having two parking spaces. Table 5.1 shows the results of this study and Attachment D-2 presents a partial breakdown of the parking survey taken. The full document is rather lengthy, but is available upon request.

**Table 5.1 - Results of Parking Space Study**

| Source | Total Number of Spaces | Acres covered by Impervious Surface |
|---|---|---|
| Churches | 1,510 | 5.62 |
| Apartments | 2,367 | 8.80 |
| Schools | 741 | 2.76 |
| Commercial and Industrial | 9,604 | 3.36 |
| Residential[2] | 17,444 | 64.87 |
| **Totals*** | **31,666** | **117.77** |

***** Totals are based on the average sized parking space, which is 18'x9' with a=162'

[1] California Regional Water Quality Control Board, San Diego Region. Order No. 2001-01; NPDES No. CAS0108758, p.2. retrieved from www.swrcb.ca.gov on May 30, 2004.
[2] Based on 8,722 housing units. Information from *2030 Cities/County Forecast*, available through www.sandag.org .

In the process of conducting the study, the City discovered some inconsistencies with parcel numbers and addresses. These inconsistencies are slowly being rectified based on need and time available.

The City hopes in future reporting years to utilize the study information in estimating load reductions.

## 5.3 Land Use Professionals Resources

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

## 5.4 Development Project Approval Process

As required by Permit Section F, the City has modified its discretionary land use permitting process to incorporate specific water quality requirements. The basic process is laid out in the City's General Plan, Chapter 17.28 *Procedure and Administration*. The Plan, itself, does not delineate for water quality; however the City includes water quality personnel in all development proposals.

The developer must submit all required documents at the beginning of the process. The project Stormwater Maintenance Plan (SWMP), Stormwater Pollution Prevention Plan (SWPPP) and/or Standard Urban Stormwater Mitigation Plan (SUSMP); plus the Hydrology Study are all due with the Site Plans for checking and approval from the on-set of the approval process. As stated in Section 6.1 above, this is to ensure a complete presentation for project approval by the Planning Commission.

The City has updated its checklists for developers to include water quality related lists. See Attachment D-3 for the final version of those lists. The City has received positive verbal feedback from the applicants who have utilized the new

checklists. The City also refers many applicants to the Lemon Grove SUSMP on our City website for further information about water quality guidelines. The Lemon Grove SUSMP can be found at the following web address:

- http://www.ci.lemon-grove.ca.us/clg/cityhall/Default.asp

During the current reporting period, the City reviewed eight potential SUSMP development projects with in the City limits. The following chart shows the development projects under review during this reporting period.

**Table 5.2 SUSMP Projects Under Review FY 2007-08**

| File Number | Project Name | Applicant | Description |
|---|---|---|---|
| TM 0047/PDP 04-02 | Center Hilltop Condos | Kevin Leon | Small multi-family housing unit |
| TPM 0042/0049 | Citrus Heights* | Carter Reese | 78 single family home development |
| TPM 0180 | Citron Court Condos | Community Collective | 12 condo units |
| TM047/PDP04-002/VA06-001 | 8137 Casio Ct. | Kevin Leon | 12 condo units |
| PDP06-008 | 8247 Broadway** | Troy Richardson | Used auto sales |
| Engineering Review | 6670 & 6700 Federal Blvd | EDCO Waste and Recycling | Public Improvements and SUSMP update |
| TPM 0174 | 7872 Mt Vernon St. | Kai Adler | 3 lot single family subdivision |

*Project on hold due to desire to sell. **This project is in Code Enforcement for illegal usage as per their conditional use permit.

The City requires all major projects, determined to be significant contributors to post-construction pollutant loading, to file a SWMP. The document ensures that effective BMPs will be put in place to foster long-term water quality improvements. The requirements for a significant contributor are listed below:

- Residential development of 100 units or more.
- Residential development of 10 to 99 units.
- Commercial development greater than 100,000 square feet.
- Automotive repair shops.
- Restaurants.
- Hillside development greater than 5,000 square feet.

- Projects discharging to receiving waters within Environmentally Sensitive Areas
- Parking Lots greater than 5,000 square feet or with greater than 15 parking spaces and potentially exposed to urban runoff.
- Streets, roads, highways, and freeways which would create a new paved surface that is 5,000 square feet or greater.

A *Preliminary Grading Plan* and the *Preliminary Hydrology/Drainage Study* are the technical basis for the SWMP; however, changes and refinements to the SWMP may be required as technical review of the application and completion of CEQA documentation continues. The complete SWMP must provide at least the following:

- A project description;
- An identification of water quality pollutants of concern and a proposed treatment volume base on the applicable design storm, site plans and adjacent land use, and soil characteristics;
- An identification of mitigation measures, including structural treatment BMPs, to protect water quality and prevent increases in downstream erosion to the maximum extent practicable;
- Agreements, easements, and licenses relating to proposed BMP construction, location, maintenance, or changes in drainage character;
- An identification of the beneficial uses of impacted receiving water bodies, including groundwater; and
- An identification of Section 303(d) impaired water bodies potentially impacted by the project.

The associated *Preliminary Grading Plan* and *Preliminary Hydrology/Drainage Study* must be prepared by a registered civil engineer with experience in fluvial geomorphology (drainage patterns). The *Preliminary Hydrology/Drainage Study* is, at a minimum, required to: 1) Characterize pre- and post-construction hydrology, both on-site and downstream, 2) Identify potential off-site discharges of stormwater and any increased potential for downstream erosion, and 3) Identify structural BMPs sufficient to address stormwater issues in compliance with the permit. To assist applicants through the permit application process, City staff has created a checklist for the development of Grading Plans, see Attachment D-5. The City uses the County's *Hydrology/Drainage Guide*, which can be found at www.sdcounty.ca.gov/dpw/watersheds/land_dev/drainage.html.

## 5.5 Environmental Review Process

JURMP 5.3 summarizes the revisions made to the City's environmental review process for new development and redevelopment projects to incorporate Permit requirements. The process outlined there continues to accurately reflect the

City's environmental review efforts. Attachment D-6 provides the checklist from CEQA that the City utilizes for its environmental review process.

## 5.6 New Development and Redevelopment Outreach

During this reporting period, the City used a variety of means to educate its customers about the potential impacts of development and redevelopment on water quality. These included direct staff interaction with the public and the development and distribution of informational checklists.

### 5.6.1 Interaction with City Staff

The City predominately utilizes staff time and the pre-application process to provide water quality information to developers and residents. Attachment D-1 provides the form required of all building and grading permits regardless of project size. Large development projects are rare in Lemon Grove. The City is approximately three miles square and is predominately existing residential development. To ensure that even the small projects are aware of water quality measures, the City requires a signed BMP checklist to be included with any permit application. The City has also created three checklists for any SUSMP redevelopment or new development project. These checklists are used by both City personnel to review SUSMP projects and by developers to ensure complete submittals. The checklists are included in Attachment D-3. The City uses the checklists and counter visits to provide as much education as possible to anyone interested in developing or building in the city limits of Lemon Grove. Face to face time with staff is the most effective way to reach the largest number of permit applicants because they must apply in person with their plans.

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator also plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but makes approval faster once the formal submittal is made. The Planning Commission knows that all issues have been dealt with prior to their approval hearing and that City staff has ensured a minimal environmental impact.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable educational resource for both the City and the developers.

City staff meets with all new applicants in some way and eleven open permit applications equal at least eleven consultations within the current reporting period.

### 5.6.2 Informational Checklists

As discussed above and as seen in Attachments D-3, D-5, and D-6; the City provides all applicants with a variety of checklists pertaining to application requirements. These checklists represent a small portion of the application checklists available for applicants. City staff is always available for further clarification and the Lemon Grove SUSMP is available at the site listed in Section 5.4 above.

## 5.7 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Land Use Planning Component in FY 2007-08.

### 5.7.1 Narrative Assessment

Although new development projects approved during the reporting period included adequate BMPs to address stormwater discharges, the City recognized that project level planning tools were largely under-utilized as many projects relied mainly on structural treatment controls, which can be expensive, maintenance-intensive, and less effective than site-design controls. Staff recognizes that it is easier to preserve a project site's natural hydrology through site design, than to artificially control it through detention or retention. As the City increases its outreach efforts, it foresees an increase in awareness of water quality knowledge in developers and the public. By providing developers with as much information at the beginning of the application process, the City hopes to encourage creative designs that improve water quality while maintaining the environmental integrity of Lemon Grove.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

### 5.7.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Improve checklists for project submittals for staff use
100%

**Target 2**
Create a database to track project reviews
75% complete (a database was created, but it needs to be re-vamped to accommodate multiple reviews of the same project in an efficient manner) This project is on hold due to implementation of a GIS system that would allow for integrated tracking.

**Target 3**
Create a working map of Waters of the State for use by City staff and developers
30% complete (data collection is slow due to limited staff numbers and budget constraints)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The primary goal of BMP implementation is to reduce the loading of pollutants to stormwater discharges. An important emphasis of annual program assessment is the estimation of loading reductions resulting from various program activities. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. Quantifying load reductions represents an important endpoint for City assessments. Table 6.2 below demonstrates the direction the City is moving towards for future reporting periods. In future reports, the Table below will provide an initial estimate of the effectiveness of the SWMP process and its ability to reduce the pollutant loadings of selected constituents of concern.

**Table 5.3 - Sample Table to Show Pollutant Loading Reduction Estimations**

| Constiuents of Concern | Loading Factor (lbs/ac/yr)[3] | Total Acreage | BMP Effectiveness Adjustment | Prevented Pollution |
|---|---|---|---|---|
| Total Copper | | | | |
| Total Nitrates | | | | |
| Total Cadmium | | | | |
| Total Arsenic | | | | |
| Total Suspended Solids | | | | |

SAMPLE

These estimates will provide a starting point for characterizing the benefits of implementing this program element, but are subject to a number of qualifications. First, load estimates assume that all projects are low-density, single-family residential developments. Second, project proponents have discretion in the selection of specific BMPs to meet the Maximum Extent Practicable (MEP) standard required of them. As such, individual projects employ a combination of BMPs, each with varying levels of effectiveness. The percentage adjustment is an estimate of the overall effectiveness of the measures based upon best professional judgment.

[3] Source: Minton, Gary. *Stormwater Treatment – Biological, Chemical, and Engineering Principles.* 2002

This project is being re-vamped due to new collaborations at the watershed level. It is the City's understanding that the new permit increases the emphasis on watershed collaboration and evaluation of up-stream contributors. However the concept is similar, but focused on the type of business (initially automotive facilities), its likely pollutants and the relationship of those pollutants to certain BMP effectiveness. The members of the San Diego Bay Watershed group have already looked at their inspection requirements and are drafting improvements in the BMP compliance and efficiency areas. The City feels it is important to tackle the issue of load reduction on a regional basis to ensure the highest level of effectiveness. The City believes that a more regional and/or watershed approach will result in better, longer lasting water quality improvements.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 5.7.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. See Attachment D-7 for a City zoning map.

## Section 6.0 Construction Component

The City implements a variety of programs to prevent and respond to discharges from construction sources. All of these programs are predicated on the assumption that knowledge and awareness is key to effecting and sustaining responsible behavior, but that an active oversight and enforcement presence is also necessary for long-term success. This section describes actions taken by the City to regulate construction sources during the FY 2007-08. It includes the following general types of activity:

- Requiring BMP implementation through ordinance and permit (6.2);
- Encouraging BMP implementation through outreach (6.3); and
- Verifying compliance through inspection and enforcement (6.4).

### 6.1 Priority Construction Sources

The City maintains a construction permit database. The City currently lists 180 open construction permits. However, because sites are continually opening and closing, that number is not definitive at all times. The number also includes all private and public construction sites. The majority of the current construction permits are for low or medium priority projects.

The City completed 8 minor infrastructure improvement projects during FY 2007-08. Many of them were continuations of partial resurfacing projects from the previous reporting period:

- El Prado
- La Corta
- Primera
- Ramon
- Alberdi
- Buena Vista
- New Jersey
- Lemon Grove Avenue

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

The City had only one high priority construction source at:

- 3615 Lemon Grove Avenue

This was the Honda site mentioned the 2006-07 report that had completed demolition. During reporting period 2007-08, building permits were approved and construction completed on this site. The site became operational toward the end of the reporting and final inspection by water quality personnel was performed. All permanent BMPs were in place as designed and functioning properly. The site was inspected on a weekly basis at a minimum to maintain proper BMP placement and functionality during the construction phase. The following reporting period will be the first year with fully operational permanent BMPs and required maintenance verification.

St. John of the Cross finally completed the last of their phases during this reporting period as well. However, they are currently experiencing some difficulties with Helix water district over the placement of a tree. Renovations maybe required during subsequent reporting periods.

## 6.2 BMP Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

### 6.2.1 BMP Requirements for Permitted Construction Sites

Prior to the adoption of this Permit, the City required implementation of sediment and erosion control BMPs. These controls continue today. During FY 2006-07, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

#### 6.2.1.2 BMP Requirements for Major Grading Permit Sites

Major grading permit applicants are required to submit a Storm Water Pollution Prevention Plan (SWPPP) Addendum to the Grading and/or Building Permit Application. The standards for SWPPP are closely related to those required for developers in the pre-approval process. The biggest difference is the focus during construction, not post-construction.

### 6.2.2 BMP Requirements for Public Construction Sites

All City-managed Capital Improvement Projects (CIPs), regardless of size, include contract specifications requiring the implementation of BMPs in compliance with the General Construction Permit even prior to this reporting period. Specific BMPs that are implemented on public construction projects were identified in JURMP 7.6 and match those required for private projects. These have not been updated.

### 6.2.3 Pollution Prevention Requirements

The City continues to encourage and, where appropriate, require the use of pollution prevention practices by construction site owners, developers, contractors, and other responsible parties. Specifically, pollution prevention practices are encouraged in all BMP implementation material. The City requires specific pollution prevention plans from any activity that disturbs more than five acres. These sites must also seek coverage under the General Construction Permit. The City believes that with proper and complete BMP implementation, pollution prevention is a natural consequence.

## 6.3 BMP Implementation

The City ensures that BMPs are implemented to the standards described in Section 6.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

### 6.3.1 Construction and Grading Approval Process

The Preliminary Grading Plan enables the City to better evaluate stormwater and drainage impacts on permitted sites The SWMP documents how dischargers will implement BMPs.

Although CIP projects do not require City Permits, their approval process is much the same as for private sites. These projects follow a process to ensure that BMPs are addressed at all phases. Starting at the project planning phase, projects are required to submit a SWMP. The SWMP refines the project by setting source controls, site design, and treatment control requirements. Once all

the elements and concerns have been addressed at the planning level, the project moves into the design phase. During design, construction and post-construction BMPs are introduced into the plans. The plans are then circulated to the Water Quality Program Coordinator for review. At a minimum, this review is conducted when the project design is 30, 70, and 100 percent complete. These checks ensure that BMPs are adequately addressed in the plans and adjoining specifications are included.

### 6.3.2 Compliance Verification

Actual implementation of on-site and off-site BMPs is verified during site inspections. Inspections conducted during this reporting period are discussed in Section 7.4.1 below.

### 6.3.3 Construction and Development Industry Outreach

The City places a high priority on educating project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. It is difficult to send mailers or brochures to construction sites because individual job foreman rarely have an office. The City is looking into the possibility of offering training to job site personnel to further increase its educational outreach for construction sites. On the checklist required with each project seen in Attachment D-1, education and training are required BMPs. The City is exploring the possibility of making it a required BMP. Political ramifications must be further researched. Through its Annual Report, the City will keep Regional abreast of its efforts in this area. Until that time, the following educational efforts are currently in place.

Customers are offered a number of educational resources as they progress through the permit application and approval process, including interaction with field and counter staff (Building Inspectors, Planning Personnel and City Inspectors) and distribution of informational checklists and document examples.

#### 6.3.3.1 Interaction with City Staff

City staff (including building inspectors and counter staff) regularly interacts with permit applicants and other members of the public. Personal interaction provides an important opportunity to increase the level of stormwater awareness among City customers. A particularly important interaction takes places at the very beginning of the project. Each applicant seeking a building permit of any kind receives a checklist of required BMPs. This form is being revised for the next reporting period to improve clarity and to streamline the process. From the very beginning, applicants are forced to think of water quality issues. The form is a required part of the application. More information on the initial process is available in Section 5.6.

## 6.4 Compliance and Enforcement

Compliance and enforcement is an integral part of the City's efforts to address BMPs at the construction phase. Inspections are conducted on a daily basis throughout the City on various projects.

### 6.4.1 Inspection of Construction Sites

JURMP Section 7.7 provided a description of the City's construction site inspection process. The stormwater component of these inspections is intended to ensure that contractors, property owners, and developers implement an effective combination of BMPs to meet minimum water quality protection requirements. Inspection staff utilizes checklists to assist them in verifying appropriate BMP implementation at each site inspected, and shares with the owner/developer to increase awareness of stormwater requirements and assist them in complying. See Attachment E-1 for a copy of one such checklist. The City conducted 35 scheduled inspections of six active constructions sites. The City also conducted an average of 3 informal inspections of these sites and potential sites weekly throughout the reporting period, providing approximately 156 inspections total during the reporting period. It should be cautioned that while average numbers of inspections are illustrative as a gross measure of program activity, they can also be misleading. As already mentioned, individual sites open and close throughout the reporting period, and significant differences also exist between these sites and their inspection records.

The City has also instituted the use of a construction inspection database to track construction site visits pertaining to water quality and pollution prevention issues. Attachment E-2 contains a print-out of the visits made to all active construction projects during the 2007-08 reporting period. City staff also performs a number of informal inspections by attending joint meetings on site with other staff members or visual inspections while out investigating complaints. City staff believes that a visible presence is an excellent deterrent to non-compliance. If the workers know the site is being observed on a regular basis, they are less likely to let BMP up-keep deteriorate.

The City has just begun to use the new tracking process for construction site inspections. The City records each inspection in a tracking database. The City, due to its small size, currently inspects all construction sites regardless of priority or size. The database also allows the City to track the number of building inspections performed at each site and ensures that each site is visited a minimum of three times. The City is currently with a representative to merge water quality data with the building permit program. This would create a centralized data source for all the businesses and building permits in the City. The building inspector's visits are tracked in a previously existing database

managed by the Planning and Development Department. The City Inspector uses the new database for tracking inspections as well as a BMP checklist that each owner/developer signs and commits to uphold, see Attachment D-1. During all building inspections, water quality concerns are taken into consideration. If the inspector discovers a problem, the Water Quality Coordinator is called upon to make a separate inspection. At the completion of each project, the City requires a final inspection requiring signatures by any involved parties including building, engineering, sanitation, water quality, and planning/development. Without the signatures, the project is not recorded and not deemed complete until all requirements are met. The City requires a water quality signature on all SUSMP projects. The City also requires all building and grading permits to comply with minimum BMPs through the use of a checklist and property owner signed confirmation of said BMPs.

As stated above the City had one active high priority construction site during this reporting period at 3615 Lemon Grove Avenue, the DCH Honda site. This site was inspected according to the weekly inspection requirement even after the rainy season ended.

### 6.4.2 Enforcement of Construction Sites

City inspectors enforce stormwater requirements according to protocols outlined in JURMP Section 7.8. The City's enforcement program is designed to educate the community, promote compliance with applicable laws and regulations, return violators to compliance in a timely manner, and penalize violators as appropriate.

The City utilizes written warnings, notices of violation, administrative citations, and stop-work orders to enforce applicable stormwater requirements on its construction projects. The City's code enforcement program was in place on a trial basis and has transitioned to permanent policy. The trial period allowed the City Council to see examples of the most common code enforcement violations and for the City to flush out any kinks with the policy. Attachment B-3 contains a copy of the flowchart for stormwater code enforcement efforts.

The policy allows the code enforcement process to be utilized making it easier to deal with any issues discovered while dry weather-testing or site inspecting. With the new code enforcement process in place, the City can deal with any stormwater violations in a more expedited manner than the previous system, which did not allow fines or recuperative costs to the violator. The City also hopes to hire a part-time code enforcement officer with a water quality focus during the next reporting period.

In severe cases of non-compliance, or in the event of significant discharges, it may be appropriate to deny or revoke a permit. As a final resort, the City may use civil and/or criminal court actions under the State Porter Cologne Water

Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

### 6.4.3 Reporting of Non-Compliant Sites

The JURMP outlines standard operating procedures for reporting non-compliant sites to the Regional Water Quality Control Board. The City did not have occasion to report any non-compliant sites over the course of this reporting period.

## 6.5 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its Construction Component in FY 2007-08.

### 6.5.1 Narrative Assessment

In FY 2007-08, the City continued to move its Construction Component forward in a number of important ways. Not only has the intensity of inspections grown, but an additional year of implementation has also allowed City staff and the regulated community to grow more accustomed to assimilating new stormwater regulations into their standard operating procedures. As familiarity and experience increase, the City expects compliance and oversight to improve commensurately.

The City hopes in future reporting periods to increase its outreach in this component. The City plans to host developer and contractor specific workshops dealing with water quality issues and compliance in future reporting periods.

Based on the City's annual review, staff has not determined that any specific management practices or BMPs relating to land use activities have been proven to be ineffective. The City therefore does not currently recommend any changes to this program component.

### 6.5.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

**Target 1**
Increase construction site inspections
100% complete

**Target 2**
Track construction site inspections
95% complete (the database continues to be in transition due to the potential for a centralized tracking source for a number of City programs)

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2006-07. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between

commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 6.5.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

Page Left Intentionally Blank

## Section 8.0 Education Component

This section provides a brief overview of the City's educational efforts during FY 2007-08. Since education is such an integral part of the all JURMP components, outreach to specific audiences is discussed in greater detail alongside program descriptions in the Land Use, Industrial, Commercial, Residential, and Construction Sections. This integrative organization allows the reader to better understand the context in which education is conducted.

### 8.1 Overview of Education

City outreach efforts continued to be guided by the three objectives set out in JURMP Section 9.1: 1) configuration and purpose of municipal separate storm sewer systems and how pollutants can be released to them, 2) how urban runoff impacts local receiving waters [mainly Chollas Creek] and surrounding habitats, and 3) BMP solutions that are available for treating or controlling the various pollutants of concern. Specific tools and methods are adapted as appropriate to best convey meaningful information to the target audience. Methods emphasized during this reporting period include:

- Presentations and Workshops
- Direct Mailings
- Community Events
- Educational Material Distribution
- Hotline Resources
- Interaction with Staff

The City participated in four outreach events during FY 2007-08. (See Attachment G for a table detailing each of the events) An accounting of formal events, however, does not adequately convey the significant amount of outreach that takes place during permit processing, inspections, on websites, and via other means. For a discussion on each of these alternative forms of outreach, see sections 3.0 through 7.0 and all corresponding attachments. What follows are overviews and selected highlights from the City's major educational components.

#### 8.1.1 Outreach to Residents

The City implements an extensive outreach program targeting school children and other members of the general public. As the program continues to evolve, the content of the City's outreach will increasingly focus on those pollutants and activities identified by water quality analysis and other program data to be high priorities. Data from the City's Dry Weather Program (See Section 7 due on December 15, 2008) have been used to identify combinations of areas and pollutants that may warrant increased or more focused outreach. We hope to expand on this type of program feedback as data sets become larger and program components increasingly integrated in future years. The City conducted

four residential outreach events during this reporting period, as well as four public participation events. Section 4.3 details these events more extensively. School outreach is another major component of the City's education program. The intent is to stimulate long-term behavioral change by exposing students at a young age to the importance of clean water and environmental responsibility. Similar to how recycling behavior has been significantly modified by targeting school aged children. City staff strives to ensure that classroom presentations are memorable and interactive by incorporating hands-on activities such as watershed models. The previous year's Whale Tale grant was a one year program only, but the City hopes to develop its own elementary education program during future reporting periods.

### 8.1.2 Outreach to Commercial and Industrial Businesses

The goal of the City's commercial and industrial outreach program is to promote effective BMP implementation by making business operators aware of their regulatory obligations and by providing them with useful information about how to comply. To this end, a variety of methods were utilized during this reporting period (i.e., direct mailings, outreach events, personal communications, educational materials).

Every industrial business and all the high priority commercial businesses on the City's inventory received facility-specific BMP guidance during inspections this reporting period.

It is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation.

Each reporting period, the City plans to increase outreach and improve communications with a new sector of the business and industrial community. Due to limited staff and fiscal limitations, the City must target and focus its program from year to year. However, no program will decrease once the outreach to a specific sector has been achieved. A consistent and constant message is instrumental in creating changes in behavior and increases in knowledge. Each year the City hopes to initiate a new focus area of increased outreach to provide in its annual report.

### 8.1.3 Outreach to the Construction Industry

The City places a high priority on education project applicants, contractors, developers, property owners, and other responsible parties to ensure that they have an understanding of water quality principles, applicable regulations, and proper BMP implementation strategies. Customers are offered a number of

educational resources, the key one being regular interaction with knowledgeable City staff.

During this reporting period, the City increased its outreach to the developers and construction sites within the City. The City increased the number of inspections, both informal and formal. Water Quality personnel review all development plans that are presented to the City. The City requires all permit applicants to complete a construction BMP plan. Water Quality personnel also require a notation on all plans to verify the use of BMPs for the duration of the project. The City continues to use and further develop the information available to contractor and developers. Several checklists are available as well as other educational materials on BMPs, both pre- and post-construction. The City is working on making its stormwater information educational and easier to use for the construction and development sector. The City continues to believe that the increase in inspections confirms the importance and commitment to an effective water quality and pollution prevention program.

## Section 9.0 Public Participation

During FY 2007-08 the City continued to actively encourage stakeholder participation in the development and implementation of its Jurisdictional Runoff Management Program (JURMP) through various venues:

- Informational Resources
- Community Outreach Efforts
- Stormwater Copermittee Meetings

In addition to the activities described further below, the City continued to rely heavily on the interaction of staff with members of the public during their regular duties. As described below, the interaction of these staff with the public through various means (i.e., permitting, inspections, presentations, etc.) continued to provide an additional avenue for obtaining direct feedback from the City's customers.

## 9.1 Public Participation Venues

A key element of an effective public participation strategy is providing the public with easily accessible resources for obtaining water quality information and reporting complaints.

### 9.1.1 Hotlines

The City continued to operate its Stormwater Hotline at (619) 825-3827. This is a new hotline number for the City. The number is a direct line to water quality staff. The primary purpose of this hotline is to facilitate complaint reporting, but it also serves as a direct source of water quality information for interested parties. Calls received are promptly referred to the correct City staff. Complaint responses are handled in a timely manner. The focus is to gain compliance from the erring source, so a speedy response time is crucial. During this reporting period, the hotline received six calls pertaining specifically to water quality issues. Two of those numbers were in reference to construction sites that were not maintaining their sediment BMPs over the weekend. Both instances were rectified without formal code enforcement involvement. These numbers do not represent the number of calls that come through the main phone line and are water quality in nature. The City is working to create a tracking system for these calls.

**Table 9.1 – Comparison of Calls**

| Number of Calls pertaining to Water Quality | Number of Calls with City Action |
|---|---|
| 6 | 2 |

### 9.1.2 Chollas Creek Clean-up Event

The City participated in I Love a Clean San Diego's Creek to Bay Clean-up event on April 26, 2008. Due to the high temperatures that day, the City had four volunteers and two staff members arrive to clean the vacant field adjacent to Palm Middle School on Camino De Las Palmas. This location is in the Sweetwater watershed and was a new clean-up location for the City. The volunteers removed 464 pounds of debris from the site and 428 pounds of recyclable materials. See Attachment C-2 for a copy of the full report for the entire event.

## 9.2 Stormwater Copermittees

### 9.2.1 Copermittee Meetings

The City continued to participate in a variety of Copermittee Meetings sponsored mostly by the County. Below is a listing of the Workgroups that the City actively participates in:

- BMP Effectiveness and Assessment Workgroup
- Permit Re-Issuance Workgroup
- San Diego Regional Management Committee
- Dry Weather Monitoring Workgroup
- Regional Monitoring Workgroup
- Report of Waste Discharge Workgroup
- Outreach Workgroup
- Green Business Program Meetings
- Watershed Workgroup (through Port of San Diego)

Each of these meetings occurs once a month on various days or bi-monthly in the case of the Management Committee. The yearly activities calendar of the former Water Quality Coordinator was lost when the computer was re-formatted for a new user, so dates are un-available for attendance records. However, each meeting was accompanied by a sign-in sheet supplied by the sponsor, typically the County. The County would have records of the City's participation in the above listed groups.

### 9.2.2 Collaborative Efforts with Copermittees

This section will highlight two particular collaborations that will be highly beneficial to Lemon Grove and the region.

*Chollas Creek Water Quality Protection and Habitat Enhancement Project*

The Chollas Creek Water Quality Protection and Habitat Enhancement Project (Chollas Creek MOU) is an agreement between the City of San Diego and the members of the Chollas Creek watershed. The City of San Diego applied for the Chollas Creek Grant to create a more comprehensive education plan for areas in the Chollas Creek watershed. The Grant included regional educational materials and programs. The Grant provided for Chollas Creek clean-ups and restoration to native habitat in and around the stream-beds. The City benefited from the programs and educational material when they joined as a Grant partner. San Diego provided the in-kind money; they are asking the partners to provide in-kind services only. The in-kind services will be equal to roughly $10,000; no actual money is exchanged. The City assisted in educational material development, local programming for businesses and schools, and offered assistance at San Diego meetings pertaining to the grant. The Chollas Creek MOU went into effect in 2005. The City feels this collaboration is beneficial to the City of San Diego, to Lemon Grove, and the residents in both cities. Although this grant is complete, the City continues its education efforts in reference to Chollas Creek.

*County of San Diego Green Business Program*

The City increased its involvement with this program by offering an automotive workshop during this reporting period. The City looks forward to continuing these efforts and further improving its outreach to the local and regional business communities. This partnership has provided the City with valuable insight into local, state and federal regulations pertaining to pollution prevention and hazardous materials. In turn, the City has provided the program with an increased awareness of water quality programs and regulations.

## Section 10.0 Effectiveness Assessment

### 10.1 Introduction

This section provides an overview of the methods used in this report to assess the implementation and effectiveness of the City's JURMP for the period of July 1, 2007 through June 30, 2008. As with the programs themselves, the City's approaches to effectiveness assessment have evolved considerably during this period. An important aspect of these new and augmented programs is ensuring their measurability and their nexus to changes in discharge and receiving water quality. In particular, Permit sections F.7 and I.1.a.F.7 require that the City identify and report on measures to assess the effectiveness of JURMP implementation and identify strategies for assessing long-term program effectiveness.

The City is taking important steps toward the development of new and improved methods for conducting assessments, and in putting those methods into practice in this report. This section provides an overview of the approach that the City has taken to conduct its effectiveness assessment this year. However, the actual assessments are contained throughout the remainder of this report within their respective program components. Specifically, the following sections contain effectiveness assessment elements, each following a common organization described further in Section 11.2 below:

- 2.0 Municipal Component
- 3.0 Industrial Component
- 4.0 Commercial Component
- 5.0 Residential Component
- 6.0 Land Use Planning Component
- 7.0 Construction Component
- 8.0 Illicit Discharges Detection and Elimination Component

The scope and content of these assessments varies widely for each program element. However, in all cases, the City has included sections corresponding to each of the major effectiveness assessments elements described below.

### 10.2 Assessment Approach

The City and other Copermittees have in past years described a number of basic measures that can be relatively easily tracked and quantified. The City's objective is to go beyond those efforts by more closely scrutinizing existing measures with an eye toward a more complete understanding of their meaning and value to the effectiveness assessment process. From this, the City has also endeavored to identify where new or revised measures might be needed. Our starting point was the collaborative development of the document, *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management*

*Programs*, submitted to the RWQCB on October 16, 2003. This document represents the Copermittees' current thinking on how effectiveness assessment can best be approached now and in the future. More importantly, it procedes an important starting point for the evolution of more detailed and sophisticated strategies by the City and other Copermittees. The remainder of this section draws heavily on the content of that framework.

The City's approach to effectiveness assessment as reflected throughout this JURMP Annual Report, is organized according to three primary elements, each described below:

- Narrative Assessment
- Assessment of Specific Measures
- Spatial and Geographic Analysis

### 10.2.1 Narrative Assessment

In previous comments on the City's JURMP, RWQCB staff has indicated a desire for a more detailed discussion of successes, strengths and weaknesses, and outstanding program features. The narrative assessment addresses this concern by qualitatively describing major programmatic achievements from throughout the year. Other more specific and quantifiable measures are addressed in the remaining portions of the assessment.

Permit Section I.1.g also requires that the City identify in its JURMP Annual Report any management measures proven to be ineffective in reducing urban runoff pollutants and flow. Each narrative assessment section also includes the identification of any such measures identified in the reporting period.

### 10.2.2 Assessment of Specific Measures

This section provides a short overview of several of the key concepts and organizing principles of *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*. That document should be read in its entirety for a more complete understanding of the City's long-term effectiveness assessment strategy. Due to the length of the document, the City has not included it in this report. However, a copy is available on request.

Essential to increasing measurability is the establishment of clear and meaningful measures that can be tracked over this and future reporting periods. To establish such measures, it is crucial that the desired or targeted outcomes of any particular program activity be clearly identified and understood. Attachment I illustrates six basic levels or categories of outcome that can be employed for any of these six levels. The City's assessment intends to follow this basic model. Ultimately, the objective of the effectiveness assessment process is to identify measures at the highest level of the hierarchy possible. In doing so, knowledge

gaps between program activity and water quality outcomes can best be addressed. It is important to note, though, that a single measure will rarely provide a complete picture of any program area. Multiple measures will therefore usually be utilized for many program activities.

#### 10.2.2.1 Compliance with Activity-Based Permit Requirements (Level 1)

This level consists of activities that are prescribed by or established under the Permit (updating source inventories, training staff, conducting inspections, etc.). A fundamental feature of Permit-derived programs is the explicit establishment of specific activities that are assumed, but not proven, to be beneficial to water quality. While many of the assumptions underlying the establishment of required activities may be correct, there are currently few means of quantifying or establishing causal relationships that will make many of them more measurable. The City's long-term goal is to explore these assumptions in more depth; this year's report focuses on clearly defining the intended outcomes of these activities and identifying specific measures by which them can be accurately assessed.

#### 10.2.2.2 Changes in Knowledge/Awareness (Level 2)

The most immediate and basic outcome of many urban runoff program activities is a change in the knowledge, awareness, or attitudes of target audiences (learning that storm drains and sanitary sewers are separate systems, that everyday activities contribute to water pollution, etc.). Such changes are most often targeted through outreach or training programs. Not an end in themselves, these changes presumably form the basis of behavioral change, or BMP implementation.

#### 10.2.2.3 Behavioral Change/BMP Implementation (Level 3)

Building on increases in knowledge, the City's primary objective is to affect significant and lasting changes in the behavior of municipal employees, residents, and business representatives. Behavioral outcomes are usually expressed in terms of BMP implementation since this is the overriding objective of the City's programs. Since this is the level at which actions are actually taken, estimating or quantifying BMP implementation is a necessary component of a successful effectiveness assessment strategy. It is also necessary as a precursor to establishing load reductions. Several elements of this year's report include a discussion of BMP implementation.

#### 10.2.2.4 Load Reductions (Level 4)

The primary goal of BMP implementation is to reduce the loading pollutants to stormwater discharges. Assuming that such reductions are properly targeted to existing or potential water quality problems, load reductions should in turn result in improvements to discharge and receiving water quality. The primary purpose

of conducting a load reduction estimation exercise is to better understand the benefit of conducting high priority activities (i.e., to characterize the expected reduction in loading of contaminants to the MS4).

The City regards the estimation of load reductions as the key to its assessment process. By working to establish Level 4 outcomes for lower level activities, we hope to increasingly improve our understanding of the relationship of these activities to water quality improvement. Because these efforts are both difficult and speculative, and often require data and information not readily available, this year's assessment includes load reduction estimates in only a couple of areas. In future years, our understanding of the many assumptions that must be made to address existing uncertainties, and variables that affect any given measure, will improve as we document and study them. Our goal this year was simply to develop and test some basic approaches.

10.2.2.5 Changes in Discharge Quality (Level 5)

In many respects, changes in discharge quality are the most direct expression of successful program implementation. Measurable improving the quality of discharges both into and from the City's MS4s will therefore be an important targeted outcome. Establishing relationships between discharge quality and specific program components, however, is beyond the scope of this year's assessment.

10.2.2.6 Changes in Receiving Water Quality (Level 6)

The ultimate objective of the City's programs is the protection and improvement of water bodies receiving discharges from its MS4. Both discharge quality (level 5) and receiving water quality are addressed through the City's Dry Weather Program (Section 8) and the Copermittees' Receiving Water Monitoring Program (submitted under separate cover). Establishing relationships between receiving water quality and specific program components, however, is beyond the scope of this year's assessment.

### 10.2.3 Spatial and Geographic Analysis

Several sections of this year's report contain analyses of program data aimed at better understanding their spatial variability and its relevance to program implementation. The approaches utilized are simple and straightforward. Data is examined regionally, by watershed, and by community to identify potentially significant trends. For instance, clustering of a particular business type may warrant outreach efforts that are specifically focused in a watershed. The City hopes to develop more sophisticated methods of spatial and geographic analyses in the future. At the same time, it is important that our understanding of the potential uses of program data evolve concurrently. Any type of meaningful

analysis is limited by the amounts and quality of data that are available to support it.

During this reporting period, the City finished a preliminary needs assessment for the implementation of a city-wide GIS program. The needs assessment encouraged the City to update its existing base data and layers using modern technology. The City hoped to have the initial phase up and running by FY 2007-08. However, due to budget constraints, the City was forced to put the initial phases on hold until the next reporting period. The City sees GIS as a powerful compliance and collaboration tool that will make tracking and reporting more efficient and accurate. The full implementation of the GIS program is dependant on budgetary constraints in future reporting periods.

## Section 11.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

### 11.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 12.1.

**Table 11.1 – 2007/2008 Fiscal Analysis Summary**

Stormwater Cost Analysis
All costs covered in the General Fund.

| ACTIVITY | CURRENT YEARLY BUDGET | CURRENT BUDGET LOCATION |
|---|---|---|
| **STORM DRAINAGE CLEANING AND MAINTENANCE** | | |
| **Public Street and Parking Lot Sweeping** | | Streets |
| Streets | $30,000 | |
| Parking Lots | $2,000 | |
| *Public Street and Parking Lot Sweeping Total* | $32,000 | |
| | | |
| **Litter Removal** | | |
| Litter Removal | $13,000 | |
| *Litter Removal Total* | $13,000 | |
| | | |
| **Storm Drainage Cleaning** | | |
| Inlets | | |
| Inspection and Cleaning | $19,820 | |
| Fossil filter replacements | $1,400 | |
| *Inlets Subtotal* | $21,220 | |
| Basins and Channels | | |
| Inspection and Cleaning (Note 1) | $38,829 | |

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

## 11.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.

Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

The City's seventh Annual Report overall and the first submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents a full year of water quality activity and programming in the City of Lemon Grove. We are confident that the report demonstrates our success in building a program that meets and often exceeds Permit requirements. At this same time, the annual reporting process offers an important opportunity to critically assess program implementation, and to identify areas in need of modification or improvement.

The programs described in this report to be significantly expanded and improved over previous years, as is evidenced by the numerous accomplishments described. City staff once again responded positively to the implementation challenges presented by the Permit; thanks to a sustained team effort, we continued to improve and augment our programs.

Moving forward, it is important to keep in mind that meaningful measurement is a necessary part of a successful program strategy. This year's report reflects more monitoring, more data, more assessment, and more deliberation on the part of City staff than ever. This speaks well of the City's program, but it is only a start, the stormwater puzzle will take many years to solve. The increased focus on measurability that is manifested in this report must remain a focus. In particular, the new and innovative approaches to effectiveness assessment that the City helped to pioneer must continue to actively evolve. The framework set out in the document *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs* provides a great deal of useful direction, but success is not guaranteed. Staff will need to develop and embrace the detailed measures and measurement tools necessary to track and evaluate long-term success. Similarly, we will also need to continue looking for ways to improve and best utilize our monitoring programs so that they continue providing timely and useful information.

As in previous years, the City continued to demonstrate strong collaboration with other Copermittees throughout the reporting period. This is reflected in the quality and vision of the Copermittees' many collaboratively conducted activities. Such collaboration has become a hallmark of the Copermittees' programs and must continue to be. Future success will require no less collaboration.

This year's report is characterized by a higher integration of elements than in the past. Although the City's programs are implemented over numerous departments, the coordination and communications between those efforts has been commendable. Our experience over the past year has also shown that we have many new challenges ahead of us. Many of the City's stormwater programs and activities are still in their infancy. Unlike many other regulatory programs, the way forward is neither easy nor straightforward. The City has also

dealt with severe budget constraints during this reporting period and does not expect them to mitigate during the next reporting period. The issues being confronted on the national and state levels have drastically affected our local communities and budgets. These factors continue to make meeting the demands of this program fiscally challenging. Meeting these challenges and the challenges ahead of us will require continued diligence and good humor.

**Certification Statement**

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

## Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2007-08 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment. What follows is a summarized list of where each IC/ID program component is discussed in this Annual Report:

- Dry Weather Monitoring (Section 7.1)
- Spill Prevention and Response (Section 7.2)
- Public Reporting of IC/IDs, Complaint Investigations, and Enforcement (Sections 3.4, 4.4, 7.3, 7.4)
- Used Oil and Toxic Materials Disposal (Section 4.3.4)
- Limiting Infiltration from the Sanitary Sewer to the MS4 (Sections 7.5 and 2.1.4)

### 7.1 Dry Weather Monitoring Program

This section provides and overview of the results of the City's 2007 Dry Weather Analytical and Field Screening Monitoring Program (Dry Weather Program), which is implemented by DMax. This section will provide a complete copy of DMax's findings and report.

### 7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 123 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls five were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 3.4 and follow-up and enforcement for residential complaints is dealt with in Section 4.4.

## 7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

## 7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 5.3.

## 7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 2.1.

## 7.6 Effectiveness Assessment

This section provides a discussion of the City's effectiveness in implementing its IC/ID Component for FY 200-08.

### 7.6.1 Narrative Assessment

In FY 200-08, the City continued its Dry Weather Program through a contract with DMax Engineering. The City saw significant improvements in its site testing. This year's sampling was further increased the City's knowledge and awareness of its watershed and waterbodies. This is reflected in the specific recommendations contained in D-Max's report and findings found attached to this section.

The City also continues to attend the Regional Dry Weather Monitoring Workgroup to assist in watershed improvements together with other copermittees.

### 7.6.2 Assessment of Specific Measures

A variety of specific measures of program effectiveness are discussed below. These are presented according to the following general categories of outcomes:

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Levels 5 & 6: Changes in Discharge and Receiving Water Quality

Section 11.2 also provides a more detailed explanation of the conceptual basis for this categorization and the selection of specific outcomes and measures described throughout this report.

*Level 1 Outcomes: Success in Meeting Activity-Based Targets*

The City did not track activity targets during this reporting period. However, the City will remedy this problem during future reporting cycles. The City believes the program was dealt with effectively, but activity-based targets were not tracked.

*Level 2 Outcomes: Changes in Knowledge/Awareness*

The City did not characterize or track specific measures related to changes in knowledge or awareness resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 3 Outcomes: Behavioral Change/BMP Implementation*

The City did not characterize or track specific measures related to behavioral change or BMP implementation resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 4 Outcomes: Load Reduction Estimation*

The City did not characterize or track specific measures related to load reduction estimations resulting from the implementation of its Land Use Planning Component in FY 2007-08. The need for such measures will be considered in

the future, and, if determined necessary, the City will consider incorporating additional tools such as surveys to characterize knowledge and awareness.

*Level 5 & 6 Outcomes: Discharge and Receiving Water Quality*

As described in *A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs*, sufficient data and methodology do not currently exist to establish either correlations or causal relationships between commercial sources and water quality outcomes. The City will continue to explore these relationships in future years.

### 7.6.3 Spatial and Geographic Analysis

A spatial and geographic analysis was not conducted for any commercial program data during this reporting period. The City will continue to pursue its current approach to regulating construction sites.

**Re: 2008 Dry Weather Field Screening and Analytical Monitoring Program**
**City of Lemon Grove, California**

Dear Ms. Long:

Per your request D-MAX Engineering, Inc. (D-MAX) has completed the 2008 Dry Weather Field Screening and Analytical Monitoring Program. This report presents the results of the monitoring program conducted in the City of Lemon Grove during the 2008 dry weather season. The contents include field screening data and analytical laboratory test results, trash assessment, analyses of the collected data, and photographs of sampling locations. The report also presents the results of follow-up investigations conducted to identify the sources of pollutants detected during the field screening program and our recommendations for additional actions.

It has been our pleasure working with the City of Lemon Grove on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering, Inc.

Arsalan Dadkhah, Ph.D., P.E.

# 1 INTRODUCTION

## 1.1 Regulatory Requirements

In accordance with San Diego Regional Water Quality Control Board (RWQCB) Order No. R9-2007-0001 (Municipal Permit), each of the Copermittees, including the City of Lemon Grove, is required to annually perform dry weather field screening of discharges into its storm drain system. This procedure is comprised of recording field observations, estimating observed flow rates, and conducting field testing at selected locations along the storm drain conveyance system during the dry weather season, May 1 through September 30. The Municipal Permit also necessitates that Copermittees conduct laboratory analyses for at least 25 percent of the visited sites with flowing or ponded water. If a sampling location is dry, meaning there is no flowing or ponded water, an alternate sampling station should be visited. If the results of the field or laboratory analyses exceed specific action levels, follow-up investigations are required within two business days. A more detailed trash assessment component has also been required. The Dry Weather Monitoring Program is an integral part of the City of Lemon Grove's Urban Runoff Monitoring Program.

## 1.2 Program Overview

The primary purpose of the Dry Weather Monitoring Program is to detect and eliminate illicit connections and illegal discharges (IC/ID) to the storm drain system, minimizing the negative impacts of human activities on receiving water bodies. The Dry Weather Monitoring Program consists of the following three components.

- Field screening observations
- Field analytical testing
- Laboratory analytical testing

Information collected from the dry weather monitoring is used to characterize dry weather discharges to the storm drain system and identify conveyances that are discharging elevated levels of pollutants. Follow-up studies and source investigations were conducted as necessary to detect and eliminate the sources of these pollutants. The results from the 2008 Dry Weather Monitoring Program conducted by D-MAX Engineering, Inc., (D-MAX) are presented herein.

## 1.3 Hydrologic Setting

The City of Lemon Grove (City), located in the southeastern portion of San Diego County, is situated within the Pueblo San Diego Hydrologic Unit (HU 908) and Sweetwater River Hydrologic Unit (HU 909). These two Hydrologic Units, along with the Otay River Hydrologic Unit, form the San Diego Bay Watershed and ultimately drain into San Diego Bay. Most of the City of Lemon Grove is located within the San Diego Mesa Hydrologic Area (HA 908.2) of the Pueblo HU, while the remainder of the City is in the Lower Sweetwater HA (909.1).

The City of Lemon Grove drains to San Diego Bay. Three of the four main drainage basins in the City drain to the San Diego Mesa HA, primarily via Chollas Creek. The approximately 1.7 square mile **Lemon Grove Avenue drainage basin** and the 0.3 square mile **Madera Street drainage basin** are both located in the southeast portion of the City; the **Federal**

**Boulevard/Broadway drainage basin** is 1.9 square miles and is located in the northern portion of the City. The fourth drainage basin, known as the **Broadway/Sweetwater drainage basin**, is approximately 0.4 square miles. It constitutes the northeast region of the City and drains to the Sweetwater River, eventually terminating in San Diego Bay.

Based primarily on wet weather data from mass loading stations (MLS), ambient bay and lagoon monitoring, bioassessments, and 303(d) listings in Chollas Creek and/or the Sweetwater River, the high priority water quality issues for the San Diego Bay Watershed as a whole have been identified in the 2008 San Diego Bay Watershed Urban Runoff Management Plan (WURMP) as bacteria, gross pollutants, metals, oil and grease, pesticides, sediment, and trash. It should be noted that the Sweetwater River is not on the 303(d) list, unlike Chollas Creek, which is 303(d) listed for bacterial indicators, copper, diazinon, lead, and zinc.

## 1.4 Previous Work

The numbers of historical dry weather monitoring sites since 2002 are presented in Table 1-2. Historical dry weather monitoring data is included in Appendix A.

**TABLE 1-1**
**SUMMARY OF HISTORICAL DRY WEATHER SITES**

| Year | Number of Field Screening Sites [1] | Number of Flowing Sites | Number of Ponded Sites | Number of Dry Sites | Number of Lab Analysis Sites [2] |
|---|---|---|---|---|---|
| 1998 | 11 | 9 | 2 | 0 | --- |
| 1999 | 13 | 11 | 2 | 2 | --- |
| 2000 | 10 | 9 | 1 | 4 | --- |
| 2001 | 12 | 12 | 0 | 3 | --- |
| 2002 | 15 | 14 | 1 | 3 | 4 |
| 2003 | 15 | 15 | 0 | 2 | 4 |
| 2004 | 15 | 14 | 1 | 4 | 4 |
| 2005 | 15 | 15 | 0 | 4 | 4 |
| 2006 | 15 | 13 | 2 | 4 | 4 |
| 2007 | 15 | 14 | 1 | 3 | 4 |

**Notes:**
[1] Number of Sites Screened = Number Flowing + Number Ponded. Field screening cannot be conducted at sites found to be dry. Dry sites are replaced by either a flowing or ponded site.
[2] Laboratory analyses commenced in 2002 as required by RWQCB Order 2001-001.

## 1.5 Report Outline

**Section 1, Introduction,** includes regulatory background, a program overview, a discussion of the City of Lemon Grove's hydrologic setting, a summary of previous work, and the report outline.

**Section 2, Sampling Locations,** describes the field screening sampling locations and site selection criteria.

**Section 3, Field and Laboratory Analytical Methods,** includes field screening and laboratory analytical procedures, quality assurance protocols, and follow-up action levels.

**Section 4, Field Screening Results,** presents qualitative observations of the sampling locations and results of the field screening analyses.

**Section 5, Trash Assessment,** discusses the procedure and results of the trash assessment.

**Section 6, Laboratory Analytical Results,** presents results of the laboratory analyses.

**Section 7, Data Analysis,** provides an analysis of field and laboratory data collected in 2008, as well as a comparison with the results of previous years.

**Section 8, Follow-Up Investigations,** details the results of follow-up investigations undertaken to isolate the sources of pollutants detected during the field screening program.

**Section 9, Summary and Recommendations,** provides a summary of the program results and recommendations for follow-up actions.

**Appendix A** Historical Dry Weather Monitoring Data

**Appendix B** Photographs of Sampling Locations

**Appendix C** Laboratory Analytical Reports

**Appendix D** Field Data Sheets

# 2 SAMPLING LOCATIONS

The City of Lemon Grove has 15 designated primary monitoring stations. If no flowing or ponded water is observed at primary monitoring stations, alternate field screening sites are visited. Four of the 15 primary sites are also designated as sites for laboratory analysis.

During the 2008 Dry Weather Monitoring Program, primary sites 4 and 13 were observed to be dry, so alternate sites 19 and 20 were selected as locations for monitoring.

Table 2-1 provides the location, conveyance configuration, land uses, hydrological subarea, and GPS coordinates of the sampling locations that were visited. Photographs of sampling locations are included as Appendix B. A map of sampling locations is included as Figure A at the end of this report. A map of the watersheds in and around the City of Lemon Grove, broken down into HSAs, is included as Figure B.

**TABLE 2-1**
**2008 DRY WEATHER MONITORING STATIONS**

| Site I.D | Location | Conveyance | Primary Land Use | Secondary Land Use | Hydrologic Subarea | Latitude | Longitude |
|---|---|---|---|---|---|---|---|
| Site 1 | 100 feet southeast of the Sweetwater Road and Broadway intersection | Outlet | Residential | Commercial | 909.12 | 32.74512 | -117.01826 |
| Site 2 | Behind the building at 6420A Federal Boulevard | Natural Creek | Industrial | Residential | 908.22 | 32.73127 | -117.06124 |
| Site 3 | Next to 6691 Federal Boulevard | Natural Creek | Commercial | Residential | 908.22 | 32.73569 | -117.05477 |
| Site 4 | Between 7102 and 7106 Westview Place, west end of street, before driveway | Catch Basin | Residential | Commercial | 908.22 | 32.74118 | -117.04557 |
| Site 5 | 6883 College Avenue, behind Discount Tire | Outlet | Commercial | Residential | 908.22 | 32.74035 | -117.04941 |
| Site 6 | Buena Vista and Lemon Avenue., in Home Depot parking lot, in front of nursery | Manhole | Commercial | Industrial | 908.22 | 32.74360 | -117.03484 |
| Site 7 | Corner of Primera Street and Madera Street | Catch Basin | Residential | Commercial | 908.22 | 32.72054 | -117.04865 |
| Site 8 | Lemon Grove Avenue, 100 feet south of Massachusetts Avenue Trolley Station | Outlet | Residential | Commercial | 908.22 | 32.72255 | -117.04050 |
| Site 9 | Main Street, under trolley tracks, between Davidson Street and Mt. Vernon Street | Outlet | Commercial | Residential | 908.22 | 32.73259 | -119.03365 |
| Site 10 | Across from 2220 and 2196 Main Street, under trolley tracks | Earthen Channel | Residential | Commercial | 908.22 | 32.72869 | -117.03591 |
| Site 11 | 100 feet west of the Broadway and Massachusetts Avenue intersection in front of McDonald's, on divider | Manhole | Commercial | None | 908.22 | 32.74255 | -117.04378 |
| Site 12 | North side of Lemon Grove Way, between residential address 8156 and the Grove Condominiums | Catch Basin | Residential | Open | 909.12 | 32.74559 | -117.02408 |
| Site 13 | Northeast corner of the Palm Street and Lemon Grove Avenue intersection | Manhole | Residential | Commercial | 908.22 | 32.73486 | -117.03152 |

| Site 16 | Citronella Street and Palm Street intersection, east of Arco station | Outlet | Residential | None | 908.22 | 32.73524 | -117.03071 |
| Site 19* | In a small cul-de-sac on west side of Skyline Drive, south of Lincoln Street | Manhole | Commercial | Residential | 908.22 | 32.73726 | -117.02695 |
| Site 20* | Intersection of Alberdi Drive and San Altos Place, 100 ft and north on dirt Road | Earthen Channel | Residential | Commercial | 908.22 | 32.71822 | -117.04422 |

**Note:** * Alternate sites 19 and 20 replaced dry primary sites 4 and 13.

# 3 FIELD AND LABORATORY ANALYTICAL METHODS

## 3.1 Field Screening Procedures and Methods

Field screening techniques consist of flow measurement, quantitative field analyses of selected water quality parameters, and qualitative field observations. Information relating to weather conditions, the amount of time since last rainfall, and the type of storm water conveyance are recorded. Specific observations and results of the field water quality analyses are documented on field data sheets, which are included in Appendix D. The data sheets also serve as a record of the field visit and are completed for every site visit regardless of whether or not samples were collected.

For 2008, field data sheets were updated to include three categories of visits. Previously they included check boxes for either routine field screening or follow-up visits. This year there are check boxes for routine field screening, confirmation, and IC/ID follow-up visits. A confirmation visit is a revisit of the original site, whereas an IC/ID follow-up is an upstream investigation. For the purposes of this report, confirmation and IC/ID follow-up visits are both referred to as "follow-up" visits.

Field screening and analyses were conducted according to the following procedures and methods.

Qualitative Observations

Irrespective of flow, qualitative field observations are made during each site visit. These observations provide a general site assessment and describe factors like water odor, clarity, the presence of floatables, visible deposits or stains, vegetation and biological organisms. Evidence of present or past illicit connections and illegal discharges to the storm drain system may also be ascertained through careful field observations. Each field screening location is photographed to provide additional information and documentation of site conditions. Photographs are included in Appendix B.

Flow Measurement

Flow measurements can be utilized to estimate pollutant mass loading, prioritize storm drains for future investigation, and identify significant changes in discharge that may indicate an illegal discharge upstream. Various field methods are used in formulas to estimate the flow rate. These include measuring the velocity, depth and width of the flowing water; recording the amount of time required to fill a bottle of known volume with sample water; or, if measuring flow within a cylindrical pipe, measuring the pipe diameter as well as the depth and velocity of the flow. Low levels of flow may also be assessed visually.

Field Water Quality Analyses

At each site with ponded or flowing water, grab samples were collected and analyzed in the field for the following constituents:

- Specific conductance
- Temperature
- pH
- Turbidity
- Surfactants (MBAS)*
- Nitrate-Nitrogen (Nitrate-N)
- Ammonia-Nitrogen (Ammonia-N)
- Orthophosphate-Phosphorus (Orthophosphate-P)

* Surfactants may also be referred to as detergents

The methods that were used to perform the above field analyses along with each method's detection limit, range and accuracy, are listed in Table 3-1.

## 3.2 Laboratory Analytical Methods

Consistent with the Municipal Permit's requirements, samples were collected for laboratory analyses at eight sites, representing over 25 percent of all sites where ponded or flowing water was observed. These samples were submitted to EnviroMatrix Analytical, Inc., a California Department of Health Services-certified laboratory, for analysis of the following constituents:

- Oil and Grease
- Total Hardness
- Cadmium (Dissolved)
- Copper (Dissolved)
- Lead (Dissolved)
- Zinc (Dissolved)
- Diazinon
- Chlorpyrifos
- Total Coliform Bacteria
- Fecal Coliform Bacteria
- *Enterococcus* Bacteria

The methods used to perform each laboratory analysis along with method detection limits and holding times are listed in Table 3-2.

**TABLE 3-1**
**FIELD ANALYTICAL METHODS**

| Parameter | Method | Reporting Limit | Range | Accuracy |
|---|---|---|---|---|
| Specific Conductance | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.01 mS/cm | 0 – 20 mS/cm | ± 2% of functional sensitivity[1] |
| Temperature | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.1℃ | 0.0℃ – 60.0℃ | ± 0.5℃ |
| pH | Hanna Instruments HI 991301 Portable pH/EC/TDS/Temperature Meter*** | 0.01 | 0.00 – 14.00 | ± 0.01 pH |
| Turbidity | Hanna Instruments HI 93703-11 Portable Turbidity Meter*** | 0.01 NTU | 0.01 – 50.00 NTU and 50 – 1000 NTU | ± 0.5 NTU or 5% of reading (whichever is greater) |
| Surfactants | CHEMetrics CHEMets Kit (K-9400) Methylene Blue Active Substances | 0.13 mg/L | 0.0 mg/L – 3.0 mg/L* | ± 0.13 & ± 0.5 mg/L[2] |
| Nitrate-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Nitrate 3 Vacu-vials® (K-6933) Cadmium reduction[3]*** | 2.26 mg/L** | 2.26 mg/L –13.6 mg/L** | ± 30% |
| Ammonia-N | CHEMetrics V-2000 Multi-Analyte LED Photometer – Ammonia 3 Vacu-vials® (K-1403) Salicylate*** | 0.10 mg/L** | 0.10 mg/L – 3.00 mg/L** | Varies with measured concetration[4,5] |
| Ortho-phosphate-P | CHEMetrics V-2000 Multi-Analyte LED Photometer – Phosphate 2 Vacu-vials® (K-8513) Stannous chloride chemistry[6]*** | 0.25 mg/L** | 0.25 mg/L – 2.61 mg/L** | Varies with measured concetration[4,5] |

**Notes:**

[1] Functional sensitivity (FS) represents the lowest limit at which quantitative information is reliable. FS is estimated as the mean concentration for a spiked sample whose coefficient of variance (CV) is 20%. CV is the standard deviation divided by the mean.

[2] ± 0.13 for the range of 0.0 to 1.0 mg/L, ± 0.25 mg/L for the range of 1.0 to 2.0 mg/L and 0.5 mg/L for the range of 2.0 to 3.0 mg/L.

[3] This method determines the concentration of nitrate in mg/L $NO_3$. To determine the amount of nitrate-nitrogen, the concentration of nitrogen must be adjusted for the presence of oxygen in the $NO_3$ molecule. Therefore, the result is multiplied by a conversion factor of 0.226, the ratio of the molecular weight of N (14 g/mol) to $NO_3$ (62 g/mol). The detection limit for nitrate is 10.0 mg/L; however, the detection limit for nitrate-nitrogen is lowered due to the conversion.

[4] Practical Detection Limit (PDL) is defined as the lower limit of the stated test range.

[5] Percent error adjusts as follows: ±30% at PDL, ±20% for 25% of full range, ±10% for 75% of full range, ±10% for 120% of full range. "Full range" is equal to the upper limit of the test kit's range.

[6] This method determines the concentration of orthophosphate in mg/L $PO_4$. To determine the amount of orthophosphate-P, the concentration of phosphate must be adjusted for the presence of oxygen in the $PO_4$ molecule. Oxygen is 67.4% of phosphate by mass but is not a plant nutrient in this form. Therefore, the result is multiplied by a conversion factor of 0.326, the ratio of the molecular weight of P (31 g/mol) to $PO_4$ (95 g/mol). The detection limit for orthophosphate is 0.75 mg/L; however, the detection limit for orthophosphate-P is lowered due to the conversion.

*Extended ranges in chemical analyses can be achieved through dilutions. Accuracies decrease proportionally with further dilutions.

** Readings below the PDL have increased percent error; measurements are reported, but are flagged as being below the PDL.

***Reporting limit, range, and accuracy information taken from Hanna Instruments and CHEMetrics manuals, available online at www.hannainst.com and www.chemetrics.com. Additional information regarding CHEMetrics accuracy was obtained from the manufacturer via email.

**TABLE 3-2**
**LABORATORY ANALYTICAL METHODS**

| Analyte | Analytical Method | Method Detection Limit | Maximum Holding Time [1] |
|---|---|---|---|
| Oil and Grease | EPA 1664 | 5 mg/L | 28 days |
| Total Hardness | EPA 200.7 | 10 mg/L | 14 days |
| Dissolved Cadmium | EPA 6020 | 0.00100 mg/L | 24 hours |
| Dissolved Copper | EPA 6020 | 0.00100 mg/L | 24 hours |
| Dissolved Lead | EPA 6020 | 0.00100 mg/L | 24 hours |
| Dissolved Zinc | EPA 6020 | 0.00500 mg/L | 24 hours |
| Diazinon | EPA 8141A | 0.05 µg/L | 7 days |
| Chlorpyrifos | EPA 8141A | 0.05 µg/L | 7 days |
| Total Coliforms | SM 9221 | [2] 20 – 1,600,000 MPN/100 mL | 6 hours |
| Fecal Coliforms | SM 9221 | [2] 20 – 160,000 MPN/100 mL | 6 hours |
| Enterococci | SM 9230 | [2] 20 – 160,000 MPN/100 mL | 6 hours |
| Total Coliforms | SM 9223 (IDEXX Colilert) [4] | 10 – 2,400,000 MPN/100 mL | 6 hours |
| *Escherichia coli* (*E. coli*) [3] | SM 9223 (IDEXX Colilert) [4] | 10 – 2,400,000 MPN/100 mL | 6 hours |
| Enterococci | IDEXX Enterolert [4] | 10 – 240,000 MPN/100 mL | 6 hours |

**Notes:**

µg/L = micrograms per liter

MPN/100 mL = most probable number (of colony-forming units) per 100 milliliters

[1] Maximum Holding Time values listed here apply to samples collected and preserved in accordance with the quality assurance and quality control procedures listed in Section 3.3.2.

[2] For D-MAX's Dry Weather Monitoring Program, EnviroMatrix Analytical, Inc. (EMA) performs standard dilutions for total coliforms to quantify from 20-1,600,000 most probable number per 100 milliliters (MPN/100 mL). For fecal coliforms and *Enterococci*, EMA performs standard dilutions to quantify from 20-160,000 MPN/100 mL. During the analysis and interpretation of the results, the number of tubes used to quantify the sample must fit the MPN index table from Standard Method 9221. The dilution set used will determine the detection limit. A standard dilution analysis is set up with 15 tubes at different concentrations. The reporting limit will always be adjusted depending on the dilution factor used for quantifying the actual results based on the MPN table. If the result for the analysis was less than 16,000 MPN/100 mL, the reporting limit will always be 20, and the dilution factor will be 10. As the dilution factor goes up, the reporting limit listed in the results from EMA will also go up based on the calculation made with EMA's data system. However, the lowest quantifiable number or reporting limit would still be 20 based on how the standard tubes for the sample is set up.

[3] Number of fecal coliforms is derived from number of *E. coli* through the following formula:
Fecal Coliforms = *E. coli* / 0.85. The converted fecal coliform count, not the number of *E. coli*, is reported in this report's data tables.

[4] IDEXX Colilert and Enterolert tests are performed by EnviroMatrix Analytical. This test is used during upstream investigations only.

## 3.3 Quality Assurance and Quality Control (QA/QC)

The QA/QC Plan utilized for this project includes the United States Environmental Protection Agency (EPA) approved test methods for the field and laboratory analysis of water samples, calibration of test equipment, and pre- and post-rinsing of sample collection containers and test vials. Key components of the QA/QC Plan are described below.

### 3.3.1 Field Sampling and Analysis QA/QC

The pH meters are calibrated periodically with sodium/potassium phosphate, monobasic buffer solutions with pH values equal to 4.00 ± 0.01, 7.00 ± 0.01, and 10.00 ± 0.01 units. The glass electrode tube is kept moist to preserve the meter's accuracy during fieldwork. The turbidity meter is calibrated and periodically checked for accuracy using standard solutions. The conductivity meter is checked periodically with standard solutions and calibrated as necessary.

Field sample collection containers are first rinsed with distilled water and then with the sample water before sample collection. Upon completion of sampling at each site, sample collection containers, test vials, and ion-sensitive electrodes were rinsed twice with distilled water and dried.

The accuracy of field analytical techniques is assessed at the beginning of each sampling week by analyzing solutions of known concentrations for ammonia-nitrogen, surfactants, nitrate, and orthophosphate. The results of the assessment are shown in Table 3-3.

**TABLE 3-3**
**FIELD ANALYSIS QA/QC RESULTS**

| Date | Analyte | Known Concentration (mg/L) | Acceptable Range* (mg/L) | Field Test Kit Results (mg/L) |
|---|---|---|---|---|
| 9/16/08 | Ammonia-Nitrogen | 1.0 | 0.8 – 1.2 | 0.802 |
| 9/16/08 | Surfactants | 1.0 | 0.75 – 1.25 | 1.0 |
| 9/16/08 | Nitrate * | 44.3 | 31.0 – 57.6 | 55.93 |
| 9/16/08 | Orthophosphate * | 1.0 | 0.75 – 1.25 | 0.904 |

**Notes:**

* Acceptable range is calculated based on the error associated with the methods as listed in Table 3-1.

** Nitrate and orthophosphate are converted to nitrate-nitrogen and orthophosphate-phosphorus, respectively, when conducting standard field screening. This is accomplished by multiplying the results by 0.226 for nitrate and 0.326 for orthophosphate. To simplify the calibration process, the unconverted numbers are used when calibrating the instruments.

### 3.3.2 Laboratory Sampling and Analysis QA/QC

Samples for laboratory analysis are collected concurrently with field samples and utilized the same sampling procedures. Pre-sterilized sample bottles are obtained from the laboratory and thus do not require rinsing with sample water prior to sample collection. After sample collection, all laboratory samples are kept in a cooler on ice until picked up by the lab. Strict chain of custody procedures are followed, and samples are delivered and analyzed within the appropriate holding times, as listed in Table 3-2. Completed chain-of-custody forms are included in Appendix C.

## 3.4 Follow-up Action Levels

Based on dry weather field screening results, immediate follow-up investigations are sometimes necessary to identify and eliminate pollutant sources. In order to determine whether an immediate source investigation is necessary, numeric action levels and best professional judgment are used to interpret the field screening results. If visual and/or analytical evidence of gross contamination are present at a site (e.g., substantial petroleum sheen, extremely high ammonia concentration, evidence of a sewage release, etc.), then an immediate source identification investigation is initiated. For sites that exceed numeric action levels but are not perceived as an immediate threat to water quality, a re-sampling is conducted within one day. An upstream pollutant source investigation is conducted thereafter if elevated concentrations persist and no sources can be identified in the immediate vicinity of the monitoring station. If elevated levels of pollutants are detected by the laboratory analyses, a comprehensive follow-up pollutant source investigation is conducted within two days of receiving the analytical reports from the lab. The results of these investigations are included in Section 8 of this report. Recommendations based on these investigations are included in Section 9.

The following three methods are employed to determine whether immediate or comprehensive follow-up investigations are necessary: (1) Numeric Action Levels; (2) California Toxics Rule (CTR); and (3) Best Professional Judgment. All three approaches are described in detail below and presented in Table 3-4.

**Numeric Action Levels**

Numeric action levels are used as the primary approach for interpreting pH, orthophosphate-P, nitrate-N, ammonia-N, surfactants, oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, and *Enterococcus* analytical results (see Table 3-4). Prior to the 2003 dry weather season, no standard action levels had been adopted for use throughout San Diego County. D-MAX calculated the current set of numeric action levels, which are based on county-wide sampling data and have been used by all Copermittees since the 2003 dry weather season. If pH, orthophosphate-P, nitrate-N, ammonia-N, or surfactants are observed above the numeric action level, a follow-up investigation is conducted within one day to investigate the source unless best professional judgment indicates otherwise. If oil and grease, diazinon, chlorpyrifos, total coliforms, fecal coliforms, or *Enterococcus* laboratory analytical results exceed numeric action levels, then source investigations are conducted within two business days of receiving the test results from the lab.

**California Toxics Rule**

The CTR criterion maximum concentration (CMC) is used to determine appropriate action levels for dissolved trace metals, including cadmium, copper, lead, and zinc. The CTR equations, as provided in EPA Federal Register Doc. 40 Code of Federal Regulations (CFR) Part 131, are used to calculate benchmarks based on the total

hardness of the sampled water, with the action levels increasing as hardness increases. More information on the CTR is available at http://www.epa.gov/region09/water/ctr.

**Best Professional Judgment**

Best professional judgment is used as the primary approach for interpreting turbidity, water temperature, and conductivity and as a secondary approach for interpreting the results of all other field and laboratory analyses. Under best professional judgment, the need for a follow-up investigation is left to the discretion of the field crew. Best professional judgment may indicate that results which either exceed certain action levels or statistical outliers may be the result of natural or background factors.

## TABLE 3-4
## ACTION LEVELS FOR FIELD SCREENING AND LABORATORY PARAMETERS

| Field Screening Analytes | Action Levels[1] | Source/ Notes |
|---|---|---|
| pH | <6.5 or >9.0 | Basin Plan, w/ allowance for elevated pH due to excessive photosynthesis. Elevated pH is especially problematic in combination with high ammonia. |
| Orthophosphate-P (mg/L) | 2.0 | EPA Multi-sector General Permit |
| Nitrate-N (mg/L) | 10.0 | Basin Plan, and drinking water standards |
| Ammonia-N (mg/L) | 1.0 | Based on Workgroup experience. May also consider unionized ammonia fraction. |
| Surfactants (MBAS) (mg/L) | 1.0 | Basin Plan, with allowance based on Workgroup field experience and possible field reagent interferences. |
| Turbidity (NTU) | Best Professional Judgment | WQOs relevant to inland surface waters are not available. Base judgment on channel type and bottom, time since last rain, background levels, and most importantly visual observation (e.g. unusual colors and lack of clarity), and unusual odors. |
| Temperature (°C) | Best Professional Judgment | Base judgment on season, air temperature, channel type, shading, etc. |
| Conductivity (mS/cm) | Best Professional Judgment | Values > 5 mS/cm may indicate IC/ID however; EC may be highly elevated in some regions due to high-TDS groundwater exfiltration to surface water, mineral dissolution, drought, and seawater intrusion. Normal source ID and discharge elimination work is not effective in these situations. Knowledge of area background conditions is important. Values < 0.75 mS/cm may indicate excessive potable water discharge or flushing. |
| **Laboratory Analytes** | **Action Levels** | **Source/ Notes** |
| Oil and Grease (mg/L) | 15 | EPA Multi-sector General Permit. If petroleum sheen is observed, the sample should be collected from the water surface. Visual observations may justify immediate investigation. |
| Diazinon (µg/L) | 0.5 | Response to diazinon and chlorpyrifos levels above 0.5 µg/L should focus on education and outreach to potential dischargers in the target drainage basin. Highly elevated levels should be investigated aggressively as with other potential IC/IDs. |
| Chlorpyrifos (µg/L) | 0.5 | |
| Dissolved Cadmium (µg/L) | California Toxics Rule | Use California Toxics Rule Table, 1-hour criteria to determine appropriate action level for individual samples. Table provides benchmarks based on hardness and dissolved metals concentration. For example, at 300 mg/L hardness the following action levels would apply: Cd – 14 ppb; Cu – 38 ppb; Pb – 209 ppb; and Zn – 297 ppb. |
| Dissolved Copper (µg/L) | California Toxics Rule | |
| Dissolved Lead (µg/L) | California Toxics Rule | |
| Dissolved Zinc (µg/L) | California Toxics Rule | |
| Total Coliform (MPN/ 100 mL) | 50,000 | Bacteria levels in many storm drains are likely to exceed public health guidance criteria. Use confidence interval test and best professional judgment to identify conveyances for source ID. |
| Fecal Coliform (MPN/ 100 mL) | 20,000 | |
| *Enterococcus* (MPN/ 100 mL) | 10,000 | |

**Notes**

[1]The referenced action levels should not be the sole criteria for initiating a source identification investigation. Dry Weather Monitoring Program data should be interpreted using a variety of available information. Factors that should be considered include within-site and between-site sample variability.

| | |
|---|---|
| °C | degrees Celsius |
| mS/cm | milliSiemens per centimeter |
| mg/L | milligram per liter |
| IC/ID | illegal connection/illicit discharge |
| MBAS | methylene blue active substances |
| MPN/100 mL | most probable number per 100 milliliters |
| NTU | nephelometric turbidity unit |
| ppb | parts per billion |
| EPA | United States Environment Protection Agency |
| WQO | Water Quality Objectives |

# 4 FIELD SCREENING RESULTS

The 2008 Dry Weather Monitoring Program took place from September 17th to October 3rd of 2008. Field screening was conducted at the 15 sites where ponded or flowing water was observed. Primary sampling station sites 4 and 13 were dry, and replaced with alternate sites 19 and 20. A confirmation visit was also performed at one site where a field constituent was found to exceed its action level. Field data sheets for each site visit are included in Appendix D.

## 4.1 Qualitative Observations

Qualitative observations, which are a routine part of the Dry Weather Monitoring Program, are summarized below and presented in Table 4-1:

**Light Conditions**
Light conditions were sunny during all site visits.

**Odor**
Water samples from the majority of sites were odorless. One sample had a slight chemical odor.

**Color**
Water samples taken from most of the sites were colorless, with the exception of two yellow water samples.

**Clarity**
Aside from negligible amounts of suspended particles, nearly all sites had clear water samples. One site had cloudy water.

**Floatable Materials**
Two sites had some bubbles and three sites had a sheen on the water surface. Eight of the screened sites had trash in contact with the water. Section 5 of this report includes the results of full trash assessment conducted at each site.

**Deposits**
Sediment and fine particulates were observed at most sites. No stains or oily deposits were observed.

**Vegetation**
Each of the sites supported vegetation in accordance with soil availability and sunlight exposure. For example, while manholes lacking soil and sunlight had no vegetation, natural creeks had normal vegetative growth.

**Biology**
The presence of aquatic flora and fauna can indicate healthy water conditions. Algal growth is an indicator of persistent water flow. Many of the sampling locations were home to insects, snails, fish, and/or crayfish.

**TABLE 4-1**
**FIELD OBSERVATIONS**

| Site No. | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |
|---|---|---|---|---|---|---|---|---|---|---|
| Site 1 | 9/17/08 | 11:20 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | Normal | Insects, algae, fish, snails |
| Site 2 | 9/17/08 | 10:00 | Sunny | Chemical | None | Clear | Bubbles/foam | Sediment/gravel, fine particulates | Normal | Insects, algae, fish, snails, crayfish |
| Site 3 | 9/18/08 | 15:25 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | Normal | Insects, algae, fish, crayfish |
| Site 4 | 9/18/08 | 9:05 | Sunny | ns | ns | ns | ns | Sediment/gravel, fine particulates | Limited | None |
| Site 5 | 9/19/08 | 11:00 | Sunny | None | None | Clear | None | Sediment/gravel, fine particulates | Normal | Insects, algae |
| Site 6 | 9/18/08 | 9:30 | Sunny | None | None | Clear | None | Sediment/gravel, fine particulates | None | Insects |
| Site 7 | 9/18/08 | 12:05 | Sunny | None | None | Clear | None | Sediment/gravel, fine particulates | Limited | Insects |
| Site 8 | 9/17/08 | 13:20 | Sunny | None | Yellow | Clear | Trash | Sediment/gravel, fine particulates | Normal | Algae, fish |
| Site 9 | 9/19/08 | 10:15 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | Normal | Insects, algae, fish, crayfish |
| Site 10 | 9/17/08 | 12:30 | Sunny | None | Yellow | Clear | Trash, sheen (dust) | Sediment/gravel, fine particulates | Normal | Algae |
| Site 11 | 9/18/08 | 10:25 | Sunny | None | None | Clear | None | Sediment/gravel, fine particulates | None | None |
| Site 12 | 9/18/08 | 14:00 | Sunny | None | None | Clear | None | Sediment/gravel, fine particulates | None | None |
| Site 13 | 9/17/08 | 16:15 | Sunny | ns | ns | ns | ns | Sediment/gravel, fine particulates | None | None |

**TABLE 4-1**
**FIELD OBSERVATIONS (CONTINUED)**

| Site No. | Date | Time | Light Conditions | Odor | Color | Clarity | Floatables | Deposits | Vegetation | Biology |
|---|---|---|---|---|---|---|---|---|---|---|
| Site 15 | 9/18/08 | 14:50 | Sunny | None | None | Clear | Trash, sheen, bubbles/foam | Sediment/gravel, fine particulates | Normal | Algae |
| Site 16 | 9/17/08 | 15:35 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | Normal | Insects, algae |
| Site 19 | 9/18/08 | 11:10 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | None | None |
| Site 19 (Confirmation) | 9/19/08 | 12:00 | Sunny | None | None | Clear | Trash | Sediment/gravel, fine particulates | None | None |
| Site 20 | 9/19/08 | 9:25 | Sunny | None | None | Clear | Trash, sheen | Sediment/gravel, fine particulates | Normal | Insects |

**Notes:**

denotes a confirmation visit

ns = not sampled (dry site)

## 4.2 Field Analytical Results

Field analyses are conducted at all sites with flowing or ponded water. The measured constituents are described below.

**Flow rates** are the measurements of the volume of fluid passing through a given surface per unit time. Flow rate measurements are needed to calculate the load or particular amount of a pollutant discharged.

**Water temperature** is needed to assess the significance of other parameters, such as pH and conductivity. Also, the aquatic habitat must remain within a certain temperature range in order to sustain sensitive aquatic life. In the field, water temperature is measured immediately upon sample collection at each site with ponded or flowing water.

The **pH** is an expression of acidity or alkalinity of a water sample. The pH of an aquatic system will drive a variety of chemical reactions, including the availability of nutrients or the solubility of chemical substances, particularly heavy metals.

**Turbidity** describes the clarity or cloudiness of a water sample, or the degree to which light is blocked by suspended material in the water. Turbid waters not only limit the amount of light that reaches submerged vegetation, thus reducing photosynthetic capacity, but excessive suspended particles can also absorb heat and increase water temperatures.

**Specific Conductance (Conductivity)** values indicate the total concentration of ions in an aquatic system and the ability of the water to conduct electricity. This parameter can be used to assess the mineral content of water and potentially help indicate the presence of dissolved pollutants.

**Surfactant** concentrations in water samples often reflect illegal discharge from industrial, commercial, or residential sources. Pollution resulting from surfactants alters the surface tension of water and disrupts the breathing mechanisms of fish gills and other aquatic organisms.

**Ammonia-Nitrogen** (ammonia-N) is an indicator of pollution from decomposing organic matter, agricultural or household fertilizer runoff, or the presence of sewage. Ammonia occurs naturally in the environment; however, in higher quantities it can become toxic to fish and other organisms.

**Nitrate-Nitrogen** (nitrate-N) is a common sign of nutrient pollution from agricultural or household fertilizer runoff. Nitrate pollution can cause excessive algal growth, which can deplete oxygen from the water during decomposition and eventually suffocate other aquatic life. During the field analysis, nitrate is measured in milligrams per liter (mg/L) $NO_3$ and converted into mg/L nitrate-N using a conversion factor of 0.226. This process is explained in Note 3 of Table 3-1.

**Orthophosphate-Phosphorus** (orthophosphate-P) is also an indicator of nutrient pollution from agricultural or household fertilizer runoff. Similar to nitrate-N, orthophosphate-P pollution can cause nutrient enrichment (eutrophication), stimulate algal growth, and thus deplete oxygen in the water to levels that are dangerous for aquatic life. Even low levels of orthophosphate-P can cause significant algal growth, as it is commonly the limiting nutrient in plant growth. During the field analysis, orthophosphate is measured in mg/L $PO_4$ and converted into mg/L orthophosphate-P using a conversion factor of 0.326. This process is explained in Note 6 of Table 3-1.

A statistical summary of the routine field analytical results is presented in Table 4-2. Table 4-3 shows the results of all field analyses conducted at the sampled sites. Graphs of the

various parameters and appropriate action levels for follow-up investigations are included at the end of this section.

**TABLE 4-2**
**FIELD ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Average | Median | Standard Deviation | Number of Exceedances | Graph Number |
|---|---|---|---|---|---|---|---|
| Flow Rate (gpm) | 27 | 0 | 5.6 | 2.0 | 8.2 | N/A | 4-1 |

# 5 TRASH ASSESSMENT

## 5.1 Regulatory Requirements

Section II.B.3.C.(7) of the Municipal Permit's Receiving Waters and Urban Runoff Monitoring and Reporting Program requires Copermittees to assess the presence of trash in receiving waters and urban runoff at each dry weather field screening site. This trash assessment program is designed to provide information on the spatial extent and relative amount of trash present, as well at the nature and origin of the trash at the site.

## 5.2 Procedure and Definitions

The San Diego Copermittee Dry Weather Monitoring Workgroup developed a two-page Trash Assessment Form to document the amount and extent of trash and the threat to human and aquatic health. The first page is completed at every site. The second page, which includes information about the types, prevalence, potential routes, and sources of trash, is also completed at sites where a larger amount of trash is observed.

A qualitative estimate of the abundance of trash is made based upon a general impression of the site. The Trash Assessment Form includes five categories to describe the amount and extent of trash. The definitions are primarily qualitative, although numbers of trash pieces are also included in each category as a rough guideline. The five categories are listed below.

- *Optimal:* On first glance, no trash is visible. Little or no trash (<10 pieces) is evident when the evaluated area is closely examined for litter and debris.
- *Suboptimal:* On first glance, little or no trash is visible. After close inspection, small levels of trash (~10-50 pieces) are evident in the evaluated area.
- *Marginal:* Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing are present.
- *Submarginal:* Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100-400 pieces). Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing are present.
- *Poor:* Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces).

The threat to human health and threat to aquatic health is assessed at each site using the following definitions:

- *Threat to Human Health* - Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris have the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g., medical waste, diapers, human waste), or have the potential for physical harm (sharps, entanglement, nails, etc.).
- *Threat to Aquatic Health* – Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc.) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and

other materials that have the potential for entanglement. Oil and other visible chemicals or chemical containers fall in this category.

In the event that a site is noted as potentially posing a threat to human or aquatic health, additional descriptive comments are recorded in the "Comments" section of the Trash Assessment Form.

If a site is labeled as submarginal or poor, it is then assessed for types of trash present (e.g., automotive, biohazard, food waste), which are ranked based on the prevalence and potential threat to water quality of the items. Lastly, the potential mechanism through which trash reached the site (e.g., dumping, littering, upstream sources) and the potential source of the trash (e.g., construction, commercial, transient) are identified.

## 5.3 Trash Assessment Results

Table 5-1 and Graph 5-1 summarize the trash assessment results for 17 sites, including two dry sites. Figure 5-1 provides a map of the sites and their corresponding trash assessment.

**TABLE 5-1**
**TRASH ASSESSMENT RESULTS**

| **Optimal** (1site) | **Suboptimal** (5 sites) | **Marginal** (9 sites) | **Submarginal** (2 sites) | **Poor** (0 sites) |
|---|---|---|---|---|
| 2 | 1<br>6<br>7<br>11<br>12 | 3<br>5<br>8<br>9<br>10<br>13<br>16<br>19<br>20 | 4<br>15 | |

**GRAPH 5-1**
**TRASH ASSESSMENT SUMMARY**

Six sites sampled in the City of Lemon Grove received either an "optimal" or "suboptimal" trash rating. Nine sites were considered "marginal," and two sites were rated "submarginal." None of the sites were considered to have "poor" trash levels. Conditions at one site were noted as posing a potential threat to aquatic health due to the presence of an aerosol paint can.

### 5.3.1 Threat to Aquatic Health

**Site 8** is located at an outlet 100 feet south of the Massachusetts Avenue trolley station, next to Lemon Grove Avenue. The site was assessed as marginal due to various bottles, cans, and a folding chair observed during field screening. The presence of an aerosol paint may also be a threat to aquatic health.

### 5.3.2 Submarginal Sites

**TABLE 5-2**
**BREAKDOWN OF SUBMARGINAL SITES**

| Site | Types of Trash | Ranking | Potential Route 1 | Potential Route 2 | Potential Source 1 | Potential Source 2 |
|---|---|---|---|---|---|---|
| 4 | Food Packaging | 1 | Littering | --- | Household | --- |
| | Household | 2 | Littering | --- | Household | --- |
| | Cigarette Butts | 3 | Littering | --- | Household | --- |
| 15 | Food Packaging | 1 | Littering | --- | Commercial | Industrial |
| | Business Related | 2 | Littering | --- | Commercial | Industrial |
| | Cigarette Butts | 3 | Littering | --- | Commercial | Industrial |

**Site 4** is a catch basin between 7102 and 7106 Westview Place, in a primarily residential area. The site was dry, however a "submarginal" level of trash was noted. Observed litter items at Site 4 included styrofoam and plastic food packaging, balls and toys, toiletry items, and cigarette butts. It appears that most of the trash could have originated in the residential area from littering, improper trash disposal, or, in the case of toys, accidental loss.

**Site 15** is an earthen channel in front of Thompson Building Materials at 6636 Federal Boulevard. The site was rated "submarginal" due to the quantity of trash items noted. Observed litter items at Site 15 included many types of food packaging, business related packaging (e.g., styrofoam peanuts, cardboard, plastic twine), paper waste (e.g., mail, receipts, coupons), a large amount of shredded paper, and cigarette butts. The site is also very near a garbage handling facility.

**FIGURE 5-1**

Base Data Sources: USGS, SanGIS, SANDAG, City of Lemon Grove

# 6 LABORATORY ANALYTICAL RESULTS

## 6.1 Summary

Laboratory analyses were conducted at four sites, representing over 25 percent of the 15 primary sites. The laboratory constituents measured are defined below.

**Oil and grease** analysis is used to detect hydrocarbon pollution from a variety of sources, including parking lots and streets, washing activities, illegal discharges, and automobile repair facilities.

**Total hardness** measures the amount of calcium and magnesium ions in a water sample, with the result expressed in mg/L of $CaCO_3$. Hardness itself is not considered a pollutant, but is measured to calculate CTR limits for dissolved metals. Hardness affects the solubility of dissolved metals as well as other minerals and ions.

**Diazinon** and **chlorpyrifos** are organophosphate pesticides that can be harmful to aquatic organisms if transported in urban runoff. Diazinon and chlorpyrifos are highly toxic to birds, mammals, and insects. They are also highly toxic to freshwater fish and invertebrates following acute exposure.

**Metal** contamination of water can arise from a variety of sources, including automobile operation, automobile repair, vehicle washing, galvanizing of metal, and electronics manufacturing. Certain dissolved metals are toxic pollutants that are hazardous to the survival and development of aquatic organisms.

The California Toxics Rule for Dissolved Metals in Fresh Waters defines metal toxicity as a function of water hardness, with toxicity decreasing as hardness increases. Therefore, each dissolved metal has a CMC for a specific total hardness. The laboratory samples are analyzed for the presence of dissolved cadmium, copper, lead, and zinc. Table 6-1 shows the sites with detectable metal concentrations, the measured total hardness of the sample, and the associated CMC.

**TABLE 6-1**
**CTR – CMC FOR DISSOLVED METALS**

| Site | Total Hardness (mg/L) | CMC (mg/L) | Concentration (mg/L) |
|---|---|---|---|
| **Dissolved Copper** | | | |
| Site 1 | 680 | 0.0818 | 0.00469 |
| Site 2 | 1,210 | 0.1408 | 0.00299 |
| Site 8 | 502 | 0.0615 | 0.00287 |
| Site 10 | 972 | 0.1145 | 0.00858 |
| **Dissolved Zinc** | | | |
| Site 1 | 680 | 0.595 | 0.0174 |
| Site 2 | 1,210 | 0.969 | 0.0117 |
| Site 8 | 502 | 0.460 | 0.00827 |
| Site 10 | 972 | 0.805 | 0.109 |
| **Dissolved Lead** | | | |
| Site 10 | 972 | 0.679 | 0.0169 |

**Notes:**
Dissolved cadmium and lead were not detected at any sampled sites.
For equations and constants used in CTR calculations, see http://www.epa.gov/ost/standards/ctr/toxic.pdf

**Coliform bacteria** are relatively harmless to humans and are present in mammalian digestive tracts and are naturally found in most surface waters and soils. Testing water samples for total coliform bacteria is a standard practice in public health since a high level of total coliform bacteria often may indicate the presence of other more harmful, pathogenic organisms, sometimes of fecal origin. Total coliform is measured in lieu of these pathogens since the various pathogens are generally present in much smaller quantities and are difficult to detect.

**Fecal coliform**, a subset of coliform bacteria, and ***Enterococcus*** are found primarily in the gastro-intestinal tracts of humans and animals and are commonly used as indicators of water contamination by fecal matter. A host of human diseases, particularly those of the gastro-intestinal tract, are spread through water contaminated with fecal matter. Without the use of significantly more expensive methods, such as ribotyping, it is not possible to determine whether the source of fecal material was human or animal. Human fecal material is known to contain pathogens dangerous to humans, but the relationship between animal waste and threat to human health is less certain.

A summary of the laboratory analytical results is presented in Table 6-2. Table 6-3 presents the laboratory results from all samples. Laboratory reports are included in Appendix C.

**TABLE 6-2**
**LABORATORY ANALYSIS STATISTICAL SUMMARY**

| Parameter (units) | Maximum | Minimum | Number of Exceedances |
|---|---|---|---|
| Total Hardness (mg/L $CaCO_3$) | 1,210 | 502 | na |

nd = not detected
na = not analyzed
CTR = California Toxics Rule; CTR action levels for metals are calculated based upon on the total hardness value of the water sample.
* Total hardness is not considered a pollutant (see section 3.4 for details), and thus has no established action level for the purposes of dry weather monitoring.

# 7 DATA ANALYSIS

This first part of this section provides an overall evaluation of test results obtained from the 2008 Dry Weather Monitoring Program. The second portion of this section describes historical trends for various constituent exceedances.

## 7.1 2008 Results

This year, three sites had action level exceedances. Site 1 had high levels of all three bacteria indicator tests; Site 10 had a total coliforms exceedance; and nitrate–nitrogen was measured above the action level at Site 19. Table 7-1 displays the 2008 action level exceedances.

**TABLE 7-1**
**2008 EXCEEDANCES AT A GLANCE**

| Site No. | Nitrate-N | Total Coliforms | Fecal Coliforms | *Enterococci* |
|---|---|---|---|---|
| 1 | | ✓ | ✓ | ✓ |
| 10 | | ✓ | | |
| 19 | ✓ | | | |

Note: Table reflects exceedances occurring during routine visits only, not confirmation or follow-up visits.

## 7.2 Previous Results

Historical results of exceedances are presented in Table 7-2, Graph 7-1, and Graph 7-2. Table 7-2 shows the percentage of sampled sites that have had exceedances each year of the Dry Weather Monitoring Program. Graph 7-1 illustrates the percentage of exceedances for field constituents, and Graph 7-2 presents the percentage exceedances by year for laboratory analyses.

Beginning in 2002, no exceedances were measured in temperature, oil and grease, cadmium, copper, lead, zinc, or chlorpyrifos. Thus, these constituents have not been included in the following table or graphs. Orthophosphate-phosphorus, turbidity, and pH were detected above the action level only in 2002. A diazinon exceedance was noted in 2003 only. There have been nitrate-nitrogen exceedances since 2002, and total coliforms have routinely measured above the action level since 2003.

**TABLE 7-2**
**PERCENT OF SITES WITH EXCEEDANCES BY YEAR**

**Notes:**
Results based on complete routine visits only. Confirmation visits, follow-up visits and dry sites not included.

* By regional consensus, the action level for conductivity has been changed during past years from numeric values to best professional judgment in order to account for sites in which salt water and groundwater increase conductivity. High conductivity levels at these sites are not necessarily exceedances or considered to be a water quality concern.

# 8 FOLLOW-UP INVESTIGATIONS

One of the main purposes of the Dry Weather Monitoring Program is to identify IC/IDs. Both field screening and laboratory analytical results are compared to regionally developed action levels (Table 3-4). When a parameter is measured at or above its action level, it is possible that an IC/ID is present. To further investigate potential IC/IDs, additional investigation is initiated whenever action levels are exceeded. Procedures for such investigations are described below.

## 8.1 Investigation Procedures

When Dry Weather Monitoring Program results exceed action levels, the City either conducts an investigation to identify the source of the discharge or provides rationale for why the discharge does not pose a threat to water quality and does not need further investigation. An immediate source identification investigation is initiated if visual and/or analytical evidence of gross contamination is present at a site during a routine investigation. Examples of gross contamination include substantial petroleum sheens, constituent concentrations well above action levels, abnormal colors or odors not attributable to natural site conditions, or evidence of a sewage release; such conditions would typically be considered a threat to human health or the environment. Immediate source identification investigations are also often conducted when surfactants exceedances are noted. Past experience has shown that an immediate investigation is much more likely to identify the source of the exceedance for this particular constituent. This is because such exceedances are often related to washing activities, which are typically intermittent in nature.

When further investigation is needed but an immediate upstream investigation is not necessary, the City initially confirms the results by resampling within two business days of being informed of the exceedance. For field screening, this is within two business days of the initial test. The overall time frame for laboratory analytical results depends on the time that results are received from the lab, but investigations will be conducted within two days of receiving the data, where applicable. These investigations are labeled as “confirmation” visits in this report, and they are used to guide further upstream investigations where necessary.

When confirmation sampling confirms continued exceedance of action levels, then the City conducts further investigation to identify the source of the exceedance. This type of investigation is referred to as “follow-up” in this report. Additional investigation is not conducted when exceedances are not noted during the confirmation visit or when the exceedance is known not to be the result of IC/IDs, as without a high constituent level to track upstream, the investigation is unlikely to identify any sources. As noted earlier, when gross contamination is observed during a routine visit, an immediate upstream source investigation is initiated. Prior to beginning an upstream source investigation, field staff review previous dry weather monitoring reports and consult MS4 maps to plan the investigation.

Dry weather flows are generally traced from the site in an upstream direction along the conveyance system. Photos, narrative descriptions of relevant visual observations made, and GPS coordinates are recorded to aid in documentation and in potential enforcement procedures. Water samples are collected at upstream confluences for analyses of the constituent(s) being tracked. All samples are documented through the completion of field data sheets, which are provided in Appendix D. If the samples are being submitted for laboratory analysis, they are delivered within the appropriate holding time, and all appropriate

chain-of-custody procedures are followed. Sampling and analysis methods are typically the same as those used for the routine portion of the Dry Weather Monitoring Program, with the exception of bacteria analyses. During confirmation and follow-up sampling IDEXX Colilert and Enterolert methods are used instead of the multiple tube fermentation (MTF) methods used for routine visits. The IDEXX methods provide faster turn-around time than the MTF methods: results can be provided within 24 hours instead of several days. Shorter turn-around time allows investigators to conduct further follow-up testing sooner where necessary. The IDEXX methods are also less expensive than MTF methods, which allows field investigators to take samples from a larger number of locations.

If the results of the upstream investigation indicate that an IC/ID may be present, appropriate City personnel will be notified. Where appropriate and feasible, field staff may also contact the party responsible for the discharge directly regarding the IC/IDs and potential BMPs.

## 8.2 Investigated Sites

During the 2008 Dry Weather Monitoring Program additional investigations to investigate potential IC/IDs were completed at three sites. One site had a nitrate-nitrogen exceedance, and two sites had exceedances for bacteria. A brief description of each site, the field and/or laboratory analytical results, photographs of selected upstream locations, and the results of upstream investigations are included below. Table 9-2 in Section 9 of this report provides a summary of the investigation results.

### Site 1

Site 1 is located at a 76" corrugated metal pipe (CMP) outfall, 100 feet southeast of the Sweetwater Road and Broadway intersection. During the initial visit to the site the water at the site was nearly ponded, with a small flow of less than 1 gpm. Laboratory analysis of the water sample resulted in levels of total coliform, fecal coliform, and *Enterococcus* bacteria above each of their respective action levels. Upon receiving the laboratory results a confirmation visit and upstream investigation were conducted.

Photo 8-1: Litter, sediment, and a sandbag in manhole at upstream location 1-1.

During the confirmation visit the sample had a high count of total coliforms, but fecal coliforms and Enterococci were below their action levels. The condition of the site appeared similar to the initial visit, when a small flow of water was observed downstream of a pooled area. The flow was traced upstream to a manhole at the eastern corner of Broadway and Lemon Grove Way, in front of a Valero gas station (upstream location 1-1). A similarly small flow was observed in the manhole, where litter and a sandbag were also noted. The sample at upstream location 1-1 had high counts of all three indicator bacteria (see Table 8-1). Of the two pipes upstream of this manhole, the southwestern pipe was dry upstream, and no sample was taken. However a significant amount of litter was observed in the manhole located

Photo 8-2: Litter and sediment in manhole near 8165 Broadway, southwest of upstream location 1-1.

in front of 8165 Broadway. The northwestern pipe into upstream location 1-1 comes from primary Site 12 on Lemon Grove Way (upstream location 1-2). The sample taken from upstream location 1-2 had relatively low levels of bacteria and did not appear likely to be a source of downstream exceedances.

From the evidence available it seemed likely that conditions in the manhole at upstream location 1-1 or transient input from the dry line southwest of upstream location 1-1 could be the cause of bacterial growth. Both upstream location 1-1 and the manhole near 8165 Broadway had a significant amount of litter and sediment in the cleanouts. Much of the trash observed was consistent with litter that may be generated by customers of convenience stores, such as the adjacent Valero, or fast food restaurants. In 2006 strong evidence of wildlife activity (i.e., feces, a carcass) was found in the storm water conveyance. While this evidence was not observed in 2008, significant amounts of food packaging litter would provide a reasonable incentive for scavenging animal activity in the storm water conveyances along Broadway upstream of Site 1, a potential source of fecal indicator bacteria. A summary of the upstream investigation at Site 1 for bacteria is presented in the following map and table.

**FIGURE 8-1**

* Fecal coliform values were obtained from *E. coli* values by dividing by a factor of 0.85.

## Site 10

Site 10 is located in an earthen channel across from 2220 and 2196 Main Street, by the trolley tracks, and is between Site 9 (upstream) and Site 8 (downstream). The sample taken during the initial visit had a total coliform count of 130,000 MPN/100mL, above the action level of 50,000 MPN/100mL. Upon receiving these laboratory results a confirmation visit and upstream investigation were conducted.

Photo 8-3: Litter and decaying organic matter in dense vegetation upstream of Site 10 at Site 16.

The sample from the confirmation visit also had a high level of total coliforms, 61,300 MPN/100mL. Site 9 (upstream location 10-1) is separated from Site 10 by a stretch of densely-vegetated earthen channel and had an even higher total coliform count, as well as some litter and a shopping cart. The flow was then traced upstream to a catch basin at the corner of Cypress Avenue and Lemon Grove Avenue (upstream location 10-2). This location had a similarly high level of total coliforms. Further upstream along the same line, Site 13 was dry. Visual observations in the upstream areas noted dense vegetation and trash in the upstream conveyance at primary Site 16. The *E. coli* bacteria counts at the upstream locations 10-1 and 10-2 indicated fecal coliforms were below the action level and fecal contamination was unlikely. Therefore, trash and decaying organic matter are the most likely sources of total coliforms at Site 10. Notably, the levels of bacteria appear to decrease as the flow moves downstream to the site. Additionally, runoff appeared to pond at Site 10 and not reach the downstream Site 8, which had a total coliform bacteria count that was below the action level.

A summary of the upstream investigation at Site 10 is presented in the map and table located below.

* Fecal coliform values were obtained from *E. coli* values by dividing by a factor of 0.85.
** Visual observations only recorded at these locations during the upstream investigation.

### Site 19

Site 19 is located in a manhole at a small cul-de-sac on the west side of Skyline Drive, south of Lincoln Street. This site has a history of nitrate-nitrogen exceedances, and again this year the nitrate-nitrogen concentration was above the action level during the initial site visit at 10.58 mg/L. However, a confirmation visit found that the nitrate-nitrogen concentration had dropped below the action level to 8.33 mg/L on the following day. A brief look in upstream conveyances revealed that they were dry and that flow likely still arose from groundwater ingress into the storm water conveyance, similar to observations in previous years.

# 9.0 SUMMARY AND RECOMMENDATIONS

## 9.1 Summary of Field Screening and Laboratory Analysis Data

### 9.1.1 Summary of Field Screening and Laboratory Analysis Data

Fifteen monitoring locations were selected and visited for the 2008 Dry Weather Monitoring Program. Two alternate sites were visited and sampled to replace the two primary sites that were dry. Table 9-1 provides a summary of action level exceedances.

**TABLE 9-1**
**SUMMARY OF ACTION LEVEL EXCEEDANCES**

| Field Screening (15 Samples) | | | |
|---|---|---|---|
| **Analyte** | **Number of Exceedances** | **Percentage of Sampled Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| Nitrate-Nitrogen | 1 | 7 % | 19 |
| **Laboratory Analyses (4 Samples)** | | | |
| **Analyte** | **Number of Exceedances** | **Percentage of Analyzed Sites with Exceedance** | **Site(s) Exceeding Action Level** |
| Total Coliforms | 2 | 50 % | 1, 10 |
| Fecal Coliforms | 1 | 25 % | 1 |
| Enterococci | 1 | 25 % | 1 |

**Note:** Data is from the initial site visits only.

A formal trash assessment was performed for the first time in 2008 in accordance with the Municipal Permit. Seventeen sites, including dry sites, were assessed, and six of the sites were scored as optimal or suboptimal, having little or no trash. Nine sites had marginal levels of trash, and two were considered submarginal. An aerosol paint can observed at Site 8 was also considered to be a potential threat to aquatic health.

### 9.1.2 Summary of Follow-Up Investigation Data

Table 9-2 presents the conclusions based on the results of confirmation visits and upstream investigations conducted at three sites for the 2008 Dry Weather Monitoring Program.

**TABLE 9-2**
**SUMMARY OF FOLLOW-UP INVESTIGATIONS**

| Site | Follow-Up Investigation Target Constituents | | Results/Probable Source |
|---|---|---|---|
| | Field | Laboratory | |
| 1 | | Total Coliforms, Fecal Coliforms, Enterococci | Only total coliforms remained above the action level during the confirmation visit. Significant amounts of trash observed in two upstream catch basins is the likely source of bacteria. Previous investigations have also found evidence of wildlife activity in the area, which could also be a source. |
| 10 | | Total Coliforms | Trash and dead organic matter were observed upstream where water flowed slowly through dense vegetation. Since fecal coliforms were low, trash and organic matter are the likely source of bacteria. |
| 19 | Nitrate-Nitrogen | | Nitrate-nitrogen was below the action level during the confirmation visit. History of elevated nitrate-nitrogen levels at this site has been attributed to upstream groundwater ingress in the past. |

## 9.2 Recommendations

Based on the results of the 2008 Dry Weather Monitoring Program, the following actions are recommended for consideration.

### 9.2.1 Maintenance

- Clean out trash in the storm water conveyance upstream of Site 1, particularly focusing on the manhole at the east corner of Broadway and Lemon Grove Way and the manhole in front of 8165 Broadway.
- Prioritize removal of trash from sites 3, 4, 5, 8, 9, 10, 13, 15, 16, 19, and 20, which were scored as submarginal or marginal by the trash assessment during routine site visits. In particular, remove the aerosol can from Site 8, which may be a threat to aquatic health. Add these sites to the City's existing clean up schedule as appropriate
    - The above list of sites includes the sites upstream of Site 10. Trash and organic debris accumulation at these locations were thought to be a likely source of total coliform bacteria at Site 10.
- Of the remaining sites with a suboptimal trash score prioritize removal of trash from Site 1, where the trash was also in contact with the water. Other suboptimal sites should also be cleaned up and added to the City's existing clean up schedule as appropriate, including sites 6, 7, 11, and 12.

# Laboratory Analytical Reports

**EnviroMatrix Analytical, Inc.**

26 September 2008

D-Max Engineering
Attn: Arsalan Dadkhah
7220 Trade Street, Suite 119
San Diego, California 92121

**EMA Log #: 0809390**

**Project Name: Lemon Grove Dry Weather**
**Project Desc./#:200842W-1**

Enclosed are the results of analyses for samples received by the laboratory on 09/17/08 14:52. Samples were analyzed pursuant to client request utilizing EPA or other ELAP approved methodologies. I certify that this data is in compliance both technically and for completeness.

**Dan Verdon**
**Laboratory Director**

CA ELAP Certification #: 2564

4340 Viewridge Avenue, Suite A - San Diego, California 92123 - (858) 560-7717 - Fax (858) 560-7763

## ANALYTICAL REPORT FOR SAMPLES

| Sample ID | Laboratory ID | Matrix | Date Sampled | Date Received |
|---|---|---|---|---|
| 2 | 0809390-01 | Water | 09/17/08 10:00 | 09/17/08 14:52 |
| 1 | 0809390-02 | Water | 09/17/08 11:20 | 09/17/08 14:52 |
| 10 | 0809390-03 | Water | 09/17/08 12:30 | 09/17/08 14:52 |
| 8 | 0809390-04 | Water | 09/17/08 13:20 | 09/17/08 14:52 |

NOTE: Due to a instrument failure the dissolved metals were performed by a subcontract laboraory, results to follow in a separate report.

*The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.*

Enclosed with this letter are the test results performed by subcontract laboratory for the following analyses:

- Dissolved Metals by EPA 6020

The samples were received by EnviroMatrix Analytical, Inc. intact and with chain-of-custody documentation. The test results and pertinent quality assurance/quality control data are listed on the attached tables.

*I certify that this data report is in compliance both technically and for completeness. Release of the data contained in this hard copy data report has been authorized by the following signature.*

Subject: **Calscience Work Order No.: 08-09-1742**
**Client Reference: 0809390**

Dear Client:

Enclosed is an analytical report for the above-referenced project. The samples included in this report were received 9/18/2008 and analyzed in accordance with the attached chain-of-custody.

Unless otherwise noted, all analytical testing was accomplished in accordance with the guidelines established in our Quality Systems Manual, applicable standard operating procedures, and other related documentation. The original report of subcontracted analysis, if any, is provided herein, and follows the standard Calscience data package. The results in this analytical report are limited to the samples tested and any reproduction thereof must be made in its entirety.

If you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,

Amanda Porter

## Glossary of Terms and Qualifiers

Work Order Number: 08-09-1742

| Qualifier | Definition |
|---|---|
| * | See applicable analysis comment. |
| 1 | Surrogate compound recovery was out of control due to a required sample dilution, therefore, the sample data was reported without further clarification. |
| 2 | Surrogate compound recovery was out of control due to matrix interference. The associated method blank surrogate spike compound was in control and, therefore, the sample data was reported without further clarification. |
| 3 | Recovery of the Matrix Spike (MS) or Matrix Spike Duplicate (MSD) compound was out of control due to matrix interference. The associated LCS and/or LCSD was in control and, therefore, the sample data was reported without further clarification. |
| 4 | The MS/MSD RPD was out of control due to matrix interference. The LCS/LCSD RPD was in control and, therefore, the sample data was reported without further clarification. |
| 5 | The PDS/PDSD associated with this batch of samples was out of control due to a matrix interference effect. The associated batch LCS/LCSD was in control and, hence, the associated sample data was reported with no further corrective action required. |
| A | Result is the average of all dilutions, as defined by the method. |
| B | Analyte was present in the associated method blank. |
| C | Analyte presence was not confirmed on primary column. |
| E | Concentration exceeds the calibration range. |
| H | Sample received and/or analyzed past the recommended holding time. |
| J | Analyte was detected at a concentration below the reporting limit and above the laboratory method detection limit. Reported value is estimated. |
| ME | LCS Recovery Percentage is within LCS ME Control Limit range. |
| N | Nontarget Analyte. |
| ND | Parameter not detected at the indicated reporting limit. |
| Q | Spike recovery and RPD control limits do not apply resulting from the parameter concentration in the sample exceeding the spike concentration by a factor of four or greater. |
| U | Undetected at the laboratory method detection limit. |
| X | % Recovery and/or RPD out-of-range. |
| Z | Analyte presence was not confirmed by second column or GC/MS analysis. |

# Trash Assessment Form

**SITE ID:** 1 **DATE:** 9/17/08

**LOCATION:** 100 ft SE of the Sweetwater Road and Broadway intersection **TIME:** 11:20

**OBSERVER:** CG, CM

**PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):** —

**ESTIMATED AREA OF ASSESSMENT L x W (FT):** 15 x 10

| Amount and Extent of Trash | |
|---|---|
| **EVALUATION OF TRASH INCLUDES*:** ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH** | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

**OBSERVER:** CG, CM

**PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):** —

**ESTIMATED AREA OF ASSESSMENT L x W (FT):** 30 x 10

| Amount and Extent of Trash | |
|---|---|
| **EVALUATION OF TRASH INCLUDES*:** ☐ MS4 ☒ RECEIVING WATER ☐ BOTH | |
| ☒ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

**COMMENTS:** Sample water appeared ~~very~~ clear, but had small reflective particulate.

# Trash Assessment Form

**SITE ID:** 6 **DATE:** 9/18/08

**LOCATION:** Buena Vista Ave and Lemon Ave., in Home Depot parking lot, in front of nursery **TIME:** 9:30

**OBSERVER:** CG, CM

**PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):** —

**ESTIMATED AREA OF ASSESSMENT L X W (FT):** 5x5

| Amount and Extent of Trash | |
|---|---|
| **EVALUATION OF TRASH INCLUDES*:** ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH** | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# Trash Assessment Form

**SITE ID:** 11 **DATE:** 9/18/08

**LOCATION:** 100 ft west of Broadway and Massachusetts Ave. intersection in front of McDonalds, on divider **TIME:** 10:25

**OBSERVER:** CG, CM

**PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):** —

**ESTIMATED AREA OF ASSESSMENT L x W (FT):** 8 x 8

| Amount and Extent of Trash | |
|---|---|
| **EVALUATION OF TRASH INCLUDES*:** ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH** | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☒ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

**LOCATION:** 6636 Federal Boulevard, in front of Thompson Building Materials **TIME:** 14:50

**OBSERVER:** CG, CM

**PREVIOUS TRASH ASSESSMENT RATING (IF APPLICABLE):** —

**ESTIMATED AREA OF ASSESSMENT L X W (FT):** 50 × 10

| Amount and Extent of Trash | |
|---|---|
| **EVALUATION OF TRASH INCLUDES*:** ☐ MS4 ☐ RECEIVING WATER ☒ BOTH | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☐ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☒ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

- **Complete the following section for Submarginal, and Poor Evaluations ONLY**

| TYPE | Ranking or Count by Type * | POTENTIAL ROUTE (CHECK UP TO 2) | | | | POTENTIAL SOURCE (CHECK UP TO 2) | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Dumping | Littering | Upstream | Unable to determine | Household | Construction | Commercial | Industrial | School | Transient | Unable to determine |
| Automotive | | | | | | | | | | | | |
| Biohazard Waste | | | | | | | | | | | | |
| Business Related | 2 | | ✓ | | | | | ✓ | ✓ | | | |
| Cigarette Butts | 3 | | ✓ | | | | | ✓ | ✓ | | | |
| Construction | | | | | | | | | | | | |
| Fabric/Clothing | | | | | | | | | | | | |
| Food Packaging | 1 | | ✓ | | | | | ✓ | ✓ | | | |
| Food Waste | | | | | | | | | | | | |
| Household | | | | | | | | | | | | |
| Shopping Carts | | | | | | | | | | | | |
| Toxic | | | | | | | | | | | | |
| Yard Waste | | | | | | | | | | | | |

* Only rank the types of trash PRESENT in evaluated area from 1 through 12 (1 is most prevalent – 12 is least prevalent). DO NOT rank types of trash that are not present in evaluated area.

Comments: All kinds of food packaging, also business-related packaging such as styrofoam peanuts, cardboard, plastic twine. Junk mail, receipts and coupons, and a large amount of shredded paper

**COMMENTS:** Trash at site included food packaging and household items such as a chair, pillow, and other fabric. High conductivity in the sample water appeared to interfere with the ammonia test kit, making the ampule cloudy, but not producing significant color change that would indicate the presence of ammonia. Field screening result is based on visual color evaluation.

| **EVALUATION OF TRASH INCLUDES*:** ☒ **MS4** ☐ **RECEIVING WATER** ☐ **BOTH** | |
| ☐ **Optimal** | On first glance, no trash visible. Little or no trash (<10 pieces) evident when evaluated area is closely examined for litter and debris. |
| ☐ **Suboptimal** | On first glance, little or no trash visible. After close inspection small levels of trash (~10-50 pieces) evident in evaluated area. |
| ☒ **Marginal** | Trash is evident in low to medium levels (~51-100 pieces) on first glance. Evaluated area contains litter and debris. Evidence of site being used by people: scattered cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Submarginal** | Trash distracts the eye on first glance. Evaluated area contains substantial levels of litter and debris (>100- 400) . Evidence of site being used frequently by people: many cans, bottles, food wrappers, blankets, or clothing present. |
| ☐ **Poor** | Site is significantly impacted by trash. Evidence of trash accumulation behind a constriction point or evidence of excessive dumping. Evaluated area contains substantial levels of litter and debris (>400 pieces). |

* In areas where receiving water is accessible and adjacent to dry weather site, trash evaluation must include receiving water.

| Site Evaluation for Threat to Human Health and/or Aquatic Health | |
|---|---|
| ☐ **Threat Human Health** | Site poses a threat to human health via swimming, wading, or walking through the area. Trash and debris has the potential to contain chemicals that may bioaccumulate, transmit dangerous bacteria (e.g. medical waste, diapers, human waste), or has the potential for physical harm (sharps, entanglement, nails, etc...). Comments should be added for clarification. |
| ☐ **Threat to Aquatic Health** | Site poses a threat to aquatic health or other wildlife (via contact, ingestion, entanglement, etc...) from the trash and debris present. Trash and debris such as small floatable material that is persistent and can be transported long distances may resemble food and may be ingested. Wire, plastic, fishing line, and other material that has the potential for entanglement. Oil and other visible chemicals or chemical containers falls in this category. Comments should be added for clarification. |

# City of Lemon Grove

## Jurisdictional Urban Runoff Management Plan Annual Report

FY 2008 – 2009
September 2009 Report

The City of

LEMON GROVE

BEST CLIMATE ON EARTH

Incorporated in 1977

## Executive Summary

The City's seventh Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2008-09, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2008-09. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2008-09, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

## Section 1.0 Introduction

Lemon Grove's eighth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2008 through June 30, 2009). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A burgeoning sustainability program of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to

public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2008-09. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

## Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2008-09 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

### 2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

### 2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

### 2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment D-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

### 2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

#### 2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

#### 2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

## 2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

## 2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

### 2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

### 2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

#### 2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP will be submitted to the Regional Board during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

### 2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2007-08.

#### 2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained
- LID requirements and additional source control requirements were added to meet or exceed Permit requirements

- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

Once the model SUSMP is accepted by the Regional Board as described in Section D.1.d(8)(b) of the Permit, the City will update its local SUSMP within one year to include requirements at least as stringent as those in the newly adopted model SUSMP. Additionally, the City's local SUSMP will include a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

#### 2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

*Discretionary Projects*

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is

reviewed by the City's Planning Commission and conditions of approval are set for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

*Ministerial Projects*

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits

are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

*Post-Construction BMP Maintenance Agreements*

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

*Capital Improvement Projects*

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

#### 2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix D4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2008-09. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

#### 2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

#### 2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

#### 2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the first year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix D5. The City currently does not have any permanent BMPs that meet the new requirement of annual owner/operator verification letters. This information will however, be tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

#### 2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

#### 2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during FY 2007-08 and FY 2008-09. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review and update of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

## Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

## 3.1 Source Characterization

### 3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2008-09 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 4 minor infrastructure improvement projects during FY 2008-09. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Northbound Lemon Grove Ave.
- Lincoln St.
- Grove Pl.
- Golden
- Sewer Main pipe replacement on Lemon Grove Ave.

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had two construction sites that it monitored very closely during this reporting period.

- EDCO Federal Blvd widening, which required a 401 Permit for the affected drainage area
- Citron Court, a politically charged redevelopment project located off Broadway

The City performed weekly inspections at both of these locations, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

### 3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

## 3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment E-5 gives a breakdown of the City's grading permit requirements.

### 3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2008-09, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);
- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection

- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

### 3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

## 3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

### 3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment

control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

### 3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only two projects with SWPPPs during this reporting period:

- EDCO Federal Blvd widening
- Citron Court Condos

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

### 3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2008-09 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

### 3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

### 3.3.5 Compliance and Enforcement Actions

#### 3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines. Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

#### 3.3.5.2 Reporting and Non-Compliance

During the FY 2008-09, approximately 35 known complaints were received through the City's hotline and other phone lines. The majority of the calls were related to the work occurring on the Citron Court project. The surrounding neighbors had unfavorable attitudes towards the project as a whole and frequently called hoping to cause trouble for the site. All calls were investigated the day of the call; the majority of the complaints were unwarranted. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

## Section 4.0 Municipal Component

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment C. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

## 4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

### 4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

### 4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

### 4.1.3 Program Implementation

This section describes the steps that were taken in FY 2008-09 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2008-09, the maintained it's street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

## 4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

### 4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

*Parks and Recreation Facilities*
The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

*Public Works Facility*

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

*Fire Stations*

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to

three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

*Other Fixed Facilities*

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

### 4.2.2 Best Management Practices

#### 4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

*Parks and Recreation Facilities*

In FY 2008-09, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

*Public Works Facility*

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

*Fire Stations*

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

*Other Fixed Facilities*

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at

fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

### 4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

#### 4.2.3.1 Maintenance

In FY 2008-09, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

#### 4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

#### 4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2008-09 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix C. Any required

corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

## 4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

### 4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

### 4.3.2 Best Management Practice Requirements

#### 4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

#### 4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

### 4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

#### 4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

## 4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the

potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

### 4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

### 4.4.2 Best Management Practice Requirements

#### 4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

#### 4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

### 4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines,

remediation of existing lines as necessary, and proper disposal of hazardous waste.

#### 4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2008-09, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

**Table 4.1**
**Sanitary Sewer Services in Feet**

| | Total FY 2005-06 | Total FY 2006-07 | Total FY 2007-08 | Total FY 2008-09 |
|---|---|---|---|---|
| **Cleaned** | **298,043** | **331,369** | **52,493** | **646,943** |
| **Root Cut** | **18,370** | **20,927** | **36,039** | **596,943** |

Within those numbers is the following information:

- 24,901 feet of hotspot line was cleaned and root cut
- 153,066 feet of easement line was cleaned and root cut
- 234,438 feet of right of way line was cleaned
- 184,438 feet of right of way was root cut
- 50,000 feet of right of way was row jetted for clearing

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

## 4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

### 4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

### 4.5.2 Best Management Practice Requirements

4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

### 4.5.3 Program Implementation

In FY 2008-09, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

## 4.6 Special Events

The City hosts a very limited number of special events each year. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

### 4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

### 4.6.2 Best Management Practice Requirements

4.6.2.1 Updated BMP Requirements

In FY 2008-09, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

4.6.2.3 Program Implementation

In FY 2008-09, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

## Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2008-09, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2008-09.

## 5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

### 5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2008-09, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

**Table 5-1 - Summary of High Priority Commercial Sources**

| Commercial Activity | Number of Facilities in Lemon Grove |
|---|---|
| Automobile Dealers/Rentals | 18 |
| Automobile Supply Stores | 9 |
| Automobile Repair/Paint | 9 |
| Automobile System and Tire Repair | 56 |
| Automobile Cleaning/Washing | 3 |
| Gas Stations | 7 |
| Eating/Drinking Establishments | 60 |
| Landscaping, includes lawn care | 9 |
| Nurseries and Greenhouses | 1 |
| Pest Control | 3 |
| Equipment Repair/Maintenance/Cleaning | 3 |
| Metalwork | 6 |
| Masonry | 4 |
| Parking Lots and Storage | 3 |
| Carpet/Building Cleaning | 21 |

| | |
|---|---|
| Pool and Fountain Cleaning | 3 |
| **Total** | **215** |

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

**Table 5-2 - Summary of High Priority Industrial Sources**

| Industrial Activity | Number of Facilities in Lemon Grove | Revised High Priority Category Facilities |
|---|---|---|
| Waste Disposal and Recycling | 1 | |
| Equipment/Transportation | 3 | 2 |
| Metalwork | 2 | 3 |
| Building Supplies and Woodworking | 3 | 2 |
| Industrial Paper | | 1 |
| Contractor, Special Trade | | 1 |
| Specialty Hardware, Drapery | | 1 |
| **Total** | **9** | **10** |
| | **Total Facilities** | **19** |

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

*Industrial Facilities*

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

*Commercial Facilities*

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

*Both Industrial and Commercial Facilities*

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

### 5.1.2 Best Management Practice Requirements

#### 5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

*Industrial Facility Specific BMPs*

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

#### 5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1)tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

### 5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2008-09, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

5.1.3.2 Inspection Frequency

FY 2008-09 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sties were inspected in FY 2008-09, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2008-09 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2008-09.

5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2008-09, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

*Inspection Tracking*

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

*Third Party Inspections*

All commercial inspections conducted in FY 2008-09 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

*Inspection Follow-up and Enforcement*

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2007-08, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2008-09, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2008-09, the City had two commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

*Reporting of Non-Filers*

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

## 5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

### 5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

### 5.2.2 Best Management Practice Requirements

#### 5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

### 5.2.3 Program Implementation

#### 5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

#### 5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2008-09, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

## Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2008-09 that contributed to the successful implementation of the City's Residential Component.

## 6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2008-09. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

### 6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

### 6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

### 6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

## 6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2008-09. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

### 6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

### 6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

*Automobile Repair and Maintenance*

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

*Automobile Washing*

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

*Automobile Parking*

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

*Home and Garden Care Activities and Product Use*

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

*Disposal of Pet Waste*

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

## 6.3 Program Implementation

This section describes the steps that were taken in FY 2008-09 to require and verify the implementation of designated BMPs for residential areas and activities.

### 6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2008-09, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

### 6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

*HHW Collection Program*

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only one demolition site qualified and completed the program during this reporting period. Citron Court is a new mixed use redevelopment project located at 7385 Broadway that began construction during this reporting period. According to their reports, their demolition site generated 108.2 tons of recyclable materials.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 25-26. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2007-08, as per the HHW program, are not due to the State regulating agency until October 1, 2008; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2009.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2008-09, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2009.

*Used Oil Recycling Program*

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

**Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005** (Calendar Years)

**Table 6-2 Annual Oil Sales and Used Oil Recycling Rates** (in millions of gallons)

| | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Lubricating Oil Sales** | 141.2 | 140.8 | 136.2 | 137.5 | 142.1 | 150.0 | 154.3 | 163.6 | 168.0 | 150.2 | 150.5 | 153.5 |
| **Industrial Oil Sales** | 78.0 | 117.3 | 140.9 | 141.7 | 152.4 | 176.4 | 155.7 | 149.1 | 147.1 | 135.8 | 144.6 | 123.1 |
| **Total Oil Sales*** | 219.2 | 258.1 | 277.1 | 279.5 | 294.5 | 326.4 | 310.0 | 312.7 | 315.1 | 286.0 | 295.0 | 276.6 |
| **Lubricating Oil Recycled**** | 59.9 | 54.6 | 56.8 | 60.9 | 73.6 | 76.9 | 80.0 | 81.9 | 83.1 | 83.7 | 87.0 | 91.3 |
| **Industrial Oil Recycled**** | 16.7 | 19.5 | 20.8 | 19.3 | 11.6 | 10.4 | 7.9 | 15.5 | 17.5 | 32.4 | 32.5 | 31.4 |
| **Total Oil Recycled** | 76.6 | 74.1 | 77.6 | 80.2 | 85.2 | 87.3 | 87.9 | 97.4 | 100.6 | 116.1 | 119.4 | 122.7 |

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

**Table 6-3 Oil Collected by Public Collection Programs** (in millions of gallons)

**Table 6-4 Oil Collected by Public Collection Programs** (in millions of gallons)

| | 94/95 | 95/96 | 96/97 | 97/98 | 98/99 | 99/00 | 00/01 | 01/02* | 02/03* | 03/04 | 04/05 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| **Curbside** | 0.9 | 0.9 | 0.8 | 0.9 | 0.7 | 0.6 | 0.5 | 0.9 | .9 | 1.0 | 1.0 |
| **Form 303** | 0.6 | 0.7 | 1.0 | 0.8 | 0.9 | 1.1 | 0.9 | 1.0 | 1.0 | 1.0 | 1.0 |
| **Certified Centers** | 5.6 | 8.7 | 10.2 | 11.3 | 13.2 | 15.2 | 16.3 | 18.5 | 19.9 | 20.6 | 19.9 |
| **Total Oil** | 7.1 | 10.3 | 12.0 | 13.0 | 14.8 | 16.9 | 17.7 | 20.4 | 21.8 | 22.6 | 21.9 |

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-4 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

### 6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2008-09, the City received 89 Residential IC/ID complaint calls. Thirty five of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

### 6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

## Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2008-09 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

### 7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

### 7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 104 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

### 7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

## 7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

## 7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

## Section 8.0 Education Component

### 8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2008-09. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

### 8.2 Municipal Staff Training

*Public Works*. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

*New Employees.* Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

## 8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2008-09.

### 8.3.1 Underserved Target Audiences and Mobile Businesses

*Underserved Target Audiences.* For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

*Mobile Businesses.* During FY 2008-09, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

### 8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

### 8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2008-09.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

### 8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

## 9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

## 9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

## 9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2008-09 reporting period.

### 9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2008-08:

- Coastal Clean up Day - April 25, 2009, 12 volunteers, Federal Blvd/San Miguel drainage channel, graffiti abatement on adjacent k-rail
- Youth Group Community Service Project – April 7-8, 2009, 35 volunteers, Lemon Grove Park clean up and mural re-painting
- Church Community Service Project – October 12, 2008, 40 volunteers, median clean up and re-landscaping with drought tolerant plants

### 9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2008-09, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal Code Enforcement proceedings. The hotline is advertised in the newsletters and

on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

### 9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

### 9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

### 9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

## Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

### 10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 11.1.

**Table 10.1 – 2008/2009 Fiscal Analysis Summary**

Stormwater Cost Analysis
All costs covered in the General Fund.

| ACTIVITY | CURRENT YEARLY BUDGET | CURRENT BUDGET LOCATION |
|---|---|---|
| **STORM DRAINAGE CLEANING AND MAINTENANCE** | | |
| **Public Street and Parking Lot Sweeping** | | Streets |
| Streets | $30,000 | |
| Parking Lots | $2,000 | |
| *Public Street and Parking Lot Sweeping Total* | $32,000 | |
| | | |
| **Litter Removal** | | |
| Litter Removal | $13,000 | |
| *Litter Removal Total* | $13,000 | |
| | | |
| **Storm Drainage Cleaning** | | |
| Inlets | | |
| Inspection and Cleaning | $19,820 | |
| Fossil filter replacements | $1,400 | |
| *Inlets Subtotal* | $21,220 | |
| Basins and Channels | | |
| Inspection and Cleaning (Note 1) | $38,829 | |
| *Basins and Channels Subtotal* | $38,829 | |
| **Video Inspections** | | |
| Video Inspections (Note 1) | $50,000 | |

| | | |
|---|---|---|
| *Video Inspection Subtotal* | $50,000 | |
| ***Storm Drainage Cleaning and Maintenance Total*** | **$155,049** | |
| | | |
| **STORM EVENT ACTIVITIES** | | |
| Sandbag stock piling and placement | $4,000 | |
| Patrols | $3,089 | |
| ***Storm Event Total*** | **$7,089** | |
| | | |
| **ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM** | | Engineering Services |
| Dry Weather Testing | $20,000 | |
| Enforcement | $5,000 | |
| Administration/Supervision | $1,000 | |
| Stormwater HotlineComplaints | $2,000 | |
| ***Illicit/Illegal Enforcement Program Total*** | **$28,000** | |
| | | |
| **STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)** | | |
| Construction Related SWPPP | $2,000 | |
| Plan Review (including SUSMP's) | $15,000 | |
| Inspection | $3,000 | |
| *Construction Related SWPPP Subtotal* | $20,000 | |
| Municipal Facility SWPPP | | |
| SWPP Implementation, Inspection, and Maintenance of Municipal Facilities | $18,798 | Streets |
| *Municipal Facility SWPPP Subtotal* | $18,798 | |
| ***All SWPPP Activities Total*** | **$38,798** | |
| | | |
| **BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION** | | |
| Inspection of Industrial and Commercial Facilities | $50,000 | |
| Inspection of Municipal Facilities | $1,000 | |
| ***BMP Total*** | **$51,000** | |
| **MISCELLANEOUS ACTIVITIES** | | Engineering Services |
| Annual Reporting (JURMP) | $5,000 | |
| Administration (General) | $74,004 | |
| NPDES Permit Fee | $7,500 | |
| Public Education/Outreach | $5,000 | |
| ***Miscellaneous Activities Total*** | **$77,504** | |
| | | |
| | | |
| ***PROGRAM TOTALS*** | **$371,440** | |

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2006-07 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

## 10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

## 11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

## 11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 Outcome Level Assessments

*Level 1*

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

*Level 2 and 3*

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

*Level 4*

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

*Level 5*

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

*Level 6*

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

### 11.2.2 Overall Component Assessments

*Development Planning*

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

*Construction*

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

*Municipal*

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

**Table 11-1**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Street Sweeping | 169.75 tons | None | 169.75 tons |
| MS4 Cleaning | 3,360 pounds (1.815 tons) | None | 3,360 pounds (1.815) tons |
| | | | **Total 171.565 tons** |

*Industrial and Commercial*

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

**Table 11-2 Program Scores for 2008-09****

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |
| **Median Rating** | 3 | 3 |

| | | |
|---|---|---|
| # of “Level 5” Ratings | 6 | 25 |
| # of “Level 4” Ratings | 28 | 34 |
| # of “Level 3” Ratings | 30 | 49 |
| # of “Level 2” Ratings | 22 | 12 |
| # of “Level 1” Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

**Table 11-2 cont. Program Scores for FY 2005-06**
(This was the first year the analysis was done and is provided for comparision)

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of “Level 5” Ratings | 0 | 14 |
| # of “Level 4” Ratings | 9 | 26 |
| # of “Level 3” Ratings | 34 | 30 |
| # of “Level 2” Ratings | 26 | 11 |
| # of “Level 1” Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

*Residential*

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

**Table 11-3**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Used Oil Recycling | 25,600 gallons | 10% | 2,560 gallons |
| C&D Ordinance Recycling | 17,852 pounds | 1% | 179 pounds |

*Education*

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City

staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

*Public Participation*

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 have been made since the submittal of this document.

## Jurisdictional Urban Runoff Management Plan Annual Report

FY 2009 – 2010
September 2010 Report

The City of

LEMON GROVE

BEST CLIMATE ON EARTH

Incorporated in 1977

## Executive Summary

The City's eighth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2009-10, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2009-10. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2009-10, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

## Section 1.0 Introduction

Lemon Grove's ninth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2009 through June 30, 2010). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with sever economic challenges both on a local and state level.

At the jurisdictional level, the city has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be significantly expanded and improved over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- A new in-house water quality inspector and code enforcement officer
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A burgeoning sustainability program of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to

public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2009-10. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

## Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2009-10 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

### 2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

### 2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

### 2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment H-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

### 2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

#### 2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

#### 2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

## 2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

## 2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

### 2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

### 2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

#### 2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP was submitted to the Regional Board at the end of this reporting cycle and will be approved and integrated into the City's program during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

### 2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2009-010.

#### 2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained

- LID requirements and additional source control requirements were added to meet or exceed Permit requirements
- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

The City adopted the new Model SUSMP during this reporting period. The SUSMP includes a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP during the next reporting period. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

#### 2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

*Discretionary Projects*

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is reviewed by the City's Planning Commission and conditions of approval are set

for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

*Ministerial Projects*

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

*Post-Construction BMP Maintenance Agreements*

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

*Capital Improvement Projects*

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix H4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2009-10. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

#### 2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

#### 2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

#### 2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the second year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix H5. The City is currently working to implement the annual verification letter requirement. As this is a new and additional requirement for businesses, there have been some initial delays in receipt of these letters and receipt of incomplete information. However, the City is working with the businesses to obtain all the required information in a more timely manner. The City is working to integrate the letter process into its annual commercial and industrial inspection program to solve the previously mentioned difficulties. This information is tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

#### 2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed

as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

#### 2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during the last several reporting periods. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review, update, and adoption of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

## Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

## 3.1 Source Characterization

### 3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2009-10 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 12 minor infrastructure improvement projects during FY 2009-10. All of the projects were minor street resurfacing or pavement rehavilitation. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Hardy Drive
- Siegle Court
- Blossom Hill Drive and Court
- Craig Court
- El Verde Court
- Olive Street
- San Altos Place
- Loma Drive
- Circle Drive
- Roosevelt Street
- Edgerton Street
- Lemon Grove Ave, N
- Mount Vernon Street

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had one construction site that it monitored very closely during this reporting period.

- The rehabilitation project at the City's Recreation Center, which was not a priority project and had a decrease in impervious surface area.

The City performed weekly inspections this location, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

### 3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

## 3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment I-5 gives a breakdown of the City's grading permit requirements.

### 3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2009-10, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);

- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

### 3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

## 3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

### 3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance

requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

### 3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only no projects with SWPPPs during this reporting period:

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

### 3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2009-10 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

### 3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

### 3.3.5 Compliance and Enforcement Actions

#### 3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines.

Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

#### 3.3.5.2 Reporting and Non-Compliance

During the FY 2009-10, approximately six known complaints were received through the City's hotline and other phone lines pertaining to construction sites. All calls were investigated the day of the call; the majority of the complaints were unwarranted and not related to stormwater. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment J. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

## 4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

### 4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

### 4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

### 4.1.3 Program Implementation

This section describes the steps that were taken in FY 2009-10 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2009-10, the City maintained its street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

## 4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

### 4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

*Parks and Recreation Facilities*

The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

*Public Works Facility*

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

*Fire Stations*

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

*Other Fixed Facilities*

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

### 4.2.2 Best Management Practices

#### 4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

*Parks and Recreation Facilities*

In FY 2009-10, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently

used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

*Public Works Facility*

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The

SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

*Fire Stations*

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

*Other Fixed Facilities*

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

### 4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

4.2.3.1 Maintenance

In FY 2009-10, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

#### 4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2009-10 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix J. Any required corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

## 4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

### 4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

### 4.3.2 Best Management Practice Requirements

#### 4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

### 4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. The same numbers as the previous reporting cycle. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

## 4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

### 4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

### 4.4.2 Best Management Practice Requirements

#### 4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

#### 4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

### 4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines, remediation of existing lines as necessary, and proper disposal of hazardous waste.

#### 4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2009-10, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

**Table 4.1**
**Sanitary Sewer Services in Feet**

| | Total FY 2005-06 | Total FY 2006-07 | Total FY 2007-08 | Total FY 2008-09 | Total FY 2009-10 |
|---|---|---|---|---|---|
| **Cleaned** | **298,043** | **331,369** | **52,493** | **646,943** | **359,174** |
| **Root Cut** | **18,370** | **20,927** | **36,039** | **596,943** | **329,174** |

Within those numbers is the following information:

- 26,919 feet of hotspot line was cleaned and root cut
- 124,265 feet of easement line was cleaned and root cut
- 207,990 feet of right of way line was cleaned and root cut

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

## 4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

### 4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

### 4.5.2 Best Management Practice Requirements

#### 4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

#### 4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

### 4.5.3 Program Implementation

In FY 2009-10, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

## 4.6 Special Events

The City hosts a very limited number of special events each year and even fewer under the current economic climate. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons

and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

### 4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

### 4.6.2 Best Management Practice Requirements

#### 4.6.2.1 Updated BMP Requirements

In FY 2009-10, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

#### 4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

#### 4.6.2.3 Program Implementation

In FY 2009-10, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

## Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2009-10, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2009-10.

## 5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

### 5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2009-10, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

**Table 5-1 - Summary of High Priority Commercial Sources**

| Commercial Activity | Number of Facilities in Lemon Grove |
|---|---|
| Automobile Dealers/Rentals | 18 |
| Automobile Supply Stores | 9 |
| Automobile Repair/Paint | 9 |
| Automobile System and Tire Repair | 56 |
| Automobile Cleaning/Washing | 3 |
| Gas Stations | 7 |
| Eating/Drinking Establishments | 60 |
| Landscaping, includes lawn care | 9 |
| Nurseries and Greenhouses | 1 |
| Pest Control | 3 |
| Equipment Repair/Maintenance/Cleaning | 3 |
| Metalwork | 6 |
| Masonry | 4 |
| Parking Lots and Storage | 3 |
| Carpet/Building Cleaning | 21 |

| | |
|---|---|
| Pool and Fountain Cleaning | 3 |
| **Total** | **215** |

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

**Table 5-2 - Summary of High Priority Industrial Sources**

| Industrial Activity | Number of Facilities in Lemon Grove | Revised High Priority Category Facilities |
|---|---|---|
| Waste Disposal and Recycling | 1 | |
| Equipment/Transportation | 3 | 2 |
| Metalwork | 2 | 3 |
| Building Supplies and Woodworking | 3 | 2 |
| Industrial Paper | | 1 |
| Contractor, Special Trade | | 1 |
| Specialty Hardware, Drapery | | 1 |
| **Total** | **9** | **10** |
| | **Total Facilities** | **19** |

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

*Industrial Facilities*

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

*Commercial Facilities*

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

*Both Industrial and Commercial Facilities*

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

### 5.1.2 Best Management Practice Requirements

#### 5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

*Industrial Facility Specific BMPs*

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

#### 5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1)tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

### 5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2009-10, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

#### 5.1.3.2 Inspection Frequency

FY 2009-10 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sties were inspected in FY 2009-10, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2009-10 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2009-10.

#### 5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2009-10, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

*Inspection Tracking*

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

*Third Party Inspections*

All commercial inspections conducted in FY 2009-10 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

*Inspection Follow-up and Enforcement*

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2007-08, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2008-09, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2009-10, the City had four commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

*Reporting of Non-Filers*

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

## 5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

### 5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

### 5.2.2 Best Management Practice Requirements

#### 5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

### 5.2.3 Program Implementation

#### 5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

#### 5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2009-10, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

## Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2009-10 that contributed to the successful implementation of the City's Residential Component.

## 6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2009-10. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

### 6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

### 6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

### 6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

## 6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2009-10. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

### 6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

### 6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

*Automobile Repair and Maintenance*

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
Leaks and Spills: prevent leaks and spills from entering the stormdrain by using or doing: drip pans, plastic sheeting, or other containment devices, work indoors or under shelter and never in the rain, immediately clean spills, use dry cleaning methods, establish clean up standards, and require that tools and parts be cleaned in a contained area
Materials and Waste Management: properly manage and dispose of automotive wastes and materials by: draining fluids from automobiles, disposing of wastes and fluids properly and lawfully, store materials, parts and tools indoors or under cover, use secure and watertight containers when storing materials and wastes

*Automobile Washing*

Management/Reduction of Wash Water: a) whenever possible, use commercial self-serve or full-serve car washes that properly dispose of or recycle the water, b) when washing at a residence be sure to: wash over a porous surface such as grass or dirt when possible, use dry cleaning methods, turn off the water when not in use or use a controllable spray nozzle, encourage the use of a neighborhood wash area where contaminants can be easily manged
Materials and Waste Management: a) properly dispose of soapy water or bucket water to a sanitary sewer or landscaped area, b) use dry methods to degrease or clean especially dirty areas such as tires

*Automobile Parking*

a) use routine preventative maintenance practices and make timely vehicle repairs to prevent fluid leaks
b) design and construct parking areas to minimize stormwater impacts; covered garages should be plumbed to the sanitary sewer

*Home and Garden Care Activities and Product Use*

Garden and Yard Care
Pollution Prevention: a) use safe substitutes and alternative gardening methods such as IPM techniques, native and drought tolerant plants, use compost or vermiculture for green waste recycling, follow manufacturers instructions for the application of any chemicals, identify pests before treatment, b) read all labels on products, c)implement water conservation, d) consider xeroscape gardens, e) repair and maintain irrigation system to prevent over watering, f) recycle green waste, g) plant or mulch hillsides and slopes to prevent erosion
Leaks and Spills: a) immediately clean any chemical spills, fertilizers, or soil, b) return spilt items to container for future use or proper disposal
Materials and Waste Management: a) store lawn care products in closed labeled containers indoors or covered areas, b) refrain from using chemicals on windy or rainy days, c) cover stockpiles of soil, compose, or fertilizer, d) dispose of chemicals through the HHW program, e) utilize dry sweeping methods for clean up
Restrictions on Activities: a) do not hose off paved surfaces to the street or gutter, b) do not put hazardous waste in the trash, landfill or stormdrain

Home Care and Maintenance
Pollution Prevention: a) utilize smart purchasing practices that reduce waste, b) use less toxic or non-toxic substitutes for cleaning, c) read and follow product labels, d) recycle used or unwanted products, e) use water based paints when possible, f) recycle unwanted appliances and equipment
Leaks and Spills: a) clean up spills immediately, b) properly dispose of waste from clean up materials

Materials and Waste Management: a) store HHW materials in closed labeled containers and in covered areas, b) recycle latex paint through local programs, c) dispose of hazardous products though the HHW program, d) dispose of trash in the proper receptacles with lids
Restrictions: do not dispose of wash waters (carpet cleaning, mop water, paint wash-up, etc.) to the street, gutter or storm drain

*Disposal of Pet Waste*

Pollution Prevention: spay or neuter pets to reduce feral populations
Waste Management/Disposal: a) clean up after pets when walking them in public places, b) clean up yards or other commonly used areas, c) properly dispose of the waste in the trash or toilet
Pet Management (Dogs and Cats): do not allow pets to run free in residential neighborhoods, whenever possible

## 6.3 Program Implementation

This section describes the steps that were taken in FY 2009-10 to require and verify the implementation of designated BMPs for residential areas and activities.

### 6.3.1 Outreach and Training

The City has an education program that is consistent with the Permit and the jurisdictional program. A significant element of this program consists of educating residents about ways in which they can minimize their impact on local waterways and the environment in general. Education of the citizens in Lemon Grove contributes to the implementation of the residential component of the stormwater program. Outreach messages that are relayed to the public include, but are not limited to:

- Impacts of urban runoff on receiving waters
- Distinction between the MS4 and the sanitary sewer
- Pollution prevention and safe alternatives
- HHW collection and recycling
- BMP implementation and maintenance
- Pet and animal waste disposal
- Equipment and vehicle maintenance and repair
- Spill response, containment and recovery
- Water conservation

During FY 2009-10, City staff conveyed these messages to the public through a variety of mechanisms, including:

- City's Website
- Production and distribution of brochures and promotional items

- Public participation in community events
- Response to residential complaints
- One on one conversations
- Public participation events such as clean-ups

Implementation of these mechanisms by the City helps to make the public aware of the types of activities that have the potential to impact water quality and the BMPs that can be implemented to reduce this impact. Awareness is the first step in the process towards behavioral change. A detailed description of the educational activities implemented by the City can be found in Section 8.

### 6.3.2 Used Oil, E-Waste, and HHW Collection Services

The City facilitates the proper management and disposal of used oil, toxic chemicals, and other household hazardous wastes (HHW) through various mechanisms. The City participates in door to door home collection, a permanent recycling facility is located in the City, and collection events for all HHW and e-waste. In addition, the City encourages weekly curbside garbage, recycling, and yard waste pick-up services through a franchise with EDCO. The various components of the solid waste and hazardous waste collection services provided by or for the City are described in detail below.

*HHW Collection Program*

The City seeks to reduce solid waste generated in its boundaries. Conservation techniques supported by the City include source reduction, reuse, and recycling, including the procurement of recycled-content products. The City must meet the state-mandated fifty percent reduction level for solid waster disposal, which means at least half of the refuse generated in 1990, adjusted for population and economics, must be spared from a landfill. This information is lengthy and is available upon request.

The City has completed and approved the construction and demolition ordinance. The ordinance went into effect at the beginning of December 2005. Only two demolition sites qualified and completed the program during this reporting period. Both projects were very small private development projects and the City has not calculated the waste totals as of this report. The totals will be available upon request by October 30, 2010.

The recycling outreach efforts include conducting public education, establishing infrastructure, and supporting existing recycling operations. Current programs focus on: revising the City's recycling plans, business recycling, enforcement (business and residential), construction and demolition waste, motor oil recycling and storm drain filters, and public education including schools, brochures, and interaction with City staff.

During this reporting period, the City participated in eight collection events for solid waste disposal. All of the events were in cooperation with a Household Hazardous Waste grant through CIWMB. .

The City held one collection day through EDCO and their facilities at the same time as the curb side clean up day. These events allow residents to dispose of unwanted bulky items and HHW free of charge. The elderly and disabled can schedule for curb-side service with City staff. The event during this reporting period took place on April 24-25. Due to the earlier due date of this report, the City is unable to supply HHW totals for the previous fiscal year. The totals for FY 2009-10, as per the HHW program, are not due to the State regulating agency until October 1, 2010; making the City's finalized data unavailable until mid-October at the earliest. The City is currently cooperating in a different capacity with the management of the local HHW program. The City of La Mesa is now the lead agency for the HHW collection contract through EDCO. EDCO's La Mesa HHW facility is the closest drop-off location to the City of Lemon Grove. The City pays La Mesa a small contract management fee to utilize the EDCO HHW facility and then obtains mass totals from the City of La Mesa. The City is happy to provide the Regional Board with those totals upon request after October 30, 2010.

The City has revamped its e-waste collection program and now contracts with Recycle San Diego to provide local events. During FY 2009-10, the City held eleven e-waste recycle events at the park adjacent to City Hall. At the time of this report, the contractor has not yet compiled the collection data for these events. That data will be available upon request after November 30, 2010.

*Used Oil Recycling Program*

Statistics from the California Integrated Waste Management Board (CIWMB) indicate that 1 in 5 households in California have a do-it-yourself (DIY) oil changer. "There were 91.3 million gallons of used lubricating oil (ULO) were recycled during 2005, which was 5 percent above the 87.0 million gallons collected in 2004. The ULO recycling rate for 2005 was 59.5 percent, which is a 3 percent increase when compared to ULO recycled in 2004. The lubricating oil recycling rate does not account for oil burned off or spilled during use, which is estimated to range from 20 to 40 percent."[1] Below are four charts that demonstrate this trend in increased recycling.

[1] http://www.ciwmb.ca.gov/usedoil/RateInfo/default.htm

**Table 6-1 Amount of Lubricating Oil Recycled as a Percentage of Sales, 1994-2005** (Calendar Years)

**Table 6-2 Annual Oil Sales and Used Oil Recycling Rates** (in millions of gallons)

| | 1994 | 1995 | 1996 | 1997 | 1998 | 1999 | 2000 | 2001 | 2002 | 2003 | 2004 | 2005 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Lubricating Oil Sales** | 141.2 | 140.8 | 136.2 | 137.5 | 142.1 | 150.0 | 154.3 | 163.6 | 168.0 | 150.2 | 150.5 | 153.5 |
| **Industrial Oil Sales** | 78.0 | 117.3 | 140.9 | 141.7 | 152.4 | 176.4 | 155.7 | 149.1 | 147.1 | 135.8 | 144.6 | 123.1 |
| **Total Oil Sales*** | 219.2 | 258.1 | 277.1 | 279.5 | 294.5 | 326.4 | 310.0 | 312.7 | 315.1 | 286.0 | 295.0 | 276.6 |
| **Lubricating Oil Recycled**** | 59.9 | 54.6 | 56.8 | 60.9 | 73.6 | 76.9 | 80.0 | 81.9 | 83.1 | 83.7 | 87.0 | 91.3 |
| **Industrial Oil Recycled**** | 16.7 | 19.5 | 20.8 | 19.3 | 11.6 | 10.4 | 7.9 | 15.5 | 17.5 | 32.4 | 32.5 | 31.4 |
| **Total Oil Recycled** | 76.6 | 74.1 | 77.6 | 80.2 | 85.2 | 87.3 | 87.9 | 97.4 | 100.6 | 116.1 | 119.4 | 122.7 |

***** The volumes for oil sales and used oil collections are revised as used oil recycling fees are collected or refunded. Sales totals for lubricating oil are subject to change. Fees on oil sales and refunds for exempt lubricating oils may be reported up to one year after the initial sale.

****** Figures include used oil collected in California and used oil sent outside of California.

**Table 6-3 Oil Collected by Public Collection Programs** (in millions of gallons)

**Table 6-4 Oil Collected by Public Collection Programs** (in millions of gallons)

| | 94/95 | 95/96 | 96/97 | 97/98 | 98/99 | 99/00 | 00/01 | 01/02* | 02/03* | 03/04 | 04/05 |

| **Total Oil** | 7.1 | 10.3 | 12.0 | 13.0 | 14.8 | 16.9 | 17.7 | 20.4 | 21.8 | 22.6 | 21.9 |

The City places a high priority on properly managing the used oil generated by residents within its jurisdiction. Every effort is made to provide residents with convenient drop-off locations and curbside pick-up services, then to promote these services through advertisement and outreach.

The Motor Oil brochure, available at City Hall, contains useful information about how and why to recycle used oil. It also lists the two collection sites and the number for curb-side pick-up. See Attachment L-2 for an example of the brochure. The centers are also listed in each of the City Newsletters that are mailed to the residents bi-annually. See Attachment L-3 for copies of the Newsletter.

The two collection sites are:

- Kragen 6925 Federal Blvd (oil and filters)
- EDCO 6670 Federal Blvd (oil only)

The curb-side service is sponsored by CIWMB. All the resident needs to do is call 1-800-HHW-PKUP (1-800-449-7587) and request a collection.

### 6.3.3 Complaint Investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the stormwater hotline or other form of communication such as e-mail, a County hotline referral, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or cleanup activities by the City or responsible party.

The City enforces its stormwater ordinance for all residential areas and activities as necessary to maintain compliance with the Permit and ensure water quality. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for the City to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the Code Enforcement data base.
In FY 2009-10, the City received 54 Residential IC/ID complaint calls. Six of those calls were construction related and are discussed in Section 3. Eight of them were related to illegal dumping in the street or gutter. All were abated within 24 hours of notification to the City and all known dischargers were educated on proper disposal methods. No citations or fines were leveed for residential complaints during this reporting period. The remaining calls were either unfounded or not related to stormwater and were delivered to the appropriate department.

### 6.3.4 Regional Residential Education Program

The City collaborated with other jurisdictions in the Education and Residential Sources Workgroup to develop the Regional Residential Education Plan. The Plan contains recommended strategies for the development and implementation of the Regional Residential Education Program. Implementing an enhanced regional program to target residential sources of stormwater pollution encourages the development of consistent messages throughout the region and enables Copermittees to better leverage resources and utilize economies of scale.

This reporting period's collaboration on a regional level was promotion of residential stormwater BMPs at the San Diego County Fair. The Copermittees combined funds to pay for a fair booth, material distribution, signage and advertisements at several locations on the fairgrounds for the duration of the fair. Booth staffers promoted the Think Blue message and presented stormwater educational materials to all fair attendees.

## Section 7.0 IC/ID Component

This section describes activities conducted during the FY 2009-10 reporting period to minimize the impact of discharges from illicit connections and discharges (IC/IDs) on receiving waters and other environmental resources. The City's IC/ID program consists of several complementary activities, some of which are discussed in detail in this section, and others that are briefly addressed here and deferred to other sections for more detailed treatment.

### 7.1 Dry Weather Monitoring Program

This portion of the report will be submitted on December 15 as required in the Permit.

### 7.2 Public Reporting of IC/IDs

The City continued to operate the Stormwater Hotline at (619) 825-3810. The primary purpose of the hotline is to facilitate complaint reporting; but it also serves as a direct source of water quality information for interested parties. Calls are promptly referred to City staff for proper handling.

During this reporting period, 54 calls were received through the hotline. The majority of the calls received on the Hotline were either informational or related to private property issues. Of these calls eight were related to illicit connections and discharges. These calls were all settled without enforcement actions or were private property disputes. All tips related to IC/IDs were investigated by City staff and dealt with accordingly. Follow-up and enforcement related to business complaints and issues is dealt with in Section 5 and follow-up and enforcement for residential complaints is dealt with in Section 6.

### 7.3 Complaint Investigations and Enforcement

The City conducted follow-up investigations on all complaints received during this reporting period. The primary objective of the City's commercial enforcement program is to ensure violators are brought into compliance in a timely manner. When education is not sufficient to do so, staff may use a variety of formal enforcement tools. These vary by department and program, but generally include Verbal Warnings, Notices of Violation, and Official Notices. The City may also use civil and/or criminal court actions under the State Porter-Cologne Water Quality Act or the Federal Clean Water Act. These last actions my result in significant fines levied upon non-compliant parties.

## 7.4 Facilitation of Used Oil and Toxic Material Disposal

During this reporting period, City staff worked diligently to promote, publicize, and facilitate the proper management and disposal of used oil, toxic materials, and other household wastes. Activities related to the City's recycling program and waste collection services are reported in detail in Section 6 of this report.

## 7.5 Limiting Infiltration from the Sanitary Sewer

The City implemented aggressive maintenance programs to limit infiltration from the sanitary sewer system to its MS4. Further details on these activities are reported in Section 4 of this report.

## Section 8.0 Education Component

### 8.1 Overview of Education

The City's outreach program includes an education and public participation component. The education component is focused on disseminating educational information to increase public knowledge of stormwater issues, while the public participation component, discussed in Section 9, provides opportunities for the public to become involved in the process of reducing pollutants of concern in stormwater and urban runoff. The education component is primarily implemented by the City's water quality staff.

The Permit establishes the following five target communities which must be addressed by the education program:

- Municipal Departments and Personnel
- Construction Site Owners and Developers
- Industrial Owners and Operators
- Commercial Owners and Operators
- Residential Community, General Public, and School Children

The overall goal of the education element is to provide an education program that will:

- Measurably increase the knowledge of the target audience regarding MS4s, impacts to urban runoff on receiving waters, and potential BMP solutions appropriate for the target audience and their activities.
- Measurably change the behavior of the target audience and thereby reduce pollutant releases to MS4s and the environment.

The City performed a wide variety of storm water education activities during FY 2009-10. Education and outreach was performed on three levels – Jurisdictional, Watershed, and Regional. Budgetary constraints are currently severely limiting the City's outreach abilities to in-house staff and resources only. However, the City has always worked hard to openly communicate with its community and staff has always been available for face to face meetings both at City facilities and while out in the community. The community also has easy access to all City staff by phone or e-mail. The City feels that this informal accessibility works in our favor and actually provides our residents with more meaningful, in depth education than multitudes of printed material.

### 8.2 Municipal Staff Training

*Public Works*. Water quality staff participates in monthly meetings with all of the public work division and weekly meetings with the public works supervisors. At these regular meetings, water quality staff provides updates on current policies

and areas of concern. Due to the regularity of interaction between water quality staff and public works staff, no separate annual training is currently being provided. Any questions or comments can be dealt with more effectively at the regular meetings and changes to regulations or activities can be instituted quickly and efficiently. Water quality staff is also integrally involved in ensuring that public works staff receives and maintains all required certifications, such as Confined Space certification, Hazwoper certification, Cal OSHA updates, pesticide application qualification, and other risk management trainings applicable to their daily jobs and their stormwater activities. Towards the end of this reporting period, the City began exploring a newly available training tracking program, which in future reporting periods will make it even easier to verify staff trainings.

*New Employees.* Water quality staff is working with the City's HR department to establish a new employee interactive training power point presentation, which will include basic stormwater information and an evaluation test at the end. This video will be shown to all new employees regardless of department and their end test results will be tracked. The City is participating in the Regional Municipal Workgroup, which is working on developing a series of employee educational videos that would be available to all Copermittees. These videos would include new employee, management and task specific trainings. With the City's new training tracking system, it will be easy to track employee trainings and track pre and post-test results to evaluate a change in knowledge.

Engineering and Planning Departments. Water quality staff meets weekly with these two departments to discuss development review projects, new policies, streamlining of existing policies and to participate in consistent interdepartmental education. The City finds these regularly scheduled meetings a much more efficient and effective way of updating and educating staff on water quality concerns, regulations and improvements. They are the foundation for the City's new sustainability mindset and have been vital initiating the overhaul of the City's General Plan. It allows the City to present an ideologically unified front to its residents, developers, contractors, and business owners.

## 8.3 Educational Outreach

This section describes education efforts conducted for each target community during FY 2009-10.

### 8.3.1 Underserved Target Audiences and Mobile Businesses

*Underserved Target Audiences.* For those segments of Lemon Grove community that do not speak English as their first language, the City provides many of its brochures and handouts in both English and Spanish. The City also employs bilingual staff to assist our residents, answer questions, and translate information. The current water quality brochures available in dual languages are

IPM pest tip cards, recycling and HHW information. The City also has available the Green Wrench BMP guide for automotive repair shops and the Green Cooking BMP guide for restaurants in Spanish. The City also works with the County's Green Business group which provides BMP information in Spanish and in English. Despite these efforts, the City realizes this continues to be an underserved audience and by collaborating with the other Copermittees hopes to continue to develop new ways to provide them with water quality data and information.

*Mobile Businesses.* During FY 2009-10, the continued to participate and provide information to the Regional Mobile Business Subcommittee for the development of the Regional Mobile Business Outreach and Education Strategy. Mobile businesses inherently provide services across jurisdictional lines; therefore the Copermittees chose to collaborate on a regional mobile business outreach and education strategy, which addresses the following elements:

- Inventory development and maintenance
- Establishment of minimum BMP requirements
- Outreach and education

The City's water quality staff, for several reporting periods, has reviewed any business license that pertains to a mobile business and required them to provide applicable BMP information on the business license application. Until the new Permit, however, these businesses were not an independent category in the business license directory. They were filed by business type, such as automotive or food service. During this reporting period, the City created the mobile business category and has begun transferring the known mobile businesses into the correct category. One of the challenges faced by Code Enforcement, in conjunction with mobile businesses, is their tendency to conduct business during off hours. City staff is very limited in their ability to work off hours and since the economic downfall, all overtime is prohibited unless emergency related. The City hopes that a Regional database of mobile businesses will help to track and regulate their activities and improve education opportunities.

### 8.3.2 New Development and Construction Communities

The City uses the following strategies to provide education and outreach to its development and construction communities:

- BMP training request as part of the permit application process
- Meetings with project developers, owners, on-site contractors and site supervisors
- SUSMP checklists as part of the development review process
- Signed BMP checklist for all ministerial permit applications (training request sheet is attached to this checklist)

- Informal meetings with developers and contractors due to questions, comments, concerns, etc. Generally occurs during the review process or normal site inspection process
- All changes to construction site BMPs are required to be submitted to City staff for approval

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

### 8.3.3 Commercial/Industrial Owners and Operators

The following is a summary of the education and outreach provided to commercial and industrial owners and operators during FY 2009-10.

- Annual inspections of all industrial facilities, restaurants and automotive facilities in the City by our in-house Code Enforcement staff. During these inspections, individual one-on-one education was presented to each facility manager/owner. Information presented included general storm water quality information and BMP requirements.
- The City also has Green Wrench and What's Cooking guides available for interested parties.
- Mailings to facilities about applicable local workshops and education opportunities, such as those offered by SDG&E and the San Diego Energy Commission.

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party. However, it is important to note that significant animosity exists within the small business community as a result of existing State and County environmental control agencies. City staff bears the complaints of the business community for the high cost and perceived over-bearance of governmental regulation. They perceive stormwater inspections as part of this over-bearance and are often reluctant to make changes without the involvement of Code Enforcement proceedings.

### 8.3.4 Residential Community and General Public

The following is a summary of venues and media outlets utilized within the defined reporting period of this report to provide education and training to various residential and public audiences:

- City Newsletter containing an environmental section with water quality and environmental tips (such as how to properly care for your lawn, list of

basic household BMPs, or home improvement – BMPs your contractor should know) and information about HHW and recycling

- Various brochures available at City Hall: Used oil recycling, car washing, pet waste disposal, etc
- Maintenance of the stormwater hotline (619) 825-3827, which monitored by water quality staff
- Water quality staffed informational Booths at the following events: Fire Station Open House and Winter Bonfire.
- Participation and staffing at the Regional Education Outreach booth at the San Diego County Fair
- Participation and collaboration in watershed-based efforts such as Creek to Bay Clean-up and watershed based school presentations

As previously stated, City staff prides themselves on being available to its residents and business community with few complications or intermediaries. Staff is always available to discuss current projects, both under review and construction, with any concerned or curious party.

The City is constantly striving to improve its outreach and education opportunities within the limited means of the current budget. Much of the current education is done by City staff in an informal manner with the public and business communities. Having a small City staff, means a consistent message is provided because staff is easily kept up to date on the current regulations and policies. This program will continue to evolve as necessary and as funds allow.

## 9.1 Public Participation

Public participation is one of the components of the City's outreach program. The goal of the education component, discussed in Section 8, is geared towards disseminating educational material to increase public knowledge of storm water issues. The goal of the public participation component is to provide opportunities for the public to become involved in the process of education and reducing pollutants in stormwater and urban runoff.

Public participation activities provide opportunities for the public to interact and become involved with water pollution issues. When the public has the opportunity to become involved there are several positive outcomes. First, those involved become more knowledgeable about stormwater issues. Second, they become educators and stewards for the stormwater program. Finally, they provide important feedback to the stormwater program regarding the concerns of the public and issues that may be overlooked. Ultimately, public participation help makes the education process more effective.

## 9.2 Public Participation Approach

The City's approach for the outreach program is to develop an understanding among its residents and businesses of some fundamental storm water concepts. These include:

- The difference between the sanitary sewer and the storm drain system (sanitary waste gets treated, but discharges into the storm drain system flow directly to our waterways and beaches untreated)
- The economic value of our beaches and inland waterways and the importance of protecting them.
- An understanding of illegal discharges, i.e. sidewalk and street wash water runoff, vehicle fluid (antifreeze and oil), landscape debris, sediment, etc.
- How to report a stormwater violation (stormwater hotline or website).
- The fact that we all live in a watershed and that the watershed is integral to wildlife, public health, and to the water quality of the rivers, streams, and oceans.
- Reducing pollutants of concern.
- Responsibility of citizens to participate in the cleaning and maintaining of the community (i.e. creeks and parks) and not to be part of the pollution problem (littering, illegal dumping, improper disposal of household chemicals).

Some of the tools that are used by the City to implement the public participation activities are:

- public outreach events
- public reporting methods
- pet waste dispensers
- Household Hazardous Waste Collection and Used Oil Recycling
- public opinion surveys
- copermittee collaborations

## 9.3 Program Implementation

This section describes the specific public participation tools used during the FY 2009-10 reporting period.

### 9.3.1 Public Outreach Events

The City participated in several outreach events during FY 2009-10:

- Coastal Clean up Day – September 19, 2009; 10 volunteers; Federal Blvd/San Miguel drainage channel
- Fire Station Open House – October 10, 2009; 60 participants
- Winter Bonfire – December 4, 2009, 800 participants
- Creek to Bay Clean up Day - April 24, 2010; 18 volunteers; Federal Blvd/San Miguel drainage channel
- San Diego County Fair – June 12, 2010; 4,500 participants

### 9.3.2 Public Reporting Methods

The City has a local hotline that connects the caller directly to the City's water quality staff. The number is (619) 825-3827. A public works person is available for after-hours emergencies, who will contact the best staff person to handle the emergency. There are also two regional stormwater hotline numbers promoted within San Diego County: a toll-free Regional Storm Water Hotline, 1-888-846-0800 and the Think Blue Hotline, 1-888-844-6525 (1-888-THINK BLUE). Both of these hotlines are staffed by the County of San Diego Monday through Friday, 8:00am - 5:00pm. In addition to personal service at these hotlines during regular business hours, the hotlines provide a voice mail message for 24-hour public access.

The City's stormwater hotline has been heavily advertised since the programs inception. In FY 2009-10, the hotline received eight stormwater related calls, typically pertaining to the illegal discharge of fluids in the gutter over the weekend or a business hosing off their parking lot. All calls are investigated by Code Enforcement and are usually handled with a verbal warning and education about household BMPs. None of the calls during this reporting period requied formal

Code Enforcement proceedings. The hotline is advertised in the newsletters and on the City's website, in brochures, on give-aways, and at City events like the Winter Bonfire and the Fire Station Open House.

The City's website also provides water quality information and event updates: www.ci.lemon-grove.ca.us.

### 9.3.3 Pet Waste Dispensers

Residents are encouraged to protect our creeks, lagoons, and ocean by cleaning up after their pets. To make this easier; pet waste dispensers can be found at all the City parks and in the vacinity of City Hall, all areas where people frequently walk their dogs. Trash cans are also readily available in all of these areas. Both the trash cans and bag dispensers are maintained by the City's Grounds division.

### 9.3.4 Household Hazardous Waste Collection and Used Oil Recycling

The City co-sponsors several HHW and e-waste events over the course of the reporting period. During these events, residents can drop off any HHW or e-waste free of charge. The City collaborates with the Cities of Chula Vista and La Mesa for HHW events and data collection. The City participated in eight HHW events and eleven e-waste events. The City has two used oil collection points in the City:

- EDCO Recycling Center 6670 Federal Blvd
- Kragen Auto Parts 6925 Federal Blvd

### 9.3.5 Copermittee Collaborations

The City continues its collaboration and encouragement of the County's Green Business program for restaurants and automotive repair shops. This effort continues to develop and explore a State wide collaboration and standards. The City will continue to promote these programs to the applicable commercial facilities where-ever possible.

## Section 10.0 Fiscal Analysis

The purpose of this section is to provide a detailed analysis of the expenditures required to implement the JURMP. The main purpose of this analysis is to enable the City to determine the level of resources needed to meet the requirements of the Permit.

Although the Regional Water Quality Control Board staff down plays the importance of this portion of the analysis - based on comments made in public hearings during the new permit process and comments in Regional Board staff reports - the City considers the analysis vital in determining the City's ability to effectively meet the conditions of the Permit.

### 10.1 Cost Breakdown

The analysis was performed as outlined in the JURMP, by assigning specific expenditure categories into the general categories suggested in Permit section F.8. The analysis is presented in Table 10.1.

**Table 10.1 – 2009/2010 Fiscal Analysis Summary**

Stormwater Cost Analysis
All costs covered in the General Fund.

| ACTIVITY | CURRENT YEARLY BUDGET | CURRENT BUDGET LOCATION |
|---|---|---|
| **STORM DRAINAGE CLEANING AND MAINTENANCE** | | |
| **Public Street and Parking Lot Sweeping** | | Streets |
| Streets | $30,000 | |
| Parking Lots | $2,000 | |
| *Public Street and Parking Lot Sweeping Total* | $32,000 | |
| | | |
| **Litter Removal** | | |
| Litter Removal | $13,000 | |
| *Litter Removal Total* | $13,000 | |
| | | |
| **Storm Drainage Cleaning** | | |
| Inlets | | |
| Inspection and Cleaning | $19,820 | |
| Fossil filter replacements | $1,400 | |
| *Inlets Subtotal* | $21,220 | |
| Basins and Channels | | |
| Inspection and Cleaning (Note 1) | $38,829 | |
| *Basins and Channels Subtotal* | $38,829 | |
| **Video Inspections** | | |
| Video Inspections (Note 1) | $50,000 | |

| | | |
|---|---|---|
| *Video Inspection Subtotal* | $50,000 | |
| ***Storm Drainage Cleaning and Maintenance Total*** | **$155,049** | |
| | | |
| **STORM EVENT ACTIVITIES** | | |
| Sandbag stock piling and placement | $4,000 | |
| Patrols | $3,089 | |
| ***Storm Event Total*** | **$7,089** | |
| | | |
| **ILLICIT CONNECTION/ILLEGAL DISCHARGE ENFORCEMENT PROGRAM** | | Engineering Services |
| Dry Weather Testing | $20,000 | |
| Enforcement | $5,000 | |
| Administration/Supervision | $1,000 | |
| Stormwater HotlineComplaints | $2,000 | |
| ***Illicit/Illegal Enforcement Program Total*** | **$28,000** | |
| | | |
| **STORM WATER POLLUTION PREVENTION PLANS (SWPPP's)** | | |
| Construction Related SWPPP | $2,000 | |
| Plan Review (including SUSMP's) | $15,000 | |
| Inspection | $3,000 | |
| *Construction Related SWPPP Subtotal* | $20,000 | |
| Municipal Facility SWPPP | | |
| SWPP Implementation, Inspection, and Maintenance of Municipal Facilities | $18,798 | Streets |
| *Municipal Facility SWPPP Subtotal* | $18,798 | |
| ***All SWPPP Activities Total*** | **$38,798** | |
| | | |
| **BEST MANAGEMENT PRACTICES (BMP) IMPLEMENTATION** | | |
| Inspection of Industrial and Commercial Facilities | $50,000 | |
| Inspection of Municipal Facilities | $1,000 | |
| ***BMP Total*** | **$51,000** | |
| **MISCELLANEOUS ACTIVITIES** | | Engineering Services |
| Annual Reporting (JURMP) | $5,000 | |
| Administration (General) | $74,004 | |
| NPDES Permit Fee | $7,500 | |
| Public Education/Outreach | $5,000 | |
| ***Miscellaneous Activities Total*** | **$77,504** | |
| | | |
| | | |
| ***PROGRAM TOTALS*** | **$371,440** | |

Note 1 –Program still in development stages, projected cost for next fiscal year

It should be noted that the cost of program implementation during the 2009-10 reporting period does not reflect the true cost of implementation. There are cost areas that were not considered in the analysis. For example, the cost of personnel in the Grounds division, who perform stormwater maintenance

activities as needed, but who do not separate those activities from their daily activities. The City is currently working to create a more thorough "type of work" tracking system to alleviate some of these omissions.

## 10.2 Funding Sources

There are a number of sources for program funding; grants, stormwater fees paid by both residents and businesses, fines, and general fund money to name a few. The City has created a stormwater fee for businesses and residents through developmental plan check fees, for businesses charged through the business license and solid waste services to residential users. The fees collected only fund approximately one third of the total stormwater program costs. They currently are not allocated to any specific section of the program, but are used to ease various costs as needed. The City has integrated water quality compliance into its Code Enforcement program, which includes potential fines for continued non-compliance. However, the City does not foresee this as a steady revenue source for program funding, as compliance is the primary and desired outcome.
Given California state law, the City finds difficulty in fully funding its stormwater program. Also given recent opposition State-wide to the creation of stormwater fees, the City is cautious in expanding its current funding strategy. As such, the City's General Fund will be required to continue subsidizing this increasingly costly program.

The total cost of the program for this reporting period equaled more than 3% of the General Fund budget. For comparative purposes, the cost of the stormwater program is equivalent to:

- Seven times the amount the City spends on its Code Enforcement program
- The City's expenditure on maintaining all of its parks, and
- 258 percent more than the City commits to youth sports and recreation programs.

Again, these comparisons are included to demonstrate the City's financial commitment to the program.

To further the City's and region's efforts in meeting the overall objective of the Stormwater program, the City challenges the Regional Board and the environmental community to take regional leadership in proposing a regional revenue source – similar to that of TRANSNET for transportation enhancements. The City's financial commitment to the program demonstrates the City's efforts in complying with the requirements of the JURMP and the Pemit. The City continues to be willing to brainstorm with Regional Board staff regarding this challenge. To date, this challenge has been outright rejected by Regional Board staff.

## 11.1 Introduction

The City began applying baseline program effectiveness assessment methodologies soon after they were developed by the San Diego region stormwater Copermittees during the last permit cycle as described in the document titled "A Framework for Assessing the Effectiveness of Jurisdictional Urban Runoff Management Programs" dated October 16, 2003. The City has also actively participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008 and as an ongoing process. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs, so the City prepared its own effectiveness assessment approach and measures modeled after conventional strategies and the existing levels of effectiveness assessment as detailed in the October 2003 document.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is anticipated that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will undertake the issue of standardized assessment metrics and procedures in the near future. The City is committed to engaging in the process of developing such regional standards and incorporating resulting work products into its own local program effectiveness assessment system. It is in consideration of the evolving and ongoing regional standardization process that the City has endeavored upon fine tuning its local effectiveness assessment approach as presented in the subsequent paragraphs and tables. Further, it is recognized that these methodologies and strategies must be adaptable as regionally developed procedures are solidified in the future.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The core structure of the City's stormwater program is composed of three primary drivers:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The programmatic process typically proceeds from planning to implementation to assessment, although in practice all three maybe in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Next the program elements developed during the planning step are implemented. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments

are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

As part of the JURMP update process, the City has identified a variety of significant activities uniques to each program element and metrics (numeric and/or narrative) to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics are provided in SEction 13 of the City's revised 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step towards the more difficult level of improvements to water quality in receiving waters. The levels are listed below.

- Level 1: Compliance with Activity-based Permit Requirements
- Level 2: Changes in Knowledge/Awareness
- Level 3: Behavioral Change/BMP Implementation
- Level 4: Load Reductions
- Level 5: Changes in Discharge Quality
- Level 6: Changes in Receiving Water Quality

## 11.2 Effectiveness Assessment Results

The new Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the stormwater program as a whole. Level 1, Level 5, and Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment - assessment that combines both monitoring data and programmatic data - are still under development at regional and statewide levels (CASQA, 2007).

### 11.2.1 Outcome Level Assessments

*Level 1*

A requirements checklist, which includes a directory of permit compliance elements and where each is described within the JURMP annual report, can be found in Appendix G.

*Level 2 and 3*

Tables 11-3 at the end of this section include discussions of Level 2 and Level 3 outcomes for activities identified as significant by the City within each program component. Note that only Level 1 assessment applies to fiscal analysis, so a table for fiscal analysis is not included.

*Level 4*

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs, reliable load reduction estimation methods have not yet been or cannot be developed.

*Level 5*

On September 10, 2008, the Regional Board adopted Addendum 2 to Order 2007-01, effectively extending the annual due date of the illicit Discharge Detection and Elimination reporting requirements to December 15. It is anticipated, consistent with previous Dry Weather Monitoring reports prepared by the City that baseline trend analysis will be provided for a number of constituents evaluated through the Dry Weather Monitoring Program. This information is further spatially correlated with sub-basins or drainage areas within the City, and evaluated against land-use areas and potential source areas.

*Level 6*

It has been determined, through ongoing development and discourse over long-term effectiveness assessment methodologies that relationships between programmatic activities and changes in receiving water quality are difficult to establish on an annual basis or a jurisdictional scale. As such, the City will point to future regionally coordinated efforts including Report of Waste Discharge (ROWD) and Long Term Effectiveness Assessment (LTEA) development to more holistically evaluate changes in receiving water quality. It is anticipated that such efforts will be further refined and supported by ongoing data gathering efforts both locally and regionally.

### 11.2.2 Overall Component Assessments

*Development Planning*

The City's review process for development projects is effectively requiring higher removal efficiency treatment control BMPs. Further, two new significant program elements were in production and in early stages of implementation within the defined reporting period of this report; both new programs are demonstrating positive trends. BMP installation verification and BMP operation and maintenance verification efforts, while not wholly implemented at the time of report production, have resulted in the establishment of programs that will support long term effectiveness assessment measures for development planning.

*Construction*

The City's review and approval process for construction related plans and documents is effectively verifying proposed construction specific BMPs. BMP implementation and maintenance is being effectively managed through construction site inspection activities, and validated through associated assessment measures. It is anticipated that in response to increased inspection frequencies and refined data gathering practices that this trend will continue.

*Municipal*

The defined reporting period of this report is marked by significant expansion of municipal operations and maintenance activities to meet the standards established in Order 2007-01. Enhanced stormwater conveyance, drainage facility, channel maintenance and inspection and street sweeping activities, were developed and implemented, equating to the removal of salient volumes of debris. Effective operations and maintenance activities are demonstrated in the Table 11-1 below, and it is anticipated that this continued level of service as well as enhancements in data gathering methods will support the efficacy of municipal activities.

**Table 11-1**

| Activity | Amount Collected | Adjustment Factor | Estimated Load Reduction |
|---|---|---|---|
| Street Sweeping | 150.75 tons | None | 150.75 tons |
| MS4 Cleaning | 3,360 pounds (1.815 tons) | None | 3,360 pounds (1.815) tons |
| | | | **Total 152.565 tons** |

*Industrial and Commercial*

Stormwater activities and actions related to industrial and commercial entities have exhibited positive trends within the defined reporting period. The City has identified inspection activities coupled with complaint response and enforcement as the significant activities by which to evaluate program effectiveness. During the defined reporting period, the City has been able to evaluate effectiveness on a number of levels (See Table 11-2) through the gathering of critical statistics, including a knowledge and BMP assessment scoring system. Data gathered and evaluated during the defined reporting period indicate that identified significant program activities targeting industrial and commercial sources have been effective.

**Table 11-2 Program Scores for 2009-10****

| | Knowledge Assessment * | BMP Assessment |
|---|---|---|
| **Average Rating** | 2.6 | 3.5 |
| **Median Rating** | 3 | 3 |

| | | |
|---|---|---|
| # of “Level 5” Ratings | 6 | 25 |
| # of “Level 4” Ratings | 28 | 34 |
| # of “Level 3” Ratings | 30 | 49 |
| # of “Level 2” Ratings | 22 | 12 |
| # of “Level 1” Ratings | 33 | 4 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.
**The scores from these two reporting periods were consistent.

**Table 11-2 cont. Program Scores for FY 2005-06**
(This was the first year the analysis was done and is provided for comparision)

| | **Knowledge Assessment *** | **BMP Assessment** |
|---|---|---|
| **Average Rating** | 2.39 | 3.33 |
| **Median Rating** | 2 | 3 |
| # of “Level 5” Ratings | 0 | 14 |
| # of “Level 4” Ratings | 9 | 26 |
| # of “Level 3” Ratings | 34 | 30 |
| # of “Level 2” Ratings | 26 | 11 |
| # of “Level 1” Ratings | 18 | 7 |

*Deft Companies was not assigned a knowledge assessment score because no business representative was onsite at the time of inspection.

*Residential*

Residential BMP implementation has been identified as the significant activity by which effectiveness has been assessed. Residential complaint response and enforcement constitute the core of residential BMP implementation assurance actions. Based upon an evaluation of data associated with these elements, including the number of incidents responded to and the ultimate resolution of these events, the City has demonstrated a notably effective program and level of service to the community of Lemon Grove.

**Table 11-3**

| **Activity** | **Amount Collected** | **Adjustment Factor** | **Estimated Load Reduction** |
|---|---|---|---|
| Used Oil Recycling | 25,600 gallons | 10% | 2,560 gallons |
| C&D Ordinance Recycling | 17,852 pounds | 1% | 179 pounds |

*Education*

Education effectiveness is assessed for a variety of program elements. In terms of education opportunities provided to the various community sectors and City staff and contractors, identified as the significant metric by which to evaluate education activities, the City has achieved a high level of success.

*Public Participation*

The City provides a variety of venues and outlets in support of public participation. The City has identified a number of measures to evaluate the effective implementation of this program element. As with education, public participation translates across a number of program areas; however the assessment measure are focused on success of the venues ad outlets supported by the City. From the measures identified and quantified, community partnerships, event attendance, hotline calls, and volumes of debris and hazardous materials collected through public participation, the City has established exceptional trends.

## 11.3 Program Review and Modification

No significant changes to the effectiveness assessment approach presented in the City's March 2008 JURMP have been made since the submittal of this document.

# City of Lemon Grove

## Jurisdictional Urban Runoff Management Plan Annual Report

FY 2010 – 2011
September 2011 Report

The City of
LEMON GROVE
BEST CLIMATE ON EARTH
Incorporated in 1977

## Executive Summary

The City's eighth Annual Report submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit") represents an opportunity to further explore and develop effectiveness assessment measures as well as re-vamp existing programs to better reflect the new Permit.

Several programmatic changes reflected in this year's report have been made in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the RWQCB and the EPA's review of the Lemon Grove Standard Urban Stormwater Mitigation Plan (SUSMP) prompted a more focused effort on plan reviews, development and re-development strategies, and construction site management.

To respond to their comments and the new Permit, the City is implementing various methods to further assist in long-term effectiveness assessments. The methods are currently under revision and in a state of flux through participation in regional standardization efforts. The City will maintain existing standards, while the regional efforts continue to take shape and develop further.

Through a collaborative workgroup process with the Copermittees, the City has significantly improved our assessment strategies and analysis methods. The Copermittees worked extensively on the completion of the Report of Waste Discharge (ROWD) during FY 2004-05. The ROWD is a collaborative effort discussing the Copermittees requests and findings for the issuance of the 2006 Permit. The Copermittees also collaborated with an independent contractor to create a formal effectiveness assessment. Both the ROWD and the long-term effectiveness assessment documents were submitted to the RWQCB separately from the Annual Reports. However, the Copermittees worked extensively on these projects during FY 2004-05 and the City's participation is worthy of notice. The documents provided valuable information that the Copermittees will be using during the next reporting period to fine tune effectiveness assessment and program focus. In 2008, the City updated its JURMP and Municipal Codes to reflect the requirements of the new Permit, Order 2007-01. The Model SUSMP was completed by the Copermittees and submitted for Regional Board approval during this reporting period and will be added to the City's Municipal Code in the next reporting period. In FY 2010-11, the City continued its extensive involvement in joint Copermittee workgroups. The City feels the collaboration is necessary to develop and maintain a well-rounded, effective program and ensure regional stability for water quality improvements.

The City continues to improve and develop its own program effectiveness assessment strategies. The ROWD and the long-term effectiveness assessment have been extremely useful tools in helping not just the City, but the Copermittees, in analyzing the current available data. The documents have

helped identify areas of improvement and program focus. The long-term effectiveness document will be critical in the City's and the Copermittee's development of regional activities to address improved water quality and pollution prevention.

The City has taken important steps in putting newly developed strategies in motion. In particular, the City has continued to develop its BMP implementation strategy for construction sites and development proposals. During FY 2005-06, the City focused on improving its SUSMP checks, the tracking of construction site inspections, and the development of consistent standards in the Planning and Engineering Departments. The City continues these efforts into FY 2010-11. Employee training continued to focus on SUSMP implementation and those departments directly affected by the document through regularly scheduled inter-departmental meetings. In FY 2010-11, the City continues to make significant steps toward the implementation of a City-wide GIS program, including the beginning of service contract to install GIS layers for the sanitary sewer system. Other departments and layers will be added as the budget allows. Currently the budget does not allow for other layers, but the City hopes this will change in future reporting periods, although perhaps not until the next permit cycle. The implemented Code Enforcement program continues to improve in efficiency and effectiveness, including a new staff member, who functions as a water quality inspector and code enforcement officer. The City realizes that many of these new approaches are in their infancy, some still in exploration, but future reporting periods will further demonstrate the new concepts and ideals discussed in this report.

In FY 2005-06, the City created an independent funding source to help fund its program. However, the funding source only funds a small portion of the program, requiring the City's strapped General Fund to finance this increasingly expensive program. This shortage of steady funding is even more prevalent this reporting period and in the short-term future, due to cuts in State funding and a lack of re-imbursements from the State. Proposition 218 and the current economy make it even more difficult to obtain funding for the water quality program and future environmental legislation. It is even more important now, that the City take into account effectiveness and efficiency in its programs, especially its environmental programs. The City appreciates the Regional Boards understanding in these times of fiscal hardship.

## Section 1.0 Introduction

Lemon Grove's ninth annual report, submitted pursuant to the San Diego Municipal Stormwater Permit (NPDES Order 2007-01, "Permit"), represents the City's continued efforts to document and assess a full year of program implementation (July 1, 2010 through June 30, 2011). We are confident that the report demonstrates success in the continued development of a program that meets and often exceeds Permit requirements. At the same time, the annual reporting process presents a cumbersome challenge to City staff when combined with participation in the WURMP reporting process, the annual RURMP report, and the Dry Weather reporting process. The City strongly supports the concept of an all encompassing City and Regional program that increases effectiveness and efficiency to the maximum extent practicable. The myriad of reports causes disconnects between programs that should run seamlessly together. The City also feels a stronger regional program could help alleviate the cost burden the current program forces on the City. The end result would be a maximization of severely scarce funds and funding. The City is currently experiencing, as are many others, serious financial hardship due primarily to the economy and the State raids on local funds to support its own programs. The loss of revenue in the past year has forced the City to redistribute General Funds to maintain even basic service levels, such as pothole repair. The City feels the current program meets regulatory requirements, but is leery of program expansion without a secure revenue source. The unfunded mandate aspect of this program continues to stress the City's already stretched thin General Fund. The City encourages the Regional Board to take a stronger leadership role in facilitating more cooperation with State agencies in obtaining long-term funding for this program. The City hopes that in future reporting periods, some of these challenges can be met with more cooperation between the Copermittees and the Regional Board.

This report continues to demonstrate several programmatic changes in response to regulatory feedback received from the Regional Water Quality Control Board (RWQCB) and the Environmental Protection Agency (EPA). In particular, the March 2005 SUSMP audit performed by the RWQCB and the EPA prompted a reassessment of the City's SUSMP requirements and plan check procedures. The City chose to focus its improvement efforts in the SUSMP area. The City implemented a construction site inspection database to allow for future assessment strategies. The City's construction and BMP databases continue to evolve as more information is gathered and tracked. Water Quality staff continues active involvement with environmental legislation affecting CEQA requirements and green house gas emission standards. The City believes in a comprehensive and collaborative approach for environmental concerns and solutions. The City is working on a strategy to map its waterways and drainage channels for a future GIS map layer. The City is actively exploring its GIS options and hopes to have GIS capabilities in the next 5 years. The City began developing a basic needs assessment and schedule for the implementation of a

city-wide GIS program. The City is currently working on implementing initial GIS programs and layers through the Sanitation District. These initial layers will include the mapping of our sewer mains and City maintained laterals, as well as the tracking of maintenance activities. All further implementation is dependant on budgetary restrictions. The City and the Copermittees are moving toward a more quantitative and qualitative approach to reporting and operations, while faced with severe economic challenges both on a local and state level.

At the jurisdictional level, the City has taken important steps in putting newly developed strategies in motion. The City continued to enhance its BMP implementation process. The City continued to improve the assessment tools through inspection databases and the plan check process. The City continues to explore effective assessment options that fit within the budgetary confines and meet the requirements of the Permit. The City continues to explore its existing systems to better track water quality data. Current financial restraints limit the implementation of new programs and software. Though the tools are often imperfect and must continue to evolve, we have already found their use to be quite instructive in many ways.

The City believes the programs described in this report to be sufficiently updated over past efforts. Some accomplishments of particular note include the following:

- Use of community events for public outreach
- Improved code enforcement process for water quality
- Participation in regional workshops pertaining to new and pending environmental legislation
- Increased involvement in WURMP programming
- A continuing sustainability effort of which stormwater is a key element

This report is organized according to the general outline agreed upon by the Copermittees. Sections 2.0 through 7.0, each corresponding to a different category of pollutant sources (i.e. Municipal, Commercial, Residential), are organized as follows:

- Priority Sources
- BMP Requirements
- BMP Implementation
- Compliance and Enforcement

Where possible, all applicable data and information are consolidated into the sections to which they best apply so as to present a more holistic and self-contained description of each program area. For example, section 5.0 discusses every program element related to the City's commercial and industrial component (e.g. outreach to commercial audiences, inspections of businesses, responses to public complaints involving commercial dischargers, and enforcement actions taken against non-compliant businesses).

Sections 8.0 through 10.0 are intended only to summarize key statistics, and to address topics not covered in pervious sections. Section 11.0 provides a consolidated assessment of key program data and information. Much of this data is also presented in greater detail in sections 2.0 through 8.0. Section 12.0 provides an analysis of the City's projected expenditures for FY 2009-10. Section 13.0 discusses the City's conclusions and recommendations based on its assessment of this year of implementation under the Permit.

Overall, this report demonstrates, in a clear and well-organized way, the considerable thought and energy that went into developing and implementing a complex and rigorous program. The City looks forward to continued progress in future years.

## Section 2.0 Development Planning Component

This section describes actions taken by the City during FY 2010-11 reporting period to minimize the short- and long-term post-construction impacts of new and redevelopment projects on receiving water quality and other environmental resources. This includes activities related both to land use planning controls, and the site-specific conditioning of development and redevelopment projects in the City.

### 2.1 Land Use Planning

The City's land use planning process facilitates the reduction of development project discharges of pollutants from the MS4 to the MEP, the prevention of development project discharges to the MS4 from causing or contributing to a violation of water quality standards, and of increases in runoff discharge rates and durations from development projects that are likely to cause increased erosion of stream beds and banks, silt pollutant generation, or other impacts to beneficial uses and stream habitat due to increased erosive force. The water quality staff works closely with engineering staff in these efforts, presenting a united, collaborative process to developers.

The City's land-use planning process consists of development and implementation of the following documents:

- General Plan
- Jurisdictional Urban Runoff Management Plan
- SUSMP
- Municipal Code, which includes the City's Development Code, Grading and Excavation standards, and all Stormwater regulations

The utilization and regular update of each of these documents enables the City to successfully conform to the requirements of section D.1 of the Municipal Permit. The following sections will describe the City's land use planning process and the four planning documents in more detail.

The City of Lemon Grove was incorporated in 1977 from the County of San Diego. The City's General Plan was adopted in 1996 and is currently undergoing an in-depth review and amendment process. The City's JURMP, Stormwater Ordinance and SUSMP were originally developed and adopted under Order 2001-01 in 2002-2003. These documents have been reviewed and updated under the new Order 2007-01.

### 2.1.1 Source Characterization

The City addresses eleven major land use categories in its General Plan:

- Low density residential
- Low/medium density residential
- Medium density residential
- Medium/high density residential
- Mixed use
- Retail commercial
- General Business
- Industrial
- Parks and recreation
- Transportation
- Special treatment area (STA)

The General Plan also recognizes eleven zoning categories:

- Residential low
- Residential low/medium
- Residential medium
- Residential medium/high
- Residential professional
- Central commercial
- General commercial
- Limited commercial
- Heavy commercial
- Light Industrial
- Special treatment area (STA)

Each of these land-use and zoning categories is associated with different combinations of pollutants and activities that have the potential to negatively affect the surrounding environment. A detailed discussion of the potential threats to water quality associated with existing residential, commercial, industrial, and municipal land uses can be found in their specific sections of this report.

Through the implementation of the land use planning policies, procedures, and requirements established in the General Plan, JURMP, Municipal Code, Grading Ordinance and SUSMP, the City aims to reduce the potential for pollutant discharges from all planned development and redevelopment land use sources.

### 2.1.2 Best Management Practice Requirements

For each development project proposed, the City requires the builder and owner to consider BMP implementation from the beginning of the project. Attachment H-1 shows the form that is presented to each applicant regardless of project size.

This initial step makes water quality important from the on-set of the project, and each consecutive step further emphasizes the importance of water quality improvements for pre- and post-construction.

The City encourages all new and re-development applicants to explore such options as tot-lots, on-site detention basins, infiltration ditches, and on-site landscaping to ensure that water quality is improved, the natural environment suffers less, and less maintenance is required. The City requires sites to treat for pollutants of concern to the MEP. The City recommends that its applicants utilize the BMP handbooks created by CASQA to explore the best option for each particular project. The handbooks are available on-line at www.casqa.org. CASQA is a valuable resource for both the City and the developers.

To date, jurisdictional and project-level planning tools have been largely under-utilized because stormwater management is often viewed as an engineering issue by developers. As a result, many site-design solutions rely significantly on structural treatment controls like detention basins and mechanical treatment devices, which can be expensive and maintenance-intensive. In most cases, it is easier and cheaper to keep pollutants out of stormwater by designing the pollutant source out of the project, while simultaneously preserving the site's natural filtration capacity. Through a series of updates and reviews, the City is working to include low impact development concepts through-out the applicant review process and in its codes and regulations, specifically the General Plan.

### 2.1.3 Program Implementation

The Water Quality Program Coordinator is available for consultation during any phase of the project. The Coordinator plays a vital role in the pre-application phase of development by ensuring that all proposed projects incorporate water quality measures. This is done mainly through interaction with the developers and project engineers, but also involves written assessments of the project designs and any water quality documents. The assessment occurs multiple times before the applicant is permitted to submit a complete proposal. This process lengthens the pre-proposal phase, but improves the final approval phase. The Planning Commission knows that all issues have been dealt with prior to the approval hearing and that City staff has ensured a minimal environmental impact.

#### 2.1.3.1 General Plan/Municipal Code/SUSMP

As a component of the 2008 JURMP update (conducted during FY 2007-08), an assessment of the City's General Plan and Municipal Code were conducted to determine the City's consistency with the watershed protection policies and principles found in the Permit. The analysis found that the City's General Plan goals and policies are consistent with the Permit and that no amendments to General Plan were required as a direct result of the JURMP update. The

General Plan discourages the use of large amounts of connected impervious surfaces, requires a landscape minimum, works to protect environmental sensitive areas, and prohibits development near or in a known watercourse. However, the City's General Plan is currently undergoing a comprehensive review process with plans for amendments occurring over subsequent reporting cycles. The City plans to ensure that each area covered in the General Plan contains environmental and sustainable options and concepts. Low Impact Development ideas will be presented and encouraged throughout the document. The City's General Plan is meant to cross reference and openly comply with the City's Municipal Code and all other pertinent development documents.

The City's General Plan serves as the blueprint for the long-range, orderly, physical development of the City. The Development Code section of the Municipal Code contains all zoning and land use requirements and stipulations. These two documents together are designed to protect the City's environmental, social, cultural, and economic resources as the City develops and redevelops.

The Municipal Code did undergo a lengthy review and amendment process due to the issuance of Order 2007-01. Section 8.48 Stormwater Management and Discharge Control was broadened and made more comprehensive. A BMP specific section was added, Section 8.48.060-110. Section 8.48.140 contains regulations for all land development and redevelopment projects and Section 8.48.150 contains BMP maintenance requirements. All of these additional sections, strengthen the City's water quality program by providing a legal basis for implementation and enforcement. During the review process, the City decided to also include the SUSMP as a Municipal Code section, Section 8.52 now contains the City's SUSMP document. This section will be further updated during the next reporting period with the approval of the new County-wide SUSMP document. During this reporting period, the City collaborated with the Copermittees to create the final draft SUSMP, which was then turned over to the Regional Board for review and approval.

#### 2.1.3.2 JURMP

In compliance with Order 2007-01, the City's JURMP document underwent a major update during FY 2007-08. This update process was continued after receiving comments from the Regional Board in early 2009. The JURMP document serves as the City's foundational storm water program management tool, capturing the developed process, procedure, and implementation strategies for described elements. The purpose of this document is to present an integrated approach to reducing the discharge of pollutants from the MS4 to the MEP, and to protect and improve the quality of water bodies in Lemon Grove.

## 2.2 Environmental Review Process

As part of the 2008 JURMP update, the City evaluated its environmental review process and confirmed that the current process accurately evaluates water quality, cumulative impacts, and identifies appropriate measures to avoid, minimize and mitigate those impacts for all development projects.

The California Environmental Quality Act (CEQA) requires environmental review of discretionary applications for development projects. Environmental initial studies are conducted to determine whether the project may have a significant impact on the environment. This review process evaluates a project's potential for significant impacts on water quality.

The environmental review process ensures that a project's impact on water quality is addressed early in the planning process. If a project is determined to have a significant environmental effect, mitigation measures are required under CEQA to avoid or reduce the effect to below a level of significance. The mitigation measures will normally take the form of adopted permanent Best Management Practices to be incorporated into project plans prior to discretionary approval.

## 2.3 Development Project Approval and Verification Process

As discussed previously, the City has an established multi-departmental review process for all new development and redevelopment projects. By using all of the above mentioned regulations, the City aims to mitigate the negative impacts of urban runoff from development projects to the MEP. Each proposed discretionary and ministerial project is subject to the City's development approval process. The following sections describe this process in detail.

### 2.3.1 Source Characterization

As discussed above, development projects have the potential to discharge different types and amounts of pollutants based on the project's size and intended land use. Pollutants such as trash and debris are anticipated from all developments, regardless of land use; however, pollutants like bacteria and viruses are more likely to originate from restaurants and residential developments, whereas grease and oil are more likely contributed by parking lots and automotive repair shops. Since the potential for a site to discharge pollutants is unique to each development, the City's design requirements for development projects vary according to size, project characteristics, and anticipated land use.

The City's SUSMP, which was updated and added to the Municipal Code during FY 2007-08, describes specific categories for priority projects and indicates common pollutants associated with each category. A priority project must

identify the potential pollutants anticipated from its development and implement design concepts and other BMPs to address these pollutants.

In the City, all development projects, including building and ministerial permits are required to implement minimum BMPs. These BMPs include construction BMPs and good housekeeping practices. Discretionary projects, however, generally pose a greater potential threat to water quality and are subject to an additional set of BMPs and more intense scrutiny.

### 2.3.2 Best Management Practice Requirements

The City's minimum BMP requirements for all discretionary development projects are summarized here and are included in the City's SUSMP. All discretionary development projects are required to explore and implement where applicable the following principles:

- Source control BMPs that reduce stormwater pollutants of concern in urban runoff, including but not limited to storm drain stenciling and signage, properly designated and covered material and trash storage areas, and the use of efficient irrigation systems.
- LID BMPs that provide retention, slow runoff, minimize impervious footprint, direct runoff into landscaping, and promote water conservation.
- Grading and construction activities must implement all requirements outlined in the City's JURMP and Municipal Code.
- Submittal of proof of on-going long term maintenance for all structural post-construction BMPs.

SUSMP priority projects must submit a water quality document, which includes identification of potential pollutants from the project, proposed LID, source control and treatment control BMPs, and an attached maintenance agreement. The document must also include how the project will manage increases in runoff discharge rates and durations associated with the project. It is the City's policy to prevent permitted projects from increasing the runoff coefficient that eventually enters the City's MS4. Both the water quality document and hydrology report must provide retention and detention details for any runoff increase due to the development or redevelopment of a site.

#### 2.3.2.1 Hydromodification Management Plan and Interim Hydromodification Criteria

To reduce the negative impacts to beneficial uses and stream habitats that are attributed to increased runoff rates and in compliance with Order 2007-01, the City is currently collaborating with the other Copermittees to adopt a detailed Hydromodification Management Plan (HMP).

The final draft HMP was submitted to the Regional Board at the end of this reporting cycle and will be approved and integrated into the City's program during the next reporting cycle. However in FY 2007-08, the City established interim hydromodification criteria that will be in effect until the final HMP is approved by the Regional Board and adopted by the City. The City requires all priority projects disturbing 50 or more acres to comply with the interim hydromodification criteria, except those sites that are considered exempt as per Section D.1.(g)(6) of the Permit. These interim requirements are consistent with the regionally adopted interim hydromodification standards. The City of Lemon Grove is a small developed community and does not anticipate any projects during the following reporting period that will meet these criteria. The City also connects almost exclusively to concrete channelized streams at its borders and does not anticipate frequent projects subject to future hydromodification requirements.

The City does not issue permits to development projects until all minimum BMP requirements are met. Any changes made to the development project's proposed stormwater BMPs during project construct must be reviewed and reapproved by City staff before being implemented.

### 2.3.3 Program Implementation

As required by the Permit, the City has implemented a program to ensure that development and redevelopment projects comply with post-construction BMP requirements, including Low Impact Development (LID), source control, and treatment control BMPs. The Permit further requires the City ensure proper installation of treatment control BMPs and their maintenance into perpeturity through such procedures as BMP verification, maintenance agreements, and annual inspections.

The following sections provide an overview of the City's SUSMP implementation practices and tracking during FY 2009-010.

#### 2.3.3.1 Model and Local SUSMP updates

As a part of the 2008 JURMP update process, the City updated its current SUSMP document to meet the interim requirements outlined in the Permit. The City's update followed the recommended language developed by the regional SUSMP update group. All required interim SUSMP updates were incorporated into the Municipal Code. In compliance with the interim SUSMP update standards established in Order 2007-01, the following tasks were performed during the review and interim update of the SUSMP:

- Priority project categories were updated
- The document was reviewed to ensure no obsolete or ineffective BMPs were retained

- LID requirements and additional source control requirements were added to meet or exceed Permit requirements
- LID BMPs that can be used as treatment control BMPs were added to appropriate tables and discussions of treatment control options were updated accordingly
- Pollution removal efficiencies of treatment control BMPs were reviewed and updated where necessary

In addition to the changes discussed above, a comprehensive model SUSMP update was completed by a regional workgroup during FY 2007-08. The comprehensive model SUSMP update includes the following as required by the Permit:

- Inclusion of LID, source control, and treatment control BMPs that meet or exceed the minimum requirements of the Permit
- Establishment of siting, design, and maintenance criteria for each LID and treatment control BMP listed in the model SUSMP
- Addition of criteria to help determine conditions where implementation of each LID BMP included in the model SUSMP is applicable and feasible
- Addition of a requirement for priority projects with low traffic areas and appropriate soil conditions to use permeable surfaces
- Addition of any necessary restrictions for infiltration BMPs from priority projects that generate high levels of pollutants

The City adopted the new Model SUSMP during this reporting period. The SUSMP includes a review process to verify all proposed BMPs for priority projects meet the criteria designated in the updated local SUSMP.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's local SUSMP during the next reporting period. The HMP was developed by a consultant and regional workgroup during this reporting period and the draft HMP was submitted to the Regional Board for approval.

#### 2.3.3.2 Development Project Approval Process

The following includes a summary of the City's current development review process.

*Discretionary Projects*

Projects requiring a discretionary review are subject to an in-depth review by City staff. During the first submittal or pre-meeting, it is determined if the project is a SUSMP priority project and if a water quality document will be required. The project is reviewed by engineering, planning, sanitation, building, and water quality staff; through all permit phases. After review at the City, the project is reviewed by the City's Planning Commission and conditions of approval are set

for the project and approved by the City Council. These conditions require the applicant to uphold all proposed water quality measures and any changes are subject to review and approval by City staff and potentially the Planning Commission and City Council depending on the significance of the changes.

The City of Lemon Grove requires applicants to complete their water quality documents at the time of discretionary review and approval. During this process, the applicants and their engineers are guided by City staff to provide adequate post-construction BMP facilities and to document those facilities on the site plans and documents being submitted. This process results in better designed, more comprehensive, post-construction BMPs since the facilities are included in the project design even in the earliest phases of the project. Each applicant who prepares a water quality report for a priority project is provided a self checklist to assist in their report preparation. This checklist provides the applicant with an outline and details pertaining to the requirements of the SUSMP and the Permit for BMP implementation and sizing.

All hydrology reports and treatment control BMP sizing are done during this phase and are upheld through the remainder of the grading and building phase through the conditions of approval. The same City staff that performs the discretionary review also performs the grading and building permit reviews. This also maintains consistency throughout the review process and ensures the conditions of approval are upheld. City staff provides constant feedback and assistance to the applicant and their engineers through out this process and all additional permit processes. The City continues to discourage the use of mechanical treatment systems. Natural systems are easier and more cost effective to maintain in the long term, as well as encouraging landscaping and additional green space with little if any additional irrigation. All proposed BMPs must meet the standards set forth in the City's SUSMP document, which upholds the requirements put forth in the Permit. If the submittal is inadequate in any regard, approval is withheld and re-submittal is required.

*Ministerial Projects*

Grading, improvement plans and building permits are all ministerial permits, which means they only require the approval of City staff, not the Planning Commission or the City Council. However, if the project is not completed to staff's approval, no permits are issued and no actual work can be done on the project site. These projects are reviewed by all the same departments and staff as the discretionary projects. Lemon Grove is a small city and has a small staff, which allows the full spectrum of departments to be intimately knowledgeable about the projects being reviewed and any concerns pertaining to the project. If it is discovered that a ministerial project meets priority project conditions as per the SUSMP, all the requirements discussed above are applicable. No permits are issued by City staff until the project satisfactorily meets all of City staff's requirements, particularly water quality requirements.

All ministerial projects, except water heater installations and electrical wiring, are reviewed by water quality staff. Even if the project does not meet priority project standards, water quality staff reviews the project for LID concepts, proper drainage design, proper erosion control, and smart irrigation.

*Post-Construction BMP Maintenance Agreements*

All priority projects under review for permits must execute a stormwater maintenance agreement guaranteeing the maintenance and/or replacement of permanent BMPs as necessary into perpetuity. The maintenance agreement is recorded against and runs with the property. This ensures that all future owners maintain the permanent BMPs to the original standards and any changes require the approval of City staff.

*Capital Improvement Projects*

The City's Capital Improvement Projects (CIP) are subject to the same post-construction BMP requirements as private development. Because many projects are redevelopment, linear or repair projects, often only construction BMPs are necessary. However, SUSMP qualifying projects must also install post-construction BMPs. Priority CIP projects are designed to incorporate the City's SUSMP requirements and LID, source control, and treatment control BMPs will be implemented. The city takes responsibility for long-term maintenance and regular inspection of any installed permanent BMPs. Section 4 of this document provides a description of the City's MS4 maintenance and inspection program.

#### 2.3.3.3 SUSMP Project Approval

During the planning process, the City reviewed eleven SUSMP projects during this reporting period. A list of those projects can be found in Appendix H4. All applicable SUSMP BMP requirements specified in the City's local SUSMP were applied to each of these projects. Under no circumstances was any priority project permitted to implement treatment control BMPs with low pollutant removal efficiency ratings. In addition, all of the development projects approved in FY 2008-09 were less than fifty acres in size; therefore none of the projects were required to meet Interim Hydromodification Standards. All treatment control BMPs met the treatment control BMP sizing requirements outlined in the City's local SUSMP; therefore, the City did not initiate a waiver mitigation program and did not issue any waivers of infeasibility during FY 2009-10. Depending on the date in which the project was reviewed and approved, conditional SUSMP requirements may vary as a result of the migration to the new Permit requirements and the required adoption of the new local SUSMP.

#### 2.3.3.4 SUSMP Project and Treatment Control BMP Tracking

Over the past fiscal year, water quality staff worked to implement a watershed-based SUSMP tracking system. In the future, this tracking system will be transitioned to a GIS based system. However, it is currently only a tracking database. Since the City is predominately in the Chollas Creek watershed with only a small portion in the Sweetwater watershed, it is not difficult to track projects by watershed. The database tracks the following information:

- Type of treatment control BMP
- Location of the BMP
- Watershed within which the BMP is located
- Date of construction of the BMP
- Responsible BMP maintenance party information
- Owner information if different from maintainer
- Receipt of annual maintenance verification
- Inspection findings
- Corrective actions if necessary

The City is continually working to refine the database as more permanent BMPs are implemented and tracked. The City currently has less than 10 tracked BMPs, although several more are still in the proposal and review stage as evidenced by the priority project list. Due to the small number of permanent BMPs in the City, staff inspects all of them regardless of JURMP priority level. They are inspected formally on an annual basis, but frequently informally inspected when staff is in the vicinity. If, in the future, the number becomes significantly larger, the City will begin to utilize the priority rating to determine inspection frequency.

#### 2.3.3.5 BMP Installation Verification Process

The City has always verified the proper installation of all permanent BMPs and LID components, which are similar to the site design elements of the previous Permit. The City continues this practice under the new Permit. Each project requires closing signatures from staff once construction is completed. This involves an on-site staff visit to verify the project was constructed per the plans and appropriate documents including any water quality reports, hydrology reports, and soil findings. If corrections are needed, staff does not provide a signature and can withhold that signature for as long as it is needed to gain compliance. Without compliance, the site cannot be used for its final purpose. If compliance is not reached within a reasonable amount of time, Code Enforcement proceedings are begun. Each project under goes frequent staff inspections during the construction as detailed in Chapter 3 of this report to ensure that any underground elements are being built according to the approved plans and provide regular staff feedback and assistance. All in the hopes of a properly designed site at signature request time. The final signature process involves the same departments that reviewed the project from its initial stages,

typically this includes planning, engineering, sanitation, and building. This means that the staff providing the final implementation inspection is the same staff that reviewed and approved the project, meaning they are very knowledgeable of the project and its requirements. The City's interdepartmental cooperation is instrumental in making this process effective and efficient. Problems are viewed and solved jointly and comprehensively.

#### 2.3.3.6 Annual Treatment Control BMP Operation and Maintenance Verification and Inspection

As required by the new Permit, all treatment control BMPs installed at development projects must be inspected annually and maintained in perpetuity by the responsible party. As part of the JURMP update, the City established a Treatment Control BMP tracking program. Because implementation of the City's JURMP did not begin until January 2008, this reporting period is the second year the tracking system has been used. Annual inspections took place by City staff during this reporting period of all permanent BMPs that have been in operation for at least one full year and rainy season. Again, due to the small size of the City and the currently small number of permanent BMPs, the City was able to inspect all of the BMPs meeting the one full year of operation criteria. As stated before, should that number increase drastically, the City will then begin to use the priority ratings established in the JURMP. A listing of the BMPs inspected during this reporting period can be found in Appendix H5. The City is currently working to implement the annual verification letter requirement. As this is a new and additional requirement for businesses, there have been some initial delays in receipt of these letters and receipt of incomplete information. However, the City is working with the businesses to obtain all the required information in a more timely manner. The City is working to integrate the letter process into its annual commercial and industrial inspection program to solve the previously mentioned difficulties. This information is tracked in the same database that tracks BMP location and inspection results. The City has mailed a notification letter to all those owners/operators that will be required to provide annual BMP verification letters to the City. These letters must be submitted prior to the start of each year's rainy season.

In the first year of implementation, the City anticipates a significant amount of information gathering and validation. Through initial contacts with responsible parties, the City will refine its inventories as well as methodologies to effectively assure proper maintenance and management of permanent BMPs.

#### 2.3.3.7 Enforcement Measures for Development Sites

Since the City's Treatment Control BMP Operation and Maintenance Verification and Inspection Programs did not commence until FY 2007-08 and prior to that the City had a very small inventory of operational treatment BMPs, no enforcement action was required. Verifications and inspections will be completed

as required prior to the rainy season of each reporting period and any subsequent enforcement action will be tracked and reported in the next annual report.

The City will use a variety of escalating enforcement methods to implement storm water requirements for all development projects within the City's jurisdiction. This process is standard for any code violation does not threaten the public's health or immediate safety. Most issues are handled informally with a verbal warning and follow up inspection. These are not always tracked, as this is considered the informal part of the compliance process. The City believes it is important to provide the owner/operator a chance to correct a violation prior to beginning a retribution process. However, if a verbal warning is insufficient, formal proceedings begin with a written notification sent certified mail to verify receipt and detailing the time of the next inspection. The City is flexible on the compliance time frame depending on the severity of the work required for compliance. If a swale needs to be mowed, the City would allow seven days for compliance. However, if a private channel needs concrete work, the City is apt to allow 30 days for compliance as this requires significantly more labor, equipment and cost. Subsequent inspections verify compliance and if continued non-compliance is found; notices of violation, monetary fines, property liens, withheld permits, and small claims court are all viable follow-up actions based on length and severity of non-compliance. A detailed description of the Code Enforcement process is available in the City's JURMP document or through the City's Municipal Code which can be found on-line at www.ci.lemon-grove.ca.us.

#### 2.3.3.8 Notable Activities

Several notable activities were conducted as part of the Development Planning Component during the last several reporting periods. Notable activities included:

- Comprehensive review and update of the City's JURMP
- Comprehensive review and update of the City's Municipal Code
- Comprehensive review, update, and adoption of the regional Model SUSMP
- Development and Implementation of the BMP Verification and Inspection tracking database
- Comprehensive review and revamp of the annual report based on Regional Board feedback
- Continued education of project developers
- Revision of checklists provided to developers to reflect new standards and language

The City will continue to develop and amend its water quality development processes to meet new requirements and demands based on water quality results and improvements in technology. Future annual reports will detail these changes as they take place.

## Section 3.0 Construction Component

The purpose of the City's construction component is to maintain an updated inventory of all construction projects, identify pollutant sources from construction projects, educate the construction community, implement construction site BMPs, inspect construction sites, provide proper enforcement of violations, and implement all of the requirements of the Permit as outlined in Section D.2.

## 3.1 Source Characterization

### 3.1.1 Site Inventory

Within the defined reporting period of this report, the City has compiled, maintained, and updated a watershed based inventory of all construction sites within its jurisdiction. The construction inventory for FY 2010-11 included a total of eight operating construction sites, mostly private driveways and private sewer laterals. Only two of the projects were SUSMP priority projects and they are discussed below. The City formally inspected all of these sites on a monthly basis and informally almost weekly. All of the sites during this reporting period were within the City's main watershed, Chollas Creek.

The City completed 12 minor infrastructure improvement projects during FY 2010-11. All of the projects were minor street resurfacing or pavement rehavilitation. The City has been forced to drastically decrease its street resurfacing due to current budgetary constraints.

- Hardy Drive
- Siegle Court
- Blossom Hill Drive and Court
- Craig Court
- El Verde Court
- Olive Street
- San Altos Place
- Loma Drive
- Circle Drive
- Roosevelt Street
- Edgerton Street
- Lemon Grove Ave, N
- Mount Vernon Street

The City defines a high priority construction site by the following guidelines:

- 50 acres or more and grading during the wet season;
- 5 acres or more and on a tributary of a 303(d) list waterway
- The City may include other sources and activities that contribute significant pollutant loads to the MS4

According to the above definition, the City had no high priority construction sites during this reporting period. However, the City had one construction site that it monitored very closely during this reporting period.

- The rehabilitation project at the City's Recreation Center, which was not a priority project and had a decrease in impervious surface area.

The City performed weekly inspections this location, during both the dry and wet seasons, to ensure the proper placement of BMPs and general site upkeep.

### 3.1.2 Ordinance Updates

As required by Section d.2.a of the Permit, applicable City documents and ordinances were updated in March 2008 to establish adequate legal authority to enforce applicable storm water requirements. As part of the comprehensive JURMP update completed in March 2008, the City also updated Municipal Code 8.48 Stormwater Management and Discharge Control and 18.08 Excavation and Grading. The following construction specific provisions have been made to these two sections:

- Best Management Practice requirements and general requirements applicable to all dischargers (8.48.060)
- Additional requirements for land disturbance activity (8.48.130)
- Minimum BMPs for land disturbance activity (18.08.140)
- BMP maintenance (18.08.180)
- Stormwater runoff (18.08.450)
- General Construction permit requirements (18.08.900)

## 3.2 Best Management Practice Requirements

The City requires that BMPs be implemented to reduce or eliminate the impact of discharges from construction site runoff primarily through its grading ordinance. The checklist available in Attachment I-5 gives a breakdown of the City's grading permit requirements.

### 3.2.1 BMP Requirements for Permitted Construction Sites

Through the JURMP update process completed in March 2008, the City reviewed and updated a set of minimum BMps that must be implemented at all construction sites. Every construction site within the City's jurisdiction is required to implement general site management BMPs and erosion control BMPs to reduce, retain, and manage pollutant discharges to the MEP. During FY 2009-10, the following BMPs were required on all sites for which permits were issued:

- Erosion Control Methods for Disturbed Slopes: Vegetation Stabilization (Planting), Hydraulic Stabilization, Bonded Fiber or Stabilized Fiber Matrix, Physical Stabilization (Erosion Control Blankets);

- Sediment Control Methods for All Disturbed Flat Areas: Mulch, straw, wood chips, or soil application, De-silting Basin (must treat all site runoff), Energy Dissipater and Outlet Protection
- Methods for Preventing Off-Site Tracking of Sediment: Stabilized Construction Entrance, Construction Road Stabilization, Entrance/Exit Tire Wash, Entrance/Exit Inspection and Cleaning Facility; and
- General Site Management BMPs for On-Site Waste: Materials Management (Material Delivery and Storage), Waste Management (Concrete Waste Management), Solid Waste Management, Sanitary Waste Management, and Hazardous Waste Management.

### 3.2.2 Seasonal Site Management Requirements

Construction sites are required to implement minimum construction BMPs to prevent pollution discharges to the MEP regardless of the season. However, the City also maintains requirements for erosion and sediment control BMPs that are additional for the wet season (October 1st – April 30th). These requirements include:

- If necessary, upgraded perimeter protection for pending storms
- Erosion prevention BMPs must be installed, maintained, repaired, improved or replaced to the MEP and as is safe
- Amount of exposed soil shall not exceed seventeen acres, exceptions must be approved by the City Engineer
- Any incomplete disturbed area not being actively graded must be fully protected if left inactive for 10 or more days

Prior to the beginning of the wet season, the City sends a letter to the owners of all active construction sites explaining the wet weather BMP requirements and reminding them of the standard minimum requirements.

## 3.3 Program Implementation

The City ensures that BMPs are implemented to the standards described in Section 3.2 through several inter-related activities including permit issuance, project approval, field inspection, and public outreach.

### 3.3.1 Construction and Grading Approval Process

The City has an established and thorough interdepartmental review and approval process for local construction and grading permits. When a construction project comes to the City for approval, it is required to obtain a building permit, a grading permit, or both. A grading permit is required prior to any activity where the total volume of material disturbed, stored, disposed, or used as fill exceeds 50 cubic yards. All other projects require a building permit. Both permits require that plans be submitted and approved by the City. The City's grading ordinance

requires that all projects, whether subject to a grading plan or not, are required to minimize site runoff, erosion, and sedimentation. In addition, all projects requiring a grading permit are required to prepare an erosion and sediment control plan. All permits that go through the City's review and approval process are tracked within a City wide data management system called HdL.

The grading permit outlines the regulatory (Federal, State, and City) conditions for new construction. The grading permit requires that grading plans be prepared, reviewed, approved, and signed by the City Engineer. As part of this approval process, the City's water quality staff also reviews the grading plans to ensure compliance with applicable construction specific regulations.

The grading plan approval process consists of a series of plan checks, revisions, and final approvals. Plans are checked by planning, engineering, water quality, and sanitation. Engineering staff reviews the plans for overall compliance with the grading ordinance. Planning checks to verify the plans are consistent with any previously approved discretionary plans and to verify landscaping, if applicable. Sanitation checks for the location of any sewer laterals and ensures that all tie-ins are legal and properly located. Water quality staff checks the plans for specific compliance with the stormwater section of the Municipal Code, the Permit, the local SUSMP, and any other applicable State or Federal regulations. If the site falls under the jurisdiction of the State's General Construction Permit, staff follows up with the developer to ensure that a SWPPP is properly prepared and submitted. In addition, the SWPPP is reviewed and approved as part of the normal approval process and must be complete before the grading permit is issued to the applicant. The City also requires proof that a Notice of Intent (NOI) has been submitted for sites that are subject to the General Construction Permit.

Prior to issuing building and grading permits, staff verifies that the proposed construction project plans to implement all applicable required BMPs to reduce pollutant discharges to the MEP.

### 3.3.2 BMP Implementation

Water quality staff spends a significant amount of time coordinating storm water management and BMP implementation at construction sites with the help of the Engineering Department and the City Inspector.

Staff constantly monitors weather patterns and storms in the Pacific through the National Weather Service. Weather reports and forecasts are emailed to all applicable inspectors to inform them of the possibility of incoming rain. This e-mail reminds them to verify BMP compliance at all active construction sites. If the forecast exceeds 40% over the coming five day period, letters are sent to site owners and inspectors check for any additional, applicable BMPs at each of the active sites and any inactive sites with exposed soil. The upkeep of these BMPs is monitored daily while the rain lasts.

Staff approved only no projects with SWPPPs during this reporting period:

Other project reviews completed by staff as part of the permitting process are addressed in more detail in Section 2.0, Development Planning.

Through the review and plan check process, staff may require additional or alternative BMPs to be implemented on individual projects. This allows the stormwater program to ensure that the proper sediment control, erosion control, and materials management BMPs are shown on the plans and are to be implemented on-site. Any changes to on-site construction BMPs require the approval of the City Inspector and are tracked as red line changes on the construction site drawings.

### 3.3.3 Construction Sites Requiring Advanced Treatment

There were no sites in FY 2010-11 that required advanced treatment. For the majority of the construction sites with the City's jurisdiction, the minimum required BMPs, if correctly installed and maintained, adequately control sediment discharges from the site. If it is determined that a project site possesses characteristics that could result in standard construction BMPs being ineffective in the treatment of sediment, resulting in an exceptional Threat to Water Quality (TTWQ), advanced treatment will be required. Standard criteria for determining projects that pose an exceptional TTWQ and a description of advanced treatment methods are included in the City's Municipal Code and in the new local Model SUSMP.

### 3.3.4 Inspections and BMP Verification

The City has an established inspection program to evaluate compliance with stormwater regulations at all construction sites within the City's jurisdiction. The City Inspector is responsible for inspections at all construction sites in the City. Stormwater issues, such as compliance with the grading and stormwater ordinances, are a main focus, especially during the rainy season. It is quite common for water quality staff to also assist in regular inspections and for building inspectors to notify City staff if a violation is observed or if compliance is questionable.

Due to the small number of active sites in the City during any given reporting period, the City inspects all active construction sites regardless of priority and extra attention is paid to any site with a higher threat to water quality during the rainy season. All sites are formally inspected monthly at a minimum and often receive informal inspections on an almost weekly basis.

The City Inspector tracks all inspection notes in a tracking database for future reference and enforcement actions if applicable. This database is updated after each inspection performed, so on a monthly basis at a minimum.

### 3.3.5 Compliance and Enforcement Actions

#### 3.3.5.1 General Compliance

The City is responsible for enforcement of local ordinances and applicable local permits at all construction sites in its jurisdiction. Enforcement for construction projects is administered by the City Inspector and other applicable City staff, such as Code Enforcement.

The City typically employs a tiered, escalating enforcement system which includes verbal warnings and education, written warnings, and administrative citations. However, the City reserves the right to determine the most appropriate enforcement course for a given situation, as dictated by the specifics of each case. For example, a stricter initial enforcement measure may by applied where significant noncompliance is noted or when a potential rain event increases the potential for the violation to have a negative impact on water quality.

Verbal warnings and education will typically be the initial enforcement methods employed, assuming that a) the site or individual does not have a history of non-compliance with storm water regulations, and b) there has not been an observed illegal discharge to the MS4. The inspector will educate the violator on what actions need to be taken to prevent a violation from occurring or to correct the violation and document the violation and verbal warning in the inspection file. A time frame will be given for an identified violation to b corrected and a follow-up inspection date will be scheduled, which will also be documented.

A written warning is typically issued to violators that are already aware of the City's stormwater regulations or to those who have not corrected their actions after being given a verbal warning. Written warnings can be given using a variety of methods, including the issuance of a Notice of Violation (NOV) or Stop Work Notice. The NOV will provide a description of the violation to be corrected, the time frame for correction, and a follow-up inspection date. All Stop Work Notices issued by the City for construction sites are reported to the RWQCB per the reporting requirements of the Permit.

Civil penalties for violations of the Municipal Code are established in Section 1.24 of the Municipal Code. Determined violations of the stormwater regulations may be subject to administrative citations and associated administrative fines. Administrative citations and fines are used in addition to other legal remedies as described in the paragraphs above.

All inspection personnel have the authority to take immediate enforcement actions when necessary. This facilitates timely correction of inadequate BMP implementation, reducing the risk of pollutants discharging from the site. City inspectors conduct follow-up inspections to determine if corrective actions have been taken to comply with City ordinances and minimum BMP requirements. The time frame for a violator to correct a documented violation is determined on a case-by-case basis at the discretion of the inspector and the severity of the violation.

#### 3.3.5.2 Reporting and Non-Compliance

During the FY 2010-11, approximately six known complaints were received through the City's hotline and other phone lines pertaining to construction sites. All calls were investigated the day of the call; the majority of the complaints were unwarranted and not related to stormwater. Any violations that were discovered were corrected within 24 working hours of verbal notification to the site manager. The site was inspected by the Regional Board during this reporting period and only minimal corrections were required and all were completed within 24 hours of notification.

## Section 4.0 Municipal Component

The municipal component of the City's stormwater program includes proper management of facilities owned and operated by the City of Lemon Grove to eliminate or reduce the amount of pollutants that enter the storm drain system. The City maintains streets, sewers, the storm drain system, and municipally owned facilities which includes six public parks, a fire station, a municipal yard, four office type buildings, a senior center, a public parking lot, one recreation center with a gymnasium, and one vacant lot. The updated municipal facilities index and inspection results are in Attachment J. The City also conducts high threat to water quality activities, as defined in the Permit, such as street and sidewalk repair, painting, graffiti abatement, equipment maintenance, and minor vehicle maintenance. The City, however, also performs a number of activities that are beneficial to water quality, such as street sweeping, inspections of municipal facilities, educational efforts geared toward municipal personnel, annual MS4 inspection and cleaning, and regular upkeep of the sanitary sewer to prevent overflows and illegal connections.

## 4.1 Roads, Streets, Highways, and Parking Facilities

Roads, streets, highways, and parking facilities can collect a variety of pollutants due to routine vehicle use and have a tendency to collect litter and debris from neighboring areas and activities. Regular maintenance is necessary to control pollutants such as sediment, metals, litter, and debris on roads, streets, highways, and parking facilities.

### 4.1.1 Source Characterization

The City maintains 65.5 miles of roadway in Lemon Grove and one public parking lot. This number includes main arterials, curbed residential, and non-curbed residential streets. The City also maintains center islands and medians on these streets and in all parking lots including those attached to municipal buildings. The City does not maintain any highways.

### 4.1.2 Best Management Practice Requirements

Both pollution prevention methods and BMPs are implemented for roads, streets, highways, and parking facilities throughout the City. The City utilizes both the City's JURMP and the CASQA Municipal Handbook to choose applicable BMPs to implement for roads, streets, and parking facilities within the City. Street sweeping is the main BMP that is implemented for these sources. Treatment control BMPs are used for all road sections which are subject to SUSMP requirements, described in more detail in Section 2.0.

### 4.1.3 Program Implementation

This section describes the steps that were taken in FY 2010-11 to require and verify the implementation of designated BMPs for all City maintained roads, streets, and parking areas and related activites as outlined in the Permit Section D.3.a(5)(a-c).

The City currently implements an aggressive sweeping schedule for its roads, streets, and parking facilities. Long before Order 2007-01 was approved, the City was sweeping to its standards.

The frequency of street sweeping is as follows:

- Major arterial curbed streets – weekly
- All other curbed streets – biweekly
- Non-curbed streets – monthly
- Center islands and medians – monthly
- Major parking lots and alleys – weekly
- All other parking lots and alleys – monthly

During FY 2010-11, the City maintained its street sweeping mileage from the previous reporting period, approximately 80 miles and 175 tons of debris were collected. These figures include the regular sweeping of roads and parking lots, as well as specialty or requested road sweeps and the municipal yard. The City also sweeps bus stops, various parking lots and miscellaneous private streets based on need.

## 4.2 Fixed Facilities

The City owns and operates a variety of fixed facilities that have been grouped in this section because these facilities received formal inspections as part of the stormwater program. Therefore, the program implementation for these facilities is generally the same. Municipal fixed facilities include the following:

- Parks and Recreation Facilities
- Public Works Facilities
- Fire Stations
- Other Fixed Facilities

### 4.2.1 Source Characterization

The City inspects all municipal facilities on an annual basis. This includes the following list of facilities:

- All six public parks (Kunkel, Berry Street, Lemon Grove, City Center, Fireman's, and Monterey Heights)

- Fire Station
- Recreation Center
- The Community Center
- City Hall/Sheriff's Station
- Senior Center
- City Hall Annex
- Trolley Depot

The City's JURMP does rank each of these facilities based on their threat to water quality, however due to the City's small size it is possible to inspect each facility on an annual basis.

*Parks and Recreation Facilities*

The City operates six public parks:

- Berry Street Park – 7101 Mt. Vernon St., Chollas Creek watershed
- City Center Park – 7715 Church St., Chollas Creek watershed
- Fireman's Park – School Ln and Central Ave, Chollas Creek watershed
- Kunkel Park – 8171 lemon Grove Way, Sweetwater River watershed
- Monterey Heights Park – Canton and Glencoe, Chollas Creek watershed
- Lemon Grove Park – Washington and Alton, Chollas Creek watershed

All landscape maintenance activities are performed through the City's Grounds Division. In previous reporting periods, a portion of the parks were maintained through a private contractor. However, due to current budget constraints, those services were cut and taken over in-house. The Grounds division is trained and certified to handle pesticides, herbicides and fertilizers properly. They perform all landscaping and irrigation maintenance, as well as all trash and debris removal for all six parks.

*Public Works Facility*

The City owns and operates one public works yard. The only equipment maintained on site is the landscaping equipment used by the Ground's Division. This frequently includes mowers, the Gator (a small all terrain vehicle), chain saws, and other small devices. The City maintains a small fleet of large vehicles including several pick-up trucks, a dump truck, a paver, a video camera truck, and a vactor truck. All large vehicle service is performed off site under a private contract at a non-City facility. The public works yard does not contain a gas filling station and all materials are stored under covered areas, in doors, or surrounded by BMPs like straw wattle and gravel bags.

*Fire Stations*

Fire fighting is an essential element of municipal activities conducted in the City. The City has one fire station at 7853 Central Ave. The fire station is home to three engines and one ambulance response vehicle. All servicing on these vehicles is done off site under contract at a non-City owned facility. Very minimal equipment maintenance is performed on site. It includes the cleaning and maintaining of the hoses and chainsaws.

*Other Fixed Facilities*

Other fixed facilities include the City's office and administrative facilities.

- City Hall/Sheriff's Station – 3232 and 3240 Main St.
- City Hall Annex – 3225 Olive St.
- Community Center – 3146 School Lane
- Recreation Center – 3131 Main St.
- Senior Center – 8235 Mt. Vernon St.

Despite theses facilities being low threats to water quality, all are inspected annually. Inspection results are in Appendix C.

### 4.2.2 Best Management Practices

#### 4.2.2.1 Updated BMPs

In FY 2007-08, the City established minimum BMPs for various municipal activities at all fixed municipal facilities. The BMPs are outlined in the City's 2008 JURMP and the City's Municipal Code. The City also references the CASQA Municipal Handbook when choosing appropriate BMPs for various fixed facility types. More detailed information about BMP implementation at specific facility types is included in the following sub-sections. The City implements additional BMPs as deemed necessary, and implements equivalent BMPs when it is determined that a specific BMP is not feasible at a particular site. In addition to implementing BMPs, the City utilizes pollution prevention measures to reduce or eliminate the amount of pollutants generated from City-owned fixed facilities.

*Parks and Recreation Facilities*

In FY 2010-11, the City implemented a variety of BMPs to reduce or eliminate the amount of pollutants entering the MS4 from municipal parks and recreation facilities and other open landscaped areas, such as medians and traffic islands. The City is maintaining general waste management BMPs and encouraging facility users to recycle, properly dispose of trash, and pick up dog waste by providing conveniently located receptacles at parks and in common dog walk areas. Doggie bag dispensers are available at the 3 largest, most frequently

used parks (Berry Street, Lemon Grove, and Kunkel) and at City Center Park. These are frequently vandalized, but the City works hard to keep them full and operational. They are checked weekly and maintained as needed.

Due to their widespread outdoor use, pesticides, herbicides, and fertilizers can be common pollutants discharged to MS4s. Transport of these pollutants is often a result of the following: a) runoff from improper irrigation after application, b) application of chemicals during or prior to storm events, c) use of chemicals that do not properly absorb into soil or plants, and d) overspray from chemical applications that may eventually enter the MS4. The City maintains the following procedures and BMPs pertaining to integrated pest management:

- Educating and training staff and contractors on all BMPs
- Requiring any contracted party to adhere to all City codes and procedures pertaining to proper use of pesticides, herbicides and fertilizers
- Implementing a process for identifying pests and/or problems by site
- Selecting less toxic treatments
- Proper training and licensing of all personnel who handle pesticides, herbicides, and fertilizers
- Use integrated pest management techniques whenever possible
- Record keeping for application dates, times, locations, and quantities.
- Pesticides, herbicides and fertilizers are applied per manufacturers directions and only as needed.
- Compost, mulch, and soil amendments are used whenever possible.
- All federal, state and local regulations are followed
- Pesticides, herbicides and fertilizers are not applied prior to a predicted rain event
- Native and drought tolerant plants are used whenever possible
- Small weeding is done by hand
- Diseased or infected plants are removed completely, if proper treatment is ineffective
- Irrigation systems are remotely controlled and weather and flow sensitive to prevent over watering due to rain or a broken line

*Public Works Facility*

Public works staff implements appropriate BMPs for all activities that take place at the Public Works yard. This facility uses good housekeeping BMPs most frequently, including but not limited to spill kits, sweeping, dry clean up methods for any oil spills, and proper cleaning of painting equipment. Minimal small equipment maintenance is performed on site, limiting potential pollutants from vehicle maintenance and repair. All of the large vehicles are maintained off site. The site has a SWPPP which includes a site description, a description of potential sources of pollutants, a summary of existing BMPs, a description of BMPs to be implemented, and a monitoring and record keeping plan. The

SWPPPs is kept at the facility and the facility is inspected annually by water quality staff and monthly on an informal basis. All Public Works employees receive monthly informal training as detailed in Section 8 of this report.

*Fire Stations*

The City implements pollution prevention measures and BMPs to reduce or eliminate the amount of pollutants generated by fire fighting activities in the City. The City's fire station uses source control BMPs to minimize and control discharges related to washing activities. All fire fighting training activities which include aqueous film forming foam are conducted at a fire station outside of the City. All the engines and emergency vehicles are maintained off site. Only small equipment such as chainsaws are cleaned and maintained on site, always using best housekeeping practices to prevent pollutant generation. The Fire Marshal receives regular water quality updates at a weekly joint meeting with water quality, planning and engineering. Water quality staff has worked jointly with the fire department on several occasions when dealing weed abatement, commercial inspections, or illegal dumps. These occasions have provided excellent informal opportunities for education, which have been passed on to other fire personnel. It is common for fire personnel to call water quality personnel from the field with potential water quality concerns. They are an invaluable set of eyes in the community on a daily basis for potential water quality concerns.

*Other Fixed Facilities*

The City implements pollution prevention methods and BMPs to reduce or eliminate the amount of pollutants generated by the management of public buildings, other fixed facilities, and surrounding areas. The City implements BMPs to control erosion and sediment, during landscaping maintenance, and for waste management as per the Municipal Code and the CASQA Municipal Handbook.

The City employs a number of pollution prevention practices at City Hall. These practices have been expanded in recent years to include:

- The use of recycled paper for all copiers and printers
- Programmable thermostats to control heating and cooling systems
- Implementing a furlough work schedule, so main City buildings are closed very Friday
- Installing timers on exterior lighting
- Supplying each employee with a personal recycling container
- Providing large recycling containers near all dumpsters and access doors
- Lids on all dumpsters
- A battery collection site accessible by employees only
- Allowing City employees to participate in all local e-waste events

4.2.2.2 Additional Controls for Municipal Areas and Activities

If the City identifies any potential sources of other pollutants of concern for which water bodies in the City are 303(d) listed that could be a result of activities at fixed municipal facilities, additional controls will be required to be implemented where applicable. The City will implement additional controls for municipal areas and activities adjacent to or tributary to ESAs when determined to be necessary. Presently, there are no municipal fixed facilities that have been determined to need additional BMPs due to 303(d) listings. The City's primary watershed, Chollas Creek, is 303(d) listed for several pollutants, including heavy metals and Diazinon. The City's current BMPs are preventing these pollutants and many others to the MEP. Any changes would be detailed in the applicable future annual report.

### 4.2.3 Program Implementation

The City implements the municipal program using a variety of different processes, including maintenance, training and education, inspections, and enforcement actions if necessary. Program implementation also includes the continuous assessment of municipal programs to ensure that they are designed and executed in a manner that is most effective to reducing, and potentially eliminating, the threat of pollution from fixed municipal facilities.

4.2.3.1 Maintenance

In FY 2010-11, the City continued to conduct regular maintenance activities at fixed facilities, which included landscape maintenance, building maintenance, parking lot,and sidewalk repair, when necessary. Sweeping of the parking facilities associated with the municipal facility is conducted at these facilities during regular street sweeping hours.

City personnel are trained and required to implement the proper BMPs when at municipal facilities and when engaging in specific activities at those facilities. City personnel are also trained to dispose of any waste properly and to report illegal discharges/illicit connections, as they may come across them during normal work activities.

4.2.3.2 Training and Education

Municipal personnel are trained on implementing appropriate BMPs and preventing non-storm water discharges. In FY 2008-09, water quality staff provided regular training and updates to the following municipal departments: Public Works, Engineering, Planning, and Fire. A detailed description of the municipal education program can be found in Section 8 of this report.

#### 4.2.3.3 Municipal Inspections

Water quality staff performs annual inspections at all of the City facilities. As part of the FY 2010-11 program, staff conducted 14 inspections, one at each facility. The results of these inspections can be found in Appendix J. Any required corrective actions have been taken. No enforcement actions were required at any of the municipal facilities during this reporting period.

## 4.3 MS4

The primary function of municipal separate storm sewer systems are to collect and transport surface runoff to receiving waters during storms in order to prevent flooding. The entire MS4 system is considered a high priority due to its tendency to collect and convey pollutants to receiving waters. The City's MS4 consists of streets, curbs, gutters, catch basins, inlets, pipes, natural channels, natural and piped creeks, and culverts. The City also maintains a number of treatment control BMPs such as filter inserts and curb inlet protection, which are included in the regular maintenance of the MS4. In order to reduce the transportation of pollutants into receiving water bodies, the City regularly maintains its MS4 to ensure that it remains both fully functional and free of pollutants to the MEP.

### 4.3.1 Source Characterization

The City maintains a variety of MS4 facilities which includes 190 catch basins and inlets, approximately 75 miles of piping, and approximately 2.5 miles of open channel. The City plans to put all of these facilities in GIS during future reporting periods. However, due to budget constraints, these plans are currently on hold.

### 4.3.2 Best Management Practice Requirements

#### 4.3.2.1 Updated BMP Requirements

In FY 2007-08, the City prepared a JURMP update which directs staff to utilize the CASQA Municipal Handbook in addition to the Municipal code to choose applicable BMPs for municipal areas and activities, including MS4 maintenance. All of these BMPs are designed to prevent waste and pollutants from entering the MS4 system as well as ensuring that waste which is collected during maintenance for the City's MS4 does not re-enter the system.

The 2007 Permit requires that retrofitting flood management facilities be evaluated to determine the feasibility of providing additional pollutant removal from urban runoff and should only be conducted where determined to be effective. The City does not own or operate any flood management projects or flood control devices that may be retrofitted.

4.3.2.2 Additional Controls For Municipal Areas/Activities

The City will implement additional controls for MS4 facilities adjacent to or tributary to ESAs when determined necessary.

### 4.3.3 Program Implementation

The City's MS4 management program includes responding to complaints, detecting and ceasing IC/IDs; inspecting and maintaining MS4s by cleaning, removing sediment, debris, and excessive vegetation, by repairing and/or replacing damaged or failing MS4 structures; and by providing signage on storm drain inlets. The City trains and requires field staff to implement BMPs, inspect equipment and follow an action plan for regular maintenance, emergency maintenance, and/or discharge control. The City utilizes a vactor truck during MS4 maintenance to collect both dry and liquid debris from catch basins and inlets. Applicable BMPs are used during routine and emergency maintenance.

All maintenance activities during this reporting period were in compliance with the current Permit. All maintenance BMPs were updated in FY 2007-08 to correspond with any new Permit requirements.

4.3.3.1 Maintenance

A summary of the City's MS4 operation and maintenance activities that occurred throughout the fiscal year is included below:

- Within this reporting period, the City inspected forty-three roads, 190 catch basins and sixteen conveyances connected with the MS4. The same numbers as the previous reporting cycle. Only seven conveyances and 68 catch basins were found to be in need of cleaning and 100 percent of these were cleaned prior to the end of the reporting period. This resulted in the removal of approximately 1,860 pounds of trash and debris from the catch basins, conveyances, and roads. The City also manually removed invasive plant growth from those seven conveyances, providing approximately another 1,500 pounds of green debris. The cleaning of catch basins and conveyances is an annual event that takes place prior to the beginning of the rainy season and usually occurs between October and November.
- The City continues to install Trident Curb screens and has added Streamhawks to several curb inlets as well. Both of these devices prevent trash, debris, and sediment from entering the MS4 by keeping the debris in the curb line and easily accessible to the street sweepers. The City attributes the decreases in trash quantities found in and around conveyances to these devices and the more efficient use of the street sweepers.

## 4.4 Sanitary Sewer System

Spills and/or leaks caused by a malfunction or failure of a component of the City's sanitary sewer system have the potential to introduce a significant volume of untreated sewage into receiving water bodies. Untreated sewage can contain high concentrations of bacteria, viruses, and parasites, all of which have the potential to negatively impact the environment and pose a significant threat to human health. Untreated sewage also has the potential to contain a variety of hazardous chemicals, which also pose threats to environmental and human health. The City conducts routine inspections and maintenance of the sanitary sewer system to ensure that the system is functioning properly. Routine inspections and maintenance of the sanitary sewer system reduces the potential for an overflow and helps prevent and eliminate infiltration of seepage to the MS4. The City also responds to sanitary sewer overflows to reduce or eliminate the amount of untreated sewage that reaches nearby portals to the MS4 and aids in cleaning up and disposing of overflow residue.

### 4.4.1 Source Characterization

The City maintains 64.952 miles of sanitary sewer pipeline. The sanitary sewer system serves the entire Lemon Grove area and connects with San Diego and La Mesa's sewer systems. La Mesa utilizes 728.60 EDU of Lemon Grove's sewer space and San Diego uses 986.20 EDU.

### 4.4.2 Best Management Practice Requirements

#### 4.4.2.1 Updated BMP Requirements

The City has created and maintains basic BMPs in the JURMP and the Municipal Code. The City also utilizes the CASQA Municipal Handbook as a reference guide for BMP implementation, including the maintenance of the sanitary sewer system.

Similar to the MS4 maintenance program, the City trains field staff on implementing BMPs, equipment inspection, and the action plan that is followed for regular maintenance and emergency maintenance and/or discharge control. Structural BMPs are used during routine and emergency maintenance, where applicable.

#### 4.4.2.1 Additional Controls for Municipal Areas and Activites

The City implements additional controls for sanitary sewer facilities adjacent to or tributary to ESAs, if applicable and when determined to be necessary. The City has a regular sanitary sewer maintenance program the minimizes sanitary sewer overflows (SSO) and is described briefly below and in more detail in the City's Sanitary Sewer Management Plan (SSMP) in accordance with Order 2006-03.

### 4.4.3 Program Implementation

The City's sanitary sewer management program includes responding to overflows and spills as necessary, identifying spills and leaks, containing and controlling spilled materials, repairing damaged and leaking sewer lines, remediation of existing lines as necessary, and proper disposal of hazardous waste.

#### 4.4.3.1 Maintenance

The City maintains a routine maintenance schedule for the sanitary sewer system. In FY 2009-10, the City cleaned and maintained the following portions of the sewer system. Hotspots are inspected three times annually and easements are inspected twice annually.

**Table 4.1**
**Sanitary Sewer Services in Feet**

| | Total FY 2006-07 | Total FY 2007-08 | Total FY 2008-09 | Total FY 2009-10 | Total FY 2010-11 |
|---|---|---|---|---|---|
| **Cleaned** | **331,369** | **52,493** | **646,943** | **359,174** | **365,174** |
| **Root Cut** | **20,927** | **36,039** | **596,943** | **329,174** | **331,174** |

Within those numbers is the following information:

- 26,919 feet of hotspot line was cleaned and root cut
- 124,265 feet of easement line was cleaned and root cut
- 207,990 feet of right of way line was cleaned and root cut

All SSO information was reported electronically to the Regional Board through the SSMP program. However, the City had no mainline overflows during this reporting period. The appropriate City staff are trained in detecting, reporting, and responding to all SSOs.

## 4.5 Mobile Municipal Activities

The City conducts a number of activities, which are not confined to any specific locations. Due to the nature of these mobile activities, temporary structural and source control BMPs are implemented as necessary.

### 4.5.1 Source Characterization

The City conducts a number of activities that are not designated to a specific location. Such activities include, but are not limited to, the following:

- Power washing for graffiti removal
- Street and sidewalk repair and maintenance (striping, repainting, and pothole repair)
- Landscape maintenance

### 4.5.2 Best Management Practice Requirements

#### 4.5.2.1 Updated BMP requirements

The City implements good housekeeping and general pollution prevention measures during municipal maintenance activities, including the mobile activities described above. During the City's JURMP update, minimum BMPs were established for all municipal activities. The City also references the CASQA handbook and the Municipal Code to ensure the use of all applicable BMPs for any given activity.

#### 4.5.2.2 Additional Controls for Municipal Areas and Activities

The City implements additional controls for municipal mobile activities adjacent to or tributary to ESAs when determined necessary. Presently, City related mobile activities have not been determined a high threat to water quality. Public Works and Grounds division staff are vigilant about the use of proper BMPs when doing any mobile activity. Pollutant generation is limited to the MEP through temporary BMPs such as gravel bags and straw wattles or good housekeeping practices such as dry spill cleaning, wet vacuums, and sweeping. During this reporting period, the current BMPs were evaluated and determined to be sufficient and to the MEP.

### 4.5.3 Program Implementation

In FY 2010-11, City staff were sufficiently educated in the proper BMPs to utilized during mobile activities. These BMPs include proper containment, control, and capture of any discharge generated by a mobile activity and possibly carrying pollutants.

## 4.6 Special Events

The City hosts a very limited number of special events each year and even fewer under the current economic climate. The current line-up consists of the Winter Bonfire, the Fire Station Open House, and Concerts in the Park. Special events have the potential to generate significant trash and litter caused by the patrons

and activities of the special event. The City utilizes many of the controls listed in Permit Section D.3(2)(f). These BMPs are described in more detail below and are implemented during and/or after special events, when and where applicable.

### 4.6.1 Source Characterization

The City hosts a few special events each year that have the potential to produce trash and debris pollutants.

### 4.6.2 Best Management Practice Requirements

#### 4.6.2.1 Updated BMP Requirements

In FY 2010-11, the City implemented many of the controls specific to special events listed in Section D.3(2)(f) of the Permit. The City has chosen the following BMPs as most effective and efficient for City needs.

Anyone outside of the City seeking a Special Events Permit, must ensure the following BMPs are maintained:

- Proper management of trash and litter, including temporary trash receptacles
- Post clean up activities, such as catch basin cleaning and general litter pick-up, when necessary
- Post event street sweeping, when necessary
- Other BMPs when considered necessary by City staff

The City will consider implementing additional BMPs depending on the site location, site conditions, and/or type of special event.

#### 4.6.2.2 Additional Controls for Municipal Areas and Activities

The City will implement additional controls for municipal special events adjacent to or tributary to ESAs when determined to be necessary.

#### 4.6.2.3 Program Implementation

In FY 2010-11, there were the following City sponsored special events:

- Movie Night in the Park
- 6 Concerts in the Park
- Winter Bonfire
- Fire Station Open House

At a minimum, these events were required to provide extra trash and recycling containers, proper disposal of grease if food preparation was involved, and proper secondary containment for port-a-potties.

During the events, City staff was on hand to ensure that the event remained free of illegal discharges and/or illicit connections to the MS4. City staff were available for the duration of the event and afterwards for immediate trash removal and to notify the appropriate staff if a problem was observed.

## Section 5.0 Industrial – Commercial Component

Activities associated with industrial and commercial businesses can contribute pollutants to the City's MS4. The City has implemented a program that aims to reduce and prevent industrial and commercial pollution discharges from the MS4 to the MEP, to protect local receiving water bodies, and to comply with the Permit.

Commercial facilities within the City include a wide range of oriented businesses from restaurants to nurseries. There is one main commercial area within the City, along Broadway and down Lemon Grove Ave. This area contains many different commercial businesses ranging from restaurants to automotive outlets. The City's industrial area runs along Federal Blvd adjacent to SR 94.

Throughout FY 2010-11, City staff has worked diligently to fulfill the requirements of Order 2007-01. The City worked to ensure our current inspection program met the requirements of the current Permit and made any adjustments necessary. Due to the City's small size, staff is able to inspect a larger than needed majority of its commercial facilities and all of its industrial facilities. The City also continues to participate in the development of a regional mobile business program. The following section will demonstrate the City's successful implementation of the requirements of the Permit (Section D.3.b) during FY 2009-10.

## 5.1 Industrial-Commercial Sites/Sources Element

Each stationary industrial and commercial facility has the potential to discharge pollutants into the MS4 and consequently degrade local water quality. Often, the most cost effective and simple solution to reducing pollution is to implement pollution prevention techniques at the source. The City emphasizes the use of pollution prevention methods as a primary mechanism for reducing commercial discharges of pollutants into the City's MS4. Further, the City requires minimum site and activity specific BMPs to be implemented, and inspections and enforcement procedures will be conducted where necessary, to comply with the Permit.

For the rest of Section 5.1, "commercial facilities" will be used to refer to stationary commercial facilities that are not mobile. The mobile commercial sites/sources component is described in Section 5.2.

### 5.1.1 Source Characterization

A watershed-based inventory of the industrial and commercial sites/sources within the City was compiled as part of the 2008 JURMP update. As required by the Permit, the inventory includes the following information for each site/source: facility name, address, possible pollutants, if the site drains to a 303(d) listed

waterbody, and a brief description including SIC codes which best reflect the principal products or services provide by each facility. This list can be found in the 2008 JURMP. Because mobile commercial businesses do not have a fixed address at which they operated, they are tracked within a separate, non-spatial database.

The commercial inventory is continually updated as facilities go out of business and new facilities open. This process is performed primarily through the business license data base. Staff also collaborates with the Fire Marshal to verify existing and new facilities and to combine inspections. In addition, the City identifies businesses that are not on the facility inventory when complaints are filed about businesses that are not registered or licensed with the City. When this occurs, these facilities are added to the inventory and the proper City staff are notified to ensure the business is brought into compliance with City licensing requirements. During annual facility inspections, City staff has the opportunity to identify new or closed businesses and update the inventory with these findings.

In FY 2010-11, the City continued its focus on high priority commercial businesses by inspecting all restaurants, manufacturers, and automotive repair facilities with in the City. This totaled 34 facilities for this reporting period, the list of which is located in Attachment K 2. Table 5-1 contains a summary of the commercial facilities found in the City. The summary includes home businesses like carpet cleaners and household cleaning services, which the City finds to be difficult to inspect due to their transitory nature and small size (typically one person operations). The City deals with these operations more from a residential perspective than a commercial perspective and requires the standard minimum residential BMPs of these services. The City also inspects parking lots in conjunction with their respective buildings and does count them separately in the site total.

**Table 5-1 - Summary of High Priority Commercial Sources**

| Commercial Activity | Number of Facilities in Lemon Grove |
|---|---|
| Automobile Dealers/Rentals | 18 |
| Automobile Supply Stores | 9 |
| Automobile Repair/Paint | 9 |
| Automobile System and Tire Repair | 56 |
| Automobile Cleaning/Washing | 3 |
| Gas Stations | 7 |
| Eating/Drinking Establishments | 60 |
| Landscaping, includes lawn care | 9 |
| Nurseries and Greenhouses | 1 |
| Pest Control | 3 |
| Equipment Repair/Maintenance/Cleaning | 3 |
| Metalwork | 6 |
| Masonry | 4 |
| Parking Lots and Storage | 3 |
| Carpet/Building Cleaning | 21 |

| | |
|---|---|
| Pool and Fountain Cleaning | 3 |
| **Total** | **215** |

The City has 19 industrial facilities, most of which are high priority due to their proximately to Chollas Creek, a 303(d) listed waterbody. The City inspects all of these facilities on an annual basis. This number includes the three facilities which fall under the Statewide Industrial Permit as well. Table 5-2 contains a summary of these facilities.

**Table 5-2 - Summary of High Priority Industrial Sources**

| Industrial Activity | Number of Facilities in Lemon Grove | Revised High Priority Category Facilities |
|---|---|---|
| Waste Disposal and Recycling | 1 | |
| Equipment/Transportation | 3 | 2 |
| Metalwork | 2 | 3 |
| Building Supplies and Woodworking | 3 | 2 |
| Industrial Paper | | 1 |
| Contractor, Special Trade | | 1 |
| Specialty Hardware, Drapery | | 1 |
| **Total** | **9** | **10** |
| | **Total Facilities** | **19** |

As part of the 2008 JURMP update and development of the interim SUSMP, the City collaborated with Copermittees to identify the pollutant loading potentials of industrial and commercial sources. Table 5-3 in Attachment K2 lists the pollutants that may be generated by each category of business. The pollutants that many be generated by each individual business can be determined by matching the category of business noted for each of the businesses in the commercial inventory in the JURMP.

All industrial and commercial facilities that meet at least one of the following criteria are included in the inventory:

*Industrial Facilities*

- Industrial Facilities, as defined at 40 CFR S. 122.26 (b)(14)
- Facilities subject to the statewide General Industrial Permit or other individual NPDES permit
- Operating and closed landfills
- Facilities subject to section 313 of Title III of the Superfund Amendments and Reauthorization Act of 1986 (SARA)
- Hazardous waste treatment, disposal, storage, and recovery facilities

*Commercial Facilities*

- Automobile repair, maintenance, fueling, or cleaning
- Airplane repair, maintenance, fueling, or cleaning
- Boat repair, maintenance, fueling, or cleaning
- Equipment repair, maintenance, fueling, or cleaning
- Automobile and other vehicle body repair or painting
- Mobile automobile or other vehicle washing*
- Automobile (or other vehicle) parking lots and storage facilities
- Retail or wholesale fueling
- Pest control services
- Eating and drinking establishments, including food markets
- Mobile carpet, drape, or furniture cleaning*
- Cement mixing and cutting*
- Masonry*
- Painting and Coating*
- Botanical or zoological gardens and exhibits
- Landscaping*
- Nurseries and green houses
- Golf courses, parks, and other recreational areas/facilities
- Cemetaries
- Pool and fountain cleaning*
- Marinas
- Portable sanitary services
- Building material retailers and storage
- Animal facilities
- Power washing services*

*All mobile commercial businesses are discussed in Section 5.2.

*Both Industrial and Commercial Facilities*

- All other commercial or industrial sites/sources tributary to a CWA Section 303(d) impaired waterbody segment, where the site/source generates pollutants for which the waterbody is impaired
- All other commercial or industrial sites/sources within or directly adjacent to (i.e. within 200 feet of) or discharging directly to coastal lagoons or other receiving waters within an Environmentally Sensitive Area (ESA)
- All other commercial or industrial sites/sources that the City determines may contribute a significant pollutant load to the MS4.

### 5.1.2 Best Management Practice Requirements

#### 5.1.2.1 Updated BMP Requirements

During the 2008 JURMP update, the City established a set of minimum BMPs for all industrial and commercial sties and incorporated these into the City's Municipal Code Sections 8.48.080 and 8.48.090. The list of minimum BMPs includes both structural and non-structural BMPs and is itemized specific to pollutant-generating activity. The City's set of minimum BMPs for industrial and commercial sites/sources also includes pollution prevention methods, where appropriate. A complete list of the City's minimum BMPs for industrial and commercial facilities can be found in the City's JURMP and Municipal Code. The Municipal Code can be accessed through the City's website: www.ci.lemon-grove.ca.us.

*Industrial Facility Specific BMPs*

Industries subject to the General Industrial Permit are required to prepare a SWPPP and implement the BMPs prescribed therein. At a minimum, the SWPPP should include sections which describe the significant materials present on site, areas and activities that are potential sources of pollutants, and BMPs to address the identified pollutants' sources onsite. In addition, because of the small scale of the City's industrial program, the City is able to require site-specific BMPs at its industrial sites. These BMPs are based on a review of the site's SWPPP and site inspections, where needed.

#### 5.1.2.2 Additional Controls

The City requires the implementation of additional controls for industrial and commercial sties and sources that are 1) tributary to CWA Section 303(d) impaired water body segments or 2) directly adjacent to or discharging directly to coastal lagoons or other receiving waters within environmentally sensitive areas.

The City prescribed additional controls during inspections of commercial and industrial facilities, as needed, depending on the proximity of the facility to the waterbody and the observed potential of the site to be a significant source of pollutants that may threaten the downstream waterbody as necessary and appropriate.

### 5.1.3 Program Implementation

This section describes the steps employed by the City to require and verify the implementation of designated BMPs for stationary industrial and commercial sources. During FY 2010-11, the City updated its program as needed, provided education and outreach through inspection actions, inspected inventoried businesses to evaluate compliance with established minimum BMP requirements

and the local stormwater ordinance, and took enforcement action as necessary to bring violators into compliance.

5.1.3.1 Inventory Prioritization

Since the new Permit no longer requires industrial and commercial facilities to be prioritized as high, medium, or low; the City prioritized industrial and commercial businesses as either high priority or non-priority.

When evaluating threat to water quality, the City considered the following attributes of each industrial and commercial business to determine priority or non-priority status:

- Type of activity (SIC code)
- Materials used at the facility
- Wastes generated
- Pollutant discharge potential
- Non-stormwater discharges
- Size of facility
- Proximity to receiving water bodies
- Sensitivity of receiving water bodies
- If the facility is subject to the General Industrial Permit or an individual NPDES permit
- Filing of a No Exposure Certification/Notice of Non-Applicability
- Facility design
- Total area of the site, area of the site where industrial or commercial activities occur, and area of the site exposed to rainfall and runoff
- Compliance history
- Any other relevant factors

Although not specifically required by the Permit, the City will continue to classify industrial facilities that have obtained coverage under the General Industrial Permit as high priority. The City uses the following additional spatial attributes to prioritize industrial and commercial facilities:

- Proximity to a 303(d) listed waterbody
- Pollutant potential of the facility type
- Stormwater violation history

If a facility was identified as having a potential threat based on two or more of these criteria, the facility was determined to be a high priority commercial facility. In addition, if during the City's commercial inspection process or based on institutional knowledge, it is determined that additional sites that would otherwise have a lower priority should be classified as high priority industrial or commercial facilities based on the Permit criteria, they were noted as such in the inventory and inspected as required.

The City's commercial inventory was updated and prioritized during the 2008 JURMP update and will be prioritized at least once per year prior to conducting annual inspections.

#### 5.1.3.2 Inspection Frequency

FY 2010-11 commercial facility inspection priorities were established in consideration of inspection frequencies and prioritization standards outlined in the Permit. As part of the JURMP update, a new process to determine high priority facilities was formulized and put into effect during the previous reporting period. To determine which industrial and commercial sites were inspected in FY 2009-10, the following steps were taken:

- Confirm that the current industrial and commercial inventories are up-to-date.
- Prioritize each facility based on the prioritization process described in Section 5.1.3.1 of this document
- Review the list of facilities that were inspected the previous year
- Determine the facilities that will be inspected in the current year based on each site's prioritization and inspection history and other relevant factors, such as TMDLs and 303(d) listings.

In compliance with Permit standards, the inspected over 50 percent of all stationary industrial and commercial facilities inventoried as high threat to water quality and over 20 percent of all stationary inventoried sites. Mobile businesses are not included when determining the inspection requirements based on percentages of the inventory. The City tracked completed inspections throughout the reporting period to ensure that the minimum inspection frequencies required by the Permit were met.

During the 2008 JURMP update, the City identified the businesses that would be inspected as part of the 2009-10 reporting period. The City's facility summaries can be found in Tables 5-1 and 5-2 of this section. The list of high treat to water quality stationary commercial facilities can be found in Attachment K2. The City inspected all of these facilities and all of the industrial facilities in Table 5-2 during FY 2010-11.

#### 5.1.3.3 Routine Facility Inspections

The City routinely inspects its commercial and industrial facilities. Inspections are intended to:

- Provide facilities with information regarding the City's stormwater program
- Provide guidance in complying with stormwater regulations
- Validate and manage the inventory

During FY 2010-11, the City conducted 19 industrial and 34 commercial inspections for compliance with ordinances, permits, and policies. All inspections included, as applicable:

- Review of BMP implementation plans, if the site uses or is required to use such a plan
- Review of facility monitoring data, if the site monitors its runoff
- Check for coverage under the General Industrial Permit (NOI or WDID), if applicable
- Assessment of compliance with Copermittee ordinances and permits related to urban runoff
- Assessment of BMP implementation, maintenance, and effectiveness
- Visual observations for non-stormwater discharges, potential illicit connections, and potential discharge of pollutants to stormwater runoff
- Education and training on stormwater pollution prevention, as conditions warrant

Based on the results of each site evaluation, City staff completed an inspection form, which can be found in Attachment K1.

Staff generally works with site contacts to provide examples of BMP solutions that could be implemented. Effective, low-cost solutions were sought whenever possible, although in some cases more expensive BMPs were needed to reduce pollutant discharges to the MEP. Each business was also evaluated for staff training procedures and the stormwater quality awareness of the contact person; educational information was provided as appropriate. Whenever possible, the findings of the inspection and related corrective actions were discussed with the responsible party while the inspector is at the site. The responsible party is always provided a copy of the inspection findings after the inspection. For any sites found not in compliance, corrective actions are written on the inspection form along with any follow-up actions or inspections, as needed.

*Inspection Tracking*

Complaint and inspection documentation is filed in a tracking database and is kept up to date on a regular basis.

*Third Party Inspections*

All commercial inspections conducted in FY 2010-11 were completed by City staff. The City has one full-time Code Enforcement officer with a stormwater focus, who is dedicated to conducting routine commercial, industrial, and residential inspections and follow up for routine inspections as well as complaint calls. A third party was not employed to conduct inspections during this fiscal year. Therefore, verification of third party inspection effectiveness was not necessary.

City staff responsible for conducting stormwater compliance inspections and enforcement of industrial and commercial facilities are training regularly on inspection and enforcement procedures, BMP implementation, and assessment of monitoring data. Water quality staff actively collaborates with inspection staff throughout the region to share methodologies and approaches that may be beneficial region wide.

*Inspection Follow-up and Enforcement*

Staff conducted follow-up inspections at all facilities that were directed to implement corrective actions. Follow-up investigations are conducted to ensure that the required BMPs were implemented and confirm full compliance of the facility. The City only had one non-compliant industrial facility. The facility was storing materials uncovered, outside. The corrective actions were given to the facility contact and all corrections were made by the follow up inspection. Twelve restaurants were found in non-compliance on the initial inspections, all corrective actions were minor and completed by the follow-up inspections. The restaurants continue to display confusion over the water quality inspections versus health code inspections and fire code inspections. For this reason, staff has worked diligently to provide on site education and to coordinate inspections with the City's Fire Marshal. It is not possible to coordinate inspections with the health inspectors as that is a County program with its own staff and own time lines for inspection requirements.

5.1.3.4 Notification

The City will notify each inventoried industrial and commercial business of the City's updated BMP requirements that are applicable to the site/source. During FY 2010-11, the City provided a formal letter notifying the facilities of any changes and that a new Permit had been issued. During FY 2010-11, the City did not feel a second formal notification was required and dealt with education during the actual inspection.

5.1.3.5 Complaint investigations, Violations, Enforcement, Follow-up and Compliance

When a complaint is registered with the City's hotline, e-mail, other phone line, or when staff directly observes an illicit discharge, a complaint investigation is conducted. All complaints are investigated by City staff with enforcement authority within a reasonable time frame. Investigation typically includes stopping any active discharges, educating the discharger, enforcing discharge prohibitions, and/or clean up activities by the City or responsible party.

As required by the Permit and depending on the severity of the violation, the City enforces its stormwater ordinances for all commercial and industrial facilities as

necessary to maintain compliance with the Permit. Enforcement could include verbal or written warnings with education, orders to abate or correct, administrative citations, monetary fines, civil lawsuits, and/or cost recovery actions. Escalating enforcement steps provide flexibility for staff to establish appropriate compliance time frames on a case by case basis. All complaints and associated violations, enforcement, and follow-up actions are thoroughly documented and tracked through the City's Code Enforcement database.

During FY 2010-11, the City had four commercial related complaints and no industrial related complaints. The two commercial complaints were the hosing of parking lots. The behavior was stopped immediately upon investigation and both dischargers were educated on the proper dry methods for cleaning impervious surfaces.

*Reporting of Non-Filers*

The City did not identify any industrial sites that may require coverage under the General Industrial Permit, but which, to the City's knowledge did not file NOIs.

## 5.2 Mobile Sources

Illegal discharges tend to be the major area of concern with mobile businesses. Mobile businesses can be difficult to inventory because they may not be based in the City and do not typically have a permanent address. Additionally, new mobile businesses are started, and previously existing mobile businesses go out of business on a regular basis. For the reasons listed, and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

### 5.2.1 Source Characterization of Mobile Sources

The mobile businesses known to operate within the City's jurisdiction are listed on an inventory found in Attachment K2. This inventory was prepared as part of the 2008 JURMP update. The following business types are addressed by the mobile sources element of the City's industrial and commercial program:

- Mobile automobile and other vehicle washing
- Mobile carpet, drape, or furniture cleaning
- Mobile construction trades such as: cement mixing or cutting, masonry, painting and coating
- Landscaping
- Pool and fountain cleaning
- Power washing services

In addition to the types of businesses listed above, any other mobile businesses that the City determines to have a significant threat to water quality will be added

to the inventory. Because not all mobile businesses have obtained business licenses in the City or have a base of operations outside the City, staff is continually refining and updating the mobile inventory. In addition, the City is participating in the creation of a regional mobile businesses list.

### 5.2.2 Best Management Practice Requirements

#### 5.2.2.1 Updated BMP Requirements for Mobile Sources

All BMPs required for station sources, described in Section 5.1.2.1 of this document and listed in detail in the City's JURMP, are also required of mobile businesse, where applicable. The most important BMPs for most mobile businesses are typically those that address non-stormwater discharge control and spill prevention, control, and clean-up.

### 5.2.3 Program Implementation

#### 5.2.3.1 Education/Outreach and Notification of Mobile Sources

The City will provide information and outreach regarding stormwater quality to mobile business owners and operators. Businesses will be given educational materials outlining pollution prevention methods and other related BMPs if businesses are found to be in violation of the City's stormwater ordinance or the Permit. City staff will also give recommendations to businesses, where applicable.

Because the mobile business program is a new element of the industrial and commercial program; it is anticipated that some mobile businesses are not aware of stormwater requirements and that education will be a significant portion of the program. The education is described in more detail in Section 8 of this report. It is worthy to note, that even before the issuance of the new Permit, City staff reviewed and gave verbal stormwater education to any mobile or automotive business license applicant.

The City will continue to coordinate and collaborate with the regional Education and Outreach Workgroup to notify the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

#### 5.2.3.2 Inter-Jurisdictional Cooperation

During this and the previous reporting periods, the City has participated with other Copermittees in a Mobile Business subcommittee to develop the Regional Mobile Business Outreach and Education Strategy. Because mobile businesses inherently provide services at offsite locations crossing jurisdictional lines, the

Copermittees have chose to collaborate on a regional mobile business strategy, which addresses the following elements:

- Inventory Development and Maintenance
- Establishment of Minimum BMP Requirements
- Outreach and Education including notifications

A consultant may be hired at some point to assist with this process. Compliance and enforcement responsibilities for mobile businesses will continue to reside with individual jurisdictions, and are therefore not addressed as shared regional tasks under this strategy.

5.2.3.3 Inspections

The inspections for mobile businesses generally follow the same procedure described in Section 5.1.3.3 of this report. The main focus of most mobile business inspections is on discharge control BMPs. After thorough investigation, enforcement, and follow-up as needed, none of the mobile businesses investigated warranted a formal inspection. Notably, as part of standard response actions, staff works directly with mobile business owners and employees to ensure that their business practices meet the City's minimum BMP standards.

5.2.3.4 Complaint Investigations, Violations, Enforcement, Follow-up, and Compliance

Complaint response, follow-up investigation, and compliance of mobile commercial businesses are handled in the same fashion as stationary commercial facilities. For a general description of the City's complaint response procedures, refer to Section 5.1.3.5 of this report.

In FY 2010-11, City staff investigated six complaints based on mobile business activities. Investigation of mobile business activities can be difficult based on the transient nature of their operations and their habit of operating primarily on weekends. The City has limited Code Enforcement abilities during non-working hours, but has managed to educated several mobile businesses by actual staff observation of activities. All calls were investigated and followed up with to the best of staff's ability to obtain contact information for the mobile business operator. All contacted operators were provided BMP requirement education and told if complaints persisted, administrative fines would be processed. To the City's knowledge, all have complied with the BMP requirements.

## Section 6.0 Residential Component

Approximately 80 percent of the City's 3.7 square mile area is designated as residential on the land-use map. Residential land use comprises a large area of the City and residential activities can have a considerable effect on water quality of receiving waters. The City's residential component of the stormwater program aims to reduce pollutant runoff from residential areas and activities to the MEP.

The overall goal of the program is to minimize the impact of discharges from residential areas on receiving waters in Lemon Grove and, where possible, to enhance the quality of these resources. The following sections will describe the program activities conducted during FY 2010-11 that contributed to the successful implementation of the City's Residential Component.

## 6.1 Source Characterization

The City of Lemon Grove encompasses 3.78 square miles. The City has a population of approximately 26,000 residents. Attachment L-1 contains a demographics chart for the population of Lemon Grove. As Attachment L-1 shows the City expects the population to grow twenty-three percent between 1995 and 2020. As the community grows, the collective impact of residential activities on water quality will increase commensurately. Maintaining an adequate emphasis on residential areas is therefore crucial to the success of the City's water quality programs.

This section identifies the high threat to water quality residential areas and activities that were focused on during FY 2010-11. The high threat to water quality areas and activities within the City were identified during the 2008 JURMP update process and are described in detail in the JURMP. The following section will briefly summarize this process.

### 6.1.1 High Threat to Water Quality Activities

In consideration of the minimum required high threat to water quality residential activities listed in Section D.3.c(1) of Order 2007-01, the following residential activities were identified as residential activities that hold the greatest threat potential to local receiving water quality:

- Automobile Repair and Maintenance
- Automobile Washing
- Automobile Parking
- Home Improvement, Garden Care Activities, and Product Use
- Disposal of Trash, Pet Waste, Green Waste, and Household Hazardous Waste

### 6.1.2 High Threat to Water Quality Areas

Section D.3.c(1) of Order 2007-01, requires that Copermittees identify all high threat to water quality residential areas. During the 2008 JURMP update, the City identified high threat to water quality residential areas using the following criteria:

- Any residential areas tributary to a CWS section 303(d) impaired water body, where the residence generates pollutants for which the water body is impaired
- Any residential areas within or directly adjacent to or discharging directly to a coastal lagoon or other receiving waters within environmentally sensitive areas (as defined in Attachment C of the Permit)

The City has one section 303(d) impaired water body within or directly adjacent to its boundaries. The 303(d) impaired water body within the City is Chollas Creek and is the main watershed for the City. Based on the definition in Attachment C of the Permit, the City does not have any coastal lagoons or environmentally sensitive areas within its boundaries. By collaborating with other copermittees, the City has identified the following pollutants as pollutants of concern for residential areas:

- Bacteria
- Nutrients
- Sediment
- Pesticides
- Trash

In consideration of identified 303(d) listed water body and the primary pollutants of concern, City staff has identified the locations of high threat to water quality residential areas as follows:

- All houses within 500 ft of Chollas Creek, USGS blueline
- All houses within 500 ft of any major Chollas Creek drainage channels

This primary affects houses along Main St, San Miguel, and Bakersfield at Ensenada.

### 6.1.3 Evaluation of Oversight of Residential Areas and Activities

The City is planning to conduct a formal evaluation of the methods used for oversight of residential areas and activities during the permit cycle of Order 2007-01. The evaluation will coincide with the City's effectiveness assessment for the Residential Component. Since the methods used for residential oversight were recently updated within this last fiscal year, City staff determined that it would be

most appropriate and most accurate to evaluate the success of these methods in following reporting periods.

## 6.2 Best Management Practice Requirements

This section describes the updates made to the City's minimum BMPs that were implemented during FY 2010-11. The minimum BMPs for residential high threat to water quality activities were established in the City's 2002 JURMP. As part of the 2008 updated, the minimum BMPs were reviewed and updated as necessary.

### 6.2.1 Pollution Prevention

Pollution prevention is the act of reducing or eliminating waste at the source by modifying production processes, promoting the use of non-toxic or less-toxic substances, implementing conservation techniques, and re-using materials rather than putting them into the waste stream. Pollution prevention methods have been integrated into the minimum BMPs established for high threat to water quality areas and activities.

### 6.2.2 List of Minimum BMPs

As part of the City's JURMP update, the City designated the following minimum BMPs for high threat to water quality residential activities and areas. The minimum BMPs are primarily nonstructural and area targeted at activities specified in Section 6.2 as having a high threat to water quality. Pollution prevention methods were incorporated into this set of BMPs, where appropriate.

*Automobile Repair and Maintenance*

Pollution Prevention: a) employ routine preventative maintenance practices, b) reduce vehicle use whenever possible (carpool, use public transportation, bike or walk for short trips, alter driving habits), c) make timely vehicle repairs
