INFORMATION ON RECYCLERS OUTSIDE OF SANTA CLARA COUNTY IS NOT FREQUENTLY UPDATED

MEMO

DATE: July 30, 2009

TO: Clara Spalding, Clean Water Program Coordinator

FROM: Dave Jones, E.H. & S. Compliance Specialist
Occupational Safety and Environmental Compliance (OSEC)

SUBJECT: Universal Waste Recycling

Listed below are the Universal Waste recycling totals from County facilities for the past fiscal year (July 1, 2008 to June 30, 2009) :

Fluorescent Bulbs	4615 Pounds
Lighting Ballasts	3387 Pounds. All were non-PBC.
Batteries	5261 Pounds

The Universal Waste Program at Facilities and Fleet (FAF) is accomplished by having all Universal Waste lamps and ballasts returned from facilities maintained by FAF to the Berger Drive complex. From the period 7/1/2008 to 6/30/2009 these lamps were either delivered to, or picked up by AERC recycling in Hayward the County's Contractor for lamp and ballast disposal.

Batteries collected from all County Buildings excluding those in Parks and Recreation, Roads and Airports, and Health and Hospitals are picked up from multiple consolidation locations Countywide and brought to the Berger Complex for sorting and recycling in the following methods. All NiCad batteries are boxed and shipped for no cost to RBRC recycling. All lead acid batteries are inventoried and either taken to Bobcat Battery Recycling, or returned to the selling vendor. All non-NiCad non-lead acid batteries are sorted and packaged for disposal by Clean Harbors the County's Hazardous Waste Disposal Contractor.

All Universal Waste activities are accomplished as ancillary duties by the E.H. & S Compliance Specialist stationed at FAF.

Additionally, the Building Operations Division and Custodial and Grounds Department within the Facilities Department all received training on Storm Water Pollution Prevention Best Management Practices in the month of July.

DATE: 8/13/2009

SUBJECT: Universal Waste Recycling

Attached please find the data sheet for the fiscal year 2009 with totals for Roads and Airport's (RDA) Universal and E-waste recycling.

The Universal Waste Program at RDA is accomplished by having all Universal Waste lamps and ballasts returned from road-side dumping and facilities maintained by RDA to the Schallenberger Rd. (East Yard) complex. All lamps and ballasts are taken to AERC in Hayward for recycle except when a grant from Household Hazardous Waste (HHW) is available they are taken to a Generator event.

Batteries collected from all RDA Buildings are picked up from three airports and three service yards and brought to the Schallenberger Yard for sorting and recycling in the following methods. All NiCad batteries are boxed and shipped for no cost to RBRC recycling. All lead acid batteries are inventoried and either taken to Bobcat Battery Recycling, or returned to the selling vendor. All non-NiCad non-lead acid batteries are sorted and brought to Household Hazardous Waste events. All monitors and other CRT's as well as all E-waste scrap is consolidated at Schallenberger and is picked up by ECS Refining. All recyclers are certified with the State.

All Universal Waste activities are accomplished as regular duties by the RDA Environmental Compliance staff.

MEMORANDUM

DATE: August 14, 2009

TO: Clara Spaulding
Clean Water Program

FROM: Trinh Pham, Environmental Health and Safety Compliance Specialist
SCVHHS Environmental Health and Safety Services

SUBJECT: Universal Waste Recycling

Please find the following list of Universal Waste recycling totals from Santa Clara Valley Health and Hospital System (SCVHHS) facilities for the last fiscal year (July 1, 2008 to June 30, 2009):

Fluorescent Bulbs	2,600 lbs.
Batteries	6,243 lbs
Electronic waste: (Misc./non SB20)	1,089 lbs

The Universal Waste Program at SCVHHS is accomplished by having all Universal Waste lamps returned from Facilities and Environmental Services (Housekeeping) Departments, to be maintained at Santa Clara Valley Medical Center (SCVMC) at 751 South Bascom Ave. in San Jose. The lamp waste is picked up at SCVMC by AERC in Hayward for recycling.

Batteries collected from SCVHHS buildings are stored in a centralized location at SCVMC and picked up from AERC for recycling.

Universal Waste activities are accomplished by SCVHHS Environmental Health and Safety Services Department in conjunction with SCVMC Environmental Services, and other HHS departments.

Please contact me at 885-4160 if you have any questions.

Santa Clara Valley Urban Runoff Pollution Prevention Program
FY 09 Work Plan

Id.	Activity	CI Item Source	FY Tasks	Status / Comments	Due Date (mo/yr)	Responsible Party
Copper Action Plan Tasks						
CB-1	Vehicle Washing Operations	CAP	• Continue to distribute outreach materials on proper vehicle/equipment washing at department counters and public events.	• Brochures continue to be available at the counter and are passed out during public events.	Ongoing	CWP Coor., Roads
			• Submit data regarding vehicle washing outreach activities as requested.	• Continue to submit data when requested.	Ongoing	CWP Coord., R&A
			• Require source control measures for Group 1&2 new development and redevelopment projects that will conduct vehicle/equipment washing and maintenance activities (consistent with Permit Provision C.3.k).	• As new and redevelopment projects are reviewed, vehicle washing facilities are identified on the projects plans. If they are present, BMPS must be implemented to address the wash water. There were no new or redevelopment C.3 applicable projects approved during FY 08/09 with vehicle equipment washing or maintenance activities.	Ongoing	LDE, Roads, FAF
			• Continue to inspect industrial/ commercial facilities that conduct vehicle/equipment washing activities on-site (this includes auto-related businesses). Ensure that BMPs for vehicle/equipment washing are implemented. Provide an effectiveness evaluation of inspection/compliance with BMPs (consistent with enhanced reporting requirements).	• 2 Auto Dismatlers and 6 automotive facilities. There was one level 1 action level enforcement actions taken for a automotive facility. A third of facilities will continue to be inspected each year.	Ongoing	DEH-HMCD
			• Continue to maintain and inspect car wash systems for County vehicles at the corporation yard.	• 11 corporate yards were inspected. No enforcement actions were taken.	Ongoing	Roads &Airports
					Ongoing	CWP Coord., FAF

Id.	Activity	CI Item Source	FY Tasks	Status / Comments	Due Date (mo/yr)	Responsible Party
			• Encourage municipal staff to use certified mobile cleaners when contracting cleaning services. • Refer mobile surface cleaners who desire BASMAA surface cleaning certification and recertification to the BASMAA website (www.basmaa.org).	• Continue to encourage certified mobile cleans when contracting cleaning services. Continue to refer mobile surface cleaners to BASMAA wbsite.	Ongoing	
CB-3	Industrial Copper Control	CAP	• Continue Industrial Inspection program, including NOI sites and other identified industrial facilities. These may include plating and metal finishing facilities, vehicle service facilities and other permitted sites (consistent with enhanced reporting requirements).	There was one metal manufacturing facility inspected. No enforcement actions taken. No enforcement actions were taken at any of the "Category A" or "NOI List" Facilities.	Ongoing	DEH- HMCD
CB-6/7	Reducing Traffic Congestion/ Promoting Alternative Transportation	CAP	• Collaborate with the agencies and organizations (e.g., VTA) that are better poised to take the lead on transportation-related tasks. • Complete revision of and implement revised development site design standards related to transportation per Permit Provisions C.3.j	• CB-6&7 issues appear to have been adequately addressed SCVURPPP CAP purposes. This issue is now in the hands of municipal transportation planners and congestion management and transportation agencies (i.e., VTA) and is not a high priority. Rural and large lot areas are not conductive to such measures. The SCV Transp. Authority (VTA) handles transit services in the uninc. Area. Fifty year old land use policy and GP and Zoning direct urban style development to the city	Under Annual Considerati on	LDE, CWP Coord.
CB-8	Watershed assessment and protection	CAP	• Revise County's General Plan, as needed at next scheduled update based on recommendations from the *Development Policies Comparison*	Not necessary. Existing GP addresses water quality issues. County will review at the next scheduled update	At next schedule update	Planning Office

Id.	Activity	CI Item Source	FY Tasks	Status / Comments	Due Date (mo/yr)	Responsible Party
			Project and Provisions C.3.l • Continue to implement guidance from SCVURPPP on addressing water quality in the CEQA review process, as part of C.3.m. implementation. • Participate in the Water Resources Protection Collaborative and implement any agreed upon guidelines and standards for watershed protection.		Ongoing	Planning Office
CB-11	Street sweeping and storm drain O&M		• Continue following Program guidance regarding the collection and reporting of street sweeping data. Provide data for Annual Report. • Implement (as appropriate) identified improvements to current street sweeping and storm drain system O&M programs (within available budgets). Provide effectiveness evaluation in FY Annual Report.	See attachment D	Ongoing As scheduled	Roads Roads
CB-12	Outreach on pool, spa maintenance	CAP	• Continue to distribute outreach materials at local public events; brochures at department counters and public places	Rotating distribution	Ongoing	CWP Coord.
CB-21	Use of architectural copper	CAP	• Continue to strongly discourage use of copper on roofs, in roof shingles, and for gutters.	Low priority: The County will monitor other jurisdiction. Few such projects have been noted.	Ongoing	CWP Coord., PLN & DEV
Nickel Action Plan Tasks						
NB-1	Measures to control nickel discharges		• Continue to implement Construction Inspection Performance Standards	Grading inspection, Parks, Roads and FAF staff implement construction inspection	Ongoing	LDE, BIO, FAF

Id.	Activity	CI Item Source	FY Tasks	Status / Comments	Due Date (mo/yr)	Responsible Party
	from construction sites		(see Construction Inspection work plan section). • Continue to have inspectors attend Regional Board/Program workshops on construction site management and learn latest erosion/sediment control techniques • Continue to attend Program-sponsored or other workshops on post-development stormwater BMPs (C.3.)	performance standards. Staff attends workshops or training events when available. See Attachment M for more details.	As scheduled As Scheduled	CWP Coord. CWP Coord., FAF, PLN

Santa Clara Valley Urban Runoff Pollution Prevention Program

FY 09 Annual Report

Attachment K- Trash Inventory and Management

Note:

1) Please refer to Attachment B, for illegal dumping complaint resolution information, and to Attachment G (PI/P), for Graffiti and Litter Abatement Activities, and to the overall SCVURPPP Annual Report, Trash Inventory and Management Section

2) The County of Santa Clara is presently not using trash assessment to evaluate the effectiveness of trash management practices. In the past a trash assessment was report when another Co-Permittee conducted one upstream of their jurisdiction.

Dear Ms. Spaulding,

The City of Palo Alto Regional Water Quality Control Plant hereby submits the 2008-2009 Annual Storm Water Review for Stanford University. The water oversight plan for Stanford University has been managed by the City of Palo Alto since February 13, 1996. The City of Palo Alto continues to monitor the areas of Stanford campus which are identified in the water oversight plan letter (Attachment 1) including the areas covered under the Industrial Waste program.

Stanford has been cooperative and responsive to all water related issues. The RWQCP and Stanford continue to meet every two months to discuss water issues.

Enclosed you will find a table of all inspections including dates, areas visited, findings, and the actions taken by Stanford (Attachment 2). The annual report covers the time period from July 2008 to June 2009. Please refer to attachment 1 which identifies the areas of the Stanford University campus specified for oversight.

No significant issues were observed during the 2008-2009 period.

If you would like to discuss this report further please call me at (650)329-2285 or Nina McNitzky at (650) 329-2518.

Sincerely,

Phil Bobel, Manager
Environmental Compliance Division

Attachment 1

Storm Water Pollution Prevention Inspection Plan
Stanford University, Stanford, California

Stanford University
Storm Water Pollution Prevention Inspection Plan

1. General Program Description

    a. Applicable Stanford University Storm Water Pollution Prevention Program (SWPPP) elements and relevant SWPPP BMPs will be reviewed annually. The focus of the review will shift from one year to the next as different problem areas are addressed.

    b. A separate binder will be maintained by the RWQCP in addition to the current industrial water permit binder. The binder will contain all storm water related information and correspondence.

    c. Bi-Monthly meetings will be held with Stanford to discuss inspection results and progress on any corrective actions needed. Action oriented minutes or agendas will be kept in the binder mentioned in (a) above.

    d. A running list of areas inspected, dates, problems identified, and status of resolution will be kept and submitted to the County on an annual basis just ahead of the County's Annual Report required by the Regional Water Quality Control Board.

    e. For Stanford lands within the City Limits of Palo Alto, appropriate enforcement action will be taken by the City of Palo Alto. For lands in the unincorporated areas (most of the campus), the City will advise Stanford of any problems both verbally and in writing. The County will be notified of all inspections and resolutions status via the annual report outlined in (d) above.

2. List of Key Facilities (to be inspected at least annually)

    a. Industrial Areas or Research Facilities (with loading docks and /or chemical deliveries) inspected as part of the semi-annual industrial waste inspections.
        i. Chemistry Buildings (e.g., Mudd)
        ii. Biology Buildings (e.g., Gilbert)
        iii. Engineering Buildings (e.g., CIS/X)
        iv. School of Medicine
        v. Central Energy Facility
        vi. Environmental Health and Safety

    b. Vehicle Service Facilities
        i. Fleet Services Garage
        ii. Golf Course Maintenance Facility

    c. Peninsula Sanitary Service Inc. (Household Recycling Facility)

d. Food Service Facilities (Inspected by County Program)

e. Equestrian Facilities (Red Barn)

f. Stanford University Maintenance Facilities
   i. Bonair Siding
   ii. Athletics
   iii. Housing and Dining
   iv. Water Department (Stock Farm Road)

3. Construction Sites

   a. Construction sites greater than one acre will be inspected by October 15 of each year and additionally on an as needed basis throughout the rainy season (October 1 – April 1).

   b. Construction site auxiliary yards will be inspected annually, including lay down yards used for equipment and material storage and temporary vehicle parking yards.

4. General Campus Grounds

   a. The campus will be divided into thirds (please see attached map).

   b. One third will be toured each year prior to the rainy season. This will include a visual inspection of catch basins, building perimeters, loading docks, storage areas, and other areas of storm water pollution potential.

				Discussed upcoming annual stormwater inspection.			
				Campus construction update.			

Stanford University
Stormwater Review
2008-2009

Date	Event	Location	Report Source	Findings	Actions Taken	Date Resolved	Responsible Party
6/3/09	Stormwater Inspection	Frances Arrillaga Alumni Center	Nina McNitzky	Observed one storm drain that was missing required signage in the dumpster area. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent. The site shall use appropriate BMP's to protect the storm drains from garbage and proper management of dumpster area.	A work order has been submitted to the Stanford paint shop. The storm drain will be stenciled by July 31, 2009. Alumni Center kitchen both staff and managers receive annual training on stormwater and wastewater BMPs. The next training will occur in the Fall of 2009. Staff and mangers will be reminded to keep this area clean in order to protect the storm drain.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Ford-Burnham Buildings	Nina McNitzky	Observed two storm drains that were missing required signage in the adjoining parking lots on the Ford side of the building. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Corner of Galvez and Memorial Way	Nina McNitzky	Observed two storm drains that were missing required signage on the side walk on the Memorial Way side of the SIEPR Building. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	SIEPR	Nina McNitzky	Observed one storm drain that was missing required signage in the handicapped parking spot (MW-20L). The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen

Stanford University
Stormwater Review
2008-2009

Date	Event	Location	Report Source	Findings	Actions Taken	Date Resolved	Responsible Party
6/3/09	Stormwater Inspection	Memorial Hall	Nina McNitzky	Observed four storm drains that were missing required signage. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Memorial Hall/ SIEPR Driveway Ramp Areas	Nina McNitzky	Observed three storm drains that were missing required signage (one on Memorial Hall driveway ramp and two on SIEPR driveway ramp). The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	SIEPR Loading Dock Beside Ramp Area	Nina McNitzky	Observed an uncovered exterior drain at the below grade end of the loading dock- it is unclear if this is a storm drain or a sewer drain. There is also an unknown discharge pipe positioned to drain into this outdoor floor drain. Please confirm if this is a storm drain or a sewer drain and accordingly add signage. Please also confirm the contents of the discharge pipe going into the drain at this location.	The drain at the bottom of the loading dock is a storm drain, and the pipe plumbed to this drain is a condensate line that is connected to an air compressor. The drain will be re-plumbed by July 31st so that it is no longer draining to the storm drain.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Kresge Auditorium	Nina McNitzky	Observed two storm drains that were missing required signage along side of the building. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Lanea and Nathan Abbott Way	Nina McNitzky	Observed two storm drains that were missing required signage near the construction area. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen

Date	Event	Location	Report Source	Findings	Actions Taken	Date Resolved	Responsible Party
6/3/09	Stormwater Inspection	Post Office	Nina McNitzky	Observed one storm drain that was missing required signage beside the loading dock area. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Row Houses	Nina McNitzky	Observed containers of household flammable chemicals (lighter fluid, paints, etc.) without secondary containment at several row houses. The site shall immediately secondarily contain and properly store or dispose of the household flammable chemicals. The site shall use appropriate BMP's to protect the storm drain system and prevent a possible prohibited release from improper storage of chemicals.	This is a residential area. All materials have been disposed of properly.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Koret Pavilion	Nina McNitzky	Observed one storm drain that was missing required signage at the parking gate driveway. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Taube-Hillel House	Nina McNitzky	Observed one storm drain that was missing required signage at the driveway. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Faculty Club Driveway	Nina McNitzky	Observed one storm drain curb and cover broken and missing required signage. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen

6/3/09	Stormwater Inspection	Tree House Restaurant	Nina McNitzky	Observed one storm drain that was missing required signage at the walk-way in front of the restaurant. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Florence Moore Hall	Nina McNitzky	Observed one storm drain that was missing required signage in the dumpster area. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent. The site shall use appropriate BMP's to protect the storm drains from garbage and proper management of dumpster area.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009. Florence Moore Hall kitchen both staff and managers receive annual training on stormwater and wastewater BMPs. The next training will occur in the Fall of 2009. Staff and mangers will be reminded to keep this area clean in order to protect the storm drain.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Florence Moore Halls	Nina McNitzky	Observed six storm drains that were missing required signage in the parking areas behind the building. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Lomita and Mayfield Ave	Nina McNitzky	Observed one storm drain that was missing required signage before the stop sign. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen

2008-2009

Date	Event	Location	Report Source	Findings	Actions Taken	Date Resolved	Responsible Party
6/3/09	Stormwater Inspection	Tresidder Union Loading Dock	Nina McNitzky	Observed an uncovered sewer drain in the loading dock next to the trash compactor with grease both inside and around the drain. Additionally, the loading dock does not have grading or berm to protect rain water run-on from entering the sanitary sewer at this location. The site shall use appropriate BMP's to protect the sanitary system and prevent a possible overflow or blockage from grease release into the sanitary sewer.	Tressider kitchen both staff and managers receive annual training on stormwater and wastewater BMPs. The next training will occur in the Fall of 2009. Staff and mangers will be reminded to keep this area clean in order to protect the sanitary sewer drain. Also, the University's Water Department has this location on a routine monthly monitoring schedule to ensure backups or blockages do not occur.		Tracy Ingebrigtsen
6/3/09	Stormwater Inspection	Tresidder Union Kiosk	Nina McNitzky	Observed one storm drain that was missing required signage at the kiosk behind Tresidder Union. The site shall place the storm drain signage so that it is clearly marked with the words "No dumping! Flows to Bay" or equivalent.	A work order has been submitted to the Stanford paint shop. The storm drains will be stenciled by July 31, 2009.		Tracy Ingebrigtsen
6/4/09	Stormwater Inspection	School of Education	Nina McNitzky	Observed an uncovered sewer drain in the bottom of the stairwell next to a tallow bin that was not secondarily contained. The site shall immediately secondarily contain or find an alternative location for proper storage of a tallow bin. The site shall use appropriate BMP's to protect the sanitary system and prevent a possible overflow or blockage from grease release into the sanitary sewer.	The tallow bin has been moved to a new location away from the sewer drain. Annual kitchen best management training has already been conducted for this facility as of March 17, 2009. Subject: Santa Clara Valley Water District Urban Runoff Program
FY 2008--2009 Annual Report of Pollution Prevention Activities

Dear Mr. Wolfe:

This report is submitted by the Santa Clara Valley Water District (District), in conjunction with the Santa Clara Valley Urban Runoff Pollution Prevention Program's (SCVURPPP) Annual Report, pursuant to provision C.6.a of the Program's reissued municipal stormwater NPDES Permit (Order No. 01-024). The report summarizes activities performed during FY 2008-2009 (July 1, 2008 to June 30, 2009) in accordance with the Santa Clara Valley Water District's Urban Runoff Management Plan (URMP), and the performance standards contained therein, submitted to the Regional Board in September 1997, updated in October 2000, and again in September 2004.

Program Highlights and Accomplishments–Permit Required Activities

- The District's Emergency Response (ER) Program's performance was evaluated by three mechanisms during FY07-08. The results of these evaluations were as follows:
  - (1) The Clean, Safe Creeks key performance indicator was met;
  - (2) The ER Program received a "Superior" rating (the highest rating possible) on the total organizational performance report; and
  - (3) The ER Program passed the quality and environmental recertification audit according to ISO 9000 and 14000 standards.
- The District ER Program responded to 124 incidents reported to the District's 24 hour per day, 7 day per week pollution hotline.
- The District's School Outreach Program visited 109 public and private schools reaching 13,932 students and 1,019 educators. Staff conducted 3 Project Wet teacher workshops, presented sessions at 4 conferences, and conducted 2 teacher in-service days.
- Removed 4,571 cubic yards of trash and debris from local creeks through the various District trash removal programs.

The District and SCVURPPP sponsored Rural Public Works training on erosion reduction and sediment control practices on rural unimproved roads, storage yards and other unimproved facilities. This workshop consisted of one day of classroom lecture followed by two, one-day

field training exercises on appropriate installation and use of various Best Management Practices. The field training took place at the District's Camden large wood debris and rock storage yard.

Enhancements-Non Permit Required Activities

- Implemented and expanded pilot treatment systems to improve water quality and reduce methyl mercury in one lake and two reservoirs (Almaden and Guadalupe) in the Guadalupe River Watershed.

- The District participated in two countywide creek cleanup events: Coastal Cleanup Day on September 20, 2008 and the National River Cleanup Day on May 16, 2009. During Coastal Cleanup Day, 1,331 volunteers collected 95,656 pounds of trash and 16,327 pounds of recyclables at 26 sites. On National River Cleanup Day, 967 volunteers collected 27,935 pounds of trash and 22,633 pounds of recyclables (which included ½ of an automobile) at 30 sites. These numbers indicate more volunteers participated and were able to remove significantly more trash from the community than the previous year.

Annual Report

The attached Annual Report provides an accurate representation of the implementation efforts of the District's Urban Runoff Management Plan and FY 08-09 work plan during the past fiscal year. The information can be shared with other Co-permittees, municipal decision-makers, and the public.

The table of contents of this report provides the outline of the Annual Report.

We appreciate the opportunity to provide you with this information on our accomplishments, and we look forward to your comments. If you have any questions regarding the materials submitted, or need additional information, please feel free to contact us.

Sincerely,

Shree Dharasker
Engineering Unit Manager
Environmental Management Unit

PERFORMANCE STANDARD COMPLETION CERTIFICATION STATEMENT

"I certify, under penalty of law, that Santa Clara Valley Water District has implemented all elements of the following performance standards, except as described in the Self-Evaluation Matrix in Attachment B of this FY 08-09 Annual Report, according to the policies and procedures described in the Santa Clara Valley Water District's Urban Runoff Management Plan dated September 1, 2004:

Rural Public Works Maintenance and Support Activities
Storm Drain Operation and Maintenance
Water Utility Discharge
Illicit Connection and Illegal Discharge
New Development and Construction Planning
New Development and Construction Inspection
Pest Management

Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, this information is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

INTRODUCTION

This is the Santa Clara Valley Water District (District) Urban Runoff Program's Fiscal Year (FY) 08-09 Annual Report (Annual Report). This Annual Report is prepared to comply with section *C.6* of Regional Board Order 01-024 and section *n* of Regional Board Order 01-119[1]. In their entirety, these two Regional Board Orders comprise the Municipal Stormwater Permit (Permit). This Annual Report demonstrates and describes District compliance with the Permit.
The Annual Report is formatted to correlate with sections identified in the soon to be adopted Municipal Regional Permit (MRP) and its revised section numbers.

Annual Report (AR)

The Regional Board established a cycle of regulatory submittals that includes the District's annual Urban Runoff Work Plan (Work Plan) which is required to be submitted by March 1 of each year. The Work Plan describes planned urban runoff pollution prevention activities for the upcoming fiscal year. The Annual Report provides a description of completed Work Plan elements and must be submitted by September 15 each year.

The Santa Clara Valley Water District's (District) Urban Runoff Program (DURP) completed several vital tasks during the 2008-2009 fiscal year (FY 08-09). The District focused on four main objectives; (1) Continuing to update the Work Plan format to be compatible with the MRP; (2) Sampling of Lake Almaden, Coyote, Calero, Chesbro, Uvas, Guadalupe, Stevens Creek, Lexington, and Almaden Reservoirs for ammonia, sulfate, nitrate, phosphorous, mercury, and methyl mercury, and continuing the study of mercury and methyl mercury processes in the Guadalupe watershed; (3) Continuing participation in numerous pollution prevention outreach activities, and (4) Continuing development of a District Trash Work Group to coordinate various District trash removal and source abatement activities.

The DURP includes both an area-wide component and an agency specific component. The area wide component is achieved through participation in the Santa Clara Valley Urban Runoff Pollution Prevention Program (Program) which is a collaborative effort by 15 agencies, including the District. The agency specific component of the Urban Runoff Program targets District activities and facilities that are potential sources, or potential receptors, of non-point source pollution. These activities include construction of capital improvements for flood control and water supply, channel maintenance, facility maintenance, and water utility operation and maintenance. Other sources of stormwater pollution, which are not associated with District activities, include illicit connections to storm drains, and illegal or accidental dumping or discharges on District facilities and waterways.

[1] Regional Board Order 01-119 revises section *C.3* (regarding runoff from new and redevelopment projects) of Regional Board Order 01-024.

Santa Clara Valley Water District Organization

The mission of the District is a healthy, safe and enhanced quality of living in Santa Clara County through watershed stewardship and comprehensive management of water resources in a practical, cost-effective and environmentally sensitive manner.

Readers interested in further background about the District are encouraged to read the FY03-04 AR.

Structure of Report

The Annual Report follows the format of the draft Municipal Regional Permit. The report includes three sections that describe 1) Program Highlights and Accomplishments 2) a Summary of Continuous Improvement Activities and 3) a series of attachments. Each attachment is consistent with the Work Plan submitted in March, 2008.

Exclusions

Several sections of the MRP do not directly apply to the Santa Clara Valley Water District. Those sections are C.4 C.10 C.12 C.13 C.14 C.16-21. These sections are requirements directed to the municipalities that own and or operate the municipal separate storm sewer systems or MS4s.

PROGRAM HIGHLIGHTS AND ACCOMPLISHMENTS

The District's Urban Runoff Pollution Prevention Program (Program) completed numerous tasks during the 2008-2009 Fiscal Year. The details of these accomplishments are included in the attachments to this Annual Report. Some of the Program highlights are summarized below. The full description of the activities can be found by referencing the section numbers with the attachments portion of the report.

C.2 Municipal Operations

Storm drain inspections and cleaning work orders continue to be distributed via the District's Comcate (field maintenance work order software) Preventative Maintenance Program for the three Water Treatment Plants. Each month facility maintenance staff receive a computer generated work order to inspect all storm drains at their facility and have them cleaned as needed. The Environmental Management Unit has been performing storm drain inspections since FY 2005 at the Vasona Meter Shop, Corporation Yard, Headquarters and Administration Campus and the Blossom Hill Annex to ensure compliance with the Urban Runoff Management Plan and Storm Water Pollution Prevention Plans.

The water quality sampling at the Corporation Yard has continued. Pollution prevention and pollutant reduction has continued to be a focus of Corporation Yard staff training.

The stormwater quality BMPs such as vegetated swales, sand filters and storm drain inlet protection were visually inspected quarterly during non-stormwater observations at most District facilities except Coyote and Pacheco Pump Stations. The pump stations do not warrant non-stormwater observations due to the low potential for these types of discharges to occur. The Corporation Yard culvert inlet protection device (constructed of cinderblocks filter fabric and washed gravels) was inspected in September, 2008 and determined to be in need of reconstruction and cleaning which was completed later in the Fall, 2008. The Corporation Yard culvert inlet protection device was again inspected in June, 2009, and will be serviced in October, 2009, as it has collected sediment preventing this material from entering the Guadalupe River. Other BMPs are working effectively, as noted on the non-storm water observation forms submitted. The three Water Treatment Plants conducted the storm drain inspections required under this program.

During FY 08-09, the District removed approximately 8,845 cubic yards of sediment and completed bank protection projects totaling approximately 7,121 linear feet (1.35 miles).

Annual SMP archeology awareness and BMP training was conducted on June 5, 2008, and June 11, 2008, and 95 % of District employees from the Watershed Field Operations Units, Watershed Program Support Units, Vegetation Management Unit, and Regulatory Compliance Unit received the training (100 employees). BMP training evaluation forms were distributed during the training session and attendees were asked to complete them before leaving. All training sessions were rated excellent (38%) or good (55%) by the respondents. Suggestions for improving the training will be incorporated into next year's training. On-site training has also

been conducted for District contractors and day laborers. The training for the Stream Maintenance Project that took place in June of 2008 is for work that was conducted in the time frame addressed by this report.

C.3 New Development

The following stream function improvement activities are not part of the permit requirements. However, in the interest of natural channel/creek design, the District has been collecting geomorphic data and designing flood control projects in the upper watershed that incorporate various geomorphic features. Some of this work is overseen by the Office of Stewardship Planning's Watershed Planning and Asset Management Unit.

Adobe Creek

Construction began in early summer, 2008, and was completed in the fall of 2008. The design incorporated some fluvial geomorphic features that could be accommodated considering the residential encroachment.

Stevens Creek

The Blackberry farm project in Cupertino, which includes some District design features, was completed in the Spring of 2009.

C.5 Illicit Discharge Detection And Elimination

Emergency Response

The District addresses IC/ID incidents effectively through its watersheds' hazmat "Emergency Response" (ER) Program. This aggressive 24-7 program responds reactively to IC/ID incidents by providing referral and inter-agency cooperation and/or conducting field investigation and clean-up activities as appropriate. The ER Program may be contacted via the Pollution Hotline (1-888-510-5151) which is advertised on the District's internal and external websites, as well as in occasional fliers and memos. The Hotline is also advertised on the Santa Clara Valley Pollution Prevention Program's website. The ER Team routinely responds to over 100 reported incidents per year as reported by District field workers, staff from other agencies, and members of the general public.

The District received and responded to a total of 124 emergency response reports throughout Santa Clara County during fiscal year 2008-2009. This total increased 8% from the 115 reports in FY 07-08. Of the 124 total incidents reported during the last fiscal year, 115 were within the jurisdiction of the San Francisco Bay Regional Water Quality Control Board and the associated Santa Clara Municipal Stormwater Permit. 83 of the 124 required a field response by a team member or members for general investigation, source identification, multi-agency coordination, clean up, or evidence collection. The 124 total incidents were distributed among the District's five major watersheds as follows: Coyote (30), Guadalupe (55), West Valley (18), Lower Peninsula (12,) and Uvas/Llagas (8). The data from the emergency response reports indicates that the Guadalupe River was once again the waterway with the greatest number of incidents

with a total of 26 reports. Coyote Creek also had a relatively high number (13) of incidents reported. Los Gatos Creek had 8 incidents reported. Chemical incidents were the most predominate with a total of 24 followed by Fuel/Oil related incidents as the second most predominate. Trash (17) was the third most common complaint.

The majority of reports (66) this year again occurred within the limits of the City of San Jose. Seventeen (17) incidents occurred in unincorporated areas. The District records every response it receives. It is important for the District to be able to accurately track the number of reports. If the incident is outside of District jurisdiction (limited to its own lands and facilities – that being properties "owned, controlled, operated, or maintained by the District") the District may forward the report information to the appropriate public agency. The District does log those forwarded reports for our records - so it is important for the Regional Board to be aware that the total number of reports from all co-permittees as reported by the Program Manager may be artificially elevated due to double reporting of such cases (District + municipal). The District is one of the few Santa Clara County Municipal Permittees that has 24 hour availability to implement stormwater pollution prevention program investigations. District staff will occasionally investigate and collect evidence at a site that can later be transferred to the appropriate jurisdictional authority during the next regularly schedule business hours whether it be our co-permittees, or state and federal agencies. The District responded within the two hour target field response time 98.3% of the time in 2008-2009 for all in-County incidents.

C.6 Construction Site Controls

The District continued to use the monthly inspection sheet developed in FY 02-03 to facilitate compliance and follow up inspections. The Environmental Management Unit (EMU) continued to coordinate with the construction inspectors in the field to go over SWPPP implementation at the construction sites. This coordination proved beneficial, and EMU will continue providing monthly reminders to Construction Inspection Unit staff to complete SWPPP implementation paper work during FY 09-10.

The Construction Inspection Unit continues to use the Incident Response/Pollution Prevention Hotline to contact Environmental Management Unit staff to report construction sites that are creating discharges of concern.

In FY 08-09, the District had 11 Capital Improvement Projects (CIP) under construction that included flood protection/channel improvement projects. The Environmental Management Unit assisted with review of CIP SWPPPs as requested. A table showing the inspections completed is included with the C.6 Attachments.

C.7 Public Information and Outreach

The District serves a community of 1.7 million countywide and has excellent outreach programs to many sectors of the community. Key elements of the District's PIP Program include creek clean up events supporting citizen participation, attendance at community events targeting the general public, numerous workshops presented by the Water Conservation Unit, and the School Outreach Program.

General Outreach

The District attended 19 community events during FY 08-09. A listing of all events is included in this Section (C.7.e.i; C.7.e.ii; C.7.e.iii).

The District's website continues to provide regular updates to the community. During the winter season, the District's home page featured a link to flood-related information, the District's efforts to protect the waterways in the event of a flood, and sandbag distribution sites. Our on-line maintenance request form empowers citizens to report dumping or waterway-related problems, and allows them to send messages to the appropriate watershed staff. The site also includes a link to the Santa Clara Valley Urban Runoff Pollution Prevention Program.

The District includes a point of contact (phone number and website) to provide the public with information on watershed characteristics and stormwater pollution prevention alternatives through the Program. Please refer to the Program's Annual Report for details (C.7.d.i; C.7.d.ii; C.7.d.iii).

Targeted Outreach

Workshops

In May, 2008, the District's Water Quality, Groundwater Management, Vegetation Management and Water Use Efficiency Units worked together with the Loma Prieta Resource Conservation District, the University of California Cooperative Extension and the United States Department of Agriculture Natural Resource Conservation Service to conduct the seventh annual Stewardship for Small Acreages – A Series of Workshops on Land Management for Clean Water. The goal was to provide rural landowners with the resources needed to protect both surface and ground water quality on and off their property. The series took rural landowners through the steps of assessing their properties and developing action plans to address the highest priority items. The workshops were held at various small acreage homes. The four sessions included general topics such as watersheds and conservation plans, groundwater quality, wells, septic systems and hazardous household products; manure/waste management and composting; small vineyards; and fire safety, landscaping and erosion control. A total of 208 people attended the 4 sessions.

In March, 2009, the Water Use Efficiency Unit conducted a four-part Water Efficient Landscaping Workshop Series. A total of 208 people attended the four sessions: Designing and Selecting Plants for a Water-Wise Garden, Gardening with Natives, Water Efficient Irrigation Design, and Water Efficient and Sustainable Landscaping Techniques. Several Units came together to present two sessions of CreekWise Workshop for creekside owners on March, 1, and March, 15. The workshops included watershed education, water conservation, urban runoff and pollution prevention, invasive species, pest management, erosion control, and being a good creek neighbor. A total of 59 people attended the two sessions.

Media Campaign

The District carried active media outreach during the winter of 2008-09. The District took advantage of the winter storms to inform and educate the public about the importance of keeping our creeks clean.

In addition to the District's own campaign, the District participated in a regional water conservation campaign, funded by a state grant and led by San Francisco Public Utilities Commission and Bay Area Water Supply and Conservation Agency. The primary message of this regional campaign is that California is in a drought and everyone can take easy steps to save water now. The campaign includes a regional website that directs users to services and programs in their own service area.

The District participates in a countywide advertising campaign through the program. Please refer to the Program's Annual Report for details (C.7.b.i; C.7.b.ii; C.7.b.iii). The District participates in a Bay Area-wide Media Relations campaign through BASMAA via the program. Please refer to the Program's Annual Report for details (C.7.c.i; C.7.c.ii; C.7.c.iii).

Other Targeted Outreach

Flood Safety Notice 2008 was mailed in November, 2008, to 104,000 flood plain residents. Although the mailer's main focus is flood preparedness and safety, it also contained articles on healthy creek ecosystems, keeping debris out of creeks and illegal dumping. A copy is included in this section.

In January, 2009, the District mailed out more than 700,000 copies of Valley Water News, a Countywide newsletter, to residents and businesses in Santa Clara County. The newsletter included information emphasizing the need to keep our streams free of trash and chemicals. It also provided the 24-hour pollution prevention number to report illegal dumping.

AquaFacts, the District's employee newsletter, continued this year as an online publication. AquaFacts contained 10 articles relating to stormwater pollution prevention and watershed education during FY 08-09. Topics included "Got Bugs?-Be careful what you spray", "Bike-to-Work Day", "Algae harvesting at Los Capitancillos Groundwater Recharge Ponds", "District fleet observes Clean Air Month", "Two-wheeled inspections of levees and creek trails", and two creek cleanup events. The employee newsletter is an excellent and cost-effective method for delivering urban runoff, pollution prevention, and watershed messages to District employees. In addition to AquaFacts, several articles were included in the District's daily "News You Can Use" emails.

An all employee Pollution Prevention Week email campaign was conducted September 22 through 28, 2008. Five emails were sent providing pollution prevention tips. Topics included: general pollution prevention week information, fighting pollution on the road, proper pesticide use and disposal, proper disposal of fluorescent bulbs, batteries and cell phones and protecting your Watershed. Numerous requests for brochures were received from the employees, as well

as many comments on the campaign. This continues to be a good method to present pollution prevention ideas to District employees.

Neighborhood work notices are posted on the District's web site for all stream maintenance and capital projects. Most notices include watershed information.

Educational Outreach

The District's educational outreach program serves a diverse population and responds to the needs of the schools throughout the County. Programming is consistent with State standards and regularly integrates messages and issues of other District communication programs. The District's School Outreach Program visited 109 public and private schools reaching 13,932 students and 1,019 educators. Staff conducted 3 Project Wet teacher workshops, presented sessions at 4 conferences and conducted 2 teacher in-service days during FY 08-09. The District offers a comprehensive education outreach program for early childhood, elementary, middle school, high school, and college-aged students to establish a foundation for understanding and appreciation of water resources. The program provides age-appropriate classroom presentations, teacher in-service training in water education, and tours, in order to help children understand and appreciate their local water resources. Classroom presentations include hands-on experiments, information on watersheds, urban run-off, pollution prevention, flood plains, conservation tips, water awareness activities, flood management, and careers in the water industry. Scheduling is conducted on a first-come, first-served basis and provided free to schools in Santa Clara County. Number of students by watershed, city, grade, focus of presentation, and school district are included with this section. AquaDrops eNews, an electronic teacher's newsletter was sent out in September 2008 and January 2009 (C.7.h.i; C.7.h.ii; C.7.h.iii).

The Coyote Creek Outdoor classroom encompasses land alongside Coyote Creek and includes a covered gazebo classroom for students and teachers, as well as a platform overlooking the creek where students can study the stream's natural habitat. Groundwater monitoring wells on site enable students to observe and evaluate the groundwater table. Also the site is used to explain how surface and groundwater interact. The site features two planting areas – one site close to the creek planted with native trees and shrubs to improve the stream's wildlife habitat, and a "high terrace" or upland area landscaped with oaks, grasses and other native plants to demonstrate drought-tolerant gardens. During the 2008-09 school year, the program did not use the Coyote Creek Outdoor classroom.

Morley Park Outdoor Classroom in the City of Campbell provides the opportunity to teach students about the purpose of wetlands, urban runoff and the value of percolation ponds. During the 2008-09 school year, the program provided tours for 20 classes, 639 students and 20 teachers.

Citizen Participation

The District established the Adopt-A-Creek Program in 1994 to encourage residents of Santa Clara County to take an active role in helping to preserve the health and beauty of our local creeks. The Adopt-A-Creek program is currently has been resurrected by the Communications and Customer Relations Unit - In FY08-09, 10 new permits and 4 renewal permits were issued and 48 creek cleanup events were conducted. A list of cleanup events is included in this section (C.7.g.i; C.7.g.ii; C.7.g.iii).

The District participated in two countywide creek cleanup events: Coastal Cleanup Day on September 20, 2008 and the National River Cleanup Day on May 16, 2009. During Coastal Cleanup Day, 1,331 volunteers collected 95,656 pounds of trash and 16,327 pounds of recyclables at 26 sites. On National River Cleanup Day, 967 volunteers collected 27,935 pounds of trash and 22,633 pounds of recyclables (which included ½ of an automobile) at 30 sites (C.7.g.i; C.7.g.ii; C.7.g.iii).

C.8 Water Quality Monitoring

Monitoring

The District continued its monitoring program to evaluate water quality in Lake Almaden, Almaden Reservoir, Calero Reservoir, Guadalupe Reservoir and Stevens Creek Reservoir. The purpose of this monitoring is to establish existing water quality conditions and seasonal variability to evaluate the implementation of management changes to improve water quality. Depth profile measurements of temperature, pH, conductivity, and dissolved oxygen were conducted monthly. In addition, water samples were collected from the epilimnion and hypolimnion for analyses of total and dissolved mercury, total and dissolved methyl mercury, ammonia, nitrate/nitrite, sulfate and phosphorus at Lake Almaden, Almaden Reservoir, and Guadalupe Reservoir. Samples were also collected from the epilimnion for analyses for chlorophyll-a.

Coordinate Regional Monitoring Efforts of BASMAA, SCVURPPP, WMI, and District

The District Environmental Management Unit staff attended program and regional monitoring work group meetings including SCVURPPP Monitoring Ad-Hoc Work Group, BASMAA Monitoring Committee, WMI Assessment Subgroup meetings, and TMDL work group meetings (PCB, mercury, sediment), to identify opportunities for coordination and collaboration of monitoring activities. District staff participated in the Monitoring Ad Hoc Workgroup meetings and worked with the SCVURPPP Program to share monitoring data. District staff reviewed and commented on Program monitoring work plans, monitoring reports, and assessments. The District dedicated significant resources to work on the Guadalupe Watershed Mercury study and the TMDL. The District also dedicated staff time to collaborate on the San Francisco Bay Mercury TMDL.

C.9 Pesticides Toxicity Control

The District uses pesticides as one of the tools for pest management on its properties and facilities. The primary category of pesticides used is herbicides. Insecticides and rodenticides are used in small quantities. In all cases, pesticide products are used only after an assessment has been made regarding environmental, economical, and public health aspects of each of the alternatives. The District has always been proactive and conservative in the use of pesticides.

The District continues to implement a pesticide policy and an "Approved Pesticide List." Except for three products, the District's Approved Pesticide List met the criteria established in the District's Pesticide Policy for water quality, environmental and public health hazards. The District's policy states "Category I and II pesticides may only be used if required to meet health and safety concerns or if mandated to maintain regulatory compliance such as dam safety." The three "Toxicity Category I" products, one herbicide and two rodenticides were exempted from meeting the toxicity restriction due to the following factors:

1) They are integral in meeting the structural engineering requirements of the District's levee systems and dam safety program.
2) There are no practical alternatives at this time.
3) The toxicity and hazard exposure of these products applies only to the applicator at the time of application. These hazards are mitigated with protective clothing and eye protection which minimize the exposure hazard to the maximum extent.

The District believes that use of the less toxic products is beneficial to the environment and the health and safety of employees.

The District began implementation of the *arundo* mitigation program in 2002. The eradication program has increased the District's use of some pesticides. The cut stump method of application minimizes the potential for environmental impacts. The District currently has a program for monitoring the water quality impacts of this work type.

Alternate Pest Management Practices

With more than 25 acres of unwanted vegetation rising up and around the Santa Teresa Water Treatment Plant, the District used nearly 700 goats to remove dry brush that could have posed a fire hazard if left unchecked. Using the goats was a welcome alternative to chemicals or mowing, which proved difficult in the past because of uneven slopes around the plant. This innovative approach reflects that the District is doing things differently and certainly keeping the environment in mind.

The District continued to integrate mechanical harvesting and non-toxic dye colorants with the use of an herbicide known as "Control Weed" to manage algae at percolation ponds.

Training/Certification

Continuing education (CE) is required to maintain certification. Employees can obtain CEs through seminars sponsored by Pesticide Applicators Professional Association (PAPA),

California Association of Pest Control Advisors (CAPCA), manufacturers and universities. CEs are tracked by PAPA/CAPCA and records can be obtained from their websites. All District employees prepare an Employee Performance Plan and County Agricultural Commissioner and the State Department of Pesticide Regulations certification and training requirements are included in individual Performance Plans. Performance Plan evaluations are conducted every summer for all employees. Employees not meeting certification and training requirements contained in their Performance Plan may face disciplinary action or termination of employment.

Bi-weekly safety meetings are held that include IPM Policy, SOP and BMP training. Label training, hazardous spill response, and symptoms of pesticide poisoning were some of the topics covered this past year.

BMP inspection checklists continue to be completed for both chemical and non-chemical vegetation management activities.

C.10 Trash Program Evaluation

It continues to be very challenging for the District to identify individual responsible parties for many of the illegal dumping activities that occur in the creeks of the county. Since the District has no police powers and no land use authority, our ability to penalize polluters and protect the environment proactively, rather than retroactively, is very limited outside of our extensive public and educational outreach activities. Homeless encampments are one of the primary sources of trash being directly deposited to the riparian corridor. With these limitations in mind, the District dispatches maintenance crews to provide frequent and routine creek cleanup for trash and debris in District waterways. Some of this material is deposited in creek channels and constitutes illegal dumping but is not reported to District hazmat or code enforcement staff due to the inability to establish an individual source or responsible party. In the spring of 2006, the District formed an internal focus group made up of water quality and field maintenance staff, and various managers, to better strategize how to identify root causes and sources of trash and how to reduce the load of trash to the creeks. This group has since evolved into the District Trash Work Group which includes a broader scope of District employees from watershed managers to field maintenance staff planners, and intermediate managers. This group was formed to coordinate the District's internal and external trash related activities such as work with SCVURPPP, the San José/District Trash MOU, and non-governmental organizations. The group meets several times a year to discuss potential options and structure devices to capture trash, and also protect the various natural resources in our creeks.

The District maintains three trash cleanup programs:

1) The Clean Safe Creek Outcome 1.4 (aka the Good Neighbor Program) which states "Neighborhood creeks will be frequently inspected and cleaned of litter and graffiti;"
2) The Adopt-A-Creek program which allows individuals, service organizations or companies to adopt a section of creek and have their name posted along that section of creek; and
3) Unscheduled litter and debris removal associated with internal and external maintenance requests generated from the District's Internet website.

These three programs collected and disposed of approximately 4,571 cubic yards of trash and debris from county waterways in 08-09. This year's breakdown by watershed is as follows; Guadalupe watershed 841 cubic yards (18%), Coyote watershed 1,503 cubic yards (33%), West Valley watershed 877 cubic yards (34%), Lower Peninsula watershed 926 cubic yards (16%), and Uvas Llagas watershed had 621 cubic yards (14%). The Guadalupe watershed Good Neighbor Program continues to conduct monthly homeless encampment cleanup activities along both the Guadalupe River and Coyote Creek. The Good Neighbor Program coordinates with the Santa Clara County Department of Corrections to utilize inmate labor for some of the creek cleanup activities. Additionally, the San José Conservation Corp labor is also utilized extensively during many of the trash removal operations. The Adopt-A-Creek program also supports trash removal from adopted sections of various creeks and this program is highlighted in the PIP activities section of the Annual Report. The Adopt A Creek program is responsible for the removal of 231 cubic yards of trash from the various watersheds.

Blood Borne Pathogen Training

The District suspended trash assessments for 2007-2009 due to safety issues associated with working in proximity to homeless encampments and other potential blood born pathogen exposures. The Districts Urban Runoff Program has been working with the District's Industrial Hygienist to develop a suite of Best Management Practices to be implemented by staff conducting Rapid Trash Assessments in areas that could potentially expose employees to significant health hazards. These BMP's include the mandatory use of puncture resistant boots, a suite of vaccinations, and focused training on how to prevent exposure to blood borne pathogens and how to respond should an individual be exposed to blood borne pathogens.

The District's Industrial Hygienist indicated that vaccinations are available to District employees who perform field work that potentially exposes them to any of the following: used hypodermic needles, human excrement and/or bodily fluids, sharp objects contaminated with soil, and employees who could come into contact with wild animals or vicious dogs. The District Environmental Health and Safety Unit will consider these work activities in order to determine which of the following preventative vaccinations are recommended for each employee:

1) Hepatitis A
2) Hepatitis B
3) Tetanus
4) Rabies

Once District staff is safely prepared to continue conducting Rapid Trash Assessments, they will likely resume.

C.11 Mercury Controls

Stream Maintenance Program

In 2008, routine sediment removal maintenance resulted in the disposal 8,205 cubic yards of material, with 1,641 of this total from the creeks in the upper portion of the Guadalupe River

Watershed. The total mercury removed from the system was 46 kg, with 45 kg from the Guadalupe River Watershed.

Monitoring (as previously stated in C.8)

The District has undertaken a monitoring program to evaluate water quality in Lake Almaden, Almaden Reservoir, Calero Reservoir, Guadalupe Reservoir and Stevens Creek Reservoir. Depth profile measurements of temperature, pH, conductivity, and dissolved oxygen were conducted monthly. In addition, water samples were collected from the epilimnion and hypolimnion for analyses of total and dissolved mercury, total and dissolved methyl mercury, ammonia, nitrate/nitrite, sulfate and phosphorus at Lake Almaden, Almaden Reservoir, and Guadalupe Reservoir. Samples were also collected from the epilimnion for analyses for chlorophyll a. The purpose of this monitoring is to establish existing water quality conditions and seasonal variability to evaluate the implementation of management change to improve water quality.

Other Mercury Controls

In 2008, the District continued to implement three projects to control mercury in the Guadalupe River Watershed: Jacques Gulch Restoration, Lake Almaden Circulation, and Reservoir Circulation.

Jacques Gulch Restoration

Jacques Gulch is a tributary to Almaden Reservoir that drains approximately one-third of the reservoir watershed. A portion of this drainage includes a small tributary that drains a portion of the former New Almaden Mining District, which is now Almaden-Quicksilver County Park. The project will remove, cap, or control erosion of extensive mercury deposits in the tributary above its confluence with Jacques Gulch, and in Jacques Gulch above its confluence with Almaden Reservoir. This project is scheduled for completion in 2011. During the reporting period, the District accepted a bid for construction, which will begin July 1, 2009.

Lake Almaden Circulation

Lake Almaden is a former gravel quarry that lies at the confluence of Guadalupe Creek and Los Alamitos Creek that drain Guadalupe and Almaden Reservoirs, respectively. Below this confluence is the Guadalupe River. This lake provides recreational amenities to the community, including swimming, boating, and fishing. The Guadalupe River Watershed Mercury Study identified the lake as a significant source of methyl mercury that bio-accumulates in fish within the lake and in fish downstream. In 2008-09 two additional circulators were installed in the lake, providing full treatment.

Reservoir Circulation

The Guadalupe River Watershed Mercury Study identified reservoirs as a significant source of methyl mercury that bio-accumulates in fish within the reservoirs and in

downstream creeks. The study also demonstrated a correlation between the seasonal development of anoxia in the hypolimnion and increased methyl mercury concentrations. Building on the success of the Lake Almaden pilot project, the District installed three solar-powered circulators in Almaden Reservoir in April, 2007, and three solar-powered circulators were installed in Guadalupe Reservoir in July, 2007. -Monitoring of the performance was continued in 2008-09.

C.15 Exempted and Conditionally Exempted Discharges

The District owns, operates, and/or maintains 3 water treatment plants, 2 pumping and metering stations, 1 pump station, 11 reservoirs, percolation facilities, water wells, a recycled water facility (South County Regional Wastewater Authority Treatment Plant), and distribution pipelines. All of these water facilities have a potential for discharging non-stormwater to surface water bodies.

The District continued reporting on all water utility O&M discharges. Please see attached inventory table (Table 15.1). Typical District discharges include raw water from water quality testing devices at District plants, San Tomas Injection Well, and Vasona Meter Shop testing.

The District's water utility maintenance staff performs all discharges. District staff implemented BMPs after consultation with the Environmental Management Unit.

SUMMARY OF PROPOSED CONTINUOUS IMPROVEMENT ACTIVITIES

1. Provide training to Water Utility staff relevant to MRP BMP's and BMP's from and other District specific NPDES permits.

2. Increase awareness among District Employees of pollutant effects on San Francisco Bay and the Pacific Ocean.

045364

Attachment 1.1

Water Quality Standard Exceedances

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.1. Water Quality Standards Exceedances			
The Permittees shall comply with Receiving Water Limitations B.1 and B.2 through the timely implementation of control measures and other actions to reduce pollutants in the discharge of stormwater runoff. The Permittees shall implement control measures and Best Management Practices (BMPs) to reduce pollutants in stormwater discharges to the maximum extent practicable in accordance with the requirements of this permit, including any modifications. The performance standards specified in Provisions C.2 through C.15 are designed to achieve compliance with Receiving Water Limitations B.1 and B.2 through implementing management practices, specifying level of implementation, and requiring timely and complete reporting to enable determination of compliance with the specified performance standards. If exceedance(s) of water quality standards or water quality objectives (collectively, WQSs) persist in receiving waters, notwithstanding implementation of these Provisions, Permittees shall assure compliance with Discharge Prohibitions A.1 and A.2, and Receiving Water Limitations B.1 and B.2 by complying with the following procedure: **a.** Upon a determination by either the Permittee(s) or the Water Board that discharges are causing or contributing to an exceedance of an applicable WQS, the Permittee(s) shall promptly notify and thereafter submit a report to the Water Board that describes BMPs that are currently being implemented and the current level of implementation and additional BMPs that will be implemented, and/or an increased level of implementation, to prevent or reduce discharge of pollutants that are causing or contributing to the exceedance of WQSs. The report may be incorporated in the Annual Report, unless the Water Board directs an earlier submittal, and shall constitute a request to the Water Board for amendment of this NPDES Permit. The report and application for amendment shall include an implementation schedule. The Water Board may require modifications to the report and application for amendment; **b.** Submit any modifications to the report required by the Water Board within 30 days of notification; **c.** Within 30 days following adoption of the amendment to the Permit described above by the Water Board, the Permittees shall incorporate the approved modified control measures and levels of implementation, and any additional monitoring required; and, **d.** Implement the revised Permit requirements and monitoring program in accordance with the adopted schedule in C.1.a. As long as Permittees have complied with the procedures set forth above and are implementing the revised Permit, they do not have to repeat the same procedure for continuing or recurring exceedances of the same receiving water limitations unless directed by the Water Board to develop additional control measures and BMPs and reinitiate the Permit amendment process.			

Program Evaluation

This work plan component will be applicable once the Municipal Regional Permit is adopted and implemented.

Attachment 1.2

Municipal Operations

Santa Clara Valley Water District
Urban Runoff Annual Report For FY 2008-09
Municipal Operations

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.2. Municipal Operations			
C.2.e. Bridge and Structure Maintenance and Graffiti Removal			
C.2.e.i. Task Description			
C.2.e.i.1	Permittees shall implement appropriate BMPs to prevent pollutant discharge from bridges and structural maintenance activities directly over water or into storm drains.	Acknowledged as a SCVWD requirement for FY0910	
C.2.e.i.2	Permittees shall implement BMPs for graffiti removal that would prevent non-stormwater discharge, such as wash waters.	Acknowledged as a SCVWD requirement for FY0910	
C.2.e.ii. Implementation Levels			
C.2.e.ii.	(1) Permittees shall prevent concrete, steel, wood paint and paint chips, coating chips, or other pollutants generated in bridge and structure maintenance or graffiti removal from entering storm drains or water courses. (2) Permittees shall protect nearby storm drain inlets before removing graffiti from walls, signs, sidewalks or other structures needing graffiti abatement. Permittees shall prevent any discharge of debris, cleaning compound waste, paint waste or wash water due to graffiti removal from entering storm drains or watercourses.	Acknowledged as a SCVWD requirement for FY0910	
C.2.e.iii. Reporting			
C.2.e.iii.	Permittees shall report compliance with these BMPs in their Annual Reports.	Acknowledged as a SCVWD requirement for FY0910	
C.2.f. Catch Basin or Storm Drain Inlet Inspection and Cleaning			
C.2.f.i. Task Description			
C.2.f.i.	Permittees shall annually inspect, before the wet season, all catch basins or storm drain inlets, and clean them to remove sediment, trash, litter, and other pollutants from the catch basins and storm drain inlets	Ongoing	
C.2.f.ii. Implementation Levels			
C.2.f.ii.1	Maintain for inspection maps of all storm drain inlets, outfalls and drainage areas contributing to those outfalls within the Permittee's jurisdiction	Ongoing	

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.2.f.ii.2	Maintain storm drain inlets and stormwater collection systems in accordance with the following: (a) Inspect and clean storm drain inlets/catch basins, at least once per year before the rainy season. (b) Increase inspection and maintenance frequency in problem areas, such as those that accumulate excessive sediment, trash and debris, to twice a year, or as required for compliance with Provision C.10. (c) During inspections, check and implement corrective follow-up actions for the following: (i) Accumulation of trash, sediments and pollutants (e.g., oily sheen); (ii) Presence of illicit discharges; and (iii) Storm drain pollution prevention message legibility (See Provision C.7.a.).	Ongoing	
C.2.f.iii. Reporting			
C.2.f.iii.	Permittees shall keep and maintain available for inspection records of inspections, cleaning, and maintenance for all drain inlets/catch basins and shall report them in their Annual Reports	Ongoing	
C.2.i. Corporation Yard BMP Implementation			
C.2.i.i. Task Description			
C.2.i.i.1.	Permittees shall prepare, implement, and maintain specific Stormwater Pollution Prevention Plans (SWPPP) for corporation yards, including municipal vehicle maintenance, parking areas, and material storage facilities to comply with water quality standards.	Ongoing	
C.2.i.i.2.	The requirements in this provision shall apply only to facilities that are not already covered under the State Board's Statewide Industrial Stormwater NPDES General Permit		
C.2.i. ii. Implementation Levels			
C.2.i.ii.1.	Implement BMPs to minimize pollutant discharges in stormwater and prohibit non-stormwater discharges, such as wash waters and street sweeper, vactor, and other related equipment cleaning washwater. Pollution control actions shall include, but	Ongoing	

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
	not be limited to, good housekeeping practices, material and waste storage control, and vehicle leak and spill control.		
C.2.i.ii.2.	Routinely inspect corporation yards to ensure that no non-stormwater discharges are entering the storm drain system and that during storms, pollutant discharges are prevented to the maximum extent practicable. At a minimum, an inspection shall occur before the start of the rainy season.	Ongoing	
C.2.i.ii.3.	Plumb all vehicle and equipment wash areas to the sanitary sewer after coordination with local sewer agencies and equip with a pretreatment device (if necessary) in accordance with the requirements of the local sewer agency	Complete	
C.2.i.ii.4.	Use dry cleanup methods when cleaning debris and spills from corporation yards. If wet cleaning methods must be used (e.g., pressure washing), Permittees shall ensure that wash-water is collected and disposed in the sanitary sewer in accordance with the requirements of the local sewer agency. Any private companies hired by the Permittee to perform cleaning activities on Permittee-owned property shall follow the same requirements.	Ongoing	
C.2.i.ii.5.	Outdoor storage areas containing waste pollutants shall be covered and/or bermed to prevent pollution of stormwater runoff or run-on to storm drain inlets.	Needs to be done	
C.2.i.iii. Reporting			
C.2.i.iii.	Permittees shall annually report the results of inspections at all corporation yards.	Ongoing	

PROGRAM EVALUATION

Corporation Yards when poorly maintained can be the source of significant amounts of contamination. Over the last decade District Urban Runoff Program staff have been instrumental in developing a significantly improved appreciation by Corp Yard staff of the need for pollution prevention. The staff of the Corp Yard have dramatically reduced the volume of potential pollutants stored on site and have implemented a very affective good housekeeping strategy. A District wide Green Business Certification has also brought a heightened environmental awareness to all District staff regarding pollution prevention.

Corp Yard stormwater samples were collected in the fall both upstream and downstream of the Sediment control best management practice device.

The District owns and operates the stormwater drainage systems at its facilities, which includes storm drains, catch basins, vegetated swales, open drainage ditches, utility trenches, and storm drain lines. Storm drains from District facilities discharge to creeks, the Guadalupe River, and recharge ponds. Storm drains outside District facilities are owned and operated by the local (city or county) jurisdiction.

The District completed the following tasks:

1) Revised drafts of Stormwater Pollution Prevention Plans for the Corporation Yard, Headquarters Campus, Santa Teresa Water Treatment Plant.

2) Continued implementation of the storm drain inspection and cleaning program.

3) Continued street sweeping functions at facility parking areas.

BMPs were formally inspected quarterly during non-stormwater observations at most District facilities except Coyote and Pacheco Pump Stations. The pump stations do not warrant non-stormwater observations due to the low potential for these types of discharges to occur. The Corporation Yard culvert inlet protection device (constructed of cinderblocks filter fabric and washed gravels) was inspected in June of 2008 and determined to be in need of cleaning and repair. The Corporation Yard culvert inlet protection device was serviced in October of 2008 and functioned well through the winter of 2008 and 2009. Once again the device is in need of service and that will take place in the fall of 2009. Other BMPs are working effectively, as noted on the non-stormwater observation forms submitted. The three Water Treatment Plants conducted the storm drain inspections required under this program.

HIGHLIGHTS AND ACCOMPLISHMENTS

The Corp Yard sampling has continued. Pollution Prevention and pollutant reduction has continued to be a focus of Corp Yard staff.

Storm drain inspections and cleaning work orders continue to be distributed via the District's Comcate (field maintenance work order software) Preventative Maintenance Program for the three Water Treatment Plants. Each month facility maintenance staff receive a

computer generated work order to inspect all storm drains at their facility and have them cleaned as needed. The Environmental Management Unit has been performing storm drain inspections since FY 2005 at the Vasona Meter Shop, Corporation Yard, Headquarters and Administration Campus and the Blossom Hill Annex to ensure compliance with Urban Runoff Management Plan.

Attachment 1.3

New Development and Redevelopment

Santa Clara Valley Water District
Urban Runoff Annual Report For FY 2008-09
New Development and Redevelopment

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)

C.3. New Development and Redevelopment	Requirements are in construction permitting agencies (NOT THE SCVWD)

PROGRAM EVALUATION

The Santa Clara Valley Water District(District) is not the local construction activities permitting agency. The District does incorporate LID principles in its own projects and at it facilities and as part of facility retrofits. As an example at the Administration Building outdoor classroom impermeable concrete was replaced with permeable concrete. In addition the Districts Headquarters and Administration Campus parking lots incorporate vegetated swales as part of the landscape and pollution prevention structures. The recently completed District Laboratory includes a storm water sand filter system for storm water treatment and it is also used example for interested parties to see what a storm water detention and treatment facility looks like and how they function.

Attachment 1.5

Illicit Discharge Detection and Elimination

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.5. Illicit Discharge Detection and Elimination			
C.5.a. Legal Authority		The Municipalities have jurisdiction over the storm drain systems	
C.5.a.i. Task Description			
C.5.a.i.	Permittees shall update ordinances and/or other relevant legal documents to the extent that is necessary to ensure adequate legal authority is available to fully implement an Enforcement Response Plan (ERP), defined in Provision C.5.b. below, that contains the following elements:	SCVWD Does not have police powers, citation authority or enforcement powers. All district property and facilities fall within the jurisdiction of local or county code enforcement regulations.	
C.5.a.i.1.	**Response Authority** – Permittees shall have the authority to effectuate cessation, abatement, and cleanup of polluted discharges, illegal dumping and significant trash/litter generating activities. **(a)** Permittees shall be able to legally require facilities, mobile sources, and responsible parties within their jurisdictions to terminate, abate, and cleanup non-exempted, non-stormwater discharges (including illicit connections and discharges), illegal dumping and significant trash/litter generating activities or other polluted discharges within the time frames specified in Provision C.5.b.i.(2). **(b)** If (a) is not possible, Permittees shall be able to take necessary cleanup and abatement actions within the time frames as specified in Provision C.5.b.i.(2), and recover costs from the responsible party.	SCVWD Does not have police powers, citation authority or enforcement powers. All district property and facilities fall within the jurisdiction of local or county code enforcement regulations. Though the SCVWD maintains a 24-7 365 pollution prevention hotline for reporting releases of hazardous materials to streams and reservoirs within Santa Clara County. a) Does not apply to SCVWD b) SCVWD maintains capability to effectuate cleanup	
C.5.b.i.1.	**Quick response** – Ability to bring about the cease and desist of a known or reported discharge and/or order the cleanup and abatement of the discharge or, if that is not possible, the Permittee performs the cleanup and/or abatement	Ability to bring about cease and desist and/or order the cleanup and abatement resides with the local law enforcement entity.	

	work and bills the responsible party, if necessary.	SCVWD maintains the ability to cleanup, abate and seek cost recovery for releases to SCVWD property.	
C.5.b.i.5.	**Appropriate Response** – Because illicit discharges, illegal dumping activities, and trash/litter generation are, by nature, highly variable in type of substance, level of seriousness, and intent of discharger, the appropriate responses (outreach, education, or enforcement) may vary case to case. The identification of the appropriate response shall ultimately be a function of the Permittee's best professional judgment.	Ongoing	
C.5.c. Spill and Dumping Response, Complaint Response, and Frequency of Inspections			
C.5.c.i. Task Description			
C.5.c.i.	Permittees shall have a central contact point, including phone numbers for complaints and spill reporting, and publicize to both internal Permittee staff and the public. If 911 is selected, also create and maintain and publicize a staffed, non-emergency phone number with voicemail, which is checked daily. Permittees shall develop a spill/dumping response flow chart and phone tree or list for internal use that shows the various responsible agencies and their contacts, who would be involved in illicit discharge incidence response that goes beyond the Permittees immediate capabilities. The list shall be maintained and updated as changes occur. Permittees shall conduct reactive inspections in response to complaints and follow-up inspections as needed to ensure that corrective measures have been implemented to achieve and maintain compliance.	Ongoing	
C.5.c.ii. Implementation Level			
C.5.c.ii.	Have the contact information available and integrated into training and outreach both to Permittee staff and the public by November 30, 2008.	Complete	
C.5.c.iii. Reporting			
C.5.c.iii.	Submit complaint and spill response number or list with October, 2009 Annual Report and update annually if changes occur.	Ongoing	
C.5.e. Tracking and Case Follow-up			
C.5.e.i. Task Description			
C.5.e.i.	All incidents or discharges reported to the complaint/spill system that might	Ongoing	

	pose a threat to water quality shall be logged to track follow-up and response through problem resolution. The data collected shall be sufficient to demonstrate escalating responses for repeated problems, and inter/intra-agency coordination, where appropriate.		
C.5.e.ii. Implementation Level			
C.5.e.ii.	Create and maintain a water quality and dumping complaint tracking and follow-up database system by November 30, 2008.	Ongoing	
C.5.e.iii. Reporting			
C.5.e.iii.	In the each Annual Report, Permittees shall report a cases/investigations conducted including types of violations and enforcement actions, through problem resolution as set forth in the Annual Report Template (Attachment L.). If the case is ongoing, report the status and ongoing activities with dates.	Ongoing	

RESPONSE TO REGIONAL BOARD COMMENTS FROM PREVIOUS YEAR'S ANNUAL REPORT

No comments from the Regional Board were received on this section of last year's annual report.

REPORTING DATA

- The ICID incident response/pollution prevention program received 124 reported incidents in Santa Clara County, 115 of which occurred in that portion of Santa Clara that lies within SF Bay Regional Board jurisdiction. Of those 115 incidents, 83 required a field response.
- Types of pollutants and pollutant sources encountered this year (see associated graphics)
- Locations: both by municipality and by watershed (see associated graphics)

PROGRAM EVALUATION

Emergency Response

The District continues to focus significant resources in support of the ICID program. Key elements of the District's ICID program include a 24-hour, 7-day per week Pollution Prevention Hotline (1-888-510-5151); Hazardous material removal; and staff training. On-call response duties are rotated weekly among a 4-person response team. All of the responses are due to some form of illegal dumping activity on District property.

Ordinance Enforcement

On 2-28-07 a new Water Resource Protection Ordinance (Ordinance 06-01) went into effect and simultaneously repealed Ordinance 83-2. The new Water Resource Protection Ordinance establishes District permitting authority only over lands and facilities "owned, controlled, operated, or maintained by the District" and requires outside parties to obtain an encroachment permit for any modification to District facilities including but not limited to development activities. The District may issue an encroachment permit if it finds, based on substantial evidence, that the proposed modification conforms to requirements of the District Water Resources Protection Manual such that, among other things, it will not pollute or erode waterways. Violators may be served a written "compliance order" delivered in person or by US Mail to the person responsible for the violation. Following prescribed hearings the District Chief Executive Officer (CEO) may impose administrative penalties up to $1000 per day (not to exceed $100,000 in total) for continuing violations. In addition to financial penalties the District may recoup administrative costs - potentially including any abatement costs - incurred by the District with regard to the violation. Additionally, violations of the Water Resource Protection Ordinance are punishable as a misdemeanor and may also be enjoined by civil action.

Utilization of enforcement components within the Water Resource Protection Ordinance is often either impractical or unnecessary when dealing with illegal dumping. This is because the parties responsible for illegal dumping can rarely be identified and sometimes the cost of enforcement may exceed the cost of simply absorbing the clean-up expense due to the limited labor resources available to develop a court case that will result in case that successfully allows the District to recovery its costs. In the case of significant spills the responsible party, if they can be identified, is usually eager to implement clean-up activities in order to avoid prosecution under more serious municipal, county, state, and federal codes. In instances where an uncooperative responsible party can be identified, the District will implement ordinance provisions such as compliance orders and administrative penalties and costs as appropriate. Additionally, District ordinance violation may be added to the list of violations prosecuted by the Santa Clara County District Attorney. During FY 08-09 no compliance orders, administrative penalties, administrative costs, civil actions, or misdemeanor prosecutions were brought against Ordinance 06-01 violators.

HIGHLIGHTS AND ACCOMPLISHMENTS

Emergency Response

The District addresses IC/ID incidents effectively through its hazardous materials "Emergency Response" (ER) Program. This aggressive 24-7 program responds reactively to IC/ID incidents by providing referral and inter-agency cooperation and/or conducting field investigation and clean-up activities as appropriate. The ER Program may be contacted via the Pollution Hotline (1-888-510-5151) which is advertised on the District's internal and external websites as well as in occasional fliers, county wide mailers and various memos. The Hotline is also advertised on the Santa Clara Valley Urban Runoff Pollution Prevention Program's website. The ER Team routinely responds to over 100 reported incidents per year as reported by District field workers, staff from other agencies, and members of the general public.

The ER Program is recognized as an effective and timely means of addressing acute contaminants that are illegally dumped or discharged to District lands and facilities. The Emergency Response Program's performance was evaluated by four mechanisms during FY09: (1) within the context of the District's Clean, Safe Creeks program (semi-annually); (2) by the District CEO's scorecard (quarterly); and (3) by an external ISO 9000/14000 recertification audit (December 2007). The results of these evaluations were as follows: (1) the Clean, Safe Creeks key performance indicator was met; (2) the program received a "Superior" rating (the highest rating possible) on the CEO scorecard based on phone and field response times; and (3) the ER Program passed the quality and environmental recertification audit of date according to ISO 9000 and 14000 standards.

The District received and responded to a total of 124 emergency response reports throughout Santa Clara County during fiscal year 2008-2009. This total is up 8% from the 115 reports in FY 07-08. Of the 124 total incidents reported during the last fiscal year, 115 were within the jurisdiction of the San Francisco Bay Regional Board and the associated Santa Clara Municipal Stormwater Permit. 83 of the 124 required a field response by a team member or members for general investigation, source identification, mulit-agency coordination, clean up or evidence collection. The 124 total incidents were distributed among the District's 5 major watersheds as follows: Coyote (30), Guadalupe (55), West Valley (18), Lower Peninsula (12), and Uvas/Llagas (8). The data from the emergency response reports indicates that the Guadalupe River was once again the waterway with the greatest number of incidents with a total of 26 reports. Coyote Creek also had a relatively high number (13) of incidents reported. Los Gatos Creek had 8 incidents reported. Chemical incidents were the most predominate with a total of 24 followed by Fuel/Oil related incidents as the second most predominate. Trash (17) was the third most common complaint.

The majority of reports (66) this year again occurred within the limits of the City of San Jose. 17 incidents occurred in unincorporated areas. The District records every response it receives. It is important for the District to be able to accurately track the number of reports. If the incident is outside of District jurisdiction (limited to its own lands and facilities – that being properties "owned, controlled, operated, or maintained by the District") the District may forward the report information to the appropriate public agency. The District does still log those forwarded reports for our records - so it is important for the Regional Board to be aware that the total number of reports from all co-permittees as reported by the Program Manager may be artificially elevated due to double reporting of such cases (District + municipal). The District is one of the few Santa Clara County Municipal Permitees that has 24 hour availability to implement a stormwater pollution prevention program investigation s. The District staff will occasionally as needed investigate and collect evidence at a site that can later be transferred to the appropriate jurisdictional authority during the next regularly schedule business hours for the jurisdictional authority whether it be our co-permittees, state or federal agencies. The District responded within the two hour target field response time, 98.3% of the time in 2008-2009 for all in-County incidents.

Included as part of this report are 4 charts for to help the reader visually evaluated the response sorted by various parameters. Water Within the graph that displays the type of pollutant, and its frequency the category "Other" means that the found pollutant did not fall under one of the pre approved 8 categories. The pollutant is known, but it just is not able to fit within a category. This is the major difference between the categories "Other", and "Unknown," that the pollutant itself is identified. Under the "Unknown" category there has not been any identification of what the pollutant is.

Water Resource Protection Ordinance Enforcement

As previously reported there were no compliance orders, administrative penalties, administrative costs, civil actions, or misdemeanor prosecutions brought against Ordinance 06-01 violators during FY 08-09. Additionally, District emergency responders continue to work cooperatively to assist investigations by law enforcement agents at the Department of Fish and Game and the District Attorney's Office, as well as municipal and Regional Board code enforcement staff.

Construction Site Control

Santa Clara Valley Water District
Urban Runoff Annual report For FY 2008-09
Construction Site Control

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.6. Construction Site Control			
C.6.f.iii. Reporting			
C.6.f. scvwd.	Continue to promote high frequency of construction site inspections. Maintain Training and Tracking tables.		Monthly
C.6.g. Staff Training			
C.6.g.i. Task Description			
C.6.g.i.	Permittees shall provide training or access to training for staff conducting construction stormwater inspections.	Ongoing	
C.6.g.ii. Implementation Level			
C.6.g.ii.	Permittees shall provide training at least every other year to municipal staff responsible for conducting construction site stormwater inspections. The training will cover updated information on BMPs' proper installation and maintenance, and implementation of ERP.	Ongoing	
C.6.g.iii. Reporting			
C.6.g.iii.	Each Annual Report shall include information on training topics covered, dates of training, and the percentage of Permittee inspectors attending.	Ongoing	

PROGRAM EVALUATION

The Environmental Management Unit continued to conduct pre-rainy season inspections to facilitate site compliance whenever it was requested by Construction Inspection Unit staff. The frequency of construction site inspection coverage continued to remain high this past year. This was facilitated by the Environmental Management Unit coordinating activities with the construction inspectors in the field and through the use of email reminders to construction inspectors to conduct SWPPP implementation evaluations.

The Lenihan Dam Outlet Modification Project had the site inspection responsibilities overseen by a construction inspection contractor. This agency conducted the SWPPP inspections at the site.

HIGHLIGHTS AND ACCOMPLISHMENTS

The District continued to use the monthly inspection sheet developed in FY 02-03 to facilitate compliance and follow up inspections. The Environmental Management Unit continued to coordinate with the construction inspectors in the field to go over SWPPP implementation at the construction sites. The Environmental Management Unit coordination proved beneficial, and will continue providing monthly reminders to Construction Inspection Unit staff to complete SWPPP implementation paper work during FY 09-10.

Construction Inspection Unit continues to use the Incident Response/Pollution Prevention Hotline to contact Environmental Management Unit staff to report construction sites that are creating exempted discharges.

In FY 08-09, the District had 11 Capital Improvement Projects (CIP) under construction that included flood protection/channel improvement projects. Environmental Management Unit assisted with review of CIP SWPPPs as requested. A table showing the inspections completed is included with this section.

All Steam Maintenance Program (SMP) work is reported by the Environmental Management Unit in the SMP annual SMP post-construction report due every January. This annual report is also submitted to the Regional Water Quality Control Board (RWQCB). The SMP report outlines activities completed to maintain the flood conveyance capacity and indicates what erosion repairs where implemented to reduce fine grained sediment availability, stabilize channel banks and protect property. The specific of each project are thoroughly described in the SMP Annual Report.

During the fiscal year of 2008-2009 3 key projects were completed by the District. They fall in different classifications, but show the Districts commitment to improved usage of their lands.

Lenihan Dam

1. Completed in Fiscal year 2009.
2. Work on this project lasted several years under the oversight of the California Department of Safety of Dams to upgrade the outlet works for the Lenihan Dam that controls water releases for Lexington Reservoir.

Adobe Creek

1. The Project was completed in fiscal year 2009
2. This creek restoration project was designed to replace some natural functions to the channel as well as improving the flood control capacity of the creek. The design incorporated fluvial geomorphic principles as could best be implemented considering the residential encroachment challenges of the creek corridor.
3. One of several geomorphic features was the addition of a low flow channel to maintain base flow conditions that provide habitat benefits for both riparian and aquatic species.
4. Several areas of the creek and various retaining walls were repaired as they had been damaged or degraded due to years of erosive forces which resulted in undercutting of retaining walls and the development of various problematic scour pools.
5. The planting phase of the project involved the installation of an irrigation system and installation of native vegetation along the mid bank and on the top of the creek banks. All disturbed areas were hydro-seeded with a native seed mix.

Bollinger Bridge Reconstruction

1. This project was completed in fiscal year 2009
2. Bollinger Bridge Reconstruction was a city/street improvement project over the Guadalupe River.
3. Improved Channel Capacity in the vicinity of the overcrossing and provided stream and slope stabilization.
4. Safety on the bridge was improved for both vehicles and pedestrians due to widening of the bridge itself..

Attachment 1.7

Public Information and Outreach

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.7. Public Information and Outreach			
C.7.a. Storm Drain Inlet Marking			
C.7.a.i. Task Description			
C.7.a.i.	At least 90 percent of municipally-maintained storm drain inlets shall be marked with an appropriate stormwater pollution prevention message, such as "No dumping, drains to Bay" or equivalent. All existing stormdrain inlet markings shall be inspected and maintained at least once per 5-year permit cycle, consistent with Provision C.7.a.ii..	Storm drains at all District facilities will be marked with an appropriate stormwater pollution prevention message. All existing storm drain inlet markings shall be inspected and maintained as least once per 5-year permit cycle.	
C.7.a.ii. Implementation Level			
C.7.a.ii.	Inspect and maintain markings of at least 90 percent of municipally maintained inlets to ensure they are legibly labeled with a no dumping message or equivalent once per permit cycle. For the Permittees San Jose and Oakland, 80 percent of inlet markings shall be inspected and maintained.	Ongoing	
C.7.a.iii. Reporting			
C.7.a.iii.	In the October, 2012 Annual Report, report the percentage of municipally maintained inlet markings inspected and maintained as legible with a no dumping message or equivalent once per permit cycle.	Ongoing	
C.7.b. Advertising Campaign			
C.7.b.i. Task Description			
C.7.b.i.	Participate in or contribute to an advertising campaign with the goal of significantly increasing overall awareness of stormwater runoff pollution prevention messages and behavior changes in target audience.	Task to be completed through SCVURPPP and/or BASMAA.	

C.7.b.ii. Implementation Level			
C.7.b.ii.	Advertising campaigns/media buys, which may be coordinated regionally, shall target the two pollutants of concern, trash/litter in waterways and pesticides, with two separate media campaigns to target a broad audience. Permittees shall conduct survey assessments to measure the overall population awareness of the message and behavior change achieved by the two pollutants of concern media campaigns. The two survey assessments shall each consist of a pre-campaign survey, and one post-campaign survey. Surveys may be done regionally.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.b.iii. Reporting			
C.7.b.iii.	Results shall be reported in the Annual Report following completion of each survey.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.c. Media Relations – Use of Free Media			
C.7.c.i. Task Description			
C.7.c.i.	Participate in or contribute to a media relations campaign. Maximize use of free media/media coverage with the objective of significantly increasing overall awareness of stormwater pollution prevention messages and associated behavior change in target audiences, and to achieve public goals.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.b.ii. Implementation Level			
C.7.c.ii.	Conduct a minimum of six pitches (e.g., press releases, public service announcements, and/or other means) per year at the countywide, program, and/or regional level.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.c.iii. Reporting			
C.7.c.iii.	In each Annual Report, include the details of each media pitch, such as the medium, date, and content of the pitch.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.d. Stormwater Point of Contact			

C.7.d.i. Task Description			
C.7.d.i.	Permittees shall individually or collectively create and maintain a point of contact, e.g., phone number or website, to provide the public with information on watershed characteristics and stormwater pollution prevention alternatives.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.d.ii. Implementation Level			
C.7.d.ii.	Maintain and publicize one point of contact.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.d.iii. Reporting			
C.7.d.iii.	Describe in each Annual Report how this point of contact is publicized and maintained.	Task to be completed through SCVURPPP and/or BASMAA.	
C.7.e. Public Outreach Events			
C.7.e.i. Task Description			
C.7.e.i.	Participate in and/or host events such as fairs, shows, workshops, (e.g., community events, street fairs and farmers markets), to reach a broad spectrum of the community with both general and specific stormwater runoff pollution prevention messages.	SCVWD to support SCVURPPP efforts and attend additional events as applicable.	
C.7.e.ii. Implementation Level			
C.7.e.ii.	Each Permittee annually shall participate and/or host the number of events according to its population, as shown in the table below: (detailed in permit)	SCVWD to support SCVURPPP efforts and attend additional events as applicable.	
C.7.e.iii. Reporting			
C.7.e.iii.	Annual Reports shall state the number of events participated in and assess the effectiveness of efforts with appropriate measures (e.g., success at reaching a broad spectrum of the community, number of participants, post-event survey results, quantity/volume materials cleaned up and comparisons to previous efforts).	Ongoing	
C.7.f. Watershed Stewardship Collaborative Efforts			

C.7.f.i. Task Description			
C.7.f.i.	Permittees shall individually or collectively encourage and support watershed stewardship collaborative efforts of community groups such as the Contra Costa Watershed Forum, the Santa Clara Basin Watershed Management Initiative, and "friends of creek" groups. If no such organizations exist, encourage and support development of grassroots watershed groups or engagement of an existing group, such as a neighborhood association, in watershed stewardship activities. Coordinate with existing groups to further stewardship efforts.	SCVWD to continue limited participation in the SCB WMI	
C.7.f.ii. Implementation Level			
C.7.f.ii.	Annually demonstrate effort.	Ongoing	
C.7.f.iii. Reporting			
C.7.f.iii.	In each Annual Report, beginning October, 2009, state the level of effort; describe the support given; state what efforts were undertaken and the results of these efforts. Evaluate the effectiveness of these efforts.	Ongoing	
C.7.g. Citizen Involvement Events			
C.7.g.i. Task Description			
C.7.g.i.	Permittees shall individually or collectively, support citizen involvement events, which provide the opportunity for citizens to directly participate in water quality and aquatic habitat improvement, such as creek/shore clean-ups, adopt-a-creek/ beach programs, volunteer monitoring, service learning activities such as storm drain inlet marking, community riparian restoration activities, community grants, other participation and/or host volunteer activities.	SCVWD Adopt-A-Creek Program will continue at its current level. County-wide cleanup events (2 per year) will be completed through Creek Connections Action Group	
C.7.g.iii. Reporting			
C.7.g.iii.	Permittees shall include in each Annual Report the	Ongoing	

	number of events participated in and an assessment of the effectiveness of efforts with appropriate measures (e.g., success at reaching a broad spectrum of the community, number of participants, post-event survey results, number of creeks/shores/parks/and such adopted, quantity/volume materials cleaned up, data trends, and comparisons to previous efforts)		
C.7.h. School-Age Children Outreach			
C.7.h.i. Task Description			
C.7.h.i.	Permittees shall individually or collectively implement outreach activities designed to change specific behaviors and/or increase awareness in school-age children (K through 12), with the objective of significantly increasing their overall awareness of stormwater and/or watershed message(s) and to cause behavior change(s).	SCVWD will continue the School Outreach Program	
C.7.h.ii. Implementation Level			
C.7.h.ii.	Implement annually and demonstrate effectiveness of efforts through assessment.	Ongoing	
C.7.h.iii. Reporting			
C.7.h.iii.	In each Annual Report, starting October, 2009, state the level of effort, spectrum of children reached, methods, and an evaluation of the effectiveness of these efforts.	Ongoing	
C.7.i. General Outreach Materials			
C.7.i.i. Task Description			
C.7.i.i.	Prepare and use outreach materials, such as printed materials, newsletter/journal articles, videos, other. As needed, develop or acquire and use materials that contribute to an increase in overall awareness of stormwater quality issues. Provide information through a variety of means.	Task to be completed through SCVURPPP	
C.7.i.ii. Implementation Level			
C.7.i.ii.	As needed to support goals	Ongoing	

C.7.i.iii. Reporting			
C.7.i.iii.	Annually report what materials were used, which materials seem to be most effective, and which materials could be modified or discontinued in the upcoming year(s).	Ongoing	
C.7.j. Commercial/Industrial/Illicit Discharge-Related Outreach			
C.7.j.i. Task Description			
C.7.j.i.	Permittees shall conduct, or enhance existing, outreach to at least one of the following or similar categories each year, based on the most prevalent type of activities and discharges within their jurisdiction: • Contracting, concrete work, painting, remodeling/lot finishing activities • Washing activities, such as vehicle and pavement washing • Community car washes (fundraisers) • Dumping (roadside or directly to water body) • Mobile washers (including carpet cleaners, vent hood filter cleaners) • Restaurants • Door Hangers in areas where unidentified illicit discharges have occurred It is acceptable but not required for activities targeting the above areas to be organized on a countywide or regional level.	Task to be completed through SCVURPPP	
C.7.j.ii. Implementation Level			
C.7.j.ii.	Focus on one polluting illicit activity or targeted industrial/commercial activity per year for proactive outreach.	Task to be completed through SCVURPPP	
C.7.j.iii. Reporting			
C.7.j.iii.	In each Annual Report, beginning October, 2009 state the focus area, describe actions taken, and evaluation of	Ongoing	

	effectiveness.		
C.7.k. Outreach to Municipal Officials			
C.7.k.i. Task Description			
C.7.k.i.	Permittees shall conduct outreach to municipal officials. One alternative means of accomplishing this is through the use of the Nonpoint Education for Municipal Officials program (NEMO) to significantly increase overall awareness of storm water and/or watershed message(s) among regional municipal officials.	Task to be completed through SCVURPPP	
C.7.k.ii. Implementation Level			
C.7.k.ii.	At least once per permit cycle, or more often.	Task to be completed through SCVURPPP	
C.7.k.iii. Reporting			
C.7.k.iii.	In the Annual Reports, state the level of effort.	Ongoing	
C.7.l. Research Surveys, Studies, Focus Groups			
C.7.l.i. Task Description			
C.7.l.i.	Permittees shall conduct outreach to municipal officials. One alternative means of accomplishing this is through the use of the Nonpoint Education for Municipal Officials program (NEMO) to significantly increase overall awareness of storm water and/or watershed message(s) among regional municipal officials.	Task to be completed through SCVURPPP	
C.7.l.ii. Implementation Level			
C.7.l.ii.	In conjunction with implementing the advertising campaign required by Provision C.7.l, Permittees shall individually or collectively undertake research to identify and quantify audiences, knowledge, attitudes, practices, and trends (as compared to previous research).	Task to be completed through SCVURPPP	
C.7.l.iii. Reporting			
C.7.l.iii.	In the Annual Reports following the fiscal years the campaigns are implemented, report results and use the	Ongoing	

	results to do the following: • Plan/update outreach strategies; • Evaluate activities; and • Measure behavior change and changes in awareness.		

RESPONSE TO REGIONAL BOARD COMMENTS FROM PREVIOUS YEAR'S ANNUAL REPORT

No comments from the Regional Board were received on this section of last year's annual report.

HIGHLIGHTS AND ACCOMPLISHMENTS

The District serves a community of 1.7 million countywide and has excellent outreach programs to many sectors of the community. Key elements of the District's PIP Program include creek clean up events supporting citizen participation, attendance at community events targeting the general public, numerous workshops presented by the Water Conservation Unit, and the School Outreach Program.

GENERAL OUTREACH

The District attended 19 community events during FY 08-09. A listing of all events is included in this section (C.7.e.i; C.7.e.ii; C.7.e.iii).

The District's website continues to provide regular updates to the community. During the winter season, the District's home page featured a link to flood-related information, the District's efforts to protect the waterways in the event of a flood, and sandbag distribution sites. Our on-line maintenance request form empowers citizens to report dumping or waterway-related problems, and allows them to send messages to the appropriate watershed staff. The site also includes a link to the Santa Clara Valley Urban Runoff Pollution Prevention Program.

The District participates in a point of contact (phone number and website) to provide the public with information on watershed characteristics and stormwater pollution prevention alternatives through the program. Please refer to the Program's Annual Report for details (C.7.d.i; C.7.d.ii; C.7.d.iii).

TARGETED OUTREACH

Workshops

In May 2008, the District's Water Quality, Groundwater Management, Vegetation Management and Water Use Efficiency Units worked together with the Loma Prieta Resource Conservation District, the University of California Cooperative Extension and the United States Department of Agriculture Natural Resource Conservation Service to conduct the seventh annual Stewardship for Small Acreages – A Series of Workshops on Land Management for Clean Water. The goal was to provide rural landowners with the resources needed to protect both surface and ground water quality on and off their property. The series took rural landowners through the steps of assessing their properties and developing action plans to address the highest priority items. The workshops were held at various small acreage homes. The four sessions included: general topics such as watersheds and conservation plans, groundwater quality, wells, septic systems and hazardous household products; Manure/Waste Management and Composting; Small Vineyards; and Fire Safety, Landscaping and Erosion Control. A total of 208 people attended the 4 sessions.

In March 2009, the Water Use Efficiency Unit conducted a four-part Water Efficient Landscaping Workshop Series. A total of 208 people attended the four sessions: Designing and Selecting Plants for a Water-Wise Garden, Gardening with Natives, Water Efficient Irrigation Design, and Water Efficient and Sustainable Landscaping Techniques. Several Units came together to present two sessions of CreekWise Workshop for creekside owners on March 1 and March 15. The workshops included watershed education, water conservation, urban runoff and pollution prevention, invasive species, pest management and erosion control and being a good creek neighbor. A total of 59 people attended the two sessions.

Media Campaign

The District carried active media outreach during the winter of 2008-09. The District took advantage of the winter storms to inform and educate the public about the importance of keeping our creeks clean.

In addition to the District's own campaign, for the third year, we are participating in a regional water conservation campaign, funded by a state grant and led by San Francisco Public Utilities Commission and Bay Area Water Supply and Conservation Agency. The primary message of this regional campaign is that California is in a drought and everyone can take easy steps to save water now. The campaign includes a regional website that directs users to services and programs in their own service area.

The District participates in a countywide advertising campaign through the program. Please refer to the Program's Annual Report for details (C.7.b.i; C.7.b.ii; C.7.b.iii).

The District participates in a Bay Area-wide Media Relations campaign through BASMAA via the program. Please refer to the Program's Annual Report for details (C.7.c.i; C.7.c.ii; C.7.c.iii).

Other Targeted Outreach

Flood Safety Notice 2008 was mailed in November 2008 to 104,000 flood plain residents. Although the mailer's main focus is flood preparedness and safety, it also contained articles on healthy creek ecosystems, keeping debris out of creeks and illegal dumping. A copy is included in this section.

In January 2009, the District mailed out more than 700,000 copies of Valley Water News, a Countywide newsletter, to residents and businesses in Santa Clara County. The newsletter included information emphasizing the need to keep our streams free of trash and chemicals. It also provided the 24-hour pollution prevention number to report illegal dumping.

AquaFacts, the District's employee newsletter, continued this year as an online publication. AquaFacts contained 10 articles relating to stormwater pollution prevention and watershed education during FY 08-09. Topics included Got Bugs?-Be careful what you spray, Bike-to-Work Day, Algae harvesting at Los Capitancillos Groundwater Recharge Ponds, District fleet observes Clean Air Month, Two-wheeled inspections of levees and creek trails, and two creek cleanup events. The employee newsletter is an excellent and cost-effective method for delivering urban runoff, pollution prevention, and watershed messages to District employees. In addition to AquaFacts, several articles were included in the District's daily "New You Can Use" emails.

An all employee Pollution Prevention Week email campaign was conducted September 22 through 28, 2008. Five emails were sent providing pollution prevention tips. Topics included: general pollution prevention week information, fighting pollution on the road, proper pesticide use and disposal, proper disposal of fluorescent bulbs, batteries and cell phones and protecting your Watershed. Numerous requests for brochures were received from the employees, as well as many comments on the campaign. This continues to be a good method to present pollution prevention ideas to District employees.

Neighborhood work notices are posted on the District's web site for all stream maintenance and capital projects. Most notices include watershed information.

EDUCATIONAL OUTREACH

The District's educational outreach program serves a diverse population and responds to the needs of the schools throughout the County. Programming is consistent with State standards and regularly integrates messages and issues of other District communication programs. The District's School Outreach Program visited 109 public and private schools reaching 13,932 students and 1,019 educators and Staff conducted 3 Project Wet teacher workshops, presented sessions at 4 conferences and conducted 2 teacher in-service days during FY 08-09. The District offers a comprehensive education outreach program for early childhood, elementary, middle school, high school, and college-aged students to establish a foundation for understanding and appreciation of water resources. The program provides age-appropriate classroom presentations, teacher in-service training in water education, and tours in order to help children understand and appreciate their local water resources. Classroom presentations include hands-on experiments, information on watersheds, urban run-off, pollution prevention, flood plains, conservation tips, water awareness activities, flood management, and careers in the water industry. Scheduling is conducted on a first-come, first-served basis and provided free to schools in Santa Clara County. Number of students by watershed, city, grade, focus of presentation, and school district are included with this section. AquaDrops eNews, an electronic teacher's newsletter was sent out in September 2008 and January 2009 (C.7.h.i; C.7.h.ii; C.7.h.iii).

The Coyote Creek Outdoor classroom encompasses land alongside Coyote Creek and includes a covered gazebo classroom for students and teachers, as well as a platform overlooking the creek where students can study the stream's natural habitat. Groundwater monitoring wells on site enable students to observe and evaluate the underground water table and understand how surface and groundwater interact. The site features two planting areas – one site close to the creek planted with native trees and shrubs to improve the stream's wildlife habitat, and a "high terrace" or upland area landscaped with oaks, grasses and other

native plants to demonstrate drought-tolerant gardens. During the 2008-09 school year, the program did not use the Coyote Creek Outdoor classroom.

Morley Park Outdoor Classroom in the City of Campbell provides the opportunity to teach students about the purpose of wetlands, urban runoff and the value of percolation ponds. During the 2008-09 school year, the program provided tours for 20 classes, 639 students and 20 teachers.

Mapping History of the Santa Clara Valley demonstrates growth and change in our valley over the past 5,000 years and into the future. Participants listen to period music, share scripts that describe six time periods, and then place appropriate symbols of change on a 12' x 12' map of Santa Clara County. The activity begins with the Native American period, 3200 BC to 1750 AD, adding wildlife, vegetation and one figure to represent the 10,000 Native Americans in the entire Bay Area. By 2050, participants have added farm animals, orchards, railroads, cities, reservoirs, water and wastewater treatment plants, hi-tech businesses and 260 figures to represent a projected population of 2,624,670. The Mapping History program was presented to22 classes, reaching 1,115 students and 19 teachers.

CITIZEN PARTICIPATION

The District established the Adopt-A-Creek Program in 1994 to encourage residents of Santa Clara County to take an active role in helping to preserve the health and beauty of our local creeks. Staff was transferred to the Program in October 2008 and the Adopt-A-Creek Program is slowly getting back up to previous level of service. In FY08-09, 10 new permits and 4 renewal permits were issued and 48 creek cleanup events were conducted. A list of cleanup events is included in this section (C.7.g.i; C.7.g.ii; C.7.g.iii).

The District participated in two countywide creek cleanup events: Coastal Cleanup Day on September 20, 2008 and the National River Cleanup Day on May 16, 2009. During Coastal Cleanup Day, 1,331 volunteers collected 95,656 pounds of trash and 16,327 pounds of recyclables at 26 sites. On National River Cleanup Day, 967 volunteers collected 27,935 pounds of trash and 22,633 pounds of recyclables (which included ½ of an automobile) at 30 sites (C.7.g.i; C.7.g.ii; C.7.g.iii).

PROGRAM EVALUATION

The District uses numerous methods to conduct outreach, including written brochures, radio, newspaper, website, theater slides, bus back ads, community events and workshops. The wide variety of methods increases the probability that the messages are being received and understood. Combining all these different methods is very effective at meeting our public education goals. The variety of methods also ensures that many segments of the Santa Clara Valley population are being reached, including residents, businesses, students, as well as people from other locations. The District evaluates the different outreach methods and continuously seeks to improve messages and outreach methods. We work collaboratively with many other agencies and organizations to conduct outreach and will continue these partnerships in the future.

GENERAL OUTREACH

The District feels that attendance at community events is an effective public outreach method. The individual contact made at the events allows staff to answer specific questions and deliver more extensive messages. A wide variety of information can be distributed and the games and displays are a good way to attract event participants.

TARGETED OUTREACH

The District's targeted outreach efforts provide in-depth training and information to a small, targeted audience with the opportunity to answer specific questions from individuals in the group. This method allows the District to assist targeted groups to meet regulatory requirements, change behaviors that impact water quality, and provide the knowledge needed for the group to solve any water quality problems they may be experiencing. The District plans to continue this outreach method as we feel it is a valuable service to these targeted audiences and can positively impact water resources.

EDUCATIONAL OUTREACH

Teacher surveys were distributed again this year. Of the returned surveys, 98% of the teachers rated the program "helpful" to "extremely helpful" and would recommend the program to others. The District feels that the educational outreach program is a cost-effective method for educating children, teachers, and indirectly, parents. Based on the teacher's surveys, minor adjustments will be made to the program.

CITIZEN PARTICIPATION

The Adopt-A-Creek program and the creek cleanup events are very effective at creating and increasing stewardship and individual responsibility for the county's water resources.

Santa Clara Valley Water District
2008-09 PIP Activities/Community Events

PI/P Activity[1]	Type of Outreach [2]	Level of Implementation (Description/Dates)	Evaluation of Effectiveness [3]
National Night Out Emma Prusch Farm Park	General	8/5/08	1,000 people stopped by our booth. Promoted Water-Wise House Call Program, distributed water conservation and general District information.
Olinder Elementary School	General	8/22/08	400 attendees. Distributed information on water conservation, water supply and water pollution prevention.
26th Annual South Bay Home and Garden Show	General	9/5-7/08	2,000 attendees. Distributed urban runoff, water conservation, and general District information.
Children's Fun Fest Berryessa Flea Market	General	9/6-7/08	1,000 attendees. Performed 2 water magic shows and staffed 2 booths. Distributed information on water conservation, water supply and water pollution prevention.
Pioneer High School	General	9/17/08	500 attendees. Presented Mapping History of the Santa Clara Valley. Distributed information on water conservation, water supply and water pollution prevention.
Lockheed/Martin Environmental Fair "Go Green' Green Your Life"	General	9/24/08	200 attendees. Promoted Water-Wise House Call Program, distributed water conservation and general District information.
West Coast Green 2008	General	9/25-27/08	400 people stopped by our booth. Promoted Water-Wise House Call Program, distributed water conservation and general District information.
23rd Annual YSI Wildlife Festival	General	10/5/08	200 attendees. Staffed a booth with the urban runoff diorama and performed one water magic show. Distributed urban runoff and general District information.

PI/P Activity[1]	Type of Outreach [2]	Level of Implementation (Description/Dates)	Evaluation of Effectiveness [3]
EcoFair 2008 Muslim Green Team	General	10/12/08	200 attendees. Promoted Water-Wise House Call Program, distributed water conservation and general District information.
Let's Go Green Event at the Tech Museum of Innovation	General	10/18/08	225 attendees. Promoted Water-Wise House Call Program, distributed water conservation and general District information.
St. Martin's School – Sunnyvale	General	2/23/09	100 attendees. Staffed a booth with the urban runoff diorama. Distributed urban runoff and general District information.
Fifteenth Annual Spring Garden Market Master Gardeners of Santa Clara County	General	4/4/09	250 attendees. Distributed urban runoff, water conservation, and general District information.
Earth Day 2009 - XenoPort	General	4/22/09	200 attendees. Distributed urban runoff, water conservation, and general District information.
Nvidia Earth Day Event	General	4/22/09	200 attendees. Distributed urban runoff, water conservation, and general District information.
Roche Sustainability Fair	General	4/23/09	200 attendees. Distributed urban runoff, water conservation, and general District information.
Earth Day at Hewlett Packard	General	4/23/09	100 attendees. Distributed urban runoff, water conservation, and general District information.
Creekwise Workshop	Targeted (Creekside Residents)	3/1/09	32 attendees. Topics included: watershed education, water conservation, urban runoff and pollution prevention, invasive species, pest management and erosion control and being a good creek neighbor.
Water Efficient Landscaping Workshop Series: Water Efficient Irrigation Design	Targeted	3/7/09	52 attendees. Distributed urban runoff, water conservation, and general District information.

Santa Clara Valley Water District
2008-09 PIP Activities/Community Events

PI/P Activity[1]	Type of Outreach [2]	Level of Implementation (Description/Dates)	Evaluation of Effectiveness [3]
Water Efficient Landscaping Workshop Series: Gardening with Natives	Targeted	3/14/09	55 attendees. Distributed urban runoff, water conservation, and general District information.
Creekwise Workshop	Targeted (Creekside Residents)	3/14/09	27 attendees. Topics included: watershed education, water conservation, urban runoff and pollution prevention, invasive species, pest management and erosion control and being a good creek neighbor.
Expanding Your Horizons	Targeted (7-9th Grade Students)	3/14/09	60 attendees. Presented Mapping History of the Santa Clara Valley. Distributed urban runoff, water conservation, and general District information.
Water Efficient Landscaping Workshop Series: Water Efficient & Sustainable Landscaping Techniques	Targeted	3/21/09	52 attendees. Distributed urban runoff, water conservation, and general District information.
Saratoga High School	Targeted (9-12th Grade Students)	3/25/09	200 attendees. Distributed urban runoff, water conservation, and general District information.
Water Efficient Landscaping Workshop Series: Designing and Selecting Plants for a Water-Wise Garden	Targeted	3/28/09	49 attendees. Distributed urban runoff, water conservation, and general District information.
Stewardship for Small Acreages Workshop: General Session	Targeted (Rural landowners)	4/29/09 Workshop in coordination with Loma Prieta RCD, UC-Cooperative Extension, and USDA-NRCS. Provided rural landowners with the resources needed to assess their properties and plan and implement improvements, if needed, to protect both surface and ground water quality on and off their property.	51 attendees. Topics covered included watersheds and conservation plans, groundwater quality and well maintenance, septic system maintenance and household hazardous waste disposal and alternatives. Distributed literature on well construction, use and maintenance, septic system design and maintenance, household hazardous waste alternatives and disposal locations, individual parcel maps with water and elevation features for conservation planning.

2008-09 PIP Activities/Community Events

PI/P Activity[1]	Type of Outreach [2]	Level of Implementation (Description/Dates)	Evaluation of Effectiveness [3]
Stewardship for Small Acreages Workshop: Small Vineyard	Targeted (Rural landowners)	5/6/09 Workshop in coordination with Loma Prieta RCD, UC-Cooperative Extension, and USDA-NRCS. Provided rural landowners with the resources needed to assess their properties and plan and implement improvements, if needed, to protect both surface and ground water quality on and off their property.	42 attendees. Topics covered included conservation for the small vineyard, fertilizer and irrigation management, water quality protection, organic methods, and integrated pest management. Distributed literature on beneficial insects, less-toxic pest control, and composting.
Stewardship for Small Acreages Workshop: Fire Safety, Landscaping & Erosion Control	Targeted (Rural landowners)	5/13/09 Workshop in coordination with Loma Prieta RCD, UC-Cooperative Extension, and USDA-NRCS. Provided rural landowners with the resources needed to assess their properties and plan and implement improvements, if needed, to protect both surface and ground water quality on and off their property.	19 attendees. Topics covered included fire fuel load management, fire safe home site, native plant identification and uses in landscape, noxious weed identification and management, irrigation management and sudden oak death syndrome. Distributed literature on landscaping to reduce fire hazard, fire safety, noxious weeds, drainage and erosion control.
IFMA (Facility Managers) Meeting	Targeted (Facility Managers)	5/20/09	25 attendees. Distributed urban runoff, water conservation, and general District information.
Stewardship for Small Acreages Workshop: Manure Management, Composting, Pastures, Pens & Paddocks, and Livestock Health	Targeted (Rural landowners)	5/27/09 Workshop in coordination with Loma Prieta RCD, UC-Cooperative Extension, and USDA-NRCS. Provided rural landowners with the resources needed to assess their properties and plan and implement improvements, if needed, to protect both surface and ground water quality on and off their property.	37 attendees. Topics covered included manure, pest and pasture management, erosion control, animal health husbandry, landfills and waste recycling, portable garden, and conservation plan implementation. Distributed literature on manure management, composting, pasture management, and animal care.
23rd Annual California Coastal Cleanup Day	Citizen Participation	9/20/08	26 sites throughout Santa Clara County, 1,331 volunteers, 95,656 pounds of trash and 16,327 pounds of recyclables collected.

Water Efficient Landscaping Workshop Series

Learn how to beautify your garden and use water more efficiently in these four Saturday workshops. With landscape and irrigation experts as our guides, we'll discuss water-wise landscape design, gardening with California natives, water-efficient irrigation design, and selecting plants for a water-wise garden.

Saturday
March 7, 2009
9 a.m. to noon

Water Efficient Irrigation Design

Miguel Aspeitia, Irrigation Consultant, will demonstrate how to efficiently design/retrofit your landscape irrigation system using drip, micro and spray heads.

Saturday
March 14, 2009
9 a.m. to noon

Gardening with Natives

Landscape Architect Stephanie Morris will discuss the exciting topic of how to garden with native plants. Learn how to select native plants that do well in a garden setting. Planting techniques and irrigation strategies for the native plant garden will also be covered.

Saturday
March 21, 2009
9 a.m. to noon

Water Efficient & Sustainable Landscaping Techniques

Local landscape architect Stephanie Morris will discuss the many ways to 'green' your landscape, working with the garden's natural cycles for sustainability. Learn how to enjoy a beautiful yard that is water conserving, low-maintenance, and innovative.

Saturday
March 28, 2009
9 a.m. to noon

Designing & Selecting Plants for a Water-Wise Garden

Alrie Middlebrook will focus on Mediterranean, drought-tolerant, and native plants that can bring out sustainable beauty in the garden. Ms. Middlebrook is an expert with California native plants, but in this workshop she will share her full library of knowledge about water-wise plants for California.

For more information, visit us at **valleywater.org.**

Workshops will be held at:
Santa Clara Valley Water District
Headquarters boardroom
5700 Almaden Expressway
San Jose, CA 95118

045413

Santa Clara Valley Water District

CreekWise Workshop

FREE!

2nd Annual

Information

Learn how to protect your watershed, conserve water on your property, minimize urban runoff pollution and be a good neighbor to the creek adjacent to your property in just one three-hour session on either date below.

Date: Saturday, March 7, 2009 or Saturday, March 21, 2009

Time: 1 p.m. to 4 p.m.

Location: Santa Clara Valley Water District Headquarters boardroom
5750 Almaden Expressway
San Jose, CA 95118

Cost: Workshops are **free!** To reserve a space, call (408) 265-2607, ext. 2739. Call today as class size is limited!

Topics will include:

Watersheds: Kathy Machado, Education Outreach Coordinator, will define watershed and show how your landscape fits into the larger scheme of things.

Conservation: Karen Morvay, Water Conservation Specialist, will share best practices to conserve water in your home and garden.

Urban Runoff: Kate Slama, Water Quality Specialist, will define urban runoff and show what happens at home affects the creek. Her presentation will include home and auto runoff, pet waste and proper disposal of trash and household hazardous waste.

Gardening: Judy Ingols, Revegetation Supervisor, will discuss invasive species, pest management, drought-tolerant gardening, erosion control and irrigation.

Being a good creek neighbor: Denise Uriarte, Program Administrator, will conclude the workshop with ways to be a good neighbor to your local creek. Her content will include an overview of the creek ordinance for Santa Clara County, home improvements, what is and isn't allowed, permits, decks and fences, private access to public easement and how to protect the health and safety of the banks in your creek.

Santa Clara Valley Water District

Help clean up the environment on Coastal Cleanup Day!

By Employee Communications on September 18th, 2008

On Sept. 20, you can help clean up the environment for Coastal Cleanup Day. Check out the district press release for more information:

Volunteers Needed for Coastal Cleanup Day

SANTA CLARA COUNTY – California Coastal Cleanup Day is the nation's premier marine environment volunteer event and has been hailed by the Guinness Book of World Records as "the largest garbage collection" (1993).

Each year, the Santa Clara Valley Water District (Valley Water) joins the Creek Connections Action Group, which includes Santa Clara County Parks and Recreation and the City of San José, to host a Coastal Cleanup Day. Join us this year in our effort to remove trash, debris and recyclables that have collected and polluted local county waterways.

"Many people don't realize that improperly disposing of garbage can have a serious negative effect on our environment. When it rains, this waste ends up in the gutter, which drains into the nearest waterway and eventually into the bay," Valley Water Board Chair Rosemary Kamei said.

Since the program started in 1985, more than 800,000 Californians have removed more than 12 million pounds of debris from our state's shorelines and coast. Debris, such as:

- 1,102,042 bottle caps
- 5,066,669 cigarette butts
- 1,197,332 food wrappers

Just last year, 60,000 volunteers collected more than 900,000 pounds of trash and recyclables from beaches, lakes and creeks across California. In Santa Clara County alone, 865 volunteers joined together to collect more than 31,000 pounds of trash and over 12,000 pounds of recyclables. This year, organizers are hoping for even better results.

Individuals, clubs and classes are welcome to volunteer, as well as those looking to fulfill community service requirements. All youth under the age of 18 must have a parent/guardian signature on their Waiver of Liability and will also need adult supervision for the entire event.

This year's event details are as follows:

Date: Sept. 20, 2008

Time: 9 a.m. until noon

Where: 26 specified cleanup locations (visit www.cleanacreek.org for locations)

Volunteers are encouraged to wear long pants, sturdy shoes, gloves and sunscreen and to bring their own pick-up sticks. Trash bags, extra gloves, first-aid supplies, water and refreshments will be provided at no cost.

A volunteer appreciation party, hosted by Whole Foods, will be held at Vasona Park in Los Gatos, from

noon to 2 p.m. For more volunteer information, Waiver of Liability forms and specific cleanup locations, please visit www.cleanacreek.org.

Coastal Cleanup Day targets area's dirtiest waterways

By Tony Mercado on September 23rd, 2008

Eager to remove three county creeks off the list of the trashiest waterways of the San Francisco Bay, volunteers turned out en masse at this weekend's Coastal Cleanup Day to spruce things up a bit.

All of which spelled good news for Coyote and Saratoga creeks and the Guadalupe River, which had the dubious distinction of landing #'s 2, 3 and 5, respectively, on the list.

"Getting on that list actually made people more aware that it's a problem," said Public Information Representative III Kathy Machado, who coordinated the event with Water Quality Specialist II Kate Slama. "I don't think people like having trashy creeks, and I think the cleanup helped."

Want proof?

Forty-two volunteers cleaned up a 1.5 mile stretch of Coyote, removing 3,000 pounds of trash, including five shopping carts and 30 pounds of recyclables. The Guadalupe's 65 volunteers cleaned 1 mile and removed 2,300 pounds of trash, including a bowling ball, couch and four shopping carts.

Statewide, volunteers covered more than 750 sites and gathered hundreds of tons of trash. Beach, inland waterway and community cleanups took place up and down the California coast, from the Mexican and Oregon borders, around San Francisco Bay and at sites as far inland as Lake Tahoe and the Salton Sea.

Each year, Valley Water joins the Creek Connections Action Group, which includes Santa Clara County Parks and Recreation and the City of San José, to host a Coastal Cleanup Day.

"Our cooperation this year is unprecedented, and we're seeing the results in the statewide turnout," said Eben Schwartz, Coastal Cleanup Day Director for the California Coastal Commission. "The Cleanup is really run by the hundreds of volunteers, non-profit groups and local government agencies that make up the heart and soul of the effort."

Two-wheeled inspections a "green" solution

By Tony Mercado on October 6th, 2008

Field Operations Administrator Dale Honda used to drive the oldest car in the fleet when doing levee and creek trail inspections, and boy, did he hate it.

Never mind how much space it takes on the levees or how it kicks up dust on people using the trails. There's also the time it takes to walk as many as three miles to get from one point to another.

"It takes us forever," he said.

There had to be a better way, right?

Enter the Equipment Management Unit's very own two-wheeled answer, expanded last month from two to four.

"It's a lot more convenient and we cover a lot of ground on these," said Engineering Technician I Patrick Fung, who's glad he won't have to lug around inspection sheets, water bottles, snacks and phones by hand anymore. "You can just get off and get on the trail, go to where we need to go and come back."

Art Taylor, manager of the Equipment Management Unit, also loves the bike as they promote a green message of saving gas and reducing the carbon footprint.

"Compared to a truck, the maintenance is nothing," he said.

The unit has four bikes available for business use available to employees. Add to that a fleet of six hybrid vehicles and a recent order to add 15 Ford Escape hybrids and you may have one of the organization's "greenest" units.

"We're trying," he said. "And employees can use the same process as checking out a motor pool vehicle. We're ready to serve our customers."

Using the bikes is also turning into a good marketing tool for the district.

Passers by on the trails notice the bright blue Valley Water placard as it whizzes by. Some stop Honda and ask about the kinds of things the district does and compliment them on using eco-friendly modes of transport.

"It all works out really well. We're outside, getting exercise and getting our job done. It doesn't get any better than this," Honda said.

Got bugs? Be careful what you spray!

By Employee Communications on June 22nd, 2009

By Kate Slama, Customer Relations Unit

The district's approved Pesticide Policy defines pesticide use at district facilities. The purpose of the policy is to control pests while protecting employee health and the environment from chemicals.

We need to remind not only the official district employees who apply pesticides at district facilities, but those of us who wish to apply "lethal doses of life-ending bug stuff" on those pests we might encounter, that we are **all** required to adhere to the following as stated in the Pesticide Policy:

- Aerosol pesticides shall only be purchased or used by district staff licensed by the state in the appropriate categories for product application.
- A state-certified Qualified Applicator with the appropriate endorsements shall provide immediate oversight for application of all pesticides. (Certified staff must be on site at all times herbicides are applied.)

Keeping food, beverages, plants, and flowers out of buildings, cubicles, and conference rooms will greatly lower your chances of having a pest problem. If you do have a problem, please contact the **Facilities Help Desk** at ext. 3020 for tips in helping control the problem. Facilities staff use Orange Spray to control ants. Orange Spray can be used with no ill effects to employees, except for the strong orange smell.

For more information on minimizing pesticide use in your garden and at home, contact **Kate Slama**, Customer Relations Unit, ext. 2739, or visit MyWatershedWatch.org and check out the "Got Bugs?" section.

For **FREE** disposal of unwanted pesticides, contact the Santa Clara County Household Hazardous Waste Program at (408) 299-7300.

MAINTAINING QUALITY SERVICE DURING ECONOMIC DOWNTURN—A message from Olga Martin Steele, CEO, Valley Water

The current economic downturn is impacting all of us in Silicon Valley with some of the most demanding and difficult circumstances in decades.

For Valley Water, our biggest test is maintaining excellent service levels in the face of rising costs, regulatory and water supply challenges, and a volatile economic climate, while trying to keep water charge increases to a minimum.

Like other public utilities, our fiscal challenges are further heightened by the pressing need to invest in protecting and maintaining Valley Water's aging infrastructure. Vital assets such as water pipelines, dams, treatment plants and levees are critical to public safety and reliable water service. Much of this infrastructure is decades old and needs to be rehabilitated or replaced sooner rather than later.

When I returned to Valley Water as CEO last January, my top priority was to increase efficiencies by making the best use of our limited resources. We began with constraining costs and reassessing the best way to carry out our business more effectively.

This year's rigorous budget process led to the Board of Directors eliminating 28 positions and significantly reducing overtime allowances. These cuts, along with the numerous operational changes I initiated, resulted in savings of nearly $11 million.

While tightening our belt, we continued to make great strides during the year, as exemplified by completing a new state-of-the-art water quality lab, breaking ground on a $256 million flood protection project to protect 7,500 homes and businesses along the Guadalupe River, opening new trails and restoring a nine-acre wetland south of Gilroy.

At Valley Water, we believe in a culture of continuous improvement. To this end, we earned agency wide ISO 9001:2000 and ISO 14001:2004 certifications this year, reflecting the highest standards of management excellence and confirming our status as a world-class organization.

We also work hard to provide and ensure a work environment where all employees, customers, suppliers and community partners feel welcome, valued and respected. We believe that workforce diversity and inclusion is essential to our long-term success.

You can be assured that Valley Water will continue to be a responsible fiscal and environmental steward as we carry out our mission into the future. For more information, contact Communications Manager Susan Siravo at 408.265.2607, ext. 2290, or e-mail ssiravo@valleywater.org.

GIVING NATURE A KICK-START

Pajaro Basin Freshwater Wetland

Thousands of acres of wetlands used to blanket the valley in the southern part of our county, but most are no longer present today. The Pajaro Basin Freshwater Wetland project, south of Gilroy, is an opportunity to bring back some of this valuable habitat.

Valley Water constructed and restored the nine-acre seasonal wetland west of Uvas-Carnadero Creek. The $4.7 million project improved the already favorable natural features of the site by re-contouring the land, increasing natural water availability and planting a variety of native wetland vegetation. The new wetland integrates with the surrounding streams and willow forests, expanding the habitat for a wide variety of wildlife including waterfowl, songbirds and amphibians.

The project site and adjacent area had historically been wetlands, and the water source was still present. Seasonally high groundwater, present near the surface of the field in the winter and spring seasons, is the water source for the wetland.

Now more than 30,000 new plants are thriving as part of this project. The plants were propagated from suitable native plant seeds collected from nearby wetlands.

045421

SOLVING THE STATE'S WATER WOES

Back in March 2008, headlines here and throughout California touted better than average rain and snowfall. Then it stopped. Today, California is in a drought after two of the overall driest years in history, back-to-back.

San Luis Reservoir, the world's largest off-stream reservoir and storage for normally about 25 percent of the district's water supplies, sat close to empty for months this summer, holding only a meager 10 percent of its capacity.

The state's water woes have been compounded by a 2007 court ruling requiring severe restrictions on pumping water from the Sacramento-San Joaquin Delta, which delivers about one-third of the Bay Area's annual water supplies and nearly half of ours in Santa Clara County. One result of this court action to help protect the endangered Delta smelt fish, was the loss to the state of enough water to serve all of Santa Clara County for more than a year and a half.

Diversified portfolio and infrastructure for reliability

Despite these difficult challenges, in Santa Clara County we have endured the reduction because of Valley Water's ongoing investments in our water system infrastructure and a diverse portfolio of water sources.

Our groundwater basins remain healthy. We replenish the groundwater basins with imported and local water through a network of percolation ponds. However, like a savings account that has seen decreased deposits and increased withdrawals, groundwater levels have dropped as a result of the two successive dry years and reductions in our imported and local water supplies.

Local water supplies alone are insufficient to meet the county's water demand. That is why resolving environmental and water management problems in the Delta is so critical to protecting our quality of life.

Conservation is key

In 2007, concerned about the prospects for natural drought conditions, combined with the court-imposed "regulatory drought," Valley Water urged the community to reduce water use by 10 percent. However by late 2008, we have only seen water savings of seven percent.

The water levels in San Luis Reservoir dropped so low in August that the lighter-colored area [illegible] water in Santa Clara County not left completely dry.

Even if it's a "normal" water year this year, the situation may not improve much because of the difficulties in the Delta. Consequently, requiring mandatory conservation is a very real possibility in 2009. Remember, when it comes to saving water, there is no time to waste.

KEEPING CREEKS FREE FROM TRASH

Creeks are natural drainage systems, carrying stormwater away from homes and businesses, and they are valuable natural resources that support wildlife and ecosystems. It is important that creeks are kept free of trash. While most people know that trash and chemicals should not go into a creek, many don't know that leaves and soil also pollute and obstruct flow, and may result in flooding. Soil is a problem because many pollutants bond to it and take a ride to pollute our rivers and bay.

It is illegal to dump anything into a creek or storm drain. Storm drains in your street flow directly to local creeks. To report illegal dumping in creeks, call Valley Water Pollution Prevention Hotline (24 hours) at 1.888.510.5151.

045422

save 10 percent water

SAVING WATER IS EASY

Valley Water has called on all residents and businesses for a 10 percent voluntary reduction in water use. It can start by simply turning off the faucet while brushing your teeth or using a broom instead of a garden hose to clean the driveway. Here are a few water-saving tips:

FOR RESIDENTS:

In the Kitchen

- *Fix the leaky faucet. This simple, inexpensive repair can save 15+ gallons per day per leak.*
- *Install a kitchen faucet aerator in your sink and save gallons of water every day.*
- *Only run your dishwasher with full loads; save 15-20 gallons per load.*
- *When washing dishes by hand, don't let the water run while rinsing. Fill one sink with wash water and the other with rinse water.*

In the Bathroom

- *Install a low-flow showerhead and faucet aerators and save 16 gallons per day per householdValley Water provides them for free upon request.*
- *Fix a leaky toilet. Add food coloring or dye tablets in your toilet tank. If the color shows in the bowl without flushing, you have a leak.*
- *Install a high-efficiency toilet and save 25 gallons per day per toilet.*
- *You can potentially save hundreds of gallons a month by timing your showers to be under five minutes at a time.*

Outdoors

- *Water in the early morning. You can save 20-25 gallons per day.*
- *Adjust your sprinklers so only your lawn is being watered. Check your sprinkler heads, valves and drip emitters once a month and save 15-25 gallons per day.*
- *Apply a layer of organic mulch around plants to reduce moisture loss and keep weeds down and save 20-30 gallons per day.*
- *Try planting a water-wise garden. Select plants that are appropriate for the site and create a landscape that can be maintained with little supplemental watering.*

SAVE WATER AND MONEY WITH VALLEY WATER PROGRAMS

Valley Water offers a number of rebates and services that will help you reduce water use.

FREE **Water-Wise House Call Program** – A trained technician will visit your home or apartment complex and survey sprinklers, toilets etc. to show where water savings can be made. To schedule an appointment, visit us at www.valleywater.org or call **1.800.548.1882.** Customers of San Jose Water Company: Call (408) 279-7900 to schedule an appointment.

Rebates of $100 to $1,000 for water-efficient equipment – These include high-efficiency toilets (up to $125), clothes washers ($125-$200), water softeners ($150), water-efficient landscape materials (up to $1,000) and efficient irrigation equipment (up to $1,000). Some restrictions apply.

In the Laundry Room

- *When shopping for a new washing machine, consider a high-efficiency model and receive a rebate.*
- *Wash clothes only when you have a full load; save 15-20 gallons per load.*

FOR BUSINESSES:

From $400 to $50,000 in rebates for water-efficient equipment – These include high-efficiency clothes washers ($400), cooling tower conductivity controllers ($900), weather-based irrigation controllers (up to $1,100), efficient irrigation equipment (up to $4,000), water-efficient landscape materials (up to $10,000) and various process and equipment upgrades (up to $50,000). Some restrictions apply.

High-Efficiency Toilet Installation Program – Includes FREE new toilets and installation for apartments and businesses throughout the county.

Water-Use Survey – A FREE onsite survey and recommendations on how to increase your facility's water efficiency.

Irrigation Technical Assistance Program – FREE site evaluations to assist property owners to better manage their landscape water use.

For more information call our conservation hotline at 408.265.2607, ext. 2554, or visit www.valleywater.org and use our online Access Valley Water customer service system.

Save water and money. Schedule a Water-Wise House Call

045424

Chynoweth Avenue Hill flooding from Valley Water Pagan Creek in January 2008

DO YOU NEED FLOOD INSURANCE?

Federal law requires flood insurance if you have a federally backed mortgage and your building is in an area shown on maps prepared by the Federal Emergency Management Agency (FEMA) as subject to flooding during a 100-year flood event, which has one percent chance of occurring in a year.

While lenders are legally responsible for determining if a flood insurance policy is required for a loan, your city provides assistance in reading and interpreting the FEMA Flood Insurance Rate Map. This assistance includes information on whether a property is in the 100-year floodplain, which zone, and elevation certificates, if available. Your city can also provide information about flood insurance purchase requirements. If you need a city contact number, call Valley Water at 408.265.2607, ext. 2650, or visit our website www.valleywater.org and use our Access Valley Water customer service system.

Boat inspection at Calero Reservoir

PROTECTING WATER SUPPLY, WHILE SUPPORTING RECREATION

To protect the drinking water supply of nearly two million people in Santa Clara County, Valley Water and Santa Clara County have instituted a boat inspection program to help prevent invasive zebra and quagga mussels from getting into local reservoirs.

Although the reservoirs were built for water supply purposes, Valley Water supports and allows these facilities to be used for limited recreational activities. Anderson, Calero, Coyote and Stevens Creek reservoirs continue to be open for boating.

The $560,000 jointly funded pilot inspection program was implemented in May this year, following the discovery of zebra mussels in San Justo Reservoir in neighboring San Benito County. The invasive mussels can be easily transported between reservoirs by recreational boats.

The spread of zebra and quagga mussels has created enormous problems for aquatic ecosystems and water utilities in other parts of the country and the state.

ARE YOU ELIGIBLE FOR TAX BREAK FOR SENIORS?

Valley Water offers qualifying low-income seniors an exemption from the Clean, Safe Creeks and Natural Flood Protection Plan Property Tax approved by county voters in 2000.

The exemption is available to Santa Clara County residents who meet these requirements:

- Own and occupy their single-family home, condominium or townhome, (mobile homes on rented spaces in parks are not eligible)
- 65 years of age or older by June 30, 2008
- Total household income of $42,484 or less for 2007

Seniors must apply for the exemption by filling out an application. The application is retro-active and seniors can claim exemption since 2001. To obtain an application or get more information, call 408.265.2607, ext. 2810, or send an e-mail to JulieWilson@valleywater.org.

PARTNERSHIP TO IMPROVE FLOOD PROTECTION AND PEDESTRIAN PATHWAYS

The Bollinger Road Bridge reconstruction project on Calabazas Creek is close to completion with Valley Water revegetation specialists beginning planting native species in December 2008.

The project, constructed at a cost of $2.7 million, is a joint effort with the City of Cupertino. It benefits the nearby Cupertino and San Jose neighborhoods by providing flood protection, as well as improving safety for bicyclists, pedestrians and vehicles. In addition, the partnership has helped reduce overall costs and minimize construction impacts.

Much of the project focused on the construction of two culverts—a new culvert in Cupertino and replacement of an existing culvert in San Jose. The culvert in Cupertino has widened the bridge over the creek by 21 feet.

Residents will now enjoy a full-sized pedestrian walkway and bicycle lane, as well as wider vehicle lanes on the bridge. Upstream, an older undersized culvert was demolished and replaced with a larger culvert that can safely convey floodwaters during a flood event that has one percent chance of occurring in a year.

LENIHAN DAM PROJECT ON SCHEDULE

This winter, commuters traveling along Highway 17 may have noticed the low water levels in the Lexington Reservoir. This is because Valley Water is replacing an aging outlet system at Lenihan Dam.

The outlet allows Valley Water to discharge water from the reservoir into Los Gatos Creek and a series of groundwater recharge ponds downstream. Buckling of the existing pipeline and operational restrictions limiting the rate at which water could be released from the reservoir necessitated the replacement of the entire outlet system.

The project, with a construction cost of $32.9 million, includes excavating a tunnel through the adjacent mountain (see picture on the right). The project is on schedule to be completed in the fall of 2009.

045426

SAVE WATER AND WIN A HIGH-EFFICIENCY CLOTHES WASHER

Valley Water offers a free Water-Wise House Call, where we'll come to your home and assess your water use, check for leaks, and optimize your irrigation schedule.

To find out more about the Water-Wise House Call Program and enter our drawing to win a clothes washer, go to www.valleywater.org and fill out an online form or the form below and mail it to:

Water-Wise and Win Drawing
Santa Clara Valley Water District
5750 Almaden Expressway
San Jose, CA 95118-3686

Yes, I wish to find out more about the Water-Wise House Call Program and enter the drawing to win a high-efficiency clothes washer.

Name: _____

Address: _____

Phone/email: _____ Water retailer: _____

No purchase necessary to win. To enter you must be a resident of Santa Clara County and at least 18 years of age as of Jan. 1, 2009. All qualified entrants will be eligible for a random drawing conducted by the Santa Clara Valley Water District. Mailed entries must be postmarked by 5 p.m. March 31, 2009. Limit, one entry per household. Other rules and restrictions apply. Official drawing rules may be obtained by sending a self-addressed stamped envelope to Drawing Rules, Santa Clara Valley Water District, 5750 Almaden Expressway, San Jose, CA 95118-3614.

Upcoming Events

Berryessa Flea Market Children's Summer Fun Fest

Date: September 6th and 7th 2008
Time: 10 a.m. to 5 p.m.
Location: 1590 Berryessa Rd.
San Jose, CA 95133

Join in on the 11th annual Fun Fest at the Berryessa Flea Market for a day full of arts and crafts, games, rides, animal exhibits, science experiments, and much more! For more information visit the Berryessa Flea Market website.

NASA Ames' Return to the Moon Family Night

Tell your students to bring their families to this free event!

Date: Saturday, September 6th from 3:00 p.m. to 10:00pm
Location: NASA Ames Research Center
Moffett Field, CA 94035

The Fun and Educational Event Features:

- Hands-on educational activities for children
- Hourly presentations with mission experts and scientists
- Moon rocks on display
- Animated videos
- Robotic rover demonstrations
- Telescope viewing of the lunar surface
- Food and Beverages will be sold

Learn how NASA's newest mission will be searching for water ice: Hear all about this exciting Lunar Crater Observation and Sensing Satellite (LCROSS) mission and for immediate details go to http://lcross.arc.nasa.gov/

Coastal Cleanup Day

Date: September 20, 2008
Time: 9 a.m. to noon

Last year, in just three hours, Coastal Cleanup Day volunteers removed more than 900,000

pounds of garbage from California shorelines and inland waterways. But the event did a whole lot more than help the marine ecosystem. It was also an important environmental lesson for thousands of kids across the state.

This year, as in every year, the California Coastal Commission is encouraging teachers to bring their classes to Coastal Cleanup Day. We have made participation easier than ever. On either Friday, September 19 or Saturday, September 20, you can conduct a "backyard cleanup" in your schoolyard or local creek. We will provide all the supplies you need and count your students among the tens of thousands that participate in this cleanup worldwide. You can help your students make the connection between the trash they remove and the trash in our oceans by using activities in our free curriculum in your Fall 2008 lesson plans.

For local information about cleanup sites in Santa Clara County go to: www.cleanacreek.org\ and to view cleanup locations view the Coastal Cleanup Map for Santa Clara County.

YSI Wildlife Festival

Date: October 5th 2008
Time: 11 a.m. to 4 p.m.
Location: YSI Alum Rock
16260 Penitencia Greek Rd.
San Jose, CA 95127

Wildlife Education Day Cupertino

Date: October 25th 2008
Time: 10 a.m. to 2 p.m.
Location: McClellan Ranch Park
22221 McClellan Rd.
Cupertino, CA

Project WET Workshop

Project WET is designed to help students, parents, educators, and communities of the world with water education. It contains websites of interest that may be useful, as well as information about Project WET teacher training in Santa Clara County through the Santa Clara Valley Water District. This day long training will introduce you to the Project WET curriculum and activities which you will receive. Kathy Machado will show you how the activities work, how they can be adapted to different grade levels, and provide supplementary material, all water related! The next project WET is scheduled for Friday, October 17, 2008 and is an all day event.

For more information about other upcoming Project WET trainings or to get some water based activities visit the Santa Clara Valley Water District website or contact Kathy Machado at kmachado@valleywater.org or (408) 265-2607, ext. 2331.

BAESI presents: Global Warming- Food Connections
A workshop for teachers

Date: Saturday, September 27, 2008
Time: 8:30 a.m. to 4:30 p.m.
Location: San Jose State University
Duncan Hall Rm 614

In this workshop keyed to the California Science Standards, you'll explore a variety of ways to help your students understand the science of global warming and the connections to the food we eat.

Presenters: Eugene Cordero (SJSU Dept. of Meteorology)
Richard Sedlock (SJSU Dept. of Geology)

Participants will receive stipend of $90, teaching materials, ready-to-use classroom activities, and (in combination with another full-day workshop), eligibility for 1 unit of Geology 104 ($44). If you do not need academic credit, the workshop is free.

Some of the workshop topics:

- The greenhouse effect
- Natural climate change and the role of the sun and volcanoes
- Climate models and forecasts for the future
- Energy and global warming
- How what we eat affects global warming

We hope you'll join us! Any and all applications received after September 15 are also welcome, and will be considered on a first-come, first-serve basis until capacity is reached. Questions? Call 408-924-5048. Or contact Ellen Metzger at metzger@geosun.sjsu.edu

California Science Teachers Association (CSTA) Conference

Date: October 30th to November 1st 2008
Location: San Jose Convention Center

The California Science Education Conference is the premier annual professional development event for science educators and science professionals. Conference events address all areas of science education, including life science, earth/space science, physical science, environmental science, literacy, English language development, and assessment.

Classroom Contests
We Can Change the World Competition
September 2008

NSTA, the Siemens Foundation, and Discovery Communications are launching a new sustainability education competition for middle school students to develop innovative green solutions for their schools, homes, and communities. This national middle school competition will involve a team of students identifying, researching, and recommending a solution to an environmental problem in their community. The competition will expand to kindergarten and elementary students in 2009 and to high school students in 2010.

http://eelink.net/cgi-bin/ee-link/newclick/8281575

Enter the California Coastal Art & Poetry Contest!

The California Coastal Commission invites California students in kindergarten through 12th grade to submit artwork or poetry with a California coastal or marine theme to the annual Coastal Art & Poetry Contest. Winners will receive $100 gift certificates to an art supply or book store, and each winner's sponsoring teacher will receive a $40 gift certificate for educational supplies. Students may have their work featured on Commission web pages and materials. Entries must be postmarked by January 31, 2009 to be eligible for this year's contest. For rules and entry form, visit the California Coastal Commission website, email coast4u@coastal.ca.gov, or call (800) Coast-4U.

River of Words Environmental Poetry and Art Contest K-12

Deadline: February 15, 2009
River of Words conducts a free international poetry and art contest for youth on the theme of watersheds and the environment. The contest helps youth explore the surroundings in which they live, and to express what they discover through poetry and art. It is held annually in affiliation with the Library of Congress Center for the book. The grand prize and international winners receive an all-expense paid trip to Washington, DC, to attend the awards ceremony at the Library of Congress.

Water Quality Monitoring

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C. 8 Water Quality Monitoring			
C.8.e.iv. Geomorphic Project			
C.8.e.iv.	This monitoring is intended to answer the questions: How and where can our creeks be restored or protected to cost-effectively reduce the impacts of pollutants, increased flows and durations of urban runoff? Permittees shall select a waterbody/reach, preferably one that contains significant fish and wildlife resources, and conduct one of the following projects within each county: (1) Gather geomorphic data to support the efforts of a local watershed partnership31 to improve creek conditions; or (2) Inventory locations for potential retrofit projects in which decentralized, landscape-based stormwater retention units can be installed; or (3) Conduct a geomorphic study which will help in development of regional curves which help estimate equilibrium channel conditions for different sized drainages. Select a waterbody/reach that is not undergoing changing land use. Collect and report the following data: • Formally surveyed channel dimensions (profile), planform, and cross-sections. Cross-sections shall include the topmost floodplain terrace and be marked by a permanent, protruding (not flush with ground) monument; • Contributing drainage area; • Best available information on bankfull discharges and width and depth of channel formed by bankfull discharges; and • Best available information on average annual rainfall in the study area. Permittees shall complete the selected geomorphic project by June 30, 2012 so that project results are reported in the Integrated Monitoring Report (see Provision C.8.h.iii.).	Complete and/or ongoing	

C.8.f.i. Locations			
C.8.f.i.	Permittees shall conduct pollutant of concern load monitoring at stations listed below. Upon approval by the Executive Officer, and after conferring with the Regional SWAMP program, Permittees may use alternate pollutant of concern monitoring locations. Load monitoring stations established under the RMP and/or SWAMP may be substituted for the stations listed below on a one-to-one basis. • Guadalupe River • Calabazas Creek at Lakeside Drive in Sunnyvale, at border with Santa Clara	Guadalupe River Station is funded by the SCVWD. These additional parameters are paid for by the SCVURPPP. See C.8.d.	
C.8.g. Citizen Monitoring and Participation			
C.8.g.i.	Permittees shall encourage Citizen Monitoring.	Ongoing	
C.8.g.ii.	In developing Monitoring Projects and evaluating Status & Trends data, Permittees shall make reasonable efforts to seek out citizen and stakeholder information and comment regarding waterbody function and quality.	Ongoing	
C.8.g.iii.	Permittees shall demonstrate annually that they have encouraged citizen and stakeholder observations and reporting of waterbody conditions. Permittees shall report on these outreach efforts in the annual Urban Creeks Monitoring Report.	Ongoing	

PROGRAM EVALUATION

Water Quality Index pilot study ended in fall of 2007 due to inconclusive nature of the results due to poor QAQC practices at the laboratory and District funding challenges.

The District will share water quality monitoring data and information from capital improvement projects and stream maintenance projects with the Program.

HIGHLIGHTS AND ACCOMPLISHMENTS

Monitoring

The District has continued its monitoring program to evaluate water quality in Lake Almaden, Almaden Reservoir, Calero Reservoir, Guadalupe Reservoir and Stevens Creek Reservoir. Depth profile measurements of temperature, pH, conductivity, and dissolved oxygen were conducted monthly. In addition, water samples were collected from the epilimnion and hypolimnion for analyses of total and dissolved mercury, total and dissolved methyl mercury, ammonia, nitrate/nitrite, sulfate and phosphorus at Lake Almaden, Almaden Reservoir, and Guadalupe Reservoir. Samples were also collected from the epilimnion for analyses for chlorophyll- a. The purpose of this monitoring is to establish existing water quality conditions and seasonal variability to evaluate the implementation of management changes to improve water quality.

Coordinate Regional Monitoring Efforts of BASMAA, SCVURPPP, WMI, and District

The District Environmental Management Unit staff attended program and regional monitoring work group meetings including SCVURPPP Monitoring Ad-Hoc Work Group, BASMAA Monitoring Committee, WMI Assessment Subgroup meetings, and TMDL work group meetings (PCB, mercury, sediment), to identify opportunities for coordination and collaboration of monitoring activities. District staff participated in the Monitoring Ad Hoc Workgroup meetings and worked with the SCVURPPP Program to share monitoring data. District staff reviewed and commented on Program monitoring work plans, monitoring reports, and assessments. The District has dedicated significant resources to work on the Guadalupe Watershed Mercury study and proposed TMDL. The District has also dedicated staff time to comment on the San Francisco Bay Mercury TMDL.

Major accomplishments included:

1. Provided debriefing on Solar Bee Mercury Removal efforts to pave the road for future support letters for grant funding.
2. Provided debriefing to WMI Land Use Subgroup on Stewardship Planning efforts to advocate the visions for the watersheds and better use of the information contained in the District's stewardship plans.
3. Facilitated the removal of "silver wash" washing machines from the water conservation rebate program, prevented toxic chemicals from entering the wastewater stream right from the source.
4. Played an important role to encourage City of San Jose to conduct a more thorough review of the impacts on groundwater resources for its Household Hazardous Waste Collection Facility.

5. Led or supported several policy-level dialogues with the District Board of Directors, Environmental Advisory Committee and interested parties on Stream Protection, Restoration,

Attachment 1.9

Pesticides Toxicity Control

Santa Clara Valley Water District
Urban Runoff Annual Report FY 2008-09
Pesticides Toxicity Control

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.9. Pesticides Toxicity Control			
	To prevent the impairment of urban streams by pesticide-related toxicity, Permittees shall implement a pesticide toxicity control program that addresses their own use of pesticides that pose a threat to water quality and the use of such pesticides by other sources within their jurisdictions that have the potential to enter the municipal conveyance system. They may coordinate with BASMAA, the Urban Pesticide Pollution Prevention Project, the Urban Pesticide Committee, and other agencies and organizations.		
C.9.a. Adopt an Integrated Pest Management (IPM) Policy or Ordinance			
C.9.a.i. Task Description			
C.9.a.i.	Permittees shall include provisions to minimize reliance on pesticides that threaten water quality and require the use of IPM in municipal operations and on municipal property in their IPM policies or ordinances.	Complete	
C.9.a.ii. Implementation			
C.9.a.ii	If not already in place, Permittees shall adopt appropriate IPM policies or ordinances no later than July 1, 2009.	Complete	
C.9.a.iii. Reporting			
C.9.a.iii.	Permittees shall submit a copy of ordinances or policies to the Water Board in the October 2009 Annual Report after adoption of the IPM policy or ordinance.	SCVWD will comply with this task	
C.9.b. Implement IPM Policy or Ordinance			
C.9.b.i.	Permittees shall establish written standard operating procedures for pesticide use that ensure implementation of the IPM.	Complete	
C.9.b.ii.	Permittees shall require municipal employees and contractors to adhere to the standard operating procedures.	Complete	

C.9.b.iii. Reporting			
C.9.b.iii.	(1) Permittees shall report in their Annual Reports on IPM policy implementation and evaluate effectiveness and status and trends of quantity and type of pesticide use, and provide reasons for increases in use of pesticides that threaten water quality; (2) Permittees shall maintain pesticide application standard operating procedures available upon request.	Ongoing	
C.9.c. Training of Municipal Employees			
C.9.c.i.	Permittees shall ensure that all municipal employees who, within the scope of their duties, apply pesticides which threaten water quality (including over-the-counter pesticides) are appropriately oriented and/or trained in IPM practices and the Permittee's IPM policy.	Ongoing	
C.9.c.ii. Reporting			
C.9.c.ii.	(1) Permittees shall report the percentage of municipal employees who apply pesticides who have been trained in IPM policy and IPM standard operating procedures. (2) Permittees shall submit training materials upon request.	SCVWD will comply with this task	
C.9.d. Require Contractors to Implement IPM			
C.9.d.i.	Permittees shall hire IPM-certified contractors or include contract specifications requiring contractors to implement the IPM no later than November 30, 2009.	SCVWD will comply with this task through modification of contract language	
C.9.d.ii. Reporting			
C.9.d.ii.	In Annual Reports, Permittees shall submit documentation to confirm compliance.	Ongoing	
C.9.f. Interface with County Agricultural Commissioners			
C.9.f.i.	Permittees shall maintain regular communications with county agricultural commissioner's to get input and assistance on urban pest management practices and use of pesticides and to inform them of water quality issues related to pesticides and violations of pesticide regulations.	Ongoing	
C.9.f.ii. Reporting			

C.9.f.ii.	Permittees shall report violations of pesticides regulations (e.g., illegal handling) associated with stormwater management to county agricultural commissioners (or other appropriate State and/or local agencies) and report follow-up actions to correct violations in Annual Reports.	Ongoing	

HIGHLIGHTS AND ACCOMPLISHMENTS

The District uses pesticides as one of the tools for pest management on its properties and facilities. The primary category of pesticides used is herbicides. Insecticides and rodenticides are used in small quantities. In all cases, pesticide products are used only after an assessment has been made regarding environmental, economical, and public health aspects of each of the alternatives. The District has always been proactive and conservative in the use of pesticides.

The District continues to implement a pesticide policy and an "Approved Pesticide List." Except for three products, the District's Approved Pesticide List met the criteria established in the District's Pesticide Policy for water quality, environmental and public health hazards. The District's policy states "Category I and II pesticides may only be used if required to meet health and safety concerns or if mandated to maintain regulatory compliance such as dam safety." The three "Toxicity Category I" products, one herbicide and two rodenticides, were exempted from meeting the toxicity restriction due to the following factors:

1. They are integral in meeting the structural engineering requirements of the District's levee systems and dam safety program.
2. There are no practical alternatives at this time.
3. The toxicity and hazard exposure of these products applies only to the applicator at the time of application. These hazards are mitigated with protective clothing and eye protection which minimize the exposure hazard to the maximum extent.

The District believes that use of the less toxic products is beneficial to the environment and the health and safety of employees. The District's annual pesticide use summary report for calendar year 2007 is included in this section as Table 17.1.

The District began implementation of the arundo mitigation program in 2002. The eradication program has increased the District's use of some pesticides. The cut stump method of application minimizes the potential for environmental impacts. The District currently has a program for monitoring the water quality impacts of this work type.

Specifications were developed for Pest Control Operators (PCOs) contracted for District applications to use pest control methods consistent with the District's IPM Policy. PCOs are required to follow the District's IPM Policy, Best Management Practices, and Standard Operating Procedures; provide evidence of current IPM training, when requested; and provide monthly pesticide use reports. Implementation of the new specifications and a pesticide use tracking system began July 1, 2004.

ALTERNATIVE PEST MANAGEMENT PRACTICES

In 2007-2009 with more than 25 acres of unwanted vegetation rising up and around the Santa Teresa Water Treatment Plant, the District used nearly 700 goats to chew and munch away dry brush that could have posed a fire hazard if left unchecked. Using the goats was a welcome alternative to chemicals or mowing, which proved difficult in the past because of uneven slopes around the plant. This innovative approach reflects that the District is doing things differently and certainly keeping the environment in mind. Please keep in mind that goats are also not always the alternative of choice as some of our facilities are remote enough that the goats could susceptible to predation by mountain lions etc.

The District continued to integrate mechanical harvesting and non-toxic dye colorants with the use of algaecides and herbicides to manage algae at percolation ponds.

Mercury Controls

Santa Clara Valley Water District
Urban Runoff Annual Report For FY 2008-09
Mercury Controls

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.11. Mercury Controls			
C.11.a. Mercury Collection and Recycling Implemented throughout the Region. Permittees shall promote, facilitate, and/or participate in collection and recycling			
C.11.a.i.	Permittees shall promote, facilitate, and/or participate in collection and recycling of mercury containing devices and equipment at the consumer level (e.g., thermometers, thermostats, switches, bulbs).	Ongoing	
C.11.a.ii. Reporting			
C.11.a.ii.	Report on these efforts in Annual Reports, including an estimate of the mass of mercury collected.	Ongoing	

RESPONSE TO REGIONAL BOARD COMMENTS FROM PREVIOUS YEAR'S ANNUAL REPORT

No comments from the Regional Board were received on this section of last year's annual report.

PROGRAM EVALUATION

District staff continued to purchase alternative products, where available, and to dispose of mercury-containing materials in accordance
with applicable regulations. The District also continued removing mercury containing sediment from the Guadalupe watershed.

HIGHLIGHTS AND ACCOMPLISHMENTS

Mercury Removal Projects and Programs Completed and Underway
Stream Maintenance Program

In 2008, routine sediment removal maintenance resulted in the disposal of 8,205 cubic yards of material, with 1,641 of this total from the creeks in the upper portion of the Guadalupe River Watershed. The total mercury removed from the system was 46 kg, with 45 kg from the Guadalupe River Watershed.

Monitoring

The District has undertaken a monitoring program to evaluate water quality in Lake Almaden, Almaden Reservoir, Calero Reservoir, Guadalupe Reservoir and Stevens Creek Reservoir. Depth profile measurements of temperature, pH, conductivity, and dissolved oxygen
were conducted monthly. In addition, water samples were collected from the epilimnion and hypolimnion for analyses of total and dissolved mercury, total and dissolved methyl mercury, ammonia, nitrate/nitrite, sulfate and phosphorus at Lake Almaden, Almaden Reservoir, and Guadalupe Reservoir. Samples were also collected from the epilimnion for analyses for chlorophyll a. The purpose of this
monitoring is to establish existing water quality conditions and seasonal variability to evaluate the implementation of management changes
to improve water quality.

Mercury Control Program

In 2008, the District continued to implement three projects to control mercury in the Guadalupe River Watershed: Jacques Gulch Restoration, Lake Almaden Circulation, and Reservoir Circulation.

Jacques Gulch Restoration

Jacques Gulch is a tributary to Almaden Reservoir that drains approximately one-third of the reservoir watershed. A portion of this drainage includes a small tributary that drains a portion of the former New Almaden Mining District, which is now Almaden-Quicksilver County Park. The project will remove, cap, or control erosion of extensive mercury deposits in the tributary above its confluence with Jacques Gulch, and in Jacques Gulch above its confluence with Almaden Reservoir. This project is scheduled for completion in 2011. During the reporting period, the District accepted a bid for construction, which will begin July 1, 2009.

Lake Almaden Circulation

Lake Almaden is a former gravel quarry that lies at the confluence of Guadalupe Creek and Los Alamitos Creek that drain Guadalupe and Almaden Reservoirs, respectively. Below this confluence is the Guadalupe River. This lake provides recreational amenities to the community, including swimming, boating, and fishing. The Guadalupe River Watershed Mercury Study identified the lake as a significant source of methyl mercury that bioaccumulates in fish within the lake and in fish downstream. In 2008-09 two additional circulators were installed in the lake, providing full treatment.

Reservoir Circulation

The Guadalupe River Watershed Mercury Study identified reservoirs as a significant source of methyl mercury that bioaccumulates in fish within the reservoirs and in downstream creeks. The study also demonstrated a correlation between the seasonal development of anoxia in the hypolimnion and increased methyl mercury concentrations. Building on the success of the Lake Almaden pilot project, the District installed three solar-powered circulators in Almaden Reservoir in April 2007, and three solar-powered circulators were installed in Guadalupe Reservoir in July 2007. Monitoring of the performance was continued in 2008-09.

Attachment 1.15

Exempted and Conditionally Exempted Discharges

Work Plan Task	Task Description	Status / Comments	Due Date (mo/yr)
C.15. Exempted and Conditionally Exempted Discharges			
C.15.b. Conditionally Exempted Non-Stormwater Discharges:			
C.15.b.i. Discharge Type - Pumped Groundwater, Foundation Drains, Water from Crawl Space Pumps and Footing Drains		Ongoing	
C.15.b.ii. Discharge Type - Air Conditioning Condensate			
C.15.b.iii. Discharge Types - Planned, Unplanned, and Emergency Discharges of the Potable Water System		Ongoing	
C.15.b.iv. Discharge Type – Individual Residential Car Washing			
C.15.b.v. Discharge Type - Swimming Pool, Hot Tub, Spa, and Fountain Water Discharges			
C.15.b.vi. Discharge Type - Irrigation Water, Landscape Irrigation, Lawn or Garden Watering			
C.15.b.vii. Additional Discharge Types		Ongoing	
C.15.b.viii. Permit Authorization for Exempted Non-Stormwater Discharges		Ongoing	

PROGRAM EVALUATION

The District owns, operates, and/or maintains 3 water treatment plants, 2 pumping and metering stations, 1 pump station, 11 reservoirs, percolation facilities, water wells, a recycled water facility (South County Regional Wastewater Authority Treatment Plant), and distribution pipelines. All of these water facilities have a potential for discharging non-stormwater to surface water bodies.

The District continued reporting on all water utility O&M discharges. Please see attached inventory table (Table 15.1). Typical District discharges include raw water from water quality testing devices at District plants, San Tomas Injection Well, and Vasona Meter Shop testing.

The District's water utility maintenance staff performs all discharges. District staff implemented BMPs after consultation with the Environmental Management Unit.

HIGHLIGHTS AND ACCOMPLISHMENTS

The District has been working with the Regional Water Quality Control Board staff to coordinate notification activities between various District units that conduct discharges. The District has also been coordinating internal notification discrepancies.

In addition the District provided both written and verbal comments on the latest draft of the MRP with a particular focus on exempted and conditionally exempted discharges.

Mr. Bruce H. Wolfe
Executive Officer
San Francisco Bay Region
Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

Subject: Submittal of FY 2009-2010 Program Annual Report

Dear Mr. Wolfe:

I am pleased to submit the Santa Clara Valley Urban Runoff Pollution Prevention Program's *FY 09-10 Annual Report* documenting Program-wide activities conducted during FY 2009-2010. The Program's *FY 09-10 Annual Report* consists of 15 sections and an Appendix. Each section reports on Program activities and the Program's involvement in regional activities associated with a specific Permit Provision. Related tasks and activities not related to a specific Permit Provision (e.g., street sweeping, Santa Clara Basin Watershed Management Initiative (SCBWMI) activities, etc.) are placed in the most appropriate section. Section 15 contains the *Regional Supplement for Pollutants of Concern and Monitoring* developed by BASMAA member agencies. Please note that much of the information in Section 15 is a work-in-progress and is being submitted to illustrate the progress being made on numerous region-wide permit provisions.

Pursuant to Provision C.16.c., the Program's *FY 09-10 Annual Report* includes a certification statement signed by the Program Manager. The Program's Management Committee, at its September 2, 2010 meeting, authorized the Program Manager to submit the *FY 09-10 Annual Report* on its behalf.

This submittal was also provided electronically to the Water Board in accordance with the directions provided by Water Board staff in the document entitled *Guide for Submitting Electronic Documents*.

Please contact me if you have any comments or questions. We look forward to working with you to successfully address new challenges during FY 10-11.

Very truly yours,

Adam W. Olivieri, Dr. P.H., P.E.
Program Manager

CREDITS

This Annual Report was a collaborative effort of the fifteen agencies participating in the Santa Clara Valley Urban Runoff Pollution Prevention Program (Program). EOA, Inc., as the Program management consultant, coordinated and compiled the Annual Reports submitted by the fifteen Co-permittees; and was responsible for the overall preparation of the Program's Annual Report. The Program expresses its appreciation to all those who contributed to this twentieth Annual Report.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 1

Introduction

September 15, 2010

Section 1 Introduction

Background

Program Description

The Santa Clara Valley Urban Runoff Pollution Prevention Program ("Program") is an association of thirteen cities and towns in Santa Clara Valley, the County of Santa Clara, and the Santa Clara Valley Water District ("Co-permittees") that share a common permit to discharge stormwater to South San Francisco Bay. The Program incorporates regulatory, monitoring and outreach measures aimed at reducing pollution in urban runoff to the "maximum extent practicable" to improve the water quality of South San Francisco Bay and the streams of Santa Clara Valley. The Program is organized, coordinated, and implemented in accordance with a Memorandum of Agreement (MOA) signed by the Co-permittees in 1990, 1999, 2005 and 2006. The MOA covers the responsibilities of each Co-permittee and a cost-sharing formula for joint expenditures.

In June 1990, the San Francisco Bay Regional Water Quality Control Board (Water Board or RWQCB) issued the Program its first NPDES permit.[1] The permit was reissued in 1995[2], 2001[3] (amended in 2001[4] and 2005[5]) and 2009[6]. The permit reissued in 2009 is referred to as the Municipal Regional Stormwater NPDES Permit (MRP). The MRP covers stormwater discharges from a total of 76 municipalities and local agencies in Alameda, Contra Costa, San Mateo, and Santa Clara Counties, and the cities of Fairfield, Suisun City, and Vallejo.

Program Management

At the inception of the Program, the Santa Clara Valley Water District took the lead responsibility for management of the Program. EOA, Inc. was later retained to provide Program management services, and the Program's Management Committee designated the District as the Program's fiscal agent. On July 1, 2005, the City of Sunnyvale became the Program's fiscal agent.

The Program's Management Committee (MC) is the official decision-making body for the Program. The MC consists of at least one person from each Co-permittee who is officially designated and duly authorized to vote in his/her capacity as representative to the Program. In most instances, Co-permittees have also designated and authorized alternative representatives to vote in the absence of the primary representative. In all cases, the person authorizing and designating the representative to the Program is a duly authorized representative of the principal executive officer or ranking official of the Co-permittee.

During the term of the Permit, the Program Manager will submit, on a "joint basis", certain permit-required reports and a certification statement on behalf of the Co-permittees to the Water Board. In

[1] NPDES Permit No. CAS029718, Order No. 90-094.
[2] NPDES Permit No. CAS029718, Order No. 95-180 (as amended 7/21/99).
[3] NPDES Permit No. CAS029718, Order No. 01-024 (2/21/01).
[4] NPDES Permit No. CAS029718, Order No. 01-119, Amendment Revising Provision C.3. (10/17/01).
[5] NPDES Permit No. CAS029718, Order No. R2-2005-0035, Amendment Revising Order 01-119 (7/20/05).
[6] NPDES Permit No. CAS612008, Order No. R2-2009-0074 (10/14/09).

August 2010, Co-permittees authorized the Program to continue submitting "joint reports" and a certification statement on their behalf. A signed confirmation statement from each Co-permittee designating a MC representative and/or alternate for their agency, and authorizing the Program Manager to submit certain reports to the Water Board on their behalf is included within Appendix 1-1.

Program Annual Report

Permit Provision C.16.a of the MRP requires each Co-permittee to submit an Annual Report by September 15 of each year. Program annual reports are not required in accordance with the MRP; however, the Program's Management Committee decided at its June 17, 2010 meeting that a Program Annual Report documenting Program-wide activities is useful and should be developed each year.

■ Organization of Report

The Program's *FY 09-10 Annual Report* consists of 15 sections, with relevant tables placed at the end of each section, and one Appendix. Each section reports on a specific Permit Provision. Related tasks and activities not related to a specific Permit Provision (e.g., street sweeping, Santa Clara Basin Watershed Management Initiative (SCBWMI) activities, etc.) are placed in the most appropriate section. The structure of each Annual Report section, in most cases, consists of the following:

- Introduction – provides brief background information about the specific Permit Provision and its requirements;
- Program Activities – provides Program accomplishments for specific sub-provisions and/or projects;
- Regional Activities – provides accomplishments conducted at the regional-level (e.g., BASMAA-related tasks) for specific sub-provisions and/or projects; and

Following Section 1, the Program *FY 09-10 Annual Report* volume consists of the following sections:

Program FY 09-10 Annual Report
Section 2- Provision C.2 Municipal Operations
Section 3- Provision C.3 New Development and Redevelopment
Section 4- Provision C.4 Industrial and Commercial Site Controls
Section 5- Provision C.5 Illicit Discharge Detection and Elimination
Section 6- Provision C.6 Construction Site Control
Section 7- Provision C.7 Public Information and Outreach
Section 8- Provision C.8 Water Quality Monitoring
Section 9- Provision C.9 Pesticides Toxicity Control
Section 10- Provision C.10 Trash Controls
Section 11- Provision C.11/12 Mercury and PCBs Controls
Section 12- Provision C.13 Copper Controls
Section 13- Provision C.14 PBDE, Legacy Pesticides and Selenium
Section 14- Provision C.15 Exempted and Conditionally Exempted Discharges
Section 15- Regional Supplement for Pollutants of Concern and Monitoring

The Appendix provides final work products and other relevant information relating to the completion of Program activities. Appendices have been developed for certain Program activities described within the following Annual Report sections:

Program FY 09-10 Annual Report Appendix
Section 1- Introduction
Section 3- Provision C.3 New Development and Redevelopment
Section 6- Provision C.6 Construction Site Control
Section 7- Provision C.7 Public Information and Outreach
Section 8- Provision C.8 Water Quality Monitoring
Section 9- Provision C.9 Pesticides Toxicity Control
Section 12- Provision C.13 Copper Controls
Section 15- Regional Supplement for Pollutants of Concern and Monitoring

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 2

Municipal Operations

September 15, 2010

Section 2 Municipal Operations

Introduction

Provision C.2 of the MRP requires Permittees to implement appropriate best management practices (BMPs) during operation, inspection and routine repair and maintenance activities of municipal facilities and infrastructure to control and reduce non-stormwater discharges and polluted stormwater to storm drains and watercourses. The provision identifies the following specific maintenance activities that require development and implementation of BMPs:

- Street and road repair maintenance (C.2.a.),
- Sidewalk/plaza maintenance and pavement washing (C.2.b.),
- Bridge and structure maintenance and graffiti removal (C.2.c.),
- Stormwater pump stations (C.2.d.),
- Rural public works construction and maintenance (C.2.e.), and
- Corporation yards (C.2.f.).

Program Activities

The SCVURPPP Municipal Operations Ad Hoc Task Group (AHTG) was formed and first met in October 2009 to assist Co-permittees with implementing the new requirements in Provision C.2. The AHTG met four additional times from January through June 2010. During this time, the AHTG provided the following guidance to assist with implementation of the MRP:

- Pump station inventory form for collecting pump station characteristics and other information as required in Provision C.2.d.ii.(1);
- Example stormwater pollution prevention plans (SWPPPs) for corporation yards (C.2.f.i.(3));
- Draft pump station dry weather sampling plan guidance (C.2.d.ii.(2)). This sampling guidance will be revised in FY 10-11 to include wet season inspections (C.2.d.ii (4)).

To ensure consistency with inspection and reporting, the Municipal Operations AHTG worked with the BASMAA Municipal Operations Committee to identify a set of criteria to be used when conducting stormwater pump station dry season inspection and monitoring. These criteria were incorporated into the Program guidance.

Regional Activities

Program staff participated in the BASMAA Municipal Operations Committee and helped identify several activities that will be conducted at the regional level:

- Expansion of the existing BASMAA Surface Cleaner Training and Recognition Program to include mobile automotive washing and carpet cleaning and add Spanish-language information for each business type;

- Development of common forms for pump station sampling and inspections; and
- Information sharing.

As stated above, Program staff is providing SCVURPPP AHTG input on the dry weather pump station sampling form and wet weather pump station inspection form.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 3

New Development and Redevelopment

September 15, 2010

Section 3 New and Redevelopment Control Measures

Introduction

Provision C.3 contains the requirements for appropriate source control, site design, and stormwater treatment measures in new development and redevelopment projects to address stormwater runoff pollutant discharges and prevent increases in runoff flows, with emphasis on implementation of low impact development (LID) techniques. This section of the Annual Report describes the Program's efforts during FY 09-10 to assist Co-permittees to control the impacts of development on stormwater quality and flow through the development project planning, review and approval process.

Program Activities

During FY 09-10, Program efforts continued to focus on assistance to Co-permittees with C.3 and HMP implementation, conducting training workshops for municipal staff and the development community, and implementation of new requirements in the MRP. The Program continued to support the C3 Provision Oversight Ad Hoc Task Group (C3PO AHTG) and use it as a forum to discuss Co-permittee needs, C.3 implementation issues, and updates on regional activities. The C3PO AHTG met approximately bimonthly during the first half of the fiscal year (three times) and then began to meet monthly during the second half of the year (six times) to accomplish required tasks.

In December, 2009, Program staff prepared a memorandum entitled "Guidance on Key Actions and Due Dates for Meeting C.3. Requirements" to help Co-permittees prioritize actions for compliance with the MRP. Program staff then prepared a Work Plan to assist Co-permittees in implementing all C.3. requirements, which identified whether tasks will be implemented locally, at the Program level or regionally by BASMAA, and the time frame for completion. The C.3 Work Plan was provided to the C3PO AHTG in December 2009 and after incorporation of AHTG input, submitted to the Management Committee in February 2010.

C.3.a. New Development and Redevelopment Performance Standard Implementation

The provision requires Co-permittees to update legal authority and development review and permitting processes, and conduct training and outreach to address new C.3 requirements. It also requires Co-permittees to encourage all projects not regulated by Provision C.3, but that are subject to the Co-permittees' planning, building, development, or other comparable review, to include adequate source control and site design measures.

The Program implemented the following activities to help meet this requirement:

Municipal Staff Training

During FY 09-10, the Program conducted and/or co-sponsored five workshops to assist Co-permittees with implementation of Provision C.3 and requirements for construction site management and inspection (Provision C.6):

- Construction Site Inspection Trainings, October 21, 2009, 9:00 AM – 12:00 PM and 1:00 PM – 4:00 PM (San Jose);
- Webcast on "Engineered Rainwater Collection and Case Studies For Sustainable Water Management" by ASCE Continuing Education and ASCE's Environmental & Water Resources Institute (EWRI), October 27, 2009 (Cupertino);
- Construction Site Compliance Workshop, January 19, 2010 (Cupertino) and January 20, 2010 (San Jose), co-sponsored by the San Francisco Estuary Partnership;
- Construction Site Stormwater Compliance Workshop, May 19, 2010 (SCVWD, San Jose); and
- The Annual C.3. Workshop, entitled "Complying with New Stormwater Requirements for New and Redevelopment Projects", June 8, 2010 (Cupertino).

More information on the construction-related workshops is provided in Section 6.
The Annual C.3. Workshop attracted 108 participants. The workshop was designed to address topics of interest to municipal and private planning/engineering staffs related to the MRP and LID. The morning sessions featured updates on stormwater regulations; a presentation on performance of bioretention areas, and case studies of implementation of C.3. on a variety of projects. The afternoon session was split into two tracks: one track offered an introduction to hydromodification management requirements and the Bay Area Hydrology Model. The other track offered advanced training on low impact development topics including rainwater harvesting, green roofs, soil specifications, and retrofitting impervious areas with landscaping. The advanced track was planned in coordination with the SCBWMI Land Use Subgroup. The workshop also featured exhibits for four vendors of stormwater control measures and related products. The workshop flyer, agenda, evaluation summary, and attendance list for the workshop are presented within Appendix 3-1

Development of Guidance Materials

Program staff worked with the AHTG to develop and/or update the following guidance materials:

- "Model Conditions of Approval for Stormwater Quality" (Site Design, Source Control, and Pesticide Reduction), May 2010;
- Fact sheet entitled "Changes to Stormwater Quality Control Requirements - Information for Developers, Builders and Project Applicants", July 2010;
- Updated fact sheet entitled "Hydromodification Management Requirements: What Developers, Builders and Project Applicants Need to Know", July 2010;
- General Plan Guidance, July 2010;
- Revisions to Planning Procedures Performance Standards (in progress).

Site Design Awards

In 2006, the Program began an awards program for exemplary site designs to protect water quality. This awards program recognizes Santa Clara Valley's public agency and private development community leaders who are solving site design challenges, reducing stormwater pollution and runoff quantity, and meeting the requirements of the NPDES permit. Applications for the awards program also help provide

information on additional site design examples for updating the Program's Site Design Guidebook[1]. An Awards Committee consisting of Program staff, Co-permittee representative(s), local consultant(s), and an environmental group representative reviews the submittals and selects the winners.

The Program continued the awards program in 2010, and the following award winners were announced at the June 8, 2010 C.3. Workshop:

- Private Project, Residential: The Self-Watering House, Mountain View;
- Private Project, Commercial: VMware, Palo Alto;
- Public Project: Stevens Creek Corridor Park and Restoration Project, Cupertino;
- Honorable Mention, Private Project, Institutional: The Humane Society of Silicon Valley, Milpitas.

An awards ceremony is being planned for Fall 2010, and the Site Design Guidebook will be updated in FY 10-11 to include the award-winning projects from the last few years.

C.3.b. Regulated Projects

Development of Guidance Materials

Program staff developed the following guidance documents to help Co-permittees implement requirements for different categories of new development or redevelopment projects regulated under C.3.:

- Fact sheet entitled "Notice to Project Applicants: Additional, New Stormwater Use and Treatment Requirements Will Go Into Effect December 1, 2011", December 2009[2];
- Fact sheet entitled "Requirements for Road Projects in the Municipal Regional Permit", February 2010;
- Updated "Provision C.3 Data Form" to collect information required by the MRP for annual reporting, July 2010.

Green Streets Pilot Projects

Program and Co-permittee staff formed the Green Streets Work Group to discuss the requirements for green streets and potential green street projects. This Work Group held three meetings in FY 09-10.

The City of Campbell is considering developing Hacienda Avenue in Campbell as a Green Street. Program staff assisted Campbell staff in submitting an application to the Strategic Growth Council to receive grant funding for this project. The grant application is currently under review by the Strategic Growth Council.

[1] SCVURPPP, "Developments Protecting Water Quality: A Guidebook of Site Design Examples", February, 2007

[2] SCVURPPP acknowledges the Alameda Countywide Clean Water Program for the original content of this document. It was modified for SCVURPPP co-permittee use.

C.3.c. Low Impact Development

Participation in BASMAA Development Committee

Program staff is participating in the BASMAA Development Committee to implement the requirements under this provision, as most of the requirements will initially be met by the development of regional products. Highlights of the tasks implemented by the BASMAA Development Committee in FY 09-10 are presented under the Regional Activities section below.

Development of Guidance Materials

In coordination with the Alameda and San Mateo countywide stormwater programs, Program staff hired a consultant to develop a list of plants that can be used in LID treatment measures in Santa Clara Valley. The list is currently under review by the C3PO AHTG.

C.3.f. Alternative Certification of Stormwater Treatment Systems

To assist Co-permittees in identifying third parties to conduct alternative certification reviews of stormwater plans for proposed development projects, the Program has maintained a "List of Qualified Consultants" on its website. This is a list of licensed engineers who are qualified to design or review proposed storm water treatment control measures and hydromodification flow control facilities for new and redevelopment projects. During FY 09-10, Program staff began the bi-annual process of updating this list. A Request for Qualifications notice was sent out on July 19, and responses are required by August 16, 2010.

C.3.g. Hydromodification Management

With the adoption of the MRP, the hydromodification management (HM) requirements for SCVURPPP Co-permittees changed in two significant ways: 1) the project size threshold was lowered to 1 acre of impervious surface; and 2) the HM applicability map changed to include more areas of the County. As a result of these changes, more projects will need to meet the HM requirements. Program staff conducted the following tasks to assist Co-permittees to implement the new requirements:

- Updated the fact sheet entitled "Hydromodification Management Requirements: What Developers, Builders and Project Applicants Need to Know", July 2010;
- Conducted a 2.5-hour training on the hydromodification management requirements and the Bay Area Hydrology Model ("HMP 101" as part of the C.3 Workshop on June 8, 2010;
- Developed local HM applicability maps for each Co-permittee;
- Worked with the City of San Jose and other Co-permittees on a more refined impervious surface analysis of the "Areas Under Review" noted on the HM applicability map.

C.3.h. Operation and Maintenance of Stormwater Treatment Systems

The requirements for Co-permittees to conduct BMP Operation and Maintenance (O&M) Verification Programs in the MRP are similar to those in the previous permit, except for changes in inspection frequency and reporting. Program staff updated the "Standard Stormwater Treatment BMP Inspection Data Collection Form" to be consistent with the MRP requirements. Program staff will continue to

collect annual inspection data from Co-permittees for conducting internal analyses of common BMP O&M issues.

Regional Activities

Program staff is participating in the BASMAA Development Committee to implement the requirements under this provision, and the Assistant Program Manager is serving as Chair of the Committee. The Development Committee identified the following MRP requirements as regional tasks, and accomplished the following tasks in FY 09-10:

- Green Street Pilot Projects – Provision C.3.b.iii. requires Permittees to construct ten pilot green street projects throughout the region (a minimum of two in Santa Clara Valley) that incorporate LID site design and treatment techniques by December 2014. The Committee finalized a scope of work for hiring a consultant to prepare annual Green Street Projects Status Reports on behalf of all Permittees and conduct modeling of water quality benefits of Green Street Projects, per Provision C.3.b.iii. and C.3.b.v.(2). An RFP was issued in June 2010.
- LID Infeasibility Criteria – Provision C.3.c.i.(2)(b)(iv) requires Permittees to submit a report on the criteria and procedures that will be used to determine whether LID measures are infeasible on a project site by May 1, 2011. The Assistant Program Manager attended several meetings of the Orange County Land Development NPDES Technical Advisory Group, which has similar permit requirements and recently developed LID infeasibility criteria, and shared information about their approach and experience with the Development Committee and the C3PO AHTG. In addition, Geosyntec, consultant to Orange County, made several presentations to the Committee about their approach. Based on this information, the Committee is in the process of formulating an approach for the San Francisco Bay area.
- Model Biotreatment Soil Media Specifications – Provision C.3.c.i.(2)(b)(vi) requires Permittees to develop a proposed set of model biotreatment soil specifications and soil media testing methods for submittal to the Water Board by December 1, 2010. The Committee organized a Bay Area Soil Specification Roundtable on April 14, 2010 that included presentations on existing specifications and collected input from various soil and plant specialists. The Committee decided to base its proposal on an existing specification developed for the CCCWP, with some modifications. The Committee then decided to contract with CCCWP's consultant to make the modifications and prepare the submittal to the Water Board. Program staff participated in the Roundtable discussion, the review, and the decision-making process.
- Green Roof Specifications – Provision C.3.c.i.(2)(b)(vii) requires Permittees to develop proposed minimum specifications for green roofs that adequately treat roof runoff consistent with MRP requirements, for submittal to the Water Board by May 1, 2011. During FY 09-10, the Committee reviewed a draft memorandum on proposed specifications developed by the Contra Costa Clean Water Program (CCCWP) and is currently discussing the content of the submittal.
- Special Projects Proposal – Provision C.3.e.ii. recognizes that certain types of "smart growth" project have inherent environmental benefits and requires Permittees to submit a proposal to allow these projects to apply "credits" to reduce the amount of LID treatment required on the site, by December 1, 2010. The Committee formed a Special Projects Work Group to address this requirement. The Work Group has met approximately monthly to identify projects that may have difficulty implementing LID on-site, develop project type descriptions, and discuss how the credits would be applied. The Work Group met with Water Board staff on April 1, 2010 to present and obtain feedback on a preliminary list of projects. The group also met with

representatives of the Building Industry Association, local developers and engineers on July 27, 2010 to get their input on the project types and approach. Program staff participated in the Work Group and both meetings.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 4

Industrial and Commercial Site Controls

September 15, 2010

Section 4 Industrial and Commercial Site Controls

Introduction

Provision C.4 requires Permittees to implement an industrial and commercial site inspection and control program at all sites which could reasonably be considered to cause or contribute to pollution of stormwater runoff, with follow-up and enforcement consistent with local Enforcement Response Plans (ERPs), to prevent discharges of pollutants and impacts on beneficial uses of receiving waters. The provision identifies specific elements of the program including identifying sites to inspect (C.4.b.ii.(1) and (2)), inspection frequency (C.4.b.ii.(3) and (5)), inspection content (C.4.b.ii.(4)), data tracking (C.4.b.ii.(6) and C.4.c.ii.(4)) and staff training. In addition, Permittees must report on the adequacy of their legal authority and implementation of their ERP in the FY 09-10 Annual Report.

Program Activities

The SCVURPPP Industrial and Commercial Business Inspection and Illicit Discharge Detection and Elimination (IND/IDDE) Ad Hoc Task Group (AHTG) was formed in September 2009 to assist Co-permittees with implementing new requirements in the MRP. The AHTG met again in December 2009, after the MRP was adopted, and another five times through June 2010. During that time, Program staff worked with the AHTG to develop the following guidance to assist with implementation of the MRP:

- Example ERPs from within and outside the Program were collected by Program staff and distributed to the AHTG. These examples were used as guides for Co-permittees to develop individual ERPs (distributed in December 2009);
- A standardized list of industrial and commercial business categories that should be considered for inspections in each agency's Business Inspection Plan was created by the AHTG and compiled by the City of San Jose staff (completed February 2010);
- Example procedures for prioritizing business inspections were provided by Program staff. The procedures were collected from within and outside the Program. These examples were used as guides for Co-permittees to develop individual Business Inspection priorities; and
- A template Business Inspection Plan was provided by Program staff (completed July 2010).

The AHTG also assisted BASMAA with input on the Pollutants of Concern Training Materials project and the annual report format.

Regional Activities

Program staff participated in the BASMAA Municipal Operations Committee and helped identify several activities that will be conducted at the regional level. For Provision C.4, the Committee decided that regional activities would be best focused on:

- Information sharing on legal authority and enforcement response plans for industrial and commercial business inspections;

- Providing input on the Pollutants of Concern Training Materials for Inspectors, being developed by the Monitoring/Pollutants of Concern Committee to address Provision C.12.a (see Section 11 of this Annual Report);
- Annual report format for C.4 inspection data reporting; and
- Potential regional inspector trainings.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 5

Illicit Discharge Detection and Elimination

September 15, 2010

Section 5 Illicit Discharge Detection and Elimination

Introduction

Provision C.5 requires Permittees to implement an illicit discharge program that includes an active surveillance component, a centralized complaint collection component, and a follow-up component to target illicit discharge and non-stormwater sources. The provision identifies specific elements of the program including a central contact point for complaints and spill reporting (C.5.c.), mobile business program (C.5.d.), collection system screening program (C.5.e) and spill and discharge complaint tracking system (C.5.f). In addition, Permittees must report on the adequacy of their legal authority and implementation of their Enforcement Response Plans (ERPs) in the FY 09-10 Annual Report.

Program Activities

The SCVURPPP Industrial and Commercial Business Inspection and Illicit Discharge, Detection and Elimination (IND/IDDE) Ad Hoc Task Group (AHTG) was formed in September 2009 to assist Co-permittees with implementing new requirements in the MRP. The AHTG met again in December 2009, after the MRP was adopted, and another five times through June 2010. During that time, Program staff worked with the AHTG to provide examples and develop guidance to assist with implementation of the MRP:

- Example ERPs from within and outside the Program were collected by Program staff and distributed to the AHTG. These examples were used as guides for Co-permittees to develop individual ERPs;
- A template Spill and Dumping Response Plan with phone tree; and
- A template spill and discharge complaint tracking Excel Workbook.

The AHTG is working with the BASMAA Municipal Operations Committee to address the mobile cleaner control program requirements in Provision C.5.d. (see discussion under Regional Activities). The AHTG will follow the progress of the BASMAA Committee as new businesses under Provision C.5.d. are addressed.

The Provision C.5.e. requirement for a collection system screening program is being addressed by the SCVURPPP Municipal Operations AHTG. To ensure consistency with inspection and reporting, the Municipal Operations AHTG and BASMAA identified a set of criteria to be used by Co-permittees when conducting collection system screening. The AHTG also developed additional optional criteria for Co-permittees to consider when conducting screenings, and an inspection and monitoring template, available as guidance.

Provision C.5.e also requires that Co-permittees make maps of their municipal storm drain systems publicly available by July 1, 2010. Most Co-permittees have maps available to address this provision and some are providing plot books at the planning counter to satisfy this permit provision. Program staff also posted on the SCVURPPP website a link to the Oakland Museum Creek and Watershed Maps, which include storm drains 24 inches in diameter and larger, to help meet this requirement.

■ Regional Activities

Program staff participated in the BASMAA Municipal Operations Committee and helped identify several activities that will be conducted at the regional level. These include:

- Assistance with a program to reduce the discharge of pollutants from mobile businesses (C.5.d.);
- Development of a common collection system screening reporting form (C.5.e.); and
- Information sharing on legal authority, enforcement response, and collection system screening programs (C.5.a., b., and e.).

C.5.d. Control of Mobile Sources

This provision requires Permittees to develop and implement a program to reduce the discharge of pollutants from mobile businesses, including development and implementation of minimum standards and BMPs, and outreach to mobile businesses. BASMAA's long-standing Surface Cleaner Training and Recognition program addresses these aspects of the provision by focusing on the most common type of outdoor cleaning – cleaning of flat surfaces like sidewalks, plazas, parking areas, and buildings. Individual Permittees address the inspection and enforcement aspects of the provision.

Previously, BASMAA, the Regional Water Board, and mobile businesses jointly developed best management practices. The BMPs were packaged and delivered in training materials (e.g., *Pollution from Surface Cleaning* folder), and via workshops and training videos. The folder and the training video have since been translated into Spanish. Cleaners that take the training and a self-quiz are designated by BASMAA as Recognized Surface Cleaners. BASMAA also created and provides marketing materials for use by Recognized Surface Cleaners. Previously, BASMAA converted the delivery mechanism to being online so that mobile businesses would have on-demand access to the materials and the training. BASMAA continues to maintain the Surface Cleaner Training and Recognition Program. Cleaners can use the website to get trained and recognized for the first time or renew their training and recognition, as required annually. Recognized cleaners can also download marketing materials from the website. Potential customers, including Permittees can use the site to verify the recognition status of any cleaner, as can municipal inspectors.

For FY 10-11, BASMAA is planning to add materials and training for additional mobile business types to the Surface Cleaner Training and Recognition program.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 6

Construction Site Controls

September 15, 2010

Section 6 Construction Site Controls

Introduction

Provision C.6 requires Permittees to implement a construction site inspection and control program at all construction sites, with follow-up and enforcement consistent with local Enforcement Response Plans, to prevent construction site discharges of pollutants and impacts on beneficial uses of receiving waters. The provision identifies specific elements of the program including six Best Management Practices (BMPs) categories (C.6.c), the plan approval process (C.6.d), inspection frequency (C.6.e.ii.(2)), inspection content (C.6.e.ii.(3)), data tracking and reporting (C.6.e.ii.(4) and iii.) and staff training (C.6.f). In addition, Permittees must report on the adequacy of their legal authority and implementation of their Enforcement Response Plan in the FY 09-10 Annual Report.

Program Activities

Co-permittee Guidance

The SCVURPPP Construction Inspection Ad Hoc Task Group (AHTG) was formed in September 2009 to assist Co-permittees with implementing the new requirements in the MRP. The AHTG met again in November 2009, after the MRP was adopted, and began developing tools to assist with implementation of the MRP, including an outline of an Enforcement Response Plan (ERP) and a model stormwater construction inspection form. In February 2010, the AHTG continued to work on developing ERPs, finalizing the model inspection form and discussed a draft Excel workbook template for construction inspection data tracking. In March 2010, the AHTG discussed guidance for identifying high priority construction sites for inspection during the wet season and reviewed the BASMAA draft reporting forms for Provision C.6. The template construction inspection Excel data tracking table was revised based on the BASMAA reporting forms and sent to the AHTG members in June 2010.

The following is a list of products developed by Program staff to assist AHTG members:

- ERP Outline (November 2009);
- Construction Inspection Form and memorandum on its use (November 2, 2009, revised November 18, 2009);
- Excel Workbook Template for Data Tracking and memorandum on its use (December 9, 2009);
- Memorandum entitled “Guidance on Identifying High Priority Construction Sites” (February 4, 2010);
- Excel Workbook Template for Data Tracking (revised June 2010).

Training

The Program conducted/co-sponsored the following construction trainings in FY 09-10:

- Construction Site Inspection Trainings, Wednesday, October 21, 2009, 9:00 AM – 12:00 PM and 1:00 PM – 4:00 PM (San Jose) – The training focused on the previous Construction General

Permit (CGP) which covered projects during the FY 09-10 wet season, inspection and enforcement procedures, and construction site management approaches. Approximately 117 municipal staff attended this training.

- Construction Site Compliance Workshop, January 19, 2010 (Cupertino) and January 20, 2010 (San Jose), co-sponsored by the San Francisco Estuary Partnership – The workshop focused on the requirements in the new CGP, stormwater BMPs for small and large construction projects, monitoring and reporting requirements and post construction stormwater management techniques. Approximately 172 municipal staff and contractors attended this training.
- Construction Site Stormwater Compliance Workshop, May 19, 2010 (SCVWD, San Jose) – The workshop focused on the requirements in the new CGP, with emphasis on the new monitoring and reporting requirements, linear utility projects and the SMARTS web tool for submitting permit-required documents. Approximately 62 municipal staff attended this training.

The agendas, attendance lists and evaluation summaries for these workshops are provided in Appendix 6-1. Presentations given at the workshops are available on the Program website www.scvurppp.org.

The Program also purchased subscriptions to the new CASQA Construction BMP Handbook portal for Co-permittees' use.

■ Regional Activities

Program staff participated in the BASMAA Development Committee, which identified the following regional activities related to Construction Site Control: 1) development of the annual reporting format for construction inspection data summaries required by the MRP; and 2) update of construction BMP outreach materials. Program staff developed the C.6. annual reporting format for the Committee's review and revised the format in response to Committee members' and Water Board staff's comments. The Committee determined that the existing regional outreach materials, including "Blueprint for a Clean Bay", BMP Plan Sheet and BMP tri-fold brochures, needed to be redone based on the intended audiences and the inspectors' needs. This task will be conducted in FY 10-11.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 7

Public Information and Outreach

September 15, 2010

Section 7 Public Information and Outreach

Introduction

The goals of the Public Information and Outreach (Public Information and Participation or PI/P) element of the Program are to identify and change behaviors that adversely affect water quality, and to increase the understanding and appreciation of streams and the Bay. The Program's FY 09-10 PI/P Work Plan provided a strategy to achieve these education and public participation goals with specific projects funded in the Program's FY 09-10 budget.

Highlights of the accomplishments of FY 09-10 PI/P projects and ongoing projects from previous years are described in the sections below according to permit requirements.

FY 09-10 PI/P projects included the following:

- Program Activities
  - Advertising Campaign – Watershed Watch Campaign
  - Public Outreach Events
  - Citizen Involvement Events - Watershed Watchers Program at the Don Edwards San Francisco Bay National Wildlife Refuge, and funding for advertising the National River Cleanup Day.
  - School-Age Children Outreach - ZunZun School Assemblies and Watershed Watchers Program at the Don Edwards San Francisco Bay National Wildlife Refuge.
- Regional Activities
  - BASMAA Media Relations Project
  - BASMAA IPM Store Partnership Program
  - BASMAA Regional Advertising Campaign

FY 09-10 Program Activities

C.7.b. Advertising Campaigns

The cornerstone of the Program's outreach activities is the Watershed Watch Campaign (Campaign). The Watershed Watch Campaign completed 10 years of implementation (and 9 years of advertising) in FY 09-10. The Campaign implemented various outreach activities including media advertising.

A draft FY 09-10 Campaign Work Plan was submitted with the Program's FY 09-10 Work Plan on March 1, 2009 and is included within Appendix 7-1. The Watershed Watch Media Advertising Plan, completed in June 2009 is also included within Appendix 7-1.

The following describes tasks completed by the Program's consultant, with assistance from Program and Co-permittee staff, during FY 09-10. The detailed Watershed Watch Campaign and Media Report is included in Appendix 7-1.

- **Task 1: Creative Development** –Updated Spanish "Green Gardener" class radio spot with fall 2009 class date information. Developed new television and transit (bus back posters).
- **Task 2: Media Advertising** – Conducted a media promotion consisting of print, radio, television, and transit advertising. Advertisements ran from August 2009 to June 2010. Media buys included 27 (26 paid and one free) print advertisements, 722 (466 paid and 256 free) radio advertisements, 3,054 (1,456 paid and 1,598 free) television advertisements, and 50 (33 paid and 17 free) transit advertisements. The net advertising budget for media was $80,402. This includes$3,000 contributed by the cities of Sunnyvale, Milpitas and Cupertino transit advertising on litter. Media partners provided a total added value package of benefits and resources of $203,807.58. The Campaign also began using social networking media, i.e., Facebook and Twitter to conduct outreach. Additional details on the media campaign are in the Watershed Watch Campaign Annual Report included in Appendix 7-1.
- **Task 3: Partnership Development and Coordination** – Continued development of the partner database and conducted meetings with potential partners. Developed six new partnerships, including two community/business partners (Jiffy Lube and Happy Hollow) and three media partners (KBRG Spanish Radio, Yahoo.com/MercuryNews.com, Valley Transit Authority, and Lamar Transit). Jiffy Lube and Happy Hollow are offering discounts to customers using the Watershed Watch discount card. A list of current partners is provided in Appendix 7-2.
- **Task 4: Added Value Development** – As a result of media partnership negotiations and community partnership activities, the Campaign received significant added-value resources. These include free advertising, partnership discounts, live promotions, etc. The estimated total added-value to the FY 09-10 Campaign from partners (community and media) is $133,521. Additional details are included in the Watershed Watch Campaign Annual Report included in Appendix 7-1.
- **Task 5: Website Maintenance** – Implemented a major update of the Watershed Watch website. The updated website was launched on April 5, 2010. Continued to maintain the Watershed Watch website. The Watershed Watch Web Statistics Report is included in Appendix 7-3.
- **Task 6: Events Coordination** – Coordinated and attended community outreach events. The consultant staffed five outreach events including three promotional car wash events.
- **Task 7: Public Relations** – Pitched an article about the Santa Clara Valley Green Gardener Program to El Observador. It ran in the September 25, 2009 publication. Began using social networking sites (Facebook and Twitter) to promote Campaign messages.
- **Task 8: FY 10-11 Work Plan and FY 09-10 Annual Report Development** – Developed the FY 10-11 Work Plan and the FY 09-10 Campaign and Media Report. Submitted monthly Campaign reports to the Management Committee.

Evaluation of Effectiveness

Many factors indicate that the FY 09-10 Watershed Watch Campaign was a success (see the FY 09-10 Watershed Watch Campaign Report in Appendix 7-1). Some of these include:

- The continued successful partnership with Classic Car Wash and Premier Car Wash;
- Developed six new partnerships, KBRG Spanish Radio, Valley Transit Authority, Yahoo.com/MercuryNews.com, Lamar Transit, Happy Hollow Park and Zoo and Jiffy Lube. In addition, key contacts have been made for other potential new partners in the new fiscal year;

- The large number of gross impressions made by media advertising 23,193,670;
- Media partners provided $129,405 in added-value resources, which greatly supplemented the Campaign's total media buy of $80,402; and
- The completion of all tasks in the FY 09-10 scope of work, with active participation of Program and Co-permittee staff.

C.7.c. Media Relations – Use of Free Media

On February 6, 2010, the Action Line Column in the *San Jose Mercury News* included a letter about draining pool water. This letter offered a good opportunity to educate *San Jose Mercury News* readers about the proper draining of pools and spas. Program staff developed a response and emailed it to Action Line columnist Dennis Rockstroh. Mr. Rockstroh printed the Program's response in his column on February 24, 2010. It included links to the Watershed Watch website and the online version of "Draining Pools and Spas" brochure. A copy of the response is included in Appendix 7-8.

During FY 09-10, the Program also participated in the BASMAA Media Relations Project which conducted three pitches. The pitches were on pesticides, car washing, and litter, relating specifically to plastic bags.

Evaluation of Effectiveness

The pitches resulted in thirty-eight media placements: six in print; eleven on the radio; and twenty-one online (this included radio station and newspaper websites). Additional details are included in the BASMAA Media Relations Final Report included in Appendix 7-8.

C.7.d. Stormwater Point of Contact

Program's Toll-Free Telephone Numbers

The Program maintained two toll free telephone numbers, the Program's information number (800-794-2482) and the Watershed Watch hotline (866-WATERSHED), for calls from the general public and requests for information. Program and Watershed Watch consultant staff continued to maintain the Program and Watershed Watch websites respectively.

Individual agency points of contact are publicized on Program outreach materials and websites and the point of contact is maintained by the Program and their authorized agents. The Management Committee Contact List and the Construction-Illegal Discharge-Industrial Inspection Contact List are included in Appendix 7-4.

Evaluation of Effectiveness

The Watershed Watch website continued to receive a large number of visits this year. Program staff received 27 requests on the Watershed Watch website for outreach materials, and 18 requests for information. Program staff also responded to approximately 20 calls from the public in FY 09-10. Material requests were mailed to residents within the United States.

C.7.e. Public Outreach Events

Program staff, the Watershed Watch consultant, and Co-permittees staffed ten events at which IPM and storm water pollution prevention outreach was conducted. Events were selected based upon target audience and expected attendance. Outreach events in FY 09-10 included:

- Pumpkins in the Park, October 10, 2009
- Muslim Green Fair, October 18, 2009
- Haunted History, October 31, 2009
- Spring Garden Market, April 10, 2010
- NVIDIA Corp. Earth Day Event, April 22, 2010
- Spring in Guadalupe Gardens, April 24, 2010
- Robertsville Classic Car Wash, May 5, 2010
- Delta Queen Classic Car Wash, May 19, 2010
- Capitol Premier Car Wash, June 2, 2010
- Festival in the Park, June 26, 2010

Staff distributed the following brochures at the events: Less-Toxic Pest Management fact sheets, "10 Most Wanted Backyard Bugs" brochures, "You are the Solution to Water Pollution" brochures, "Clean Cars & Clean Creeks" brochures, and giveaways (e.g. flyswatters, OWOW magnets, notepads, and temporary tattoos). The flyswatters have the Watershed Watch website and hotline number and the words "The Original Earth-Friendly Pest Control" printed on them. The beanbag game for children was used at most of the outreach events.

Evaluation of Effectiveness

Event staff distributed approximately 5,176 fact sheets, brochures and giveaways. Additional details on each event are provided in Table C.7.e Outreach Events Reporting.

C.7.f. Watershed Stewardship Collaborative Efforts

Santa Clara Basin Watershed Management Initiative (SCBWMI)

During FY 09-10, the Program continued to participate in the Santa Clara Basin Watershed Management Initiative (SCBWMI). Program staff participated in the following activities:

- Core Group participation – Program staff participated in the WMI Core Group and reviewed work products as needed.
- Trash Summit – In FY 09-10, the WMI launched a "Zero Litter Initiative" (ZLI) to address litter problems in Santa Clara Valley. Program staff participated in ZLI meetings and helped plan the WMI Trash Summit held on May 10, 2010. The Program provided funding to purchase lunch for Summit participants. Additional information about the ZLI and its relationship to SCVURPPP trash control activities is presented in Section 10 of this Annual Report.
- Product Action Committee (earlier called Product Stewardship Committee) – Program staff participated in the WMI Product Action Committee. The Committee began planning a "Plastics

Summit", to be held in fall 2010. The Summit will bring together interested parties to talk about plastic litter issues at local, state, national and international levels. The Program also continued to financially support and track the efforts of the California Product Stewardship Council.

- SCBWMI Land Use Subgroup – Program staff participated in the SCBWMI Land Use Subgroup (LUS) and implemented the following activities:
  - Prepared meeting agendas and meeting summaries
  - LUS initiated collaboration with the Going Native Garden Tour (GNGT) to help incorporate gardens featuring watershed-friendly site designs into their 2011 tour. Program staff provided input for modifying the 2011 Garden Submission Form to capture information on watershed-friendly site designs. In addition, LUS began coordinating with Acterra to update the "Soak it Up!" brochure.
  - Assisted with developing the advanced track of the Program's annual C.3 Workshop held on June 8, 2010. Specific tasks included identifying and coordinating speakers for the advanced track which included low impact development topics such as rainwater harvesting, green roofs, soil specifications, and retrofitting impervious areas with landscaping.

Going Native Garden Tour

The Program provided funding to support the Going Native Garden Tour (GNGT) held on April 18, 2010. There were approximately 12,447 visits to the gardens. The tour featured 67 gardens that demonstrated environmentally sensitive gardening practices with an emphasis of reduced water use, reduced chemical and pesticide use and improved habitat using California native plants. The GNGT Summary Report is included in Appendix 7-5

C.7.g. Citizen Involvement Events

The Program provided funding for the following citizen involvement events:

1) Citizen involvement events at the Don Edwards San Francisco Bay Wildlife Refuge (Refuge) – A number of citizen involvement and stewardship programs were conducted as part of the Program funded Watershed Watchers Program at the Refuge. Participants worked in the Refuge gardens planting native plants, pulling non-native plants, and mulching. More details are included in the Watershed Watchers Report in the Program Annual Report Appendix 7-6.
2) National River Clean-up Day – The Program provided funding to conduct advertising to promote the National River Clean-up Day held on May 15, 2010.

Evaluation of Effectiveness

Citizen Involvement Events at the Refuge – Approximately 57 people participated in the citizen involvement events conducted at the Refuge.

Creek Clean-up Events - In FY 09-10, the Creek Connection Action Group sponsored two creek clean-up events: Coastal Clean-up Day on September 19, 2009 and National River Clean-up Day on May 15, 2010. The Program provided financial support for one of the events (National River Clean-up Day). During National River Clean-up Day, a total of 1,068 volunteers participated in cleaning 34 sites and removed approximately 29,098 pounds of trash and 6,394 pounds of recyclables. During the course of both

clean-up events, a total of 2,554 volunteers participated in cleaning 69 sites and removed approximately 66,164 pounds of materials (trash and recyclables) from local creeks.

Results by clean-up event for FY 09-10 are as follows:

	Coastal Clean-up Day September 19, 2009	National River Clean-up Day May 15, 2010	Total
Number of sites	35	34	69
Number of volunteers	1,486	1,068	2,554
Pounds of recyclables	7,499	6,394	13,893
Pounds of trash	23,173	29,098	52,271
Pounds of material (trash plus recyclables)	30,672	35,492	66,164

To evaluate the effectiveness of the two annual creek clean-up events, data from the past ten years of events were compiled and reviewed. The table below presents the total numbers of sites, numbers of volunteers, and pounds of materials collected each year.

Summary Results of Creek Clean-up Events, September 1998 – June 2010

	No. of sites	No. of volunteers	lbs. of recyclables	lbs. of trash	Total lbs. collected	Average lbs./site
FY 00-01	41	1,745	n/a	58,108	58,108	1,417
FY 01-02	37	1,742	13,750	59,340	73,090	1,975
FY 02-03	48	2,091	8,071	44,883	52,954	1,103
FY 03-04	56	1,943	6,537	36,718	43,255	778
FY 04-05	61	1,618	7,890	39,730	47,620	781
FY 05-06	55	1,458	4,110	29,248	33,358	607
FY 06-07	44	1,631	15,394	52,067	67,461	1,533
FY 07-08	51	1,534	23,570	49,194	72,764	1,427
FY 08-09	56	2,298	38,960	123,591	162,551	2,903
FY 09-10	69	2,554	13,893	52,271	66,164	958
Annual Average	52	1,861	14,686	54,515	67,733	1,348
Total	518	18,614	132,175	545,150	677,325	13,482

Beginning in FY 01-02, some site managers implemented a procedure for separating out recyclable materials from trash prior to weighing it. Thus, the total pounds of material collected are the sum of the recyclables and trash quantities. According to the Santa Clara Valley Water District, this procedure is done more frequently at Coastal Clean-up Event sites than at National River Day sites. Since this procedure is not done at all sites, it is more appropriate to compare the total quantities of materials collected rather than the individual components.

The total amount of trash and recyclables collected during the two creek cleanup events each year are plotted in the figure below:

The average pounds of trash and recyclables collected at each site during the two creek cleanup events each year are plotted in the figure below:

The data in the table and figures indicate that the total amount of trash and recyclables collected shows a decreasing trend from FY 00-01 to FY 05-06, but an increasing trend from FY 06-07 to the present. This increase is related to targeting and addressing the most problematic trash problem areas (not including homeless encampments) with significant amounts of trash. In the past, some sites were chosen due to their familiarity and close proximity to certain local organizations participating in the creek cleanup. In some instances, these sites did not have significant levels of trash. In addition, the number of sites and the number of volunteers increased in FY 09-10.

Volunteers are becoming more aware of current trash issues within local creeks and the San Francisco Bay. As a result, the level of effort of removing all observed trash and recyclables has increased

resulting in more thorough trash cleanups. Co-permittees intend to continue participating in future creek cleanups, as they provide a valuable opportunity for citizen participation as well as an important element of a trash management program.

Table C.7.g. describes the Program-funded FY 09-10 citizen involvement events including evaluation of effectiveness.

C.7.h. School-Age Children Outreach

ZunZun Musical Assembly

Each year the Program sponsors up to 50 ZunZun assemblies at elementary schools in the Santa Clara Valley. These bilingual musical assemblies educate elementary school students and their teachers on watersheds and urban runoff pollution prevention. ZunZun performances use physical comedy, audience participation and musical instruments to educate teachers and children about watersheds and stormwater pollution prevention.

The Program's Schools and Youth Education and Outreach Work Group provide a list of schools for ZunZun to contact. In addition to schools with high Hispanic populations, the list includes schools with high Asian/Pacific Islander populations. A list of 170 schools was provided to ZunZun in FY 09-10.

Evaluation of Effectiveness

In FY 09-10, ZunZun conducted 47 assemblies at elementary schools in Santa Clara Valley. In addition, two assemblies were conducted at the Pumpkins in the Park event and one at the Water Wizards festival. The assemblies reached approximately 14,161 students and their teachers in grades K-6.

ZunZun assemblies were evaluated using postage-paid evaluation cards that were distributed to all teachers present at the performances. The Program received completed evaluation cards from 130 teachers. Overall, the feedback has been very positive and indicates an increase in the students' knowledge about watersheds and pollution prevention. The FY 09-10 Teacher Evaluation Report and the FY 09-10 ZunZun School Assembly Report are included in Appendix 7-7.

Watershed Watchers Program at the Refuge

The Program funds an interpretive specialist position to conduct the Watershed Watchers Program at the Refuge. The Watershed Watchers program conducts numerous activities and sessions to educate children about watersheds and urban runoff pollution prevention. These include marsh walks, gardening events, bird watching, wildlife observation etc.

Evaluation of Effectiveness

In FY 09-10, Refuge staff conducted 104 educational activities and sessions, attracting a total of approximately 3,659 people. Participants included 80 pre-kindergarteners, 1,359 elementary school students, 33 middle school students, and 199 high school students. A copy of the Watershed Watchers Fourth Quarter Report is included in Appendix 7-5.

Additional details on the Program's schools outreach activities are included in Table C.7.h. School- Age Children Outreach.

■ FY 09-10 Regional Activities

The Program participated in the BASMAA PIP Committee which implemented the following projects:

Media Relations Campaign – The BASMAA Media Relations Project conducted three pitches in FY 09-10. The pitches were on pesticides, car washing, and litter caused by plastic bags. The pitches resulted in thirty-eight media placements: six in print; eleven on the radio; and twenty-one online (this included radio station and newspaper websites). More details are included in the BASMAA Media Relations Final Report included in Appendix 7-8.

Regional IPM Partnership Program – The Regional IPM Partnership Program (also known as *Our Water, Our World* program) implemented the following activities in FY 09-10.

- Coordinated program implementation with major chains Home Depot, Orchard Supply Hardware, and Ace Hardware National. OSH reported "natural insecticides" sales up 8.5% compared to previous year. Home Depot increased their less toxic offerings 17.2%.
- Coordinated a master print run of the following: fact sheets, shelf talkers, literature rack signage, banner, beneficial bug brochure, business card, magnet, Pest or Pal activity guide for kids, pocket guide, and Pests Bugging You? booklet.
- Updated less-toxic Product Lists: Master – by brand name version; by pest version, and OSH and Home Depot-specific lists/labels.
- Maintained the *Our Water, Our World* website , and provided the Ask-the-Expert service.
- Provided and staffed exhibitor booths at the following events:
  - Excel Gardens Dealer Show (August 2009)
  - Ace Hardware National Show (October 2009) (see attached photo)
  - L&L Dealer Show (October 2009)
  - NorCal trade show (February 2010)
- Provided on-call assistance (e.g., display set-up, training, IPM materials review) to specific stores (e.g., OSH, Walgreens).
- Conducted print advertising in the Green Zebra guide, Bay Nature magazine, and Bringing Back the Natives Garden Tour's garden guide.
- Provided assistance to supplier Excel Garden Products to identify all their less toxic products and to include mention of *Our Water, Our World* in their catalog.
- Made presentations at the following events:
  - Excel Gardens Dealer Show (August 2009)
  - Urban Pesticide Committee (September 2009)

Additional details and copies of advertisements are included in Appendix 9-3 Regional IPM Partnership Report.

Regional Advertising Campaign – Through the BASMAA Public Information / Participation (PI/P) Committee, Permittees decided in December 2009, shortly after the MRP took effect, to take a broader

view of some of its regional tasks (e.g., Regional Advertising Campaign, Regional Media Relations, *Our Water, Our World* program) to ensure that work on individual MRPprovisions was coordinated and part of an overall strategy. The broader strategy will include all audiences related to the MRP provisions and ways of reaching them (e.g., advertising, media relations, schools outreach, events). Although the scope of the strategy will be broad, the level of stormwater agency (regional, areawide program, city) implementing each part will vary (i.e., each part will not be implemented via BASMAA). The strategy will be multi-year and also include recommendations for creative, media placement, media relations, partnerships, and evaluation. During the remaining portion of FY 09-10, the PI/P Committee developed and released a Request for Qualifications, and interviewed and selected a firm to develop a Regional Outreach Strategic Plan.

Regional Point of Contact - BASMAA continued to maintain the Baywise website (www.Baywise.org) as a regional point of contact. In FY 09-10, BASMAA enhanced the website by listing and/or linking to member programs' lists of points of contact, and contact information for the stormwater agencies in the Bay Area.

C.7.e. ► Public Outreach Events - Outreach Events Reporting Table

Program staff, the Watershed Watch consultant, and Co-permittees staffed ten outreach events in FY 09-10. Events were selected based upon target audience and attendance. Materials distributed at the events included the following: Less Toxic Pest Management fact sheets, "10 Most Wanted Backyard Bugs" brochures, "Don't Plant a Pest" brochure, "You are the Solution to Water Pollution "brochures, "Clean Cars & Clean Creeks" brochure, and giveaways (e.g. flyswatters, OWOW magnets, notepads, and temporary tattoos). The flyswatters have the Watershed Watch website and hotline number and the words "The Original Earth-Friendly Pest Control" printed on them. The beanbag game for children was used at most of the events. Event staff distributed more than 5,000 outreach materials and giveaways.

Event Details	Focus & Short Description	Evaluation of Effectiveness
Name: Pumpkins in the Park Date: October 10, 2009 Location: Guadalupe River Park and Gardens, San Jose Region: Countywide	Type of Event: Community fair Audience: Families with children Message: Stormwater pollution prevention, less-toxic pest control and, proper disposal of household hazardous waste (HHW).	General Feed Back: The event was very well attended. A lot of attendees stopped at the booth to play the bean bag game and pick up brochures. This is a good event for educating families with children. Estimated Overall Event Attendance: 12,000-14,000. Number of Brochures Distributed: 432 Number of Giveaways Distributed: over 1,000
Name: Muslim Green Fair Date: October 18, 2009 Location: 3003 Scott Blvd., Santa Clara Region: Countywide	Type of Event: Community fair Audience: Families with children Message: Stormwater pollution prevention, less-toxic pest control and, proper disposal of HHW	General Feed Back: This is a good event for reaching members of the Muslim community. The bean bag game was used at this event. Estimated Overall Event Attendance: 1,000 Number of Brochures Distributed: 14 Number of Giveaways Distributed: 221
Name: Haunted History Date: October 31, 2009 Location: History Park at Kelley Park, San Jose Region: Countywide	Type of Event: Halloween Event Audience: Families Message: Stormwater pollution prevention.	General Feed Back: This event is good for getting the Program's name out, but not for educating attendees. Most children stop at the booth only for candies and are not receptive to information. Estimated Overall Event Attendance: 1,500 Number of Brochures Distributed: 12 Number of Giveaways Distributed: 267
Name: Spring Garden Market Date: April 10, 2010 Location: History Park at Kelley Park, San Jose Region: Countywide	Type of Event: Plant sale Audience: Home owners/gardeners Message: Stormwater pollution prevention, less-toxic pest control	General Feed Back: Most people came to the event to buy plants and did not want to pick up information. The Program will probably not attend this event next year. Estimated Overall Event Attendance: 3,000 Number of Brochures Distributed: 181 Number of Giveaways Distributed: 61
Name: NVIDIA Corp. Earth Day Event Date: April 22, 2010 Location: 2701 San Tomas Expwy, Santa Clara Region: Countywide	Type of Event: Corporate event Audience: Information Technology Professionals Message: Stormwater pollution prevention, less-toxic pest control	General Feed Back: The event was held during lunch hour in the cafeteria and very well attended. Most employees stopped at the booth to ask questions and take brochures. Estimated Overall Event Attendance: 500 Number of Brochures Distributed: 60 Number of Giveaways Distributed: 183

045493

C.7.e. ► Public Outreach Events - Outreach Events Reporting Table

Event Details	Focus & Short Description	Evaluation of Effectiveness
Name: Spring in Guadalupe Gardens Date: April 24, 2010 Location: Guadalupe River Park and Gardens, San Jose Region: Countywide	Type of Event: Community fair, plant sale. Audience: Families with children, homeowners and gardeners Message: Stormwater pollution prevention, less-toxic pest control and, proper disposal of HHW.	General Feed Back: Good attendance at booth. Most people were looking for specific pest control information. The bean bag toss game was used. Estimated Overall Event Attendance: 4,500 Number of Brochures Distributed: 423 Number of Giveaways Distributed: 797
Name: Watershed Watch Car Wash Event Date: May 5, 2010 Location: Robertsville Classic Car Wash, 5005 Almaden Expwy, San Jose Region: Countywide	Type of Event: Car Wash Audience: Car wash customers Message: Stormwater pollution prevention, proper car washing.	General Feed Back: Excellent turn-out, resulted in a 50% increase of business for the car wash during the 2-hour time period. Event staff spoke with customers and provided them information on proper car washing. Most people were interested in taking the Watershed Watch discount card. Estimated Overall Event Attendance: 150 Number of Brochures Distributed: 103 Number of Watershed Watch Discount Cards Distributed: 129
Name: Watershed Watch Car Wash Event Date: May 19, 2010 Location: Delta Queen Classic Car Wash, 981 E Hamilton Ave, Campbell Region: Countywide	Type of Event: Car Wash Audience: Car wash customers Message: Stormwater pollution prevention, proper car washing.	General Feed Back: Due to a rainy day forecast, attendance was low at this event. Estimated Overall Event Attendance: 45 Number of Brochures Distributed: 34 Number of Watershed Watch Discount Cards Distributed: 49
Name: Watershed Watch Car Wash Event, Date: June 2, 2010 Location: Capitol Premier Car Wash, 735 Capitol Expwy Auto Mall, San Jose Region: Countywide	Type of Event: Car Wash Audience: Car wash customers Message: Stormwater pollution prevention, proper car washing.	General Feed Back: Good turn-out. Car wash owner indicated there was an increase in business from their normal expectations. Estimated Overall Event Attendance: 100 Number of Brochures Distributed: 101 Number of Watershed Watch Discount Cards Distributed: 107
Name: Festival in the Park Date: June 26, 2010 Location: Hellyer County Park, San Jose Region: Countywide	Type of Event: Community Health Fair Audience: Families with children. Message: Stormwater pollution prevention, less-toxic pest control and, proper disposal of HHW.	General Feed Back: Good event for reaching the Hispanic community. The bean bag game drew a lot of families with children to the booth. Estimated Overall Event Attendance: 5,000 Number of Brochures Distributed: 418 Number of Giveaways Distributed: 365

045494

C.7.g. ►Citizen Involvement Events

The Program provided funding for the following citizen involvement events:

1) National River Clean up Day – The Program supports the involvement of Santa Clara County citizens by providing advertising support for the National River Clean-up Day.
2) Citizen involvement events at the Don Edwards San Francisco Bay Wildlife Refuge (Refuge) – A number of citizen involvement and stewardship programs are conducted as part of the Program funded Watershed Watchers Program at the Refuge. Participants usually work in the Refuge gardens planting native plants, pulling non-native plants, and mulching. More details are included in the Watershed Watchers Report in the Program Annual Report Appendix 7-5.

Event Details	Description	Evaluation of effectiveness
Name: Summer of Service Programs Date: 7/16/09, 7/30/09, 8/13/09 Location: Don Edwards Wildlife Refuge, Alviso Focus: Countywide	Partnership program between Santa Clara Valley youth groups and the Watershed Watchers program. Youth spend a day at the Refuge and they work in the gardens in the morning and explore the Refuge in the afternoon.	Number of attendees on 7/16/09: 2 elementary school students and 6 middle school students. Number of attendees on 7/30/09: 10 middle school students. Number of attendees on 8/13/09: 8 middle school students.
Name: Gardening at the Refuge Date: 11/21/09 Location: Don Edwards Wildlife Refuge, Alviso Focus: Countywide	Participants usually work in the Refuge gardens planting native plants, pulling non-native plants, and mulching.	Number of attendees: 4 elementary school students, 2 high school students, and 9 adults.
Name: Community Service Days Date: 1/16/10, 3/20/10, 4/17/10, 5/17/10 Location: Don Edwards Wildlife Refuge, Alviso Focus: Countywide	This is an open day for the general public. Participants work in the gardens planning native plants, puling non-native plants, and mulching.	Number of attendees on 1/16/10:1 elementary school student, 1 high school student, and 6 adults. Number of attendees on 3/20/10: 1 elementary school student and 6 adults. Number of attendees on 4/17/10: 4 elementary school students and 4 adults. Number of attendees on 5/17/10: 13 elementary school students and 7 adults.
Name: National River Cleanup Day Date: 5/15/10 Location: Various locations throughout the County Focus: Countywide	In FY 09-10, the Creek Connection Action Group sponsored two creek clean-up events: Coastal Clean-up Day on September 19, 2009 and National Rivers Clean-up Day on May 15, 2010. The Program provided funding for the National Rivers Clean-up Day advertising.	A total of 1,068 volunteers participated in cleaning 34 sites and removed approximately 29,098 pounds of trash and 6,394 pounds of recyclables from creeks.

045495

C.7.h. ►School-Age Children Outreach

Outreach to school-age children is implemented through ZunZun assemblies at local elementary schools and the "Watershed Watchers" program at the Environmental Education Center at the Don Edwards San Francisco Bay Wildlife Refuge (Refuge) in Alviso. The Program sponsors up to 50 ZunZun assemblies at elementary schools in Santa Clara Valley and funds an Interpretive Specialist position at the Refuge for conducting activities and programs about watershed and urban runoff pollution prevention. The Fourth Quarter "Watershed Watchers" Report including the End-of-Year summary is included in the Program Annual Report Appendix 7-5. The ZunZun Final Report is included in the Program Annual Report Appendix 7-7.

Program Details	Focus & Short Description	Number of Students/Teachers reached	Evaluation of Effectiveness
Name : ZunZun Musical Assembly Grade or level: elementary	Interactive, musical school assemblies educating K-6 children about watersheds and pollution prevention.	14,161 students	ZunZun assemblies were evaluated using postage-paid evaluation cards that were distributed to all teachers present at the performances. The Program received 130 completed evaluation cards from teachers. Overall, the feedback is positive and indicates an increase in the students' knowledge about watersheds and pollution prevention. A few highlights of the evaluations are: • Twenty-two teachers indicated that after the performance, 50% of their students knew what a watershed is; 51 teachers indicated that 75% of their students knew what a watershed is and 28 teachers indicated that 100% of their students knew what a watershed is. • Eight teachers indicated that after the performance, 50% of their students could name a way to prevent pollution in the watershed; 38 teachers indicated that 75% of their students could name a way to prevent pollution in the watershed; and 78 teachers indicated that 100% of their students could name a way to prevent pollution in the watershed. The Final Teacher Evaluation Report is included in the Program Annual Report Appendix 7-7.

045496

C.7.h. ►School-Age Children Outreach

Program Details	Focus & Short Description	Number of Students/Teachers reached	Evaluation of Effectiveness
Name: Watershed Watchers Program at Don Edwards Wildlife Refuge in Alviso Grade or level: elementary, middle, high school	The Refuge offers a number of interpretive programs to educate children and youth about preventing urban runoff pollution. These include: Bike the Levees; Discover Native Species; Habitat Exploration; Living Wetlands; Marshes, Mud and Plankton; Quackers and Honkers; and Water Water Everywhere.	80 pre-kindergarteners, 1,359 elementary school students, 33 middle school students, and 199 high school students	Visitor Surveys are used to determine visitor demographics, effectiveness of publicity, and the effectiveness or the Watershed Watchers Program. In addition, an "Urban Runoff Bead Drop" display is used to record actions (e.g., pick up litter, spread the word, take car to car wash) that children promise to do the help keep storm drains clean. Results of both these evaluation mechanisms are summarized in the Watershed Watchers Fourth Quarter Report included in the Program Annual Report Appendix 7-5.

Urban Runoff
Pollution Prevention Program

Section 8

Water Quality Monitoring

September 15, 2010

Section 8 Water Quality Monitoring

Introduction

Since its inception, the Program has maintained an effective and scientifically sound water quality monitoring program that has provided Co-permittees, the Water Board and other stakeholders with invaluable information on the condition of water quality and associated beneficial uses in Santa Clara Basin creeks and the San Francisco Bay Estuary (Bay). Provision C.8 of the MRP requires Co-Permittees to continue conducting water quality monitoring and associated projects during the Permit term. Although monitoring requirements have become more prescriptive and expanded significantly under the MRP, the goal generally remains the same - develop high quality information on water quality in local creeks and the Bay that leads to effective municipal stormwater management.

Water quality monitoring activities were conducted at the Program and regional levels during FY 09-10. This section provides a summary of water quality monitoring activities/projects conducted at each level. Summaries of the following C.8 sub-provisions, organized by Permit provision or by major heading (both marked in bold), are included in this section:

- Compliance Options (C.8.a)
- San Francisco Estuary Receiving Water Monitoring (C.8.b)
- Creek Status Monitoring (C.8.c)
- Monitoring Projects (C.8.d)
- Pollutants of Concern and Long-Term Trends Monitoring (C.8.e)
- Citizen Monitoring and Participation (C.8.f)
- Reporting (C.8.g)
- Monitoring Protocols and Data Quality (C.8.h)

Program Activities

C.8.a. Compliance Options

Provision C.8.a allows Permittees to address monitoring requirements through a “regional collaborative effort”, their stormwater program and/or individually. On June 29, 2010, Co-permittees notified the Water Board in writing of their agreement to participate in a regional monitoring collaborative to address all requirements in Provision C.8. The regional monitoring collaborative is referred to as the BASMAA Regional Monitoring Coalition (RMC). The RMC is focused on providing a forum to implement regionally consistent creek monitoring approaches and designs in the Bay Area, through the improved coordination among existing Bay Area municipal stormwater monitoring programs; and, in turn stabilizing the costs of creek monitoring by reducing duplication of effort and streamlining reporting. Participation in the RMC is coordinated by stormwater program and/or Co-permittee representatives (or equivalent), and facilitated through the BASMAA Monitoring and Pollutants of Concern Committee (MPC), which meets monthly.

With notification of participation in the RMC, Co-permittees are required to commence water quality data collection by October 2011. Therefore, with the exception of monitoring described under Provision C.8.b (San

Francisco Estuary Receiving Water Monitoring), Co-permittee efforts in FY 09-10 were generally focused on the development of the RMC and associated near-term projects. To better define the scope of the RMC and its implementation over the term of the MRP, Program staff took the lead on developing a Draft RMC Work Plan (Draft RMC Work Plan), which includes over 30 RMC monitoring projects and associated project schedules. Many RMC monitoring tasks were approved by the BASMAA Board of Directors (BOD) and began in FY 09-10. Others are being considered for funding by the BOD in FY 10-11 and future fiscal years through annual planning.

Status reports for monitoring activities coordinated through the RMC are included in Section 15 – Regional Supplement for Pollutants of Concern (POCs) and Monitoring. Monitoring activities coordinated through the Program in FY 09-10 are further described in this section.

C.8.b. San Francisco Estuary Receiving Water Monitoring

In compliance with Provision C.8.b, Co-permittees are required to contribute their fair-share financially on an annual basis towards implementing an Estuary receiving water monitoring program that at a minimum is equivalent to the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP). During FY 09-10, Co-permittees complied with this Provision by contributing a total of $178,000 to the RMP. In addition, Program and Co-permittee staff actively participated in RMP committees and work groups. Specifically, on behalf of all BASMAA member agencies, the Program Manager provides representation on the RMP Steering Committee and Program's watershed monitoring and assessment coordinator sits on the RMP's Technical Review Committee and a number of work groups and strategy teams. Additional information on the RMP, including monitoring results and conclusions, can be found on the San Francisco Estuary Institute's website (www.sfei.org/rmp/).

C.8.d. Monitoring Projects

Provision C.8.d.i requires Co-permittees (through the Program or RMC) to conduct stressor/source identification studies based on receiving water data conducted through creek status monitoring. In previous fiscal years, the Program collected status monitoring data in the mainstem of Coyote Creek. In FY 09-10, the Program began planning a monitoring project designed to better characterize water quality in the mainstem by conducting continuous water quality monitoring of pH, dissolved oxygen, conductivity, temperature and turbidity during the late summer and fall of 2010.

The monitoring project is intended to answer the following questions related to water quality in Coyote Creek, with a focus on dissolved oxygen and turbidity concentrations during the late summer season and the first runoff event of the wet weather season:

1. What is the diurnal variability in dissolved oxygen concentrations?
2. What is the spatial variability of dissolved oxygen and turbidity concentrations?
3. How does water quality change during and following the first runoff event of the season?
4. To what extent do monitoring results provide information to identify and prioritize potential stressors or sources?

The monitoring project will be implemented by the Program, the City of San Jose and the Santa Clara Valley Water District (SCVWD). The Program/agencies will collaborate together to calibrate, deploy and retrieve continuous monitoring equipment at nine locations in Coyote Creek. Monitoring equipment will

be deployed for three sampling events starting in August 2010. The last sampling event will target the first runoff event of the season. For each event, the equipment will be deployed over a roughly two-week period. Continuous monitoring equipment will be programmed to collect dissolved oxygen (DO), conductivity, pH, turbidity, and temperature at 15-minute intervals.

As part of the monitoring project plan development, Program staff developed Standard Operating Procedures (SOPs) for continuous water quality monitoring probes that will be utilized for this and future projects. Once data collection is completed, the Program will compile all water quality data and present the results in a summary report, which will likely be included in Program's FY 10-11 Annual Report.

Bay Area Macroinvertebrate Bioassessment Information Network (BAMBI)

The increased interest in bioassessment within the Bay Area spawned the formation of the Bay Area Macroinvertebrate Bioassessment Information Network (BAMBI) in February 2002. BAMBI is a network of scientists, watershed managers, regulators and community members interested in using biological communities (i.e., benthic macroinvertebrates or BMI) as indicators of stream health in the San Francisco Bay Area. The goal of BAMBI is to maximize the utility of aquatic bioassessment in the Bay Area by developing a programmatic and analytical framework for the collection, sharing, analysis and use of bioassessment data. Specific activities conducted by BAMBI in FY 09-10 are presented below. Additional information on BAMBI is provided at the following website: www.bayareabugs.org.

BAMBI 2010 Annual Meeting

Since 2002, Program staff has coordinated an Annual BAMBI meeting where bioassessment data and analyses can be presented from a local, regional or state perspective. On February 16, 2010, the eighth annual BAMBI meeting was held in Oakland. The agenda for the annual meeting is included within Appendix 8-1. Presentations can be found at www.bayareabugs.org.

Index of Biotic Integrity (IBI) for San Francisco Bay Area Creeks (SCVURPPP)

In collaboration with Alameda Countywide Clean Water Program and Water Board staff, Program staff began developing a Benthic Macroinvertebrate Index of Biotic Integrity (B-IBI) for creeks in the San Francisco Bay Area in FY 04-05. A B-IBI serves as an easy-to-use scorecard for determining the condition of water quality and stream habitat (i.e., stream health) using biological communities. The IBI approach is designed to maximize detection of degradation by controlling for natural variation in biological communities.

The development of a B-IBI for the Bay Area complements B-IBIs that were recently developed through a partnership between the State Water Resources Control Board (State Board) and the California Department of Fish and Game. Through that effort B-IBIs for southern and northern California coastal and Central Valley streams were developed. These B-IBIs will likely serve as the starting point for the development of biological objectives by the State Board (see summary later in this section).

To guide the development of the San Francisco Bay Area B-IBI, a Work Plan was created early in the development process (see Program's FY 04-05 Annual Report). The Work Plan has six main tasks listed in sequential order:

1. Form Technical Advisory Group;
2. Compile Existing BMI Data from Participating Agencies/Organizations;
3. Standardize Datasets and Import into Database;
4. Develop Reference Conditions;
5. Select Metrics for the IBI; and
6. Develop, Validate and Refine IBI.

Tasks 1 through 3 are complete. During FY 09-10, the Program continued to contribute substantial in-kind services towards the completion of Task 4 (Develop Reference Conditions), which is an integral step in completing the B-IBI. Reference conditions provide a way for comparing biological data from a potentially impacted site to a "least disturbed" site. They are also used to determine the degree of impact of a site. Program staff worked with Kevin Lundy, UC Berkeley PhD candidate, to conduct a GIS based land use analysis to define "least disturbed sites" that will form the pool of reference sites used to establish the B-IBI. The data from these reference sites were then evaluated to determine what factors may affect variability in BMI community assemblages. Results from these analyses suggest that flow regime (i.e., perennial versus intermittent) may be an important factor influencing natural variability.

Additional effort is needed to document flow regime for a large proportion of sites throughout the Bay Area that were sampled in previous years. In FY 10-11, Program staff plans to work with other BAMBI participants in developing and implementing a plan to characterize the flow regime for these sites. In addition, work will begin on Task 5 to conduct analyses to select, score and confirm metrics that will be used in the B-IBI for San Francisco Bay Area creeks.

Biological Objective Development for California Freshwater Creeks

In FY 09-10, the State Board initiated a process to develop biological objectives for assessing the health of creeks statewide. These objectives will supplement existing narrative and numeric chemical water quality objectives currently in place. The biological objectives will be in the form of a narrative statement that will be applied statewide, accompanied by a detailed implementation plan that, where possible, sets regionally appropriate numeric targets. Tools such as the B-IBI for San Francisco Bay Area Creeks described above will likely serve as one of the types of tools used to set and evaluate numeric target attainment.

Three oversight committees (Stakeholder, Scientific Steering and Regulatory Oversight) have been established for the development and public vetting of the regulatory and technical policy statements. Program staff was asked by the State Board staff to participate on the Stakeholder Committee, which had its first meeting on May 26, 2010. The Stakeholder Committee will continue to meet periodically during FY 10-11 and FY 11-12.

■ Regional Activities

Regional activities coordinated through the RMC in FY 09-10 are summarized in Section 15 - Regional Supplement for Pollutants of Concern and Monitoring. In combination with monitoring coordinated directly through the Program, these regional activities are intended to fully comply with Provision C.8.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 9

Pesticides Toxicity Control

September 15, 2010

Section 9 Pesticides Toxicity Control

Introduction

Provision C.9 of the MRP requires Co-permittees to implement pesticide toxicity control programs that address their own and others use of pesticides within their jurisdictions that pose a threat to water quality and have a potential to enter the municipal stormwater conveyance system. Consistent with the requirements within Provision C.9, the Program's (and Co-permittees') approach to pesticide management focuses on the use of best management practices (BMPs) for source control and pollution prevention. Program BMPs for pesticide management include significant outreach efforts to residents, businesses, and municipal staff to provide education and achieve behavior changes relative to uses of pesticides and less toxic pest control methods. Outreach efforts have been supplemented by monitoring studies to define the problem; participation in regional monitoring and organizations to address pesticide regulations and other issues; and development of local pest management plans.

In FY 09-10, activities associated with Provision C.9 were conducted at the Co-permittee, Program and Regional levels. Local actions are documented in each Co-permittee's section of the annual report. This section highlights pesticide toxicity control activities conducted at the Program and/or Regional levels that are associated with the following sub-provisions of the C.9 Provision:

- Program Activities
  - Interface with County Agricultural Commissioner (C.9.f)
  - Public Outreach (C.9.h)
- Regional Activities
  - Track and Participate in Relevant Regulatory Processes (C.9.e)
  - Evaluate Implementation of Source Control Actions Relating to Pesticides (C.9.g)

These activities built upon a large body-of-knowledge gained through tasks completed in previous fiscal years.[1] Program and regional task highlights presented in this section are organized by Permit provision or by major heading (both marked in bold).

Program Activities

C.9.f. Interface with County Agricultural Commissioners

Program staff met with Kevin O'Day (Agricultural Commissioner, Santa Clara County Division of Agriculture) in April 2010 to update him on the MRP requirements for pesticide toxicity control. Program staff provided him with a Fact Sheet on the Program's pesticide control activities and updated him on the regulatory, outreach and monitoring activities implemented by the Program and Co-permittees to meet MRP requirements. Mr. O'Day provided the following feedback on the MRP requirements:

[1] Pesticide-related work products completed by the Program or through regional efforts in previous fiscal years, and associated task summaries of Program efforts can be found on the SCVURPPP website (www.scvurppp.org).

- Reporting Violations in Pesticide Use - The Division of Agriculture (DOA) receives about 20 pesticide related complaints (mostly illegal dumping) each year and has the authority to administer civil fines in response to complaints. Most complaints are received from residents. He suggested the Program publicize the DOA's phone number (408-918-4600) on the Watershed Watch website. Co-permittees should also make sure that their staff is aware of this number. The DOA website will also provide a link to the Watershed Watch website.
- Assemble and submit information (such as monitoring data) as needed to assist DPR and County Agricultural Commissioners in ensuring that pesticide applications comply with water quality standards – This requirement applies more to DPR than to the DOA.

The meeting resulted in the following action items:

- A link to the "less-toxic gardening" section of the Watershed Watch website has been posted on the DOA website.
- The pesticide violations reporting phone number has been posted on the Watershed Watch and SCVURPPP websites.
- Program staff contacted Ms. Michelle Thom (Deputy Agricultural Commissioner, County of Santa Clara) and obtained a copy of the database of pesticide violations reported to the DOA in FY 09-10. The violations were reported by private residents, employees of pesticide companies and health agencies. In a follow-up telephone conversation with Program staff, Ms. Thom said that she does not recall receiving any pesticide use complaints from municipal staff.

In future years, Program staff intends to continue interfacing with the County's Agricultural Commissioner through discussions and sharing of information.

C.9.h. Public Outreach

Point of Purchase Outreach to Consumers (C.9.h.i & ii)

The Program contributed funds to and actively participated in, the BASMAA IPM Store Partnership Program (also know as the *Our Water Our World Program*). The Program implemented the IPM Store Partnership Program in 38 stores locally. Program staff routinely visited the participating stores for restocking literature racks and updating shelf-talkers. A major success in FY 09-10 was the implementation of the program in all 10 Home Depot stores in the Program's jurisdiction.

The Program contracted with Ms. Ann Joseph for store employee training. Ms. Joseph trained approximately 99 employees representing 13 stores. She provided two hours of onsite training at 13 different stores in Santa Clara County and supplied attendees with handouts and store lists of less-toxic products. In addition, she worked with two participating stores, Summer Winds (Palo Alto) and Los Altos Garden Supply (Los Altos) to implement the "Increasing Shelf Space for Less-Toxic Products" projects. Her work included: 1) meeting with pesticide buyers at stores; and 2) motivating them to increase the store's inventory of less-toxic products. Appendix 9-1 includes the detailed Store Training Summary Report and the list of stores participating in the program in Santa Clara Valley.

Based on the Program's evaluation of effectiveness, the IPM Store Partnership Program continued to be a success in FY 09-10. The store managers and employees were enthusiastic about the program and extremely receptive to having the Our Water Our World (OWOW) display in stores. Feedback on the

trainings was also very positive, as indicated in the evaluation summary included in Appendix 9-1. Employees from Home Depot stores received the training for the first time this year. Their feedback indicates that, compared to employees from stores that have been in the program for a number of years, Home Depot employees are less aware of IPM issues. A few highlights of the evaluation are:

- 100% of Home Depot employees agreed that the training changed their attitude about pesticides; compared to 59% of employees from other stores.
- 43% Home Depot said information was new to them; compared to 33% of employees from other stores.
- 100% of Home Depot employees said that they would recommend the training to co-workers.

The Program intends to continue the local implementation of the IPM Store Partnership Program, including IPM training for store employees and the "Increasing Shelf Space for Less-Toxic Products" project.

Pest Control Contracting Outreach (C.9.h.iii)

As required by Provision C.9.h.iii., the Program conducted outreach about less-toxic pest control to residents who use or contract for structural or landscape pest control. Messages included proper use and disposal of pesticides, IPM, information about the *Green Gardener* Program, the list of trained *Green Gardeners*, and the OWOW Program. The Program conducted the following IPM outreach activities in FY 09-10 to meet this requirement:

- Media Advertising - Messages about less-toxic pest control were included within Watershed Watch advertising. Advertisements were placed in a Spanish community newspaper, local radio stations and online. Additional details on the media campaign are included in Appendix 7-1.
- Outreach at Events – Program, Co-permittee and Watershed Watch staff conducted IPM outreach at seven events. These were:
  - Pumpkins in the Park, October 10, 2009
  - Muslim Green Fair, October 18, 2009
  - Haunted History, October 31, 2009
  - Spring Garden Market, April 10, 2010
  - NVIDIA Corp. Earth Day Event, April 22, 2010
  - Spring in Guadalupe Gardens, April 24, 2010
  - Festival in the Park, June 26, 2010

Results from the media advertising and outreach events conducting in FY 09-10 by the Program yielded the following conclusions regarding the effectiveness of these activities:

- Media Advertising - The IPM outreach media campaign, which included free promotional ads, received a large number of gross impressions. Additional details are included in the FY 09-10 detailed Watershed Watch Campaign and Media Report within Appendix 7-1.
- Outreach at events - Overall, the seven outreach events were successful in providing opportunities for educating the public about less-toxic pest control methods. Event staff

distributed approximately 5,176 total IPM fact sheets, brochures and giveaways (e.g., activity books, magnets, flyswatters, notepads, etc.).

The Program also provided funding to support the Going Native Garden Tour held on April 18, 2010. There were approximately 12,447 visits to the gardens. The tour featured 67 gardens that demonstrated environmentally sensitive gardening practices with an emphasis of reduced water use, reduced chemical and pesticide use, and improved habitat using California native plants.

Outreach to Pest Control Operators (C.9.v)

In FY 07-08, the Program piloted the first Santa Clara Valley *Green Gardener* training which is an educational initiative that brings quality training to professional landscapers, gardeners and landscape maintenance workers on how to "garden green." Each training session consists of ten 2-hour classes, held once a week for ten weeks. The training is conducted in collaboration with the Metropolitan Adult Education Program (MAEP), and the Master Gardeners of Santa Clara County. The Program conducted two training sessions in FY 09-10, including one session conducted entirely in Spanish. The Program provided funds toward student fees, guest speaker fees, Spanish interpreter fees, and supplies (soil probes, magnifying lenses, and "Good Bug Bad Bug" Charts). In addition, the Program held four two-hour re-certification classes for *Green Gardeners*. The City of Sunnyvale provided staff support for coordinating and conducting the *Green Gardener* trainings, and provided space to host the re-certification classes. The West Valley Clean Water Program provided funds for mailing *Green Gardener* training announcement fliers.

A total of 22 individuals completed the *Green Gardener* training in FY 09-10 (12 took the training in English and 10 in Spanish). In addition, 30 individuals attended the re-certification classes. A summary of the evaluations from the *Green Gardener* training is included in Appendix 9-2. It indicates that attendees found the class very useful and will be making changes to their landscape management practices based on what they learned at the trainings. Attendees were required to take a final test to receive the certificate of completion. This ensured that they understood the curriculum and will be able to implement the practices at their client locations. Additional details on the FY 09-10 *Green Gardener* trainings are included in the *Green Gardener* Training report in Appendix 9-2.

Program and City of Sunnyvale staff also met with representatives from the California Landscape Contractors Association (CLCA) to update them on the Green Gardener training program. The CLCA will promote the training program to their membership.

The Program plans to continue implementing the Green Gardener training program in FY 10-11. Classes will be held at the Sunnyvale-Cupertino Adult Community Education (ACE) training center in Sunnyvale. Due to budget constraints, MAEP could no longer hold the classes at their facility in San Jose. The Program will also continue to work with the Santa Clara County Master Gardeners to receive their help in teaching the class and promoting the use of trained Green Gardeners through their hotline and other outreach venues.

■ Regional Activities

Regional activities conducted in FY 09-10 to address MRP C.9 Provisions are summarized in Section 15 (Regional Supplement for Pollutants of Concern and Monitoring). These include the status of projects to: 1) Track and Participate in Relevant Regulatory Processes (C.9.e), and 2) Evaluate Implementation of

Source Control Actions Relating to Pesticides (C.9.g). In addition, a copy of the Regional IPM Partnership (Our Water Our World) Program report is included in Appendix 9-3.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 10

Trash Controls

September 15, 2010

Section 10 Trash Controls

Introduction

The goal of MRP Provision C.10 (Trash Load Reduction) is to implement control measures and other actions to reduce trash loads to local urban creeks by 40% by 2014, which will set the course for additional load reductions in future years. To achieve this goal, Co-permittees are required to develop and implement a Short-Term Trash Load Reduction Plan, which includes the installation and maintenance of trash full-capture devices, designed to treat a mandatory minimum level of land area, and implementation of other control measures and best management practices (i.e., trash reduction ordinances) to prevent or remove trash loads. To address longer-term goals of trash reduction, Co-permitees are also required to develop a Long-Term Trash Load Reduction Plan near the end of the Permit term in preparation for the next Permit.

Activities associated with Provision C.10 requirements were conducted at the Co-permittee, Program and Regional levels In FY 09-10. Local actions are documented in each Co-permittee's section of the annual report. This section highlights trash reduction activities conducted at the Program and/or Regional levels, including:

- Program Activities
  - Development and Testing of Draft Trash Baseline Load Estimation Methods
  - Prioritization of Potential Trash Generation Areas
  - Characterization of Catch Basin Trash and Debris
  - Trash Hot Spot Selection and Assessment Guidance and Reporting
  - Participation in Bay Area-wide Trash Capture Demonstration Project
  - Participation in Santa Clara County Zero Litter Initiative (ZLI)
  - Trash Ad hoc Task Group Meetings
- Regional Activities
  - BASMAA Trash Committee
  - Development of Trash Load Reduction Tracking Method

These activities built upon a large body-of-knowledge gained through tasks completed in previous fiscal years.[1] Program and regional task highlights presented in this section are organized by Permit provision or by major heading (both marked in bold).

[1] Trash-related work products completed by the Program in previous fiscal years and task summaries of Program efforts can be found on the "trash" section of the SCVURPPP website (http://www.scvurppp-w2k.com/poc_wp.shtml#trash).

■ Program Activities

C.10.a. Short-Term Trash Load Reduction

Development and Testing of Draft Trash Baseline Load Estimation Methods

Provision C.10.a.ii of the Municipal Regional Permit (MRP) requires Co-permittees to determine baseline trash loads from their municipal separate storm sewer systems (MS4s) to establish the basis for trash load reductions. Co-permittees are required to submit trash load levels to the Water Board by February 1, 2012.

Using information gained through trash characterization studies conducted by the Program during this and previous fiscal years, Program staff developed and tested preliminary methods to calculate baseline trash loads from MS4s in FY 09-10. Preliminary trash loading rates were derived from data collected at trash full capture devices installed at catch basins in the Cities of San Jose (n=35) and Sunnyvale (n=12). Trash and debris were periodically removed and measured at these catch basins during 2008 and/or 2009.

Through this exercise, Program staff identified and evaluated several factors that may influence trash loading rates from MS4s. These factors included:

- Season (wet versus dry) – based on very preliminary data, average daily loading rates during the wet season (Oct. 15 – May 15) are 4 times greater than the dry season;
- Drainage Area Size – although extremely difficult and cumbersome to predict, the estimated size of the area draining to a catch basin can affect loading rates. On a unit basis, loading rates to catch basins with larger drainage areas appear to be smaller than those from smaller drainage areas;
- Land Use – as expected, land uses within catch basin drainage areas appear to partially explain differences in loading rates; and,
- Road Density and Type - road type and density in the drainage area may affect loading rates, although preliminary data suggest that land use type and road type/density are highly correlated.

Methods, results and conclusions of the study are presented in the technical report entitled *Results and Lessons Learned from Pilot Implementation of Trash Full Capture Devices* (see www.scvurppp.org). Based on lessons learned to-date, plans are already underway in FY 10-11 to continue to refine loads estimation methods. Ideally, methods would be consistently applied throughout the region.

Prioritization of Potential Trash Generation Areas

Provision C.10.a.iii of the MRP requires all population-based Permittees to install and maintain a mandatory number of full capture devices by July 1, 2014, to treat runoff from an area equivalent to 30% of Retail/Wholesale Land that drains to MS4s within their jurisdictions. During FY 09-10, Program staff developed maps based on preliminary lessons learned from the loads methods development (see above) that show priority drainage areas for potential trash generation. The maps are intended to assist Co-permittees in identifying the most ideal locations to implement trash full capture devices or other control measures, based on predicted loading rates. Two types of maps were developed, depending upon the availability of existing GIS data sources for each Co-permittee. The first type of map prioritizes

catch basins and the second identified priority storm drain catchments. A technical memorandum describing the methods used to develop the maps is included on the SCVURPPP website (www.scvurppp.org).

C.10.b. Trash Hot Spot Selection and Cleanup

Provision C.10.b of the MRP requires each Co-permittee to identify and select a required number of trash hot spots in creeks or shorelines within their jurisdictions that will be the focus of required annual trash assessments and cleanups. To assist Co-permittees in meeting this requirement, Program staff developed the necessary tools (i.e., initial trash hot spot list and guidance memorandum) used to identify and select final trash hot spots; and developed and submitted (on the Co-permittees behalf) the report entitled *Trash Hot Spot Selection: Final Report* to the Water Board on June 29, 2010. The *Final Report* includes the final trash hot spot list, information sheets detailing the final trash hot spots and maps.[2] The trash hot spot selection process and timing of hot spot cleanups and assessments is detailed below.

Trash Hot Spot Selection Assistance and Reporting

To assist Co-permittees in developing the final trash hot spot list, Program staff compiled all readily available information on trash hot spots in the Santa Clara Valley. In December 2009, Program staff held two public meetings for Co-permittees and other interested stakeholders to discuss MRP trash hot spot requirements, gain additional information on known trash hot spots and document new hot spot locations within Santa Clara Valley creeks and shorelines. During January 2010, existing and new information gained through the December meetings were compiled to form the initial hot spots list. Approximately 150 potential trash hot spots were included on the initial list. To further assist Co-permittees in identifying and selecting their final trash hot spots, Program staff developed a guidance memorandum entitled *Permit Provision C.10.b - Trash Hot Spot Selection Guidance*(dated February 5, 2010) that included: 1) a step-by-step process for selecting and assessing final trash hot spots; 2) a list of considerations when selecting final trash hot spots; 3) required information needed for Program staff to develop the Trash Hot Spot Selection: Final Report; and 4) a schedule for completion of the Final Report. In addition, the initial hot spots list was distributed with the guidance memorandum. Each Co-permittee was requested to review the initial list and use this information as the starting point for identifying final trash hot spots. In spring 2010, Co-permittees selected their final trash hot spots for inclusion in the *Final Report*.

Trash Hot Spot Cleanup and Assessment Guidance

Provision C.10.b(ii) of the MRP requires Permittees to cleanup trash hot spots to a level of "no visual impact" at least one time per year for the term of the permit (December 1, 2009 through November 30, 2014). Based on discussions with lead Water Board staff[3], trash hot spot cleanups and assessments will be conducted each calendar year (CY) during the term of the permit (i.e., 2010 through 2014). Initial annual cleanups required by the MRP will occur by the end of CY 2010. The timing of annual cleanups will vary between hot spots. Timing will likely depend on the location of the hot spot, potential for natural resource impacts, crew availability and other site-specific factors. The schedule for reporting the results of hot spot cleanups and assessments which occurred during CY 2010 and future years is

[2] See http://www.scvurppp w2k.com/pdfs/0910/Trash_Hots_Spots_Selection_Final_Report_062910.pdf) for the full report.
[3] Program staff communications with Dr. Tom Mumley, Assistant Executive Officer of the Water Board, at multiple Board of Directors meetings of the Bay Area Stormwater Management Agencies Association (BASMAA).

currently being discussed with Water Board, Co-permittee and Program staff. As a result, CY 2010 cleanup and assessment results may not be reported as part of the Co-Permittees' FY 09-10 annual report submittal, but will be reported as part of the FY 10-11 Annual Report. In addition, reporting of future assessments will occur as part of annual reporting.

Bay Area-wide Trash Capture Demonstration Project

In October 2009, the San Francisco Estuary Partnership (SFEP) was awarded a $5 million grant to fund the San Francisco Bay Area-wide Trash Capture Demonstration Project ("Project"). This grant was funded through the State Water Resources Control Board's Clean Water State Revolving Fund using federal stimulus monies (American Recovery and Reinvestment Act of 2009). The 3-year project is primarily intended to provide preliminary resources to Bay Area municipalities in purchasing a limited number of the Permit-required trash full capture treatment devices for installation into municipally owned stormwater conveyance systems. All municipalities in the eight Bay Area counties (i.e., Marin, Sonoma, Napa, Solano, Contra Costa, Alameda, Santa Clara and San Mateo) that hold an NPDES Phase I or II permit may participate in the Project. Participating municipalities have been allocated a minimum dollar amount to fund the purchasing and installation of full-capture trash capture devices.

Project Oversight/Steering

During FY 09-10, Program staff worked closely with SFEP by participating in three groups/subgroups related to the Project. A description and the status of each group are provided below.

- Trash Advisory Group (TAG) – The TAG "kicked-off" the Project in October 2009 and has had subsequent meetings to guide the Project. TAG members serve as technical resources to the Project and include Co-permittee and Program staff.
- Trash Vendor/RFP Subgroup – Program and Co-permittee staff actively participated in the Trash Vendor and RFP Subgroup that assisted with: the Request for Proposal (RFP) process to select trash device vendors; planning of the trash vendor fair held May 4, 2010; development of "Fact Sheets" content and format for each device certified as full capture; and development of a list of frequently asked questions (FAQs) for municipalities to use at the vendor fair.
- Monitoring Subgroup – Program staff participated in this subgroup that is responsible for identifying the types of data needed to document siting and maintenance issues as well as assisting in the development of a reporting mechanism. It is anticipated that SFEP will develop a web-based database to store and maintain data.

In July 2010, SFEP sent the "Agreement for Local Agency Participation in Grant-Funded Bay Area-wide Trash Capture Demonstration Project", trash device ordering documents and a list of FAQs regarding the project to the stormwater contacts of each eligible municipality within the Bay area. Co-permittees are in the process of reviewing the "Agreement" and deciding whether to participate in the Project.

During FY 10-11, Program staff will continue to assist participating municipalities in deciding which small and/or large trash control devices are best suited for their local conditions and characteristics.

Participation in SCBWMI Zero Litter Initiative

The SCBWMI Zero Litter Initiative (ZLI) is a self-organized group of agencies that are impacted by litter issues or have an interest in reducing litter in Santa Clara County. The ZLI developed as an outgrowth of the Santa Clara Basin Watershed Management Initiative's Trash Subgroup.

In FY 09-10, the ZLI made considerable progress in: 1) developing a draft resolution for participating municipalities and agencies in Santa Clara County to adopt in support of the ZLI; 2) planning and holding the second Santa Clara Basin "Trash Summit"; and 3) establishing the ZLI's relationship to existing commissions, organizations, agencies and committees. The ZLI Steering Committee, which includes Co-permittee and Program staff, met monthly during FY 09-10 and will continue to meet monthly in FY 10-11.

Trash Ad hoc Task Group Meetings

The Program's Trash Ad hoc Task Group (Trash AHTG) meet a total of four times during FY 09-10 to discuss C.10 permit requirements and future implementation strategy, draft work products and the Bay Area-wide Trash Capture Demonstration Project. In addition, members of the Trash AHTG meet twice to discuss hot spot selection and once to discuss the development of the trash load reduction tracking method. During FY 10-11, the Trash AHTG plans to meet monthly to discuss the development of the trash baseline load and load reduction tracking method development, hot spot cleanup and assessments, and other permit-related requirements.

■ Regional Activities

BASMAA Trash Committee

The BASMAA Trash Committee was formed in FY 09-10 to provide a forum to discuss trash-related activities, projects and issues that have regional applicability. Program staff (Chris Sommers) serves as the Chairperson of the Committee, which meets monthly. Committee agendas in FY 09-10 included presentations, discussions and updates on hot spot selection, assessment and reporting tools and guidance, SCVURPPPP trash baseline load estimation methods, SFEP's Bay Area-wide Trash Capture Demonstration Project, and Clean Water Action's *Taking Out the Trash* Project. In addition, one regional project (Trash Load Reduction Tracking Method) was developed and is currently under the purview of the Trash Committee (see below for description).

C.10.a.ii Trash Load Reduction Tracking Method

During FY 09-10, BASMAA agreed that the development of a trash load reduction tracking method, as required by Provision C.10.a.ii, will be a regional project with the BASMAA Trash Committee providing project oversight. The project is being conducted through in-kind contributions from SCVURPPP and the San Mateo Countywide Water Pollution Prevention Program (SMCWPPP).

Based on the project scope of work, the project will include the development of a tracking method, including associated formulas, baseline formation and future data needs (i.e., identification of data needed to populate these formulas). In combination with the Baseline Trash Loading Estimate, the tracking method will assist MRP Permittees in demonstrating progress towards trash load reduction

goals (i.e., 40%, 70% and 100%) through quantification of the effectiveness of trash load reduction activities (i.e., BMPs and control measures).

To assist with this process, Program and Co-permittee staff from the Cities of San Jose and Cupertino identified a list of potential control measures that should be considered for loads reduction tracking methodology development. Once the list was developed, Program and Co-permittee staff conducted a literature review to evaluate quantification methods that have been used by others to assess trash control measure effectiveness or progress towards quantitative goals (e.g., TMDL allocations). Results of the literature review will be documented in Technical Memorandum scheduled for completion in fall 2010. During FY 10-11, Program and Co-permittee staff (through in-kind contributions) will assist in the development of recommended formulas to quantify load reductions for specific control measures; identify data required to populate formulas; and identify future data requirements.

Urban Runoff
Pollution Prevention Program

Section 11

Mercury and PCBs Controls

September 15, 2010

Section 11 Mercury and PCBs Controls

Introduction

Provisions C.11 and C.12 of the MRP require Co-permittees to implement control programs for mercury and Polychlorinated Biphenyls (PCBs). These pollutants are grouped into a single section of this report because many of the requirements in the two MRP Provisions are written identically, due to the similarities in the sediment-associated and legacy nature of their occurrence.

For mercury and PCBs, the Water Board has previously determined that the water quality objectives and associated beneficial uses of water bodies in the Bay Area are impacted as a result of these legacy pollutants. The Water Board adopted water quality attainment strategies called Total Maximum Daily Loads (TMDLs), which assign load reductions (through waste load allocations) to Bay Area municipal stormwater programs. Co-permittee control measures to address load reductions for mercury and PCBs are prescribed through Provisions C.11 and C.12 of the MRP.

In FY 09-10, nearly all requirements in Provisions C.11 and C.12 were addressed through regional projects coordinated through BASMAA. Summaries of all regional projects conducted in FY 09-10 are described in Section 15 – Regional Supplement for Pollutants of Concern and Monitoring of this report. Those requirements addressed directly by Co-permittees are included in Co-permittee annual reports, and those addressed through the Program are described below.

Program Activities

C.11.a. Mercury Collection and Recycling Implemented throughout the Region

Provision C.11.a requires Co-permittees to promote, facilitate, and/or participate in the collection and recycling of mercury-containing devices and equipment at the consumer level. During FY 09-10, Co-permittees continued to participate in Santa Clara County's Household Hazardous Waste (HHW) Program to meet this requirement. The HHW Program continued its retail store partnership program and partnered with approximately 48 retail stores to provide free fluorescent bulb drop-off locations for residents. The Program promoted these drop-off locations at outreach events and on the Watershed Watch website. In addition, the Program promoted mercury thermometer collection events on the Watershed Watch website and Watershed Watch social networking sites (Facebook and Twitter).

During FY 09-10, the HHW Program collected a total of 92,684 lbs[1] of fluorescent bulbs at 34 retail drop-off locations within Santa Clara County.[2] This equates to a substantial increase (52%) from FY 08-09. The reason for this increase could be the discontinuation of the HHW Program's pilot project where the retail partners were responsible for recycling the collected compact fluorescent bulbs. The goal was to transition some of the collection and recycling responsibilities to the partners. However, after some

[1] Since fluorescent light bulbs come in different sizes, quantities are reported in terms of the total pounds. A new conversion factor for fluorescent lamps is used in FY 09-10. The new conversion was established by the California Integrated Waste Management Board, now CalRecycle, in 2009, and is: 1 foot equals .125 lbs and 1 CFL equals .25lbs. Previously, the conversion used was: 1 foot equals .25lbs, and 1 CFL equals .0625lbs.

[2] Information regarding the collection of mercury containing products (e.g., fluorescent bulbs, thermostats, thermometers and other products) during FY09-10 was obtained from a memorandum *entitled Fiscal Year 2009-2010 HHW Program Update* (dated August 11, 2010). This memorandum was prepared by Wendy Fong, Household Hazardous Waste Program, County of Santa Clara.

time, many of the partners no longer wanted to participate in the pilot project because of the cost associated with recycling. Some stopped taking CFLs from residents. As a result, the pilot program ended in February 2009 and the County HHW Program now collects and recycles all universal wastes collected at the retail partners. The County HHW Program does not have plans to continue the pilot project.

In addition, the HHW Program also collected the following during FY 09-10:

- 178,602 pounds of household batteries; and,
- 580 pounds of elemental mercury (including thermostats, thermometers and other products).

Draft methods for quantifying the mercury loads reduced from urban stormwater due to control measures implemented by Co-permittees, like the HHW Program, are presented in Section 15. Once these methods are finalized, the loads of mercury reduced in urban stormwater, in comparison to those required by the Mercury TMDL, will be reported in future annual reports.

Program In-kind Contributions to Regional Projects

Regional PCB and mercury projects described in Section 15 were completed by either in-kind financial or staff support by Co-permittees and Programs, or by BASMAA-hired contractors under the direction of Programs and Co-permittees. For the following regional projects, the Program provided substantial in-kind services by developing project scopes of work and budgets, serving as the project officer, conducting the project, and developing project deliverables:

- Identification of PCBs and PCB-Containing Equipment During Industrial Inspections (C.12.a);
- Conduct Pilot Projects to Evaluate Managing PCB-Containing Materials and Wastes during Building Demolition and Renovation (e.g., Window Replacement) Activities (C.12.b);
- Monitor Stormwater Pollutant Loads and Loads Reduced (C.11/12.g); and,
- Develop Allocation Sharing Scheme with Caltrans (C.11.j).

In addition, Program staff managed and actively participated in regional tasks/projects that are included under the Clean Watersheds for a Clean Bay (CW4CB) project. The CW4CB project is a partnership of Bay Area municipalities and countywide municipal stormwater management agencies whose overarching objective is to implement priority actions called for by the San Francisco Bay PCBs and mercury TMDLs and Provisions C.11 and C.12 of the MRP. The $6.84 million CW4CB Project is funded through a combination of grant funding received by BASMAA from the USEPA ($5 million) and a $1.84 million match contributed by six Bay Area stormwater programs (including SCVURPPP).

Implementation of CW4CB addresses Co-permittee compliance with the following MRP provisions:

- C.11/12.c - Pilot Projects To Investigate and Abate Mercury/PCB Sources;
- C.11/12.d - Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices;
- C.11/12.e. - Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit; and,
- C.11/12.i - Development of a Risk Reduction Program Implemented Throughout the Region.

045519

■ Regional Activities

Regional activities coordinated through BASMAA in FY 09-10 are summarized in Section 15 - Regional Supplement for Pollutants of Concern and Monitoring. In combination with projects and pollutant control activities coordinated directly by Co-permittees or through the Program, these regional activities are intended to fully comply with Provisions C.11 and C.12.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Section 12

Copper Controls

September 15, 2010

Section 12 Copper Controls

Introduction

Provision C.13 of the MRP is intended to address copper control measures identified in the Basin Plan that the Water Board has deemed necessary to support copper site specific objectives in San Francisco Bay. Requirements in the MRP are included in the following sub-provisions:

- C.13.a. Manage waste generated from cleaning and treating copper architectural features, including copper roofs, during construction and post-construction;
- C.13.b. Manage discharges from pools, spas and fountains that contain copper-based chemicals;
- C.13. c. Vehicle Brake Pads;
- C.13.d. Industrial Sources;
- C.13.e. Studies to Reduce Copper Pollutant Impact Uncertainties

In FY 09-10, activities associated with Provision C.13 were conducted at the Co-permittee, Program and regional levels. Local actions are documented in each Co-permittee's section of the annual report. This section highlights copper control activities conducted at the Program and/or regional levels. These activities built upon a large body-of-knowledge gained through tasks completed in previous fiscal years.[1] Program and regional task highlights presented in this section are organized by Permit provision or by major heading (both marked in bold).

Program Activities

C.13.c. Vehicle Brake Pads

For many years, SCVURPPP has supported (directly or through BASMAA and CASQA) the Brake Pad Partnership, a voluntary partnership of brake pad manufacturers, government agencies and environmental organizations formed in 1999 to address the impacts of copper-containing brake pad wear debris on surface waters. Information on Brake Pad Partnership efforts during FY 09-10 are described in Section 15 (Regional Supplement). In addition to tasks completed by the Brake Pad Partnership, Program and Co-permittee staff continued to track the development of SB 346 (Kehoe) – Hazardous materials: motor vehicle brake friction materials – a bill to limit the amount of copper in brake pads. Tracking legislation focused on updating Co-permittees on the bill's status and current language; and preparing each to develop letters of support for the bill, if possible. The Program sent two letters of support for the bill, on June 11 and July 22, 2010, to assemblymembers on the committees approving the legislation. The Cities of Sunnyvale and Palo Alto and the West Valley Clean Water Program also sent letters of support.

[1] Copper-related work products completed by the Program or through regional efforts in previous fiscal years, and associated task summaries of Program efforts can be found on the SCVURPPP website (www.scvurppp.org).

Copper (and other pollutant) Loads Removed via Street Sweeping

Summary of Co-Permittee Street Sweeping Results

A summary of street sweeping activities conducted by Co-permittees is provided within the table entitled *Summary of Co-permittee Street Sweeping Activities- FY 2009-2010* (see Appendix 12-1). During FY 09-10, Co-permittees swept approximately 195,288 miles of paved streets and removed approximately 79,004 yd^3 or 51,313 tons of material[2]. Approximately 28,637 yd^3 of leaf litter was removed by Co-permittees who have leaf removal programs other than routine street sweeping. In addition, approximately 198,378 tons of yard waste (which includes large amounts of leaves) was routinely collected by Co-permittees.

One way to measure street sweeping effectiveness is to determine what solids and associated pollutants are collected within street sweeping debris. A typical unit of measure is the total volume of the pollutant removed by the sweeper relative to the curb length swept (e.g., yd^3/curb mile). This unit is typically referred as the removal rate. In the case of this effectiveness evaluation, the Program uses average removal rate to show the effectiveness of Co-permittee street sweeping activities within the Program's jurisdiction. The average Co-permittee removal rate during FY 09-10 was 0.40 yd^3/curb mile (see Appendix 12-1) with a range from 0.03 yd^3/curb mile (Town of Los Altos Hills) to 0.69 yd^3/curb mile (City of Palo Alto). In comparison, the average Co-permittee removal rate during FY 08-09 was 0.42 yd^3/curb mile.

The removal rate is influenced by a number of factors including accumulation rates of pollutants, the relationship between rainfall and sweeping frequencies, particle size, pavement condition and automobile parking controls[3]. As a result, effectiveness (i.e., removal rate) may vary each year depending on a change to any one of these factors. Many studies have shown that street sweeping removes significant quantities of dirt and debris from street surfaces[4]. However, results also demonstrate that the coefficient of variation of copper values and other metals (e.g., lead and zinc) in street sweeping debris is quite high[5]. In addition, the estimated pollutant load reduction is dependent on the volume of material collected (i.e., the more material collected, the greater the pollutant removal).

To illustrate the effectiveness of street sweeping activities for pollutant removal, Program staff estimated the mean pollutant reduction for the following four metals: copper, nickel, lead and zinc. These estimates are provided within the tables entitled *Summary of Co-permittee Street Sweeping Activities and estimated Mean Pollutant Load Reduction for Copper and Nickel- FY 2009- 2010* and *Summary of Co-permittee Street Sweeping Activities and estimated Mean Pollutant Load Reduction for Lead and Zinc- FY 2009- 2010*. Both tables are provided within Appendix 12-1.

---

2 To determine the total volume of material removed in tons, it is necessary to convert cubic yards to tons. It is estimated that the average density of street sweeping material is 1,299 pounds per cubic yard (0.6495 tons per cubic yard) (Source: EOA, Inc., October 1996, *Estimation of Copper Collected Through Street Sweeping Efforts*. Prepared for San Mateo Countywide Stormwater Pollution Prevention Program). A value of 51,313 tons is calculated when 79,004 cubic yards is converted over to tons (79,004 cubic yards* .6495 tons/cubic yard= 51,313 tons).

3 Woodward Clyde Consultants, December 1994. *Street Sweeping Literature Review/Storm Inlet Modification*, Prepared for Alameda County Urban Runoff Clean Water Program.

4 Sartor, J. and G. Boyd, 1972. *Water Pollution Aspects of Street Surface Contaminants*. Prepared for United States Environmental Protection Agency, Washington, DC.

5 EOA, Inc, October 1996. *Estimation of Copper Collected Through Street Sweeping Efforts: Final Report*. Prepared for San Mateo Countywide Stormwater Pollution Prevention Program.

To determine the estimated pollutant load reduction (in pounds), the volume of material collected (in cubic yards) for each Co-permittee land use type (i.e., residential, commercial and industrial) was determined. This value was then multiplied by the mean concentration of trace metal content for street sweeping samples collected in the study entitled *Chemical and Physical Characteristics of Street Sweeping Sediments in Tampa, Florida, May 1999* and converted to pounds of pollutant removed (mean concentration values and the algorithm used to calculate the pounds of pollutant removed are provided in Appendix 12-1). The estimated mean pollutant load reduction values for each land use type were then summed. Estimated pollutant load reductions for copper, nickel, lead and zinc via street sweeping in FY 09-10 are presented in Table 12-1. It is important to note that there is uncertainty with these estimates since certain assumptions were made regarding the exact volume of material collected from a particular land use type.

Table 12-1. Estimated average pollutant load reduction from street sweeping conducted by Co-permittees in FY 09-10.

Land Use Type	Estimated Mean Pollutant Load Reduction (Pounds)			
	Copper	Nickel	Lead	Zinc
Residential	1052	2078	1959	2637
Commercial	505	1000	2414	1710
Industrial	250	48	234	193
Total	**1807**	**3127**	**4607**	**4540**

It is estimated that street sweeping activities from FY 04-05 through FY 09-10 resulted in the following pollutant removals for copper, nickel, lead and zinc (see Figure 12-1). During FY 09-10, a decrease in pollutant removals was observed when compared to FY 08-09 totals. As mentioned above, this decrease is due to a decrease in the total volume of material collected (81,652 yd^3 in FY 08-09 and 79,004 yd^3 in FY 09-10).

Figure 12-1. Estimated pollutant load reductions from Co-permittee street sweeping activities (in pounds) from FY 04-05 through FY 09-10.

■ Regional Activities

Regional activities conducted in FY 09-10 to address MRP C.13 Provisions are summarized in Section 15 - Regional Supplement for Pollutants of Concern and Monitoring. Summaries include the status of projects that comply with the following MRP Provisions:

- C.13.c. Vehicle Brake Pads – active engagement in legislation to reduce copper discharged from automobile brake pads to surface waters;
- C.13.d. Industrial Sources – development of educational tools to train industrial inspectors to identify facilities likely to use copper or have sources of copper and proper Best Management Practices (BMPs).
- C.13.e. Studies to Reduce Copper Pollutant Impact Uncertainties – planning of studies to investigate possible copper sediment toxicity and technical studies to investigate sub-lethal effects on salmonids.

In addition, the Program has supported CASQA efforts on the statewide level to engage in the legislative process to advance SB 346 (Kehoe). CASQA is serving as a technical resource in the bill negotiations, and significant efforts by the Executive Director and other CASQA members were expended during FY 09-10 to support and promote passage of the bill.

Section 13

PBDE, Legacy Pesticides and Selenium

September 15, 2010

Section 13 PBDE, Legacy Pesticides and Selenium

Introduction

Based on the Water Board's determination, legacy organochlorine pesticides (e.g. DDT, dieldrin and chlordane), Polybromated Diphenyl Ethers (PBDEs), and selenium are either known to impair or potentially impair water quality in the San Francisco Bay. The Water Board is currently developing, or planning to develop Total Maximum Daily Loads (TMDLs) for each of these groups of pollutants.[1] Provision C.14 requires all MRP Co-permittees to work together to identify, assess, and manage controllable sources of these pollutants found in urban runoff. Therefore, all tasks associated with this Provision are regionally-coordinated and described below, or in Section 15 *(Regional Supplement for Pollutants of Concern and Monitoring)* of this report.

Regional Activities

Provision C.14 requires Co-permittees to collectively characterize the representative distribution of PBDEs, legacy pesticides, and selenium in the urban areas of the Bay Region to determine:

1. If PBDEs, legacy pesticides, and selenium are present in urban runoff;
2. If PBDEs, legacy pesticides, or selenium are distributed relatively uniformly in urban areas; and
3. Whether storm drains or other surface drainage pathways are, in themselves, sources of PBDEs, legacy pesticides, or selenium, or whether there are specific locations within urban watersheds where prior or current uses result in land sources contributing to discharges of these pollutants to San Francisco Bay via urban runoff conveyance systems.

As described in Section 15, Co-permittee and Program activities conducted in FY 09-10 to address this provision were focused on planning efforts for conducting characterizations in future years. Planning efforts included investigating the potential nexus between Provision C.14 requirements and characterization studies planned for implementation in fall 2010 by the Regional Monitoring Program for Water Quality in the Bay (RMP).

[1] Selenium in the North Bay and for PBDEs and legacy pesticides in all parts of the Bay.

Section 14

Exempted and Conditionally Exempted Discharges

September 15, 2010

Section 14 Exempted and Conditionally Exempted Discharges

Introduction

Provision C.15 exempts unpolluted non-stormwater discharges from discharge prohibitions in the MRP (Provision A.1) and conditionally exempts non-stormwater discharges that are potential sources of pollutants. Per Provision C.15.b., the following categories of non-stormwater discharges are conditionally exempt from Provision A.1 if they are either identified as not being sources of pollutants or if appropriate control measures to eliminate adverse impacts are developed and implemented:

- Pumped groundwater from non-drinking water aquifers;
- Pumped groundwater, foundation drains, and water from crawl space pumps and footing drains;
- Air conditioning condensate;
- Planned, unplanned and emergency discharges of the potable water system;
- Individual residential car washing;
- Swimming pool, hot tub, spa and fountain water discharges;
- Irrigation water, landscape irrigation and lawn or garden watering.

Provision C.15.b.i.-viii. contains best management practices, monitoring and reporting requirements to allow these types of discharges to be conditionally exempt.

Program Activities

Potable Water System Discharges

The Water Utility Operation and Maintenance Pollution Prevention Ad Hoc Task Group (AHTG) was formed to evaluate and recommend Program strategies for meeting new requirements in Provision C.15.b.iii. for planned, unplanned and emergency discharges that apply to water utility operations. The AHTG met on March 2 and April 8, 2010. The AHTG began the task of updating the SCVURPPP *Water Utility Operation and Maintenance Discharge Model Pollution Prevention Plan* (WUDPPP) developed in June 1998. The focus of the WUDPPP update is to incorporate guidance for implementing the new, more prescriptive MRP-required BMPs, notification, monitoring and reporting requirements. A draft WUDPPP update was provided to the AHTG for review in June 2010.

Other Conditionally Exempted Discharges

Program staff reviewed Provision C.15.b. to identify any significant changes to existing Program elements that are needed to meet the requirements of C.15.b. not related to potable water discharges, and to prioritize Program work based on deadlines presented in the MRP[1]. Based on this review, there were no high priority tasks identified that needed to be addressed by the AHTG.

[1] Memorandum entitled *Recommendations for Addressing Requirements for Non-Potable Water Discharges in the MRP Provisions for Conditionally Exempted Discharges* (March 16, 2010).

Public outreach efforts that would benefit from Program-wide collaboration are being addressed in the Watershed Watch Campaign. The Watershed Watch Campaign Work Plan for FY 10-11 has incorporated elements to help the Program and Co-permittees comply with the outreach requirements of the following MRP Provisions:

- C.15.b.iv. Individual Residential Car Washing Discharge;
- C.15.b.iv. Swimming Pool, Hot Tub, Spa, and Fountain Water Discharges;
- C.15.b.vi.a. Irrigation Water, Landscape Irrigation, and Lawn or Garden Watering.

In addition, Program staff will be updating the SCVURPPP Conditionally Exempted Discharges (CED) Report (June 2000) for consistency with MRP Provision C.15 in FY10-11.

Section 15

Regional Supplement for Pollutants of Concern and Monitoring

September 15, 2010

Section 15 Regional Supplement for Pollutants of Concern and Monitoring

This Section contains the *Regional Supplement for Pollutants of Concern and Water Quality Monitoring* (Regional Supplement) and associated appendices. It was prepared jointly by member agencies of the Bay Area Stormwater Management Agencies Association (BASMAA), on behalf of Municipal Regional Permit (MRP) Permittees and is intended to report compliance activities associated with Permit Provisions C.8 (Water Quality Monitoring), C.9 (Pesticides), C.11 (Mercury), C.12 (Polychlorinated Biphenyls), C.13 (Copper) and C.14 (Legacy Pesticides, Polybromated Diphenyl Ethers and Selenium) implemented through regional collaborative efforts.[1] Summaries of activities conducted in compliance with the following Permit Provisions are included in this Section:

- **Water Quality Monitoring (C.8)**
  - C.8.a Compliance Options
  - C.8.b San Francisco Estuary Receiving Water Monitoring
  - C.8.c Creek Status Monitoring
  - C.8.d Monitoring Projects
  - C.8.e Pollutants of Concern and Long-Term Trends Monitoring
  - C.8.f Citizen Monitoring and Participation
  - C.8.g Reporting
  - C.8.h Monitoring Protocols, Data Quality and Data Management
- **Pesticides Toxicity Control (C.9)**
  - C.9.e Track and Participate in Relevant Regulatory Processes
  - C.9.g Evaluate Implementation of Source Control Actions Relating to Pesticides
- **Joint Mercury and Polychlorinated Biphenyls (PCBs) Controls (C.11 and C.12)**
  - C.11/12.c Pilot Projects To Investigate and Abate Mercury/PCB Sources
  - C.11/12.d Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices
  - C.11/12.e - Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit
  - C.11/12.i Development of a Risk Reduction Program Implemented throughout the Region
  - C.11/12.f Diversion of Dry Weather and First Flush Flows to POTWs
  - C.11/12.g Monitor Stormwater Pollutant Loads and Loads Reduced
- **Mercury Controls (C.11)**
  - C.11.b Monitor Methylmercury
  - C.11.h Fate and Transport Study of Mercury in Urban Runoff
  - C.11.j Develop Allocation Sharing Scheme with Caltrans
- **PCB Controls (C.12)**
  - C.12.a Identification of PCBs and PCB-Containing Equipment During Industrial Inspections
  - C.12.b Conduct Pilot Projects to Evaluate Managing PCB-Containing Materials and Wastes during Building Demolition and Renovation (e.g., Window Replacement) Activities
  - C.12.h Fate and Transport Study of PCBs in Urban Runoff

[1] Additional activities conducted independently by SCVURPPP Co-permittees or by SCVURPPP on behalf of Co-permittees are included within Sections 8, 9, 11, 12 and 13 of this Annual Report and in individual Co-permittee Annual Reports.

- **Copper Controls (C.13)**
  - C.13.c Vehicle Brake Pads
  - C.13.d. Industrial Sources
  - C.13.e Studies to Reduce Copper Pollutant Impact Uncertainties
- **PBDEs, Legacy Pesticides, and Selenium (C.14)**
  - C.14.a Control Program for PBDEs, Legacy Pesticides, and Selenium

The Regional Supplement is divided into two portions – the main body and appendices. The main body is included within this Section and provides the status of compliance activities associated with each Permit Provision listed above. Reports, technical memoranda and other related documents referenced in the main body are provided within the Appendix to Section 15. It is important to note that much of the information in Section 15 is a work-in-progress and is being submitted to illustrate the progress being made on numerous region-wide Permit Provisions.

INTRODUCTION

This Regional Supplement has been prepared to report on regionally-implemented activities that comply with portions of the Municipal Regional Stormwater Permit (MRP), issued to 76 municipalities and special districts (Permittees) by the San Francisco Bay Regional Water Quality Control Board (Water Board). The Regional Supplement describes regionally-implemented activities conducted under the auspices of the Bay Area Stormwater Management Agencies Association (BASMAA)[1], in compliance with the following MRP provisions:

- Provision C.8 (Water Quality Monitoring); and
- Portions of Provisions C.9, C.11, C.12, C.13 and C.14, collectively referred to as "Pollutants of Concern" (POCs).

The 2010 annual reporting requirements for MRP Provisions covered in this Regional Supplement are completely met by BASMAA Regional Project activities, except where otherwise noted. Scopes, budgets and contracting or in-kind project implementation mechanisms for BASMAA Regional Projects follow BASMAA's Operational Policies and Procedures as approved by the BASMAA Board of Directors (BOD). MRP Permittees, through their program representatives on the BOD and its subcommittees, collaboratively authorize and participate in BASMAA Regional Projects or Regional Tasks. Regional Project costs are shared by either all BASMAA members or among those Phase I programs that are subject to the MRP[2][3].

This Regional Supplement does not include separate reporting products that will be required in future years by the following MRP provisions:

- C.8.g.ii Electronic Status Monitoring Data Reports;
- C.8.g.iii or v Urban Creeks Monitoring or Integrated Monitoring Reports; and
- C.8.g.iv Monitoring Project Reports.

The above Provision C.8.g reporting requirements cover most data collection activities required in C.8. While MRP C.8.g reporting is not required for the 2010 Annual Report, in Fiscal Year (FY) 2009-10 the Permittees initiated several Regional Projects for planning and development of tools needed to coordinate and support those data collection and reporting functions, described below in the section on Water Quality Monitoring.

---

[1] BASMAA is a 501(c)(3) non-profit organization comprised of the municipal stormwater programs in the San Francisco Bay Area.

[2] The BASMAA programs supporting MRP Regional Projects include all MRP Permittees as well as the cities of Antioch, Brentwood, and Oakley which are not named as Permittees under the MRP but have voluntarily elected to participate in MRP-related regional activities with the expectation that regionally coordinated activities undertaken by the Contra Costa Clean Water Program and other BASMAA partners will fulfill requirements that will be established by the Central Valley Regional Water Quality Control Board through its separate NPDES permit regulating stormwater discharges from eastern Contra Costa County.

[3] Additional activities related to the Pollutants of Concern or Water Quality Monitoring provisions reported here may have been conducted during FY 2009-10 by individual Permittees or groups of Permittees acting through a joint stormwater program. Summaries of these activities contained in annual reports submitted by Permittees or programs may include information that was not required by the MRP, or activities performed for regional compliance with MRP provisions but not approved as part of a Regional Project by the time this Regional Supplement was completed.

POLLUTANTS OF CONCERN

Provisions C.9 through C.14 of the MRP address pollutants that the Water Board has identified as potentially contributing to water quality concerns for the San Francisco Bay and/or local waterbodies. These pollutants are referred to as "pollutants of concern" (POCs). For some POCs, water quality attainment strategies have been adopted such as Total Maximum Daily Loads (TMDLs).

For mercury, polychlorinated biphenyls (PCBs) and other sediment-bound pollutants, the Water Board has proposed to implement control measures through MRP using four modes or levels described in the following framework:

1. Full-scale implementation throughout the region;
2. Focused implementation in areas where benefits are most likely to accrue;
3. Pilot-testing in a few specific locations; and
4. Other: This may refer to experimental control measures, Research and Development, desktop analysis, laboratory studies, and/or literature review.

Many Regional Projects reported in this section focus on MRP provisions relating to modes 3 and 4, which require studies or pilot projects intended to reduce uncertainties about the sources, occurrence or effectiveness of control measures for POCs. Other Tasks will be implemented through participation in regional or state-wide collaborative initiatives, such as:

- The Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP), described in more detail under Provision C.8.b below; and
- Initiatives to control sources of specific pollutants (e.g., Clean Watersheds for a Clean Bay project).

PESTICIDES TOXICITY CONTROL (C.9)

C.9.e Track and Participate in Relevant Regulatory Processes

The essential requirements of this provision are to track USEPA and DPR actions related to urban-use pesticides and actively participate in the shaping of regulatory efforts underway. This provision allows for cooperation among Permittees through the California Stormwater Quality Association (CASQA), BASMAA and/or the Urban Pesticide Pollution Prevention Project (UP3 Project). Recognizing that this approach is the most likely to result in meaningful changes in the regulatory environment, Permittees elected to take this route to achieve compliance with this provision. A project profile was developed by the BASMAA Monitoring and POCs Committee (MPC) to fund the reporting element of this task and the BASMAA Board of Directors (BOD) subsequently approved this Regional Project in May 2010.

The actual work of tracking and participating in the ongoing regulatory efforts related to pesticides was accomplished through BASMAA member participation in the UP3, as well the chairpersonship of the CASQA Pesticides Subcommittee. Permittees have been working with the UP3 project as well as the CASQA Pesticides Subcommittee for a number of years, so there was no lag time associated with compliance as the committee structures and membership were already fully engaged before the MRP was adopted. As a result, FY 2009-10 was very productive. Details of the specific achievements of this year can be found in the attached report, "Pesticide Regulation for Water Quality Protection, Annual BASMAA Participation Summary and Outcomes Assessment, 2010" prepared by TDC Environmental, LLC. (Appendix A1)

C.9.g Evaluate Implementation of Source Control Actions Relating to Pesticides

There are no Annual Reporting requirements for Provision C.9.g in 2010. In future years, additional information will be provided on the status of implementation activities designed to comply with this provision.

JOINT MERCURY AND POLYCHLORINATED BIPHENYLS (PCBS) CONTROLS (C.11 AND C.12)

Provisions C.11.c through Provision C.11.g for mercury are essentially identical to Provisions C.12.c through C.12.g for PCBs. This reflects similarities between the respective TMDLs for these pollutants, based on the legacy and sediment-associated nature of their occurrence. For Provisions C.11/12.c through C.11/12.f, MRP requirements focus on pilot studies; sites for these pilots will primarily be chosen on the basis of the potential for reducing PCB loads, but consideration will be given to mercury removal in the final design and implementation of the studies. Provisions C.11.i and C.12.i are also written identically, since fish consumption is a primary concern for both mercury and PCBs.

Clean Watersheds for a Clean Bay (CW4CB) is a new project funded by a grant to BASMAA from the US Environmental Protection Agency (USEPA). Implementation of the CW4CB project will result in Permittee compliance with the following MRP provisions:

- C.11/12.c - Pilot Projects To Investigate and Abate Mercury/PCB Sources;
- C.11/12.d - Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices;
- C.11/12.e. - Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit; and
- C.11/12.i - Development of a Risk Reduction Program Implemented Throughout the Region.

The project is a partnership of Bay Area municipalities and countywide municipal stormwater management agencies. The CW4CB's overarching objective is to

implement priority actions called for by the San Francisco Bay PCBs and mercury Total Maximum Daily Load (TMDL) water quality restoration programs[4] including developing and pilot-testing a variety of methods to potentially reduce urban runoff loading of PCBs and mercury to the Bay. BASMAA will receive $5.0 million in funding from the USEPA's San Francisco Bay Area Water Quality Improvement Fund towards the $6.84 million total project cost. The remaining $1.84 million (about 27% of the total project cost) will be contributed by BASMAA and six of the Bay Area countywide stormwater management programs as a match to the funding received from the USEPA. In addition, in-kind assistance from participating Permittee staff will provide additional resources to leverage the project effort. Appendix A2 contains the CW4CB project work plan, which was approved by the USEPA on July 1, 2010.

The CW4CB project management team consisting of BASMAA's Executive Director and representatives from several BASMAA agencies and participating Permittees provides project oversight and coordination. The team meets monthly on second Wednesday of each month to discuss the status of the project, implementation of tasks, and coordination among project participants.

Appendix A3 is a memorandum describing the CW4CB project's current status. It should be noted that the project started significantly later than originally anticipated. USEPA's original Request for Proposal included an anticipated award date of February 2010. However, despite USEPA's and BASMAA's best efforts to expedite the process, USEPA was not able to provide BASMAA with an assistance agreement until June 2010 which resulted in a project start date of July 1, 2010. Thus project implementation is currently at a very early stage.

C.11/12.c Pilot Projects To Investigate and Abate Mercury/PCB Sources

Provisions C.11/12.c. require that Permittees work collaboratively to identify five Bay Area watershed areas that contain high levels of mercury and/or PCBs and conduct pilot projects to investigate and abate these high mercury and/or PCB concentrations. The CW4CB has developed proposed criteria to inform selection of the five watershed areas and is currently performing a comprehensive review of existing data relevant to the selection. Most of these data were originally compiled and made available by the Regional Stormwater Monitoring and Urban BMP Evaluation Project conducted by the San Francisco Estuary Institute (SFEI). The SFEI study investigated options for better managing mercury and PCBs in urban stormwater and was conducted in collaboration with BASMAA and the Water Board. It was funded through a grant from the State of California Proposition 13 stormwater non-point-source program. The SFEI recently completed the study and is currently updating a web site that will make the project data and results readily available. The memorandum in Appendix A3 provides additional details about the watershed selection process and status.

[4]The MRP implements those TMDL actions related to stormwater runoff.

C.11/12.d Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices

Provisions C.11/12.d of the MRP require that Permittees work collaboratively to develop and pilot-test methods to enhance removal of sediment with PCBs and mercury, mainly during existing municipal street and storm drain system operation and maintenance activities. Permittees are required to conduct this pilot work in the five pilot watersheds selected for Provisions C.11/12.c. The evaluation will include typical routine municipal operation and maintenance practices such as street sweeping, catch basin cleaning, and stormwater conveyance system cleaning, and will also include consideration of street flushing with routing of wash water to a sanitary sewer. Evaluation of existing information on high-efficiency street sweepers is also a specific C.11/12.d requirement. Permittees are required to submit a progress report on the results of these two evaluations in this 2010 Annual Report and the final evaluation results in the 2011 Annual Report. As described in the memorandum in Appendix A3, BASMAA agencies have initiated a comprehensive review of existing literature and other information relevant to the evaluations.

C.11/12.e - Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit

Provisions C.11/12.e require that Permittees retrofit PCB and mercury treatment systems into existing storm drainage infrastructure at ten locations throughout the Permittees' jurisdictions and evaluate effectiveness. It is anticipated that some but not all of the retrofits will be sited within the five pilot watersheds identified through Provisions C.11/12.c. Permittees are required to install at least one retrofit in each of five major Bay Area counties covered by the MRP (Santa Clara, San Mateo, Alameda, Contra Costa, and Solano) and report on candidate locations with types of treatment retrofit for each location in the September 2011 Annual Report. This effort is at an early stage and has consisted to-date of initial conceptual discussions at project management team meetings. The project management team is also working with USEPA to better define procurement rules related to retention of consultants to assist with the project. The initial project need is to obtain a consultant to perform an initial conceptual screening of treatment retrofits potentially applicable to this project.

C.11/12.i Development of a Risk Reduction Program Implemented throughout the Region

Provisions C.11/12.i require that Permittees implement a regional program of risk communication activities to raise public awareness of fish contamination issues in San Francisco Bay and to encourage fish-consuming populations to reduce their exposure to pollutants in contaminated fish. These provisions require that Permittees submit in this 2010 Annual Report the specific manner in which these risk reduction activities will be accomplished and the associated schedule for their implementation. Task 6 of the CW4CB project work plan in Appendix A2 includes a description of the tasks that will be conducted via the project to raise public awareness and encourage reduction of exposure. Table 3 of the CW4CB project work plan includes the Task 6 schedule.

C.11/12.f Diversion of Dry Weather and First Flush Flows to POTWs

Provisions C.11.f and C.12.f are nearly identical provisions for control of mercury (C.11) and PCBs (C.12) requiring the evaluation of diversion of dry weather urban runoff and first flush events into publicly owned treatment works (POTWs). The first product required under these provisions is a feasibility evaluation to be included in the 2010 Annual Report. The feasibility evaluation is to include, but is not limited to, costs, benefits, and impacts on the stormwater and wastewater agencies and the receiving waters relevant to the diversion and treatment of the dry weather and first flush flows.
The report entitled "Stormwater Pump Station Diversions Feasibility Evaluation (AppendixA4) summarizes the feasibility evaluation including:

- Proposed selection criteria to inform the identification of five candidate and five alternate pump stations;
- Draft proposed time schedules for conducting pilot studies; and
- A draft proposed method for distributing mercury and PCBs load reductions to participating wastewater and stormwater agencies.

To comply with provisions C.11.f and C.12.f, BASMAA chose to approach this project as a Regional Project and a number of steps were taken to carry it out in FY 2009-10. A detailed scope of work was developed in the January – April 2010 time frame and the firm of Brown and Caldwell was retained to perform the work. Brown and Caldwell's work was directed and overseen by a Technical Oversight Committee (TOC) made up of BASMAA participants that recently began meeting on the afternoon of the second Wednesday of each month. This first TOC meeting was held July 14, 2010 during which a draft technical memorandum was reviewed that presented selection criteria for pump station projects. Data gathered to date were also reviewed by the TOC and direction was provided for completion of the feasibility evaluation report.

Following completion of the feasibility evaluation report, the oversight committee will identify how best to support programs and / or individual Permittees in using the report to scope out candidate pilot projects that are required to be completed during this permit term, for reporting in the 2014 Integrated Monitoring Report.

C.11/12.g Monitor Stormwater Pollutant Loads and Loads Reduced

Provisions C.11.g and C.12.g require Permittees to develop and implement a monitoring program to quantify mercury and PCB loads and loads reduced through source control, treatment and other management measures implemented by Permittees. Average annual mercury (160 kg/yr) and PCB (20 kg/yr) loads to the San Francisco Bay from urban (and non-urban) runoff discharges have been calculated by the Water Board through the development of Total Maximum Daily Loads (TMDLs) for these pollutants. Over the next five years, refinement of PCB and mercury loading estimates will occur through the implementation of POC Monitoring required by Provision C.8.e, and associated technical studies coordinated through the BASMAA Regional Monitoring Coalition (see Water Quality Monitoring Section) and the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP). These loading

estimates provide a baseline to which compliance with TMDL Waste Load Allocations (WLAs) issued to Bay Area stormwater agencies can be determined.

Through a BASMAA Regional Project in FY 2009-10, preliminary draft methods to assess Permittee progress towards TMDL milestones and attainment of WLAs began to be developed. This project is intended to assist Permittees in calculating PCB and mercury loads reduced through stormwater management measures. The regional project entails the review of existing information on loads reduced methodologies developed through other recent efforts (e.g., SFEI Proposition 13 Urban Runoff BMP Project) and development of draft loads reduced formulas for specific stormwater management measures.

A Working Draft Technical Memorandum is provided in Appendix A5 that describes preliminary loads reduced methodologies for PCBs and mercury. This Technical Memorandum is a work-in-progress that requires additional feedback and revisions based upon Permittee review. During FY 2010-11, the Draft Technical Memorandum will be further developed and presented to Water Board staff for discussion and input. After further revisions, a Final Technical Memorandum will be developed and made available to Permittees to use as a tool to account for pollutant reductions that are attributable to specific stormwater management measures implemented by Permittees, and assess progress towards PCB and Mercury TMDL WLAs.

MERCURY CONTROLS (C.11)

This section describes regional activities designed to comply with specific requirements in MRP Provision C.11 that are not connected to parallel PCB provisions in C.12.

C.11.b Monitor Methylmercury

MRP Provision C.11.b duplicates the requirement in Provision C.8.g - to report results of methyl mercury monitoring required in Provision C.8.e. Per the schedule for commencement of monitoring described in the Water Quality Monitoring section of this report below, there is no data collection to report for FY 2009-10.

C.11.h Fate and Transport Study of Mercury in Urban Runoff

This MRP provision requires Permittees to conduct, or cause to be conducted, studies aimed at better understanding the fate, transport, and biological uptake of mercury discharged in urban runoff to San Francisco Bay and tidal areas. The 2010 annual reporting requirement includes a work plan describing the specific manner in which these information needs will be accomplished and describing the studies to be performed with a schedule.

This requirement is met through the RMP, which has approved a Mercury Synthesis project in 2011 (Appendix A6). The RMP Master Planning process incorporates several

Strategies to address pollutant-specific information needs and support management decisions through investigation of prioritized Management Questions. The RMP Mercury Strategy previously funded a multi-year suite of special studies being completed in 2010. The synthesis will combine results and noteworthy findings from recent Status and Trends monitoring to set the stage for a new multi-year plan for RMP studies in 2012 and beyond. Ongoing or projected future RMP efforts for the Mercury Strategy also include:

- Monitoring of mercury, PCBs and other pollutants in biota, both ongoing (Status & Trends) and in a special 3-year study of Small Fish living along the Bay margins that are an important link in the Bay food web (funded 2008-2010); and
- Development of conceptual models of transport and food web uptake for mercury and PCBs, and Bay Margin areas that will be incorporated with a planned water-sediment-contaminant model linking small tributary inputs to Bay processes.

In FY 2010-11, BASMAA representatives will continue participating in RMP Work Groups and committees to ensure future implementation of studies that meet the MRP's stated information needs, which include understanding the in-Bay transport of mercury discharged in urban runoff, the influence of urban runoff on the patterns of food web mercury accumulation, and the identification of drainages where urban runoff mercury is particularly important in food web accumulation.

C.11.j Develop Allocation Sharing Scheme with Caltrans

Wasteload allocations (WLAs) assigned to urban stormwater dischargers through the San Francisco Bay Mercury TMDL implicitly include California Department of Transportation (Caltrans) roadway and non-roadway facilities within the geographic boundaries of MRP Permittees. Provision C.11.j, requires Permittees to develop an equitable mercury allocation-sharing scheme in consultation with Caltrans to address the Caltrans facilities in the program area, and report the details to the Water Board.

In an effort to begin the development of an equitable mercury allocation-sharing scheme in FY 2009-10, the BASMAA regional technical lead for the mercury TMDL (on behalf of all Permittees) contacted lead Water Board and CalTrans staff to set a course for working collaboratively on this project. Based on these discussions, technical staff representing Permittees and CalTrans will meet in FY 10-11 to assess agency perspectives, potential methods for sharing allocations, and future collaborative efforts to reduce mercury impairment in San Francisco Bay. Additional information on the progress of collaboratively developing an allocation-sharing scheme between Permittees and CalTrans will be provided in the 2011 and subsequent Annual Reports.

PCB CONTROLS (C.12)

This section describes regional activities designed to comply with specific requirements in MRP Provision C.12 that are not connected to parallel mercury provisions in C.11.

C.12.a Identification of PCBs and PCB-Containing Equipment During Industrial Inspections

Provision C.12.a requires Permittees to develop training materials and train municipal industrial facility inspectors to identify, in the course of their existing inspections, PCBs or PCB-containing equipment. Additionally, Permittees are required to incorporate such PCB identification into existing industrial inspection programs. To assist Permittees in complying with this provision, the BASMAA Board of Directors (BOD) agreed to fund a regional project in FY 2009-10 to develop training material for stormwater inspectors. The scope of the project was to develop regional training and reporting materials to assist commercial/industrial facility stormwater inspectors in identifying PCBs, copper and mercury during their inspections, and provide inspectors with useful Best Management Practices (BMPs) and information materials for distribution to facility owners/operators. The draft training materials were completed in late FY 2009-10 and included a guidance manual for stormwater inspectors (see Appendix A7), inspection form templates, power point training presentation and example BMP materials. Results of training conducted by Permittees in FY 2009-10 are included in Permittee-specific Annual Reports.

C.12.b Conduct Pilot Projects to Evaluate Managing PCB-Containing Materials and Wastes during Building Demolition and Renovation (e.g., Window Replacement) Activities

Provision C.12.b requires that Permittees conduct pilot projects to evaluate managing PCB-containing materials and wastes during building demolition and renovation, including some activities that may not require permitting (e.g., replacement of window panes). Permittees are complying with Provision C.12.b via BASMAA's proactive participation in a project entitled "PCBs in Caulk." The project is administered by the San Francisco Estuary Partnership.[5] The project partners include BASMAA, the San Francisco Estuary Institute (SFEI), and a variety of consultants. Project funding was originally provided through a state Proposition 50 Coastal Nonpoint Source Pollution grant but was replaced by federal stimulus funds (American Recovery and Reinvestment Act of 2009 through the Clean Water State Revolving Fund). Consistent with the requirements of Provision C.12.b, the PCBs in Caulk project will:

- Evaluate PCB levels in caulk from at least 10 Bay Area sites to better understand which types/ages of buildings are most likely to have caulks with PCBs, so that management actions can be targeted effectively. Surveys previously conducted in Europe and other parts of North America have found sealants

[5]The San Francisco Estuary Partnership is a project of the Association of Bay Area Governments.

containing PCBs, sometimes in very high concentrations, in a large proportion of older buildings, particularly those built or renovated in the 1950's, 1960's and 1970's.

- Develop Best Management Practices (BMPs) and associated model policies or ordinances to prevent the release of PCBs from caulks into urban runoff during renovation, maintenance and demolition of Bay Area buildings. The project will build on work that was performed elsewhere and develop methods to identify, handle, contain, transport, and properly dispose of PCB-containing caulks.

- Test and evaluate the effectiveness of the proposed BMPs at three to five sites in the Bay Area and document which methods work best in our region and other lessons learned.

The long-term goal is for Bay Area municipalities to adopt policies or ordinances requiring construction sites to implement the management practices developed by this project, so that legacy caulks containing PCBs are prevented from polluting urban runoff and the Bay.

Appendix A8 contains the project work plan. BASMAA has approved a Regional Project that allows staff from member stormwater programs to dedicate time on behalf of all Permittees to working with the partnership's project team on implementing the project. The stormwater program staff report to and receive feedback and guidance from the BASMAA Monitoring and POCs Committee. The staff have fully participated in all facets of the project, including frequent project teleconferences, development of project work plans, review and commenting on all project deliverables (e.g., the Sampling and Analysis Plan described below), selection of a contractor to develop BMPs, a stakeholder meeting held July 15, 2010, and a public meeting held by EPA on July 22, 2010 on a proposed rulemaking related to relevant PCBs regulations.

Provision C.12.b's requirements include development of a Sampling and Analysis Plan (SAP) to evaluate PCBs at construction sites (including research on when, where, and which materials potentially contained PCBs). Submittal of the SAP is required in this 2010 Annual Report and Appendix A9 contains the SAP. It should be noted that the project has also prepared a Quality Assurance Project Plan (Appendix A10).

Provision C.12.b also requires that this 2010 Annual Report include a status report on the sampling and analysis along with whatever sampling results are available. The sampling and analysis has not yet commenced. Early in 2010 BASMAA representatives began attempting to obtain permission to access municipal properties to perform sampling and analysis and BMP implementation trials. This effort included contacting all Permittees through BASMAA e-mail distribution lists and speaking directly to individual representatives from a number of municipalities. In all cases the BASMAA representatives were informed that municipalities could not further consider providing access to their buildings and projects until they are provided with additional information, including the exact field methods that will be applied and the potential

consequences to municipal agencies that agree to participate in the field investigation. One particular concern is that EPA currently requires preparation of a cleanup plan and implementation of that plan if PCBs are found at a level exceeding 50 ppm in building materials such as caulks and sealants. The project is therefore preparing during the fall of 2010 a memorandum that will articulate the study methods and available information about potential consequences, including estimated costing information related to cleanup and proper disposal of PCB-laden materials. The sampling and analysis and BMP implementation trials are currently scheduled to commence in parallel near the end of calendar year 2010.

C.12.h Fate and Transport Study of PCBs in Urban Runoff

This MRP provision requires Permittees to conduct, or cause to be conducted, studies aimed at better understanding the fate, transport, and biological uptake of PCBs discharged in urban runoff. The 2010 reporting requirement includes a work plan describing the specific manner in which these information needs will be accomplished and describing the studies to be performed with a schedule. This requirement is met through participation in the RMP, which has approved a PCBs Synthesis project in 2011 (Appendix A11). The RMP Master Planning process incorporates several Strategies to address pollutant-specific information needs and support management decisions through investigation of prioritized Management Questions. The synthesis will combine noteworthy findings from recent Status and Trends monitoring and special studies to set the stage for a new multi-year plan for RMP studies in 2012 and beyond. Ongoing or projected future RMP efforts for the PCBs Strategy also include:

- Monitoring of mercury, PCBs and other pollutants in biota, both ongoing (Status & Trends) and in a special 3-year study of Small Fish living along the Bay margins that are an important link in the Bay food web (funded 2008-2010); and
- Development of conceptual models of transport and food web uptake for mercury and PCBs, and Bay Margin areas that will be incorporated with a planned water-sediment-contaminant model linking small tributary inputs to Bay processes.

BASMAA representatives will continue participating in RMP work groups and committees to ensure future implementation of studies that meet the MRP's stated information needs, which include understanding the in-Bay transport of PCBs discharged in urban runoff, the influence of urban runoff on the patterns of food web PCBs accumulation, and the identification of drainages where urban runoff PCBs are particularly important in food web accumulation.

COPPER CONTROLS (C.13)

C.13.c Vehicle Brake Pads

The MRP requires that Permittees report on legislation development and implementation status in Annual Reports during the permit term. Compliance is being

achieved through continued participation in the Brake Pad Partnership (BPP) process to develop California legislation phasing out copper from certain automobile brake pads sold in California.

Appendix A12, an "Investor's Circle Update" from Sustainable Conservation, provides a primer on the issue of copper from brake pad wear, the Brake Pad Partnership (BPP), and the control measure determined through the BPP to be the most appropriate for reducing copper emissions from brake pads: proposed legislation SB 346 (Kehoe) – Hazardous materials: motor vehicle brake friction materials. As described in the Update, SB 346 was introduced to the California legislature in early 2009 and, after passing out of the Senate and moving to the Assembly, was made a two-year bill in late June 2009.

In FY 2009-10, Permittees' efforts focused on:

1. Researching and providing information to assist with bill language;
2. Helping the bill's sponsors to further develop the bill language to address concerns raised by industry representatives from the auto and brake pad manufacturers, brake pad wholesalers and retailers, and car dealers; and
3. Advocating for passage of the bill by the Assembly Environmental Safety and Toxic Materials (Toxics) Committee.

The above activities were coordinated through the California Stormwater Quality Association (CASQA) BPP Team, a group of stormwater quality agencies affected by copper or metals listings, TMDLs, or permit requirements. Permittees participated in the process through BASMAA representation on the BPP team and supported SB346 with letters and lobbying efforts.

The language of SB 346 as of the end of FY 2009-10, two fact sheets on the bill, and BASMAA's letter of strong support for SB 346 to the Assembly Toxics Committee are provided in Appendices A13, A14, A15 and A16, respectively.

C.13.d. Industrial Sources

Provision C.13.d requires Permittees to identify facilities likely to use copper or have sources of copper (e.g., plating facilities, metal finishers, auto dismantlers) and include them in their inspection program plans. Additionally, Permittees are required to educate industrial inspectors on industrial facilities likely to use copper or have sources of copper and proper Best Management Practices (BMPs).

As part of the regional project described under Provision C.12.a, BASMAA developed training materials in FY 2009-10 to assist Permittees in complying with Provision C.13.d. Specifically, draft training materials were for developed to assist Permittees in training commercial/industrial facility stormwater inspectors to identify PCBs, copper and mercury during their inspections, and provide inspectors with useful BMPs and information materials for distribution to facility owners/operators. Results of training

conducted by Permittees in FY 2009-10 are included in Permittee-specific Annual Reports.

C.13.e Studies to Reduce Copper Pollutant Impact Uncertainties

This MRP provision requires Permittees to conduct, or cause to be conducted, technical studies to investigate possible copper sediment toxicity and technical studies to investigate sub-lethal effects on salmonids. These uncertainties regarding copper effects in the Bay are described in the amended Basin Plan's implementation program for copper site-specific objectives.

The MRP reporting requirement for 2010 includes description of the specific manner in which these information needs will be accomplished and of the studies to be performed with a schedule. The information needs will be filled by RMP studies coordinated through the Exposure Effect Work Group (EEWG). The RMP Master Plan (currently under development) lists EEWG priorities for the next 5 years, including effects on benthos and fish. EEWG efforts on benthos in 2011 will focus on completion of studies from prior years that include development of methods and tools for identifying the causes of sediment toxicity, followed by development of long-term plans for 2012 and beyond.

Copper impacts to the olfactory system of salmonids have been found in freshwater experiments, where short-term exposure to increased copper reduced response to alarm odors, and affected predator-avoidance behavior of young coho salmon. A special study approved for 2011 (Appendix A17) will use similar experimental methods on young Chinook salmon in saltwater.

BASMAA representatives will continue participation in the EEWG and the Benthos work groups as needed to ensure that the developing work plans include appropriate follow-up studies in these two areas.

PBDES, LEGACY PESTICIDES, AND SELENIUM (C.14)

C.14.a Control Program for PBDEs, Legacy Pesticides, and Selenium.

This MRP provision requires the Permittees to work with the other municipal stormwater management agencies in the Bay Region to identify, assess, and manage controllable sources of polybrominated diphenyl ethers (PBDEs), legacy pesticides, and selenium found in urban runoff. The reporting requirement for 2010 is to describe progress towards the following MRP implementation objectives:

C.14.a.ii. Implementation Level – The PBDEs/Legacy Pesticides/Selenium Plan shall include actions to do the following:
Characterize the representative distribution of PBDEs, legacy pesticides, and selenium in the urban areas of the Bay Region covered by this permit to determine:

(1) If PBDEs, legacy pesticides, and selenium are present in urban runoff;
(2) If PBDEs, legacy pesticides, or selenium are distributed relatively uniformly in urban areas; and
(3) Whether storm drains or other surface drainage pathways are sources of PBDEs, legacy pesticides, or selenium in themselves, or whether there are specific locations within urban watersheds where prior or current uses result in land sources contributing to discharges of PBDEs, legacy pesticides, or selenium to San Francisco Bay via urban runoff conveyance systems.

The 2012 Annual Report will provide the results of the above characterization and information necessary to calculate loads of these pollutants in stormwater. The 2013 Annual Report will Identify control measures and/or management practices to eliminate or reduce discharges of these pollutants from urban runoff conveyance systems.

Legacy organochlorine (OC) pesticides (e.g. DDT, dieldrin and chlordane), PBDEs, and selenium are either known to impair or potentially impair Bay and tributary beneficial uses. The Water Board is planning or developing TMDLs for each of these groups of pollutants: Selenium in the North Bay and for all parts of the Bay for PBDES and legacy OC pesticides.

The Permittees will address this provision through a BASMAA Regional Project that will compile existing monitoring data from multiple sources including:

- Reconnaissance characterization and Pollutant of Concern Loads Monitoring as described for Provision C.8.e under Water Quality Monitoring below.
- Local tributary monitoring by the RMP, including Coyote Creek and Guadalupe River, and more recent data on PBDEs and OC pesticides at Zone 4 Line A in Hayward; some samples were also analyzed for selenium in winter 2010.
- Previous BASMAA agency sampling for OC pesticides in storm drain sediments conducted through the Joint Stormwater Agency Project.

In FY 2009-10 BASMAA representatives participated in the RMP's Sources Pathways and Loadings Work Group and Small Tributaries Loading Strategy (STLS) Team to guide RMP sampling and to design future stormwater sampling for both the RMP and MRP Permittees under Provision C.8.e.

WATER QUALITY MONITORING

Provision C.8 of the MRP requires Permittees to conduct water quality monitoring and associated projects during the permit term. All water quality monitoring activities required by Provision C.8 are coordinated regionally through the BASMAA Regional Monitoring Coalition (RMC). Scopes and budgets for specific RMC monitoring projects are proposed for BASMAA Board of Directors (BOD) approval by the BASMAA Monitoring and Pollutants of Concern Committee (MPC). Many were approved as Regional Projects by the BOD during FY 2009-10. Others are planned to begin in FY 2010-11 or subsequent fiscal years based on schedules outlined in the MRP.

This portion of the Regional Supplement provides a status report on water quality monitoring activities/projects coordinated through the RMC in FY 2009-10 and briefly describes RMC projects planned to occur in future fiscal years. Activities described herein were conducted on behalf of all RMC participants, and in full compliance with Provision C.8 of the MRP. Summaries of the following C.8 sub-provisions are included in this section:

- Compliance Options (C.8.a)
- San Francisco Estuary Receiving Water Monitoring (C.8.b)
- Creek Status Monitoring (C.8.c)
- Monitoring Projects (C.8.d)
- Pollutants of Concern and Long-Term Trends Monitoring (C.8.e)
- Citizen Monitoring and Participation (C.8.f)
- Reporting (C.8.g)
- Monitoring Protocols and Data Quality (C.8.h)

C.8.a Compliance Options

Provision C.8.a (Compliance Options) of the MRP allows Permittees to address monitoring requirements through a "regional collaborative effort" (e.g., RMC), its' Stormwater Program, and/or individually. The regional collaborative effort option is only available if a majority of MRP Permittees agree to participate. If the regional monitoring collaborative option is selected, participants must formally notify to the Water Board in writing by July 1, 2010 and their water quality data collection required by Provision C.8 must commence by October 2011. If the stormwater program or Permittee option is selected, monitoring efforts are required to commence by October 2010. This one-year extension for the regional collaboration option is due to the time and resources needed to develop a regional monitoring collaborative.

In June 2010, Permittees notified the Water Board in writing of their agreement to participate in a regional monitoring collaborative to address requirements in Provision C.8[6]. The regional monitoring collaborative is referred to as the BASMAA Regional

[6] The Cities of Antioch, Brentwood and Oakley, although not named as Permittees under the MRP, have voluntarily elected to participate in the RMC.

Monitoring Coalition (RMC). With notification of participation in the RMC, participating Permittees are required to commence water quality data collection by October 2011. Therefore, with the exception of monitoring described in this section under Provision C.8.b (SF Bay Receiving Water Monitoring), Permittee efforts in FY 2009-10 described in this section were generally focused on the development of the RMC and associated near-term projects.

BASMAA Regional Monitoring Coalition (RMC)

The RMC is a collaboration of San Francisco Bay Area stormwater programs and associated Permittees focused on effectively and efficiently developing and implementing a regionally coordinated water quality monitoring program that will improve stormwater management in the region. The goals of the RMC are to:

- Assist Permittees in complying with requirements in MRP Provision C.8 (Water Quality Monitoring);
- Develop and implement regionally consistent creek monitoring approaches and designs in the Bay Area, through the improved coordination among RMC participants and other agencies (e.g., Water Board) that share common goals; and
- Stabilize the costs of creek monitoring by reducing duplication of effort and streamlining reporting.

Through its implementation, the RMC allows Permittees and the Water Board to effectively modify their existing creek monitoring programs, which improves their ability to collectively answer core management questions in a cost effective and scientifically rigorous way. Participation in the RMC is coordinated by stormwater program and or Permittee representatives (or equivalent), and facilitated through the BASMAA Monitoring and Pollutants of Concern Committee (MPC), which meets monthly.

To guide implementation of the RMC over the term of the MRP, stormwater program representatives developed a Draft RMC Work Plan (Draft RMC Work Plan) in FY 2009-10 (see Appendix B1). Applicable management questions, descriptions of over 30 RMC monitoring projects, and associated project schedules are included in the Draft RMC Work Plan. Monitoring projects described in the Draft RMC Work Plan that were approved by the BOD and begun in FY 2009-10 include:

- Creek Status and Long-Term Trends Monitoring Standard Operating and Data Quality Assurance Procedures
- Creek Status and Long-Term Trends Standard Contract Language and Reporting Formats
- Multi-Year Pollutants of Concern (POC) Sampling Plan
- POC Standard Operating and Quality Assurance Procedures
- POC Laboratory Standard Contract Language and Reporting Formats
- POC Monitoring Information Management System Development
- POC Information Management and Quality Control
- Sediment Estimate Budget Development

Additional RMC monitoring projects described in the Draft RMC Work Plan are being considered for approval as Regional Projects by the BOD in FY 2010-11 and for future fiscal years through annual planning. Status reports on RMC projects that began in FY 2009-10 are included under the applicable MRP C.8 provision in this report.

C.8.b San Francisco Estuary Receiving Water Monitoring

As described in Provision C.8.b, Permittees are required to contribute their fair-share financially on an annual basis towards implementing an Estuary receiving water monitoring program that at a minimum is equivalent to the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP). During FY 2009-10, Permittees complied with this provision by making financial contributions to the RMP directly or through stormwater programs (Appendix B2). Additionally, Permittees actively participated in RMP committees and work groups through Permittee and/or stormwater program staff as described below. The following sections provide a brief description of the RMP, associated monitoring activities conducted in FY 2009-10, and Permittee participation RMP committees and work groups.

Regional Monitoring Program (RMP)
The Regional Monitoring Program for Water Quality in the San Francisco Estuary is a long-term monitoring program that shares financial support, direction, and participation by regulatory agencies and the regulated community with the goal of assessing water quality in the San Francisco Bay. The regulated community includes Permittees, publicly owned treatment works (POTWs), dredgers and industrial dischargers. The RMP is intended to answer the following core management questions:

- Are chemical concentrations in the Estuary potentially at levels of concern and are associated impacts likely?
- What are the concentrations and masses of contaminants in the Estuary and its segments?
- What are the sources, pathways, loadings, and processes leading to contaminant related impacts in the Estuary?
- Have the concentrations, masses, and associated impacts of contaminants in the Estuary increased or decreased?
- What are the projected concentrations, masses, and associated impacts of contaminants in the Estuary?

The RMP budget is generally broken into two major program elements: Status and Trends, and Pilot/Special Studies. The following paragraphs provide a brief overview of these programs.

RMP Status and Trends Monitoring Program
The Status and Trends Monitoring Program (S&T Program) is the long-term contaminant-monitoring component of the RMP. The S&T Program was initiated as a pilot study in 1989 and redesigned in 2007 based on a more rigorous statistical design that enables

the detection of trends. In FY 2009-10, the S&T Program was comprised of the following program elements that collect data to address RMP management questions described above:

- Water/Sediment/Biota Chemistry and Toxicity Monitoring
- Sediment Benthos Monitoring
- Small and Large Tributary Loading Studies
- Small Fish and Sport Fish Contamination Studies
- Studies to Determine the Causes of Sediment Toxicity
- Suspended Sediment, Hydrography and Phytoplankton Monitoring
- Bird Egg Monitoring

Additional information on the S&T Program and associated monitoring data are available for downloading via the RMP website using the Status and Trends Monitoring Data Access Tool at www.sfei.org/rmp/data.htm.

RMP Pilot and Special Studies
The RMP also conducts Pilot and Special Studies (P/S Studies) on an annual basis. Studies usually are designed to investigate and develop new monitoring measures related to anthropogenic contamination or contaminant effects on biota in the Estuary. Special Studies address specific scientific issues that RMP committees and standing workgroups identify as priority for further study. These studies are developed through an open selection process at the workgroup level and selected for funding through RMP committees. Results and summaries of the most pertinent P/S Studies can be found on the RMP website (www.sfei.org/rmp/).

Participation in Committees, Workgroups and Strategy Teams
In FY 2009-10, Permittees actively participated in the following RMP committees and work groups:

- Steering Committee (SC)
- Technical Review Committee (TRC)
- Sources, Pathways and Loadings Workgroup (SPLWG)
- Contaminant Fate Workgroup (CFWG)
- Exposure and Effects Workgroup (EEWG)
- Emerging Contaminant Workgroup (ECWG)
- Sport Fish Monitoring Workgroup
- Toxicity Workgroup
- Strategy Teams (e.g., PCBs, Mercury, Dioxins, Small Tributaries)

Committee and workgroup representation was provided by Permittee, stormwater program staff and/or designees that were agreeable to RMC participants and the BASMAA Board of Directors (BOD). Representation included participating in meetings, reviewing technical reports and work products, co-authoring articles included in the RMP's Pulse of the Estuary, and providing general program direction to RMP staff. Representatives of the RMC also provided timely summaries and updates to, and

received input from stormwater programs representative (on behalf of Permittees) during MPC and/or BOD meetings to ensure Permittees interests were adequately represented.

C.8.c Creek Status Monitoring

Provision C.8.c requires Permittees to conduct creek status monitoring that is intended to answer the following management questions:

1. Are water quality objectives, both numeric and narrative, being met in local receiving waters, including creeks, river and tributaries?
2. Are conditions in local receiving waters supportive of or like supportive of beneficial uses?

Creek status monitoring parameters, methods, occurrences, durations and minimum number of sampling sites for each stormwater program are described in Table 8.1 of the MRP. Based on the implementation schedule described in MRP Provision C.8.a(ii), Permittees were not required to conduct creek status monitoring in FY 2009-10. Alternatively, Permittee and stormwater program staff (on behalf of Permittees) spent considerable time identifying and scoping RMC projects included in the Draft RMC Work Plan. Planning efforts conducted in FY 2009-10 were intended to assist Permittees in designing and implementing a regional creek status monitoring program that will allow each stormwater program to assess the status of local water bodies, while contributing data to answering regional questions about water quality and beneficial use condition in all Bay Area creeks.

As described in the RMC Draft Work Plan, most creek status monitoring tasks will begin in FY 2010-11, with the exception of standard operating and data quality assurance procedure development, which is described under Provision C.8.h in this report. Additional information on the status of RMC tasks associated with Provision C.8.c (Creek Status Monitoring) will be included in future Annual Reports.

C.8.d Monitoring Projects

Three types of monitoring projects are required by Provision C.8.d of the MRP: 1) Stressor/Source Identification (C.8.d.i); 2) BMP Effectiveness Investigation (C.8.d.ii); and 3) Geomorphic Project (C.8.d.iii). Based on the compliance schedules described in the MRP for these provisions, in FY 2009-10 Permittees focused mostly on scoping future collaborative RMC projects associated with these requirements. These projects are generally described in the Draft RMC Work Plan (see Appendix B1) and will be implemented in future fiscal years.

C.8.e Pollutants of Concern and Long-Term Trends Monitoring

POC Loads Monitoring

Pollutants of Concern (POC) loads monitoring is required by Provision C.8.e (i) of the MRP. Loads monitoring is intended to assess inputs of POCs to the Bay from local tributaries and urban runoff, assess progress toward achieving wasteload allocations (WLAs) for TMDLs, and help resolve uncertainties associated with loading estimates for these pollutants. In particular, there are four priority management questions that need to be addressed though POC loads monitoring:

1. Which Bay tributaries (including stormwater conveyances) contribute most to Bay impairment from POCs;
2. What are the annual loads or concentrations of POCs from tributaries to the Bay;
3. What are the decadal-scale loading or concentration trends of POCs from small tributaries to the Bay; and
4. What are the projected impacts of management actions (including control measures) on tributaries and where should these management actions be implemented to have the greatest beneficial impact.

Based upon compliance schedules described in MRP Provision C.8.a(ii), participants of the RMC are required to begin POC loads monitoring in October 2011. Therefore, RMC participant activities associated with POC loads monitoring during FY 2009-10 were generally spent preparing for monitoring in future years. More specifically, Permittees continued to monitor POC loads via the RMP (i.e., Zone 4 – Line A) and began exploring alternative approaches to POC loads monitoring prescribed in Provision C.8.e. As described below, Permittee exploration of alternative approaches occurred through the RMP's Small Tributary Loading Strategy (STLS) Team, which includes RMC representatives, Water Board staff, RMP staff and technical advisors.

Small Tributaries Loading Strategy (STLS)

To assist Permittees in effectively and efficiently conducting POC loads monitoring required by the MRP and answer POC loads management questions , a draft Small Tributaries Loading Strategy (STLS) was developed in 2009 by the STLS Team (Appendix B3). The objective of the STLS is to develop a comprehensive planning framework for POC loads monitoring/modeling within which associated activities conducted via the RMP and monitoring by Permittees in compliance with the MRP will be complementary.

FY 2009-10 STLS Projects

Consistent with the STLS, POC loads monitoring continued at one station and special studies designed inform future loads monitoring were conducted via the RMP in FY 2009-10. More specifically, the following three RMP special studies related to POC loads monitoring began/continued in FY 2009-10:

- Small Tributaries Loads Monitoring – Loads monitoring continued in Zone 4-Line A, a small flood control channel located in Hayward that drains to the Bay. The watershed draining to the monitoring site is highly impervious and comprised of mostly industrial land use. Fiscal Year 2009-10 served as the fourth year of monitoring at this site.
- Watershed Categorization - The STLS Team conducted a desktop study in FY 2009-10 that categorized watersheds into different "types" based on a variety of watershed characteristics (e.g., land use, imperviousness, area, sediment loading, and contaminant history). The goal of this study was to assist the RMP and Permittees in selecting groups of tributaries where POC loads monitoring will occur.
- Sampling Methods Comparison - This study evaluated a variety of POC loads sampling methods, including currently employed RMP sampling methods (e.g., turbidity surrogate) and MRP default sampling methods (i.e., flow-weighted composite), in an effort to develop recommendations on the most cost effective methods that could be employed Permittees and still adequately address POC loads management questions.

Results of these studies are currently in draft form and will be finalized by early 2011. Additional STLS studies that began in FY 2009-10 include the initial development of a spreadsheet model designed to estimate POC loads from specific watersheds to the Bay, and scoping the need for the development of Event Mean Concentrations (EMCs) for specific POCs. These studies/projects are planned to be completed in FY 2010-11 via the RMP and intended to provide additional tools to assist Permittees in answering POC loads management questions.

FY 2010-11 Projects

In addition to STLS projects mentioned above that will continue in FY 2010-11, an additional related project will also begin in late 2010. As an alternative to conducting long-term POC loads monitoring at bottom of watershed locations (e.g., Zone 4 – Line A), the STLS Team agreed that the RMP should conduct a geographically broader study in FY 2010-11 to characterize POC concentrations in a number of small tributaries in the Bay Area. The STLS Team is currently developing the full scope of the study, but it will generally be designed to further assist Permittees in selecting POC loads monitoring sites. The project will occur early in the FY 2010-11 wet weather season (October 2010 – April 2011) and entail the collection and analysis of POCs in water from between 15 and 20 small tributaries during one or two storms. The proposed list of POC analytes for this reconnaissance includes PCBs, total mercury, PBDEs, and polycyclic aromatic hydrocarbons (PAHs). A report documenting the results of the characterization study is planned for completion in early 2011.

All FY 2009-10 and FY 2010-11 STLS studies described above are intended to assist Permittees in complying with Provision C.8.e through alternative approaches to those prescribed in the MRP. Based on the results of these studies and Permittee input, RMC participants may choose to propose an alternative approach to POC loads monitoring to the Water Board's Executive Officer (EO). If an alternative approach is agreed to

among RMC participants, an *RMC Multi-Year POC Loads Monitoring Plan* (POC Loads Monitoring Plan) documenting the alternative approach will be submitted to the Water Board EO for approval prior to commencement of POC loads monitoring required by the MRP (October 2011). The POC Loads Monitoring Plan will include the rationale for the choice of sampling locations and methods (i.e., number and type of samples, number of storms, and recurrence interval for sampling).

Long-Term Trends Monitoring

In addition to POC loads monitoring, Provision C.8.e requires Permittees to conduct long-term trends monitoring to evaluate if stormwater discharges are causing or contributing to toxic impacts on aquatic life. Required long-term monitoring parameters, methods, intervals and occurrences are included in Table 8.4 of the MRP and prescribed long-term monitoring locations are included in Table 8.3. Applying MRP Provision C.8.a in a manner similar to that described above for creek status and POC loads monitoring, long-term trends monitoring is scheduled to begin in October 2011 for RMC participants.

The State of California's Surface Water Ambient Monitoring Program (SWAMP) through its Statewide Stream Contaminant Trend Monitoring Program currently monitors the seven long-term monitoring sites required by Provision C.8.e.ii, at the sampling occurrence and interval described in Provision C.8.e.iii in the MRP. Although a long-term trends design for creeks will likely be included in the design of the RMC creeks monitoring design, at this time, RMC participants continue to assume that SWAMP will continue to conduct long-term monitoring at a level of effort necessary to comply with the long-term trends requirement in the MRP (as allowed by Provision C.8.e.ii). In FY 2010-11, RMC representatives will confirm that SWAMP will continue the current level of effort of this program in future years and plan accordingly.

Sediment Delivery Estimate/Budget

Provision C.8.e(vi) of the MRP requires Permittees to develop a design for a robust sediment delivery estimate/sediment budget in local tributaries and urban drainages, and implement the study by July 1, 2012. The purpose of the sediment delivery estimate is to improve the Permittees' ability to estimate urban runoff contributions to loads of POCs, which are generally closely associated with sediment. To determine a strategy for a robust sediment estimate/budget, the BASMAA Board of Directors (BOD) approved a Regional Project in FY 2009-10 to begin reviewing current sediment delivery estimates, better define the objectives for improvement and determine what additional work is needed in FY 2010-11. Tasks that may be coordinated through the RMC include: 1) updating sediment delivery estimates recently completed via the RMP by incorporating an improved watershed boundaries dataset, that will also be the basis for future spreadsheet modeling of POC loads under the STLS; 2) listing potential data needs and the extent to which they will be filled through the STLS and MRP creek monitoring; and 3) identifying methods and a schedule for incorporating the above to produce a robust estimate/budget. Additional information on the status of this project will be included in the FY 2010-11 Annual Report.

Emerging Pollutants Work Plan
In compliance with Provision C.8.e.v, Permittees are required by March 2014 to develop a work plan and schedule for initial loading estimates and source analyses for the following emerging pollutants: 1) endocrine-disrupting compounds; 2) PFOS/PFAS (Perfluorooctane Sulfonates (PFOS); 3) Perfluoroalkyl Sulfonates (PFAS); and 4) and NP/NPEs (nonylphenols/nonylphenol esters —estrogenlike compounds). The intent of the work plan is to begin planning for implementation during the next permit term (i.e., post December 2014). Because the compliance date for completion of this work plan is over four years into the future, only initial discussions of the scope of this project were discussed in FY 2009-10 by the MPC. BASMAA Representatives t the RMP will coordinate efforts with the Emerging Contaminants Strategy being developed by the RMP through the Master Planning process. Additional information on the status of this project will be provided in subsequent Annual Reports.

C.8.f Citizen Monitoring and Participation

Participants of the RMC, to varying degrees, currently coordinate with or support citizen monitors within their geographical areas. As a result, relationships have been developed between RMC participants and citizen monitors. In FY 2009-10, Permittees began to plan for future coordination with citizen monitors in their respective geographical areas. Information sharing among RMC participants about activities designed to encourage citizen monitoring is planned to occur in FY 2010-11 and future years at MPC meetings.

C.8.g Reporting

Provision C.8.g requires Permittees to report annually on water quality data collected in compliance with the MRP. Annual reporting requirements include: 1) water quality standard exceedances; 2) creek status monitoring electronic reporting; and 3) urban creeks monitoring reporting. For RMC participants, annual reporting requirements begin following monitoring which is scheduled to commence in October 2011. Therefore, reporting of water quality monitoring data collected in compliance with the Provision C.8 of the MRP is not required in this FY 2009-10 Annual Report.

In preparation for the development of future annual reports described above, and less frequent reporting requirements included in Provisions C.8.g.iv (Monitoring Project Reports) and C.8.g.v (Integrated Monitoring Report), the Draft RMC Work Plan describes projects planned for implementation in future fiscal years. These projects include: 1) standardized reporting templates for creek status electronic reporting; 2) model annual urban creeks monitoring report templates; and 3) reporting templates and outlines for the integrated monitoring report due near the end of the permit term.

C.8.h Monitoring Protocols, Data Quality and Data Management

Provision C.8.h requires that water quality data collected by Permittees in compliance with the MRP should be of a quality that is consistent with the State of California's Surface Water Ambient Monitoring Program (SWAMP) standards, set forth in the SWAMP

Quality Assurance Project Plan (QAPP). To assist Permittees in meeting SWAMP data quality standards and developing data management systems that allow for easy access of water quality monitoring data by Permittees, the RMC began scoping and/or implementing regional projects in FY 2009-10. These include:

- Standard Operating and Data Quality Assurance Procedures – Two projects designed to address monitoring protocols and data quality requirements described in Provision C.8.h were approved by the BOD in FY 2009-10. The first entails the development of a new field standard operating procedure (SOP) and quality assurance project plan (QAPP) for POC loads monitoring. The SOP and QAPP will be completed in FY 2010-11 once a final sampling methodology for POC loads monitoring is agreed to by RMC participants (see POC Loads Monitoring discussion). The second project entails the adaptation of existing creek status monitoring SOPs and QAPP developed by SWAMP or creation of new SOPs, as necessary, that document the field procedures necessary to maintain comparable and high quality data region-wide. The project is also scheduled for completion in FY 2010-11.
- Information Management System Development/Adaptation – As described in the Draft RMC Work Plan, participants would like to store and manage water quality data collected in compliance with Provision C.8 in a cost effective manner that allows data users to easily access and query data and information. Therefore, in FY 2009-10 the RMC began scoping a series of Regional Projects that are scheduled to begin in FY 2010-11 and designed to develop new or adapt existing Information Management Systems (IMSs) for use by the RMC. The goal of these projects is to provide standardized data storage formats, thus providing a mechanism for sharing data among RMC participants. MRP Provision C.8.e.vi requires Permittees to develop a design for a robust sediment delivery estimate/sediment budget in local tributaries and urban drainages, and implement the study by July 1, 2012. The purpose of the sediment delivery estimate is to improve the Permittees' ability to estimate urban runoff contributions to loads of Pollutants of Concern, which are generally closely associated with sediment.

ACRONYMS AND ABBREVIATIONS

BASMAA	Bay Area Stormwater Management Agencies Association
BMP	Best Management Practice
BOD	Board of Directors (of BASMAA)
CASQA	California Stormwater Quality Association
CW4CB	Clean Watersheds for a Clean Bay (BASMAA project)

Name of Management Committee Alternate (if any): Kelly Carroll

Alternate#2: Kristin Borel

This is confirm that the above referenced individuals have been officially designated and duly authorized to vote in their capacities as representative and alternate representative to the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVUPPP) Management Committee, and that such prior designations and authorizations extend to casting votes to direct the SCVURPPP Program Manager to provide certain reports to the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) on behalf of the above referenced co-permittee as required by NPDES permits adopted by the Regional Water Board and in compliance with the signatory and certification for such reports in the manner required as specified by the Regional Water Board with respect to municipal stormwater permit programs in the San Francisco Bay Area.

Signature of Appropriately Delegated Supervisor:

Title of Appropriately Delegated Supervisor: Director of Public Works

CONFIRMATION OF AUTHORIZATION FOR NPDES PERMIT SUBMITTALS BY SCVURPPP PROGRAM MANAGER

Date: August 25, 2010

Name of Co-Permittee: City of Sunnyvale

Name of Management Committee Representative: Lorrie Gervin

Name of Management Committee Alternate (if any): Kristy McCumby Hyland

This is confirm that the above referenced individuals have been officially designated and duly authorized to vote in their capacities as representative and alternate representative to the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP) Management Committee, and that such prior designations and authorizations extend to casting votes to direct the SCVURPPP Program Manager to provide certain reports to the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) on behalf of the above referenced co-permittee as required by NPDES permits adopted by the Regional Water Board and in compliance with the signatory and certification for such reports in the manner required as specified by the Regional Water Board with respect to municipal stormwater permit programs in the San Francisco Bay Area.

Signature of Appropriately Delegated Supervisor: Mauri A Rao

Title of Appropriately Delegated Supervisor: Director of Public Works

CONFIRMATION OF AUTHORIZATION FOR NPDES PERMIT SUBMITTALS BY SCVURPPP PROGRAM MANAGER

Date: 8-12-10

Name of Co-Permittee: County of Santa Clara

Name of Management Committee Representative: Clara Spaulding

Name of Management Committee Alternate (if any): Gary Park

This is confirm that the above referenced individuals have been officially designated and duly authorized to vote in their capacities as representative and alternate representative to the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVUPPP) Management Committee, and that such prior designations and authorizations extend to casting votes to direct the SCVURPPP Program Manager to provide certain reports to the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) on behalf of the above referenced co-permittee as required by NPDES permits adopted by the Regional Water Board and in compliance with the signatory and certification for such reports in the manner required as specified by the Regional Water Board with respect to municipal stormwater permit programs in the San Francisco Bay Area.

Signature of Appropriately Delegated Supervisor: Thomas P. Whisler

Title of Appropriately Delegated Supervisor: Thomas P. Whisler

CONFIRMATION OF AUTHORIZATION FOR NPDES PERMIT SUBMITTALS BY SCVURPPP PROGRAM MANAGER

Date: September 1, 2010

Name of Co-Permittee: Santa Clara Valley Water District

Name of Management Committee Representative: Ann Draper

Name of Management Committee Alternate (if any): Brett Calhoun

This is confirm that the above referenced individuals have been officially designated and duly authorized to vote in their capacities as representative and alternate representative to the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVUPPP) Management Committee, and that such prior designations and authorizations extend to casting votes to direct the SCVURPPP Program Manager to provide certain reports to the California Regional Water Quality Control Board, San Francisco Bay Region (Regional Water Board) on behalf of the above referenced co-permittee as required by NPDES permits adopted by the Regional Water Board and in compliance with the signatory and certification for such reports in the manner required as specified by the Regional Water Board with respect to municipal stormwater permit programs in the San Francisco Bay Area.

ANNUAL C.3. STORMWATER WORKSHOP:

"Complying with New Stormwater Requirements for New and Redevelopment Projects"

Tuesday, June 8, 2010
9:00 am – 3:30 pm
Quinlan Community Center
10185 North Stelling Road
Cupertino, CA 95014-5732

Who should attend this workshop: Stormwater program coordinators; planning and public works staff who select, review and approve development projects and design and construct public projects. Members of the development community are also welcome to attend.

Workshop agenda: This full-day workshop will include regulatory updates on the Municipal Regional Permit and a panel presentation on implementing stormwater requirements at local new and redevelopment projects. There will be two tracks in the afternoon session. One track will offer an introduction to hydromodification management requirements and the Bay Area Hydrology Model. The other track will offer advanced training on low impact development topics including rainwater harvesting, green roofs, soil specifications, and retrofitting impervious areas with landscaping.

The Workshop will also include vendor exhibits.

New this year: AICP Certification Maintenance Credits (Pending)

*There will be **no charge** for the workshop. Continental breakfast & box lunch will be served.*
Please pass this flyer to appropriate staff within your organization.

REGISTRATION FORM: **Date: June 8, 2010**

ANNUAL C.3. STORMWATER WORKSHOP:

"Complying with New Stormwater Requirements for New and Redevelopment Projects"

Tuesday, June 8, 2010
Quinlan Community Center
10185 N. Stelling Road
Cupertino, CA 95116

WORKSHOP AGENDA

8:30 AM	Registration and Refreshments	
9:00 AM	Welcome and Introduction • Site Design for Protecting Water Quality – 2010 Award Winning Projects	Jill Bicknell *SCVURPPP*
9:10 AM	What's New in Stormwater Regulations? Challenges for Municipalities and the Development Community • Municipal Regional Permit • State Construction General Permit	Jill Bicknell *SCVURPPP*
9:40 AM	Performance of Bioretention Areas	
	Serramonte Library/Gellert Park Parking Lot – "Green Streets" Demonstration Project	Jonathan Buck *ENGEO*
	Green Infill for Clean Stormwater	Nicole David *San Francisco Estuary Institute*
10:20 AM	Overcoming Obstacles to LID Implementation – Tales from Silicon Valley	Mike Campbell *HMH*
10:50 AM	**Break**	
11:00 AM	Panel Discussion –Implementation of C.3. in Local Projects	
	Stevens Creek Corridor Park and Restoration Project	Gail Seeds *Cupertino*
	Mitchell Park Library & Community Center	Joe Teresi *Palo Alto*
	Happy Hollow Park and Zoo	Glenn Rock *San Jose*
	VMware Headquarters Building	Jacob Nguyen *BFK Engineers*
	The Self-Watering House	Forrest Linebarger

12:00 PM	**Lunch and Vendor Exhibits**	
	Track 1 – HMP 101 (Location: Social Room)	Jill Bicknell *SCVURPPP*
12:45 PM	Introduction, Overview of Requirements	
1:30 PM	HMP Applicability Maps	
2:15 PM	**Break, Vendor Exhibits, and Refreshments**	
2:30 PM	Case Studies	
3:00 PM	Bay Area Hydrology Model	
3:30 PM	Adjourn	
	Track 2 – Advanced C.3. Topics (Location: Cupertino Room)	
12:45 pm	Integrated Water Harvesting & Watershed- Based Stormwater Planning	Bill Wilson *Carlile Macy*
1:30 PM	Green Roofs: From Concept to Reality	Sarah Sutton *Design, Community & Environment*
2:15 PM	**Break, Vendor Exhibits, and Refreshments**	
2:30 PM	Using the Bay-Friendly Landscape Standards to Implement Low Impact Development in the San Francisco Bay Area	Teresa Eade *StopWaste.org*
3:00 PM	Retrofit Case Studies	
	Double Duty: Working Landscapes for Urban Settings	Jane Martin *PlantSF*
	San Jose Sidewalk Landscaping: Site #1	Carrie Jensen *H. T. Harvey Associates*
3:30 PM	Adjourn

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Evaluation Form
Summary

"Complying with New Stormwater Requirements for New and Redevelopment Projects"

Quinlan Community Center, Cupertino, CA -- Tuesday, June 8, 2010

Attendees: 108 **Evaluations: 65**

1. **What's New in Stormwater Regulations? Challenges for Municipalities and the Development Community** – Given by Jill Bicknell, *SCVURPPP*

   Very Useful 53 **Somewhat Useful 10** **Not useful 0**

   - This is always the most important part of the annual workshop.
   - Great comprehensive view of new regulations.
   - Thank you for the comparison between the C6 of MRP and the CGP.
   - Material is very dry.
   - Could have used more time on the subject – a lot of useful information.
   - I always learn something new from Jill.

2. **Overcoming Obstacles to LID Implementation – Tales from Silicon Valley** – Given by Mike Campbell, *HMH*

   Very Useful 40 **Somewhat Useful 22** **Not useful 0**

   - Good guidance for designers.
   - Potential solutions for different site constraints – this can help with multiple project types.

3. **Serramonte Library/Gellert Park Parking Lot – "Green Streets" Demonstration Project** – Given by Jonathan Buck, *ENGEO*

   Very Useful 38 **Somewhat Useful 26** **Not useful 0**

   - Retrofits of existing sites are useful to understand – potential use for regional treatment? Good info on the classification of the project (contractor interpretation of project type and how to advertise for more bid responses).
   - Good practical advice.

4. **Green Infill for Clean Stormwater** – Given by Nicole David, *San Francisco Estuary Institute*

   Very Useful 30 **Somewhat Useful 26** **Not useful 1**

   - Knowledgeable speaker, great data.
   - Good to see quantified results.
   - Great to see results of effectiveness of stormwater facilities.
   - Good to have numbers to back up a project.
   - Too much biological information – some information is needed showing data of pre and post project contaminants, which Nicole did provide.
   - Good information, but a little too technical for this audience.

5. **Stevens Creek Corridor Park and Restoration Project** – Given by Gail Seeds, *Cupertino*

Very Useful 37 **Somewhat Useful 24** **Not useful 1**

- Interesting and relevant project.
- Super project.
- Great project! The improvements were interesting – however, a little more detail of the design elements would also be quite useful.
- What an amazing site makeover, very inspirational.
- Beautiful creek presentation project.
- Great example of restoration.

6. **Mitchell Park Library & Community Center** – Given by Joe Teresi, *Palo Alto*

Very Useful 32 **Somewhat Useful 31** **Not useful 1**

- Interesting components.
- If anything happens through construction completion (i.e., lessons learned) would be nice to hear at a later workshop.
- Would like to see installed projects to get a better understanding of successes.
- What is the post construction information – how are various LID measures performing?

7. **Happy Hollow Park and Zoo** – Given by Glenn Rock, *San Jose*

Very Useful 17 **Somewhat Useful 40** **Not useful 6**

- Great presenter and presentation.
- Not enough specifics
- Info on cross sections?
- Good pictures. The swale bottom solution (spiral swale) would be nice to hear about later.

8. **VMware Headquarters Building**– Given by Jacob Nguyen, *BFK Engineers*

Very Useful 33 **Somewhat Useful 27** **Not useful 1**

- Interesting to see how these BMPs/site design retrofitted into an existing site.

9. **The Self-Watering House** – Given by Forrest Linebarger, *Vox Design Group*

Very Useful 27 **Somewhat Useful 28** **Not useful 5**

- Nice to see a small project so successful, very inspirational.
- Makes one think about what can be done at a home. Some of this could also be useful on a small site.

TRACK 1 – HMP 101

1. **Track 1 – HMP 101 Presentations** – Given by Jill Bicknell, *SCVURPPP*

Very Useful 22 **Somewhat Useful 4** **Not useful 0**

- Well organized, clear presentation, good selection of slides.

TRACK 2 – ADVANCED C.3. TOPICS

1. **Integrated Water Harvesting & Watershed-Based Stormwater Planning -** Given by Bill Wilson, *Carlile Macy*

   Very Useful 27 Somewhat Useful 11 Not useful 1

   - Would have liked a more concentrated view. He did not have enough time to present what he wanted to share.
   - Many interesting and innovative examples.
   - Good stories. Any lessons learned? Recommendation for one system over another?
   - Too general – showed examples of his design, but not much detail.

2. **Green Roofs: From Concept to Reality** – Given by Sarah Sutton, *Design, Community & Environment*

   Very Useful 24 Somewhat Useful 14 Not useful 0

   - Too much detail, tried to present her presentation with her original amount of time.
   - Lots of great detailed technical information.
   - Good to understand what goes into a green roof and what should be involved.
   - Needed more attention to sustainability and maintenance.

3. **Double Duty: Working Landscapes for Urban Settings** –Given by Jane Martin, *PlantSF*

   Very Useful 18 Somewhat Useful 13 Not useful 2

   - Good information, but didn't know target audience.
   - She is a great person for the community and helping neighbors get involved.
   - Interesting but not particularly applicable to Santa Clara Valley.
   - Love the retrofit-type projects! Analyzing what can be tracked into small spaces.
   - Needs to be more familiar with local Santa Clara County conditions.
   - The before and after photos were excellent.
   - Good number of pictures helped to explain her project.

4. **San Jose Sidewalk Landscaping: Site #1** –Given by Carrie Jensen, *H. T. Harvey Associates*

   Very Useful 18 Somewhat Useful 13 Not useful 5

   - Perfect last presenter – nice energy.
   - Fun, human-interest story.
   - The tip on planting a plus (planting something to break up the soil before planting "real" plants).
   - Interesting approach and some good ideas.
   - A light example of what a homeowner can do.

GENERAL COMMENTS

Did this workshop meet your expectations? Yes: 56 No: 1

- Got updates on new permits, and other ideas for site design/ BMPs and other potential ways to incorporate stormwater design into a site.
- Had expected more useful information on rainwater harvesting – cisterns – how to size, etc.
- Came to see Bay Friendly Landscaping - Please post a copy of the Bay Friendly Landscaping presentation online.

What parts of the workshop were most useful to you?

- Updates on MRP and general permit, examples of LID application.
- Lots of great case studies, lessons learned.
- Good background information for those new to this topic.
- Examples and thorough explanation about the topics were discussed.
- Review of regulations and HMP 101.
- Great workshop overall – I know lots of folks are annoyed with the new permit but it makes trainings like this one much more interesting.
- Green roof, SFEI test results, regulatory overview.
- Advanced topics.
- Jill's updates and changes to MRP, actual case studies of projects that worked.

What would have made this workshop more useful?

- More time for questions and answers.
- Better time management to allow case studies to be better explained.
- Some topics (HMP, LID) could be expanded on – possibly make the "annual" training a 2-day workshop with more specific topics explored.
- More short breaks – to stretch, get coffee, etc.
- Give presenters a realistic time – many presentations felt rushed.
- The video image and pointer system could work better to help with understanding the lecture.
- The morning sessions were more applicable to stormwater management – the afternoon sessions tended to be more specialized and therefore tended to be less useful if not applicable to one's area of work/interest.

What topics would you recommend for a future workshop?

- C.6. Workshop.
- Low cost measures to use given budget constraints.
- Case studies of retrofits.
- Opportunities for grant funding and/or partnerships.
- BAHM training.
- Practice design in urban areas – give a standard – streetscape and design landscaped areas like Jane and Carrie.
- Topics in Track 2 could be more interesting if time permits.
- Implementation of LID.
- Lessons learned (for more constructed projects) and how these unexpected conditions were retrofitted. Cost of BMPs (are they in line with info you find on-line?).

General Comments?

- Try to avoid vendors or venues that still use Styrofoam coffee cups.
- Great workshop all around.
- Please give presenters enough time – breaks are necessary.
- Best workshop over past several years on C.3 issues.
- Need a better laser pointer – it was very difficult to see where the presenter was pointing on the slides.
- Great venue – comfortable, good acoustics, and central.

Construction Site Inspection Training

October 21, 2009

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Presents

"Construction Site Inspection Training"

Wednesday, October 21, 2009
9:00 am – 12 noon
Roosevelt Community Center
901 E Santa Clara St
San Jose, CA 95116

Wednesday, October 21, 2009
1:00pm – 4:00 pm
Roosevelt Community Center
901 E Santa Clara St
San Jose, CA 95116

The same training will be offered in both sessions

Who should attend: This workshop is primarily for municipal inspectors who perform stormwater inspections of construction sites for their agency's stormwater program; staff responsible for public construction projects and local stormwater program coordinators are also welcome.

Workshop agenda will include information on: Current construction site regulations & responsibilities; effective erosion and sediment control BMPs, inspection procedures.

Workshop Benefits: Acquire or refresh your knowledge of current permit requirements; effective BMPs for your construction projects; inspection and enforcement procedures; and construction site management approaches to stay in compliance.

*There will be **no charge** to agency staff for the workshop. Refreshments will be served.*
Please pass this flyer to appropriate staff within your organization.

Evaluation Form Summary

CONSTRUCTION SITE INSPECTION TRAINING
Roosevelt Community Center, San Jose
Wednesday, October 21, 2009
9:00 AM – 12:00 noon

Attendees: **74** **Evaluations:** **39**

---

1. **Construction Site Inspection and Enforcement Procedures** – Given by Cathy Hoang-Mendoza, City of San Jose

   Very Useful 28 **Somewhat Useful 10** **Not useful 1**

   Comments:

   - Appreciate the practical examples.
   - Esp. good as substitute.
   - Good notes/pictures.
   - Cathy's presentation was great!
   - Not with a city (Not Useful)
   - Refresh city municipal-code.
   - I'm not sure how useful this information is to people from other jurisdictions who attended.

2. **Stormwater Quality – Construction Site Compliance/Controls -** Given by Scott Taylor, RBF Consulting

   Very Useful 30 **Somewhat Useful 7** **Not useful 0**

   Comments:

   - Very informative and a good heads up for what is coming.
   - Appreciate the practical examples.
   - Extremely qualified, good presentation.
   - Always great presentations.
   - Photo slides were helpful to help understand different BMPs.
   - Deeply knowledgeable.
   - One of the most knowledgeable people in the field and a good speaker.

3. **Check-in with Water Board Construction Inspection Team -** Given by Christine Boschen, SF Bay Regional Water Quality Control Board

   Very Useful 19 **Somewhat Useful 11** **Not useful 0**

   Comments:

- Interesting to see what the state considers a "violation"
- Knowledgeable/practical.
- Does not explain enough.
- It is good to know what the Board looks for and how strict they are.
- Pictures of violations give good idea of what Board is looking for – good insight into their philosophy.

Did this training meet your expectations? Yes: 38 No: 0

Comments:

- Always good to hear new ideas and products.

What parts of the training were most useful to you?

- Costs of EC measures and products.
- Photos of violations. Heads up on new GOP requirements.
- Procedures.
- Stormwater quality.
- All of them, but in particular, the City of San Jose presentation.
- Who is responsible for what activities.
- Photos. (2)
- Better management practices.
- Site containment.
- Construction site BMPs.
- BMPs. (2)
- Filter fabric should not be used during rain seasons.
- Examples.
- Method of control.
- Visual examples.
- All. (4)
- Keep refreshers coming and with some new info as available, we need the consistency and updates, esp. if we do not match these all the time (or if we do…)
- Example photos.
- Storm water quality notes and pictures.
- Best management practices. Best available technology.
- This is the most educated AND field educated group of speakers – I'm used to listening to people in their heads without field experience or that rare uncommon "common sense".
- Photo examples and some discussions of permit change for July 2010.
- Visual examples – right vs. wrong way to do it.
- Erosion control measures and examples of problems.
- Example (slides) of "Do's" and "Don'ts".
- Applicable examples in photographs with discussion of practices.
- Knowing what the water board is looking at.
- Recent examples/cases.
- Water Board presentation.

What would have made this training more useful?

- Better quality presentation from Regional Board – less repetitive, more informational regarding Board operations, regulations, etc.
- More handouts.
- Better explanation of upcoming permit requirements.
- Flow charts of responsibility.
- More time. (2)
- Information for prevention/implementation.
- Movies.
- Leave some type of org chart or chain of command and phone numbers to contact.
- More coffee.
- More time with the RWQCB rep.
- Can we have a class for inspectors only?
- Nothing.
- Show how these regulations can be monitored.
- Define acronyms – list on handout. List all websites on a single sheet/handout.
- Copy of BMP handbook.
- Starting on time.
- More examples/cases to review. Good vs. bad as class examples.
- If it can be geared to utility work in Public Right of Way

What topics would you recommend for a future training?

- New Permit. (2)
- How to take digital photos for best investigations.
- Encourage city staff to make habit to keep work site neat and clean/work with construction team.
- Demonstrations and examples.
- Utilities companies involved in construction.
- Negative aspects of over hill or erosion and sediment controls. E-training – do at own pace.
- Erosion control for utility permitted jobs/projects.
- Topics for enforcement were well covered.
- Storm water control on unregulated sites, i.e., Farms, Foothills, Construction Yards, to name a few.
- Case studies.
- Example of citing locally with steps of remediation by local agency and water board collaborating.
- Class exercise/group project planning exercise.
- Requirements of new construction permit and new MRP.

General Comments?

- Need a little more time.
- Good job.
- Great refresher, a must.
- Thank You. (4)

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Evaluation Form Summary

CONSTRUCTION SITE INSPECTION TRAINING
Roosevelt Community Center, San Jose
Wednesday, October 21, 2009

Attendees: 43 **Evaluations: 24**

---

1. **Check-in with Water Board Construction Inspection Team** - Given by Christine Boschen, SF Bay Regional Water Quality Control Board

   Very Useful 7 **Somewhat Useful 16** **Not useful 1**

Comments:

- Photos showed various violations but effect on environment not addressed and no consideration of effects of natural erosion vs. human causes.
- Pretty brief – would be helpful to have a little more time.
- Give more detail of the damage the creeks & bay has occurred due to violations.

2. **Construction Site Inspection and Enforcement Procedures** – Given by Cathy Hoang-Mendoza, City of San Jose

   Very Useful 7 **Somewhat Useful 14** **Not useful 2**

Comments:

- As a county agency, not so useful to us.
-

3. **Stormwater Quality – Construction Site Compliance/Controls -** Given by Scott Taylor, RBF Consulting

   Very Useful 17 **Somewhat Useful 6** **Not useful 0**

Comments:

- When considering types of erosion control, presented as if we had to decide what should be used. We are only inspectors, not to dictate what is used. Responsibility of property developer – City properties decided by higher ups.
- Most informative presentation – appreciate examples of real world construction problems and discussion (re: different BMP techniques).

- Who are you talking about? That needs to do the inspections? Contractors or CSJ Inspectors???

Did this training meet your expectations? Yes: 18 No: 1

Comments:

- Somewhat
- This should have been more specific to what we as inspectors for the City of San Jose are required to do – not what other entities are required to do.

What parts of the training were most useful to you?

- Examine if procedures used by developers are adequate. Cost of different products not our concern.
- Scott Taylor's presentation was excellent and look forward to attending his overview of the new 2009 General Permit. (Note: presentations with examples of bad practices should include examples how situations could be handled better.)
- Section 3 – I liked the ½ day.
- Enforcement procedures.
- Scott Taylor's talk.
- Scott's presentation is practical and although I've seen these measures before, it's good to be reminded.
- BMPs.
- Contacts that are available if violations exists.
- SWPPP requirements.
- Refresh info and update of new requirements coming.
- 2 and 3.
- All.
- The parts that were addressed to contractors and developers.
- Examples of what to do.

What would have made this training more useful?

- Morning training, not pm. (3)
- Be more specific for City of San Jose inspectors. Coffee and tea and water would have been nice. Not everyone drinks soda.
- More examples of what are the acceptable practices. Examples of fines given to contractors.

What topics would you recommend for a future training?

- New Permit requirements.
- Discuss specific responsibilities of inspection staff under the new Municipal Regional Permit. Contrast between current policy and upcoming policy.
- Contact phone numbers.
- Be more specific for CSJ inspectors. Who are you speaking to?
- Update the photo library. Some photos seen a few times.

General Comments?

- Dry

Construction Stormwater Management Compliance Workshop

January 19 and 20, 2010

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

SAN FRANCISCO ESTUARY PARTNERSHIP

"Construction Stormwater Management Compliance Workshop"

Tuesday, January 19, 2010
8:30 am – 3:30 pm
Quinlan Community Center
10185 N. Stelling Road
Cupertino. CA 95014

Wednesday, January 20, 2010
8:30 am – 3:30 pm
Roosevelt Community Center
901 E. Santa Clara St.
San Jose, CA 95116

Same Workshop Will Be Offered On Both Days

Who should attend this workshop: Municipal inspectors who perform stormwater inspections for their agency's stormwater program; staff responsible for public construction projects; local stormwater program coordinators. **Contractors and others interested in attending are requested to sign up for the workshop at http://www.sfestuary.org/projects/detail.php?projectID=7**

Workshop agenda will include information on:

- How to comply with the New Statewide Construction General Permit
- Simple and effective stormwater BMPs (Best Management Practices) for small and large construction projects
- Selecting and maintaining BMPs during construction
- Monitoring and reporting requirements
- Post construction stormwater management techniques

*There will be **no charge** to municipal staff for the workshop. Breakfast & box lunch will be served.*
Please pass this flyer to appropriate staff within your organization.

Construction Site Compliance Evaluation Summary

SAN FRANCISCO ESTUARY PARTNERSHIP

Location: Quinlan Community Center, Cupertino
Date: Tuesday, January 19, 2010

Attendees: 65 ***Evaluations: 43***

A. OVERALL	*Strongly Disagree*	*Disagree*	*Neutral*	*Agree*	*Strongly Agree*	**COMMENTS**
1. Room/Facility was pleasant	1	0	2	12	28	• Too cold
2. Materials were useful	1	0	3	14	23	• Some handouts were too small to see
3. Pacing was neither too quick nor to slow	1	1	10	20	9	
4. Content was interesting	1	0	6	24	13	• Some material was a repeat of previous workshops
5. I learned a lot	1	0	7	20	15	• Good slides, very informative

B. INSTRUCTORS						
1. Instructors were knowledgeable	1	0	0	14	27	• Helpful knowledge
2. Instructors answered my questions	1	0	5	15	20	• Good for staff engineers and inspectors
3. Instructors kept me interested	1	1	8	16	16	

C. RESULTS						
1. This course will improve the quality of my work	1	0	7	20	14	
2. I would recommend the course to others	1	1	2	21	17	
3. This training was a worthwhile investment of my time	1	2	4	19	16	

D. The most useful information for me was:

- Information about the new permit requirements
- How to carry out a thorough inspection – knowledge and awareness of new/upcoming regional permits
- Handouts and CD material
- New changes and new requirements in the new permit requirements and the exercise work plan
- Timeline implementation
- All the new requirements and explaining the differences between the MRP and GCP
- Viewing photos of BMP practices, both good and bad implementations
- Contacts for help with implementation
- Application of erosion control measures
- What cities are required to inspect
- Information on turbidity testing

E. **The least useful information for me was:**

- Water Board Inspection Program
- Vendor portion
- Municipal/residential inspections
- Too many details at once
- SWPPP drawing at end
- Redundant info from past 15 years

F. What type of additional information would you like to see presented in the class?

- It should be clarified what agencies are responsible for enforcing if not the owner of a project vs. if they own the project (public works/capital improvement project). Jill's talk should specify who is responsible (agency) & Scott's should say owner/builder is responsible.
- Provide more on biodegradable materials.
- Information for non-city agencies (counties and NPDES/permit requirements in rural, un-residential areas)
- If we could get computers for everyone when running through RL calculations
- Sampling equipment types
- More BMP practices for public-right-of-way facilities
- More practical experience
- Specific local case studies
- NPDES requirements related to parks and trails
- Streamlined forms specific to what the agencies want

G. **Additional Comments**

- This class was very useful to me, flowed well, and had a fair balance of construction site management protocols and actual site scenarios.
- Don't use the same site plan for the exercise every year.
- Scott was very knowledgeable and interesting. He kept the class engaged.
- More information on CD and websites would be helpful.
- Less theory and more hands-on
- Scott needs to develop a new/different group exercise for this presentation for a more experienced group.
- Although very technical, the acronym list was helpful when deciphering materials.
- I always enjoy how these workshops that are so technical can be so easy to understand. Great job by the presenters to make the content interesting and easy to understand!

Construction Site Compliance Evaluation Summary

SAN FRANCISCO ESTUARY PARTNERSHIP

Location: Roosevelt Community Center, Cupertino
Date: Wednesday, January 20, 2010

Attendees: 107 ***Evaluations: 57***

A. OVERALL	*Strongly Disagree*	*Disagree*	*Neutral*	*Agree*	*Strongly Agree*	**COMMENTS**
1. Room/Facility was pleasant	2	9	13	19	13	• Room was uncomfortably cold • Next time have wifi • Great facility
2. Materials were useful	0	0	3	33	21	• Text on handouts difficult to read • Too many acronyms
3. Pacing was neither too quick nor to slow	0	3	10	29	14	• Too much over-lap
4. Content was interesting	0	0	8	33	15	• Organization was lacking
5. I learned a lot	0	1	13	28	13	

B. INSTRUCTORS						
1. Instructors were knowledgeable	0	0	1	26	30	
2. Instructors answered my questions	0	2	10	19	23	
3. Instructors kept me interested	0	2	7	31	16	• Less monotone to help keep people interested • Discouraged by lack of good outlines for procedures

C. RESULTS						
1. This course will improve the quality of my work	0	0	12	26	19	
2. I would recommend the course to others	0	2	5	26	24	
3. This training was a worthwhile investment of my time	0	0	9	27	21	

D. The most useful information for me was:

- Overview of requirements

- Inspection tips
- Actual situations
- The table summaries and the CD
- Photos of existing site, examples of good and bad

E. **The least useful information for me was:**

- Vendors
- New regulation explanation was inadequate and confusing
- Examples of various erosion and how it was resolved and cost estimating
- Review was too long
- Rain for Rent presentation

F. What type of additional information would you like to see presented in the class?

- A better handbook or guideline of procedures – not just PowerPoint handouts
- Stuff related to roadway construction – arterials
- Demo of gauges to use in field
- Better distinction between general construction permit and local municipal permits.
- What does and does not work in construction inspections.

G. **Additional Comments**

- If you have inspectors for each project, why are every simple BMP not being implemented? Make inspection staff responsible for making sure BMP's are on site. Designers are rarely in the field and inspectors are daily.
- Polyacrylamide pusher – if passive use puts high levels in the output, then why would we want to use it in any form?
- The backgrounds on some slides do not transfer well on photocopies – cannot see what was on the page.
- Course was too long and very repetitive
- PowerPoint allows printing of slide handouts without the background color resulting in a white slide background. Please take this step so that the slide handouts are more readable.
- Presentation flow by all was very productive. Going through the slides in a speedy manner kept presentations from being boring.
- Too much information to absorb and follow – can someone develop a flow chart or table summary that guides the field inspector to efficient evaluation and implementation?
- The exercise was very helpful to think about and apply what was learned.
- Go through risk levels, what they mean and how to calculate them first. This will help people understand if their projects generally fall into a particular risk level.
- Should require contractors to attend these workshops to give them heads up of what agencies will be looking for in regards to compliance.
- More photos and examples would be helpful when describing the general permit changes.
- Higher quality photos would be useful; the ones presented were hard to see.
- I don't think that it is appropriate for Scott Taylor, a private for-profit consultant, to be presenting to the level where he is setting the standards for municipal requirements. This level of material should be interpreted by a state employee, associated with that program. This is a conflict of interest.

Santa Clara Valley
Urban Runoff
Pollution Prevention Program

Evaluation Form Summary

Construction Site Stormwater Compliance Workshop

SCVWD, San Jose, CA — Wednesday, May 19, 2010, 9:00 AM – 1:00 PM

Attendees: 60 — **Evaluations: 13**

1. **Understanding the New State General Construction Permit** – Given by Scott Taylor, RBF Consulting

   Very Useful 12 **Somewhat Useful 1** **Not useful 0**

   Comments:
   - Excellent delivery
   - Provide one sheet with all acronyms

2. **Linear Utility Projects -** Given by Tanya Bilezikjian, RBF Consulting

   Very Useful 10 **Somewhat Useful 3** **Not useful 0**

   Comments:
   - Eliminate the frequent "ums", "ahs", and "ands"
   - A bit too fast
   - Difficult to read slides on handout

3. **SMARTS Web Tool -** Given by Tanya Bilezikjian, RBF Consulting

   Very Useful 10 **Somewhat Useful 2** **Not useful 0**

   Comments:
   - Do not use power point slides with background color – makes handouts difficult to read
   - Number your slides

Did this training meet your expectations? Yes: 11 No: 0

What parts of the training were most useful to you?
- New permit regulations
- Smarts portion
- Presentation #1 and #3
- Charts and procedure
- Questions about grandfathering about existing projects

What would have made this training more useful?
- Handout readability
- Bring computer and run risk level assessment
- Legible handouts

What topics would you recommend for a future training?
- Preparing a SWPPP according to the new NPDES permits

General Comments?
- Great job!

September 15, 2010

FY 09-10 Watershed Watch Campaign Work Plan - DRAFT

BACKGROUND

The primary goals of the Watershed Watch Campaign are to:

1. Change behaviors that negatively impact the watershed.
2. Encourage behaviors that protect, preserve and restore the watershed.
3. Inform audiences about activities that impact the watershed.
4. Build awareness of watershed issues in general.

In fiscal year FY 08-09, the Watershed Watch consultant AdManor, Inc.:

- Implemented the FY 08-09 Watershed Watch Campaign work plan
- Maintained and developed partnership relationships that benefit the Program
- Maximized campaign resources through value-added development and effective media implementation
- Coordinated campaign activities in consultation with the Watershed Education and Outreach Ad Hoc Task Group (WEO AHTG)
- Developed new outreach collateral and litter messages

The Campaign's FY 08-09 media buys focused on community newspapers and South Bay radio stations. Messages included problem-specific IPM messages from FY 07-08, newly developed litter messages and Mercury pollution prevention messages.

Each year, the campaign effectiveness has been measured through

- Hits on the www.MyWatershedWatch.org website
- Inquiries on the phone hotline
- Requests for information on the hotline and website
- Quantity of fluorescent bulbs dropped off at participating hardware stores and household hazardous waste collection events.
- Media gross impressions
- Spot surveys conducted at community events
- Attendance at Watershed Watch promotional events

In February 2009, the Program is contracting with a research firm to conduct a public opinion survey to evaluate the effectiveness of the Campaign. The FY 09-10 media and creative plans will be refined based on the finding of the public opinion survey.

FY 09-10 Watershed Watch Campaign Work Plan

The FY 09-10 Work Plan is based on a campaign budget of $150,000. If additional funds become available, they will be allocated according to the prioritized needs of the campaign and feedback from the WEO AHTG.

Whenever possible, Watershed Watch Campaign activities will be coordinated with activities of other local and regional outreach programs (e.g., the BASMAA Regional Ad Campaign, HHW Program and the County Integrated Waste Management Program campaigns, and the BASMAA/BACWA Media Relations Committee). Campaign activities will be evaluated on an ongoing basis, and changes made as required for effectiveness.

In FY 09-10, AdManor Inc. ("consultant") will implement the following tasks to achieve the goals of the Campaign.

TASK 1: Creative Development

This task includes revisions to existing messages or the development of an additional message (e.g. automotive related message). Creative needs will be determined by results of evaluations and as dictated by the priorities of the Campaign (media selection, messages, and all applicable production).

TASK 1 DELIVERABLES:

Final deliverables are contingent upon media plans and WEO AHTG agreement about the message focus for each campaign flight. Deliverables may include creative materials for:

- Print media (newspaper, magazine, coupon ads)
- Transit media (bus board posters)
- Radio (recorded messages, public service announcements)
- Collateral (point-of-purchase displays/prompts, materials for distribution)
- New media (internet, social media, or other new media production)
- Cable television

A part of the budget will be used to develop and produce giveaways (e.g., flyswatter, pencils)

TASK 1 BUDGET: $8,500

TASK 2: Media Advertising

The FY 09-10 media plan will be reflective of the recommendations, evaluations and any trends found in the 2009 public opinion survey. For example, focus group research from 2003 and 2006 suggested that a top of mind awareness (TOMA) approach to media could be more effective than concentrated media campaigns, as a consistent reminder to "do the right thing." After two complete campaign years and media schedules with this approach, the public opinion survey may indicate whether TOMA is being achieved.

The consultant will develop media partnerships, schedules / flight plans and budget allocations in a comprehensive media plan. In developing these plans, the consultant will work with the WEO AHTG to clearly identify and define their media goals and preferences, and obtain their approval.

Requests for proposals will be developed to educate the media regarding the goals of the campaign, the prospective media schedule(s)/plan, budget, and the criteria on which proposals will be judged. RFPs will be distributed to media in the geographic target area, defined as Santa Clara County geographic area, also known as the area of dominant influence (ADI). San Francisco media may also be included with the instruction that comparative data is based on coverage of Santa Clara County audiences.

"New media" or online and mobile phone advertising messaging will be explored in

addition to traditional media.

Media Allocation

The consultant will allocate the media budget proportionate to language/population of the target audiences, and the media's effectiveness in delivering audiences and added-value to the campaign. The consultant will create an appropriate balance based on the goals, budget for the campaign, any timely circumstances and/or other campaign partner activities relevant to Watershed Watch goals and messages.

Media Selection

Media selection may be impacted by the outcome of the public opinion survey, and whether the TOMA approach is effective. The TOMA campaign has focused on delivering more consistent messages to a narrower, more targeted audience. The alternate is utilizing media with a broader reach and more "high-impact" short-term schedule.

Media will be evaluated for its: effective reach in the ADI (ratings); efficiency based on cost per point, reach & frequency to target audience(s), added value, and partnership opportunities.

Media will be selected to create a desirable balance of reach and frequency; limited duplication in programming and formats for maximum reach; maximum impact weighing rating points and impressions; and adequate frequency to create impact.

Selection will consider the proportion of media in English and Spanish relative to the population, effectiveness in delivery of the message, the messages the Campaign wants to deliver, partnerships and value-added media and promotions.

Media Schedule

The FY 09-10 media schedule will be reflective of the results of the public opinion survey (TOMA/ongoing vs. concentrated schedules) and in support of Campaign events and seasonal messages.

The consultant will present the recommended detailed media plan to the WEO AHTG for approval. The media plan will be revised as needed based on comments received.

Upon approval of the media plan, the consultant will confirm schedules with the media and secure contracts, including written commitments of added value and promotions. All creative materials and traffic instructions/insertion orders will be distributed to the media.

Task 2 DELIVERABLES:

- RFP to Media (Media Negotiation)
- Media Recommendations
- Media Plan
- Traffic (creative and scheduling instructions) / Distribution to Media
- Billing / Reconciliation / Documentation
- Media Campaign Summary (Report)

Task 2 BUDGET: $82,850

Task 3: Partner Development and Coordination

Developing partners has proven successful in augmenting campaign resources. Partners have distributed Watershed Watch materials through educational and promotional activities and events, offered web site links, sponsorship status for events, and shared other resources. The consultant will continue to work with past and existing partners so that the list of partners continues to grow each year.

The consultant will explore development of additional partnerships, such as:

- Additional or alternate media partners – Comcast Cable, VietUSA, Cinemas, Pennysaver, ValPak (direct mail media), movie theaters, etc.
- Water-related / outdoor activity businesses or sporting retailers – Fishing, boating, rafting, kayaking, parks and open space groups
- Hardware/garden/home improvement – OSH (currently through BASMAA), Ace Hardware.
- Educational - San Jose Tech Museum, San Jose State University Environmental Studies Department, Santa Clara University Environmental Sciences Institute; encourage student studies and projects focused on watershed protection and pollution prevention in cooperation with Watershed Watch.
- Automotive – dealers, oil change / service centers, auto parts / targeting do-it-yourself oil changes

The consultant will distribute a partnership kit to all new partners and potential partners, which presents partnership benefits and opportunities and tools for displaying their support of WW, and thanks them for their partnership. In pursuing new partners, when appropriate, the consultant will develop customized proposals with specific benefits and creative partnering opportunities, developing mutually beneficial relationships and activities. The consultant will continue to seek partners that provide discounts on products and services to patrons using the Watershed Watch card.

The support of these relationships includes coordinating outreach materials or messages, promoting the partner's interests that are shared with the Program, participating in key activities and events, and suggesting or developing win-win opportunities. A calendar of events will be maintained to keep all partnership activities "on the same page."

Changes and developments in media from the previous year may impact the availability or recommended change in partnership pursuits.

If needed, the consultant will help the WEO AHTG review other local and regional campaigns (e.g., the BASMAA Regional Ad Campaign), and provide feedback.

Task 3 DELIVERABLES:

- Ongoing contact with partners; work with existing partners and renew previous partners
- Partnership kits (ongoing)
- Maintain updated contact data and partnership details
- Development of new creative partnership opportunities / scenarios

- Monthly written report of results or activities
- 2 new community/business partnerships

Task 3 BUDGET: $5,000

Task 4: Development of Value-Added Resources

The media offers excellent value added opportunities. The consultant will negotiate media buys and partnerships for added media exposure, requesting innovative partnerships and sponsorship opportunities with the media and their advertisers. When media proposals lack relevance or inspiration, the consultant will develop and propose concepts, beginning with additional media.

Opportunities include but are not limited to:

- Contests to provide public awareness and incentive
- Donations of products or services to use as incentive
- Signage or space to provide prompts
- Public Service Announcements / donated airtime or space
- Sponsorships
- On-site events
- Cross-promotions with other media clients and with the stations/publications
- Web links, etc.

The consultant will also explore new methods and channels of distribution for campaign messages, as well as activities or opportunities to encourage desired outcome from the audience, and reinforce the positive impact of that action.

Events offering relevant opportunities may be:

- Earth Day events throughout the region
- Home & Garden Shows
- Garden Tours
- Santa Clara County Parks & Recreation events and venues
- Beach/Creek Clean-up days
- Outdoor events/activities that take place in a watershed recreation area
- “Green” living/sustainability or health-related events

Task 4 DELIVERABLES:

- Value-added as negotiated with media and partners
- Monthly written report of results or activities
- Two third-party promotions

Task 4 BUDGET: $5,000

Task 5: Website Maintenance

The consultant will maintain the Watershed Watch website on an ongoing basis, encouraging partners to provide news, and creating more ways and reasons for the public to use the site.

The consultant will edit the site to maximize the usability of the site and help people easily and quickly find the information they seek, and maximize the educational impact and effectiveness of the site. As budget allows, this will involve streamlining the functionality of the site to eliminate extraneous files, and translating more features of the site into Spanish (relevant Watershed Watch pages linked to the Spanish site).

The consultant will update it regularly with the latest news/ articles, creative, partnership links, and events/announcements, including removal of expired or past events and news in a timely manner.

The consultant will track web activity and comment on any potentially relevant trends observed.

Task 5 DELIVERABLES:

- Monthly/ongoing maintenance
- Monthly written report of results or activities

Task 5 BUDGET: $7,000

OPTIONAL: WEBSITE REDESIGN
Please see Addendum I with an optional website redesign proposal.

If the website redesign proposal is approved, the regular maintenance cost would be reduced to $6,000 and other changes will be completed within the scope of site redesign. Website redesign estimate: $11,500

TOTAL TASK 5 + Addendum I Budget: $17,500

Task 6: Outreach Events

The consultant will maintain a comprehensive calendar of events including:

- Partner events (car wash events, garden/gardening, HHW, etc.)
- Relevant holidays or observances (Earth Day, Arbor Day, etc.)
- Media schedules

The consultant will work with WEO AHTG to create an event plan for prioritizing events according to budget, resources and Campaign goals.

The consultant will evaluate and recommend relevant events in the FY 09-10 to reach greater numbers of people, support campaign partners, promote messages/areas of focus (litter, IPM, etc.), and take advantage of added-value / media opportunities when possible.

Task 6 DELIVERABLES:

- Event plan development and maintenance
- Coordination of events (applications, registration fees, materials, etc.)

- Participation / representation at events (equivalent to 5 days)
- Event survey / written report of results or activities

Task 6 BUDGET: $7,000

Task 7: Media and Public Relations

Public and press relations, both proactive and reactive, will be utilized to increase audience awareness and understanding of current events and activities that affect the watersheds.

News created by the actions of nature, politicians and local citizens, and BASMAA media outreach activities may be maximized to promote watershed awareness and public education opportunities. When appropriate, the consultant will craft a relevant news story based on general conditions, campaign events or partner events, or current trends.

Specifically, the recruitment and public awareness of Santa Clara Valley Green Gardeners will be promoted.

The consultant will pitch stories to the local press promoting the Program's perspective.

Materials will be emailed to partners and co-permittees for their approval, use and distribution, and/or loaded to the website for download.

The consultant will also utilize community calendars in internet, print, TV and radio for no-cost announcements of events, programs and activities.

Task 7 DELIVERABLES:

- PR plan development and execution (3 pitches/PSAs)
- Ongoing maintenance of press contact data
- Clippings when available

Task 7 BUDGET: $5,000

Task 8: FY 10-11 Work Plan Development

The consultant will compile and submit monthly, mid-year and year-end campaign activity reports for all applicable tasks. Details will include measurable results of campaign activities and estimated added-value amounts.

The consultant will develop the FY 10-11 Work Plan and Media Plan, consistent with the 3-year conceptual plan and adapting to the outcome of the FY 09-10 campaign.

Task 8 DELIVERABLES:

- FY 10-11 Work Plan
- FY 09-10 mid-year and year-end reports

- Monthly reports

Task 8 BUDGET: $5,500

BUDGET SUMMARY:

BUDGET SUMMARY:

TASK 1 Creative Development	$8,500
TASK 2 Media Advertising	$82,850
TASK 3 Partnership Development	$5,000
TASK 4 Added-Value Development	$5,000
TASK 5 Website Maintenance plus Redesign	$17,500
TASK 6 Event Coordination	$7,000
TASK 7 Media/Public Relations	$5,000
TASK 8 FY 10-11 Work Plan	$5,500
TOTAL CONSULTANT BUDGET	$136,350
EOA Mark Up	$13,635
TOTAL CAMPAIGN BUDGET	**$149,985**

Addendum I

SCVURPPP Watershed Watch Campaign Website Rejuvenation FY 09-10

Overview

The Watershed Watch website is of significant importance to the campaign, providing an affordable and customizable medium for disseminating watershed education and pollution prevention messages, and a method for measuring public response and interest.

The current website provides a wealth of information, but has room for improvement in evolving to meet new standards in user expectations and achieving better rankings in online searches.

Some changes are not possible based on the existing design, such as adding or deleting navigation buttons, so a new site design would allow more freedom and flexibility in what we can present to keep the site fresh and relevant.

The back end of the site is a complex web of content that requires review to ensure that only relevant content is linked to and contained in the site in order to streamline the function.

The top 600-1000 pixels of the current home page look unchanged to each visitor, every time. That is, when they open the site in their web browser, it always looks the same until they scroll down to see the newest additions to the home page (the most current events and features), and some visitors may not bother to do so.

A new home page design will allow the user to see more current news and relevant (desired) information at first glance. Ideally, this will encourage users to spend more time on the site and to visit more frequently.

Goals

- Function
  - Condense and streamline
    - More intuitive to the user's use of the site
    - Fewer clicks to find the data visitors seek; quick links from main page to most popular (frequently visited) items
  - Optimize for search engines with relevant information and key words
- Design / Appearance
  - Update visual and navigational style for a clean look that presents more current information in primary view with less scrolling
  - Contemporary look to appeal to an evolving and more savvy internet audience
- Content
  - Maintain the relevant information from the current site to minimize rewriting and translation
  - Develop (write) new content as needed to meet the needs of the site and user-desired content
- Completion / Work Plan
  - Complete English site prior to starting Spanish site
  - Upon approval of English site and all content, implement Spanish site

- Continue maintaining and updating data on existing site throughout production
- "Go live" upon approval

Scope of Work

1. Develop design style

- Develop and present several layout options.
- Maintain familiar elements of the existing site (e.g. images, colors) while implementing a more current presentation and streamlined navigation
- Revise as needed to achieve approval
- Implement all pages to approved/final style: Approximately 40 active pages (plus linked attachments and external links) for each English and Spanish (approximately 80 pages total)

Samples of modern sites that present a high quantity of content on the page without seeming too busy:

- City of Monterey recycling page www.montereyrecycles.org
- Monterey Regional Waste Management District - http://www.mrwmd.org

2. Content

- Utilize the site activity data (reporting) to determine which content should be featured most visibly and readily accessible, such as Definitions, Volunteer Opportunities, and Problems / Solutions.
- New technology / new media
  - Determine whether or not new technology such as RSS Feeds, blogging or other social networking tools can enrich the content and expand the use of the site
  - Determine how to maintain and maximize it
  - Integrate as deemed appropriate by the Program
- Outline the proposed site content / site map and organize all content
- Use existing messages / content where relevant
- Revise as needed to maximize the visible content for search engine optimization *(ensure the text has popular relevant search words appearing frequently and early as possible in the site content)*
- Develop new content as needed
- Translate into Spanish
  a. All new and revised content
  b. Any content currently linked to the Spanish site that is not yet provided in Spanish

3. Coding

- Code and link all pages
  - Site and page functionality
  - Internal and external page links
  - Link all downloadable attachments
- Search Engine Optimization (SEO)
  - Identify and integrate key words/meta tags *(words and short phrases that describe the content of the site – the more these words appear in the site – both visibly and on the back-end – the better chance the site has of*

ranking highly on search engines in relevant searches; words are strategically selected to address maximum users' searches)
    - Search engine registration
- Tracking / Evaluation
    - Google Analytics, other free web activity analysis tools – fully coded site to track all linked / downloaded documents and activity
- Load and test
- Go live upon approval

Estimate

Estimate is based on:

1. Design & Production
    - Design style (present up to 3; implement 1)
        - Includes up to 2 Revision cycles to achieve final design approval
    - Format content; implement content into approved layout
        - English and Spanish

    DESIGN & PRODUCTION TOTAL $5200

2. Content
    - Copy editing (review and revise existing copy)
    - Copy writing (develop new copy as needed)
    - Translation to Spanish

    CONTENT TOTAL $3250

3. Coding
    - Code and link
    - SEO and registration
    - Test

    CODING TOTAL $3040

TOTAL WEBSITE REDESIGN: $11,490

Work Plan

The proposed work plan is as follows:

PHASE I
Research & Development
- Meet with the Script Review Committee to determine any preferences, wants and needs for the site
- Review example sites (Committee can provide sites they like for example of function, features and layout)
- Compile data regarding popular search words and phrases

Design / Layout
- Design three different looks / layouts

- Present layouts and receive feedback
- Revise selected look to achieve approved design

Content
- Present outline for site (site map) including all linked files and resources
- Present new and revised content for review and approval
- Revise content as needed to achieve approval

Estimated time for Phase I = 1 month
Contingent upon review and approval

PHASE II
Design / Layout
- Implement approved content into English site
- Present and revise as needed to achieve approval

Content
- Translate approved content into Spanish

Estimated time for Phase II = 1 month
Contingent upon review and approval

PHASE III
- Code site as needed
- Implement Spanish site
- Present and revise as needed to achieve approval
- Test
- Register
- Go live

Estimated time for Phase III = 2 weeks
Contingent upon review and approval

FY 09-10 Watershed Watch Media Plan

REVISED 7-27-09

MEDIA OVERVIEW

Budget

The total FY 09-10 media budget is $82,850 in Watershed Watch Campaign funding.

To reflect target audience demographics, approximately 25% or $21,000 of the budget should be in Spanish-language media (per 2007 Census data for Santa Clara County, persons of Hispanic origin).

Co-permittees City of Sunnyvale and City of Cupertino to date have pledged combined $2,000 additional to be allocated to VTA Transit (Bus Tail) ads with a Litter message. This brings the total media budget to $84,850.

Audiences

All ratings/reach information is specifically for the Santa Clara County market.
For general market, efficiencies are based on reaching adults 25-54. When available, efficiencies for audiences 35+ have been provided to gauge the most efficient media for reaching the primary target audience. For Spanish language, the consultant focused on ratings in the 18-49 demographic, consistent with the population.

Messages

The media campaign will focus on pesticide, Green Gardener and litter messages, with car wash messages to promote promotional partnership events and awareness of automotive pollutants. Most messages for print and radio are produced and ready to air / publish.

New messages in the form of brief and frequent tips for pollution prevention and watershed education/trivia will be developed in order to take advantage of blogging, emailing and social networking opportunities. If television and/or online video applications will be utilized, new production will be developed accordingly.

Scheduling

Schedules will maintain a media presence throughout the year. IPM messages are timely in late spring, summer and early fall. Litter messages are especially timely during the rainy season early winter through the spring. Mercury (CFL as HHW) messages are timely outside of daylight savings hours when indoor lighting is used more. Green Gardener messages will be focused around the class schedules (student recruitment prior to registration deadlines, and promotion of Green Gardeners following graduations).

Car wash messages and events are ideal for late spring and throughout the summer and early fall when car washing is eminent. Media and carwash events with partners will be scheduled accordingly.

The following are the media plans for Spanish and English based on decisions/requests by the WEO AHTG. <u>All costs are contingent upon final negotiation with the media, after the plan is approved.</u>

SPANISH MEDIA - RADIO / PRINT / INTERNET

BUDGET: $21,330

Radio – *KSJO 92.3 FM*

- 12 weeks radio
  - Run 6 months; 2 weeks per month
- Provides targeted reach to the local audience
  - A top rated station in Santa Clara County market
  - KSJO mentioned as a preferrred station in Campaign focus groups
- Radio stations are promotions-oriented
  - Support for Campaign events
  - Sponsorship of station events (select or develop relevant events)
- Existing creative allows the Campaign to hit the ground running

Print - *El Observador*

- 26 insertions out of 52 weekly issues; run every-other-week for year-round campaign
- Provides small but targeted reach to the local audience (20K in Santa Clara County)
- ADDED-VALUE
  - ONLINE
    - Print ads will appear in *El Observador* electronic edition (online)
    - Website banner with a link to Campaign website year-round
  - EVENTS
    - Distribution of Watershed Watch marketing material/handouts and messages (e.g. Discount Cards) at local festivals and events where EO participates (long list of events throughout the South Bay)
  - TRANSLATION / CREATIVE
    - Translation provided for new messages
  - EDITORIAL
    - Editorial support (3 articles/press releases - 400 words per article)

Internet – *Google AdWords, KSJO.com*

- Google AdWords
  - 12 weeks Google AdWords based on estimated $0.50 cost per click and 150 clicks per week.
  - Actual costs will vary according to key words and competitive cost-per-click bids (likely lower costs will allow more clicks, and weeks will be added as they are afforded).
  - Target local audiences searching for solutions, events and education; use frequently searched key-words to guide local users to Watershed Watch website
- KSJO Online
  - 10-weeks banner ads
  - Combine on-air with online station media for synergy and added frequency
    - Ad content and on-air announcements invite site traffic
  - Relationship to favorite station provides good-will in Latino community

ENGLISH - CABLE TELEVISION / RADIO / OUTDOOR / INTERNET

BUDGET: $62,536

Television – *Comcast Spotlight Cable*

- 16 weeks of cable TV advertising; 2 weeks per month from November 2009-June 2010.
- Provides geographic targeting to San Jose Zone, Silicon Valley Zone and South Peninsula Zone to reach all jurisdictions with limited waste
- Scheduled to reach maximum viewers in prime access (4-7pm) and prime time (7pm-12mid)
- Builds frequency with audience over course of the campaign
- NETWORK SELECTION:

- Networks selected for ratings with primary target audience (college educated homeowners 35+) and rates to fit within the campaign budget
- Paid networks are all basic cable subscription channels
  - TNT "we know drama"
    - Features sports (golf, NASCAR, NBA), syndicated and original drama series, movies
  - TBS "very funny"
    - Features syndicated and original comedy programs, movies and Sunday MLB baseball
  - HISTORY
    - Features original programming and movies
  - ESPN
    - Features "SportsCenter," sports and games
  - COMEDY CENTRAL
    - Features movies, "Daily Show," "Colbert Report," original and syndicated comedy programming
  - COMCAST SPORTS BAY AREA
    - Features Sharks, 49ers, Raiders, A's, Giants, Kings, Warriors, Earthquakes
  - FX
    - Features original and syndicated programming, movies
- ADDED VALUE
  - Every paid spot is matched with a 6am – 12mid spot (no overnights) on the same channel as the paid spots
  - 500 additional spots on Planet Green, Comedy Central, True TV, Style TV, National Geographic (based on target audience and inventory availability)

Radio – *KBAY 94.5 FM*

- Budget allows 10 weeks of radio
- Recommend one station rather than several, toallow adequate frequency and impact with the listening audience and maximize added value opportunities
- KBAY provides large reach to the target audience on top-ranked station
- Added value:
  - PSAs
  - On-air announcements / tips
  - Online media
  - Promotional support for Campaign events
  - Community involvement in station-sponsored events

Internet – *Facebook, Yahoo, Google*

- *Yahoo.com to be determined: MercuryNews.com does not generally sell Yahoo.com independently.*
- Affords an estimated 16 weeks on Google and Facebook; 8 weeks on Yahoo.com
  - Google AdWords and Facebook based on estimated $0.50 cost per click and 150 clicks per week.
  - Actual costs will vary according to key words and competitive cost-per-click bids (likely lower costs will allow more clicks, and weeks will be added as they are afforded).
- Direct links to WW website, Facebook page, WW Quiz, Discount Card, etc.
- Target geographically, by interests, and key words
- Measurable response
- Effective to reach 18-34 audience
- 35+ audience use is growing

Outdoor / Transit – *VTA Bus Tails*

- Bus tails targeted in Santa Clara County

- High visibility position on back of bus
- 50 showing for one 4-week period in FY 09-10, pending final negotiation of VTA contract and final sum of Co-permittee funding contributions.
- Currently, two jurisdictions have pledged contributions toward VTA advertising with Litter messages. If additional funding is available, it may allow additional bus tails, and/or more weeks in FY 09-10.
- Planned for the end of FY 09-10 and will be carried into FY 10-11 media to allow a longer run and higher impact. This assumes approval of the FY 10-11 media budget for this purpose.

Re: **FY 09-10 Watershed Watch Campaign**
Annual Campaign Report; July 2009 – June 2010

Campaign Summary
In the FY 09-10, the consultant worked with SCVURPPP to implement the FY 09-10 Work Plan. Highlights of this year included the development of television creative and new transit ad creative featuring anti-litter messages, participation in social networking, and Watershed Watch Campaign (Campaign) website redesign.

"Watch Out" message continued in print (only in Spanish), web and radio advertising in a frequency-based media plan to keep the Campaign messages continually present in the local media.

The consultant pursued partnerships and value-added development, creative support to update Campaign materials, provided event coordination and staffing, and maintained the website.

This report summarizes completion of tasks, activities, and effectiveness of the annual campaign.

Summary of Tasks

Task 1: Creative Development
Existing Spanish Integrated Pest Management (IPM) and Litter radio and print ads were utilized, as well as existing IPM and "Hire a Green Gardener" English radio spots. Spanish "Green Gardener" class radio spot was updated with fall 2009 class date information. New creative utilized existing/approved themes.

New creative was developed as follows:

<u>TELEVISION</u>
LITTER TV
A 30-second English spot was developed. Several creative concepts were presented and evaluated for their effectiveness and appropriateness in educating the public about the importance of litter prevention as it impacts storm water pollution. Existing creative developed by other storm water agencies were also considered.

The "Karma" concept (litter and it comes back to you) was selected and implemented, striving for a unique execution of a popular concept. The spot presents a variety of problem litter items and sources (auto litter, food wrappers, cigarette butts, uncovered truckloads), and their direct solutions (tarp your load, use a car litterbag, don't litter), as well as a direct storm drain

AdManor Inc
Multimedia Marketing

connection from curb to creek. Tagline for the message was "what happens here (storm drain) doesn't stay here."

RADIO

CAR WASH RADIO AD

A 60-second radio spot (English) was developed for the Capitol Premier Car Wash event to meet the needs of the KBAY radio schedule.

GREEN GARDENER CLASSES RADIO AD

The Spanish Green Gardener radio spot was updated with Fall 2009 class dates.

WEB/ONLINE ADS

IPM WEB ADS

Animated ads were developed in Spanish for ClearChannel KCNL web sponsorship and donated El-Observador.com web space. Ads implemented content from the four print ads featuring roses, yellowjackets, snails, and weeds into animated flash files.

CAR WASH WEB ADS

Car wash ads were developed for use on Yahoo.com to promote the spring car Wash Events at Classic Car Wash (2 locations/dates) and Capitol Premier Car Wash, using previous print ads as visual inspiration.

FACEBOOK FAN – WEB ADS

An ad promoting the Watershed Watch Facebook page was developed. The consultant also developed simple car wash event ads for Facebook.com.

PRINT and COLLATERAL

WW DISCOUNT CARDS

Watershed Watch Discount Cards were updated to include a 2010 expiration date and uploaded to the website. In Spring 2010, the card was redesigned to include a Jiffy Lube offer.

POOL BROCHURE

The consultant updated the online version of the pool/spa brochure to include the new website address and print date. The updated version was posted to the Campaign website.

CAR WASH BROCHURE

The consultant provided graphics and feedback regarding content for the car wash brochure. The brochure was posted on the Campaign website.

TEMPORARY TATTOOS

A new 2"x2" sized 2-color design was implemented into temporary tattoos for event giveaways.

TRANSIT/OUTDOOR

LITTER TRANSIT AD

A bus tail ad was developed to incorporate the litter message from the TV campaign utilizing the tagline "what happens here (storm drain), ends up here (in a creek)" with corresponding images.

This ad was also adapted for interior bus card use for a partnership with VTA to be implemented in Summer 2010, and provided in an editable format to the City of San Jose for use on trash/recycling receptacles in parks.

AdManor Inc
Multimedia Marketing

Task 2: Media
In 2009, some media prices had dropped to reflect the change in advertiser demand for airtime, and/or media companies were providing added value to campaign proposals to compete for the Campaign's business. The consultant recognized the opportunity to extend the Campaign's media by inviting a broader group of media to compete for the budget, while also addressing specific WEO AHTG media requests and preferences.

The approved FY 09-10 media campaign approach was a continuation of the frequency-based approach, utilizing: Spanish radio, print and online media; top-rated South Bay general market (English) radio; cable television targeting Santa Clara County; transit; and paid online advertising.

Campaign audiences include the primary target audience of college-educated Santa Clara County homeowners aged 25-54, with secondary audiences of Spanish adults aged 18-49, and general market audiences of all ages. To reflect the audience demographics, approximately 25% of the budget was allocated to Spanish-language media.

The consultant developed a media calendar to include planned events, media dates and corresponding creative messages; received and reviewed media proposals, ratings data and contracts; negotiated media buys and added-value; reacted to changes in the local media (Spanish radio station changing format[1]); sent traffic orders and creative (including copy points for live announcements and art direction for added-value web ads) to fulfill media buy according to the approved plan; coordinated and reconciled billing.

MEDIA BUDGET AND CONTRIBUTIONS
The total FY 09-10 media budget was $82,850 in Watershed Watch Campaign funding.

Additional media support funding was contributed by co-permittees specifically for the implementation of anti-litter messaging on transit (bus tail) advertising, bringing the total media budget to $85,850.

Co-permittee	Contribution
City of Sunnyvale	$1,000
City of Cupertino	$1,000
City of Milpitas	$1,000

MEDIA SELECTIONS
Program-funded media included:

- KBAY general market (English language) radio with added-value partnership support, event promotions, and Planet KBAY sponsorship during our paid schedule weeks, which included a daily 15-second recorded tip and refers the audience to the Planet KBAY page for more information where they find a Watershed Watch logo and link to the Watershed Watch website.

[1] La Preciosa radio maintained its format and parent company, while moving from one station/signal to another. It moved from KSJO 92.3 FM to KCNL 104.5 FM on September 18, 2009. At the end of February 2010, KCNL was sold and changed format. At that time, the Consultant cancelled the remaining KCNL contract, sent requests for proposals to several Spanish broadcast media companies and (in consultation with Program staff) selected the best replacement.

- KSJO/KCNL La Preciosa Spanish radio and online ads
- KBRG Spanish radio
- Comcast Cable TV in Santa Clara County (excluding Gilroy/Morgan Hill areas) including Comcast.net and prize donation added-value which will be utilized for contest incentives in FY 10-11
- Transit VTA bus tails in Santa Clara County
- Online ads on Facebook, Yahoo.com with MercuryNews.com as added-value, and Google AdWords
- Spanish weekly newspaper *El Observador* with online added-value

GREEN GARDENER ADVERTISING
"Hire a Green Gardener" Radio spots promoting the Green Gardener program, encouraging homeowners to hire a Green Gardener, ran August 24-30 and September 7-13, 2009 on KBAY radio.

GREEN GARDENER RECRUITMENT ADVERTISING
"Become a Green Gardener" Spanish radio spots promoting the Fall 2009 Green Gardener certification course program ran August 31-September 6 and September 14-18 on KSJO/KCNL.

IPM ADVERTISING
"Watch Out for Pesticides" radio ads promoting the use of IPM practices ran September and October 2009 and April through June 2010 on KBAY; Spanish language ads ran in October on KCNL and April through June on KBRG.

Print ads in *El Observador* featured IPM problems and solutions for snails/slugs, roses, yellow-jackets, and weeds July through November 2009, then April through June 2010.

Animated online ads reflecting print ad campaign (popular garden/pest problems) ran on El-Observador.com and KCNL LaPreciosa.com October and November 2009, and again on El-Observador.com April through June 2010.

LITTER ADVERTISING
Litter messages "Litter is Water Pollution" ran in *El Observador* print and online December 2009 through March 2010 informing audiences that litter is water pollution and making the storm drain connection to the Bay.

Spanish "Litter is Water Pollution" web message ran on KCNL LaPreciosa.com December 2009-February 2010.

Litter TV "Karma" ran on Comcast Spotlight February 2010 through June 2010 with accompanying online ads on Comcast.net March through June 2010.

"Watch Out for Water Pollution" litter radio ran January and February on KCNL Spanish La Preciosa.

Litter "What happens here…" bus tails were installed at the end of May 2010 and continued through June 2010.

Litter online ads ran on Yahoo.com in April, May, and June 2010.

CAR WASH ADVERTISING

Carwash online ads ran on Yahoo.com and Facebook.com in April, May, and June 2010 to promote the 50% off car wash events.

Radio ads ran on KBAY FM in May and June to promote the 50% off car wash events and educate about preventing runoff pollution from car washing.

SUMMARY OF MEDIA BUYS

The media schedule included:

27 print ads including:

- 26 ads in *El Observador* Spanish weekly newspaper
- Additional distribution of donated half-page ad in KBAY's "Summer Made Simple Guide"

722 radio ads including:

- 210 spots on KBAY 94.5 FM
- 71 PSAs on KBAY
- 100 30-second tips (provided by the consultant) on KBAY's "Planet KBAY" daily green living feature
- 40 15-second promotional announcements by KBAY promoting Summer Made Simple Guide with Watershed Watch mention
- 30 15-second KBAY promotional announcements for Car Wash events
- 208 spots on KSJO/KCNL (La Preciosa 92.3 / 104.9 FM)
- 48 spots on KBRG (Recuerdo 100.3 FM)
- 15 PSAs on KBRG, KSOL and KVVF

50 VTA bus tails:

- 33 paid bus tails in Santa Clara County
- 17 bonus bus tails in Santa Clara County
- 2 weeks early installation for bonus coverage of 50 bus tails

3,054 cable television ads:

- Comcast Spotlight in Silicon Valley Zone, San Jose Zone and South Peninsula Zone (covering entire SCVURPPP area without waste)
- Networks included:
    - TLC "The Learning Channel"
    - Comedy Central
    - Comcast Sports Bay Area
    - Discovery Channel
    - ESPN
    - FX
    - SYFY Science Fiction
    - TBS
    - TNT
- 1,456 paid spots
- 1,598 PSAs

Internet (purchased) media:

AdManor Inc
Multimedia Marketing

- 5 months site-wide rotation on KCNL www.LaPreciosa.com
- 11,344,625 impressions on Facebook.com
- 525,369 impressions on Google.com (AdWords)
- 200,000 impressions on Yahoo.com

Internet added-value ads that the Campaign received from media partners:

- 9 months banner ads on www.el-observador.com
- 10 weeks on www.kbay.com with tile ad on all pages
- 10 weeks on KBAY Cares page
- 52 weeks on KBAY Advertisers page
- 3 weeks on KBAY Event page (Car Wash events)
- 12 weeks on KBAY Summer Made Simple page (including the Watershed Watch ad in the online version of the Summer Made Simple guide)
- 1 email blast to KBAY.com e-newsletter subscribers for Earth Day
- 4 months banner and tile ads on Comcast.net (550,000 impressions)
- 50,000 impressions on MercuryNews.com, tile ad on Breaking News page April through June

The following shows estimated gross impressions during the fiscal year:

KBAY	Adults 35+	4,561,960
El Observador	Adults 25+	519,974
KSJO/KCNL	Hisp. Adults 18+	553,600
KBRG	Hisp. Adults 35+	210,174
VTA Bus Tails	Santa Clara County	1,884,000
Comcast Spotlight	Adults 35+	2,793,968
Comcast.net	Geo-targeted	550,000
Facebook.com	Persons 16+	11,344,625
Google.com	Geo-target/keyword	525,369
MercuryNews.com	All viewers	50,000
Yahoo.com	Homeowners 35+	200,000
Total Gross Impressions		***23,193,670**

** Figure does not include unverified gross impressions on California's Great America billboard (not confirmed for FY 09-10), or impressions on www.kbay.com, www.El-Observador.com, or www.lapreciosa.com*

The following table describes the media costs and estimated value-added obtained from media advertising.

Program Funded Media Buy

MEDIA	TOTAL COST	VALUE ADDED (minimum)	TOTAL VALUE
KBAY 94.5 FM	$ 19,950	$ 62,000	$ 81,950
KBRG FM	$ 5,280	$ 1,650	$ 6,930
KSJO 92.3 FM KCNL 104.9 FM	$9,760	$ 1,600	$ 11,360

AdManor Inc
Multimedia Marketing

LaPreciosa.com	$750	$ 750	$ 1,500
Comcast Spotlight	$ 28,713.79	$ 42,141.58	$ 70,855.37
VTA Transit/Lamar	$ 7,012.50*	$ 13,218.75	$ 17,231.25
Bay Area News Group (Yahoo.com + MercuryNews.com)	$ 2,000	$ 1,000	$3,000
Facebook.com	$ 1,948.91	$ 0	$ 1,948.91
Google AdWords	$ 697.05	$ 0	$ 697.05
El Observador	$ 4,290	$ 7,045	$ 11,335
TOTAL	**$ 80,402.25****	**$ 129,405.33**	**$ 209,807.58**

*Includes $3000 co-permittee contributions.
**Total amount is lower than the budgeted amount for media as some scheduled Comcast Spotlight did not run (pre-empted) during the political advertising period and could not be made up before the end of the fiscal year because inventory was not available. Additional budget was allocated to creative development for VTA bus tails and television production time and expenses that exceeded original estimates.

Creative messages breakdown (Program-funded media):

	IPM	Green Gardener	Litter	Car Wash Events	Tips/Promo General WW	Total
Radio - Paid	229	94	104	39		466
Radio - PSA	59	14		43	140	256
TV - Paid			1,456			1,456
TV - PSA			1,598			1,598
Transit - Paid			33			33
Transit - PSA			17			17
Print - Paid	17		9			26
Print - PSA	1					1
Total	**306**	**108**	**3,217**	**82**	**140**	**3,853**

Online ads are not included in ad count because they are actually purchased by month, clicks, and impressions rather than number of ads.

Task 4: Partner Development & Coordination
Existing partners were contacted and some new partnerships explored. The consultant worked at maintaining relationships with existing partners, creating new partnerships, and updated and maintained partner contact information.

Continuing Partners in the FY 09-10 included:

- City of San Jose/History San Jose (Haunted History)
- KBAY Radio
- Yamagami's Nursery
- Capitol Premier Car Wash
- Classic Car Wash (all 4 Santa Clara County locations)
- Creek Connections Action Group
- El Observador newspaper
- Comcast Spotlight Cable
- Mel Cotton's Sporting Goods
- Guadalupe River Park and Gardens
- KSJO/KCNL "La Preciosa" Radio

New or renewing Partners in the FY 09-10 included:

- KBRG Spanish Radio (New media partner)
- Yahoo.com/MercuryNews.com (New media partner)
- Valley Transit Authority (VTA) (New community partner)
- Lamar Transit (New media partner - advertising/media sales and production for VTA)
- Jiffy Lube (New community partner)
- Happy Hollow Park & Zoo (Renewing partner)

Partnerships currently under development:

- Aussie Rain Tanks – Rain collection tanks help to reduce household runoff; will offer a free gauge ($75 value) with purchase of new tanks with WW Discount Card (pending confirmation).
- Heavenly Greens - Referral from media partners; submitted proposal to the Heavenly Greens marketing agency.

Task 5: Added Value Development

As a result of media partnership negotiations and community partnership activities, the campaign received the following added value during the campaign year:

- City of San Jose, History Park –
  - Donated booth space for Haunted History event included Watershed Watch logo on all event media outreach
- Guadalupe River Park & Gardens –
  - Watershed Watch was credited as a sponsor in all Pumpkins in the Park event advertising: GRPG.org website and email newsletters; KNTV 11 NBC; KLIV/KRTY; KEZR; *San Jose Mercury News;* and 25,000 flyers distributed to school children
  - Provided survey services for ZunZun performances at Pumpkins in the Park
  - GRPG and Watershed Watch cross-promoted news and events on Facebook and Twitter (social networking)
- Capitol Premier Car Wash –
  - Ongoing discounts with Watershed Watch discount card; honored $4 discounts through the fiscal year (and committed through 12/31/10)
  - Supported June 2, 2010 Car Wash event with 50% off car washes and social networking promotion of the event
- Classic Car Wash –
  - Ongoing discounts with Watershed Watch discount card
  - 504 $4 WW discounts were redeemed, for a total of $2,016 in discount value

  - Supported May 5 and May 19 Car Wash events in which a combined 200 car washes were provided at 50% off, estimated $10 discount per vehicle for $2,000 value
  - Will honor $4 discounts through 12/31/10
- KBAY –
  - 10 weeks on www.kbay.com with tile ad on all pages
  - 10 weeks on KBAY Cares page
  - 52 weeks on KBAY Advertisers page
  - 3 weeks on KBAY Event page (Car Wash events)
  - 12 weeks on KBAY Summer Made Simple page (including the Watershed Watch ad in the online version of the Summer Made Simple guide)
  - 1 email blast to KBAY.com e-newsletter subscribers for Earth Day
  - 71 PSAs
  - 100 recorded tips (litter, Green Gardener and IPM messages provided by the Consultant) for KBAY Cares/Planet KBAY
  - Distribution of Watershed Watch discount cards on website and 1000+ cards at community events
  - Provided half-page full color ad in 2009 *Summer Made Simple Guide* distributed 600 per event throughout the summer 2009 and named Watershed Watch in 40 promotional announcements promoting the Guide
  - 3 staffed onsite events (car wash events) at no charge, supported by 30 promotional announcements plus live on-air DJ mentions. Provided giveaways and incentives at the events
  - Included Watershed Watch in Earth Day-themed email blast to 16,000 subscribers on April 7, 2010
  - Provided third-party partnership coordination with Yamagami's Nursery and Jiffy Lube
- KSJO/KCNL –
  - Provided discounted media rates and bonus rotation of WW ad on www.lapreciosa.com
- KBRG –
  - Provided 15 PSAs on KBRG, KSOL and KVVF in April 2010
  - Distributed 1,000 Spanish Discount Cards at their events
- Comcast Spotlight –
  - Matched paid spots with free spots
  - Discounted rates on media
  - Provided creative collaboration for TV concept development
  - $100 in Golfland Fun Money for use as prize incentive (will be used in FY 10-11)
  - Comcast.net ad production
  - 550,000 targeted impressions on Comcast.net
- *El Observador* Newspaper –
  - Donated online web ads 300x250 for 9 months
  - Upsized three ads, from 2x5" to 1/4 page
  - Upgraded two ads to full color
  - Published Green Gardener editorial feature
  - Distributed 1,500 Spanish Discount Cards at their events
  - Produced Litter tile ad for website rotation (under direction of Consultant)
  - Translated two IPM ads to Spanish
- Lamar Transit/VTA Bus Tails –
  - 17 bonus tails donated for 33 purchased

AdManor inc
Multimedia Marketing

    - Installed nearly all 50 bus tails 2-weeks early (bus ads entered rotation for 2 bonus weeks of media coverage)
- Yamagami's Nursery –
    - Offered 25% off featured "Green" gardening product each month with Watershed Watch discount card
    - Featured WW discount card offer on their website home page
- Creek Connections Action Group –
    - Campaign promoted the Cleanup Day events by posting information on the Watershed Watch website
    - Campaign promoted the National River Clean-up Day on the Campaign website, Facebook page and Twitter
- Mel Cotton's Sporting Goods –
    - Provided ongoing discounts to customers; 10% off total purchase with the WW Discount Card
- Yahoo.com/MercuryNews.com –
    - Provided production assistance for Yahoo.com (under direction from the Consultant)
    - Production of logo tile ad and 50,000 impressions on MercuryNews.com as added-value
- VTA –
    - Will donate part of their allocation of interior transit card space to WW (Campaign provides production) in Summer 2010
    - Coordinated approval of WW creative for production
- Jiffy Lube –
    - Offers a $10 discount on Signature Oil Change Service with WW Discount Card
- Happy Hollow Park & Zoo –
    - A previously existing partnership underwent hiatus during HHPZ closure for renovation. Partnership is back on track for 2010 with installation of the Watershed Watch interpretive display (following renovation) and other activities to be determined

Minimum estimated value-added provided to the Campaign from media and community partners July 2009 - June 2010 is $133,521.

Task 6: Website Maintenance & Development

Website Design
The original Campaign website had become outdated in style and function (especially navigation). The FY 09-10 work plan allowed for a new website design and development.

- Co-permittee volunteers formed a work group to suggest features, needs, functions, design aesthetics, and content.
- Page styles were designed, reviewed and revised to meet sub-committee approval.
- Site index (content outline) was developed, reviewed and revised to meet sub-committee approval.
- Existing content from Campaign website was copied, updated and adapted to fit the new site index, and implemented into the template page design.
- Upon completion, the new site was uploaded "live" on April 5, 2010 and re-registered with search engines.
- Continuing through April, pages were reviewed and edited as needed to meet approval.
- Upon completion of the English site, the Spanish site was developed and implemented to complement the English site. The Spanish site went live in May 2010.

AdManor Inc
Multimedia Marketing

- The resulting site has fewer pages, more features, and has eliminated redundant attachments for a more streamlined site with more direct navigation to frequently sought information.
- Ongoing adjustments continued through the campaign year, and regular updates were made to the new site to keep content current and correct.

Website Maintenance
Throughout the fiscal year, the consultant performed ongoing updates to the website to keep information current and applicable to the new creative, partnerships and Co-permittee news and events.

Website Activity
The website was promoted in print, radio, television and online, as well as on Campaign materials and promotional items handed out at community events.

The activity on the site has been tracked by page views, which are the total/gross number of hits to the site. The graph illustrates the average daily page views by month, July 1, 2009 through June 30, 2010, with a direct comparison against the previous year.

AdManor Inc
Multimedia Marketing

Traffic Sources
Visitors arrived at the site by way of:

- 8.14% direct traffic
  - 3,021 visitors typed in "mywatershedwatch.org" (#3 traffic source overall)
- 22.47% referring sites (other sites linked to mywatershedwatch.org)
  - learn.flvs.net (#2 traffic source overall)
  - paguito.com
  - facebook.com
- 69.38% search engines (organic searches)
  - Google (#1 traffic source overall)
  - Search.com
  - Bing
  - Yahoo

Top Content
Most frequently visited pages on the site:

1. **"/description_Spanish.html" –** Spanish "All About Watersheds" page
2. **"/description.html" –** English "All About Watersheds" page
3. **"/IPM_Problems_Solutions_Sp.htm" –** Spanish IPM Problems & Solutions page, linked from the main Spanish "Got Bugs" or IPM (MIP) page
4. **"/IPM_Index_Sp.htm" –** Spanish "Got Bugs" page, also known as "El Manejo Integrado de Plagas (MIP)"
5. **"/" –** Watershed Watch home page
6. **"/important_Spanish.htm" –** Spanish "Why watersheds are important"
7. **"/Education_Spanish.htm" –** Educators' page in Spanish
8. **"/important.htm" –** English "Why watersheds are important"
9. **"/index.htm" –** Watershed Watch home page (old site)
10. **"/aboutwatersheds.html" –** "About Watersheds" on the new site

Please note that some of these page names belonged to pages on the old site and those pages no longer exist, although the subject matter is available on the new site under new page names.

Key Words
During the April-June Google AdWords campaign, the following were the top-producing key words or phrases: Roses, free activities, car wash coupon, bugs, ants, fleas, weeds, green gardener, to prevent pollution, roaches, mosquitoes, aphids, pests, snails, slugs, and a variety of combinations that include the phrases "pest control" and "water pollution."

Key words (and phrases) in organic searches that resulted in the most visits to the site were also very consistent with the results in Top Content: cuencas hidrgraficas/cuenca hidrografica, mip, importancia de las cuencas hidrografica (several variations on this phrase), venero para hormigas, why watersheds are important, watershed pollution, watershed watch, and importance of watersheds.

Downloads

- Estimated number of downloads from July 2009 - June 2010 was 15,897, compared to 17,580 in FY 08-09.

- Average number of downloads per month was 1,325, compare to 1,465 in FY 08-09 and 1,290 in FY 07-08.
- The decline in downloads from the previous year is likely attributed to the period of time between launching the new English site and the new Spanish site (when Spanish was temporarily unavailable) and the period of time it takes for a new site to propagate the web for search engines to find it.
- Most popular downloads included Watershed Watch Discount Card, Public Participation/Volunteer Opportunities list, Thermometer Exchange Event Calendar, Spanish Roses fact sheet, Good Bug Tub fact sheet, Business Fluorescent Light article, Spanish Ants (Hormigas) fact sheet, Kids Guide to Backyard Bugs, and Zun Zun flyer.
- Other notable downloads in the top 20 are the WW Brochure in English and Vietnamese, the Pool Brochure, and IPM fact sheets.

Task 7: Outreach Events

The consultant researches and evaluates new event opportunities, registers for approved events, and maintains an events worksheet with general information for all scheduled events.

The consultant staffed five community outreach events: Haunted History in History Park San Jose, October 31, 2009; Classic Car Wash Events in San Jose and Campbell, May 5 and May 19, 2010; Capitol Premier Car Wash Event in San Jose on June 2, 2010; and Festival in the Park at Hellyer Park, San Jose on June 26, 2010. Co-permittee and Program staff provided additional staffing.

Materials distributed at these events included Our Water Our World fact sheets, Grow It Guides, flyswatters, note pads, temporary tattoos, “Pest or Pal” activity books, “10 Most Wanted” brochure, the new Watershed Watch “You are the Solution” brochures (English and Spanish), “Draining Pools and Spas” brochure, “Clean Cars & Clean Creeks” brochure, and Watershed Watch Discount Cards.

The Watershed Watch Campaign booth was present at the following events in July 2009 through June 2010:

Pumpkins in the Park, Guadalupe River Park & Gardens (GRPG), October 10, 2009

- The Program sponsored 2 ZunZun performances for the event
- Attendance was estimated at 12,000-14,000
- Audience was families with children
- GRPG staff conducted a survey at the event to evaluate the ZunZun performance. A total of 45 surveys were collected. After the ZunZun performance, 96% could understand the concept of watersheds
  - 64% had knowledge of watersheds prior to the performance
  - 80% felt they could name ways to prevent pollution in the watershed including:
    - Keep pesticides and household products from entering runoff
    - No soapy water in the street
    - No dumping in the storm drain
    - Use reusable bags (not plastic)
    - Recycle
    - Don’t litter
    - Save water (turn off while brushing teeth, use less bath water)

Muslim Green Fair – Muslim Community Center, Santa Clara, October 18, 2009

- Attendance at this event was estimated at 1,000
- Audience was families with children

Haunted History – History Park, San Jose (replaced Haunt the Hollow event during Happy Hollow Park & Zoo remodeling), October 31, 2009

- Attendance at this event was estimated at 1,500
- Audience was families with children
- 279 promotional outreach and informational items were distributed, along with a lot of Halloween candy

Spring Garden Market – History Park, San Jose, April 3, 2010

- Estimated attendance of event was 3,000
- Estimated that attendance was lower than previous years (around 4,000) because of inclement weather.
- Audience was gardening enthusiasts

NVIDIA Corp. Earth Day Event – NVIDIA, Santa Clara, April 22, 2010

- Estimated attendance of event was 500
- Audience was NVIDIA employees

Spring in Guadalupe Gardens – Guadalupe River Park and Gardens, San Jose, April 24, 2010

- Estimated attendance of event was 4,500
- Audience was gardening and outdoor enthusiasts

Robertsville Classic Car Wash – Almaden Expressway, San Jose, May 5, 2010

- Estimated attendance of event was 150
- Included an onsite promotion with KBAY radio

Delta Queen Classic Car Wash – Hamilton Avenue, San Jose, May 19, 2010

- Estimated attendance of event was 45
- Included an onsite promotion with KBAY radio

Capitol Premier Car Wash – Capitol Expressway Auto Mall, San Jose, June 2, 2010

- Estimated attendance of event was 100
- Included an onsite promotion with KBAY radio

Festival in the Park – Hellyer Park, San Jose, June 26, 2010

- Estimated attendance of event was 5000
- Audience was families with children (included a large number of Spanish-speaking residents).
- Event focused on health and wellness

Task 8: Public Relations

Public Relations (PR) efforts are described below:

- Santa Clara Valley *Green Gardener* Training Program Recruitment for fall classes; PR outreach
    - Media outreach to *El Observador*; announcement ran in September 25, 2009 publication
- BASMAA Pesticide Press Release
    - Reviewed and provided suggested edits
- Social networking media
    - Developed social networking strategy and recommendations
    - Established Twitter and Facebook accounts on behalf of Campaign
    - Researched and reported regarding Facebook Groups vs. Pages
    - Developed Facebook Page
    - Implemented Twitter and Facebook posts
    - Connected with Pages for Campaign partners and related Bay Area organizations
    - Implemented ongoing updates to Facebook page
    - Sought new Page fans through social networking and paid advertising on Facebook
    - Established personalized URLs for Campaign Facebook account and Facebook Page

Task 9: FY 10-11 Work Plan Development
The consultant developed the FY 10-11 work plan and media plan.

Reports & Meetings
The consultant attended WEO AHTG meetings as needed. Time was not billed for attendance or travel/expenses; participation was donated to the campaign as value-added.

The consultant developed a social networking overview presentation for the Management Committee.

The consultant provided monthly reports, invoices, partnership updates, and web statistics, and a mid-year campaign report with recommendations. In addition, the consultant developed social networking reports/recommendations including a social networking overview presentation to the management committee, and support for a media presentation was provided.

Evaluation of Effectiveness:
The following is a summary of the measurable results of the Campaign from July 2009 through June 2010:

- Established social networking presence and achieved 300 Facebook Fans and15 followers on Twitter.
    - Social networking is a public relations activity that provides an additional way to deliver direct messages to the target audience.
    - It resulted in just 277 visits to the Watershed Watch website (through ads and the Page), but the Campaign's Facebook Page itself received an estimated 4,500 visits.
    - Paid ads on Facebook resulted in the majority of the Fans who now follow the Page, since the primary focus of our paid ad campaign was to establish a relevant Fan base.
- Two new partnerships were added and one previous partner renewed after a hiatus. In addition, several key contacts have been made for other potential new partners.
- Media advertising delivered a minimum of 23,193,670 in targeted gross impressions.

- The media partners provided a minimum added value package of benefits and resources of $129,405 in addition to the $80,402 spent YTD on advertising.
- Total (measured/realized) Value Added Resources from media and community partners: $133,521.
- Number of web page views: 95,728
- Number of requests on the website for Watershed Watch brochure and other materials: 27
- Number of IPM or other queries: 18
- Hotline Calls: 20
- Number of WW Discount Cards used at Classic Car Wash:
    - 504 discounted car washes ($2,016 in value)
    - Compare to FY 08-09: $420 discount value; 105 total customer discounts (480% increase!)

Recommendations for the FY 10-11 Campaign

- Continue to maximize existing partnership opportunities with promotional and outreach events geared toward public participation and awareness, and for additional outreach and awareness.
- Continue developing new partnerships to increase resources and outreach opportunities, and to provide practical applications for the public to reduce urban runoff pollution.
- Promote website through online ads, social networking and paid media.
- Include Twitter and Facebook logo (and URL where space allows) in newly produced printed items to increase public awareness and participation in social networking with the Campaign.
- Implement direct messages to Facebook Fans, and directly to Watershed Watch email list through Constant Contact, a popular online contact management system that provides personalized and customized HTML emails without showing up as spam. Since the launch of the new site, the Campaign has received 13 requests for email updates through the "Contact" form, usually in concert with requests for a brochure and/or Discount Card.
- Future Facebook paid ad campaigns can promote more Watershed Watch direct calls to action such as downloading a Discount Card or other incentives to visit and interact with the Watershed Watch website (such as a contest or survey utilizing donated prizes as incentives).
- Ideally, other ads and outreach will also promote the Watershed Watch Facebook page as well, to build a larger Fan base to increase the Campaign's social networking influence. With more than a million Facebook users in proximity of Santa Clara County, there is a large potential audience. Frequent Facebook users may be more likely to respond to a call to action to "Find us on Facebook" than they would be to visit the Campaign website.
- Continue to develop media added-value in support of Campaign partner events (van stops and live broadcasting to promote Campaign activities, contests/prizes, web ads, e-newsletters/e-mails, twitter postings, etc.).
- Utilize donated prizes for incentives in direct-response campaigns such as surveys and general awareness contests. Promote results through Facebook and on Campaign website.
- Implement social networking media strategies utilizing pre-approved messages and timely news items.
- Evaluate and adjust social networking strategies as needed.

- Plan ahead (as far in advance as possible) the messages for Univision TV editorial features to tie in with paid campaign messages. Promote and use these productions in social networking and other outreach.

FY 09-10 Watershed Watch Partner Report

September 15, 2010

PARTNER	CONTACT	RESULTS
KUFX / KCNL / KSJO ClearChannel Radio	Kevin Kimerer 408-451-7663 kevinkimerer@clearchannel.com	Partnered through February 2010 on La Preciosa radio and web until station changed formats. Kevin provided contact information for potential partners, Heavenly Greens and Aussie Rain Tanks.
Capitol Premier Car Wash	Chuck Brassfield 408-979-7811x12	Capitol helped promote the June 2 event on Facebook and Twitter. Hosted the June 2 event with 50% off car wash services from 5-7 p.m. Provided $4 discounts on car washes on the Discount Card.
KRTY / KLIV Empire Broadcasting	Jan Bell 408-961-0443 jbell@empirebroadcasting.com	Previous media partner, provided FY 08-09 final report data and FY 10-11 media proposals.
KEZR / KBAY	Janna Hathaway janna@kbay-kezr.com	Media partner, provided added value in radio, print and web media, partnership coordination with Yamagami's Nursery and Jiffy Lube for Discount Cards. Presented Discount Card opportunity to entire sales team to solicit partners on our behalf. Distributed Discount Cards at events, and provided car wash event support.
Yamagami's Nursery	(Via KBAY)	Offered 25% off monthly featured "Green" product with WW Discount Card, and featured WW on their website home page.
Don Edwards SF Bay Wildlife Refuge at Alviso	Genie Moore 408-262-5513 x100 Genie_Moore@fws.gov	SCVURPPP supports education at the Wildlife Refuge. WW refers individuals to the Refuge for volunteer opportunities and promotes events and activities at the Refuge on the Campaign website. Recommended promotion of the Alviso Ed Center to EcoMetroGuide and KBAY's Summer Made Simple.
Guadalupe River Park & Gardens	Phil Cornish 408-298-7657 phil@grpg.org	Provides WW with sponsorship of Pumpkins in the Park event in exchange for ZunZun performances. WW also participates in Spring in Guadalupe Gardens, and cooperates with GRPG to promote these events on the website and through social networking.
El Observador Newspaper	Angelica Rossi	Media partner; provided discounted rates, upsized and added color as added value when possible; assisted with ad translation and provided basic web ad design services when needed. Ran WW ads on their website as added value, and distributed Spanish Discount Cards at community events.
Classic Car Wash (corporate)	Marty Jensen (408) 371-2414 x 216	Provided $4 discounts at all locations throughout the year, tracked responses and provided information to the Campaign. Hosted two Car Wash events 5/5 and 5/19 with 50% off car wash services from 7-9 a.m.
California's Great America	Jim Stellmack (408) 986-5841 jim.stellmack@cagreatamerica.com	Previous partner; did not respond to messages requesting rotation in Great America's electronic billboard or other requests for partnership opportunities.
Creek Connections Action Group	Kate Slama	Campaign supported outreach for Clean Up days / events on Campaign website and in social networking.
Santa Clara County HHW Program (co-permittee)	Rob D'Arcy (408) 918-1967 Rob.Darcy@deh.sccgov.org	Campaign promotes hhw.org for proper disposal of household hazardous waste.
BASMAA	Geoff Brosseau geoff@brosseau.us	Campaign reviewed and commented on media outreach for spring gardeners.
Childrens Discovery Museum	Sandy Derby (408) 298-5437x261 sderby@cdm.org	CDM has education program for watershed and water pollution prevention; sponsors teams for Creek Clean Up days. Campaign requested distribution of "Solution to Water Pollution" brochure and additional partnership activities but did not receive response to messages.
Santa Clara County Parks and Recreation Dept.	Tamara Clark-Shear (408) 355-2215 tamara.shear@park.sccgov.org	Campaign participated in Festival in the Park. Followed up with suggestions/queries for 2011 event.
Stevens & Permanente Creeks Watershed Council	Mondy Lariz (408) 356-8258 ed@spcwc.org	Websites linked; Campaign promotes volunteer opportunities through the website.
Happy Hollow Park & Zoo	Vanessa Rogier (408) 277-3065 vanessa@bayarea.net	Previous partner; Consultant and Vanessa had a dynamic meeting shortly after the reopening. Examined the condition of WW interpretive display, discussed rennovation and placement of sign in the Zoo, and other partnership opportunities including Discount Card, events, Green Gardener Program, Facebook, more.
Mel Cotton's Sporting Goods	China (Chris) (408) 287-5994 china@melcottons.com	Offers a 10% discount on purchases with the Discount Card.
Heavenly Greens	Troy Scott troy@heavenlygreens.com 866.518.7888	Potential partner; seemed interested in the partnership.
Comcast Spotlight Cable	Matthew Ryan (408) 291-3977	Media partner; provided discounted rates, PSAs, creative meeting, and online creative and media as added value. Provided $100 in GolfLand fun money ($10 x 10) to be used in FY 10-11 as an incentive.
MercuryNews.com **Yahoo.com**	Lauren Jacob Dody Gerick	Media partner; provided creative support for the car wash events. Ran Tile ads on mercurynews.com breaking news page as value-added to the Yahoo.com campaign.
Valley Transit Authority	Dino Guevarra (408) 321-5527	Lamar transit installed most of the bus tails 2 weeks early which delivered extra impressions at no extra cost to the campaign. Dino agreed to a 4-week full run of interior bus and lightrail cards in partnership with the Campaign (for FY 10-11)
KSOL / Univision Radio SF **KBRG**	Jose Serrano Marisa	Media partner; provided discounted rates and PSAs as added value. Distributed Spanish Discount Cards at community events in Spring 2010.
Aussie Rain Tanks	Bruce Hallinan bruce@aussieraintanks.com (408)796-7511	Potential partner; expressed he was very pleased to be part of the campaign but did not follow through. May offer a free wireless gauge with any installation as part of the Discount Card program for 2010.

Going Native Garden Tour 2010- Summary Report

September 15, 2010

Going Native
Garden Tour

GOING NATIVE GARDEN TOUR 2010
SUMMARY REPORT

June 30, 2010

Highlights

This report describes the GNGT committee's efforts during the past year (July 2009 through June 2010). The document also provides details about tour day, when hundreds of volunteers share their time, expertise and gardens to ensure that the thousands of tour visitors enjoy the day and receive inspiration for their own gardens. Table 1 lists some tour highlights.

Date	**April 18, 2010**
Time	**10am-4pm**
Number of gardens	**67**
Number of registrants	**4673**
Number of garden visits	**12447**
Number of volunteers	**262**
Volunteer-hours on tour day	**1163**
Number of Sponsors	**16**
Number of Supporters	**22**
Ongoing efforts to ensure a quality tour	• **Volunteer orientation meeting** • **Web-based volunteer signup** • **Enhanced web-based registration to cooperate with ISP anti-Spam filters.** • **Custom designed t-shirts for volunteers.** • **Plant labeling info on website** • **Invasive plants list on website** • **On-line survey, with a prize drawing to encourage participation.**
New initiatives	• **Native plant sales were expanded and featured nine nurseries at ten gardens.**

Table 1: Tour Highlights

The eighth annual Going Native Garden Tour took place on April 18, 2010 from 10AM to 4PM. The 4673 registrants who signed up for the tour made 12447 visits to the open gardens. There were 262 volunteers participating on tour day, serving as docents and greeters at the 67 open gardens.
Once again this year, various initiatives enhanced the tour experience for registrants and volunteers. Volunteers received a custom-designed organic cotton t-shirt. An on-line survey was conducted after the tour, and prize drawing offered to encourage people to input their comments. Our nine nursery sponsors conducted native plant sales at selected tour gardens. We received many positive comments about the tour and the plant sales.

New Presenting Organization

The Going Native Garden Tour Steering Committee is now a recognized part of the California Native Plant Society, Santa Clara Chapter.

California Native Plant Society, Santa Clara Chapter, a non-profit 501(c)(3), is the tour's fiscal agent. They provide insurance and administrative support for the tour, and their non-profit status makes donations to the tour tax deductible.

Sponsors and Supporters

This year's tour was sponsored by the following 16 organizations:
Acterra
Almaden Valley Nursery
Azureheart Structural Integration
Bay Area Water Supply & Conservation Agency
Bay Natives
Central Coast Wilds Nursery
East Bay Wilds
Friends of Master Gardeners of Santa Clara County
Gold Rush Nursery
Mediterranean Garden Society
Middlebrook Gardens
Native Revival Nursery
Santa Clara Valley Urban Runoff Pollution Prevention Program
Santa Clara Valley Water District
Watershed Watch
Yerba Buena Nursery
Sponsors paid for the following: garden signs, fliers, copying, orientation meeting and website expenses, and volunteer t-shirts.

The tour was supported by the following 22 organizations:
Bay Nature Magazine
California Native Plant Society, Santa Clara Valley Chapter
Capitol Wholesale Nursery
Conexions
Cory Neighborhood Association
Don Edwards San Francisco Bay National Wildlife Refuge
Expert Support, Inc.
Gardening With Natives
Guadalupe River Park and Gardens
Japantown Neighborhood Association
Larner Seeds
National Wildlife Federation
Neighborhood Development Center (City of San Jose)
Old Mountain View Neighborhood Association
Our City Forest
Rainbow West Neighborhood Association
Santa Clara Valley Audubon Society
Sierra Club (Loma Prieta Chapter)
Shasta/Hanchett Park neighborhood Association
Sunnyvale Garden Club

UCCE Master Gardeners
Western Horticultural Society
Supporters provided assistance in the following areas:
- Soliciting gardens and volunteers
- Publicizing the tour to their members
- Linking their website to the tour website
- Distributing tour fliers at events

Sponsor and supporter information was publicized through tour literature, fliers, and press releases. The garden signs featured logos and graphics of sponsors and supporters, as shown in Figure 1.

Figure 1: Garden sign graphic

In addition to the listed sponsors and supporters, four designers volunteered to contribute their time in one-hour consultations, serving as the grand prizes for the on-line survey drawing: Fran Adams(*Sense of Place*), Stephanie Curtis(*Curtis Horticulture*), Agi Kehoe(*Agnes Kehoe Landscaping*), and Deva Luna(*EarthCare Landscaping*). The steering committee appreciated their contribution

Steering Committee

Table 2 lists the steering committee members and their roles.

Role	**Core Member**	**Additional Contributors**
Garden Selection/Descriptions/-Directions	Renate Kempf, Madeline Morrow , Diana Stanley, Ginny Veach	Peigi Duvall, Agi Kehoe, Deva Luna
Website	Krzysztof Kozminski, Diana Stanley, Bob Weissman,	Jan Clayton

Publicity	Kay Gutknecht, Arvind Kumar	
Sponsor Liaison/Development	Arvind Kumar	Ginny Veach
Fiscal Agent	CNPS: Julie Scherer, treasurer	
Visitor Materials (maps, descriptions, etc.)	Krzysztof Kozminski	
Coordination	Ginny Veach	

Table 2: Steering Committee members

The steering committee itself logged more than 800 volunteer-hours during the past year. The *Don Edwards San Francisco Bay National Wildlife Refuge* at the Environmental Education Center in Alviso (San Jose) provided meeting space. Some meetings occurred at committee members' homes. The committee met on the first Sunday of each month (varied as necessary).

Volunteers

This year the tour drew a total of 262 volunteers who logged 1163 volunteer-hours working at gardens on tour day. Some volunteers worked as docents who were knowledgeable about native plants and conducted guided tours of gardens. Others worked as greeters who welcomed visitors, encouraged them to sign the guest book, and answered general questions. In addition to contributing their time on tour day, garden owners worked hard readying their gardens for the tour.

The tour has been designated a project by UCCE Master Gardeners of Santa Clara County so that volunteer hours for the tour would count toward the Master Gardener volunteer service requirement. As a result, eighty-one of the tour day volunteers were Master Gardeners.

Funding

Our sponsors supplied both monetary donations and donations of signage and flyer production.
The primary tour expense is production of volunteer t-shirts. Minor expenses included supplies for the Orientation Meeting and the fiscal agent fee.

Garden Selection

This year's tour featured 67 gardens. Of these, 26 gardens (39%) were on the tour for the first time. This year, 9 public native gardens and 3 school gardens were included in the tour. Most of the gardens were located in Santa Clara County, and a few gardens were in southern San Mateo County. The southernmost garden was in Morgan Hill. The Garden Selection Committee evaluated a total of 78 submitted gardens and prepared garden descriptions and plant listings for the gardens selected.

Figures 2 and 3 depict area maps showing the approximate locations of gardens selected for the 2010 tour.

Figure 2: Gardens in the northwestern part of the tour area

Figure 3: Gardens in the southeastern part of the tour area

Garden Previews

As a way to attract and retain volunteers, the tour committee offers a Garden Preview program for volunteers (inspired by the Garden Soirees organized by the East Bay Bringing Back the Natives Tour). Under this program, volunteers receive invitations to visit private native gardens throughout the year. This is a reward for their volunteer efforts, and a chance to see gardens they otherwise miss due to their volunteer duties on tour day. Many appreciate the opportunity to see native gardens at different times of the year. Under this program, a total of 7 garden previews were arranged between July 2009 and June 2010, attracting from 6 to 20 volunteers to any one garden visit.

Other Volunteer Benefits

This year all volunteers received custom designed t-shirts. Myra Saylor designed the T-shirt art. She is an artist on paper, canvas and gourds and lives part time in Yuma, AZ and part time in California. She is a Master Gardener in Arizona and a great proponent of native landscaping. Her design for this year's shirt, featuring toyon leaves, is on the front page of this report. GNGT sponsor Azureheart supplied additional funds to enable the purchase of organic cotton shirts.

Tour Orientation

Tour organizers once again offered a well-received volunteer orientation program two weeks before tour day. All volunteers and garden hosts were invited to attend an evening meeting; a short presentation covered greeter, docent, and garden owner tasks and benefits followed by a question and answer session. Tour materials and signs were distributed and refreshments were served. The meeting also provided the opportunity for attendees to talk with members of the steering committee and meet other like-minded volunteers.

Publicity

The publicity this year targeted print media, gardening and environmental groups, colleges/academics, broadcast media, city business bureaus, water companies, nurseries, special interest groups and neighborhood associations

Hard copy press releases were mailed to selected media outlets. Five thousand color fliers were distributed to libraries, nurseries, Water District, CNPS meetings, Master Gardener meetings, and other locations. This year, the majority of the fliers were mailed to these locations.

The tour received coverage in the following publications:

Western Horticulture
Yerba Buena Nursery newsletter
Gilroy Dispatch
Santa Clara County Master Gardener newsletter
Avocet (Santa Clara County Audubon newsletter)
CNPS Yerba Buena chapter newsletter
Pacific Horticulture
Palo Alto Weekly
San Jose Mercury News
San Francisco Chronicle

Registrants identified many varied sources for learning about the GNGT. Registrants who completed the on-line survey indicated that most obtained information from the San Jose Mercury News and via email. Now entering its ninth year, the tour has established a loyal base of adherents, and a reputation and following among the gardening public.

Website

The tour website is located at www.goingnativegardentour.org and features a number of significant enhancements. This same site can be accessed using www.gngt.org.

The garden submission form is online. All gardens featured this year came through this automated form, which is live 365 days of the year. The registration system is also online.

Jan Clayton from Expert Support came up with a new design for the Garden Tour landing pages. The design has a modern look and feel, condenses the information, and makes it easier to find the information. The design was implemented just in time for the main sign-up time (last month before the tour). Jan has volunteered to help with the design of the rest of the website so we can have a consistent, easy to use, and informative web site for all our users year round.

The number of web pages increased with the addition of information about this year's gardens. The showcase feature of each garden is described along with other garden attractions, wildlife value, years gardening at this location, and lot size. Up to four pictures from each garden allows website visitors to see the actual garden. Where available, plant lists are provided online. Garden addresses are not given. These web pages, along with pages from previous years' tours, are available year-round, serving as a valuable resource for people searching for great native garden ideas.

Descriptions for making various styles of labels are on the website, as an aid for the garden owner. Clear labeling helps answer many of the garden visitors questions, so that docents have more time to discuss other aspects of the garden with visitors.

With the permission of Cal-IPC, a summary list of plants considered invasive in California natural areas was extracted from their documents (California Invasive Plant Inventory, Feb. '06, and Cal-IPC News Spring 2007). This list is available on the GNGT website. A link to their full database allows interested browsers to access more details about these invasive plants. Note that this list focuses on plants that imperil natural areas – there are other cultivated plants that can be quite invasive in the home garden.

Volunteer signups are now automated on the website, with information going directly to a database that allows for easier coordination on tour day.

A new "GNGT store" link on the website provides a shopping opportunity! This year's custom t-shirt design is available on various products –sweatshirts, mugs, bags – with some of the proceeds benefiting the Going Native Garden Tour.

2010 Registration

Table 3 shows that San Jose supplied 1233 (26% of the total) registrants, followed by Palo Alto, Sunnyvale, Los Altos, Mountain View and Redwood City.
Santa Clara County supplied 3316 registrations (71% of the total), and San Mateo County supplied 888 registrations (19% of the total).

City	Total
San Jose	1233
Palo Alto	409
Sunnyvale	317
Los Altos	283
Mountain View	233
Redwood City	174
Menlo Park	157
Los Gatos	156
Santa Clara	154
Cupertino	144
San Mateo	115
Campbell	113
Saratoga	112
Portola Valley	110
Burlingame	92
San Carlos	77
Morgan Hill	71
San Francisco	51
Fremont	50
Gilroy	44
Oakland	38
Milpitas	32
Belmont	31
Santa Cruz	30
Pacifica	29
Watsonville	20

Table 3: Number of registrants by city

Tour Materials

Links to web-based tour materials were emailed to all registrants two weeks before the tour. These materials were designed to allow tour visitors to plan out their route and which gardens to visit. The tour materials consisted of:

Garden addresses and detailed descriptions and directions
Area maps showing the approximate locations of gardens

Each garden received the following materials:
Guest book for visitor sign-in
Tour Garden Sign (durable, weather-proof, and should last for a long time) and 2 stakes
Garden Etiquette (description of procedures on tour day)
Small sign requesting donations

Gardens received brochures and literature to distribute, and some gardens provided plant lists and garden write-ups.

Tour Day

Tour day weather was warm and sunny. The tour traffic was reasonably well distributed. In general, the southeastern locations received fewer visitors than the gardens that are further up the peninsula. A total of 12447 visits were logged, which is an underestimate as not every visitor signs the guest book. Also, most public gardens did not return a visitor count, so total number of visits during the tour actually exceeded the number quoted above. A garden in Palo Alto logged the tour record: 665 visitors.

Chart 2 shows the attendance at the gardens on this year's tour, arranged in order by garden number. Lower garden numbers tend to be located to the northwest (Belmont, Redwood City), and higher garden numbers southeast (Evergreen area in San Jose). Garden #1 is in Hillsborough and Garden #68 is in Morgan Hill.

Chart 2: number of visitors by garden number

Visitor Feedback – Guest Books

Here are a few of the comments entered in the guest books by visitors. It's not surprising few comments are written in the guest books, as the visitors are rushing to see gardens in the time allowed.

Garden	Comments
5	This has got to be the best organized garden we've seen in 4 or 5 years of taking this tour. I enjoyed your sense of humor in the rock sculpture garden. To me, the back yard captures the sense of being in the mountains. It must be a peaceful place to sit. Thanks.
10	Nice to see a native garden at something other than a private home.
16	The meadow in back was beautiful. Thank you for sharing.
30	Your garden has evolved into a wonderful place. Do you rent out the hammock by the day?
45	Love show of small space usage, combination edibles, natives, continuation of neighbor's native garden. Could use more plant signs/labels.
50	Very educated tour. We got more information here than other places. Our student tour guide was really good.
51	First stop – don't have to see more! Can I take it all home?
65	Great job. Good alternative to a front lawn.

Visitor Feedback – On-Line Survey

For the third time, the GNGT conducted an on-line survey, patterned after the *Bringing Back the Natives Garden Tour* organized by Kathy Kramer. A random drawing was offered for participation in the survey, with t-shirts and four 1-hour design consultations offered as 'grand' prizes. More than 600 people submitted the survey, rating various aspects of the tour and supplying many detailed comments. About half of the respondents had attended a previous GNGT, and party size was mostly one or two people. Here are some of the ratings and feedback supplied by survey participants:
Overall rating of tour: 68% Excellent, 30% Good
Familiarity with native plant gardening: 34% beginner, 58% some knowledge

Garden Comments
Most respondents supplied detailed and frank comments regarding the gardens they toured – for example:

Garden #3: Fantastic, owner gave us printed layouts of the garden and was so friendly and helpful and her sons had hot coffee or lemonade for sale which was most appreciated as we were there at 10:00 a.m wanting to also purchase plants from Acterra.
Garden #11: Charming vignettes and intimate seating areas in front. In rear, the combination of design areas, existing landscaping, mature trees and native themes weaves a harmonious and welcoming whole.
Garden #18: The courtyard was the most successful part of this newly planted garden. The back yard was not filled in much yet, but we noticed that even when filled in, there was not much variety in the height of plants to break the intense heat of the afternoon sun.
Garden #32: Wonderful park, great examples of full size shrubs and small trees that would have needed to be cut back in a garden setting. looks like it's size makes it hard to keep free of weeds
Garden #59: Beautiful combination of plants and art; I especially loved the waterfall mural and the dry creekbed. Nice combination of natives and nonnatives; a very controlled garden.
Garden #66: Good collection, but random placement of material. No sense of direction of design.

Suggestions for Improvement
Respondents supplied more than 372 suggestions for improving the tour, which the Steering Committee will review while preparing for next years tour – for example:

We visited about 6 gardens in our neighborhood. The map was a little difficult to navigate - it would help if you could enlarge it more. Everyone was very gracious and it inspired us to get after it in our own yard.

On the description of plants that are included in the gardens, having a link (or a picture) of the plant with its size when mature, color, purpose (good for bees, butterflies...) etc. can help identify them quickly.

Include the numbers of the sites on the list with links, so that gardens can be easily cross referenced to map and other material. the maps and Google links were great.

It was all very wonderful! I had problems figuring out which gardens to go to. I was only able to go to 10 in the 6 hours since I'm new to this and asked a lot of questions. Maybe having the tour on 2 separate days, split by the Northern cities, then the Southern the next day or weekend.

Identify gardens that are open to public so that one can choose the ones that are private and see the ones open to public later.

It would be nice to have the list of gardens earlier.
Also - more info on deer resistant plants.

Table 4 lists 14 garden management practices and survey respondents' strategy regarding them. Note that most have already reduced insecticide and herbicide use, and many plan to increase planting density, reduce lawn size, group plants with similar water needs, and encourage birds and butterflies.

Will tour influence you to do this?	already doing this	I began doing after Tour	I plan to do this	I have no plans to do this	Response Count
1. Mulch with wood chips, leaves, etc.	69.0% (372)	1.9% (10)	24.1% (130)	5.0% (27)	539
2. Increase planting density to out-compete weeds.	33.3% (164)	3.7% (18)	45.3% (223)	17.7% (87)	492
3. Encourage birds, butterflies, etc. with plant choices, food, shelter, and water.	55.7% (298)	3.4% (18)	34.6% (185)	6.4% (34)	535
4. Tolerate some insect damage to plants.	72.0% (368)	4.7% (24)	18.2% (93)	5.1% (26)	511
5. Reduce/eliminate insecticide/herbicide use.	76.6% (402)	4.0% (21)	17.0% (89)	2.5% (13)	525
6. Include water-wise plants in the garden.	63.5% (346)	4.6% (25)	31.0% (169)	0.9% (5)	545
7. Include native plants in the garden.	57.7% (318)	7.4% (41)	33.9% (187)	0.9% (5)	551
8. Group plants of similar water needs.	52.1% (267)	5.7% (29)	39.1% (200)	3.1% (16)	512
9. Install efficient irrigation (e.g., drip, timers, soaker hoses).	57.0% (297)	2.7% (14)	28.4% (148)	11.9% (62)	521
10. Reduce the size of the lawn.	49.7% (257)	1.4% (7)	38.7% (200)	10.3% (53)	517
11. Leave grass clippings on the lawn.	45.5% (197)	2.1% (9)	12.5% (54)	40.0% (173)	433
12. Compost yard waste and kitchen scraps.	62.7% (328)	1.3% (7)	18.2% (95)	17.8% (93)	523
13. Amend soil with compost.	73.0% (382)	2.3% (12)	17.2% (90)	7.5% (39)	523
14. Minimize hardscape (patios, decks).	37.0% (183)	1.4% (7)	20.2% (100)	41.3% (204)	494

Table 4: On-line survey results regarding garden management practices.

Host Gardener Feedback

Here is a sample of host gardener feedback:

Lots of inspired people, lots of people planning to convert their lawns into native gardens. Many thanks to our greeters Sandy and Jan who were helping with everything what was needed, even with our young children.

We had 90 people visit our garden. The experience was wonderful and the day could not have been more beautiful!

We had 231 visitors, including 4 neighbors who had not signed up in advance. I'm not sure we got absolutely everybody to sign in. A lot of people arrived at the same time to attend the talks.

We had lots of intelligent questions and very positive comments about the yard.

The weather was great and the visitors very interested in the use of water and how plants can grow in the shade.

Future Plans

Steering Committee volunteers are tackling the task to automatically build garden web pages by using information supplied by garden owners and stored in a common database. They are also trying to develop a cross-reference system to supply website links to various gardens based on topics of interest. For example, a website visitor could find and browse all gardens that have rain capture/containment features, or all gardens with meadows.

Summary

Table 5 compares some key statistics for the last four tours.

Year of Tour	**2006**	**2007**	**2008**	**2009**	**2010**
Number of gardens	46	45	42	53	67
Number of registrants	3,656	3,120	3523	5090	4673
Number of garden visits	7,606	6,688	7,137	12,824	12447
Number of volunteers	147	200	220	265	262
Volunteer hours on tour day	660	690	741	800	1163

Table 5: Tour statistics, 2006 through 2010

This year's Going Native Garden Tour featured 26% more gardens than last year. There were 8% fewer registrants and 3% fewer garden visits.

The tour received grants that enabled the purchase of organic t-shirts for the volunteers. There was a slightly different mix of sponsors and supporters this year, with more nursery sponsors and more neighborhood association supporters.

The on-line survey was used for the third time this year and supplied lots of informative feedback and some great suggestions. The steering committee will find this very helpful for future planning.

The continued success of the Going Native Garden Tour demonstrates that our community has a sustained interest in growing California native plants in home gardens and in environmentally conscious gardening practices.

Watershed Watchers: Keeping Out Waterways Clean: FY 09-10 Fourth Quarter Report including end-of-year Summary from Alviso

September 15, 2010

WATERSHED WATCHERS:
Keeping Our Waterways Clean

FY09-10
4th Quarter Report
April - June 2010

Intern Jennifer Nielsen cheerfully poses with the Blue Goose at South Bay Bird Fest on May 1st, 2010.

Prepared for:
Santa Clara Valley Urban Runoff Pollution Prevention Program
San Francisco Bay Wildlife Society
Don Edwards San Francisco Bay National Wildlife Refuge

A. Program Title and General Focus:

This partnership program between the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP), the U.S. Fish and Wildlife Service's Don Edwards San Francisco Bay National Wildlife Refuge Environmental Education Center (EEC), and the San Francisco Bay Wildlife Society (SFBWS) provides services and programming that interpret the message of the Watershed Watchers program. The purpose of the Watershed Watchers program is to increase the surrounding communities' knowledge of urban runoff pollution and how to reduce its harmful effects through personal behavior changes.

B. Program Team:

•Debra King has been the Interpretive Specialist and Watershed Watchers Program Coordinator as of March 2009. Debra studied at the University of California, Berkeley, and graduated with a B.S. in Environmental Sciences and a Minor in Music. After finishing college, Debra worked at the East Bay Humane Society Hospital and taught at various non-profit education organizations (including Giraffe Learning Center and World Culture and Education Organization). She also worked in the Education Department at the San Francisco Zoo, coordinating volunteers, working with animals, and developing interpretive programs, before she landed at the EEC in Alviso in September as the Slow the Flow Intern.

•Genie Moore is the Environmental Education Center Director. She brings her experiences of coordinating the "Wetland Round-Up" and "Trekking the Refuge" field trip programs, and the Common Murre Restoration Project for the Visitor Center in Fremont.

•Renee' Maningding is the Watershed Watchers Intern for the San Francisco Bay Wildlife Society. She graduated from the University of California, Santa Cruz, with a B. A. in Environmental Studies and Anthropology. Renee' is also actively involved with her Filipino folkdance group, and has volunteered with Happy Hollow Park and Zoo.

•San Francisco Bay Wildlife Society, established in 1987, is a non-profit cooperating association that has supported education, interpretation and other public use programs at the Don Edwards San Francisco Bay National Wildlife Refuge. The San Francisco Bay Wildlife Society administers the Watershed Watchers Program.

•Volunteers are vital and are often very involved with the Watershed Watchers Program by assisting with interpretive programs, field trips, and special events.

C. Highlights

Earth Day Community Service

This quarter's Earth Day Community Service was composed of a small but very energetic group of volunteers. We first discussed the importance of wildlife refuges and conservation. We then talked about invasive species and the significance of removing invasive species and planting native ones. The participants were all hard working, lively, and cleared a huge amount of mustard in our restoration area. We then went on a short hike to discuss the different habitats here at the Don Edwards San Francisco Bay National Wildlife Refuge, and learned about how urban runoff pollution not only affects wildlife, but also people.

Our awesome Earth Day Community Service group poses in front of the Pavilion on April 18th, 2010.

A volunteer: hard at work removing mustard.

Scout Programs

Scouts have been consistently enthusiastic about our Watershed Watchers programs. In addition to satisfying badge requirements, scouts enjoy learning all about the habitats here at the Environmental Education Center while practicing their binocular skills. They make their own wetland bird guides, pinecone bird feeders, and write journals about the wildlife they observe. The word is definitely out, and each quarter we field more and more calls about people wanting to participate in our scout programs.

Scouts brave the cold and rain during one of our Junior Girl Scout Wildlife Badge programs in May.

South Bay Bird Fest

Another year, another great event! For this year's South Bay Bird Fest, we partnered with the Santa Clara Valley Audubon Society, Wildlife Center of Silicon Valley, Los Gatos Birdwatcher, and, of course, the San Francisco Bay Wildlife Society. The Wildlife Society donated funds to keep our volunteers well fed, happy and energized, and the Los Gatos Birdwatcher donated program supplies and raffle prizes. As in previous years, the SCV Audubon Society brought out their "bird popsicles" and helped participants make their very own binoculars. We were also very excited to have the Wildlife Center of Silicon Valley bring out two of their education birds – a Red-shouldered hawk and an albino American crow.

Participants loved all the games, hikes, live birds, the puppet show, our new magic show, as well as all the other fun activities going on at the Environmental Education Center, and by the end of the day, we had 330 smiling faces walk through our doors.

D. Fouth Quarter Summary (April-June)

Total Number of Programs Summary

Program Type	# of Programs Proposed	# of Programs Offered	# of Programs Conducted	Proposal Met?
Public Programs	7	13	12	Exceeded
Group Programs	5	8	8	Exceeded
Stewardship Programs	2	3	2	Met
Outreach Programs	1	6	6	Exceeded
Summer Camp	n/a	n/a	n/a	Met
Special Events	1	1	1	Met
TOTAL	16	31	29	

Total Number of Participants Summary

Program Type	Pre K	Elem	Middle	High	Adult	Total #
Public Programs		111		1	146	258
Group Programs		101	7		69	177
Stewardship Programs		17			11	28
Outreach Programs	23	217		4	88	332
Summer Camp						n/a
Special Events						330
TOTAL	23	446	7	5	314	1125

E. Program Details:

Public Program – Wildlife in Our Watershed Depends on You
A series of guided nature walk, hands-on science, and/or nature activities that focus on how individual behaviors cause or prevent urban runoff pollution and affect wildlife habitat in the watershed. (See Appendix A for programs offered this quarter)

Goal – 7 programs

Date	Programs	Pre K	Elem	Middle	High	Adult	Total # of Attendee
4/3/10	Beginning Bird Photography		4			8	12
4/10/10	Monster Bacteria		10			19	29
4/11/10	Drawbridge					4	4
4/24/10	All About Owls		14			15	29
4/24/10	Habitat Exploration		11			13	24
5/8/10	Beginning Bird Photography		14				14
5/9/10	Beginning Bird Watching		7			7	14
5/15/10	Bike the Levees				1	4	5
5/21/10	Night Sky Party!		38			36	74
5/22/10	Advanced Bird Photography						vol. cancel
6/19/10	Wetland Safari		6			14	20
6/19/10	Salt Marsh Life…Food Chain		6			10	16
6/26/10	Advanced Bird Photography		1			16	17
Offered: Conducted:	13 12		111		1	146	258

Proposal: ___Met ___Not Met _X_Exceeded

Many programs wouldn't be possible without the help of our wonderful interns and amazing volunteers.

Group Programs – Our Role in Preventing Urban Runoff Pollution
Presentation and walk focusing on each individual's role in preventing urban runoff pollution, including examples of alternative behaviors. (See Appendix A for program descriptions)

Goal – 5 programs

Date	Programs	Pre K	Elem	Middle	High	Adult	Total # of Attendee
4/3/10	Brownie Eco-Explorer Patch		12			10	22
4/23/10	Private Brownie Scouts		12			6	18
5/4/10	Private Monster Bacteria		6	7		6	19
5/15/10	Lyceum Mysteries…Marsh		5			4	9
5/22/10	Webelos Naturalist Badge		20			14	34
5/25/10	Private Girl Scouts		10			4	14
6/5/10	Private Wolf Scouts		18			15	33
6/5/10	Private Brownie Scouts		18			10	28
Offered: Conducted:	8 8		101	7		69	177

Proposal: ___Met ___Not Met _X_Exceeded

Stewardship Programs – Gardening Without Chemicals
Workshops and garden workdays are both included in this category. Workshops highlight California native plans, emphasizing their benefits to native animals and demonstrate how to garden without chemicals. The workshops focus on how chemicals entering the watershed compromise the integrity of our waterways and are harmful to wildlife. Garden workdays illustrate chemical-free gardening techniques. (See Appendix A for specific program details)

Stewardship – Gardening Without Chemicals
Goal – 2 programs

Date	Programs	Pre K	Elem	Middle	High	Adult	Total # of Attendee
4/17/10	Community Service		4			4	8
5/8/10	Community Service						cancelled
5/14/10	Scout Community Service		13			7	20
Offered: Conducted:	3 2		17			11	28

Proposal: _X_Met ___Not Met ___Exceeded

Outreach Programs
Take information about the program to offsite events in order to attract new participants to weekend programs and special events.

Outreach
Goal – 1 program

Date	Programs	Pre K	Elem	Middle	High	Adult	Total # of Attendee
4/8/10	Alum Rock Library		22			15	37
4/10/10	Willow Glen Library	6	19			13	38
5/19/10	Santa Teresa Library	10	25			19	54
5/26/10	GRPG Water Wizards		97			20	117
5/28/10	Evergreen Library	7	29		4	18	58
3/19/10	Wisdom Education Org.		25			3	28
Offered: Conducted:	6 6	23	217		4	88	332

Proposal: ___Met ___Not Met _X_Exceeded

Summer Camp
Marsh-In Summer Camp is offered for elementary school-age children, for one week in August. Participate as a camp coordinator and activity leader. Assist in program development, implementation, execution, and cleanup.

Summer Camp
Goal – n/a

Proposal: _X_Met ___Not Met ___Exceeded

Special Events
Special events are offered twice a year and are designed to attract at least 200 people to the EEC for various activities educating participants about urban runoff pollution prevention.

Special Events
Goal – 1

Date	Programs	Pre K	Elem	Middle	High	Adult	Total # of Attendee
5/1/10	South Bay Bird Fest!						330*
Offered: Conducted:	1 1						330

*specific ages were not recorded

Proposal: _X_Met ___Not Met ___Exceeded

F. Public Outreach – The Audience and How it was Reached

This project involves public outreach encompassing a wide variety of groups and individuals in Santa Clara County. The audience varies in age, ethnicity, interest, occupations, and income levels. The following programs offer an opportunity for public outreach:

•The Environmental Education Center in Alviso offers trails and access to wildlife viewing for the public to gain first-hand knowledge of the value of our Bay habitats. Visitors who tour the Environmental Education Center have an opportunity to use the storm drain model, speak with the interpretive specialist about the salt marsh, have access to "things to see," as well as learn about current threats to wildlife of the salt marsh. The "audience" is as diverse as the population in the Bay Area, including people from varied ethnic backgrounds and socioeconomic status.

•The Watershed Watchers programs are primarily held on the weekend at the Environmental Education Center. *Bay Area Parent* continues to send numerous new visitors to the EEC. Santa Clara County residents attending these weekend programs are given informational flyers produced by SCVURPPP, including "Grow-It" and "You are the Solution to Water Pollution". The program is continually trying to reach new and different audiences, and goals for the next quarter involve doing programs at more libraries in Santa Clara County, and reaching out to more high school students.

G. Outreach Materials Produced

Quarterly fliers for weekend programs are attached. These materials are distributed at outreach opportunities and they are distributed as noted below:

H. Making the Project Known to the Community at Large

Programs are advertised in the following media:

Tideline (the Refuge newsletter with over 17,000 subscribers)
Don Edwards San Francisco Bay National Wildlife Refuge website
Bay Area Parent publication
Flyers (located at the Refuge, schools, and South Bay libraries, Central YMCA, Learning Rainbow Teacher Supply Store, Hicklebee's Children's Bookstore)
Lyceum publication and website
Bay Nature Magazine
Bay Area Publications
Active Days website
Los Gatos Birdwatcher
Santa Clara Valley Unified School District Middle and High Schools
San Jose Unified School District Middle and High Schools
Tri-City Voice

I. Coordinating Refuge Volunteers

Contact volunteers to lead programs, training, and maintaining relationships with volunteers. Schedule volunteers to work on special events. Volunteers are instrumental in providing programs at the EEC.

J. Project Feedback

How the project has changed specific behaviors which adversely affect water quality and increase the understanding and appreciation of streams and the Bay.

Participants in the Watershed Watchers programs provided feedback as to how the program has increased their awareness of urban runoff pollution. The following statements are actual written comments taken from surveys and represent behavioral changes survey respondents are willing to make to minimize storm drain pollution:

- save garbage for trash bins
- don't pour chemicals (paint, soap, motor oil) down storm drains
- don't litter/ dispose of trash properly
- pick up dog poo
- use environmentally-friendly soap and chemicals
- will save water, use less during showers
- will improve my habits

The following are general comments that visitors made about the Refuge and programs:

- projector needs to be fixed
- excellent
- fantastic!
- This is a wonderful resource - thank you!
- We wanted to walk further!

K. Visitor Survey

A Visitor Survey is used to determine visitor demographics, effectiveness of publicity, and effectiveness of the Watershed Watchers programs. Each survey represents an entire family, typically composed of 2 adults and 2 children. The current quarter survey results are summarized below for the Watershed Watchers: Keeping Our Waterways Clean program (Survey is attached in appendix).

Number of Surveys Completed in the 4th Quarter = 91
59% were first time visitors
27% were repeat visitors

Visitors rate programs on a scale of 1 to 5, 5 being highest

1% rated programs 1-3
11% rated programs 4
54% rated programs 5

After visiting the EEC, 80% of the visitors knew that storm water flows into storm drains and then directly to creeks and the bay. As a result of their visit, 79% listed a behavioral change they are willing to make to keep their storm drains clean.

83% of visitors learned about urban runoff
80% of visitors learned about preserving and protecting South Bay habitats
69% of visitors learned something about watersheds

Visitor Demographics

Bead Drop Display FY0910

2009 – 2010 Highlights

■ Participants really enjoyed our Earth Day Community Service project, clearing mustard from our native plant garden and restoration areas, while enjoying the beautiful weather and good company.

■ Shark Day was a great success, with over 500 participants enjoying the live leopard shark, games, mud lab, walks, story time, and making their own shark tooth necklaces. We even had a visit from Sharkie, the San José Sharks' mascot.

■ South Bay Bird Fest was another hit this year! About 330 participants enjoyed the live bird show, magic show, puppet show, face painting, and arts and crafts, which wouldn't have been possible without the 45 volunteers who helped out that day.

■ There was a significant increase in outreach events with the San José Public Library system that encouraged participants to visit the Refuge.

■ The smaller number of participants in relation to the previous fiscal year is due in part to attending less large-scale outreach events (USGS Open House).

■ The Children's Discovery Museum Summer of Service program has continued to help out at the Refuge by doing a tremendous amount of weeding, while still enjoying themselves by taking hikes and coloring their own tote bags to take home.

■ Summer camp was enjoyed by over 60 students this year, as they participated in fun activities, enjoyed healthy snacks, went out an urban runoff related scavenger hunt, and sang along to mucky marsh music at the overnight.

- Appendix A: Program Descriptions
- Appendix B: Watershed Watchers Proposed Work Plan for July 2009 – June 2010
- Weekend Program Flyers
- Event Flyers
- Tideline
- Visitor Survey

Appendix A: Program Descriptions

ABC's of Raptors
Participants learn all about raptors! The program begins with a slideshow that defines what a raptor is and what types of behavior raptors typically portray. Then the slideshow shows images of local or regularly spotted raptors and their physical characteristics are discussed. Participants learn how to identify raptors and learn about how humans impact raptors, especially how urban runoff pollution makes its way up the food chain. Finally, participants make a raptor ID guide by cutting and pasting local raptors into a book they can take home.

Advanced Bird Photography Workshop
Volunteer Paul Bridges takes over when Jen Woo left off. This 3-hour workshop will first address aesthetic issues (e.g., advanced composition) and nature (animal behavior, seasons, tides). Then the focus is on photography topics (exposure, depth of field, flash, etc.). Urban runoff pollution solutions are discussed at the beginning of the program, and "You are the Solution to Water Pollution" is distributed to all class participants.

All About Owls
Kids learn about owls through an interactive presentation and then dissect owl pellets. At the conclusion of the program, kids learn that owls can be adversely affected by urban runoff pollution and toxins that enter the food chain at lower levels.

An Eye for the Butterfly
Volunteer Intern Renee' Maningding leads participants in a discovery of all things related to butterflies: their life cycles, places in culture, habitats, etc. Participants can go on a walk through the Butterfly Garden and make their own Butterfly Life Cycle mobile. Urban runoff and how it affects butterflies is discussed.

Beginning Bird Photography Workshop
Jennifer Woo, a refuge volunteer, puts on a photography workshop for visitors interested in wildlife photography. A slide show is followed by a walk outside for practical application of skills. Urban runoff pollution solutions are discussed at the beginning of the program, and "You are the Solution to Water Pollution" is distributed to all class participants.

Beginning Bird Watching
Visitors start with a slide show to get to know the most typical birds spotted along the boardwalk trail. Methods of identifying birds in the field are discussed. Human impact on local birds through urban

runoff is explained and visitors are asked to name actions they could take at home to reduce storm drain pollution. The group then takes a bird walk around the EEC. Conducted by volunteer Ceal Craig.

Bike the Levees
Ed Kantack leads visitors on a bird spotting bike ride around the salt ponds. Prior to departure, participants received an interpreter-led session of the storm drain model and bioaccumulation simulator to learn about the consequences of urban runoff pollution.

Brownie Eco-Explorer Patch
The girls get a chance to go on a walk where they learn about Refuge habitats and its inhabitants. They fill out an "Explore Nature" sheet where the scouts mark off a checklist of living and non-living things found in the marsh. Then the girls come inside and learn about food chains and the bio-accumulation of toxins that enter the food chain through storm drain pollution. They make their own food paper ring salt marsh food chains. Finally, the girls get a chance to make bird feeders for the birds in their backyards.

Butterflies, Etc.
Children take an informal guided tour of the Butterfly Garden looking for butterflies or larva. Chemical free gardening is explained, along with benefits to butterflies and other living things.

Community Service
This is an open day for the general public. The audience usually consists of high school students who need to fulfill community service requirements. The groups are introduced to chemical-free gardening and its impact on aquatic environments, including salt marshes. Participants then work in the gardens planting native plants, pulling non-native plants, and mulching.

Discover Native Species
June Smith from the Native Plant Nursery takes visitors on a tour through the EEC's chemical-free native plant gardens. The program includes a discussion about designing a habitat for birds in your backyard, emphasizing the use of native plants, as well as detailed information about all the plants. Participants also learn how using chemical-free gardening methods protects wildlife in their neighborhood as well as wildlife throughout the watershed.

Drawbridge
Ceal Craig, a volunteer, gives a presentation about the historic town of Drawbridge. Urban runoff pollution is mentioned as one reason people abandoned the town. On a drive out to the viewing point, Refuge wildlife and habitats are discussed. People are reminded that urban runoff starts at their homes and techniques to reduce runoff pollution are suggested.

Exploring the Weep!
Volunteer Dr. Wayne Lanier leads a bike ride from the Marina to the research site of the Weep, a biologically rich site with a myriad of bacteria and algae growing. Bacteria, algae and water samples are taken, and participants get to look through field microscopes to get a closer look. The topic of urban runoff is discussed, as these organisms are easily affected by the actions of humans.

Habitat Exploration
Volunteer Ed Kantack leads a leisurely walk around the marsh at the EEC, looking for birds and other wildlife. Urban runoff pollution impacts and solutions are discussed at various stops along the way.

Junior Girl Scout Wildlife Badge
Girl Scouts earn their Wildlife Badge by visiting the Refuge and learning about food chains, wildlife specific to their local area, and using binoculars to study a wild animal. This is accomplished through the use of several games, hands on activities, taking a hike around the EEC studying habitats and looking for animals. The program also covers actions they can take at home to prevent urban runoff. Each participant states to the group an action they will take to help protect wildlife.

Lazy Days of Summer
Seasonal marsh walk around the EEC lets participants look for young wildlife and their families. Walk is led by wildlife enthusiast Ed Kantack. Urban runoff pollution impacts and solutions are discussed at various stops along the way.

Living Wetlands
Participants can learn about all the different habitats here are the Refuge, including salt marshes, former salt ponds, tidal and non-tidal sloughs. They also learn about human and wildlife dependence on wetlands. Urban runoff pollution impacts and solutions are discussed at various stops along the way. Program is led by Ed Kantack.

Making Tracks
This program teaches about animal tracks. At the start of the activity, each person makes their own animal track guide, then they take their guides outside to see what they can identify. All participants watch a watershed demonstration to illustrate how preventing urban runoff can protect the animals that make the tracks they have just studied.

Marshes, Mud and Plankton
Participants examine mud and salt pond water samples looking for macro invertebrates. The importance of mud creatures and plankton in the food chain is illustrated with food pyramids and a flannel banner activity. A Marsh walk follows the labs. Urban runoff pollution is identified as the culprit in unhealthy sloughs. People are asked to name actions they can take at home to protect macro invertebrates around the bay.

Monster Bacteria and Other Suspicious Critters
During this program, participants get a chance to step into the shoes of a scientist by exploring one of the salt marsh's hidden habitats. Dr. Wayne Lanier, a scientist for the San Francisco Exploratorium, starts with a short hike where participants take samples from the marsh waters and then participants examine these samples with field microscopes. Urban runoff effects on the bay habitats are discussed.

Night Sky Party
Amateur astronomers come to the EEC to educate and entertain visitors with a casual astronomy talk, fun activities, and a telescope viewing of the night sky. During the program, hot chocolate is served and the urban runoff pollution prevention box is discussed.

Ohlone Uses of Plants
During this program, volunteer Pat Hartinger discusses the plants that were traditionally used by the Ohlone Indians. She takes them on a guided tour through the native plant garden and discusses the importance of planting native plants.

Seasons and Weather

This is a new program developed by volunteer Ed Kantack, which talks about seasons and weather as related to the sun, the water, and everything else around us! He uses demonstrations to illustrate the tilt of the poles, how clouds are formed, as well as many other topics. Urban runoff material is handed out to participants.

Shorebirds

Participants learn all about shorebirds. Ed Kantack leads with a short slide show and then takes participants out on a hike to observe these interesting and sometimes comical Refuge visitors. Urban runoff plays a huge part in how well the animals survive, and methods for how humans can help are discussed.

Summer of Service

Partnership program between various youth groups and SCVURPPP position at the EEC. Kids spend a day at the EEC; they work in the gardens in the morning and explore the Refuge in the afternoon. Urban runoff pollution prevention ideas are discussed. They finish up by designing their own environmentally friendly tote to take home.

Quackers and Honkers

Visitors learn to identify the different ducks and geese that visit the refuge with an informative slide show. The difference between diving and dabbling ducks is discussed. Human impact on local birds through urban runoff is explained and visitors are asked to name actions they could take at home to reduce storm drain pollution. The group then takes a bird walk around the EEC. Conducted by volunteer Ed Kantack.

Water Water Everywhere

Ed Kantack's program is all about H_2O. This program covers the water cycle, including a working model used to demonstrate evaporation, condensation, precipitation, and runoff. Next, watersheds are addressed and participants get to observe the watershed model and learn about sources of urban runoff pollution. Everyone gets to make their own watershed model to take home.

Webelos Naturalist Badge

Webelos earn their Naturalist Badge by visiting the Refuge and learning about food chains, wildlife specific to their local area, and using binoculars to study wild animals. This is accomplished through the use of several games, hands on activities, taking a hike around the EEC studying habitats and looking for birds. Prior to the walk, the scouts make bird field guides which they use on their walk. The program also covers actions they can take at home to prevent urban runoff. Each participant states to the group an action they will take to help protect wildlife.

Appendix B: Watershed Watchers Proposed Work Plan for July 2009 – June 2010

WATERSHED WATCHERS PROGRAM TITLE AND GOALS JULY 2009 – JUNE 2010	METHODS AND OBJECTIVES OF PROGRAMS
Public Programs at the EEC- Wildlife in our Watershed Depends on You **Goal:** Interpretive programs offered to the public, focusing on how individual behaviors cause urban runoff pollution and affect wildlife habitat in our watershed.	Offer a variety of programs for adults, children, and families. These programs can include but are not limited to nature walks, hands-on activities, puppet shows, holiday programs, and other interpretive programs. These programs change frequently. **Objective:** Participants will state various ways they can protect the refuge
Group Programs at the EEC- Our Role in Preventing Urban Runoff Pollution **Goal:** Interpretive programs focusing on each individual's role in preventing urban runoff pollution, including examples of alternate behaviors.	These programs will be conducted for senior groups, youth groups, birthday parties, special interest clubs, college groups, day care, after school programs, and other local organizations. These programs will be reserved in advance by the group. **Objective:** Participants will state two examples of actions they will try at home to prevent urban runoff pollution
Special Events **Goal:** These all day events are designed to attract at least 200 people to the EEC for various activities educating about urban runoff pollution prevention.	These two events include Shark Day in October and International Migratory Bird Day (IMBD) in May. Planning for these two events begins 3-6 months in advance. Thus much of the prep work for Shark Day will be in the first Quarter and prep work for IMBD will be in the third Quarter.
Outreach **Goal:** Participating in outreach activities helps spread the word about the urban runoff pollution prevention program and provides opportunities for people to learn about how to prevent urban runoff pollution in the watershed.	Outreach activities include festivals, fairs, watershed clean-ups, or off site interpretive programs.

WATERSHED WATCHERS PROGRAM TITLE AND GOALS JULY 2009 – JUNE 2010	METHODS AND OBJECTIVES OF PROGRAMS
Stewardship at the EEC- Gardening without chemicals and Coastal Cleanup **Goal:** Stewardship activities encourage and inspire visitors to create wildlife habitats and use chemical-free garden techniques in their own backyards. Coastal Cleanup also helps participants connect their trash habits with the effects on the environment and wildlife.	These stewardship activities include garden work days emphasizing chemical-free gardening techniques and garden workshops that guide visitors through various native plant demonstration gardens around the EEC, while discussing chemical-free gardening techniques used in the gardens and implementation methods for the home garden. Coastal cleanup involves volunteers seeing the effects of urban runoff trash on coastal environments and wildlife. Trash is now the largest source of urban runoff pollution.
Informal Indoor Visitor Contact **Goal:** Includes interaction with visitors at the EEC, answering questions over the phone and in person.	Assist visitors over the telephone and in person. Provide excellent customer service to all visitors.
Distribution of Specified Programs to Local Media **Goal:** Contact and distribute informational fliers, press releases, and other programmatic information about the urban runoff pollution prevention program to local media such as, Bay Area Parent, Mercury News, as well as local newsletters and websites.	Create and distribute a listing of programs on a regular basis to provide to Bay Area Parent, online calendars, websites, local newsletters and newspapers. Write press releases and informational fliers to distribute for special events. Conduct follow-up calls to ensure information is posted.
Developing and Maintaining Partnerships with Local Community Organizations **Goal:** Maintain and create partnerships with local community organizations via phone calls, emails, and in person meetings to groups such as San Jose Community Gardens, the San Francisco Bay Bird Observatory, Audubon, Guadalupe River Parks and Gardens, Nortel Networks, Intel, etc.	This takes place throughout the year, however, the key time for working directly with these groups is for International Migratory Bird Day (IMBD) in May and for the chemical-free garden stewardship projects. During the rest of the year, relationships are maintained through the exchange of information and collaboration on issues related to urban runoff pollution prevention and wildlife.
Coordinating Refuge Volunteers for Interpretive Programs/ Gardens **Goal:** Work with and maintain ongoing relationships with volunteers at the Refuge. Work with volunteers that: lead programs; maintain the chemical – free gardens; and assist with special events.	Work with the Volunteer Coordinator to recruit, meet with and provide on the job training for volunteers that have an interest in leading programs and working to maintain the chemical-free gardens. Work directly with and maintain relationships with long-term volunteers who lead programs and work in the gardens.

WATERSHED WATCHERS PROGRAM TITLE AND GOALS JULY 2009 – JUNE 2010	METHODS AND OBJECTIVES OF PROGRAMS
Marsh-In Summer Camp **Goal:** This week long camp is designed to provide opportunities for young campers to learn about and connect with the wetland habitats, animals and plants, and to introduce them to how individual behaviors cause urban runoff pollution and affect wildlife habitat in our watershed.	This includes acting as a leader and assisting in program planning for the one week annual summer camp that encourages participation of students from the local elementary school in Alviso.
Program Activity Kits **Goal:** Continue to develop self contained Activity Kits in durable plastic storage containers to improve overall program efficiency.	Many programs and activities have been developed over the years and they are offered on a regular basis. The supplies and equipment used for each program are gathered each time the program is offered. This takes time. It would improve overall efficiency to have all supplies and equipment needed for each program or activity stored in a labeled plastic storage tub. These programs and activities are used for Public Programs, Group Programs, Special Events, Outreach, Volunteers, and Summer Camp. **Objective:** For each activity, determine equipment and materials needed, acquire storage tubs and necessary supplies so each activity is completely self-contained and ready to go off the shelf. Develop scripts as needed.
Program Research and Development **Goal:** Research and development time necessary for the creation of new urban runoff pollution prevention programs and learning new information to supplement and expand existing programs. This also includes time spent planning and scheduling future programs.	Time spent reviewing historical program offerings and analyzing the results of evaluations to plan future programs to maximize attendance and the variety of programs. This includes researching programs, and participating in free program development trainings (in house or local) to expand knowledge of the subject, create and develop new ideas for programs. As well as time spent learning information for specific programs by reading and researching topics, and communicating with knowledgeable staff and volunteers for additional information related to the program topic.

PROGRAM TITLE AND GOALS	QUARTER 1 JULY – SEPTEMBER 2009 OBJECTIVES	QUARTER 2 OCTOBER - DECEMBER 2009 OBJECTIVES	QUARTER 3 JANUARY - MARCH 2010 OBJECTIVES	QUARTER 4 APRIL - JUNE 2010 OBJECTIVES

ZunZun Assembly Programs for Watershed Watch
FINAL REPORT 2009-2010 School Year
June 30, 2010

ZunZun performed "The Musical Watershed" in Watershed Watch's service area in the 2009-2010 school year. ZunZun performed fifty assemblies at 26 schools, Pumpkins in the Park, and the Water Wizards festival. Visiting approximately 13,267 students at elementary schools, plus the audiences at Pumpkins in the Park and the Water Wizards festival, ZunZun saw **14,161** young people this year to share information about the Santa Clara Valley watershed—what it is, where students are in their watershed, how to keep it clean, and how to protect the watershed.

OUTREACH

Using the list of target schools provided by Watershed Watch, ZunZun advertised this year's program to the principals and assembly coordinators at eligible elementary schools. ZunZun faxed or emailed a flyer to the school contact person and then followed up to answer questions and book assemblies. Schools booked directly with ZunZun and a monthly performance update was sent to Vishakha Atre.

One month before each school's scheduled assembly, we emailed a confirmation letter and sent the vocabulary lists and newsletter article to the school contact person. One week before the scheduled performance we called the school to confirm show times.

SUPPLEMENTAL MATERIALS

Supplemental materials to aid in retention of the assembly information were sent to each school one month prior to the assembly. A vocabulary list for grades K-2 and another for grades 3-6 were emailed to the contact person to be distributed to the teachers for use before and after the performances. A newsletter article about the performance was also sent. Including this in their school newsletter, schools helped inform families about the presentation, so that parents could ask questions about what the students learned about watershed pollution prevention and facilitate discussions at home about Watershed Watch's message and the ZunZun show. At every assembly, the performers also handed out two post-assembly activity sheets and the Watershed Watch pamphlets and evaluation postcards.

PERFORMANCES

As always, we designed our assembly segments to be interactive and to appeal to the many learning styles of the students, so there are always visuals, call and response, movements, comedy, and lots of fun information and facts. All assemblies were in English and Spanish, with a greater emphasis on Spanish whenever necessary. Each assembly was 45 minutes in length and introduced students to the topic of watershed. The segments were as follows:

Watershed Instruments from Around the World

The show began by showing **water instruments** from all over the world that represent watershed sounds, while we explained how important and precious clean safe water is all over the world. We showed instruments from North and South America, Africa, and Asia that represent the sounds of rain, storms, water in rivers and streams, and finally the ocean. This "water music" segment served as a great jumping off point to explain the importance of the watershed and to show how cultures worldwide depend on their watersheds.

Watershed Saving Dances

We used this segment to have all students and teachers take a turn doing a comic dance, then explaining why "sometimes we don't like that dance!" The first dance was the "Jellyfish". Here the students wiggle like jellyfish, and after we explain that sometimes this dance is not great because the jellyfish is really a plastic bag. We then explain how to prevent plastic bags from entering our watershed and why this is so important to protecting the watershed. We get to kids to remember about bringing their own bags and recycling the plastic bags that do end up in their homes. The second dance is the "Car Wash," which we get the teachers to do (they act like they are washing the car). Here we explain that car washing is fine, but it is best not to use very much soap, or better yet no soap at all, as it enters area storm drains which connect into creeks and rivers and into the bay. We use this segment to then show the audience the difference between a storm drain and the sewer. The third dance, done by the teachers, is the "Rainbow Dance." After the dance, we say we love seeing rainbows in the sky, but when you see a rainbow on top of water, it is usually oil that has leaked from a car. Then we go on to help audience members to think of ways to prevent oil from going into the watershed.

Fish Flies to Audience

After explaining how pollutants go into storm drains and go through our watershed, we reiterate those facts with the flying fish activity. We show as if we are dumping oil

PO Box 2951 ▮ Santa Cruz, CA 95063
Tel: 831-426-0684 ▮ Fax: 831-426-0634
email: zunzun@zunzuntunes.com
website: www.zunzuntunes.com

down the storm drain on the backdrop, then we have the audience remind themselves of the path that oil would take, from the storm drain, to a creek, then a river, the bay, and then the ocean. (We specify the particular path based on the local geography.) Then we see a black blob of oil enter into the ocean section of the backdrop and from backstage some fish begin flying out of the water, unhappy to be in the oil. We repeat the same steps with paint and garbage, see the paint and garbage make it to the ocean, and this time the fish not only flies up into the air, but out into the audience. It is perhaps the most memorable aspect of our assembly! Kids love this segment. We refer to this activity in our parent newsletter to help students with recall and give parents a chance to hear about assembly content.

Dirty Water

This is a call and response song where we have students come in front while the audience sings the call and response. The whole audience sings
"Dirty water, down the storm drain, goes to a creek which reaches the sea where the fish are swimming. They start to feel sick, the poor poor fish, it makes you think."
The song is repeated three times as the students dance faster and faster.

"Hour After Hour", 2,500,000 Bottles

The next activity was the "so many bottles thrown away" segment. We showed how many plastic water bottles were thrown away every hour in the U.S. using a place value activity. Three students came up initially, held a 2, a 5 and a 0 (two hundred and fifty). We would say "Is that it? No there's more- we need another volunteer!" By adding a zero each time the number grew and grew until we reached 2,500,000. This is the number of plastic bottles estimated to be thrown away, not recycled, every hour in the U.S. We used this segment to reiterate keeping the watershed clean (not throwing the bottles away, recycling them) and also to encourage families to use tap water. We explain that plastics in our watershed do not biodegrade for hundreds of years and we encourage kids to use re-useable, metal water bottles. This activity was appropriate for older grades, 3rd and up, who have studied or are studying place value.

Agua Batucada

We talked about getting water in pipes to our houses, but then said 47 % of the people on Earth do not get water in pipes and we showed two water carrier/container instruments: an "udu pot" from Africa and the "wash tub bass" from the United States. Then we showed the type of water containers kids do use–plastic water bottles. We reminded kids to use reusable bottles rather than disposable, reminded them how much water they could save by not using plastic bottles (it takes 5 bottles of water to make one disposable bottle of water) and reminded them that 2,500,000 are thrown

PO Box 2951 ▮ Santa Cruz, CA 95063
Tel: 831-426-0684 ▮ Fax: 831-426-0634
email: zunzun@zunzuntunes.com
website: www.zunzuntunes.com

away an hour, so please recycle the ones they use. Then we did the "agua batucada" where some students played music on the bottles while teachers and the rest of the students did a water celebration dance.

High Tide/ Low Tide Limbo

Using steelpan and marimbula, two instruments made from recycled things that come from the Caribbean, we celebrate our bay getting cleaner because of the actions of the audience. This segment allows us to define the San Francisco Bay as an estuary where fresh water drains from our towns and cities and mixes with salty water from the Pacific Ocean. We help students know there are two high tides and two low tides per day, with the low tides exposing mudflats which are a rich habitat for egrets, herons, and other animals to get food. Students then come up for the limbo and they act as though they are fish under a high tide with lots of water and under a low tide.

FOLLOW-UP AND EVALUATION

ZunZun hands out the Watershed Watch evaluation postcards to the teachers at each assembly. These are then sent directly to Watershed Watch for analysis.

On-site feedback was very positive this year. Schools are very appreciative of a free assembly program, especially one that incorporates the Arts since that has been cut or reduced from so many schools budgets.

The mid-year report showed positive feedback as well. Because the evaluation postcards are sent directly to Watershed Watch, we have not seen the comments and scores from January –June 2010.

POSSIBILITIES FOR NEXT YEAR

We look forward to working with Watershed Watch again in the 2010-2011 school year! Thank you for your continued support of our assembly programs.

After assemblies teachers and students are always very excited about watershed protection and watershed pollution prevention. We would love to encourage more action at the classroom level with a follow-up activity sheet that would include the following:

1) Suggest an on-site "field trip" at their school where students walk together to find all the storm drains on the school campus. They return to class and draw

maps with the storm drains (CA State Standard re: map creation and use). Then dedicated classes can even monitor the storm drains throughout the school year to see what goes down the storm drain at their school and then decide how to prevent the pollution.

2) How to create a "Basura Batucada" band.

3) Suggest visiting some of the wildlands near their homes and the watershed in their area with their families.

TO: Schools and Youth Outreach Work Group

FROM: Vishakha Atre and Jill Bicknell, Program staff

DATE: July 20, 2010

SUBJECT: **End-of-Year Evaluation of the School Assembly Program**

In FY 09-10, the school education assembly program completed its eight year of implementation. Each year, the Schools and Youth Outreach Work Group develops a target list of schools for ZunZun to contact. During FY 09-10, ZunZun conducted 47 assemblies at 26 elementary schools in eight cities. In addition, two assemblies were conducted at the Pumpkins in the Park event for the general public and one at the Water Wizards festival in San Jose. The assemblies reached approximately 14,161 students and their teachers in grades K-6.

The vocabulary lists (one for students grades K-2 and another grades for 3-6) were faxed to each school before the assembly. Teachers were requested to familiarize the students with the vocabulary words. ZunZun also continued distributing postage-paid survey cards to teachers attending the assemblies. The Program received 130 completed evaluation cards this year. Teachers were requested to indicate the grade level of students taking the survey on the cards. Of the 234 cards received, 66 cards were from K-2 teachers and 45 from 3-6 teachers. There were also 19 cards where the grade was not indicated. As requested by the Work Group, results are presented as “grades K-2”, “grades 3-6” and “overall”.

Results of the survey, along with comments and suggestions received from teachers are listed below.

111 West Evelyn Avenue, Suite 110 • Sunnyvale, CA 94086 • tel: (408) 720-8833 • fax: (408) 720-8812
1410 Jackson Street • Oakland, CA 94612 • tel: (510) 832-2852 • fax: (510) 832-2856
1-800-794-2482

ZunZun Survey Results
(130 responses)

1. What percentage of your students know what a watershed is?

	25%	50%	75%	100%
Grades K-2 results	23%	17%	39%	17%
Grads 3-6 results	7%	22%	44%	27%
Overall results**	20%	17%	39%	22%

***The overall results include survey cards where grades were not indicated.*
Note: Not all teachers mark all answers, so numbers do not always add up.

2. What percentage of your students can name a way to prevent pollution in the watershed?

	25%	50%	75%	100%
Grades K-2 results	3%	2%	32%	58%
Grads 3-6 results	0%	4%	24%	71%
Overall results**	2%	6%	29%	60%

***The overall results include survey cards where grades were not indicated.*
Note: Not all teachers mark all answers, so numbers do not always add up.

3. How would you characterize the content of the assembly?

	Educational	Balanced	Entertaining	Neither
Grades K-2 results	14%	86%	0%	0%
Grads 3-6 results	11%	89%	0%	0%
Overall results**	12%	87%	1%	0%

***The overall results include survey cards where grades were not indicated.*
Note: Not all teachers mark all answers, so numbers do not always add up.

Sampling of Comments:

Grades K-2 comments

- A wonderful assembly. Both adults and kids loved it. Highly recommend it!
- It was a wonderful, well-planned presentation.
- ZunZun rocks!
- It is a great idea to provide teachers with vocabulary sheets before hand to help with preparation.
- My students are disabled – they were entertained by the assembly, but not informed – it was too fast paced for them.
- The students enjoyed the music with instruments used to help teach about the watershed.
- Many of my students are EL learners and needed more reinforcement and review for this concept. Excellent presentation that kept students entertained while learning content! Great because it was English and Spanish!
- This was one of the best assemblies I have seen. The children were totally engaged and learned a lot!
- The assembly was very educational and fun! The musicians definitely got their message across and put a lot of effort into their performance.
- Great program. My kindergarten students were actively engaged and walked away with new concepts.
- Children loved the dancing and singing. We enjoyed the young boy playing the drums. Also we enjoyed the various instruments. The kids said they learned a lot about the watershed!
- The presenters were well educated on the topic and shared material in an interactive and entertaining format.
- Thank you – One of my students went home and told her mother all about it. Very impressive! The bilingual part was great. Too bad everything was a little rushed due to time.
- What a fun way to introduce such a serious topic to these students!
- Awesome – very accessible and age-appropriate for K/1 – music and movement integrated with message.
- Some of the vocabulary was a little advanced for 1st grade but we enjoyed the show and got the message that we shouldn't pollute the water.
- Best assembly in my 12 years at Meyerholz – really excellent!
- We really liked this assembly! Our kinder students started talking about how to help earth although they did not completely understand the vocabulary of "watershed".
- Great use of music and humor to deliver an important message. Gwen and Steve were fantastic! All 400 of our K-5 students were engaged through the assembly. My own kids – 4th, 2nd, and preschool – remembered the information delivered! Thank you!

Suggestions:
- Would have been great to have the assembly earlier in the year.
- A slower pace will make it better for all.
- We love your program but one change would be to not imply things are easy because for some students the concepts are difficult to understand.
- Great job! Move drums because we couldn't see behind you at the map.

Grades 3-6 comments
- The assembly was excellent – fun and educational!
- Wow! I was so impressed! Also inspired – I'm going to try and include more humor in my lessons.
- Thank you for coming to our school and for teaching in an entertaining way!
- Very fun integration of music and environmental education. Excellent content and management of kids. They loved it and learned a lot.
- Loved all the musical dancing and inclusion of teacher participation.
- Very entertaining and informative – my 3rd grade students really enjoyed it!
- The length of the assembly was perfect. Fantastic audience participation!
- My students and I thought it was great!

Suggestions:
- It was great! I like the student involvement. Only a little more music would improve it.
- Have directions on how to make the instruments. And include more volunteers, songs, and dances!
- I would like my students (and myself) to learn exactly what to recycle. For example tooth paste tube – recycle or not? A wet paper towel? Does everything recycled have to be clean?
- Watershed was a term that did not stick. More explanation needed. Storm drain and sewer stuck with them.

Comments from cards with grades not marked
- The student's responses were intelligent after the assembly. Good job of the balance of music and language.
- It was fun! The message was very student-friendly in their language.
- Awesome show! Good for all ages!
- Teachers at Argonaut unanimously agreed that this was the best assembly we've had in years!
- The students really enjoyed it and were very attentive.

Suggestions:
- Slow down when enunciating new terminology.

Action Line: Neighbors drain their pool the wrong way

By Dennis Rockstroh
drockstroh@mercurynews.com

Posted: 02/06/2010 12:00:00 AM PST

Q In spite of telling my neighbors numerous times to pull the hose all the way to the street in order to drain water from their pool, they don't.

They drain directly in front of the house.

The result is the street as well as our front and side yards get so much water.

Also, our sump pump has all the more work to do.

Sarla

Sunnyvale

A Both methods are wrong, Sarla, but there are proper ways to do this.

Thanks for bringing this up because pool season is coming up and some folks might need to drain their pools.

Pool water should never be drained to the street or the storm drain.

Storm drains in the Bay Area typically run into local creeks, rivers and the bays.

In most places, it's against the law to drain pools and spas this way because pool water contains chemicals that can endanger or kill wildlife.

To empty a pool, one needs to call a pool service company or find your "sanitary sewer clean-out" and direct the water there.

That line leads to the sewer system and the water is treated before it is released for recycling or into the bay.

So where is your sanitary sewer clean-out?

Here are some tips I found on the city of Sunnyvale's Web site (http://sunnyvale.ca.gov/Departments/Public +Works/Water+ Pollution+Control+Plant/Draining+P ools+and+Spas.htm).

Or, do a Web search for "California draining water from pools."

If your kitchen or bathroom is on an exterior wall of your house, look outside along that wall for a clean-out.

Stand on the sidewalk looking toward your house. Line up the main water sources in your house (bathrooms, kitchen, washers, etc.). The clean-out is often located on that line, in front of or behind your house.

Look for an "S" carved on the curb near your house. It marks where the sewer line is. Your clean-out may be along it.

Look on your property for a small concrete or metal cover marked "sewer." Clean-outs are often located under them.

Advertisement

045735

The Mercury News
MercuryNews.com

Look for a small circular cap on a pipe, with a raised square on it, protruding out from one wall of your house, or out of the ground. These caps often cover clean-outs.

Look for a slight linear depression in your yard between your house and the street. They are often remnants of sewer line installation, and your clean-out may be on it.

If you are on a septic system or do not have a sanitary sewer clean-out, contact the Sunnyvale Water Pollution Control Plant at 408-730-7260 or your local government offices.

Pass this information on to your neighbor, Sarla.

Tell your friends.

Here is how to reach Action Line:

Action Line: Company gets 'F' from customer, Better Business Bureau

By Dennis Rockstroh
drockstroh@mercurynews.com

Posted: 02/24/2010 12:00:00 AM PST

Q Hi Dennis, My fiancee and I ordered a coffee table from modabode.com , a San Francisco-based furniture sales site, in early November of last year.

The table finally arrived on Dec. 24 in a condition that could only be described as destroyed — scratched, all corners smashed and the internal structure shattered.

When we spoke to customer service and asked for a refund, we were told repeatedly to look at the terms and conditions: No refunds, they could ship us another table.

I spoke to a supervisor who assured me that if the table again arrived destroyed, we would receive a full refund.

Fast forward to mid-January, when our new table arrived smashed up and with holes torn in the box.

I again e-mailed pictures to the company.

Now, I cannot get my calls answered or get help from anyone.

We paid $800 for this table, and now I have two damaged tables, which they refuse to pick up despite the Web site stating they will pick up any damaged goods.

Please help us. We just want fair treatment!

Evan Mills

San Jose

A I sent your complaint to the company, Evan.

"As of today, we have refunded the customer in full. We have worked with this customer all the way through this process, and have done our best to make the customer happy," the company responded by e-mail.

Didn't happen.

To be continued.

Meanwhile, this is a company to avoid. Its rating with the Better Business Bureau — F.

Q Thank you for your response to Sarla, who wrote about draining pool water to the streets (Action Line, Feb. 6). I am writing to you on behalf of the Santa Clara Valley Urban Runoff Pollution Prevention Program, a coalition of 15 local government agencies that work together to prevent the pollution of our creeks and the bay. As you correctly stated, storm drains carry storm water away from streets and roads directly to local creeks and the bay, without any cleaning or filtering. They are not a disposal outlet for pool water. Draining pool water to the sanitary sewer is the preferred method.

Residents can call their local cities to find out information on draining pools or spas. Contact numbers for all Santa Clara Valley cities are available

BAY AREA STORMWATER MANAGEMENT AGENCIES ASSOCIATON

Media Relations Program

March – June 2010

Final Report Submitted by

O'Rorke Inc.

Overview

O'Rorke Inc. was hired by the Bay Area Stormwater Management Agencies' Association to conduct three media pitches to satisfy media relations work as outlined in the MRP.

O'Rorke participated in meetings with the PIP committee to determine the pitch topics and then developed strategies for each working closely with project manager, Sharon Gosselin.

The three pitch topics were:

- pesticides
- car washing
- litter, relating specifically to plastic bags

Coverage

In all, the three pitches resulted in thirty-eight media placements: six in print; eleven on the radio; and twenty-one online (this included radio station and newspaper websites).

What follows is a brief synopsis of each pitch strategy and the coverage results. Attached are individual media reports for each pitch.

Pesticides

Working with the media relations campaign project manager, O'Rorke strategized a pitch on pyrethroid pesticides. Using materials developed for Our Water Our World, O'Rorke wrote a release about pyrethroids emerging as a new force in the market and detailed information about how one chemical will be banned only to have a new one take its place.

The pitch resulted in six placements. The Alameda Sun ran the story with the headline, "Exercise Caution When Choosing Pesticides." Another coverage highlight

included Geoff Brosseau's interview on KMKY (Radio Disney), a station that has good reach among women because mothers listen to the station with their children.

Car Washing
To promote using professional car washes or simply washing on grass or gravel instead of paved surfaces, O'Rorke focused on a public-affairs driven pitch with prepared PSA copy as the cornerstone.

This was very effective. PSAs aired on five stations, including the high profile KCBS and KOIT. Additionally, translating the PSAs allowed O'Rorke to secure placement with KIQI, a Spanish language station. Numerous stations included the PSA copy on their websites and Sharon Gosselin was interviewed on the subject by KEAR.

Overall, this pitch resulted in fourteen placements.

Litter/Plastic Bags
Because litter is such a major issues facing stormwater programs, this was an important topic to cover. Again working with the project manager and PIP committee, O'Rorke developed a press release focusing on plastic bags as a major source of litter and promoting reusable bags as a better choice. The release also featured several tips to help peopled remember to use their reusables.

For this pitch, O'Rorke used a two-pronged strategy. The first part consisted of doing "DJ drops" at five key radio stations. A DJ drop is when a press release and leave-behind is brought to a station's morning show along with some food and refreshments for the morning show crew. In this case, O'Rorke brought food, the press release and a few reusable chico-style bags to each station. The results were fantastic: two of the five stations covered the story that day. A third included some mention on air and requested copy to use online.

Coverage highlights included a two-minute discussion of plastic bags by Sarah & Vinnie of the immensely popular Radio Alice (KLLC) and a "Fog Files" segment on KFOG.

The second piece of the pitch consisted of sending the release out to other stations not covered by the drops and also to print. For print, O'Rorke also included a courtesy photo of a plastic bag on a storm drain. The second round of pitching resulted in several print and online placements. At this writing, two additional placements are still pending with Asian Week and Diablo magazine.

Overall, at this time, the litter pitch resulted in eighteen placements.

PRESS RELEASE

SPRING INTO ACTION
Bay Area Stormwater Agencies Ask Consumers to Exercise Caution When Choosing Pesticides

April 20, 2010—Spring has sprung. With Spring comes new life and new opportunities to make better decisions for your yard and garden and for the environment.

With all the new growth, pests are not far behind. As gardeners figure out how to keep pests from bugging them too much, the Bay Area Stormwater Management Agencies Association (BASMAA) is asking consumers to make careful choices when purchasing pest control products.

After the highly publicized voluntary recalls of diazinon and chlorpyrifos (Dursban) as home and garden pesticides, consumers could easily think that most products on store shelves are safer. But this is not the case. In the wake of the recalls a new class of pesticides has come into prominence: pyrethroids.

"We have a situation where some highly toxic chemicals were taken off the market only to be replaced by newer—and just as toxic—chemicals," says James Scanlin, chair of BASMAA. "It's a vicious cycle that can leave consumers very confused and has a negative impact on the environment."

Pyrethroids are a class of pesticide designed to kill a wide variety of pests, such as lawn grubs and ants. But pyrethroids are also highly toxic to beneficial insects like ladybugs, earthworms, and lacewings, which help to keep problem pests in-check. Once beneficial bugs are eliminated, pests are free to multiply without the natural checks and balances that beneficial insects provide. According to a 2010 report prepared for the San Francisco Estuary Project, pyrethroid pesticides "remain the highest priority….because they have been linked to widespread toxicity in California surface waters."

"Pyrethroids came into wider use after bans on chlorpyrifos and diazinon took effect," explains Mr. Scanlin "They are found in easily over 900 products." Yard and garden pesticides are a particular problem when it comes to stormwater pollution. Once they wash off from rain and watering, pesticides flow into storm drains, polluting local creeks and the Bay, harming fish and other aquatic life.

BASMAA, a consortium of stormwater programs in the San Francisco Bay region, wants to help residents make less-toxic choices while maintaining beautiful yards and gardens.

BASMAA offers these tips when dealing with garden pests:

- Try less-toxic methods before making a purchase. Go to OurWaterOurWorld.org for tips and information. Sometimes biological controls (like bringing beneficial bugs into your yard and garden) can do the trick without any chemicals.

- Read labels. The word "pyrethroid" will not appear on a label, but look out for the following active ingredients: permethrin, bifenthrin, cyfluthrin, cypermethrin, deltamethrin, lambdacyhalothrin, and tralomethrin. A quick tip: active ingredient names ending in "-thrin" are usually in the pyrethroid class. The exception to this is pyrethrin which is produced naturally from the chrysanthemum flower – though can still be toxic to aquatic life. To download a free pocket guide that gives examples of products without pyrethroids, go to OurWaterOurWorld.org

- When shopping, seek out the least toxic products. Look for shelf signs with the Our Water, Our World name and logo, which call out the best choices in each category. Participating stores include Orchard Supply Hardware, Sloat Garden Centers, Ace Hardware Stores, Home Depot, and many other local nurseries and garden centers. To find a store near you, go to OurWaterOurWorld.org.

Final BASMAA Carwash PSA's Spring 2010

A: Love washing your own car? Keep doing it – but wash it on the lawn or on gravel or go to a car wash. Here's why: When you wash your own car in your driveway or street, you're also washing off pollutants like copper from brake pads and other chemicals. In many places, this runoff goes right to the storm drain untreated and from there it pollutes our waters. At the car wash, runoff water is collected and treated. Check out baywise.org for more information. (:30)

B: Be green this summer. Instead of washing your car on the driveway, wash it on a lawn or gravel. Here's why: when you wash your car in your driveway or street, copper from brake pads and other chemicals wash off, too – right into the nearest storm drain and into the Bay – untreated. For more pollution prevention tips, check out baywise.org. (:20)

C: Love washing your own car? Keep doing it – but don't do it in your paved driveway or street, where water runs off into the storm drain. Try washing your car on a grassy area or gravel instead. Why? To limit runoff. When you wash your car, you're also washing off pollutants like copper from brake pads and other chemicals. From there, they go right to the Bay. See baywise.org for more information. (:30)

D: Be green! Wash your car on a lawn or gravel. Here's why: when you wash your car in your driveway, copper from brake pads and other chemicals wash off, too – into the nearest storm drain and the Bay – untreated. For more tips, check out baywise.org. (:10)

PAPER OR PLASTIC? NO THANKS, I'VE GOT MY OWN
Bay Area Stormwater Management Agencies in reusable bag push to reduce water pollution

June XX, 2010—With a plastic bag ban in the offing for California this year, the Bay Area Stormwater Management Agencies Association (BASMAA), wants residents to start taking action now to break the plastic bag habit.

"Noting 'bring bag' at the top of your shopping list is an easy addition," said James Scanlin of BASMAA, a consortium of municipal stormwater pollution prevention programs from around the region. "By the end of 2010, California may have a plastic bag ban in place, so we are prepping residents to start using reusable bags now."

By now, seeing a plastic bag perched on a tree branch or hugging the pavement near a storm drain is a normal sight. Often these bags find their way into storm drains, local waterways, and eventually the ocean. Plastic debris like this represents nearly 90 percent of floating marine debris, according to the California Coastal Commission.

"Plastic bags are a huge environmental issue," says Scanlin of BASMAA. "Plastic never breaks down. It's little bits of litter, including plastics, that have added up to the immense island of garbage floating in the Pacific." According to the Earth Resource Foundation, over 100,000 marine animals die from plastic entanglement each year because they mistake plastic bags for food.

An analysis by the California State Assembly shows that Californians use 19 million plastic bags per year. From their very production (which entails use of petroleum), to the litter they create, to the havoc they have wreaked on the world's oceans, plastic bags are a major environmental issue.

BASMAA is asking Bay Area residents to make a renewed push toward using reusable bags. There are incentives for consumers, too: While many supermarkets have long offered five-cent bag credits, big box retailers like Target are now doing the same.

BASMAA offers these tips to residents to ensure they have reusables at the ready:

- Keep a rolled up or Chico-style bag in your purse to have handy for quick shopping trips.

- Leave reusable bags by the front door near keys, cell phones and other must-have items.
- Place some in the trunk or on the front passenger seat of your car so they're easily available when running errands.
- Just say no! If buying a small item, just refuse a plastic bag from the store clerk.

Bay Area Macroinvertebrate Bioassessment Information Network

- 9th Annual Bay Area Macroinvertebrate Bioassessment Information Network (BAMBI) Meeting Agenda – February 16, 2010

9th Annual

Bay Area Macroinvertebrate Bioassessment Information Network (BAMBI) Meeting

Tuesday, February 16, 2010
10:00 AM to 3:15PM
Room 1, 2nd Floor, Elihu Harris State Office Building
1515 Clay St., Oakland, CA, 94612

MEETING AGENDA

9:45 Registration and Coffee/Tea

10:00 Welcome and Agenda Review
Arleen Feng – Alameda Countywide Clean Water Program

10:10 Bay Area Bioassessment Activities - Introductions and Summaries from Bay Area Agencies and Organizations - *Meeting Attendees (up to 5 minutes per attendee)*

10:40 Update of San Francisco Bay Area IBI Development -
Chris Sommers (EOA, Inc.) and Kevin Lunde (UC Berkeley PhD Candidate)

11:10 California Bioassessment Reference Condition Management Program -
Andy Rehn (California Department of Fish and Game)

11:40 Lessons Learned from Southern California - Regional Bioassessment Program -
Raphael Mazor (Southern California Coastal Water Research Program)

12:10 *Lunch (Provided)*

12:40 Contra Costa Macroinvertebrate Monitoring – B-IBI Scores and Antecedent Rainfall
Armand Ruby (Armand Ruby Consulting)

1:10 Results and Conclusion from a Decade of Bioassessment in Marin County -
Chris Sommers (EOA, Inc.) and Terri Fashing (MCSTOPPP)

1:40 Macroinvertebrate Response to Biotic and Abiotic Stresses in Freshwater Wetlands of the San Francisco Bay Area - *Kevin Lunde (UC Berkeley PhD Candidate)*

2:10 SWAMP Bioassessment and Physical Habitat Assessment (PHAB) Protocols – Current Practices & Issues - *Arleen Feng (Alameda Countywide Clean Water Program)*

2:40 SWAMP Bioassessment and PHAB – Discussion of Next Steps for Bay Area -
Arleen Feng (Alameda Countywide Clean Water Program) and Attendees

3:00 Wrap-up, Questions and Suggestions for the Coming Year

3:15 Adjourn

Driving Directions to Bambi Meeting

From San Francisco:
Distance: 8.8 miles Approximate Travel Time: 30 minutes

Go East on US 101 to I-80
Go Northeast on I-80 (Portions toll)
Take the I-80 EAST ramp.
Take the I-580 EAST exit towards HAYWARD/STOCKTON/DOWNTOWN OAKLAND/CA-24/ALAMEDA.
Merge onto I-580 E.
Take the I-980 WEST exit towards DOWNTOWN OAKLAND/(I-880 S).
Take the I-980 WEST exit on LEFT.
Take the 18TH STREET exit towards 14TH STREET.
Turn SLIGHT LEFT onto BRUSH ST.
Turn LEFT onto 17TH ST.
Turn RIGHT onto CLAY ST.

From Sacramento:
Distance: 80.6 miles Approximate Travel Time: 1 hour, 49 minutes

Go South on I-5 to I-80
Go Southwest on I-80 (Portions toll)
Merge onto I-580 E/I-80 W.
Merge onto I-580 E.
Take the I-580 EAST exit towards DOWNTOWN OAKLAND/HAYWARD
Keep LEFT at the fork in the ramp.
Merge onto I-580 E.
Take the I-980 WEST exit towards DOWNTOWN OAKLAND/(I-880 S).
Take the I-980 WEST exit on LEFT.
Merge onto I-980 W.
Take the 18TH STREET exit towards 14TH STREET.
Turn SLIGHT LEFT onto BRUSH ST.
Turn LEFT onto 17TH ST.
Turn RIGHT onto CLAY ST.

From San Jose:
Distance: 49 miles Approximate Travel Time: 1 hour, 9 minutes

Take the I-880 NORTH ramp.
Merge onto I-880 N.
Follow the signs to get onto I-980 E.
Take the 11TH ST exit towards 14th St.
Turn SLIGHT LEFT onto CASTRO St.
Turn RIGHT onto 14th St.

STORE EMPLOYEE TRAININGS AND INCREASING SHELF SPACE PROJECTS

FY 09-10 FINAL REPORT

Ann Joseph Consulting

Since FY 02-03, SCVURPPP has been using the services of Ms. Ann Joseph to provide training to store employees on selling less-toxic products. Since FY 07-08, SCVURPPP has also used the services of Ms. Joseph to work with two Santa Clara Valley stores to increase shelf space dedicated to less-toxic products.

This report summarizes the work done by the consultant in FY 09-10 to complete these projects.

Store Employee Trainings: 99 employees trained, 13 trainings conducted

The 1 to 2-hour employee trainings cover topics like IPM, current pest problems in Santa Clara County, information on available less-toxic products for dealing with them, water quality problems due to pesticides with a focus on pyrethroids, problems with nutrient runoff of chemical fertilizers, how to read a pesticide label, beneficial insects etc. Additional information has been included upon request of the store staff i.e. light brown apple moth, Colony Collapse Disorder, and giant whitefly, citrus leaf miner, and spider mites. The consultant prepared the training material and provided it to SCVURPPP staff for photocopying and organizing into folders.

The year was another very challenging year economically but the stores value the training so much, that they made additional efforts to make time for the training before, during and after hours. For trainings conducted during business hours the consultant trained staff in shifts to accommodate the store's needs. Many stores such as Home Depot and OSH experienced deep cuts in employee hours and this made training part-time staff difficult. These stores spent their staff-hours early in the spring and had to adjust later in the quarter to remain profitable. The consultant has never seen so few nursery and garden staff; sometimes only two were on duty for a large department.

Overall, there was more interest in learning details of how pesticides effect the environment and how they can better recommend non-toxic and less-toxic alternatives. The consultant spent time focusing on pest prevention strategies and engaging the staff in troubleshooting pest problems before recommending pesticides.

The consultant also spent time discussing the issues with pesticides that can contribute to Colony Collapse Disorder and pests like whitefly and spider mites that can be onsite as a result of certain pesticides that knock out the predator populations for these pests.

There were also additional efforts by pesticide companies to ramp up their trainings this year to garner their share of the market in a very difficult economic climate. The consultant has never seen the pesticide companies as vigilant for the business. Some had paid staff stocking stores and working the aisles on weekends at OSH and Home Depot.

The following trainings were conducted in FY 09-10:

- **Los Altos Garden Supply, Los Altos, 12/19/10 –** Trained 6 employees. The staff was very shy at first but seemed to be interested to learn more about beneficial insects. The consultant focused on using pesticides that would have the least impact on the environment.

- **Home Depot, Capitol Expressway, San Jose, 1/11/10 –** Trained 9 employees. Excellent response. New manager of garden requested a larger Good Bug Bad Bug chart, so the consultant had an 8.5x 11 inch one made up for him to display in the garden section indoors. Manager Chris was very cooperative and when the consultant saw him at another store later he said the staff had great feedback for him.
- **Home Depot, Sunnyvale, 1/13/10 –** Trained 10 employees. Great response. Miranda Melen (SCVURPPP staff) and Jackie Besoyan (Sunnyvale) attended the store training. Helen (Store Training Coordinator) really had her act together and this store will be a shining star in the Home Depots.
- **OSH, Alum Rock, San Jose, 1/20/10 –** Trained 5 employees. Very good support here for training. One of the assistant managers is a former organic farmer and he joined the training. The consultant was very impressed with the questions and interest of those in the training.
- **Yamagami's Nursery, Cupertino, 3/3/10 –** Trained 9 employees. The staff had many questions about the systemic pesticides on the market and the effect on edible crops. This lead to a very lively discussion and it became clear to me that the stores needs 3rd party input on what the pesticide industry is promoting as "safe".
- **Los Altos Nursery, Los Altos, 4/5/10 –** Trained 6 employees. It was a great opportunity to jumpstart interest in the program here. Previously, this nursery was not fully involved in the OWOW program. The owners felt that they did not have floor space for a literature rack and were only providing a few fact sheets on their outside bulletin board for customers to view. Due to limited shelf space, they were not willing to have shelf talkers either. Dean and Darrell (the owners) both attended the training and were very happy to participate in a lively discussion about the hype from the pesticide companies that their systemic products are safe to use on food. They also agreed to allow the fact sheet rack out on the floor and were happy to have the consultant put up shelf talkers.
- **Home Depot, Hillsdale, San Jose, 4/6/10 –** Trained 4 employees. The training was scheduled after two store visits and one cancelled training. The staff was very interested and had many questions about less toxic products.
- **Home Depot, Monterey Road, San Jose, 4/13/10 –** Trained 16 employees. Great turn out and good support at the store. They had folks come in 2 separate shifts so the floor could be staffed. Employees were very interested and actually wanted a longer training.
- **Home Depot, Story Road, San Jose, 5/4/10 –** Trained 11 employees. This store was very challenging to commit to a time for training and the consultant ended up having to reschedule after having arrived with folders in hand the week prior. The staff was very enthusiastic and wanted more of the garden folks there but this is what they were able to schedule. This group said their customers know the least about the environment and really could use some help and support beyond the training.
- **Home Depot, Blossom Hill, San Jose, 5/4/10 –** Trained 4 employees. This was one of the more challenging stores to schedule. The consultant had 3 cancellations and two additional store visits to get the final one scheduled. The trainees were very enthusiastic but they commented that more of the co-workers would have benefited being a part of the training.
- **OSH, Cottle Road, San Jose, 5/19/10 –** Trained 3 employees. Very enthusiastic but because of cut in staff hours the number of attendees was small. The consultant was glad to see a trainee from 8 years ago that is now the department manager. He was very complimentary of the training and suggested that the consultant try to get an opportunity to train at the regional trainings that OSH has for garden staff. The consultant has contacted the OSH coordinator for the trainings.

- **SummerWinds, Palo Alto, 6/17/10 –** Trained 5 employees. Bob Voshell, the store manager, joined the training. The consultant concentrated on a new pest; spotted winged fruit fly that attacks unripe soft skinned fruits like cherries, blueberries, and strawberries, and the citrus leaf miner in addition to the pending asian citrus psyllid. Bob was very complimentary of the training.
- **Almaden Valley Nursery, San Jose**, **6/23/10 –** Trained 11 employees. The owner is very dedicated to the trainings and has all employees including cashiers attend each year, even on their day off. The nursery staff is very sophisticated and they always have questions about pesticides and their toxicity to the environment. The consultant covered the new invasive pests and reminders about reading the pesticide label.

Increasing Shelf Space for Less Toxic Products

The objective of this project was to work with pesticide buyers and distributors at selected stores to encourage them to buy more less-toxic products. The following stores participated in this project: Los Altos Garden Supply and SummerWinds in Palo Alto.

Los Altos Garden Supply, Los Altos
This store was particularly challenging as they did not have a receptive attitude toward the program. Although they had shelf talkers they resisted putting the literature rack up in a visible area. The rack was often buried behind stacks of equipment.

The main goal was to bring them back into the fold. The consultant contacted one of their distributors Larry Byers and told him about the challenges with the store. Larry offered to have the consultant accompany him on his regular call schedule and he would introduce the consultant to the manager and the buyer. They were slightly receptive when the consultant offered to do training for the staff. A training was scheduled for December 19th and the consultant trained 6 employees. They were all very interested in learning about the beneficial insects for the garden. Following the success of the training, the consultant implemented the following activities at this store:

- The consultant updated shelf talkers and requested that the literature racks (one for Spanish fact sheets and one for Enlishg) be placed in the pesticide section rather than behind a garage door. George said that would be fine to move the racks to a more visible spot.
- On February 13th the consultant did an outreach event for customers which ended up being more of a tabling event handing out Sluggo samples and free white fly traps. The consultant contacted about 30 customers and met many Spanish speaking families who were delighted and wanted to know if the event would be held again.
- In May, the consultant held a special class on beneficial insects and less-toxic products for members of the Bay Area Gardeners Association (BAGA) at the store. The consultant contacted the head of BAGA and he spread the word to BAGA members. A small group attended the talk and received free whitefly traps, good bug bad bug charts, and samples of organic fertilizer and Sluggo. Juan seemed extremely pleased as the attendees also purchased products from the store. This has increased the sales of their less toxic products

SummerWinds Nursery, Palo Alto.
The consultant was not included in the SummerWinds kickoff meetings this year because they went to a different format for their annual meeting that would not allow time this year. Usually the consultant is able to contact 60 of their employees at this meeting. Hopefully next season the consultant will be able to join.

The consultant asked the general managers at SummerWinds which nursery they would like the consultant to work with and they chose SummerWinds in Palo Alto.

The consultant worked with the garden department manager Warren and focused on beneficial insects and the plants that attract them. The consultant worked several days this spring with Warren in the pesticide section with customers. Warren said that his store was the top store in SummerWinds for lady bug sales. The consultant also kept the shelf talkers refreshed and made new laminated photos of the beneficial insects for Warren to post in the pesticide section. He asks folks first if they want to go organic and if not he shows them other options. The consultant worked with Warren on four separate occasions making a tape of one of his "Mr. Organic" talks. The consultant worked with Warren and his customers on February 13th in the afternoon after the Los Altos Garden Supply event, April 5th, April 18th, and May 15th.

Warren is a great sales person and one that is good to have in the less toxic camp. The consultant has sent photos to Program staff for these events.

Evaluation of Effectiveness

The following factors indicate the success of these projects:

- The success of the program is the frequent contact and trainings. The stores have appreciated the trainings and additional attention. Due to the success of the training, Los Altos Nursery is now fully supporting the OWOW Program.

- SummerWinds in Palo Alto: More beneficial insect sales and exposure for good bug identification in the pesticide section.

- Los Altos Garden Supply: Improved relationship with the store management and increased visibility of the OWOW program. A big success was scheduling the customer outreach event. A distributor representative from a pesticide company called the consultant to inquire about the customer outreach event. The representative said the company had tried to do outreach at the store but had been unsuccessful. The customer outreach event also highlighted the OWOW Program as an information resource to the Spanish speaking gardeners. This benefited the store's business as customers now come to the store looking for less-toxic products and less-toxic pest management information. The store now sees the value in OWOW.

Conclusions and Recommendations

The consultant sees the increased interest in the trainings and IPM due to the wave of interest in environmentally friendly practices. Many of the stores want to be more environmentally friendly but need guidance when it comes to filtering information they receive from pesticide companies and have come to depend on unbiased feedback they get through OWOW. This became ever more apparent with the pesticide companies heavily soliciting the stores for sales because of the poor economy. They offer a lot of money to advertise and display the more toxic materials. This made this year particularly challenging for the consultant.

The 10 Most Wanted Bug Brochures are important for the stores to have. These have become the single most important tool for staff and customers to quickly identify beneficial insects in their adult and larval stages and list the flowers they are attracted to. With the popularity of this brochure it makes it easy for the stores and the public to identify insects they may be spraying inadvertently and also makes an easy transition to talking about not using pesticides that leave a residue for beneficial insects. The consultant recommends the purchase of at least 600 of these brochures next season.

SCVURPPP PESTICIDE USER OUTREACH
FY 09-10 Summary of Store Employee (not including Home Depot Employees) Training Evaluations

Number of Attendees: 52
Number of Evaluations Submitted: 39

	Agree	Neutral	Disagree	Comments
The instruction was well organized and interesting.	39	0	0	• *Already using/promoting organics* • *Flowed nicely*
The information changed my attitude about pesticides.	23	13	2	• *Learned new ways to identify problems* • *Already use/sell organic/natural solutions* • *Views not changed, already agree*
The information was useful.	39	0	0	• *I have a degree in horticulture & I still learned a lot.* • *Nice handouts – useful to share*
The information will help me sell less-toxic products.	39	0	0	
The instructor was responsive to questions.	37	1	0	
The level of detail was appropriate.	36	2	1	• *More detail would be good*
Visual aids were effective.	35	3	1	• *Easy to understand*
Written materials were effective.	35	4	0	
I would recommend the training to co-workers.	36	3	0	

What part of the training was most useful?

- *Visual slide show*
- *What was bad about synthetics*
- *Citrus minor information*
- *Pictures of insects*
- *The danger of slug bait to dogs*
- *Bug chars for me, questions answered*
- *Time and proper application of chemicals*
- *Pest ID and controls*
- *Slides and literature*
- *Visual aids – seeing the useful products*
- *Learning both chemical and organic (bug) methods*
- *New pest concerns and identification*
- *Using Neem at dusk*

What part of the training was least useful?

- *Review of old material*

When this training is held again, what changes do you suggest?

- *Different visual aids would be more helpful, larger pictures of bugs already on chart not so helpful*
- *Add soil and fertilizer (organic)*
- *Great specific information on organics*
- *More hands on learning*
- *More information cards to hand out to interested customers*
- *More information on pests other than citrus*
- *Continuing new information*

How much of today's information was new to you? All: 13 Some: 25 None: 2
Comments:

- *New bug information was very helpful*
- *Presenter knew a lot of information about plants and insects*
- *Spraying all chemicals at dusk*
- *Great to have updates*

For store managers - Will you continue to provide this training to new employees yourself?
Yes: 5 No: 0 I will use a trainer: 2

SCVURPPP PESTICIDE USER OUTREACH
FY 09-10 Summary of Home Depot Employee Training Evaluations

Number of Attendees: 47
Number of Evaluations Submitted: 39

	Agree	Neutral	Disagree	Comments
The instruction was well organized and interesting.	38	1	0	• *Already using organics* • *Good presentation* • *Kept me interested* • *Excellent*
The information changed my attitude about pesticides.	39	0	0	• *Had not thought about good and bad insects* • *Very informative* • *Did not know there were so many varieties of pesticides* • *I used to think all products had bad poison* • *I will definitely recommend less toxic products now!* • *Already knew about information*
The information was useful.	37	1	0	• *This information will be useful in the future* • *I learned a lot* • *Good detail*
The information will help me sell less-toxic products.	37	1	0	• *Very informative, but I'm not in the garden department* • *Also I can recommend* • *Pet-friendly*
The instructor was responsive to questions.	39	0	0	• *Very helpful/ good info*
The level of detail was appropriate.	39	0	0	
Visual aids were effective.	37	2	0	
Written materials were effective.	38	1	0	
I would recommend the training to co-workers.	39	0	0	• *I would recommend this to all*

What part of the training was most useful?

- The visual aids were very helpful
- Good bugs & bad bugs
- How to recommend eco-friendly products to our customers & be safe to our water & environment & keep animals & kids safe
- Pointing out various products
- Fleas, fruits, and roses
- True life examples
- Slides and handouts

- Bug identification
- Information on reading labels
- Pictures of the insects
- Learned the basics about correctly using pruning and fertilizer to prevent infestations
- Types of bugs that help gardens
- Common pests and useful bugs and how to manage
- Finding out that pesticides can kill pets
- Tips for snails

What part of the training was least useful?

- More time reserved to make the lesson less rushed
- It was a lot of information to take in
- We do not need to see the pictures of all the bugs – could be condensed

When this training is held again, what changes do you suggest?

- Maybe have some real life insects to show for hands on
- The presentation was very well put together, next time talk more about the products
- Have this class taught to garden associates
- Mention products that Home Depot sells and pictures of those products
- Please extend the amount of time and go more in depth
- More Home Depot product detail and how to apply
- Make the training two hours long – it wasn't long enough
- Examples of diseases that attack plants
- Do not give too much detail on what good bugs and bad bugs do
- Have more of our employees involved - so they can hear the info and be able to sell products to customers
- Smaller field guide that we could carry with us
- Go through all the information that is in the folder as you talk about each subject
- Passing around chemical containers/Home Depot products

How much of today's information was new to you? All: 17 Some: 18 None: 1
Comments:

- I learned more about bugs and what kills them
- Very helpful, really liked visual aids
- I knew nothing before hand and now I am confident in selling our products
- I had been learning about organics anyway, so the training was extremely helpful
- Really helpful, thanks for your time – it was all new to me!
- Nicely presented

For store managers - Will you continue to provide this training to new employees yourself?
Yes: 7 No: 0 I will use a trainer: 2

Santa Clara Valley *Green Gardener* Training Program

FY 09-10 Activities

Background

In FY 07-08, the Program piloted the first Santa Clara Valley *Green Gardener* training which is an educational initiative that brings quality training to professional landscapers, gardeners and landscape maintenance workers on how to "garden green." Each training session consists of ten 2-hour classes, held once a week for ten weeks. The training has been conducted in collaboration with the Metropolitan Adult Education Program and the Master Gardeners of Santa Clara County.

On completion of the training, graduates are provided a certificate of completion and a *Green Gardener* card.

To maintain their status as *Green Gardeners*, and to renew the *Green Gardener* card, landscape maintenance professionals are required to fulfill one of the following Continuing Education requirements:

- Take two hours of additional classes that are related to at least one of the topics covered in the class. OR
- Fill out and submit the *Green Gardener* Self Assessment form. OR
- Have three customers fill out and submit the *Green Gardener* Customer Evaluation Form.

FY 09-10 Activities

The Program conducted two training sessions in FY 09-10, including one session conducted entirely in Spanish. The training session in English was on Tuesdays, September 22 - December 1, 2009 and the session in Spanish was on Wednesdays, September 23 – December 2, 2009. The Program provided funds toward student fees, guest speaker fees, Spanish interpreter fees, and supplies (soil probes, magnifying lenses, and "Good Bug Bad Bug" Charts).

In addition, the Program held four two-hour sustainable landscaping classes to offer *Green Gardeners* an opportunity to re-certify. Other landscape professionals were also allowed to attend. Class details are below:

- Smart Irrigation Controllers (Spanish class) - Thursday March 4, 2010, 4-6 PM
- Smart Irrigation Controllers (English class) - Saturday, March 6, 2010, 10 AM - Noon
- Maintenance of California Native Plants (English class) - Thursday, March 11, 2010, 4-6 PM
- Controlling Common Garden Pests Using IPM (Spanish class) - Saturday, March 13, 2010,10 AM - Noon

The Program conducted outreach to inform local landscape maintenance businesses about the training. Outreach to residents was also done to inform them about the availability of trained *Green Gardeners*. Outreach efforts included the following:

- Mailing letters and flyers to local landscaping businesses;
- Advertising on English and Spanish radio stations;

- Posting training announcements on the Watershed Watch website, Facebook, and Twitter;
- Distributing flyers at outreach events; and
- Posting the list of trained *Green Gardeners* on the Watershed Watch website;

Evaluation of Effectiveness

In FY 09-10, 22 individuals completed the *Green Gardener* training; 12 took the training in English and 10 in Spanish. In addition, 30 individuals, including 18 *Green Gardeners*, attended the re-certification classes.

A summary of the evaluations from the *Green Gardener* training is included in Appendix 9-2. It indicates that attendees found the class very useful and will be making changes to their landscape management practices based on what they learned at the trainings. Attendees were required to take a final test to receive the certificate of completion. This ensured that they understood the curriculum and will be able to implement the practices at their client locations.

In FY 09-10, 25 *Green Gardeners* renewed their *Green Gardener* card meeting the Continuing Education Requirements. Of these, 18 met the requirement by attending the Program's re-certification classes. Due to the success of these re-certification classes, the Program may offer them again next year.

Currently, there are 46 *Green Gardeners* (31 are professional landscape maintenance contractors and 15 are individuals that do not provide professional services) on the Santa Clara Valley *Green Gardener* list. This list is available online at http://www.mywatershedwatch.org/findgardener.html.

Find a *Green Gardener*

Is your gardener a ***Green Gardener***? Hire a Santa Clara Valley *Green Gardener* to maintain your garden using sustainable landscape maintenance practices.

Santa Clara *Green Gardeners* have received training to:

- Use resources wisely, conserve water, protect the soil, and reduce waste.
- Improve the health, appearance and value of landscapes.
- Reduce urban runoff and stormwater pollution from landscape maintenance activities.

These Santa Clara Valley *Green Gardeners* provide professional landscape maintenance and/or design services throughout Santa Clara County.

**Green Gardener* since April 2008

Class Evaluation - Final (12 Evaluations Received)

1. How did you learn about this class?

Flyers	2	Newspapers		Radio		Friends	
Article in CLCA	3	MAEP Class Mailer	4	Clients		No Answer	
Supervisor/Boss	5	Other	CCOC Pamphlet				

2. Which cities do you have clients located in or have worked on jobs there within the past year?

Campbell	8	Cupertino	6	Los Altos	5	Los Altos Hills	5
Milpitas	3	Monte Sereno	6	Mountain View	6	Palo Alto	5
Saratoga	6	Sunnyvale	9	Los Gatos	8	San Jose	9
Unincorporated Santa Clara County			6	No Answer		Santa Clara	8
Other							

3. Were the following topics useful?

Soils	Yes	12	Somewhat	No	No Answer
Comments on Soils		Soil probe helpful			
Pruning	Yes	12	Somewhat	No	No Answer
Comments on Pruning					
Right Plant, Right Place	Yes	12	Somewhat	No	No Answer
Comments on Right Plant, Right Place					
Integrated Pest Mgmt.	Yes	12	Somewhat	No	No Answer
Comments on Integrated Pest Mgmt.		Appreciate this one			
Compost / Mulches	Yes	12	Somewhat	No	No Answer
Comments on Compost / Mulches		Great field trip.			
Fertilizers	Yes		Somewhat	No	No Answer
Comments on Fertilizers		12			
Irrigation (1, 2 & 3)	Yes	12	Somewhat	No	No Answer
Comments on Irrigation (1, 2 & 3)					
Air Quality	Yes	12	Somewhat	No	No Answer
Comments on Air Quality					

Other topics that you would have liked to learn?
Programming "Smart" controllers, specialized pruning techniques for plant varieties. Using tools properly. Advanced classes.

4. Will you be changing any of your landscape management practices based on what you have learned in class?

Yes	11	No	No Answer	1

5. Please provide one or two examples of a practice that you will be changing:
Better pruning practices, water management for clients through frequent and better knowledge of irrigation scheduling
Pruning, irrigation techniques, pestidide management
Irrigation
I will use less polluting tools and will consider mulch and compost before using pesticides
Water lawn according to CIMI chart and Right Plant, Right Place
Watering schedule will be better managed
Offering clients environmentally friendly machinery
Fertilizers and progamming irrigation
Fertilizera and IPM
Irrigtaion techniques, pruning, fertilizers

6. What benefits from this program are important to you? Valuable?

Information & Training	Yes	12	Somewhat	No	No Answer
Comments on Info & Training					
Comparing ideas with others	Yes		Somewhat	No	No Answer

Comments on Comparing ideas w/ others		12							
Meeting with experts and guest lecturers	Yes	12	Somewhat		No		No Answer		
Comments on Meeting w/ Experts, etc...									
Getting on the certification list for Green Gardeners	Yes	11	Somewhat	1	No		No Answer		
	Eventually								
Comments on Certification List									
Other?									
7. Class slides and information: Valuable?									
Were the class slides shown in class useful?	Yes	10	Somewhat	2	No		No Answer		
Comments on class slides									
	Some slides were obscure								
Were the slide copies in your notebooks useful?	Yes	10	Somewhat	2	No		No Answer		
Comments on handbook slides									
	Difficult to see the small print								
	Small Print								
Were the other handouts provided useful?	Yes	11	Somewhat	1	No		No Answer		
Comments on handouts									
Please tell us what we could do better:									
	More hands on material & equipment								
	Have an advanced class								
	Great								
8. Would you recommend taking this Green Gardner class to a friend?			Yes	12	No		No Answer		
9. Would you be interested in taking an advanced Green Gardener course?			Yes	12	No		No Answer		
			Maybe						
10. Was the location convenient for you at Metro Ed?			Yes	10	No	2	No Answer		
			Sort Of						
11. Were the class times convenient for you?			Yes	12	No	2	No Answer		
			In Between Y & N						
12. Is there a time of day that would be more convenient for the class?			After 6 p.m.		No Answer	6	3 p.m.		
			5:30 p.m.		Evening		5 p.m.		
			8-9 AM	1	Okay		5PM - 7 PM		1
13. Do you work for:	Yourself	6	A Company	6	An Agency		No Answer		
	Transitioning Into								
14. How many different landscape maintenance clients do you have?			Zero		One	1	Two		
	Four		Five	2	Six		Twelve		
	Twenty	2	Thirty		70-100	3		180	
	Unknown		Mine		Various				
	None	1	No Answer						

045771

15. Please tell us about how much landscape maintenance training you have had before taking this class:

None	4	Some Classes	6	A degree in horticulture or other program	1
No Answer	1				

16. How much would you be willing to pay for this class?

$40	1	$80	4	$120	7	Depends	No Answer

Comments

17. In which language do you prefer to receive training?

English	12	Spanish	2	Vietnamese	0	Other	Italian
No Answer							

18. Please tell us any other suggestions you may have to make the Green Gardner classes better?

A field trip to a sustainable landscaping company or a nursery

Concentrate more on organic fertilizers, not petroleum based . Discuss harm petroleum based fertilizers do. Express the damange that improper pruning and laying down plastic as a weed surpressor do

Same place, same day each time as I couldn't make it to the SMaRT Station

Thank you

045772

Class Evaluation - Final (Received 10 Evaluations)

1. How did you learn about this class?

Flyers		Newspapers		Radio	5
Article in CLCA		MAEP Class Mailer		Clients	
Supervisor/Boss		2 Other	Internet-2		
Friends	1				
No Answer					

2. Which cities do you have clients located in or have worked on jobs there within the past year?

Campbell	2	Cupertino	4	Los Altos	4	Los Altos Hills	2
Milpitas	2	Monte Sereno	2	Mountain View	3	Palo Alto	4
Saratoga	3	Sunnyvale	2	Los Gatos	5	San Jose	6
Unincorporated Santa Clara County		1		No Answer	1	Santa Clara	2
Other	Fremont						
En ninguna (sin experiencia en el ramo)							

3. Were the following topics useful?

Soils	Yes	9	Somewhat	No	1	No Answer
Comments on Soils						
Pruning	Yes	10	Somewhat	No		No Answer
Comments on Pruning						
Right Plant, Right Place	Yes	10	Somewhat	No		No Answer
Comments on Right Plant, Right Place

Announcing:
Green Gardener Training Classes - Fall 2009

Two Santa Clara Valley Green Gardener Classes will be held by the Community Interest Program of the Metropolitan Adult Education District located at the Erikson Adult Education Center, 4849 Pearl Ave, San Jose, CA 95136 starting in September.
Learn ways to conserve water, protect the soil, reduce the use of pesticides, create a healthier work environment, and expand your business prospects.

➡ Tuesdays, September 23 - December 2, 2009, 4:00 PM - 6:00 PM (Spanish)

➡ Wednesdays, September 24 - December 3, 2009, 4:00 PM - 6:00 PM (English)

Class registration fee is $120. (Scholarships for up to $80 are available. Let Metro Ed staff know if you are interested in applying for one when you sign up.)

Class written materials are available in Spanish or English

Professional gardeners and landscape maintenance professionals who attend 80% of the classes and successfully complete an exam will receive a certificate of completion and their Santa Clara Valley Green Gardener Card.

Call the MAEP Administrative Center at **(408)723-6450** to sign up for a class. For more information on the Green Gardener program, visit

www.MyWatershedWatch.org

As successful Santa Clara Valley Green Gardener Graduates, please tell your friends, family, or co-workers who might be interested about this upcoming training opportunity.

Clases de Jardinería Verde - Otoño 2009

Dos clases de Jardinería Verde de Valle de Santa Clara iniciarán en septiembre. Serán ofrecidos por el Programa de Interés Comunitario del Distrito Metropolitano de Educación de Adultos (MAEP), localizado en el Erikson Adult Education Center, 4849 Pearl Ave, San José, CA 95136

Aprenda métodos para preservar el auga, proteger los suelos, disminuir el uso de pesticidas, crear un ambiente laboral más saludable y ampliar su clientela.

- Los martes 23 de septiembre y 2 de diciembre de 2009, de 4:00 PM a 6:00 PM (en español)
- Los miércoles 24 de septiembre y 3 de diciembre de 2009, de 4:00 PM a 6:00 PM (en inglés)

El costo por registrarse es de $120. (Hay becas de hasta $80 disponibles. Si le interesa solicitar una, dígale al personal del centro metropolitano cuando se registre.)

Los materiales para la clase están disponibles in español o en ingles

Los jardineros profesionales y contratistas de mantenimiento de jardines que asistan al 80% de las clases y completen satisfactoriamente un examen, recibirán un certificado de culminación y su tarjeta de Jardinería Verde De Valle de Santa Clara.

Llame al centro administrativo del MAEP al **(408)723-6450** para registrarse. Para más información sobre el programa de Jardinería Verde, visite **www.MyWatershedWatch.org**

Ayúdenos a informar a sus familiares y compañeros de trabajo sobre esta oportunidad de capacitación en el área de Jardinería Verde.

Announcing Santa Clara Valley Green Gardener Re-Certification Classes in 2010

A series of four classes, two in Spanish and two in English will be offered in March 2010 for any of our Green Gardener Graduates. Attending just one of these classes will meet the continuing education requirement to keep your Green Gardener card active and your name on our website. However, you may attend more than one, if you want to do so.

These classes are sponsored by the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP) with the assistance of the Master Gardeners of Santa Clara County and are free to all Green Gardeners. Voluntary donations to the Master Gardener program will be accepted at the classes.

See the back of this flyer for more information and how to register for a class.

Classes in Spanish

Smart Irrigation Controllers with Richard Bean, Lane Irrigation & Laura Monczynski, Translator
Thursday March 4, 2010
4-6 PM
Sunnyvale Community Center-
Heritage Center Building
550 E. Remington Ave
Sunnyvale, CA

Controlling Common Garden Pests Using IPM (MIP) with Laura Monczynski and Kristy McCumby
Saturday, March 13, 2010
10 AM—Noon
Murphy Park Building
236 North Sunnyvale Ave.
Sunnyvale, CA

Classes in English

Smart Irrigation Controllers with Richard Bean, Lane Irrigation
Saturday, March 6, 2010
10 AM—Noon
Sunnyvale Community Center-
Heritage Center Building
550 E. Remington Ave
Sunnyvale, CA

Maintenance of California Native Plants with Agi Kehoe, Agi Kehoe Landscaping
Thursday, March 11, 2010
4-6 PM
Sunnyvale Community Center -
Heritage Center Building
550 E. Remington Ave.
Sunnyvale, CA

Smart Irrigation Controllers with Richard Bean, Lane Irrigation (Classes held in English and Spanish—Laura Moncyznski, translator)

To help save water used for landscape irrigation, learn about the features of the different brands of Smart Controllers on the market, the information you need to program them, and some of the programming basics. As of 2012, only Smart Controllers will be available for sale in California for use in new or retrofitted landscape irrigation installations.

Richard has a B.S. in Ornamental Horticulture from Cal Poly and 30 years of experience in the landscape industry. He is the owner of Lane Irrigation and has taught the Irrigation 2 and 3 classes for the Santa Clara Valley Green Gardener Program for the past two years.

Maintenance of California Native Plants with Agi Kehoe, Agi Kehoe Landscaping (Class held in English only)

Learn about the seasonal care of California native plants in the garden; irrigation, pruning, deadheading, cutting back, dividing, weeding, mulching, etc.

Agi is a Master Gardener and professional landscape designer, specializing in CA native plants and has worked in the green industry for the past 12 years. Through her own business, she designs and manages residential gardens in the Bay Area and some have been featured in the "Going Native Garden Tour". www.goingnativegardentour.org She is also an active member of the Santa Clara Valley Chapter of the California Native Plant Society and helped design several local native demonstration gardens.

Controlling Common Lawn &Garden Pests with IPM (MIP) with Laura Moncyzynski & Kristy McCumby (Class held in Spanish only)

What are some practical Integrated Pest Management techniques to deal with commonly found garden and lawn pests? Learn about ways to help control aphids, ants, snails, powdery mildew, weeds, rose rust, and other plant diseases without using pesticides.

Laura has a passion for gardening so she became a Master Gardener and Master Composter in 2001. She has served on the MG advisory board, as program coordinator and chair of the education committee. She has a MA in Psychology, a minor in Biology and continues her education with Spanish and Horticultural classes. She enjoys learning and sharing her knowledge with others

For the past 10 years, Kristy has worked for the City of Sunnyvale helping coordinate the City's approach to IPM for staff and information to residents, as well as helping coordinate the Santa Clara Valley Green Gardener program classes since 2008. Her degree is in Biology from the University of Alaska Fairbanks and she loves to garden at home using IPM practices.

Registration Form: FAX: (408) 720-8812 or Call (408) 720-8811 ext. 2 or e-mail to Miranda@eoainc.com to register for a class. THERE IS NO REGISTRATION FEE.

REMINDER: **Your Santa Clara Valley Green Gardener card is due for renewal!**

REMINDER: **You must renew your Green Gardener card before May 15th, 2010 to maintain your Green Gardener status!**

There are three options for renewing your Green Gardener card:

Option 1 - Take 2 hours of additional classes that are related to at least one of the topics covered in the class.
Option 2 - Fill out the Green Gardener Self Assessment form
Option 3 - Have 3 customers fill out the Green Gardener Customer Evaluation Form.

Complete one option, fill out the Green Gardener Card Renewal Form and send it to us.

All forms are available for download at
www.MyWatershedWatch.org/renewggcard.html

For paper copies of the forms, contact 408-720-8811 xnt. 2

Regional IPM Partnership Program Report (Our Water, Our World)

September 15, 2010

FY 09-10 Regional IPM Partnership Program Report

Below is a report of activities and accomplishments of the Regional IPM Partnership Program (also known as *Our Water, Our World* program) for FY 09-10.

- Coordinated program implementation with major chains Home Depot, Orchard Supply Hardware, and Ace Hardware National. OSH reported "natural insecticides" sales up 8.5% compared to previous year. Home Depot increased their less toxic offerings 17.2%.
- Coordinated master print run of the following: fact sheets, shelf talkers, literature rack signage, banner, beneficial bug brochure, business card, magnet, Pest or Pal activity guide for kids, pocket guide, and Pests Bugging You? booklet.
- Updated less-toxic Product Lists: Master – by brand name version; by pest version, and OSH and Home Depot-specific lists/labels.
- Maintained *Our Water, Our World* website <http://www.ourwaterourworld.org/>.
- Provided Ask-the-Expert <http://www.ourwaterourworld.org/AskOurExpert/tabid/103/Default.aspx> service.
- Provided and staffed exhibitor booths at the following events
    - Excel Gardens Dealer Show (August 2009)
    - Ace Hardware National Show (October 2009) (see attached photo)
    - L&L Dealer Show (October 2009)
    - NorCal trade show (February 2010)
- Provided on-call assistance (e.g., display set-up, training, IPM materials review) to specific stores (e.g., OSH, Walgreens).
- Provided print advertising and article – Green Zebra guide <http://www.thegreenzebra.org/>.
- Provided print advertising – Bay Nature magazine <http://www.baynature.org/>; Bringing Back the Natives Garden Tour's garden guide; OSH weekly fliers, including 10 year anniversary ad (attached)
- Provided assistance to supplier Excel Garden Products to identify all their less toxic products and to include mention of *Our Water, Our World* in their catalog (attached). That catalog is now available online so all their customers and representatives can continue to access the current and new less toxic products.
- Received mention in articles by others: Sunset magazine (attached); San Francisco Chronicle <http://www.sfgate.com/cgi-bin/article.cgi?f=/c/a/2010/02/26/HOFJ1BVESD.DTL&type=homeandgarden>; and Edible East Bay (attached)
- Made presentations at the following events:
    - Excel Gardens Dealer Show (August 2009)
    - Urban Pesticide Committee (September 2009)

Ace has some suggestions for Helpful Earth Choices

If you stop by the Helpful Earth Choices area in the exhibit hall, you are likely to encounter Ace retailers who are passionate about environmentally friendly products.

Among those retailers on Friday was Kathy Stephenson from Maple Leaf Ace Hardware (store no. 1130) in Seattle, who spent considerable time combing through the products in the 50-percent-off deal section.

"This is my favorite booth," she said. "Ace has done a great job of providing great products. There's a terrific selection."

Stephenson, who has been in the business since she was nine years old, said her store now carries environmentally conscious products in about 30 percent of its cleaners and lawn and garden products. She said she wants to keep increasing that percentage and Ace is making it easier.

Stephenson previously purchased eco-friendly products outside of Ace. She noted, however, that Ace has recently stepped up its commitment to green products, which has brought her purchases back to Ace.

Tracey Gidich-Zupke, Ace brand manager, is happy to hear that Ace retailers are taking notice.

"We are continuing on our mission of providing the products and services that add value to the community and are gentle on the Earth," she said.

"If your demographic is keen on green, these products and services help retailers support their communities, protect their environment, and prove to be good for business."

> We are continuing on our mission of providing the products and services that add value to the community and are gentle on the Earth.
>
> Tracey Gidich-Zupke
> Ace brand manager

Besides the 50-percent-off deals that include products such as recycled dishware, eco-blowers and trimmers, water timers, and paint products, a number of other companies were invited to participate in the area. These companies include Mercury Technologies of Minnesota, Thermostat Recycling (TRC) and even Ace Paint.

TRC, from Arlington, Va., recycles mercury used in older residential thermostats. Those devices, which are found in most homes that are 10 years or older, can contain dangerous levels of mercury, said Mark Tibbetts, executive director of TRC. He said those thermostats have 3 grams of mercury in them.

Simply tossing the unwanted thermostats in the trash is bad for the environment. Besides education, his company provides Ace retailers with plastic containers and prepaid mailing slips so they can collect old thermostats and turn them in for recycling.

Many retailers are noticing that Ace has done well to increase the scope of what is offered at the Helpful Earth Choices area and that has brought them back to Ace.

"By working with Ace retailers, we make it easy for them to be a good community partner by collecting and turning these thermostats in for recycling," Tibbetts said.

And that is the point of Helpful Earth Choices, said Ace's Gidich-Zupke.

"We offer the 50-percent-off section to provide the one-stop shop for all things green and less impactful on the environment," she said. "It's good for the environment, good for the community and good for business."

ENVIRONMENTALLY **FRIENDLY**

Here at Excel, we take pride in providing you with the most "Environmentally Friendly" products. With the help of Annie Joseph from Our Water Our World, we have identified products that have less impact on our environment.

In this catalog such products are highlighted in green.

WORRY FREE GARDEN INSECT CONTROL

Uses nature's own insecticide from the chrysanthemum flower. Also with canola oil to suffocate insects and their eggs.
Kills all stages of insects on roses, flowers, fruits & vegetables and house plants.
Contains Pyrethrins .01%, Canola Oil 1%.

What to do in Northern California
September

WHAT'S YOUR ZONE?

Check out the *Sunset Western Garden Book* and our Plant Finder (*sunset.com/plantfinder*) for more about climate zones.

Get inspired and shop

Learn about sustainable gardening Attend the Late Show Gardens in Sonoma (*Sep 18–20; tickets from $20; thelateshowgardens.org or 415/721-1550*), a new event focusing on landscape ideas that address drought, global warming, and sustainability. See 18 professionally designed display gardens; go to lectures by well-known authors, photographers, and horticulturists; and buy art and top-of-the-line plants including organic, drought-tolerant, and rare choices from well-known nurseries.

Plant now

Plant garlic In mild-winter areas, start bulb sets late this month or next for a harvest in early summer. In areas that regularly get frost on consecutive nights, plant them four weeks before the last frost date. Place cloves 6 inches apart, pointed ends up, with tops 1 inch deep (in coldest zones, plant up to 4 inches deep). Buy soft-neck varieties for braiding after harvest, or hardnecks for their extra cold hardiness.

Start cool-season greens *Sunset* climate zones 7–9, 14–17: Set out transplants of broccoli, cabbage, and cauliflower. Sow seeds of bok choy, chard, mustard greens, peas, and spinach. For vivid colors and striking leaf shapes and textures, try these new seed selections from Botanical Interests (*botanicalinterests.com or 720/880-7293*): Asian Salad Mix mesclun, 'Bordeaux' spinach, 'Five Color Silverbeet' chard, and 'Ruby Streaks' mustard greens.

Tend your plot

Care for or remove lawns Deep-water grass to keep it green during this often very hot month; rake out thatch and aerate soil. Or replace your lawn this fall with shrubs and groundcovers that need little water. Check out a range of options for lawn-free landscapes on page 46.

Harvest tomatoes Let tomatoes ripen on the plant to their deepest color for maximum sweetness, then store them at room temperature. If night frost is forecast, throw a sheet over the plant. This month or next, pick the last fruits and ripen them indoors in a closed paper bag.

Outsmart pests

Manage ants Ants streaming up the trunk of a bush or tree probably are protecting scale or aphids from predators. Stop them with Tree Tanglefoot Insect Barrier (a sticky, chemical-free substance that traps crawling insects) applied to a collar of duct tape around the trunk. Otherwise, leave ants alone since they aerate the soil and clean up garden debris, advises Annie Joseph, an educator with Our Water Our World (*ourwaterourworld.org*), a program devoted to pest-management strategies that protect waterways. –HAZEL WHITE

Plant a late-summer bloomer

Grow 'Frenzy' gaillardia for a bold splash of color just as other blooms begin to fade. The flower's fluted petals radiate red from the center and end in blasts of yellow for a ruffled look. This compact perennial reaches 1½ to 2 feet tall and wide. Plant it in a sunny spot with well-drained soil. Buy locally, or order from Bluestone Perennials (*bluestoneperennials.com or 800/852-5243*) or High Country Gardens (*highcountrygardens.com or 800/925-9387*). –JOHANNA SILVER

HIGH COUNTRY GARDENS

cost saver Save cash by buying perennials like rudbeckia, salvia, and yarrow instead of annual blooms that need regular replacing.

045789

BUGS IN THE BALANCE

STORY AND ILLUSTRATION BY HELEN KRAYENHOFF

On a beautiful spring day shortly after we moved into our new house, I noticed that the rosebuds on the bush in the front yard were literally covered in red aphids. I thought to myself, "I have to get out the insecticidal soap and blast those little buggers off there or they will ruin the first flowers." It was a busy time in the nursery so I didn't get around to it. Then one afternoon as I was walking by the roses, I noticed some flying beetles hopping around on the new growth. Stopping for a closer look, I found a bevy of orange-bellied beetles feasting on the aphids. They cleaned the bush in a few days and disappeared.

This incident was the start of a whole new perspective for me on bugs. Now I look at the aphids and instead of regarding them as delinquents vandalizing our gardens I ask, "Who will follow?" I've come to regard bugs as an important part of the garden community that I am part of as well.

When I pick up any nursery trade magazine, even an organic-leaning one, I see ads from companies promoting insecticides in which insects are categorized as 'bad bugs' and 'good bugs.' I also see options for purchasing beneficial insects from companies that dig hibernating ladybugs out of their nests in the Sierra and send them all across the country to 'battle' bad bugs in our gardens. The view from my own garden indicates that this kind of bug-running might not be necessary; we've never had trouble attracting ladybugs and keeping them hanging around, in part because of the previous owner's eight-year commitment to gardening without chemicals.

We've learned that the way to encourage the presence of a large variety of bugs is to have food available for them year round. Many carnivorous insects need nectar to complete their diets, and since they have small mouth parts, they need flowers that afford easy access. One group of plants that does this are the umbellifers, which have flower clusters that look a bit like umbrellas, making the name easy to remember. Common vegetable umbellifers include carrots, parsley, and cilantro. (Let a few of these flower to see the umbrella shape.) Ornamental choices include yarrow and alyssum, which are easy to tuck into open nooks and crannies in your veggie beds. It's important to have some aphids or other prey insects as well, so there's never a dearth of protein for the predator insects.

One bonus to growing umbellifers is that bees like them. Bees are a must for pollinating your cucurbit crops (cucumbers, squash, melons, etc.) as well as many fruit and nut trees. Leave parts of your garden a bit wild and untidy so there are places for frogs and other small critters to hide and bugs to overwinter. Raccoons can be a nuisance but they also love to eat those imported French snails that in turn love our newly planted seedlings. Who will get to what first? It's the constant push-pull of prey-predator that keeps the garden healthy.

In our culture we tend to oversimplify and label things 'good' and 'bad,' but in the garden, as in life, I try to learn whether things are moving toward balance. As enterprising humans, we work so hard at making our urban gardens look tidy or natural, according to our preferences, creating artificial ecosystems that we judge mostly by their appearance. If we can step back from our preconceptions and ideas and just be in our gardens, many things are revealed.

Spend time becoming more intimate with your garden community to learn how you can develop healthy relationships and be a positive member. **Feed your plants well** but not too well: Overfed plants develop lots of soft, new green growth that's sweet and easy to chew on. Likewise, **water well** but not too much or too often.

WHY AVOID PESTICIDES AND HERBICIDES?

In March, Annie Joseph, a consultant working with the Alameda Countywide Clean Water Program, gave an enlightening talk at Berkeley Horticultural Nursery on the subject of beneficial insects. She spoke about why reducing use of pesticides and herbicides in our gardens is important to the goal of controlling toxic runoff into our waterways, and pointed us toward many resources that are available to the home gardener interested in moving in the chemical-free direction. To learn more, go to OurWaterOurWorld.org.

045790

"Feed the soil" is a useful mantra from the organic farmers: Work on amending your soil to create good drainage and active bacteria and invertebrate life. **Mulch and compost** added consistently will ensure that your soil has ample moisture and nutrients. Be still, don't stress, don't force, and see what your garden has to reveal.

This morning as I was thawing out in the sun, contemplating my rose bushes, a flock of bushtits landed in them and poked around looking for insects on the dark red new growth. Oscar the cat and I stood transfixed until they flew on to the abutilon (flowering maple) that always has a few aphids and also provides good cover for the tiny birds. Soon, when the buds appear on the roses, I hope the soldier beetles will come for their annual visit and there will be a feast of red aphids laid out for them. All I have to do is enjoy the event. The year in the garden continues.

FURTHER READING

Insects and Gardens:
In Pursuit of a Garden Ecology
by Eric Grissell, Timber Press, 2001

Here you'll get an in-depth look at the lives of insects in the garden at a level you've probably not gone to before. It is an important new perspective that may help you move away from making those life-and-death decisions about who gets to continue to cohabitate with you.

Grissell first examines the somewhat secret lives of insects. He follows this with concepts of the ecology of gardening, explaining the function of insects in the garden as well as the interactions of insects with each other and with the plants and other animals. The last part of the book covers the gardener's perspective and offers tips for increasing diversity in the garden, showing the incredible difference that can result from those efforts. In the chapter entitled "The Realistic Gardener," the author says, "In our gardens, we have an overbearing desire for order, an overwhelming obsession with perfection, and an oversimplified concept of biological facts. Taken together, this combination can stop naturalistic processes dead in their tracks." That stopped *me* in my tracks!

I am always looking at ways to become a 'better gardener,' to have a lush veggie garden that spills over with a harvest that looks beautiful and isn't so insect damaged as to be unappetizing. This book has helped me relax and start to enjoy the process more—to see that in my quest to be healthier and grow my own food I can reconnect with the natural world in my own small plot of land here in Oakland. I hope my garden can someday be an oasis where everyone with any number of legs can prosper. Taking the time to learn about the multitudes that live here, to observe them and befriend them, both 'good' and 'bad,' moves my life in a healthier direction.

Helen Krayenhoff is co-owner of Kassenhoff Growers, a local certified organic plant nursery. You can find out more at kassenhoffgrowers.com. She is also an illustrator, watercolorist, designer, and photographer. You can see her work at helenkrayenhoff.com or check out the Berkeley Horticultural Nursery website where many of her photographs and illustrations are featured. berkeleyhort.com

QUALITY SERVICE
STAR GROCERY
STAR MEATS
3068 Claremont Ave
in Berkeley since 1922
510-652-2490
meat: 510-652-2490
We are driven by a passion for food. Through our close relationships with local producers such as Marin Sun, Pitman, Niman, Full Belly, Blue Heron, Capay Organics, Fra'mani, Phoenix Pastaficio, Cowgirl Creamery, Fleur de Lyon, June Taylor Jams, and many others, we are able to offer a fantastic variety of products, augmented by a selection of exemplary imports. Star Meats is a full-service butcher shop and deli with great prepared dishes, house made charcuterie, and the best sandwiches in town. Come look around—If we don't have it, we'll find it for you.
Open Mon – Sat 8–7 Sun 10–5

Pollution Prevention Program

Summary of Co-permittee Street Sweeping Activities - FY 2009-2010

Municipality	Miles of Paved Streets	Total Miles Swept	Volume of Material Collected	Removal Rate Vol./ Mile	Leaf Litter Collected[15]
City of Cupertino[1,2]	308	8,284	2,298 yd^3	0.28 yd^3/miles	8,033 yd^3
City of Los Altos[1,2]	108	5,292	1,300 yd^3	0.25 yd^3/miles	2,495 yd^3 10,912 tons
City of Los Altos Hills[2]	57	1,363	41 yd^3	0.03 yd^3/miles	26 yd^3 167 tons
City of Milpitas[3,4]	126	10,348	4,970 yd^3	0.48 yd^3/miles	78 tons
City of Mountain View	340	9,196	7,620 yd^3	0.83 yd^3/miles	6,966 tons
City of Palo Alto	419	21,192	14,584 yd^3	0.69 yd^3/miles	16,084[5] yd^3 12,185[6] tons
City of San Jose	6,930	62,421	24,554 yd^3	0.39 yd^3/miles	31,381[5] tons 134,643[7] tons
City of Santa Clara[2,8,8a,9]	247	29,768	7,593 yd^3	0.26 yd^3/miles	1,427 yd^3
City of Sunnyvale[10]	734	14,768	8,769 yd^3	0.59 yd^3/miles	572 yd^3 17,221[16] tons
West Valley Communities					
City of Campbell[11]	149	5,794	1,468 yd^3	0.25 yd^3/miles	6,039 tons
Town of Los Gatos	110	11,335	905 yd^3	0.08 yd^3/miles	6,513 tons
City of Monte Sereno	28	545	73 yd^3	0.13 yd^3/miles	779 tons
City of Saratoga[2,12]	275	3,348	830 yd^3	0.25 yd^3/miles	13,787 tons
County of Santa Clara[2]	232	11,634	4,000 yd^3	0.34 yd^3/miles	
Santa Clara Valley Water District[13]					
TOTALS	**10,063 miles**	**195,288 miles**	**79,004 yd^3** **(51,313 tons)[14]**		**198,378 tons** **28,637 yd^3**
AVERAGE		**13,949 miles**	**5,643 yd^3**	**0.40 yd^3/miles**	

Notes:

1. Leaf litter included in material removed.
2. No leaf removal program other than routine street sweeping or yard waste collection.
3. Quarterly advertisement in the Milpitas Post and door hangers notifying each residential home of their sweeping day.
4. Volume does not include leaves. Leaf removal program is effective during the winter months. The City does not keep track of the volume of leaves removed, as leaf bags are picked up by solid waste garbage trucks.
5. Estimated weight of leaves collected during FY 09-10.
6. Total weight of yard trimmings (excluding leaves) collected during FY 09-10.
7. Total weight of yard trimmings (including leaves) collected during FY 09-10.
8. Leaf VAC's out on route November and December 2009.

8a. Employee Injury - March 2020-May 2010

9. Clean-up campaigns conducted in March 2010.
10. Sweeping is scheduled once per month in residential areas, more frequently in commercial areas. When requested, staff will post "No Parking" signs to remove parked cars in problem areas. Frequency is increased during heavy leaf drop season, and returned to reduced schedule during other seasons.
11. City of Campbell garbage hauler, West Valley Collection and Recycling provides containers to our residents for leaves, grass clippings, etc.
12. Extra sweeping of main arterials and residential 3 was eliminated this year due to budget constraints.
13. Does not conduct street sweeping.
14. To determine the total volume of material removed in tons, it is necessary to convert cubic yards to tons. It is estimated that the average density of street sweeping material is 1,299 pounds per cubic yard (0.6495 tons per cubic yard) (Source: EOA, Inc., October 1996, Estimation of Copper Collected Through Street Sweeping Efforts. Prepared for San Mateo Countywide Stormwater Pollution Prevention Program). A value of 53,033 tons is calculated when 79,004 cubic yards is converted over to tons (79,004 cubic yards* .6495 tons/cubic yard= 51,313 tons).
15. Includes total weight of yard trimmings collected by individual Co-permittees. Leaf litter is co-mingled with yard trimmings. Co-permittees do not have the ability to separate the weight or volume of leaves from this waste stream. This total does not include the efforts of all Co-permittees.
16. Yard trimmings from source separated collection program was 14,682 tons. Clean-green materials delivered to SMaRT station by City of Sunnyvale Residents was 2,539 tons. Total yard waste collected by the City of Sunnyvale was 17,221 tons.

Santa Clara Valley Water District[1]																	
TOTALS	**10,063**	**122,326**	**69,251**	**3,711**	**195,288**	**51,603**	**25,089**	**2,312**	**79,004**	**1,052**	**505**	**250**	**1,807**	**2,078**	**1,000**	**48**	**3,127**

Notes:

1. Does not conduct street sweeping.

2. To determine the estimated pollutant load reduction of copper (in pounds), the volume of material collected from each Co-permittee land use type (i.e., residential, commercial and industrial) was multiplied by the mean concentration of trace metal content for street sweeping samples determined in the study entitled Chemical and Physical Characteristics of Street Sweeping Sediments in Tampa, Florida, May 1999. In this study, the mean copper concentration for samples collected in residential areas (n=51) was 23.51 mg/kg. In addition the mean copper concentrations for samples collected in commercial (n=17) and industrial (n=7) areas was 23.24 mg/kg and 124.71 mg/kg, respectively. These values were then converted over to pounds and summed to represent the estimated mean pollutant load reduction for copper. A sample calculation is as follows: (1670*23.51*6.43*0.785*0.85)/(0.00495*1000*1000) = 34.03

3. To determine the estimated pollutant load reduction of nickel (in pounds), the volume of material collected from each Co-permittee land use type (i.e., residential, commercial and industrial) was multiplied by the mean concentration of trace metal content for street sweeping samples determined in the study entitled Chemical and Physical Characteristics of Street Sweeping Sediments in Tampa, Florida, May 1999. In this study, the mean nickel concentration for samples collected in residential areas (n=51) was 46.47 mg/kg. In addition the mean nickel concentrations for samples collected in commercial (n=17) and industrial (n=7) areas was 46.00 mg/kg and 24.14 mg/kg, respectively. These values were then converted over to pounds and summed to represent the estimated mean pollutant load reduction for nickel. A sample calculation is as follows: (952*46.47*6.43*0.785*0.85)/(0.00495*1000*1000)= 38.34

Notes:

1. Does not conduct street sweeping.

2. To determine the estimated pollutant load reduction of lead (in pounds), the volume of material collected from each Co-permittee land use type (i.e., residential, commercial and industrial) was multiplied by the concentration of trace metal content for street sweeping samples determined in the study entitled Street Sweeping for Pollutant Removal, Department of Environmental Protection, Montgomery County, Maryland, February 2002. In this study, the lead concentration for samples collected in residential areas was 43.8 mg/kg. In addition the lead concentrations for samples collected in commercial and industrial areas was 111 mg/kg and 117 mg/kg, respectively. These values were then converted over to pounds and summed to represent the estimated mean pollutant load reduction for lead. A sample calculation is as follows: (1670*43.8*6.43*0.785*0.85)/(0.00495*1000*1000)= 63.40.

3. To determine the estimated pollutant load reduction of zinc (in pounds), the volume of material collected from each Co-permittee land use type (i.e., residential, commercial and industrial) was multiplied by the mean concentration of trace metal content for street sweeping samples determined in the study entitled Chemical and Physical Characteristics of Street Sweeping Sediments in Tampa, Florida, May 1999. In this study, the mean zinc concentration for samples collected in residential areas (n=51) was 58.96 mg/kg. In addition the mean zinc concentrations for samples collected in commercial (n=17) and industrial (n=7) areas was 78.65 mg/kg and 96.29 mg/kg, respectively. These values were then converted over to pounds and summed to represent the estimated mean pollutant load reduction for zinc. A sample calculation is as follows: (952*78.65*6.43*0.785*0.85)/(0.00495*1000*1000)= 48.65.

Pesticide Regulation for Water Quality Protection

Annual BASMAA Participation Summary and Outcomes Assessment 2010

Documentation of action taken to comply with San Francisco Bay Area Municipal Regional Stormwater NPDES Permit, Order R2-2009-0074, Section C.9.e.

Prepared for the Bay Area Stormwater Management Agencies Association

August 30, 2010

PREFACE

This is a report of research performed by TDC Environmental, LLC for the Bay Area Stormwater Management Agencies Association (BASMAA). This report was prepared to assist San Francisco Bay Area municipalities with documenting compliance with Municipal Regional Stormwater Permit Provision C.9.e. Preparation of this report was funded by the Alameda Countywide Clean Water Program through an agreement with Applied Marine Sciences, Inc.

TDC Environmental, LLC does not make any warranty, expressed or implied, nor assume any legal liability or responsibility for any third party's use of this report or the consequences of use of any information, product, or process described in this report. Mention of trade names or commercial products, organizations, or suppliers does not constitute endorsement or recommendation for or against use.

ACKNOWLEDGEMENTS

The author greatly appreciates assistance provided by members of the Urban Pesticides Committee in navigating California and Federal pesticide regulatory activities relating to water quality. TDC Environmental thanks the following colleagues and reviewers for their assistance with completing this report:

- BASMAA Monitoring and Pollutants of Concern Committee
- Geoff Brosseau, Bay Area Stormwater Management Agencies Association
- Jamison Crosby, Contra Costa Clean Water Program (CCCWP)
- Arleen Feng and James Scanlin, Alameda Countywide Clean Water Program (ACCWP)
- Athena Honore, San Francisco Estuary Partnership
- Dave Tamayo, Sacramento County Stormwater Quality Program

Thanks are also due to Jamison Crosby of CCCWP and Paul Salop of Applied Marine Sciences for project management.

EXECUTIVE SUMMARY

Section C.9.e. of the San Francisco Bay Area Municipal Regional Stormwater NPDES Permit (MRP) requires tracking and participating in pesticide-related California and Federal regulatory processes and reporting on these activities. This regional report is intended to document actions taken to comply with Section C.9.e.i. to fulfill the reporting requirement in Section C.9.e.ii. The time period covered by this report is July 1, 2009 through June 30, 2010 (fiscal year [FY] 2010).

During this time period, Bay Area Stormwater Management Agencies Association (BASMAA) members participated in pesticide regulatory activities through the California Stormwater Quality Association (CASQA). CASQA is supported by its statewide membership—including BASMAA agencies--which manage, staff, and fund consultant support for pesticide regulatory engagement. CASQA also relied on the Urban Pesticide Pollution Prevention Project (UP3 Project) for tracking California and Federal pesticide regulatory activities, identifying priorities for municipality engagement, and coordinating CASQA's regulatory engagement with the pesticide regulatory activities of California municipal wastewater treatment plants and the State Water Resources Control Board and Regional Water Quality Control Boards. All of these agencies relied on the UP3 Project to provide scientific information, regulatory analysis, and assistance in communicating with pesticide regulators.

The ultimate goals of CASQA's and BASMAA's pesticide regulatory engagement are to prevent surface water impairment and to prevent violations of stormwater NPDES permits (see Section 4.1). Major FY 2010 objectives were to end pyrethroid-related toxicity in California urban watersheds without transitioning to other harmful products and to encourage changes in California and Federal pesticide regulatory processes such that these processes effectively prevent future water quality and compliance problems.

CASQA's pesticide regulatory engagement prioritized the pesticides of concern listed in the MRP (see Section 3.2). Pyrethroid insecticides, which have been linked to widespread toxicity in creek waters and sediments, were the highest priority for pesticide regulatory involvement. CASQA wrote 6 letters, participated in 2 public workshops, and 6 regulatory process meetings to provide information and recommendations to pesticides regulators (see Section 3.3 and Table 2). CASQA also shared information with regulators and other stakeholders at four Urban Pesticides Committee meetings and through UP3 Project informal contacts with regulators (Table 2).

Although regulatory processes can take many years to reach outcomes, the results of pesticide regulatory engagement are starting to be evident, and show substantial progress toward the BASMAA, CASQA, and Water Board goals of preventing surface water impairment from pesticides, implementing the Diazinon and Pesticide-Related Toxicity in Bay Area Urban Creeks Water Quality Attainment Strategy and Total Maximum Daily Load, and preventing pesticide-related violations of stormwater NPDES permits (see Section 4 and Table 3). Nevertheless, much additional work will be needed to end pyrethroid-related toxicity in urban watersheds and to achieve the ultimate goal of ensuring that pesticides do not interfere with Clean Water Act compliance.

1.0 INTRODUCTION

1.1 Scope of This Report

The San Francisco Bay Area Municipal Regional Stormwater NPDES Permit includes the following provision for tracking and participating in pesticide-related regulatory processes and for reporting on these activities:

> ***C. 9. e. Track and Participate in Relevant Regulatory Processes*** *(may be done jointly with other Permittees, such as through CASQA or BASMAA and/or the Urban Pesticide Pollution Prevention Project)*
>
> ***i. Task Description***
>
> *(1) The Permittees shall track USEPA pesticide evaluation and registration activities as they relate to surface water quality, and when necessary, encourage USEPA to coordinate implementation of the Federal Insecticide, Fungicide, and Rodenticide Act and the CWA and to accommodate water quality concerns within its pesticide registration process;*
>
> *(2) The Permittees shall track California Department of Pesticide Regulation (DPR) pesticide evaluation activities as they relate to surface water quality, and when necessary, encourage DPR to coordinate implementation of the California Food and Agriculture Code with the California Water Code and to accommodate water quality concerns within its pesticide evaluation process;*
>
> *(3) The Permittees shall assemble and submit information (such as monitoring data) as needed to assist DPR and County Agricultural Commissioners in ensuring that pesticide applications comply with water quality standards; and*
>
> *(4) As appropriate, the Permittees shall submit comment letters on USEPA and DPR re-registration, re-evaluation, and other actions relating to pesticides of concern for water quality.*
>
> ***ii. Reporting –*** *In their Annual Reports, the Permittees who participate in a regional effort to comply with C.9.e. may reference a regional report that summarizes regional participation efforts, information submitted, and how regulatory actions were affected. All other Permittees shall list their specific participation efforts, information submitted, and how regulatory actions were affected.*

This regional report is intended to document actions taken to comply with Section C.9.e.i. to fulfill the reporting requirement in Section C.9.e.ii. The time period covered by this report is July 1, 2009 through June 30, 2010 (fiscal year [FY] 2010).

1.2 Report Organization

This report is organized as follows:

- <u>*Section 1*</u> (this section) provides the scope and organization of the report.

- *Section 2* explains why BASMAA members have joined municipalities across California in participating in pesticide regulatory activities and summarizes the major California and Federal pesticide review processes.
- *Section 3* summarizes FY 2010 pesticide regulatory engagement.
- *Section 4* evaluates the outcomes of pesticide regulatory engagement to the extent that outcomes were known as of July 2010 (most pesticide regulatory processes of interest in FY 2010 are still underway).

2.0 BACKGROUND

2.1 Pesticides and Water Quality—A Regulatory Gap

Numerous scientific studies have demonstrated that use of some pesticides registered in accordance with Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) requirements can adversely affect aquatic species. Those impacts can, in turn, cause violations of water quality standards. As a result of discharges containing pesticides registered for use by the U.S. Environmental Protection Agency (U.S. EPA), many surface waters in California have been designated as "impaired" in accordance with Federal Clean Water Act §303(d). This finding means that the surface waters do not meet water quality standards. These listings demonstrate that current U.S. EPA and California Environmental Protection Agency (Cal-EPA) procedures for regulating pesticides are insufficient to ensure that pesticide use does not cause violations of the Federal Clean Water Act and California Porter-Cologne Water Quality Control Act.

Federal law provides U.S. EPA with the ability to protect surface water from pesticides. California law technically provides two parts of the California Environmental Protection Agency (Cal-EPA), the California Department of Pesticide Regulation (DPR) and California state water quality regulators, with the ability to protect surface water from pesticides. Except in extraordinary circumstances, California Water Boards defer pesticides regulation to DPR.

While the mandates of these pesticide and water quality laws differ slightly, the approaches to implementing these two groups of laws are very different and have important ramifications for pesticides and water quality. In general, pesticide regulatory programs are structured to respond slowly when water quality problems occur—and without financial penalties to pesticide manufacturers or users. In contrast, water quality programs are generally structured to react quickly when water quality problems occur—with immediate financial consequences, particularly for municipalities. Pesticide regulators and water quality regulators employ very different procedures to manage pesticides. While these differences sometimes seem arcane, they create regulatory gaps that leave states and municipalities responsible for solving water quality problems that could have been prevented at the time a pesticide was registered or re-registered.

Three groups of agencies that manage California's water quality are working with pesticide regulators to address this regulatory gap: the State Water Resources Control Board and Regional Water Quality Control Boards ("Water Boards"), municipal wastewater treatment plants (also known as sewage treatment plants or publicly-owned treatment works [POTWs]), and urban runoff management agencies (including BASMAA members). This report refers to these three groups of agencies collectively as "California water quality agencies."

Urban runoff management agencies—including BASMAA's members—have conducted their portion of this effort through their statewide organization, the California Stormwater Quality Association (CASQA).

Why California Municipalities Are Working with Pesticide Regulators

California municipalities began regular engagement in pesticide regulatory processes because they had concluded that the most cost-effective approach to protecting surface water from pesticide-related toxicity is to <u>prevent</u> pesticide uses that have significant potential to cause water quality impairment or that cause violations of NPDES permits.

Preventing water quality problems at the source is well known to be more effective—and far less costly—than alternatives.

The recent scientific finding that pyrethroid insecticides are linked to widespread toxicity to sediment-dwelling organisms in California urban creeks[1] has increased the importance of active California municipality participation in California and Federal pesticide regulatory processes. Since California law precludes local regulation of pesticides, municipal urban runoff programs must rely on pesticide regulators to solve this problem.

Role of the Urban Pesticide Pollution Prevention Project (UP3 Project)

Because understanding and participating in regulatory activities is complex and time-intensive, CASQA, the Water Boards, and POTWs found that they needed scientific and regulatory support to participate in pesticide regulatory processes. The Urban Pesticide Pollution Prevention (UP3) Project was established in mid-2004 specifically to provide this much-needed support.

To maximize the effectiveness of their pesticide regulatory involvement and minimize cost, CASQA, the Water Boards, and POTWs have organized their pesticide regulatory involvement efforts jointly. Since its inception, the UP3 Project has taken on the role of coordinating the joint cooperative regulatory involvement effort.

The UP3 Project supports California water quality agency participation in pesticide regulatory actions by identifying and tracking pesticide regulatory processes of significant interest for water quality, analyzing pesticide regulatory documents to identify water quality protection gaps, and reviewing scientific studies to assemble the information needed to fill the identified gaps. The UP3 Project assists water quality agencies with communicating this information directly to regulators at U.S. EPA, and California Department of Pesticide Regulation (DPR) through letters, meetings, informal communications, and presentations.

To coordinate agency activities and facilitate dialog, the UP3 Project also manages the Urban Pesticides Committee (UPC), which serves as a center for information exchange, coordination, and collaboration among local, regional, and state agencies and other stakeholders seeking to end pesticide-related surface water toxicity problems.

The UP3 Project operates an announcement-only e-mail list for UPC members to keep them up to date on regulatory, scientific, and educational program developments.

The UP3 Project also maintains a web site (www.up3project.org) that provides documents and other resources to assist agencies with implementing programs to prevent pesticide-related water quality problems.

From its inception through 2010, UP3 Project has been funded by a State Water Resources Control Board grant administered by the San Francisco Estuary Partnership (SFEP). TDC Environmental has provided technical support for the project.

The UP3 Project is currently seeking funding to allow it to continue after the end of 2010.

2.2 U.S. EPA and DPR Pesticide Review Processes

California water quality agencies primarily engage with pesticide regulators within the existing regulatory processes established by U.S. EPA and DPR. Both U.S. EPA and

[1] The many scientific studies documenting this toxicity are summarized in TDC Environmental (2008). *Pesticides in Urban Surface Water: Annual Review of New Scientific Findings 2008*, prepared for the UP3 Project. April.

DPR have processes to review pesticides prior to their first use and processes to respond to human health and environmental problems that occur after a pesticide is approved for use. Both agencies also have the responsibility to review all pesticides periodically. Table 1 (on the next two pages) provides a brief description of the various pesticide review processes conducted by U.S. EPA and DPR and identifies the public input opportunities associated with each process.

If a pesticide-related water quality problem (like the problems with diazinon, chlorpyrifos, and the pyrethroids) is documented in the environment, the DPR regulatory process offers the most immediate response mechanism. DPR's pesticide "reevaluation" process is structured to respond to environmental problems more rapidly than the "special review" process at U.S. EPA.

On the basis of the structure of the public involvement processes and the nature pesticide regulatory agency authorities, two pesticide regulatory processes have been the focus of regulatory engagement: U.S. EPA Pesticide Registration Review and California DPR pesticide reevaluation. While the focus is on engagement in formal regulatory processes, the participation has extended to less formal situations, to facilitate a sharing of scientific information and to increase mutual understanding of the regulatory context provided by California and Federal pesticide and water quality legal frameworks.

Table 1: Summary of U.S. EPA and DPR Pesticide Review Processes

Agency	Process	Description	Overview of Public Input Opportunities
U.S. EPA	Registration	New pesticides must be registered or exempted by U.S. EPA before they may be sold. New uses of existing pesticides must also be registered. During registration, U.S. EPA evaluates effects on humans and the environment (including surface water).	Other than making its registration workplan available,[2] U.S. EPA has no public involvement process for pesticide registration.
	Registration review	All currently registered pesticides are planned for review on a 15-year cycle.[3] Each pesticide's review process starts with a "docket opening," which is an opportunity to submit scientific information and to comment on the registration review workplan. Subsequent steps are established by the workplan.	Public involvement opportunities after the docket opening depend on the workplan; these may include opportunities to review U.S. EPA-prepared risk assessments, to provide recommendations for risk reduction options, and to comment on U.S. EPA's proposed registration review decision.
	Special review	U.S. EPA initiates special review when it discovers that the use of a registered pesticide may result in unreasonable adverse effects on humans or the environment. The special review process usually involves intensive review of a specific problem. During special review, U.S. EPA may review scientific information, re-evaluate the identified risk, and select risk reduction measures.	Processes vary. At a minimum, the public is offered the opportunity to comment on the decision proposed by U.S. EPA on the basis of its special review.

045808

Table 1: Summary of U.S. EPA and DPR Pesticide Review Processes (Continued)

Agency	Process	Description	Overview of Public Input Opportunities
DPR	Registration	California has a state requirement for pesticide registration. Like U.S. EPA, it evaluates effects on humans and the environment. Unlike U.S. EPA (which reviews products containing the same active ingredient as group) DPR registers each pesticide product individually. DPR determines whether to evaluate a pesticide product's potential to cause surface water quality or wastewater discharge impacts on a case by case basis.	Other than making lists of products entering review available, DPR has no public involvement process for pesticide registration. By providing these lists to its interagency advisory committee (the Pesticide Registration and Evaluation Committee), DPR provides an opportunity for interagency consultation.
	Annual Registration Renewal	California law requires annual renewal of all pesticide registrations. This review is very brief; ordinarily, registrations are renewed if fees are paid and if registrants certify compliance with the requirement to disclose factual or scientific evidence of any adverse effect or risk of the pesticide to human health or the environment.	DPR issues a formal notice of the proposed annual renewal for all pesticides and provides a comment period. Because the notice does not include pesticide-specific information, the process serves as an annual opportunity for the public to provide DPR with information about adverse effects of pesticides.
	Reevaluation	If DPR finds that a significant adverse impact has occurred or is likely to occur from the use of a pesticide, it initiates a reevaluation. During reevaluation, DPR reviews existing data and may require development of additional data related to the impacts of the pesticide. DPR's goal is to identify ways to reduce or eliminate confirmed problems.	DPR has no formal public involvement process for reevaluation; however, it has offered selected stakeholders opportunities to review various documents associated with the reevaluation of pyrethroid insecticides. DPR usually consults with its interagency advisory committee (the Pesticide Registration and Evaluation Committee) when approaching major reevaluation decisions.

045809

3.0 PESTICIDE REGULATORY ENGAGEMENT SUMMARY

3.1 BASMAA Participated through CASQA and UP3 Project

Since 2005, urban runoff management agencies—including BASMAA's members—have conducted their engagement in pesticide regulatory activities through their statewide organization, the California Stormwater Quality Association (CASQA). In keeping with this strategy, the BASMAA Monitoring/Pollutants of Concern (POC) Committee established that BASMAA's FY 2010 pesticide regulatory involvement would be conducted via CASQA. In FY 2010, MRP Permittees participated in pesticide regulatory processes through CASQA.

CASQA has a Pesticides Subcommittee that manages its day-to-day involvement in pesticide regulatory activities. In fiscal year 2010, the subcommittee had two co-chairs: Jamison Crosby of the Contra Costa Clean Water Program (CCCWP) and Dave Tamayo of the Sacramento County Stormwater Quality Program. Ten teleconference meetings were held in FY 2010. Representatives of the Alameda Countywide Clean Water Program (ACCWP), the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP), and the City of Palo Alto are also on the subcommittee roster. Both CCCWP and ACCWP actively participated in subcommittee meetings in FY 2010.

The CASQA Pesticides Subcommittee coordinates stormwater agency participation in pesticide regulatory activities. The subcommittee determines the actions to be taken by CASQA, provides direction to its representatives for participation in agency meetings, peer reviews draft correspondence, and shares information among members. As co-chair, Ms. Crosby has assumed a role in identifying financial resources necessary to support CASQA's activities (which are obtained not only from CASQA but also through contributions from member agencies) and in managing committee-related contracts.

Ms. Crosby provides the linkage between CASQA and the BASMAA Monitoring/POC Committee.

3.2 Engagement Prioritized Pesticides of Concern in the MRP

U.S. EPA and DPR regulatory processes involve thousands of pesticides each year. Only a small fraction of these pesticides pose significant threats to the quality of urban runoff. CASQA has focused its participation in pesticide regulatory processes on pesticides identified by the UP3 Project as most likely to threaten urban surface water quality through urban runoff.[4] Of these pesticides, the highest priorities are the same current-use pesticides listed as pesticides of concern in the MRP (pyrethroids, fipronil, carbamates, and organophosphorous pesticides).

On the basis of urban watershed monitoring data from across California and urban pesticide use estimates assembled by the UP3 Project, when further prioritization is necessary, CASQA has followed the UP3 Project recommendation to prioritize the pyrethroids (bifenthrin, cyfluthrin, beta-cyfluthrin, cypermethrin, deltamethrin, esfenvalerate, lambda-cyhalothrin, permethrin, and tralomethrin) and fipronil.[5] Among the pyrethroids, those most commonly linked to aquatic toxicity (bifenthrin, cyfluthrin [including beta-cyfluthrin], and cypermethrin) have been prioritized.

---

[4] For the most recent list see TDC Environmental (2010). Pesticides in Urban Runoff, Wastewater, and Surface Water. Annual Review of new Scientific Findings 2010. Prepared for the UP3 Project. March.
[5] TDC Environmental (2008). Pesticides of Interest for Urban Surface Water Quality. Urban Pesticides Use Trends Annual Report 2008. Prepared for the UP3 Project. July 30; Moran, K. D. (2007). "Urban Use of the Insecticide Fipronil—Water Quality Implications." Memorandum prepared for the UP3 Project. June 18.

According to UP3 Project analysis, organophosphates (chlorpyrifos, diazinon, and malathion) and carbamates (carbaryl) are lower priorities than the pyrethroids and fipronil. Neither diazinon nor chlorpyrifos pose a continuing threat to urban watersheds now that U.S. EPA has prohibited almost all urban use.[6] Similarly, urban watersheds are benefitting from significant reductions in use of both carbaryl and malathion, likely the consequence of U.S. EPA regulatory requirements.[7]

3.3 Engagement Summary for Fiscal Year 2010

CASQA and UP3 Project Conducted All Four Tasks Listed in MRP Section C.9.e.

CASQA encouraged USEPA and DPR to coordinate implementation of pesticide and water laws to accommodate water quality concerns as required under MRP sections C.9.e.i.(1) and (2) and submitted comment letters as required under C.9.e.1.(4). Table 2 (on the following pages) lists specific CASQA and BASMAA member actions, including meetings and correspondence.

In FY 2010, CASQA relied on the UP3 Project to complete the pesticide evaluation and registration activities tracking required under C.9.e.i.(1) and (2) and the assembly and submittal of information to DPR as required under C.9.e.i.(3). UP3 Project regulatory tracking tables for FY 2010 are available on the UP3 Project website together with other Urban Pesticides Committee (UPC) meeting materials. Due to the suspension of grant funding for part of the fiscal year, tracking tables were prepared four times during the fiscal year instead of bimonthly. UP3 Project submittal of information to DPR is included in Table 2.

During the UP3 Project's 2009 grant hiatus, UP3 Project regulatory tracking, communications with U.S. EPA and DPR, and one FY 2010 UPC meeting were partially funded by two Bay Area municipalities: the Cities of San Francisco and Palo Alto. (Other funding was provided by other CASQA members and by POTWs).

California Pyrethroid Reevaluation Was 2010 Priority

Responding to widespread toxicity in California surface waters linked to pyrethroid insecticides, in August 2006 DPR initiated regulatory action ("reevaluation") to identify mitigation measures to address the toxicity. DPR has offered California water quality agencies—including CASQA—opportunities to provide information at various junctures in the pyrethroid reevaluation. Participating in DPR's pyrethroid reevaluation was the top priority for CASQA in FY 2010. DPR has responded to California water quality agency engagement—the level of interagency information-sharing occurring in the pyrethroid reevaluation is unprecedented in the history of DPR reevaluations.

[6] For this reason they were dropped from the UP3 List of pesticides of concern in urban runoff (see TDC Environmental (2010). Pesticides in Urban Runoff, Wastewater, and Surface Water. Annual Review of new Scientific Findings 2010. Prepared for the UP3 Project. March.)

[7] TDC Environmental (2010). Pesticides in Urban Runoff, Wastewater, and Surface Water. Annual Urban Pesticide Use Data Report 2010. Prepared for the UP3 Project. June 28.

Table 2: Pesticide Regulatory Process Participation in FY 2010

Organization	Process	Action	Desired Outcome
U.S. EPA	Office of Pesticide Programs (OPP) and Office of Water (OW) Effects Assessment Methodology Reconciliation Project	CASQA Letter – August 25, 2009 Thanked U.S. EPA for initiating project, requested project scope expansion to include differences in aquatic toxicity test species, asked that the U.S. EPA project team be expanded to include OW Office of Wastewater Management, and that the project be designed to consider both fresh and salt water. Oral testimony by representatives of CASQA, CCCWP, ACCWP, and SCVURPPP at U.S. EPA stakeholder meeting – January 22, 2010 Thanked U.S. EPA for conducting the project, explained the regulatory gap caused by inconsistent effects assessment methods between the two U.S. EPA Offices, provided examples of aquatic toxicity resulting from this gap, described costs to municipalities to respond to this toxicity, and requested that U.S. EPA expand the scope of the project to resolve the toxicity testing differences.	Expand project scope to examine approaches for coordinating OPP's effects assessments with the OW-approved toxicity testing procedures. Educate U.S. EPA OPP environmental risk assessors. Draw attention to pesticide-related toxicity in urban watersheds and ask U.S. EPA to change its regulatory processes so that they identify and prevent this toxicity.
	Advanced Notice of Proposed Rulemaking – Pesticide Inert Ingredients Disclosure	CASQA letter – February 22, 2010 Supported U.S. EPA's intention to require disclosure of pesticide inert ingredients. Urged U.S. EPA to develop this rule so as to capture the full range of such chemicals that may be harmful to human health or the environment, and to require public disclosure of their presence in any products that are available for use by "consumers" including both government agencies and the general public. Provided responses to specific questions raised by U.S. EPA describing how the regulation could best be designed to assist with water quality protection. San Francisco Department of the Environment letter – April 21, 2010 Echoed CASQA's comments plus provided information based on City experience operating a municipal integrated pest management program.	Disclosure of pesticide inert ingredient identities to assist with efforts to prevent water pollution. Of interest because some "inert" (other) pesticide ingredients are water pollutants; others facilitate the transport of pesticides into urban runoff.

045812

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
U.S. EPA	Esfenvalerate Registration Review	CASQA letter – February 16, 2010 Requested specific changes to Registration Review workplan, including an exposure assessment for urban uses of esfenvalerate including both water column and sediments as well as cumulative risks with other pyrethroids in urban watersheds. Supported proposed environmental risk assessment data request list. Recommended utilization of existing information from the scientific literature, from surface water monitoring programs, and from the DPR pyrethroid reevaluation.	Changes to the registration review process to better identify and mitigate urban water quality impacts and adoption of these changes as part of U.S. EPA's overall approach to the registration review process for all pesticides with urban use patterns.
	Deltamethrin Registration Review	CASQA letter - June 1, 2010 Requested specific changes to Registration Review workplan, including an exposure assessment for urban uses of deltamethrin including both water column and sediments as well as cumulative risks with other pyrethroids in urban watersheds. Recommended utilization of existing information from surface water monitoring programs and from the DPR pyrethroid reevaluation.	Changes to the registration review process to better identify and mitigate urban water quality impacts and adoption of these changes as part of U.S. EPA's overall approach to the registration review process for all pesticides with urban use patterns.
	None	The UP3 Project provided the following information to U.S. EPA: • Information on fipronil to support concerns about its presence in urban runoff – December 2009 • Paper on urban runoff modeling approaches - January 2010 • Conceptual model for pyrethroids in urban runoff – March 2010	Improve U.S. EPA's scientific understanding of pesticides in urban runoff such that EPA has sufficient scientific information to structure regulatory processes to ensure that pesticide applications comply with water quality standards.

045813

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
DPR	Pyrethroid Reevaluation	<u>CASQA/PWG Meeting – July 22, 2009</u> At DPR's request, CASQA representatives, including Jamison Crosby of CCCWP, met directly with PWG to explain concerns with the slow pace of the pyrethroids reevaluation including the potential for high monitoring costs for municipalities due to pyrethroids and associated toxicity, and the ongoing threat of third-party lawsuits. CASQA asked for faster progress and for the next steps to be rooted in a conceptual model developed on the basis of the extensive existing scientific literature about pollutants in urban runoff. CASQA and PWG agreed that communications processes for to the pyrethroid reevaluation needed to be improved. <u>CASQA/PWG Meeting – December 9, 2009</u> At DPR's request, CASQA met with PWG to provide verbal comments to PWG on its draft conceptual model for pyrethroids in urban runoff and a draft list of scientific studies proposed to fill what PWG had identified as priority data gaps. Agreed with the general conceptual model with some minor modifications, but found the model was not structured in a manner that meets the needs for the next steps in the pyrethroid reevaluation. Recommended significant modifications to the list of scientific studies and an urban runoff literature review to eliminate perceived data gaps and provide a scientifically based focus for study designs and mitigation proposals.	End pyrethroid-related toxicity in California urban watersheds without transitioning to other harmful products. Educate DPR about pesticide-related toxicity in urban watersheds. Ask DPR to change its regulatory processes so that it identifies and prevents such toxicity.
		<u>PWG Controlled Urban Pyrethroid Applications and Monitoring Study – CASQA Letter July 10, 2009</u> Recommended against pursuing this study proposal because it would be time-consuming and would have a low probability of providing useful information. Detailed scientific comments supported these points.	

045814

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
DPR	Pyrethroid Reevaluation	PWG Applicator Survey Proposal – Input to Sacramento County Letter to DPR, January 28, 2010 Because DPR afforded an abbreviated review period for this PWG study proposal, CASQA did not have time to complete required internal peer review prior to submitting a letter. To provide a quicker alternative, Sacramento County volunteered to incorporate CASQA's recommendations into a letter to DPR. Recommendations included focusing the survey on priority data gaps about professional structural pest control identified by the UP3 Project (differentiating outdoor, indoor, underground, and pre-construction termiticide applications and understanding the relative quantities applied on outdoor impervious and pervious surfaces); reducing the survey length and taking other actions to increase participation; and making other changes to increase the validity of survey results.	See above
		CASQA meeting with DPR & Water Boards – March 17, 2010 Requested faster pace toward ending pyrethroid-related toxicity in urban watersheds. Explained concerns with the slow pace of the pyrethroids reevaluation including the potential for high monitoring costs for municipalities due to pyrethroids and associated toxicity, and the ongoing threat of third-party lawsuits. DPR announced its intent to initiate monthly stakeholder meetings, and requested participation of CASQA decision-makers. CASQA agreed. Obtained insight into practical aspects of various DPR regulatory options to address pyrethroid-related toxicity.	

045815

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
DPR	Pyrethroid Reevaluation	<u>DPR Pyrethroid Reevaluation Stakeholder Meetings (PRSM meetings) – Monthly starting in May 2010 (two in FY 2010)</u> Initiated monthly meetings among DPR, CASQA, the Water Boards, POTWs, PWG, and professional pest control applicators to improve communications, to conduct joint fact finding, to identify priority data gaps requiring additional information to be generated by pyrethroid manufacturers, and to identify mitigation strategies to end pyrethroid-related toxicity in urban watersheds. In FY 2010 meetings, the stakeholder group came to agreement on a conceptual model for pyrethroids in urban runoff, shared information about the feasibility and environmental benefits of various pyrethroid mitigation strategies, and shared relevant scientific information with DPR and other stakeholders. CASQA and the UP3 Project provided the following information to DPR at FY 2010 meetings: • A CASQA-UP3 Project alternative conceptual model for pyrethroids in urban runoff prepared with joint funding from the UP3 Project. • A UP3 Project compilation of bifenthrin monitoring data for urban runoff and urban watersheds across California. • A UP3 Project compilation of available pyrethroid environmental fate data to highlight data gaps and to show indications that bifenthrin's slow environmental degradation is one of several reasons that it alone is the largest contributor to pyrethroid-related toxicity in urban watersheds.	See above
		<u>Conceptual model for Pyrethroids in Urban Runoff</u> CASQA and the UP3 Project jointly funded UP3 Project development of a conceptual model for pyrethroids in urban runoff that can be used to quantify the linkage between urban pyrethroid use patterns and pyrethroids in urban waterways. The UP3 Project provided the model to U.S. EPA and DPR, and shared it with these agencies other stakeholders via presentations at the following events: • American Chemical Society Pyrethroids session – March 24,2010 • DPR PRSM meeting May 2010	

045816

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
DPR	Surface Water Regulatory Concept	Teleconference meeting with DPR – November 18, 2009 Thanked DPR for pursuing regulatory concept. Supported adoption of surface water protection regulations. Learned about DPR's approach to the regulations. Asked questions on areas of concern like the list of covered pesticides and the exemption for applicators participating in a "green or sustainable program." Obtained feedback from DPR that will be used to inform the preparation of written comments. Oral testimony by a representatives of CASQA and CCCWP at DPR Workshop –February 11, 2010 Thanked DPR for pursuing regulatory concept. Supported adoption of surface water protection regulations. Requested DPR establish clear water quality protective standards and process for the exemption for applications under a "green or sustainable program."	Implement effective measures to prevent water pollution associated with professional urban pesticide use. Include in regulatory structure the ability to control pesticides most likely to threaten urban surface water quality through urban runoff, including pesticides that might be registered in the future.
	Pest Management Advisory Committee (PMAC)	DPR PMAC meetings - Quarterly DPR has one general external stakeholder advisory group, called the Pest Management Advisory Committee. A CASQA representative (Dave Tamayo of the Sacramento County Stormwater Quality Program) participates in most meetings and is formally an alternate member of the committee (the lead member in the seat is a POTW representative).	Educate DPR and other urban pest management stakeholders.
	None	The UP3 Project provided the following information to DPR: • Scientific information relevant to two new outdoor urban insecticides (indoxacarb and spinosad), their aquatic toxicity and potential water quality impacts – March 2010	Improve DPR's scientific understanding of pesticides in urban runoff such that EPA has sufficient scientific information to structure regulatory processes to ensure that pesticide applications comply with water quality standards.

045817

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
UP3 Project	Urban Pesticides Committee (UPC) Meetings	UPC meetings - Four meetings in FY 2010 The UPC serves as a center for information exchange, coordination, and collaboration among local, regional, and state agencies and other stakeholders seeking to end pesticide-related surface water toxicity problems. Examples of information and insights shared by CASQA in 2010 include: • Concerns about the slow pace of the pyrethroid reevaluation and need for an approach based on existing scientific literature relevant to urban runoff. • Summaries of meetings with pyrethroid manufacturers. • Concerns with the ongoing pyrethroid-related toxicity—the potential for high monitoring costs for municipalities due to pyrethroids and associated toxicity, and the ongoing threat of third-party lawsuits. • Perspectives on the National Pest Management Association's Green Pro certification. • Updates on participation in California and Federal pesticide regulatory activities.	Educating other stakeholders through informal interactions. Become informed about issues relevant to the development of regulatory and non-regulatory measures to prevent pesticide-related water pollution.

045818

Table 2: Pesticide Regulatory Process Participation in FY 2010 (Continued)

Organization	Process	Action	Desired Outcome
County Agricultural Commissioners	None	MRP Permittees had the following communications with County Agricultural Commissioners regarding pest management to improve water quality protection: • Contra Costa County has been meeting regularly (bimonthly) with the Agricultural Commissioner's office to cover all topics related to integrated pest management (IPM). Meetings were held on July 1, 2009; September 2, 2009; November 4, 2009; January 6, 2010; March 3, 2010 and May 5, 2010. Topics included discussions of the various IPM methods being used by the Flood Control and Water Conservation District (including weed abatement with manual labor, tractor mower, sheep grazing, and spot spraying of broadleaf weeds) and by County Departments (regarding the placement of sticky traps to monitor pest invasions, placement of door sweeps, sealing of cracks, and other physical deterrents [including the use of the "Rodenator"], while encouraging biological controls with the installation of owl boxes and raptor perches). • In June 2010, the City of Concord asked the Contra Costa County Agricultural Commissioner's office for advice in dealing with a sudden surge of bugs this summer in some city parks. The Agricultural Commissioner confirmed the bugs were leaf hoppers and since they do not bite or sting and their populations were predicted to drop sharply in a few weeks, no treatment was recommended. Concord city staff monitored the parks to confirm that the problem did indeed go away in a few weeks without the use of pesticides.	Encourage Agricultural Commissioners to strengthen incorporation water quality protection into their implementation of local pesticide regulatory programs.

4.0 EVALUATION OF 2010 OUTCOMES

4.1 Goals and Objectives for Pesticide Regulatory Engagement

The goals of CASQA's and BASMAA's engagement in pesticide regulatory processes are:

1. To prevent surface water impairment.
2. To prevent violations of stormwater NPDES permits.

To achieve these goals, CASQA has three long-term objectives for its participation in pesticide regulatory processes:

A. Improve design of pesticide water quality impact evaluations. Pesticide water quality impact evaluations conducted by U.S. EPA and DPR should be based on all available scientific information, assess the impacts of pesticides transported to surface water via all pathways (including urban runoff), fully address all urban use patterns, and incorporate evaluation endpoints consistent with Clean Water Act regulatory endpoints.

B. Encourage pesticide regulators to address urban surface water quality in pesticide risk management decisions and to do so in a timely manner. Pesticide risk management decisions should address all significant surface water quality risks including those posed by urban pesticide use patterns, consider costs to water quality agencies, be implemented quickly when water quality problems occur, and prevent new environmental or health impacts from future pesticide market shifts.

C. Seek meaningful public participation opportunities for water quality agencies. To achieve the above objectives, pesticide regulatory decisions relevant to water quality need to include public participation processes that make all relevant information available for water quality agency review and provide opportunity for water quality agencies to share information to ensure that decisions are based on accurate scientific and management information and include practical and effective risk management strategies.

Major FY 2010 objectives were:

- To end pyrethroid-related toxicity in California urban watersheds without transitioning to other harmful products.
- To encourage changes in pesticide regulatory processes such that these processes effectively prevent future water quality and compliance problems.

4.2 Overview of Past Outcomes

Regular interagency dialogue about pesticide-related water quality problems started with the formation of the Urban Pesticides Committee (UPC) in the mid-1990s. By the late 1990s, California water quality agencies recognized that while the information-exchange forum provided by the UPC is valuable, informal dialogue with pesticide manufacturers and pesticide regulators was not a sufficient means to achieve the changes needed to ensure long-term water quality protections from the impacts of urban pesticide use.

In 1999, California water quality agencies started to engage in pesticide regulatory processes on an ongoing basis. In 2003, the scope of the effort was increased in recognition of the water quality threat posed by the market shift to pyrethroid insecticides

in response to the phase out of most urban uses of diazinon and chlorpyrifos. Beginning in mid-2004, the effort was further strengthened due to State Water Board grant funding to the UP3 Project, which provided California water quality agencies with an ongoing base of scientific and regulatory support for their individual engagement with pesticide regulators.

Although the process was slow at first, by 2005 staff from both pesticide and water quality regulatory agencies had recognized the importance of pesticide-related water quality issues. By 2007, pesticide regulators had recognized and acknowledged that gaps in their regulatory processes—particularly gaps related to urban pesticide use—were connected to urban water quality problems from pesticides.

In 2006, pesticide regulatory agencies began to take specific steps to address pesticide-related urban surface water quality problems. At the Federal level, U.S. EPA changed allowable uses for several pesticides due to water quality problems. California DPR initiated the pyrethroid reevaluation in response to water quality problems and created the Urban Pest Management Workgroup to give it advice on development of management strategies specific to pesticide use in urban areas.

In 2007-2009, further changes continued, particularly at the Federal level. Federal regulators required a few initial measures to prevent washoff of pyrethroids into urban runoff. Federal regulators also initiated the Office of Pesticide Programs (OPP) and Office of Water (OW) Effects Assessment Methodology Reconciliation Project to address a regulatory gap highlighted in California water quality agency comments.

4.3 FY 2010 Outcomes

Table 3 (on the next two pages) summarizes the outcomes of CASQA's recent pesticide regulatory engagement. Outcomes since the last UP3 Project regulatory outcomes evaluation in December 2008[8] are included in the table.

In FY 2010, encouraging progress continued. Federal pyrethroid Registration Review workplans acknowledged the need to address urban runoff. California regulators floated the idea of surface water protection regulations, including measures to protect urban runoff. DPR accelerated the pace of the pyrethroid reevaluation and solved a communication problem by initiating monthly stakeholder meetings.

While these specific outcomes reflect meaningful progress toward achieving the goals listed above, the goals of California water quality agency engagement in pesticide regulatory processes have not yet been fully achieved. The record shows that the engagement of California water quality agencies has significantly improved water quality protection since their initial engagement in the 1990s.

This evaluation is necessarily an interim evaluation. The types of processes that CASQA and other California water quality agencies have engaged in take years to complete—and the systemic changes desired will probably take many years to implement fully. Due to the complexity of pesticide regulatory processes, responses to comments may not be issued for more than one year after comments are submitted and outcomes often occur years after comments are made.

In evaluating regulatory outcomes, it is important to recognize that water quality is but one of many economic, social, and environmental factors that U.S. EPA and DPR consider when making regulatory decisions.

[8] TDC Environmental (2009). Pesticides in Urban Runoff, Wastewater, and Surface Water. Annual Summary of Regulatory Activities to Protect Water Quality 2008. Prepared for the UP3 Project. December.

Table 3. FY 2010 Pesticide Regulatory Engagement Outcomes

Regulatory Process	Desired Outcome	Actual Outcome	Assessment of Relationship of Water Quality Agency Involvement to Outcome
U.S. EPA Antimicrobials Data Rule	Require manufacturers to provide all data necessary for a complete evaluation of urban runoff impacts when a pesticide is registered or is subject to registration review.	Unknown. Waiting for U.S. EPA to finalize the regulation.	To be determined
U.S. EPA Office of Pesticide Programs (OPP) and Office of Water (OW) Effects Assessment Methodology Reconciliation Project	Expand project scope to examine approaches for coordinating OPP's effects assessments with the OW-approved toxicity testing procedures. Educate U.S. EPA OPP environmental risk assessors. Draw attention to pesticide-related toxicity in urban watersheds and ask U.S. EPA to change its regulatory processes so that they identify and prevent this toxicity.	Project-specific outcome unknown. Waiting for U.S. EPA to take next step in project. Education goals apparently achieved as evidenced by improved, more well-informed environmental risk assessment workplans for pyrethroids.	Project-specific relationship cannot yet be determined <u>High</u> for education goals. Informal communications with U.S. EPA indicate a direct linkage between California communications and environmental risk assessment workplan improvements.
U.S. EPA Advanced Notice of Proposed Rulemaking – Pesticide Inert Ingredients Disclosure	Disclosure of pesticide inert ingredient identities to assist with efforts to prevent water pollution.	Unknown. Waiting for U.S. EPA to issue the draft regulation.	To be determined
U.S. EPA Esfenvalerate, Deltamethrin, and Cyphenothrin Registration Review	Changes to these registration review processes to better identify and mitigate urban water quality impacts and adoption of these changes as part of U.S. EPA's overall approach to the registration review process for all pesticides with urban use patterns.	Unknown. Waiting for U.S. EPA to issue final workplans.	To be determined

045822

Table 3. FY 2010 Pesticide Regulatory Engagement Outcomes (Continued)

Regulatory Process	Desired Outcome	Actual Outcome	Assessment of Relationship of Water Quality Agency Involvement to Outcome
DPR Pyrethroid Reevaluation	End pyrethroid-related toxicity in California urban watersheds without transitioning to other harmful products. Educate DPR about pesticide-related toxicity in urban watersheds. Ask DPR to change its regulatory processes so that it identifies and prevents such toxicity. 2010 priorities: Implement mitigation measures quickly. Modify process to increase the pace toward a full solution.	As of July 2010, the reevaluation process had not generated significant new scientific information nor had substantial progress been made toward an end to pyrethroid-related toxicity. Initial mitigation is being implemented. At DPR's request, U.S. EPA asked all pyrethroid manufacturers to submit revised product labels implementing a set of water quality protection mitigation measures by June 2010. DPR restructured the reevaluation process to include monthly stakeholder meetings intended to increase the pace of the reevaluation toward ending pyrethroid-related toxicity.	High. Without active involvement by CASQA and other California Water Quality Agencies, reevaluation would probably still be stalled. Label change process was initiated in response to joint CASQA/Water Board comments and was based on a list of potential early mitigation measures provided with the comments.
DPR Surface Water Regulatory Concept	Implement effective measures to prevent water pollution associated with professional urban pesticide use. Include in regulatory structure the ability to control pesticides most likely to threaten urban surface water quality through urban runoff, including pesticides that might be registered in the future.	Initial goal achieved—DPR has announced its intent to proceed with development of formal regulations. Detailed outcome is unknown. CASQA is currently preparing detailed comments and is waiting for DPR to issue first draft of formal regulation.	High. It is unlikely that DPR would have included urban areas in these regulations without CASQA/Water Board engagement and UP3 Project scientific information linking professional pesticide applications to water pollution.

Project Title: *CLEAN WATERSHEDS FOR A CLEAN BAY* - Implementing the San Francisco Bay PCBs and Mercury TMDLs with a Focus on Urban Runoff.

Abstract: Clean Watersheds for a Clean Bay (CW4CB) will use a partnership-driven strategy to take the next step in a multi-year regional effort to reduce loading of sediment-bound pollutants to the Bay and implement the PCBs and mercury Total Maximum Daily Load (TMDL) water quality restoration programs. CW4CB will make substantial progress towards reducing annual loading of PCBs and mercury to the Bay and will lay the groundwork for fully meeting the TMDL allocations in the future. CW4CB will select five high priority subwatersheds that discharge urban runoff with PCBs and other pollutants to the Bay, identify PCB and mercury source areas within the project subwatersheds and refer these sites to regulatory agencies for cleanup and abatement, develop methods to enhance removal of sediment with PCBs and other pollutants during municipal sediment management activities, retrofit eight to 10 urban runoff treatment facilities into existing infrastructure throughout the Bay Area, and facilitate development and implementation of a regional risk reduction program that focuses on educating the public about the health risks of consuming certain species of Bay fish that contain high levels of PCBs and mercury. The knowledge and experience gained and the lessons learned during CW4CB will be promoted and made readily available to inform future similar efforts by others in the Bay Area and elsewhere in California and the United States.

Applicant: Bay Area Stormwater Management Agencies Association (BASMAA)
Principal Investigator: Geoff Brosseau (BASMAA Executive Director)
P.O. Box 2385, Menlo Park, CA 94026, (510) 622-2326, info@basmaa.org

Funding Requested: $5 Million

Total Project Cost: $6.84 Million ($1.84 Million Non-Federal Match)

Project Period: Four Years (May 2010 – April 2014)

Proposal Narrative Organization

This proposal narrative consists of the following sections: 1) Introduction, 2) Project Overview, 3) Problem Statement, 4) Environmental Results, 5) Partnering and Budget Narrative 6) Scope of Work, and 7) Programmatic Capability. These sections are followed by Attachment A) Resumes, B) Support Letters, and C) Watershed Maps.

1. Introduction

San Francisco Bay is one of the largest and most biologically diverse estuaries on the west coast of the United States. The Bay Area basin (Figure 1) is world renowned for its scenic beauty, commercial and industrial enterprises, recreational opportunities, fisheries, and wildlife habitat. All of these features are vital to the health and economies of the local communities, where more than seven million people live and work in the highly developed watersheds that surround the Bay. The water quality of this precious resource is inextricably linked to historical and current human activities in these urban watersheds. Urban stormwater runoff is of particular concern as it conveys many types of pollutants from the urban landscape to the Bay.

The Bay Area Stormwater Management Agencies Association (BASMAA), a 501(c)(3) non-profit organization representing Bay Area cities and counties, focuses on a number of regional challenges related to stormwater runoff, including identifying opportunities to improve the quality of urban runoff that flows to the Bay. The water quality link between the Bay and its surrounding watersheds inspired BASMAA to propose the project described below - Clean Watersheds for a Clean Bay (CW4CB).

Figure 1. Map of San Francisco Bay Basin.

2. Project Overview

CW4CB represents the next step in a multi-year regional effort that began in 2000 to reduce loading of sediment-bound pollutants to the Bay and implement the PCBs and mercury Total Maximum Daily Load (TMDL) water quality restoration programs. CW4CB will select five high priority subwatersheds that discharge urban runoff with PCBs and other pollutants to the Bay, usually in areas with industrial land uses dating back many decades. CW4CB will then identify PCB and mercury source areas within the project subwatersheds and refer these sites to regulatory agencies for cleanup and abatement. CW4CB will also develop methods to enhance removal of sediment with PCBs and other pollutants during municipal sediment management activities (e.g., street sweeping) in the project subwatersheds. Furthermore, CW4CB will retrofit eight to 10 urban runoff treatment facilities into existing infrastructure throughout the Bay Area to address areas with elevated PCBs and other pollutants in urban runoff. Yet another element of this project will facilitate development and implementation of a regional risk reduction program that focuses on educating the public about the health risks of consuming certain species of Bay fish that contain high levels of PCBs and mercury. Finally, the knowledge and experience gained and the lessons learned during CW4CB will be promoted and made readily available to inform future similar efforts by others in the Bay Area and elsewhere in California and the United States. BASMAA is requesting $5M in project funds from USEPA's San Francisco Bay Area Water Quality Improvement Fund towards the $6.84M total project cost. The remaining $1.84M (about 27% of the total project cost) will be a match contributed by BASMAA and six of the Bay Area countywide stormwater management agencies.

3. Problem Statement

PCBs, mercury and other sediment-bound pollutants are found in San Francisco Bay water, sediments, and biota. Concentrations of PCBs and mercury in certain Bay fish exceed target levels and may pose a health risk to people who consume fish caught in the Bay. As a result, the California Office of Environmental Health Hazard Assessment issued an advisory on the consumption of fish from the Bay. Thus it was established that a vital beneficial use of the Bay, commercial and sport fishing, is not attained, with local subsistence fishers and their families being of particular concern. This led to the Bay being designated an impaired water body on the Clean Water Act "303(d) list" due to PCBs and mercury. In response, the San Francisco Bay Regional Water Quality Control

Board (Regional Water Board) has developed comprehensive TMDL programs to identify and control sources of PCBs and mercury to the Bay and restore water quality.

It has long been suspected that municipal stormwater discharges may contribute to the PCB and mercury water quality problem in the Bay, but before the year 2000 there was little direct evidence to support this hypothesis. BASMAA agencies addressed this data gap by surveying concentrations of PCBs and mercury in embedded sediments collected from stormwater conveyances (e.g., catch basins, storm drain system piping, stormwater pump station sumps, flood control channels, and creeks) throughout the Bay Area during the fall of 2000 and 2001. This project is referred to as the Joint Stormwater Agency Project (JSAP). PCB and mercury concentrations were highly variable in urban locations, but ranged up to three orders of magnitude higher than in open space areas. Concentrations were also up to two orders of magnitude higher in urban sediment than in Bay surface sediments collected and analyzed by the San Francisco Estuary Regional Monitoring Program (RMP), suggesting that urban runoff may impact the Bay.

Over the next several years following the JSAP, individual stormwater programs performed case studies in selected urban areas with relatively elevated pollutant concentrations to begin identifying sources and controls, with a focus on PCBs. The techniques employed included further collection and analysis of embedded sediment samples and research on historical and current land use. About 20 areas were investigated.

Most recently, a California Proposition 13-funded project implemented by the San Francisco Estuary Institute (SFEI) performed additional sediment surveys for PCBs and mercury, with the goal of better defining urban watersheds and subwatersheds with elevated levels of these pollutants throughout the Bay Area. The results of this effort are anticipated to be available in the near future.

All of these efforts have identified some watersheds with relatively elevated levels of PCBs and mercury and in a few cases source areas were discovered within these watersheds, but much work remains to be done to identify remaining source areas and in particular, to implement methods to prevent discharges of stormwater runoff containing PCBs, mercury and other pollutants from urban watersheds to the Bay.

4. Environmental Results - Project Outputs and Outcomes

CW4CB is the next step in the above-described multi-year regional effort to reduce loading of PCBs, mercury and other sediment-bound pollutants (e.g., dioxins, PBDEs, chlorinated pesticides and PAHs) to the Bay from urban watersheds, reduce levels entering the estuary food chain, and thereby reduce harm to aquatic ecosystems and human communities.[1,2]

CW4CB's overarching objective is to implement priority actions called for by the San Francisco Bay PCBs and mercury TMDLs and make substantial progress towards attaining the PCB TMDL urban runoff allocation. Although CW4CB is anticipated to reduce loadings of mercury and other sediment-bound pollutants to the Bay as an ancillary benefit, project activities will be designed and implemented to optimize the reduction of PCB loads. CW4CB's effectiveness evaluation will also focus on PCB load reductions. It is anticipated that the combined effect of all project activities will

[1]EPA Strategic Plan Goal 2 (Clean and Safe Water), Objective 2.2 (Protect Water Quality), and Sub-Objective 2.2.1 (Improve Water Quality on a Watershed Basis).
[2]EPA Strategic Plan Goal 4 (Healthy Communities and Ecosystems) and Objective 4.3 (Restore and Protect Critical Ecosystems).

reduce annual loading of PCBs to the Bay by approximately 0.3 - 1.5 kg per year, reducing the current estimated stormwater runoff load of 20 kg per year[3] by about two to eight percent. Furthermore, CW4CB will lay the groundwork for fully meeting the TMDL allocations in the future and thereby help address important impairments to the Bay's beneficial uses. Table 1 summarizes key project tasks and associated outputs and outcomes.

CW4CB is comprised of priority activities that will achieve significant and sustainable environmental results, based on the planning and assessment work completed for the PCB and mercury TMDLs. The TMDL urban runoff requirements will be implemented through the San Francisco Bay Area NPDES Municipal Regional Stormwater Permit (MRP).[4] The MRP is anticipated to be adopted in the near future and will require a number of PCBs and mercury control activities that are consistent with the TMDLs and CW4CB's tasks. CW4CB's general strategy is also consistent with the San Francisco Bay Basin (Region 2) Water Quality Control Plan (Basin Plan), the Bay Area Integrated Regional Water Management Plan, and the San Francisco Estuary Project Comprehensive Conservation and Management Plan, as summarized in below.

SF Bay Basin (Region 2) Water Quality Control Plan (Basin Plan) (January 2007)

Table 1. Summary of Key CW4CB Tasks and Associated Budgets, Outputs and Outcomes.

TASK	IMPLEMENTING PARTIES	USEPA FUNDING	MATCH	TOTAL	OUTPUTS/OUTCOMES
1. Management, oversight, and reporting.	BASMAA, TAC, QAPP consultant.	--	$460,000	$460,000	▪ QAPP, quarterly progress reports, draft/final project report.
2. Select project watersheds.	BASMAA.	--	$30,000	$30,000	▪ Five priority subwatersheds identified.
3. Identify locations with elevated PCBs/Hg, refer sites to regulatory agencies, and establish cleanup fund.	BASMAA, records review consultant, city staff, monitoring contractor.	$750,000	$350,000	$1,100,000	▪ Locations referred for cleanup. ▪ 100K fund to facilitate cleanups established. ▪ PCB and other pollutant loadings to the Bay reduced.[1]
4. Enhance municipal sediment removal and management practices.	BASMAA, city staff, monitoring contractor.	$400,000	$350,000	$750,000	▪ Enhanced municipal removal and management of sediment with pollutants. ▪ PCB and other pollutant loadings to the Bay reduced.[1]
5A. Urban runoff treatment retrofits - planning and design.	BASMAA, design consultant, city staff.	$550,000	$200,000	$800,000	▪ Conceptual/engineering design, planning and permitting of eight to ten urban runoff treatment retrofits.
5B. Urban runoff treatment retrofits - construction, operation and monitoring.	BASMAA, city staff, construction firms, monitoring contractor.	$3,200,000[2]	$200,000	$3,350,000	▪ Eight to ten urban runoff treatment retrofits installed and evaluated. ▪ An estimated 2 to 12 square miles treated by retrofits to reduce potential hydrologic impacts on downstream receiving waters. ▪ PCB and other pollutant loadings to the Bay reduced.[1]
6. Regional risk reduction program.	BASMAA (other partners may include CDPH, BACWA and WSPA).	$100,000	$100,000	$200,000	▪ Public education/outreach materials. ▪ Impacted populations will have a greater awareness and understanding of fish contamination issues and options for reducing exposures to pollutants in Bay fish.
7. Outreach and technology transfer.	BASMAA, consultant(s)	--	$150,000	$150,000	▪ Project web portal. ▪ Guidance manual. ▪ Written outreach materials. ▪ Technical workshops.
	TOTAL:	**$5,000,000**	**$1,840,000**	**$6,840,000**	

[1]All project activities combined are anticipated to reduce PCBs loadings about 0.3 - 1.5 kg/year.
[2]This figure assumes a 15% contingency will be built in to estimated construction costs.

045830

CW4CB will yield a number of other important local and regional benefits, including:

- Providing residents, workers and visitors in the project watersheds with a safer and healthier environment (PCBs concentrations in sediment samples from Bay Area watersheds have sometimes exceeded screening levels for human direct exposure at sites within residential and commercial/industrial land uses).
- Enhancing the desirability of commercial enterprise zones and residential neighborhoods in the project watersheds.
- Increasing Bay Area urban acreage treated with infrastructure retrofits to remove pollutants and reduce hydrologic impacts on downstream receiving waters and thereby protect their beneficial uses.
- Reducing pollution in run-off from urban development and helping mitigate the impact of development on water quality.
- Informing future land use planning, development practices (e.g., low impact development), and efforts to investigate and abate sediment-bound pollutants in other urban watersheds, and thus leading to improvements in water quality and the environment in the Bay Area and other urban areas in California and the United States.

In summary, CW4CB is anticipated to realize significant and sustainable environmental benefits to Bay Area local communities, the region, and other urban communities in California and the United States that apply the lessons learned in this project.

5. Partnering and Budget Narrative

BASMAA is a well established regional partnership that focuses on water quality issues related to stormwater runoff. BASMAA is comprised of the nine municipal stormwater programs in the San Francisco Bay Area which in turn represent 96 agencies, including 79 cities and 6 counties. The jurisdictions of these agencies cover most of the watershed immediately surrounding San Francisco Bay. The BASMAA partnership facilitates the efficient use of public resources through regional information sharing, consistency, and cooperation.

BASMAA member agencies[5] comprise six of CW4CB's specific project partners. An additional potential partner, the Bay Area Clean Water Agencies (BACWA), is not part of BASMAA. BACWA is a joint public powers authority whose members include public utilities that collect and treat municipal wastewater from the nine Bay Area counties that surround San Francisco Bay. BACWA's partnership in CW4CB would focus on the regional risk reduction task described later.

BASMAA is requesting $5M in project funds from USEPA's San Francisco Bay Area Water Quality Improvement Fund towards the $6.84M total project cost. The remaining $1.84M (about 27% of the total project cost)[6] match will be comprised of contributions from project partners over the four year project term (Table 2). These contributions will be largely in the form of in-kind services. A

[5]These agencies are the Santa Clara Valley Urban Runoff Pollution Prevention Program (SCVURPPP), the Alameda Countywide Clean Water Program (ACCWP), the Contra Costa Clean Water Program (CCCWP), the San Mateo Countywide Water Pollution Prevention Program (SMCWPPP), the Fairfield-Susuin Urban Runoff Management Program (FSURMP), and the Vallejo Sanitation and Flood Control District (VSFCD).
[6]Bay Area municipal agencies were able to commit to this $1.84M match despite the current difficult economic climate and budget shortfalls faced by many local agencies.

letter is attached from each of these agencies verifying the commitment to contribute to the project match.

Many of the project activities will take place within the Cities of San Carlos, San Jose, Oakland and Richmond. These cities have agreed to be additional project partners and, as described later, host project subwatersheds (support letters are attached), but are not making a specific financial commitment to the project. However, many of CW4CB's activities will be leveraged in that staff from these cities will assist with implementation of various aspects of the project fieldwork, as described in more detail later. The opportunity for future leveraging of some tasks is also anticipated through California's Proposition 84 Bond.

Table 1 summarizes the project tasks, implementing parties, and associated budgets, including how USEPA funding and the project match are apportioned to each task. It should be noted that Table 1 divides Task 5, Urban Runoff Treatment Retrofits, into subtasks A and B, with the budget itemized for each subtask. Subtask A covers planning and design, including preparing the documentation required to enable environmental review of the proposed retrofit projects under the California Environmental Quality Act (CEQA). Subtask B includes construction, operation/maintenance and monitoring.

BASMAA Agency		Contribution
SCVURPPP	$	570,000
ACCWP	$	500,000
CCCWP	$	285,000
SMCWPPP	$	240,000
FSURMP	$	45,000
VSFCD	$	40,000
BASMAA	$	160,000
Total:	$	1,840,000

Table 2. Non-Federal Match Contributions.

6. Scope of Work / Approach

The following sections describe CW4CB's seven project tasks. Table 3 summarizes the schedule of project milestones and deliverables. Figure 2 is a flow chart illustrating the interelationships among the tasks and associated sub-tasks.

Task 1. Management, Oversight, and Reporting

- **WQIF Funding:** $0. **Non-federal Matching Funds:** $460,000.
- **Key Tasks and Activities:** Project management, record-keeping, accounting, reporting, technical oversight of all project activities, and QAPP development.
- **Deliverables:** QAPP, quarterly progress reports and draft and final project report.

BASMAA will serve as CW4CB's prime contractor. On behalf of the BASMAA Board of Directors, the Principal Investigator (PI) will be Geoff Brosseau, BASMAA's Executive Director. He will be responsible for overall project management and all fiscal activities related to agreements with USEPA and sub-contractors. Mr. Brosseau will be assisted by a project management team consisting of representatives from several BASMAA agencies (i.e., stormwater management programs). One member of the team and BASMAA's technical lead on PCBs, Jon Konnan (SMCWPPP), will be the Project Manager (PM). The other members of the project management team will be: Chris Sommers (SCVURPPP), Arleen Feng (ACCWP), Jamison Crosby (CCCWP),

and Kevin Cullen (FSURMP). The project management team will assist the PI and PM to ensure that all project activities are completed on-time and within budget by having specific responsibility for oversight of project activities within the jurisdiction of the BASMAA agency that they represent. BASMAA will consult with USEPA and contract with project consultants, contractors and construction firms. In addition, the project management team will coordinate with the project partners and key regional agencies for project activities within the jurisdiction of the BASMAA agency that they represent, including the Regional Water Board, and prepare quarterly progress reports and a draft and final project report. The project management team will also work closely and coordinate with key personnel from the project partners, including the following Bay Area city personnel: James Downing (City of San Jose), Robert Weil (City of San Carlos), Lesley Estes (City of Oakland), and Lynne Scarpa (City of Richmond).

Resumes are attached for the PI, PM, project management team members, and project partner key personnel.

At the outset of the project, BASMAA will convene a Technical Advisory Committee (TAC). The TAC will be tasked with providing the project with technical guidance and oversight, including key input on all major decision points (e.g., confirming the location of project subwatersheds and selecting and siting treatment retrofits) and reviewing and commenting on drafts of all project deliverables. The TAC will be comprised of Dr. Tom Mumley (Assistant Executive Officer, Regional Water Board) and other appropriate technical experts from the Bay Area and elsewhere in the United States.

During the first quarter of year one of the project (Table 3), a Quality Assurance Project Plan (QAPP) addressing the field monitoring in the below tasks will be developed and submitted to USEPA for approval. All specified field and laboratory sampling and Quality Assurance / Quality Control (QA/QC) protocols, data management methods, and reporting procedures will be compatible with the California Surface Water Ambient Monitoring Program (SWAMP) and the San Francisco Estuary Regional Monitoring Program (RMP).

Task 2. Select Project Subwatersheds

- **WQIF Funding:** $0. **Non-federal Matching Funds:** $30,000.
- **Key Tasks and Activities:** Implement pertinent data review and final selection of five project subwatersheds.
- **Deliverables:** Subwatershed selection documented in first quarterly progress report.
- **Outputs:** Five priority Bay Area subwatersheds identified.

CW4CB will include a program of pollution investigation and abatement in high priority Bay Area watersheds. The project will target urban subwatersheds with high potential for discharges of PCBs in urban runoff that is ultimately conveyed to the Bay. The project subwatersheds will include areas of current or historic industrial land uses where elevated levels of PCBs have been found in sediments collected from creeks, stormwater conveyances and roadway-related infrastructure. The selection of project subwatersheds will primarily focus on the presence of PCBs, which are often found in areas with industrial land uses dating back several decades, but mercury and other sediment-bound pollutants will likely be present in such locations. At the outset of the project, CW4CB will perform a comprehensive review of the existing data described earlier (Section 3), including the JSAP, follow-up stormwater program case study work, and sediment surveys

conducted by the SFEI Proposition 13-funded project. Based on the above review and input from the TAC, five project subwatersheds will be selected.

At the time of this application the Cities of San Carlos, San Jose, Oakland and Richmond have agreed to host project subwatersheds (support letters are attached). Most or all of the project subwatersheds will be located in these cities. Examples of candidate subwatersheds are described below.

Pulgas Creek Pump Station Subwatershed, San Carlos

The Pulgas Creek pump station subwatershed is located in the City of San Carlos in San Mateo County. San Carlos has agreed to host one of the five project subwatersheds and this subwatershed will likely be selected. Much of the land use within this approximate 0.5-square mile subwatershed has been industrial dating back several decades. PCBs have been detected at up to about 11 parts per million (ppm) in embedded storm drain and creek sediment samples collected from the pump station sump and its drainage. Based on the results of field sampling and agency research, two potential sources of PCBs to storm drains in the study area were identified: a PG&E substation and a soil and groundwater investigation and remediation site with PCBs and other pollutants. Investigations to date also suggest multiple unidentified sources of PCBs in the study area, given the widespread spatial distribution of PCBs found in storm drain sediments.

Ettie Street Pump Station Subwatershed, Oakland

The Ettie Street pump station subwatershed is located in the City of Oakland in Alameda County. Oakland has agreed to host one of the five project subwatersheds and this subwatershed may be selected. This approximate 2.5-square mile subwatershed includes residential, commercial, and industrial land uses. As part of a state-funded water quality grant project, Oakland has performed visual inspections of public and private properties in this subwatershed and sampling of sediments and soils. PCBs have been found at concentrations up to about 93 ppm in sediments and soils collected from the pump station sump and other locations throughout the subwatershed.

Leo Avenue Subwatershed, San Jose

The Leo Avenue subwatershed is located in the City of San Jose in Santa Clara County. San Jose has agreed to host one of the five project subwatersheds and this subwatershed is under consideration. Land uses in the subwatershed are primarily commercial and industrial. Relatively elevated levels of PCBs (up to about 20 ppm) have consistently been found in the Leo Avenue area. The spatial distribution of PCBs concentrations coupled with an analysis of PCBs homolog distributions suggested that the Union Pacific railroad track right-of-way adjacent to Leo Avenue is a source of PCBs in this subwatershed. Other potential PCB sources include historical activities at other properties adjacent to Leo Avenue.

North Richmond Pump Station Subwatershed, Richmond

The North Richmond Pump Station subwatershed is located in the City of Richmond in Contra Costa County. The City of Richmond has agreed to host one or two of the five project subwatersheds and this area is under consideration. The drainage area of this subwatershed is about 0.5 square miles and includes a variety of land uses. The City of Richmond recently embarked on a planning effort to identify target pollutants in city stormwater, identify priority watersheds within the city, identify likely sources of pollutants, and identify potential control mechanisms for these

pollutants. The primary pollutants of concern in this subwatershed are PCBs and mercury, which are likely present due to a long history of industrial activity in the area. Concentrations of PCBs found in sediment have ranged up to about 1 ppm.

Santa Fe Channel Subwatershed, Richmond

Another subwatershed under consideration in Richmond is the Santa Fe subwatershed. This approximately 2.3 square mile watershed includes a variety of land uses and has historical PCBs and mercury contamination. The City of Richmond has selected the Sante Fe subwatershed as a priority watershed and concentrations of PCBs in sediment have ranged up to about 2 ppm in industrial areas.

Task 3. Identify Locations with Elevated PCB and/or Mercury Concentrations for Abatement

- **WQIF Funding:** $750,000. **Non-federal Matching Funds:** $350,000.
- **Leveraged Resources:** City staff will assist with site inspections and other aspects of the fieldwork. Site cleanups will be overseen by appropriate regulatory agencies and implemented by responsible parties or with other available funding.
- **Key Tasks and Activities:** Implement review of existing data and field inspections and monitoring to identify locations with elevated PCB concentrations within project subwatersheds, refer sites to regulatory agencies for cleanup, and establish fund to facilitate site cleanups.
- **Deliverables:** Results documented in quarterly progress reports and draft and final project report.
- **Outputs:** Properties/locations with elevated PCBs and potentially mercury and other pollutants identified and referred to regulatory agencies for cleanup and fund to facilitate cleanups established.
- **Outcomes:** PCB and mercury loadings to San Francisco Bay reduced.

This task focuses on identifying specific locations and properties within the project subwatersheds that are potential sources of PCBs and/or mercury to stormwater conveyances. One model for this task is a recent project conducted by the City of Oakland through a Proposition 13 grant in the amount of $460,000 awarded by the California State Water Resources Control Board. The project focused on identifying sources of PCB-containing sediments to the storm drain system in the Ettie Street Pump Station subwatershed in Oakland. Based on the Ettie Street project, CW4CB will conduct the below steps at each project subwatershed, adapting and refining these methods as appropriate to local conditions.

1. **Records Review**. CW4CB will interview local and state agency staff and review local and state databases and information sources (e.g., Geotracker, SLIC, Cerclis, and Vistacheck.com), appropriate agency files (e.g., local environmental/health department data, local fire department hazardous material records, and facility inspection and illicit discharge records), and other readily available information, as appropriate (e.g., land use records, historical aerial photographs, reverse telephone directories, Sanborn Fire Insurance Maps, and transformer locations requested of PG&E) to identify potential PCB/mercury source properties and areas where PCB/mercury contaminated sediment accumulates within each of the project subwatersheds, including within stormwater conveyances. To the extent practicable, appropriate records on all businesses in each subwatershed will be screened.[7] Potential PCB/mercury source areas in each subwatershed will be identified and given a preliminary priority ranking.

2. **Driving/Walking Survey.** CW4CB will work with municipal staff to perform a driving/walking survey of the entire area of each project subwatershed to identify properties that are high priority for site inspections. The survey will build upon the results of the above records review to further identify potential source areas and determine whether runoff from such locations is likely to convey soils/sediments with PCBs or mercury to municipal stormwater conveyances. Based on criteria developed during the Ettie Street project, examples of potential high priority sites include:
   - Previously identified PCB spill site.
   - Historic land use associated with PCB-containing materials.
   - Potential for soils/sediments to erode and migrate off-site, including unpaved areas.
   - Sites with outdoor storage yards and storage tanks.
   - Sites with poor housekeeping.

3. **Site Inspections.** CW4CB will work with municipal staff to perform inspections of selected high priority sites within each project subwatershed. Inspectors will use a checklist developed for Ettie Street project regarding priority uses and activities potentially associated with PCBs, adapted as appropriate for this project. Inspected sites will then be ranked for further investigation, including the below soil/sediment sampling, using criteria developed during the Ettie Street project, adapted for this project as appropriate.

4. **Sediment/Soil Sampling.** CW4CB will test for elevated PCB/mercury concentrations through surface sediment/soil sampling and analysis where visual inspections and/or other information suggest potential source areas within each subwatershed. As with the Ettie Street project, sampling will occur on both the public right of way and private properties. It is anticipated that the process of reconnaissance/inspections and sediment sampling will be iterative in many cases to hone in on source areas in the most cost-effective manner. CW4CB will collect and analyze approximately 70 soil/sediment samples from each of the five project subwatersheds, a number of samples comparable with the Ettie Street project on a per subwatershed basis. Based on 350 samples analyzed for PCBs, total mercury, total organic carbon and particle size distribution (and ten percent of these samples analyzed for the following additional analytes: dioxins, PBDEs, legacy chlorinated pesticides, and PAHs), the total estimated laboratory analysis cost is $366,000.

[7]This is an extensive task (e.g., the Ettie Street Pump Station subwatershed had approximately 1,700 businesses).

5. **Site Referrals.** Where laboratory data confirm significantly elevated PCB/mercury concentrations in surface sediments/soils, available information on current site conditions and owner/operators and other potentially responsible parties will be provided to the Regional Water Board. The Regional Water Board is a state regulatory agency with investigation and cleanup authorities to facilitate issuance of orders for further investigation and remediation of the subject sites.[8] The Regional Water Board may refer sites to other regulatory agencies if appropriate (e.g., Department of Toxic Substance Control, USEPA). CW4CB will also provide Regional Water Board staff with general assistance in evaluating abatement options and identify funding sources for abatement. In addition, CW4CB will identify areas within the project subwatersheds for potential expedited abatement on the basis of loading potential including factors such as PCB concentration, mass of sediment, and mobilization potential and/or human health protection thresholds, such as California Human Health Screening Levels. CW4CB will set aside a budget of $100,000 for technical services to facilitate priority site cleanups as needed on a case by case basis (e.g., further identification of cleanup funding sources, additional history/records research, additional sampling and analysis, communications, other activities as needed to move the cleanup process forward).

To evaluate the effectiveness of this task, CW4CB will assess the available data on the effectiveness of the abatement activities at specific properties/locations within the project subwatersheds and quantitatively estimate the resulting reduction in loads of PCBs (and mercury where applicable) to the Bay. The results of the effectiveness evaluation will be reported in the progress reports as data become available and summarized in the draft and final project report. It is anticipated that the efforts described in this task will be highly leveraged since the cleanups of the identified source areas will be funded outside of this project, including oversight by appropriate regulatory agencies (most likely state agencies) and implementation by responsible parties or with other available funding (e.g., California Cleanup and Abatement Account). In addition, city staff will assist with implementation of the fieldwork, further leveraging this task's efforts.

Task 4. Enhance Municipal Sediment Removal and Management Practices

- **WQIF Funding:** $400,000. **Non-federal Matching Funds:** $350,000.
- **Leveraged Resources:** City staff will assist with implementation of the fieldwork and sediment management enhancements put into place will likely continue in the project subwatersheds (and expand to other locations) into the future.
- **Key Tasks and Activities:** Preparation of subwatershed-specific strategies to enhance the pollutant load reduction benefits of municipal operation and maintenance activities; implementation of the strategies in the field in the project subwatersheds.
- **Deliverables:** Subwatershed-specific strategies report; implementation results documented in quarterly progress reports and draft and final project report.
- **Outputs:** Enhanced removal of sediment with PCBs and other pollutants during municipal sediment removal and management activities.
- **Outcomes:** PCB and mercury loadings to San Francisco Bay reduced.

[8]The point of contact with the Regional Water Board will be Janet O'Hara, the Regional Water Board Staff currently tasked with implementation of the San Francisco Bay PCBs TMDL.

In the project subwatersheds, CW4CB will evaluate ways to enhance the PCB, mercury, and other pollutant load reduction benefits of municipal operation and maintenance activities that remove or manage sediment. The evaluation will include working with city staff to enhance sediment-bound pollutant removal during municipal activities such as street sweeping, storm drain inlet and catch basin cleaning, stormwater conveyance maintenance, and pump station maintenance. The evaluation will include consideration of street flushing (potentially with recycled water) and capture, collection, and/or routing to the local sanitary sewer. Simple removal of sediments from gutters and storm drains will also receive consideration. CW4CB will work with city staff to prepare a written strategy for implementing enhancements in each project subwatershed. The TAC will review the subwatershed-specific strategies and provide key input and recommendations to the project management team before the fieldwork to implement enhancements commences.

To evaluate the effectiveness of this task, CW4CB will collect and analyze appropriate sediment samples to inform a quantitative estimation of how the enhanced sediment removal and management activities reduce loads of PCBs (and mercury as applicable) to the Bay. The results of the effectiveness evaluation will be reported in the progress reports as data become available and summarized in the draft and final project report.

The efforts described in this task will be leveraged in that city staff will assist with implementation of the fieldwork. It is also anticipated that these efforts will be leveraged into the future in that the sediment management enhancements put into place and the associated pollutant load reductions will likely continue in the project subwatersheds (and expand to other locations) after the four year project period.

Task 5. Urban Runoff Treatment Retrofits

- **WQIF Funding:** $3,750,000. **Non-federal Matching Funds:** $400,000.
- **Leveraged Resources:** City staff will assist with aspects of siting, designing, installing and operating/maintaining the retrofit facilities and operation/maintenance of the retrofits will likely continue into the future. During retrofit conceptual design CW4CB will leverage BACWA's study on the feasibility of diverting stormwater to wastewater treatment plants.
- **Key Tasks and Activities:** Implementation of retrofits, including conceptual design (retrofit locations and types); planning/design/permitting/CEQA; construction of retrofits (dry season); operation and monitoring (wet season); effectiveness evaluation.
- **Deliverables:** Conceptual design report (retrofit locations and types); implementation results documented in quarterly progress reports and draft and final project report.
- **Outputs:** Installation of eight to 10 urban runoff treatment retrofits.
- **Outcomes:** PCB and mercury loadings to San Francisco Bay reduced and an estimated two to twelve square miles treated by retrofits to reduce potential hydrologic impacts on downstream receiving waters.

CW4CB will retrofit urban runoff treatment systems into existing MS4s at selected sites in the Bay Area urban landscape to intercept pollutants before they can enter San Francisco Bay. Solids removal is generally the most feasible option to treat PCBs and other sediment-bound pollutants in stormwater runoff. Stormwater treatment structures that remove solids commonly rely on sedimentation, filtration, flow through separation, or some combination of these processes. These

technologies are readily available and can effectively remove sediment and associated pollutants when properly designed, installed, operated and maintained (CASQA 2003).

CW4CB will identify eight to 10 locations throughout the Bay Area that present opportunities to retrofit treatment systems and assess the best retrofit options for each location. If CW4CB evaluates 10 retrofits, up to two of these may be existing retrofits, provided they meet all project goals. Retrofit locations will be selected primarily on the basis of elevated PCBs concentrations with additional consideration given to mercury concentrations. Options considered for types of retrofits will include detention basins, media filtration structures (e.g., sand filter), bioretention units, infiltration basins, constructed wetlands, and diversions from stormwater pump stations to existing domestic wastewater treatment plants.[9]

The planning of stormwater treatment retrofitting is potentially complex and will be carried out in a watershed context primarily during year one of the project (Table 3). To the extent feasible, Low Impact Development principles will be considered to reduce potential hydrologic impacts on downstream receiving waters (e.g., tidal portions of creeks, sloughs, and wetlands) and thereby protect related beneficial uses, habitat and ecosystems. The evaluation will consider technical and economical feasibility, taking into consideration that siting of some technologies may be limited by factors such as soil types, groundwater elevation, slopes, insect breeding and space constraints. In addition, in some cases treatment structure design may need to account for minimizing mercury methylation. The evaluation will include GIS spatial analysis and ground-truthing of potential sites and will consider appropriate locations both within and outside of the project subwatersheds discussed previously. The final selections will span treatment types and Bay Area watershed characteristics. A conceptual design report with proposed retrofit locations and types will be prepared with input and recommendations from the TAC.

Engineering design and permitting, including local agency approval, is anticipated to occur primarily during year two of the project. As required and appropriate, CW4CB will also prepare the documentation required to enable environmental review of the proposed retrofit projects under the California Environmental Quality Act (CEQA). It is anticipated that the environmental review under CEQA will not require developing an Environmental Impact Report (EIR) and at most initial studies with mitigated negative declarations will be sufficient.

We anticipate that the retrofits will be constructed during the dry season of the third year of the project and operation and evaluation of the retrofits will span the wet season between years three and four. Retrofit influent and effluent sampling and analysis data will be collected to evaluate and quantify the removal of PCBs, mercury, and other pollutants. The results of the effectiveness evaluation will be reported in the progress reports as data become available and summarized in the draft and final project report. The efforts described in this task will be leveraged in that city staff will assist with aspects of siting, designing, installing and operating/maintaining the retrofit facilities. It is also anticipated that these efforts will be leveraged into the future in that the operation/maintenance of the retrofits and the associated pollutant load reductions will likely continue after the four year project period.

[9]The Bay Area Clean Water Agencies are currently preparing a "white paper" that will evaluate existing data to describe the feasibility of diverting stormwater to wastewater treatment plants in the Bay Area. CW4CB will leverage this effort by reviewing the results of the evaluation during retrofit conceptual design.

Task 6. Regional Risk Reduction Program

- **WQIF Funding:** $100,000. **Non-federal Matching Funds:** $100,000.
- **Key Tasks and Activities:** Stakeholder advisory group convened; broad risk communication strategy developed; mini-grants awarded and implementation overseen; evaluation activities conducted.
- **Deliverables:** Broad risk communication strategy developed, mini-grant program documented and evaluated in quarterly progress reports and draft and final project report.
- **Outputs:** Public education outreach materials.
- **Outcomes:** Impacted populations will have a greater awareness and understanding of fish contamination issues and options for reducing exposures to pollutants in Bay fish.

Fish caught in San Francisco Bay have elevated levels of harmful chemicals, including mercury and PCBs. The current health advisory recommends limiting consumption of most Bay fish to no more than two meals per month. For high risk groups (pregnant and breastfeeding women, and children) only one meal per month is advised. The San Francisco Bay Seafood Consumption study showed that approximately two-thirds of people fishing in the Bay had limited understanding or no awareness of the health advisory. This study also showed that the consumption patterns among certain ethnic groups results in higher exposure to contaminants in Bay fish. CW4CB will implement a regional program of risk communication activities to raise public awareness of fish contamination issues in San Francisco Bay and to encourage fish-consuming populations to reduce their exposure to pollutants in contaminated fish. BASMAA may partner with the Bay Area Clean Water Agencies (BACWA) and other agencies to perform this task. Based on consultations with the California Department of Public Health (CDPH), the risk reduction task will consist of the following four sub-tasks.

Sub-task 1. Convene a risk reduction stakeholder advisory group (SAG)
CW4CB will initiate a stakeholder process to bring together local groups and organizations that are interested in seeking ways to reduce exposures to chemicals in contaminated fish. We will reach out to a broad range of stakeholders for participation on the SAG, including, but not limited to, community-based, social services, watershed, fishing, environmental justice, and parks organizations, as well as state and local agencies. The objective of the SAG will be to create, inform, and guide the development of a risk communication strategy (Task 2). In addition, CW4CB will use the SAG meetings to solicit general input on the objectives of the mini-grants program (Task 3), to keep members updated on the progress of the mini-grants and related activities (e.g., fish monitoring activities, Bay PCBs TMDL, new San Francisco Bay fish consumption advisory), and encourage new activities and collaborations among the participating groups (e.g., sign posting by fishing location managers).

Sub-task 2. Develop a broad risk communication strategy
CW4CB will work closely with the SAG to develop a broad risk communication strategy that will serve as the basis for planning future outreach, education, and risk reduction activities. The strategy will address how to communicate information about fish contamination issues, including the current advisory, to fish consuming populations, with an emphasis on those populations at greatest risk. The risk communication strategy that was used in the CALFED-funded Fish Mercury Project risk

reduction project in the Central Valley and Sacramento/San Joaquin Rivers watershed will be used as a model, but tailored by the SAG for the purpose of this project. The strategy will describe the target populations, the key messages that will be communicated, the types of future activities that would be most effective to reach these target populations (e.g., focused community/population-specific mini-grants, broader-based education efforts through established non-profit education centers), and methods for evaluating the effectiveness of these activities. The strategy will be updated as relevant and critical information becomes available, including a new fish consumption advisory for San Francisco Bay that the Office of Environmental Health Hazard Assessment plans to issue in 2010. One important component of the strategy will be a mini-grant program (Task 3) to engage some of the SAG members in implementing outreach, education, or risk reduction projects in the short term.

Sub-task 3. Award and oversee implementation of mini-grants

It is important to begin engaging local organizations regarding implementing outreach, education, and risk reduction activities concurrent with developing the broad risk communication strategy (Task 2). Local organizations may already have close relationships with communities who consume Bay fish and be able to address language and cultural barriers. CW4CB will develop a process to select and award small grants for local organizations to conduct these projects. We will seek input from the SAG to guide the general goals of the mini-grant program and seek SAG participation on the selection panel. Based on the needs of the funded groups, CW4CB may, as needed, conduct limited capacity building trainings on topics related to fish contamination (e.g., mercury health impacts, advisories) and help the groups to develop the skills needed to implement their projects. CW4CB will also monitor their progress and assist with evaluation and reporting requirements.

Sub-task 4. Conduct evaluation activities

Evaluation activities will include the following parts: evaluation of the SAG; mini-grant evaluation activities by the funded groups; CW4CB evaluation of mini-grants; and potentially evaluation of other broader-based education efforts through established non-profit education centers conducted in association with CW4CB. CW4CB will conduct evaluation of the SAG process, focusing on process indicators (e.g., who attends SAG meetings, what input they provide, how they guide strategy development). Broader feedback will also be solicited on whether the SAG is meeting its goals, the SAG activities that were most helpful to members, and ways the SAG could be improved. Mini-grant funded groups will implement an evaluation of their mini-grant project activities. CW4CB will provide guidance on how to conduct these evaluations. Evaluation will most likely focus on process indicators, such as the number of people who were reached by their mini-grant project activities or the number of materials distributed. CW4CB will also provide an evaluation summary that describes evaluation activities across funded groups. The evaluation summary will also include input from funded groups on their overall experience in the mini-grant program and how it could be improved, and grantee feedback on how their mini-grant activities will be sustained after the mini-grant funding ends.

Task 7. Outreach and Technology Transfer

- **WQIF Funding:** $0. **Non-federal Matching Funds:** $150,000.
- **Key Tasks and Activities:** Development of project web portal, written outreach materials, and project guidance manual; technical work shops.
- **Deliverables:** Results documented in quarterly progress reports and draft and final project report.
- **Outputs:** Project web portal, guidance manual, written outreach materials, technical workshops.

CW4CB will document the knowledge and experience gained and the lessons learned during this project. The goal will be to make information and guidance readily available to inform future efforts to mitigate urban runoff discharges of PCBs and other pollutants from other urban watersheds in the Bay Area and elsewhere in California and the United States. This task will promote the use of project results by others and will result in the public and professionals in the field being informed and engaged. CW4CB's methods and tools to facilitate outreach and information transfer will include the following:

- A project web portal will be developed at the outset of project and updated quarterly throughout the project term.
- A guidance manual will be prepared that provides essential information to others that wish to implement similar efforts.
- Written outreach materials will be developed, including a user-friendly summary of the project with references to where additional information is available (e.g., the web portal and guidance manual). The urban runoff treatment retrofits will be publicized and presented as demonstration projects.
- A technical workshop will be held covering all aspects of the project.

As feasible and appropriate, the monitoring data from this project (especially the urban runoff treatment retrofit monitoring) will be submitted for inclusion in the International Stormwater BMP Database.

7. Programmatic Capability and Past Performance

The Bay Area Stormwater Management Agencies Association was established in 1989 as a regional association through a memorandum of understanding (MOU) covering the nine Bay Area counties. BASMAA was started by local municipalities to facilitate information sharing and cooperation and to develop products and programs that would assist them in meeting their NPDES permit and Clean Water Act requirements. BASMAA is designed to encourage information sharing and collaboration and it provides an institutionalized mechanism for its member agencies to develop innovative products and programs that are more cost-effective done regionally than can be accomplished locally.

BASMAA is focused on regional challenges and opportunities to improving the quality of stormwater that flows to our local creeks, San Francisco Bay and Delta, and the Ocean. BASMAA's work covers the full breadth of stormwater-related topics including monitoring, new

development, public information / participation, commercial / industrial, illicit discharges, flood control, TMDLs, and permitting.

Currently, BASMAA is a consortium of nine San Francisco Bay Area municipal stormwater quality programs, comprised of 96 Bay Area agencies (municipalities, counties, and special districts). Each BASMAA member agency plays a significant role in managing stormwater and urban runoff within its jurisdiction and in coordination with others in our region in order to protect the health of waters and aquatic life of Bay Area watersheds that drain into the region's six USEPA-identified sub-basins: Suisun Bay, San Pablo Bay, Coyote Creek, San Francisco Bay, Tomales-Drake Bays, and San Francisco Coastal South.

For the past 20 years, BASMAA has provided a forum for agencies with common interests, challenges, and responsibilities to collaborate on stormwater management issues of mutual interest and needs. Though its organizational framework has evolved from an assortment of agencies bound together by an MOU to the 501(c)(3) nonprofit entity it is today, BASMAA has continued to help its members by promoting understanding of existing and emerging stormwater quality management issues and technologies, facilitating agency cooperation, increasing program efficiency and effectiveness, and advancing sustainable stormwater quality management approaches in executive and legislative decision-making and public debate. Through BASMAA, stormwater quality management programs have been able to address regional, partnership, and locally specific needs as set forth in NPDES stormwater management permits issued by the Regional Water Board.

BASMAA committees and work groups have overseen the completion of numerous collaborative regional projects contracted to its agencies or consultants under its baseline and tasks of regional benefit budgets.[10] BASMAA's new challenge and opportunity is to assist its member stormwater quality management programs and their constituent agencies to work with the Regional Water Board on the finalized version of a municipal regional stormwater permit (MRP) that addresses watersheds in the Bay Area, and to foster collaboration and mutual assistance on implementation of MRP provisions. For the past twenty years, BASMAA and its participating entities have proven their capacity to collaborate on significant projects of regional importance, and have produced deliverables and outcomes that provide much of the foundation for current regional stormwater quality management efforts, including this proposal. BASMAA fully expects to continue to deliver the same quality of project capacity and success its members have achieved through collaborative association.

Some Major BASMAA Regional Projects

- Recognized Surface Cleaner program (1996 -)
- Construction site inspection / education program (1990s)
- Regional Advertising Campaigns (1996 -)
- Brake Pad Partnership (1996 -)
- *Start at the Source* design manuals (1997, 1999)
- IPM Partnership /*Our Water, Our World* program (1998 -)
- Joint Stormwater Agency Project to Study Urban Sources of Mercury, PCBs, and Organochlorine Pesticides (2001-'03)
- Bay Are Hydrology Model (BAHM) (2003)

[10] For additional capacity documentation, see Attachments Section for key staff resumes and the BASMAA Baseline Budget Projects and Programs Report.

In addition to the tens of projects and programs started and sustained by BASMAA using millions of dollars in funds from its members and other agencies over the years, BASMAA has received and conducted one USEPA grant project: the *Our Water, Our World Promotion — Statewide Expansion and Evaluation*; funded through a Pesticide Environmental Stewardship Program (PESP) grant through the National Foundation for IPM Education. Although the grant amount was relatively small ($40,000), the actual tasks were significant, including using some of the grant monies to leverage the existing *Our Water, Our World* Program in the Bay Area to expand the program statewide by recruiting tens of agencies outside of the Bay Area to start and support the program in their jurisdictions. The other key aspect of the grant was the development and implementation of a program evaluation to evaluate the effectiveness of the *Our Water, Our World* Promotion through direct performance measurement of store customers and to make recommendations for future efforts[11].

[11] See Attachments section for Final PESP Grant Compliance Report.

MRP Regional Supplement for POCs and Monitoring

A3

MEMORANDUM

TO: CW4CB Project Management Team

FROM: Kristin Kerr and Jon Konnan, EOA, Inc.

DATE: September 13, 2010

SUBJECT: Clean Watersheds for a Clean Bay (CW4CB) Project Status

1.0 INTRODUCTION

This memorandum presents the status of Clean Watersheds for a Clean Bay (CW4CB), a new project funded by a grant to the Bay Area Stormwater Management Agency Association (BASMAA) from the United States Environmental Protection Agency (EPA).[1] It was prepared to address the 2010 reporting requirements for portions of Provisions C.11 and C.12 (described below) of the regional stormwater NPDES permit adopted October 14, 2009 by the San Francisco Bay Area Regional Water Quality Control Board (Regional Water Board), which is commonly referred to as the "Municipal Regional Permit" (MRP).[2]

The CW4CB project is a partnership of Bay Area municipalities and countywide municipal stormwater management programs. The overarching project objective is to implement priority actions called for by the San Francisco Bay PCBs and mercury Total Maximum Daily Load (TMDL) water quality restoration programs[3] including developing and pilot-testing a variety of methods to potentially reduce urban runoff loading of PCBs and mercury to the Bay. The project work plan (BASMAA 2010) submitted to EPA on September 23, 2009 (the final revised version is dated April 19, 2010) describes the project's principal tasks:

- Selecting for pilot investigations five Bay Area region watersheds with relatively high levels of PCBs[4] in sediments collected from roadway and stormwater drainage infrastructure and other desirable attributes;
- Identifying PCB and mercury source areas within the pilot watersheds and referring these sites to regulatory agencies for cleanup and abatement;
- Developing and pilot-testing methods to enhance removal of sediment with PCBs and mercury, mainly during existing municipal street and storm drain system operation and maintenance activities in the five pilot watersheds;
- Retrofitting eight to ten urban runoff treatment facilities into existing infrastructure in the Bay Area region to remove PCBs and mercury; and

[1]Funding is provided through EPA's San Francisco Bay Water Quality Improvement Fund.
[2]National Pollutant Discharge Elimination System (NPDES) Permit No. CAS612008, Order R2-2009-0074.
[3]The MRP implements the TMDL actions related to stormwater runoff.
[4]Per the MRP, "Reducing loads of PCBs is the main pilot location selection factor...and reducing loads of mercury is a secondary criterion."

- Facilitating development and implementation of a Bay Area regional exposure reduction program that focuses on educating the public about the health risks of consuming certain species of Bay fish that contain relatively high levels of PCBs and mercury.

The successful project outcome will contribute to developing a comprehensive regional strategy for reducing PCB and mercury loads in urban runoff, based on the cost-effectiveness of a range of pollutant control strategies, including pollution prevention, site remediations, enhanced sediment management, stormwater treatment retrofits, and diversion of stormwater to existing publicly owned treatment works (POTWs).[5] The knowledge and experience gained and the lessons learned during the CW4CB project will inform similar efforts by others in the Bay Area and elsewhere in California and the United States.

The anticipated project period is four years, beginning July 1, 2010. BASMAA is receiving $5.0 million in funding from the EPA toward the $6.84 million total project cost. The remaining $1.84M (about 27% of the total project cost) is matching funding contribution from BASMAA and six of the Bay Area countywide stormwater management programs. In addition, in-kind assistance from participating city staff will leverage the project effort.

A project management team consisting of BASMAA's executive director and representatives from several BASMAA countywide programs and Bay Area cities is providing project oversight and coordination. The team recently began meeting regularly on the second Wednesday of each month.

CW4CB is also convening a Technical Advisory Committee (TAC) comprised of local and national experts. The TAC will help optimize the scientific and technical soundness, integrity, and objectivity of the project. It will be comprised of Dr. Tom Mumley (Assistant Executive Officer, Regional Water Board), Dr. Lester McKee (Director of the Watershed Program, San Francisco Estuary Institute), and other appropriate technical experts from the Bay Area and elsewhere in the United States. CW4CB project management team members have conducted initial discussions with the existing two TAC members regarding finding additional members and have prepared a draft scoping document and a list of questions to ask when interviewing candidate additional members. Per the initial discussions, the project will seek to find TAC members with experience related to implementation of stormwater controls targeting particulate-bound pollutants in highly urbanized built-out industrial areas where available land is often sparse. Per Table 3 of the CW4CB project work plan, the schedule for initially convening the TAC is during the first quarter of the project (see Task 1).

The project work plan includes seven major tasks, several of which are intended to directly assist Permittee compliance with specific MRP provisions. These tasks and the corresponding provisions are as follows:

- CW4CB Tasks 2 and 3 (MRP Provisions C.11/12.c - Pilot Projects to Investigate and Abate Mercury/PCB Sources).
- CW4CB Task 4 (MRP Provisions C.11/12.d - Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices).
- CW4CB Task 5 (MRP Provisions C.11/12.e - Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit).

[5]Pollution prevention and stormwater diversion to POTW strategies are being developed and pilot-tested separately from CW4CB.

- CW4CB Task 6 (MRP Provisions C.11/12.i - Development of a Risk Reduction Program Implemented throughout the Region).

The following sections in this memorandum describe progress to-date on each of the above CW4CB tasks and corresponding MRP provisions and the schedule for moving forward. It should be noted that although CW4CB's conceptual planning and discussion began in early 2010, the actual project start date was July 1, 2010.[6]

2.0 PILOT PROJECTS TO INVESTIGATE AND ABATE MERCURY/PCB SOURCES

Provisions C.11/12.c. of the MRP require that Permittees work collaboratively to review pertinent existing data and identify five Bay Area watersheds that contain relatively high levels of PCBs and mercury (CW4CB Task 2) and conduct pilot projects to investigate and abate these pollutants (CW4CB Task 3). The CW4CB project management team is developing selection criteria and is currently working with Permittees towards selecting the five pilot watersheds by reviewing and evaluating relevant existing data.

Table 1 summarizes the proposed criteria that will inform selection of the five watersheds and the associated existing data sources. Most of these data were originally compiled and made available by the Regional Stormwater Monitoring and Urban BMP Evaluation Project conducted by the San Francisco Estuary Institute (SFEI) and referred to as the "SFEI Proposition 13 Study." The study investigated options for better managing mercury and PCBs in urban stormwater and was conducted in collaboration with BASMAA and the Regional Water Board. It was funded through a grant from the State of California Proposition 13 stormwater non-point-source program. SFEI recently completed the study and is currently updating a web site that will make the project data and results readily available.

The CW4CB project management team is currently working with SFEI to perform a GIS analysis of the SFEI Proposition 13 Study data to inform pilot watershed selection. The available data types include: watershed boundaries; spatial (including clustering) and temporal aspects of concentrations of PCBs and mercury in sediments; potential pollutant source sites (e.g., pollutant spill sites, PG&E facilities,[7] transformers with PCBs registered with the EPA, auto dismantlers, and historic railroads); historic land use; and pump station locations.

MRP Provisions C.11/12.d. require that Permittees work collaboratively to develop and pilot-test methods to enhance removal of sediment with PCBs and mercury during existing municipal street and storm drain system operation and maintenance activities. Permittees are required to conduct this pilot work in the five pilot watersheds selected for Provisions C.11/12.c. Thus the pilot watersheds will be located in areas where such municipal operation and maintenance activities are conducted routinely.

[6]The project started significantly later than originally anticipated. EPA's original Request for Proposal included an anticipated award date of February 2010. However, despite EPA's and BASMAA's best efforts to expedite the process, EPA was not able to provide BASMAA with a proposed assistance agreement until June 2010, resulting in the project start date of July 1, 2010. Thus the project is currently at an early stage.
[7]CW4CB currently does not have permission to use PG&E facility data but is working with Regional Water Board staff and SFEI to obtain that permission.

Table 1. Summary of Proposed Criteria to Inform Pilot Watershed Selection and Associated Data Sources

Category	Criterion	Data Sources
Benefits - Potential Pollutant Load Reductions	Are there relatively high levels of PCBs (and secondarily mercury) in sediments collected from roadway and stormwater drainage infrastructure in the watershed?	SFEI Proposition 13 Study compilation of sediment chemisty data.
	Are there other indicators of potential sources of PCBs in the watershed?	• SFEI Proposition 13 Study "hot spot" GIS layer. • SFEI Proposition 13 Study GIS land use analysis using ABAG data. • SFEI Proposition 13 Study PG&E facility GIS layer.[1] • SFEI Proposition 13 Study auto dismantler GIS layer. • SFEI Proposition 13 Study railroad GIS layer. • EPA Transformer Database (GIS layer created by SFEI).
Other Desirable Watershed Attributes	Is the watershed's size (i.e., area in square kilometers) within an acceptable range for the pilot study work?	SFEI Proposition 13 Study Bay Area watershed GIS layer.
	Is there a pump station at the bottom of the watershed?	SFEI Proposition 13 Study Bay Area pump station GIS layer.
	Are municipal street and storm drain system operation and maintenance activities conducted routinely in the watershed?	CW4CB project management team knowledge, municipal staff interviews.
Regional Context	Will pilot work in this watershed fit into the broader regional context of pilot-testing a range of pollutant control strategies, including pollution prevention, site remediations, enhanced sediment management, stormwater treatment retrofits, and diversion of stormwater to existing POTWs?	CW4CB project management team knowledge.
Barriers and Opportunities	Are there institutional, regulatory, political, technical, and/or organizational barriers to conducting pilot work in the watershed that cannot be easily addressed?	CW4CB project management team knowledge, municipal staff interviews.
	Have previous pertinent studies been conducted in the watershed?	CW4CB project management team knowledge, municipal staff interviews, project reports or other data.

[1]CW4CB currently does not have permission to use PG&E facility data but is working with Regional Water Board staff and SFEI to obtain that permission.

The CW4CB project management team and municipal staff will also determine whether there are institutional, regulatory, political, technical, and/or organizational barriers associated with a potential pilot watershed. In addition, an important consideration during the selection process will be whether pilot work in a proposed watershed would fit into the broader regional context of pilot-testing a range of pollutant control strategies, including pollution prevention, site remediations, enhanced sediment management, stormwater treatment retrofits, and diversion of stormwater to existing POTWs.

The CW4CB project work plan schedule calls for completing the pilot watershed selection process by the end of the first quarter of the project (September 30, 2010). It is anticipated that most or all of the watersheds will be selected by this date. After the five pilot watersheds are selected, CW4CB Task 3 will identify PCB and mercury source areas within the project watersheds and refer these sites to regulatory agencies for cleanup and abatement. Table 3 of the CW4CB work plan includes the schedule for implementation of this effort.

3.0 PILOT PROJECTS TO EVALUATE AND ENHANCE MUNICIPAL SEDIMENT REMOVAL AND MANAGEMENT PRACTICES

As noted previously, MRP Provisions C.11/12.d. require that Permittees work collaboratively to develop and pilot-test methods to enhance removal of sediment with PCBs and mercury, mainly during existing municipal street and storm drain system operation and maintenance activities. CW4CB Task 4 will implement this requirement. Permittees are required to conduct this pilot work in the five pilot watersheds selected for Provisions C.11/12.c. (CW4CB Tasks 2 and 3). The evaluation will include typical routine municipal operation and maintenance practices such as street sweeping, catch basin cleaning, and stormwater conveyance system cleaning, and will also include consideration of street flushing and routing the wash water to a sanitary sewer. Evaluation of existing information on high-efficiency street sweepers is also a specific C.11/12.d. requirement. As a first step, CW4CB has recently initiated a review of existing literature and other information relevant to these evaluations. Table 3 of the CW4CB work plan includes the schedule for implementation of this effort (see Task 4).

4.0 PILOT PROJECTS TO EVALUATE ON-SITE STORMWATER TREATMENT VIA RETROFIT

Provisions C.11/12.e. require that Permittees retrofit PCB and mercury treatment systems into existing storm drainage infrastructure at 10 locations throughout the Permittees' jurisdictions and evaluate effectiveness. CW4CB Task 5 will implement this requirement. It is anticipated that some but not all of the retrofits will be sited within the five pilot watersheds identified by CW4CB Task 2. Permittees are required to install at least one retrofit in each of five major Bay Area counties covered by the MRP (Santa Clara, San Mateo, Alameda, Contra Costa, and Solano) and report on candidate locations with types of treatment retrofit for each location in the September 2011 Annual Report. This effort is at an early stage and has consisted to-date of initial conceptual discussions at the project management team meetings. The project management team is also working with EPA to better define procurement rules in relation to retaining a consultant in the near future to perform an initial conceptual screening of retrofits potentially applicable to this project. Table 3 of the CW4CB work plan includes the schedule for implementation (see Task 5).

5.0 DEVELOPMENT OF A RISK REDUCTION PROGRAM IMPLEMENTED THROUGHOUT THE REGION

Provision C.11/12.i. requires that Permittees implement a regional program of risk communication activities to raise public awareness of fish contamination issues in San Francisco Bay and to encourage fish-consuming populations to reduce their exposure to pollutants in contaminated fish. CW4CB Task 6 will implement this requirement. The project work plan (BASMAA 2010) describes how this effort will be accomplished and includes four general subtasks:

- Sub-task 1. Convene a risk reduction stakeholder advisory group.
- Sub-task 2. Develop a broad risk communication strategy.
- Sub-task 3. Award and oversee implementation of mini-grants.
- Sub-task 4. Conduct evaluation activities.

Table 3 of the CW4CB work plan includes the schedule (see Task 6). It should be noted that BASMAA developed the work plan tasks and schedule in coordination with a Bay Area risk reduction work group that includes representatives from BASMAA, the California Department of Public Health, Bay Area Clean Water Agencies (BACWA), and Regional Water Board staff. Task 6 is being funded through CW4CB, potentially with additional funding from other dischargers to the Bay that have similar NPDES permit requirements, including BACWA and industrial dischargers. The work group held scoping meetings on December 1, 2009 and January 26, 2010 and also had many telephone and e-mail communications during early 2010 related to task and schedule development.

Executive Summary

This Feasibility Evaluation Report (FER) fulfills reporting requirements for Fiscal Year 2009/10 under provisions C.11.f and C.12.f of the Municipal Regional Stormwater National Pollutant Discharge Elimination System (NPDES) Permit (Order No R2-2009-0074), more commonly referred to as the Municipal Regional Permit (MRP). Provisions C.11.f and C.12.f of the MRP are nearly identical provisions for control of mercury (C.11) and polychlorinated biphenyls (PCBs) (C.12) that require the evaluation of pilot diversions to publicly owned treatment works (POTWs) of dry weather urban runoff and/or first flush events from stormwater pump stations. The pilot projects are being evaluated in parallel with other BMP pilot implementation projects, including stormwater treatment retrofits, sediment management pilot projects, and source investigations to identify contaminated sites. The first product required under these provisions is a feasibility evaluation to be included in the 2010 Annual Reports for each Permittee. The feasibility evaluation is to include, but is not limited to, costs, and impacts on the stormwater and wastewater agencies and benefits to the receiving waters that would result from pilot projects that divert and treat dry weather runoff and first flush flows. The 2010 Annual Report is to summarize the feasibility evaluation, including:

- Selection criteria leading to the identification of five candidate and five alternate pump stations;
- Time schedules for conducting pilot studies; and
- A proposed method for distributing mercury and PCBs load reductions to participating wastewater and stormwater agencies..

Selection criteria have been developed based on a review of other programs that have scoped and/or implemented urban runoff diversion projects and discussions with stormwater program representatives. The Selection criteria are intended to inform the selection of sites (i.e., pump stations) for potential diversion and framed around water quality needs, the broader regional context of pilot-testing a variety of pollutant control strategies in the Bay Area, and acceptability, as summarized in Table ES-1 below.

Maps of PCB concentrations in sediments, pump station locations, and POTW service areas are included in this report to assist with the needs criterion. Guidance is also provided for addressing the acceptability criteria. Tools for developing cost estimates and estimating potential load reductions of PCBs and Hg from stormwater discharges as a result of pilot diversion projects are also included.

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Table ES-1. Proposed Selection Criteria and Information Needed

Criteria		Information Needed
Needs	Will the project yield a significant PCB load reduction?	PCB concentrations in sediments from the local drainage; Pump station inventories in GIS and tabular formats Event-mean PCB concentrations in stormwater; TSS and flow measurements; Drainage area assessments
	Will the project provide unique or new information?	Peer review from Technical Oversight Committee
	Does a pilot project fit into the broader regional context of pilot-testing a range of pollutant control strategies, including pollution prevention, site remediations, enhanced sediment management, and stormwater treatment retrofitting strategies?	Peer review from Technical Oversight Committee
Costs and Alternatives	Are the capital and operation and maintenance costs associated with diversion prohibitive?	Site investigations Conceptual designs and drawings Preliminary site-specific cost estimates Treatment and connection costs/charges.
	Are there ways to control upstream sources of PCBs through remediation, removal, isolation, or run-on diversion?	Source identification studies Peer review from Technical Oversight Group
	Can onsite treatment or infiltration retrofits be implemented?	Site investigations, including right-of-way mapping
Acceptability	Is there an accessible POTW willing and able to provide treatment service?	POTW service area map Communication with POTW managers
	Can the pilot diversion be sited within acceptable design criteria?	Pre-design checklist assessment (Table 1)

The cost and load estimating tools were applied to three hypothetical scenarios: a constructed pilot diversion, a temporary pilot diversion, and a strategic conveyance system cleanout pilot project. The constructed pilot diversion scenario resulted in an estimated PCB load reduction of 1.6 grams per year discharged to the Bay at a one-time cost of $750,000; over twenty years this would reduce 32 grams of PCBs at a cost of $23,500 per gram of PCBs removed; the cost per gram would increase if the hypothetical pilot diversion were to be terminated in less than twenty years. The temporary pilot diversion scenario resulted in an estimated one-time load reduction of 0.11 grams discharged to the Bay, at a cost of $180,000, or $1,600,000 per gram of PCBs removed in total. The strategic conveyance system cleanout scenario resulted in an estimated one-time load reduction of 0.095 grams of PCBs per year, at a cost of $28,000, or $300,000 per gram of PCBs removed in total. All three of these scenarios represent fractionally small (0.0006 to 0.008 percent) amounts of the total estimated stormwater PCB load currently discharged to the Bay (20 kg). Those hypothetical costs all reflect the simplifying assumption that the receiving POTW waives treament fees.

The simplifying assumption that a POTW waives treatment fees is, in fact, unlikely. In most cases, wastewater and stormwater programs are funded through separate sources, and so institutional factors may make such a waiver problematic. Connection fees typically range from $9,000 to $18,000 per thousand gallons per day, and treatment fees typically range from $300 to $2,400 per MG treated. As a result, these cost estimates for the hypothetical scenarios are llikely underestimated. Other charges may also be assessed, such as East Bay MUD's "wastewater capacity fee" of at least $97.40 per 100 cubic feet per month, or $130,000/MG/month.

The report concludes with a proposed approach to distribute credit for load reductions to participating stormwater programs and POTWs, and a proposed preliminary schedule for pilot project implementation.

G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Section 1

Background

This Feasibility Evaluation Report (FER) fulfills reporting requirements for Fiscal Year 2009/10 under provisions C.11.f and C.12.f of the Municipal Regional Stormwater National Pollutant Discharge Elimination System (NPDES) Permit (Order No R2-2009-0074), more commonly referred to as the Municipal Regional Permit (MRP). Provisions C.11.f and C.12.f of the MRP are nearly identical provisions for control of mercury (C.11) and polychlorinated biphenyls (PCBs) (C.12) that require the evaluation of pilot diversions to publicly owned treatment works (POTWs) of dry weather urban runoff and/or first flush events from stormwater pump stations. The pilot projects are being evaluated in parallel with other BMP pilot implementation projects, including stormwater treatment retrofits, sediment management pilot projects, and source investigations to identify contaminated sites. The first product required under these provisions is a feasibility evaluation to be included in the 2010 Annual Reports for each Permittee. The feasibility evaluation is to include, but is not limited to, costs, and impacts on the stormwater and wastewater agencies and benefits to the receiving waters that would result from pilot projects that divert and treat dry weather runoff and first flush flows. The 2010 Annual Report is to summarize the feasibility evaluation, including:

- Selection criteria leading to the identification of five candidate and five alternate pump stations;
- Time schedules for conducting pilot studies; and
- A proposed method for distributing mercury and PCBs load reductions to participating wastewater and stormwater agencies.

The data sources, computational tools, and recommendations of this report are intended to guide municipal Permittees in the selection and scoping of stormwater pilot diversion pilot projects. This section presents a brief overview of the problem statement and planning context of the pilot diversion concept. The second section summarizes the approach to develop this Feasibility Evaluation Report (FER). The third section summarizes the findings in regard to:

- Selection criteria to inform site selection
- Cost/benefit analysis of three example scenarios
- A framework for crediting load reductions attained
- Information tools available
- Opportunities and constraints

The fourth section of the report briefly summarizes for Permittees how the tools in this report can be used to scope out candidate pump station pilot diversion projects. The report concludes with a proposed preliminary schedule for selection of candidate pump stations and development and implementation of pilot project studies.

1.1 Problem Statement

Bay Area storm water dischargers have been required to implement significant reductions in the annual loads of mercury and polychlorinated biphenyls (PCBs) discharged to San Francisco Bay (the Bay) from areas served by municipal separate storm sewer systems (MS4s). The requirements have been established as wasteload allocations (WLAs) in the Total Maximum Daily Load (TMDL) plans for mercury and PCBs in the Bay adopted by the San Francisco Bay Regional Water Quality Control Board

(SFB-RWQCB 2006; SFB-RWQCB, 2008). The mercury TMDL requires a two-fold reduction in the annual average mass of mercury discharged from urban stormwater, from the current estimated load of 160 kg/yr down to 82 kg/yr by the year 2026. The PCBs TMDL requires approximately a tenfold reduction in the annual average mass of PCBs discharged from all stormwater[1] (i.e., urban and non-urban), from 20 kg/yr down to 2 kg/yr by the year 2028.

Those numeric load reduction targets are important to keep in mind when evaluating the load reduction benefit of any specific pilot project and comparing to other alternatives for PCB load reduction. They also show that PCB load reduction is the driver for planning control measure implementation, because the reductions required are larger than those of mercury. For this reason, SFB-RWQCB staff has guided Bay Area Stormwater Management Agencies Association (BASMAA) members to plan pilot projects with a focus on PCB load reductions, and report the mercury load reductions attained by those same pilots. Following that guidance, this FER focuses on PCBs for planning and scoping pump station pilot diversion projects; parallel load reduction calculations for mercury are included for completeness with the MRP requirements.

The MRP states that the objectives of the pilot diversion pilot studies are to:

- Evaluate the reduced loads of PCBs and mercury from diversion of dry weather and first flush urban runoff to sanitary sewers;
- Gain knowledge and experience to determine the implementation level of urban runoff diversion in subsequent permit terms; and
- Document the knowledge and experience gained through pilot implementation.

The pilot diversion projects that would result from this study are not expected to be the sole, or even most significant, actions to implement reductions in discharges for the PCBs TMDL. Although pilot diversions are expected to yield some quantifiable pollutant load reduction benefit, the most significant benefit of the pilot projects is the lessons learned about key management questions:

- Can pilot diversion of first flush and/or dry weather urban runoff significantly reduce stormwater loads of PCBs?
- What is the cost per gram of PCBs removed by the pilot diversion approach?
- How does that cost per gram for pilot diversion compare to alternatives such as pollution prevention, remediation of contaminated sites, strategies to enhance pollutant removal during sediment management, and stormwater treatment retrofits?
- What are the technical, regulatory, and institutional challenges to stormwater diversion into POTWs for the purposes of reducing PCB loads?
- What would motivate a POTW to accept stormwater for treatment?

Answering these management questions is beyond the scope of this FER. The questions above establish a framework for the final report on the pilot projects.

[1] The PCBs TMDL assumes that the non-urban contribution of PCBs is relatively small, i.e., < 0.1 kg/yr, compared to the urban contribution. If this assumption is correct, then the requirement for a 90 percent load reduction from “all stormwater sources” would have essentially the same outcome as requiring a 90 percent load reduction from urban stormwater.

1.2 Planning Context

It is important to understand the overall planning context of this FER. Pilot diversion projects are but one facet of a broader control strategy for PCBs and mercury that involves many different activities (Figure 1-1). The implementation plans for the PCBs and mercury TMDLs are adaptive – lessons learned during the first decade of implementation will guide future emphasis on projects and activities that have relatively greater efficacy per unit cost. Projects required of stormwater dischargers to adaptively implement the mercury and PCBs TMDLs are specified in provisions of the MRP, and are briefly summarized below.

Load reductions expressed as WLAs in a TMDL are implemented by the SFB-RWQCB through provisions in adopted NPDES permits. For Bay Area stormwater dischargers, the MRP requires four general types of pilot projects and activities to show progress towards attaining WLAs for PCBs and mercury: pollution prevention, remediation of contaminated sites, strategies to enhance pollutant removal during sediment management, and stormwater treatment.

Pollution prevention activities focus on stopping PCBs and mercury from getting into stormwater in the first place. Pollution prevention for mercury focuses on collection and recycling of mercury-containing products (Provision C.11.a of the MRP). Pollution prevention for PCBs focuses on industrial inspections (Provision C.12.a), such as the evaluation and prevention of PCB release from building materials such as caulk (Provision C.12.b).

Remediation of contaminated sites and strategies to enhance pollutant removal during sediment management rely on the fact that both mercury and PCBs tend to be associated with sediments. Monitoring studies have shown that PCB concentrations are heterogenous throughout the San Francisco Bay area. Substantial concentrations of PCBs in sediments (e.g, 1 mg/kg up to 90 mg/kg) may be found today in flood control conveyances downstream of areas where PCBs were historically used and/or released (Yee and Mckee, 2010)[2]. The report by Yee and Mckee (2010) also pointed out that in many cases, identification of high PCB concentrations in sediments at one location would indicate that a "halo" of elevated PCB concentrations in sediments may be found within approximately 2500 meters of the contaminated site. Provisions C.11.c and C.12.c require pilot projects to investigate and remediate on-land locations with elevated PCB and mercury concentrations in sediment.

Provisions C.11.d and C.12.d require pilot projects to develop and pilot-test methods to enhance removal of sediment with PCBs and mercury, mainly during existing municipal street and storm drain system operation and maintenance activities. These provisions also require consideration of street flushing and routing to the sanitary sewer, an approach that overlaps with one of the scenarios evaluated in this FER (stormwater conveyance cleanouts). In addition to managing contaminated sediments through street sweeping and cleanouts of stormwater conveyances, it will be important to focus efforts on removing or capping in-place sources of contaminated sediments to streets and stormwater conveyances.

Stream maintenance and ecosystem restoration projects in streams and baylands at times involve sediment removal and/or stream bank stabilization. To the extent that those activities also remove or isolate in place contaminated sediment, they provide a load reduction benefit to the Bay. Conversely, if stream maintenance or ecosystem restoration projects mobilize previously isolated contaminated sediments, those activities would increase contaminant loads to the Bay.

[2] The summary report by Yee and Mckee compiles data from studies including: Applied Marine Sciences (AMS) Inc. (2002a); AMS 2002b; AMS, 2007; EOA (20002a); EOA (2002b); EOA (2002c); EOA (2003a); EOA (2003b); EOA (2004); EOA (2007a); EOA (2007b); and Klienfelder (2006). Those original reports are available in the supplemental CD provided with this FER.

Stormwater treatment may be beneficial in situations where it is too late to prevent on-land pollution, and defined, controllable source areas cannot be identified. Stormwater treatment can include designing and constructing dedicated treatment retrofits to serve contaminated catchments. Pilot treatment retrofits are required under Provision C.11.e for mercury and C.12.e for PCBs.

MRP Provisions C.11/12.c., d., and e. are being implemented through a regional collaboration that is funded through a grant from the United States Environmental Protection Agency, with local cost matches (BASMAA, 2010). Alternatively, stormwater treatment can be accomplished by existing POTWs, if diversion and conveyance systems can be feasibly constructed and a local POTW can be identified that is willing and able to provide treatment services. That approach is required by Provision C.11.f for mercury and C.12.f for PCBs, and this approach is the focus of this FER.

Figure 1-1. Conceptual Illustration of Pilot Stormwater Diversion to POTW Projects in Context with Other Potential Control Strategies

Section 2

Approach

2.1 BASMAA Technical Oversight

This report has been prepared under the direction of BASMAA representatives. The scope of work was developed through a series of discussions at BASMAA Monitoring and Pollutants of Concern (MPC) committee meetings in January through March, 2010. Staff and Permittees from each countywide stormwater program began meeting once a month in June 2010 to provide technical oversight to development of this FER. This Technical Oversight Committee (TOC) will continue to advise Permittees who are scoping and implementing pilot diversion projects. The primary role of TOC during the implementation stage will be to provide consistency in effectiveness evaluation methods and peer review on the value of new information expected from pilot projects and the merits of diversion pilots as compared to other pollutant control alternatives possible at the proposed locations. The TOC for this FER also has considerable overlap with the Clean Watershed for a Clean Bay (CW4CB) grant project, providing coordination between the two experts.

2.2 Information gathered

In general, two types of information were gathered and compiled for this report: information on contaminated sediments in the Bay Area, and information about urban runoff diversion into POTWs. In addition, geographic information systems (GIS) data were made available by the San Francisco Estuary Institute (SFEI) upon completion of their Proposition-13 funded study focused on urban runoff best management practices (Yee and Mckee, 2010). Concentrations of PCBs in sediments have been superimposed on locations of pump stations and POTWs to assist in the selection of candidate locations. Maps of POTW service areas are provided alongside the GIS representations to further assist the selection[3].

2.3 Approach to Development of Selection Criteria

The approach to developing the draft selection criteria starts by looking at other programs that have scoped and/or implemented urban runoff diversion projects. The approach builds on the thought process worked out by other programs by addressing the following questions:

- What selection criteria have been used by other programs to evaluate the feasibility of urban runoff diversions into treatment plants?
- What are the most appropriate selection criteria for projects in the San Francisco Bay region that would meet the requirements of Provision C.11.f/C.12.f? Selection criteria should address relevant pump station and POTW characteristics and institutional barriers/incentives.
- What regional and site information is needed to evaluate a project using the selection criteria?
- What specific regional information is currently available that would enable use of the selection criteria?

[3] Note to BASMAA reviewers: GIS layers of POTW service areas have been recently acquired and, at the direction of the oversight committee for this report, can be incorporated directly onto the maps of contaminated sediments and pump station locations.

- What are the known data gaps?
- How would a program that is scoping a diversion project address the data gaps?

2.3.1.1 Selection criteria used by other programs

This section summarizes selection criteria used to scope and/or implement pilot diversion projects from three case studies: California Beach communities, the Las Vegas Valley, and the California Department of Transportation.

2.3.1.1.1 California Beach Communities

During the information gathering stage of this project, the following California communities were identified that have developed diversion programs:

- Orange County
- San Diego County
- Los Angeles County
- Ventura County
- Monterey County
- Santa Cruz County

All of the counties above have beach communities. Essentially all of the dry weather diversion projects carried out in those communities have been motivated by the need to reduce or eliminate sources of bacteria to beaches and other areas used for water contact recreation. Of the programs reviewed, the Orange County Watersheds (2003) report was the only one which provided detailed documentation of their selection (or decision) criteria. The flowchart illustrating the decision criteria for dry weather diversions in Orange County is shown in Figure 1.

The Orange County selection criteria thought process illustrated in Figure 1 starts by screening against the two following general questions about dry weather discharges in coastal watersheds:

- Is there a water quality impairment to be addressed?
- Are there source control or treatment alternatives to dry weather diversions?

If the answers are yes, there is a water quality impairment and no, there are no better alternatives such as source control or onsite treatment, then the site is assessed against acceptability criteria for diversion into the Orange County Sanitation District conveyance and treatment system. Acceptability criteria used in Orange County Watersheds (2003) are:

- Local conveyance and treatment capacity;
- Potential to impact recreation or habitat by diversion;
- Other community and/or regulatory concerns.

As noted above, the Orange County Watersheds (2003) report is the most formal documentation of diversion selection criteria available. Interviews with project stakeholders from some of the above beach communities (e.g., City of Santa Cruz, Orange County Sanitation District), were conducted during the development of a draft Selenium Management Plan for Las Vegas Wash (Brown and Caldwell, 2009a). In addition, stakeholders involved in dry weather diversions in the cities of Los Angeles and Ventura were interviewed during the development of a white paper on urban runoff diversions on behalf of the Bay Area Clean Water Agencies (Carollo, 2009). Those stakeholder interviews tend to support the more formal acceptability criteria, as outlined above.

2.3.1.1.2 Las Vegas Valley

The draft Las Vegas Wash Selenium Management Plan (Brown and Caldwell, 2009a) followed an overall thought process similar to Southern California beach diversion projects, starting with water-quality needs and source area opportunities, and subsequently screening opportunity areas against capacity, constructability, cost, and community acceptance criteria. In the case of the Las Vegas Wash, the pollutant of concern was selenium in a desert wetland ecosystem, rather than bacteria in waters of swimmable beaches. The interest in reducing selenium loads was as a mitigation measure for the construction of an effluent bypass pipeline project to a deepwater outfall at Lake Mead. If constructed, the pipeline would generate electric power from the elevation drop to Lake Mead, and it would remove treated wastewater discharges from the Las Vegas Wash. These discharges provide dilution of selenium concentrations within existing groundwater seepage that enters the wash. Consequently, a means of reducing selenium loads via diversion of dewatering and seepage flows from tributaries of the wash into wastewater treatment plants would add value to the project by enabling diversion of relatively larger effluent flows from Las Vegas Wash into the pipeline, thereby creating relatively more electric power while concurrently reducing surface water impacts of treated effluent to Lake Mead, as the pipeline would allow discharge at the bottom of the lake.

The selection criteria led to diversion of selenium seepage sources into treatment plants from the base of watersheds as the most cost-effective alternative, because of the economic value of water flowing through the proposed bypass pipeline. The plan accounted for uncertainty in the alternatives analysis by proposing an adaptive approach that would initiate the more straightforward diversion projects in initial stages, while concurrently evaluating the feasibility of reducing seepage flows by changes in upland irrigation management practices or installation of onsite treatment or upstream diversion projects. The adaptive management decision tree proposed in the draft Las Vegas Wash Selenium Management Plan is illustrated in Figure 2-2 below.

Owing to declining economic conditions in the Las Vegas Valley, the bypass pipeline project has been put on hold (i.e., shelved); therefore, the draft Selenium Management Plan has not advanced beyond the planning and conceptual design/cost estimating stage. The draft plan does offer useful preliminary design and cost estimating concepts for large scale (i.e., 1 to 6 mgd) diversion projects involving varying levels of complexity in conveyance system design.

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Figure 2-2. Adaptive Management Decision Tree for the Las Vegas Wash Selenium Management Plan.
Numbers associated with each arrow represent the estimated minimum effluent flow range (mgd) to attain 5 µg/L water quality standard at the completion of each stage. The goal of the plan is to attain the lowest possible effluent flow, while maintaining selenium concentrations below the water quality standard. Underlined numbers represent the estimated minimum effluent flow ranges at the completion of Plan implementation. Dashed boxes indicate decision points. Shaded boxes indicate the likely course of action based on current information.

2.3.1.1.3 The California Department of Transportation (Caltrans)

The Caltrans Stormwater Quality Handbooks' Project Planning and Design Guide (PPDG) defines a regimented process for selection of structural BMPs during the design process for major projects. Selection criteria are defined by the "T-1 Checklist," which appears in Appendix E of the PPDG. If dry weather flows are present, designers are to consider dry weather diversions. Figure 2-3 below shows the feasibility and design criteria used in the Caltrans design process to consider dry weather diversions. The Caltrans example is a useful starting point for informing more detailed selection analysis of siting and design feasibility.

One example of a dry weather diversion constructed by Caltrans is the Jamboree Road overcrossing near Interstate 5 in Orange County. In that location, dewatering discharges are sent to the Orange County Sanitation Disrtict because of concerns over nitrogen and selenium in San Diego Creek. An example of temporary diversions by Caltrans is the Caldecott Tunnel, connecting Alameda County and Contra Costa County. Power washing discharges from the tunnel are diverted to the East Bay Municipal Utility District.

G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Dry Weather Flow Diversion

Feasibility

1. Is a Dry-Weather Flow Diversion acceptable to a Publicly Owned Treatment Works (POTW)? ☐Yes ☐No
2. Would a connection require ordinary (i.e., not extraordinary) plumbing, features or construction methods to implement? ☐Yes ☐No

   If "No" to either question above, Dry Weather Flow Diversion is not feasible.
3. Does adequate area exist within the right-of-way to place Dry Weather Flow Diversion devices? ☐Yes ☐No
   If "Yes", continue to Design Elements sections. If "No", continue to Question 4.
4. If adequate area does not exist within right-of-way, can suitable, additional right-of-way be acquired to site Dry Weather Flow Diversion devices and how much right-of-way would be needed? _____ (acres) ☐Yes ☐No
   If "Yes", continue to the Design Elements section.

   If "No", continue to Question 5.
5. If adequate area cannot be obtained, document in Section 5 of the SWDR that the inability to obtain adequate area prevents the incorporation of this Treatment BMP into the project. ☐Complete

Design Elements

* **Required** Design Element – A "Yes" response to these questions is required to further the consideration of this BMP into the project design. Document a "No" response in Section 5 of the SWDR to describe why this Treatment BMP cannot be included into the project design.

** **Recommended** Design Element – A "Yes" response is preferred for these questions, but not required for incorporation into a project design.

1. Does the existing sanitary sewer pipeline have adequate capacity to accept project dry weather flows, or can an upgrade be implemented to handle the anticipated dry weather flows within the project's budget and objectives? * ☐Yes ☐No
2. Can the connection be designed to allow for Maintenance vehicle access? * ☐Yes ☐No
3. Can gate, weir, or valve be designed to stop diversion during storm events? * ☐Yes ☐No
4. Can the inlet be designed to reduce chances of clogging the diversion pipe or channel? * ☐Yes ☐No
5. Can a back flow prevention device be designed to prevent sanitary sewage from entering storm drain? * ☐Yes ☐No

Figure 2-3. Feasibility and Design Criteria Used by Caltrans for Dry Weather Diversions.

From the December 2008 Update of the Caltrans PPDG, Appendix E, T-1 Checklist Part 3

Feasibility Question #2 in Figure 2-3 above references "extraordinary plumbing." By way of example, the Caltrans PPDG defines extraordinary plumbing:

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

> "Sites requiring extraordinary plumbing to collect and treat runoff (e.g., jacking operations under a highway, bridge deck collection systems, etc.) may be considered infeasible due to their associated costs. Sites requiring extraordinary features or construction practices, such as retaining walls and shoring, may also be infeasible due to their associated costs relative to the cost of the BMP itself."

Other than those examples of extraordinary plumbing, the wording of the PPDG is deliberately broad to allow the designer and the District Stormwater Coordinator lattitude to make design decisions.

In summary, the most well-documented programs of urban runoff diversion into sanitary conveyance and treatment systems involve dry weather diversions of urban runoff. In both the California beaches and Las Vegas Wash examples discussed above, the evaluation criteria started with water quality needs, then looked for alternatives to diversion to POTWs, and then screened diversions against acceptability criteria including conveyance and treatment capacity, constructability, cost, and community/regulatory acceptance. In the Caltrans example, the selection criteria reviewed focused on feasibility and constructability. Some important distinctions that set the above examples apart from this FER are:

- The tangible benefits of reducing beach closures or harvesting water in a desert may be more immediate and apparent to municipal decision makers than the concept of reducing PCB loads to the Bay; and
- The technical challenges of capturing and treating first flush and other stormwater flows would require some refinements to selection criteria to be used in this FER.

With those distinctions in mind, Section 3.1 in the Findings section below builds on the framework of "needs, alternatives, acceptability" to propose screening criteria to be used in this FER.

2.4 Approach to Develop Cost/Benefit Analysis

2.4.1 Cost Estimating Tools

Cost estimates for pilot diversions can be divided into two categories: **capital costs**, and **operations and maintenance (O&M) costs**.

Capital cost estimates for each component of a pilot diversion project are shown in Table 2-1. The estimates were developed from existing case studies for different agencies. These estimates are provided to illustrate ranges and will vary substantially depending on the agency and pump station location. Construction materials and labor will vary depending on the type of pilot diversion to be constructed. A pilot diversion which requires no additional pumps and is adjacent to a sanitary sewer line with excess capacity will have relatively small construction costs, while a pilot diversion which requires large quantities of large diameter pipe will cost much more. Connection fees will also vary depending on the sanitation agency and location of the pilot diversion. Diversions to POTWs with excess plant and sanitary sewer capacity will cost less than locations which require upgrades to sanitary sewers and treatment plants. Right-of-way (ROW) acquisition would depend on the type and quantity of land which is acquired. For the purposes of this analysis, it is assumed that ROW acquisition (or overly complex easement agreements) or treatment plant upgrades would lead to the conclusion that a pilot diversion project is not feasible. Supervisory control and data acquisition (SCADA) control costs will vary depending on the type of monitoring and control equipment specified. Some form of monitoring and controls would likely be required in all cases.

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Table 2-1. Planning Cost Estimates for Pilot Diversion Project Components		
Component	Cost Range ($1000's)	Factors Affecting Cost
Construction Materials and Labor	25 – 750	Type of pilot diversion, length
Connection Fees	9 – 18/1,000 gpd	Sanitary sewer capacity, plant capacity, sanitary sewer ordinance requirements, discharge/sanitary sewer use fees
Right of Way	Variable	Size, land use, location
SCADA/Safety Controls	10 – 50	Type of monitoring/control
Capital Support (Permits, Planning and Design)	40 percent of construction costs	Complexity of diversion

Cost estimates based on information from Brown and Caldwell (2009a); Brown and Caldwell (2009b); Sacramento Stormwater Quality Partnership (2006); Orange County Stormwater Program (2003); San Francisco Estuary Partnership (2010).

Another significant consideration affecting capital costs would be the need to re-route existing utilities to accommodate the diversion. This has been a major cost factor in determining acceptable locations for treatment measures targeted at other pollutants, e.g. large in-line trash capture devices. For the purposes of this FER, those additional costs are not considered for pilot projects, as significant re-routing is assumed to be outside the scope of a pilot project.

O&M Costs are primarily related to the annual cost of electricity to operate pumps (if needed), monitoring the diversion to ensure proper function, scheduled and emergency maintenance of pumps and diversion structure, and the treatment fees established by the receiving POTW. Cost estimates for these activities and items are summarized in Table 2-2 below. The annual costs of electricity, inspections and maintenance are derived from monthly O&M costs reported by the Orange County Stormwater Program (2003) for small diversions ranging from 0.01 MGD to 0.3 MGD. By comparison, the Sacramento Stormwater Quality Partnership (2006) estimated annual O&M costs of $40,000 for similarly sized diversions. The lower range of treatment fees is based on the estimated "chemicals and electricity only" costs for a large Las Vegas Valley treatment plant estimated by Brown and Caldwell (2009a). The upper range is based on the "whole plant operational costs" estimated by Brown and Caldwell (2009a). The actual fee charged will depend on the individual POTW, and the jurisdictional relationship between the POTW and the stormwater discharger and local sanitary sewer use ordinance requirements. For comparison, treatment fees estimated by the Sacramento Stormwater Quality Partnership (2006) are approximately $340 per MG treated; The San Jose /Santa Clara Water Pollution Control Plant reports O&M costs of approximately $400 per MG treated.

Table 2-2. Planning O&M and Treatment Cost Estimates for Pilot Diversion Projects	
Pump electricity, inspections and maintenance ($/year)	10,000 – 60,000
Treatment fees ($/MG gallons treated)	300 – 2400

Cost estimates based on information from Brown and Caldwell (2009a); Brown and Caldwell (2009b); Sacramento Stormwater Quality Partnership (2006); Orange County Stormwater Program (2003).

Electricity costs would be reduced for intermittent pumping, in proportion to the planned run time. For planning purposes, it can be assumed that a minimum of $5,000 per year is required for inspections and maintenance.

Table 2-3 shows the estimated costs for different potential pilot diversion scenarios. It is important to note that these cost estimates are based on simplifying assumptions and existing information. Actual costs can vary heavily depending on site/diversion specific characteristics.

For non-constructed pilot diversions there are no capital costs as the pilot diversion occurs by rented equipment and hired labor. The operation costs will vary depending on how the pilot diversions are

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

staged. For pilot diversion and cleanouts staged during dry weather, scheduling and availability of equipment and staff is easier, thus lower costs are achieved, as opposed to increased costs attributed to mobilizations in response to wet weather events. The expected capital costs of constructed pilot diversions will vary depending on conveyance distance, pipe size, and if additional hydraulic head is required to divert stormwater.

Two types of constructed pilot diversions are potentially available. The type employed would depend on the location of the pump station (Figure 2-4). The one type (Option 1) would involve the installation of an additional pump (or pumps) within the wet well to divert flow directly to the sanitary sewer. This type of diversion provides inherent control of the quantity of water that can be diverted to the sanitary sewer, but involves higher initial costs due to pump station reconfiguration. However, the use of dedicated pumps selected to match the specific head requirements of the conveyance system would allow that system to be optimized, i.e., smaller pipe sizes can be used. This could result in cost saving for the conveyance system, which could be of particular importance for systems that require long conveyance pipes. Operation and maintenance would vary depending on the type and size of the pilot diversion. Another option (Option 2) would be a gravity-fed flow system using the existing pumps and capacity of the station. All stormwater discharged after the pumps would be diverted using only gravity flow to the sanitary sewer. A weir or other control device would be needed to prevent overloading of the sanitary sewer during large storm events. This type of pilot diversion requires larger-sized pipes, but no additional pumps. Gravity flows and passive pilot diversions would require less O&M while larger flows and pumps would regularly fall on the higher end of the expected range.

Figure 2-4. Conceptual diagram of two different options for pump station diversions.

Table 2-3. Estimated Costs for Different Pilot Diversion Approaches

Pilot Diversion Approach	Capital Cost ($1,000)	O&M Cost ($1,000/yr)
Non-constructed pilot diversion using all rented equipment for strategic cleanout (7 days duration)	0	28
Non-constructed pilot diversion using all rented equipment in dry weather (90 days duration)	0	360
Non-constructed pilot diversion using all rented equipment in wet weather (30 days duration)	0	180
Constructed pilot diversion adjacent to sanitary sewer large enough to support gravity feed	100	10 – 60
Constructed pilot diversion adjacent to sanitary sewer requiring pumped feed	500	10 – 60
Constructed pilot diversion with moderate connection distance (<500 ft) to sanitary sewer large enough to support gravity feed	500 – 1,500	10 – 60
Constructed pilot diversion with moderate connection distance (<500 ft) to sanitary sewer via small diameter conveyance requiring pump	500 – 1,000	10 – 60
Constructed pilot diversion with long connection distance (>500 ft) to sanitary sewer large enough to support gravity feed	1,500 – 3,000+	10 – 60
Constructed pilot diversion with long connection distance (>500 ft) to sanitary sewer via small diameter conveyance requiring pump	500 – 1,500	10 – 60

Temporary pilot diversion costs assume $4,000 per day for labor during dry weather pilot diversions (four person crew) and equipment (one 20,000 gallon storage tank, three pumps, two support trucks, temporary check dams, and incidental equipment). Temporary pilot diversion costs are assumed to be 50 percent higher ($6,000 per day) during wet weather because of difficulties introduced by scheduling, safety and logistics.

2.4.2 Load Estimating Tools

The potential PCB load reduction benefits attainable from pilot diversion projects can be estimated based on either expected average PCB concentrations in stormwater, or expected average PCB concentrations in sediments captured by the pilot diversion. This section provides planning tools to assist with this estimation.

The first approach starts by asking “how much water is expected to be diverted into the POTW,” and “what is the average PCB concentration in that diverted water?” Water volumes can be estimated from the design storm perspective and the conveyance and treatment capacity perspective. The design storm perspective would multiply the catchment area (acres) by the design storm event (inches of rain) to derive the treatment volume, after unit conversion. However, in most cases, the limiting factor on treatment volume would be storage, conveyance and treatment capacity. Therefore, it makes most sense, for scoping purposes, to base treatment volume estimates on constraints established by the conveyance system, available storage capacity (if any), and limits on the treated volume that are either set by the POTW or that necessarily result from treatment costs. A similar approach would apply to dry weather diversions; rather than design storm considerations the flow question for a dry weather diversion would be “what is the average expected dry weather flow.”

For reference, a typical portable water tank can hold approximately 20,000 gallons. A diversion pump running at 75 gpm would move approximately 100,000 gallons in a day. If a 50 MGD treatment plant accepted up to 500,000 gallons of stormwater per day, the pilot diversion would use about 1 percent of the treatment capacity of the plant. Flows spanning this range are used to estimate loads.

PCB concentrations in stormwater can be estimated based on limited case study information available. The Ettie Street Pump Station Supplemental Environmental Project report (EBMUD 2010) serves as a useful benchmark for PCB concentrations in stormwater from a highly contaminated catchment of about 8 square kilometers comprised of mixed urban land uses with a predominantly industrial history. The report also provides data from Cerrito Creek, which is a similar sized catchment having an open creek in a suburban location that recieves stormwater flows from upstream residential and commercial areas.

- Average PCB concentrations in dry weather from the Ettie Street Pump Station ranged from 3 ng/L to 5 ng/L at the pump station, and approximately 1 ng/L at the reference creek (Cerrito Creek).
- Average first flush stormwater concentrations ranged from 16 ng/L in Cerrito Creek to as much as 50 ng/L in the first flush and wet weather influent to the Ettie Street Pump Station.
- Episodic measurements as high as 200 ng/L were observed.
- That concentration range is used as a basis for estimating PCB loads removed by pilot diversions ranging from 20,000 gallons to 500,000 gallons in Table 2- below.

Table 2-4 highlights the fact that dry weather diversions would not yield substantial load reduction benefits if the PCB concentrations are relatively low (e.g., 1 ng/L). A dry weather diversion of 0.1 mgd would yield between 0.0004 to 0.004 grams of PCBs per day, or 0.1 to 1 grams per year if dry weather flows were pumped 250 days out of the year. That is equivalent to 0.0006 to 0.006 percent of the total PCB load reduction (18 kg) required from urban stormwater by the TMDL. To attain 10 percent of the total PCB load reduction (i.e., 1.8 kg), a total of 3.5 billion gallons per year of dry or wet weather runoff having an average concentration of 50 ng/L would be required.

For storm events that yield higher PCB concentrations in runoff, more substantial load reductions may be attained. If 100,000 gallons of water having 200 ng/L PCBs were diverted from a single storm event, a total mass of 0.08 grams of PCBs could be diverted from discharge to the Bay. If 500,000 gallons could be diverted during a single event, it would be equivalent to 0.4 grams of PCBs, or 0.002 percent of the 18 kg load reduction required of urban stormwater by the TMDL.

The equation used to calculate values in Table 2-4 is:

$$PCB(g) = PCB\left(\frac{ng}{L}\right) \times Volume\ (gal) \times \frac{3.785\ L}{gal} \times \frac{1g}{10^9 ng}$$

Table 2-4. PCB Load Estimating Tool (grams)

Diverted Volume (gal)	PCB Concentration in Stormwater (ng/L)				
	1	10	50	100	200
20,000	0.0001	0.0008	0.0038	0.0076	0.015
50,000	0.0002	0.0019	0.0095	0.019	0.038
100,000	0.0004	0.0038	0.019	0.038	0.076
200,000	0.0008	0.0076	0.038	0.076	0.15
400,000	0.0015	0.015	0.076	0.15	0.31
500,000	0.0019	0.019	0.095	0.19	0.38
1,000,000	0.0038	0.038	0.19	0.38	0.76

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

For context, the expected range of PCB concentrations in stormwater can be estimated based on assumed concentrations of PCBs in sediments and total suspended sediments (TSS) concentrations (Figure 2-5). Typical PCB concentrations in sediments within the urban landscape range from 0.1 mg/kg to 1 mg/kg; contaminated sediments found in localized areas can be as high as 10 mg/kg or more. It is assumed that highly contaminated sediments would be addressed through sediment management or site remediation, and that diversion projects would address more diffuse contamination areas where the average first flush concentration of PCBs on suspended sediments is 1 mg/kg or less. Under typical TSS concentrations in stormwater (< 500 mg/L), PCB concentrations would tend to be 200 ng/L or less.

Figure 2-5. Concentrations of PCB vs. TSS under different assumed concentrations of PCBs in sediment.

Solid line indicates the California Toxics Rule (CTR) water quality objective (0.17 ng/L)

Tools similar to those used for PCBs can also be applied to estimating mercury loads avoided (Table 2-5, Figure 2-6). The higher range of mercury concentrations in stormwater (< 2,000 ng/L) reflects the assumption that mercury concentrations in suspended sediments from contaminated areas could be as high as 10 mg/kg.

This approach to load estimating is used to develop the cost-benefit analysis of example pilot diversion scenarios in Section 3.2.

Section 3

Findings

3.1 Recommended Selection Criteria

This section proposes screening criteria that are developed around the framework of needs, alternatives, and acceptability outlined in the previous sections. These criteria are intended to inform the selection of pilot diversion sites, but may not include all considerations that would need to be taken into account as potential pilot diversion sites are evaluated.

3.1.1 Needs

The overall water quality need is a reduction in the load of PCBs and mercury discharged from urban areas into the Bay. Guidance from the SFB-RWQCB further specifies that pilot diversion projects should focus on abating discharges of PCBs from contaminated drainages, and concurrently evaluate the added value of mercury load reductions achieved by PCB-focused projects. That is, project siting decisions should be led primarily by PCB loads.

Watershed load reduction goals help put PCB loads into context as a selection criterion. The CW4CB grant recently awarded to BASMAA sets forth the ambitious goal of reducing PCB loads by 0.3 to 1.5 kg per year through a series of coordinated investigation, reporting, potential remediation, and treatment retrofit projects. If the goal is achieved, the load reduction would be about one to seven percent of the currently estimated 20 kg per year of PCBs discharging from Bay Area urban storm systems.

It is proposed that individual pilot diversion projects that reduce the current PCB load to the Bay by one percent or more per year (i.e., reduce PCBs by 0.2 kg/yr or more) could be considered meaningful steps towards attainment of the PCB wasteload allocation for urban stormwater. In contrast, pilot projects that attained load reductions on the order of 0.01 kg/year (ten grams) or less would not yield significant progress, by themselves. Small pilots could be useful if they can be cost-effectively replicated numerous times throughout the watershed, or if they provide information that can be scaled up to evaluate the costs and benefits of larger projects.[4]

The selection criteria based on water quality needs are summarized by the following two questions:

Will the project yield a substantial PCB load reduction? An important tool for answering this question is an understanding of the spatial distribution of PCBs in sediments of the San Francisco Bay watersheds. The most recently available synthesis of PCB monitoring data is available in the grant-funded study by Yee et al (2010), titled "Concentrations of PCBs and Hg in soils, sediments and water in the urbanized Bay Area: Implications for best management." Figures and tables in that report highlight urbanized areas of the Bay with the highest PCB concentrations in sediments collected from catch basins and street curbs.

Provisions C.11.f and C.12.f strongly emphasize existing stormwater pump stations as the most likely areas for pilot diversion projects. Pump station inventory reports have been submitted to the SFB-RWQCB and compiled in tabular and GIS formats. Matching areas of high PCB concentrations in sediments with the known spatial distribution of pump stations is a useful step to efficiently make an

[4] The SFB-RWQCB has stated that diversion projects may have other benefits unrelated to PCBs and Hg (e.g., reductions in discharges of low DO water, bacteria, etc.

initial screening of likely candidate pump stations based on potential for load reductions. Figures 3-1 through 3-6 below show the locations of pump stations, measured PCB concentrations in storm drain sediments, and POTW service areas. For illustration purposes, only sediment samples with detectable PCB concentrations are included in the figures. These planning tools can be used to assist in the evaluatation of the water quality needs criteria.

045891

Will the project provide unique or new information? This is a more subjective question that would require input from the Technical Oversight Committee, including the SFB-RWQCB, to properly screen. It is an important question because, given the compliance time frame and inherent scale of pilot projects, they will most likely be small and temporary in nature. Therefore, in addition to targeting opportunity areas where pump stations serves drainage areas that have high PCB concentrations, pilot projects should be designed with the intent of producing information that will be useful to assess the costs and benefits of full scale implementation.

3.1.2 Costs and Alternatives

Overall cost is an important screening crtieria for pilot projects. Some simple planning tools for determining whether or not a pilot project is cost prohibitive are presented in Section 2.4.1 above. In general, pilot projects that would require significant new conveyance infrastructure or incur significant treatment costs may be less attractive than pilot projects with relatively simple diversion connections located in jurisdictions where reduced or waived treatment costs could be negotiated.

Alternatives to diversion, such as pollution prevention, street sweeping, sediment management, and stormwater treatment retrofits, should always be considered in conjunction with diversion to POTWs. This FER is developed to comply with an MRP requirement that also prescribes five pilot projects; therefore, consideration of alternatives is not a specific screening criterion for pilot projects, although it would be an important screening criteria for additional implementation beyond the pilot stage. The oversight committee will provide input and feedback on diversion sites considering the broader regional context of pilot-testing a variety of pollutant control strategies in the Bay Area.

3.1.3 Acceptability

There are two screening criteria that should be evaluated to determine whether diversion into POTWs is acceptable:

Is there an accessible POTW willing and able to provide treatment service? A key piece of information to help identify the POTW which serves an area of interest s a map of POTW service areas, such as the examples shown in Figures 3-1 through 3-9. Additionally, Pump station inventory data compiled by the SFB-RWQCB includes partial listings of the nearest POTW. The best way to assess the willingness, existing ability and challenges of a POTW to accept a diversion is to begin discussions with the appropriate staff and collectively explore opportunities and constraints of the potential diversion in question. Because of the likely change needed to existing POTW procedures, policies, and principles, it is expected that inevitably, decision makers representing the POTW will also need to be involved and approve the pilot diversion. In order for a POTW decision maker to evaluate the request, they would need certain information, including the amount to be diverted, the expected timing and duration of the pilot diversion, and the loads of PCBs, mercury, suspended sediment, dissolved solids, and biochemical oxygen demand expected. Some of the concerns of POTWs are briefly summarized in Section 3.3 below and by the Bay Area Clean Water Agencies (Carollo, 2009)

Can the pilot diversion be sited within acceptable design criteria? This criterion would be evaluated using maps, diagrams, a site walk, and other resources necessary to complete a pre-design checklist comparable to the one illustrated in Figure 2-3. A more pertinent checklist has been developed for this FER and is shown in Table 3-1.

Table 3-1. Proposed Checklist for Evaluating Engineering Feasibility of Pilot Diversions	
1	Does the POTW in question have existing capacity during wet weather?
2	Does the POTW in question have existing capacity during dry weather?
3	What is the distance to any potential sanitary sewer pilot diversion connections (linear feet)?
4	Does the potential connection require any land acquisition or easements?
5	Does the POTW fully own or control the sanitary sewer system?
6	Is the POTW willing to accept discharge from a stormwater pilot diversion project?
7	What is the capacity of the pump station (gpm)?
8	What is the wet weather capacity of the sanitary sewer system downstream of the potential pilot diversion connection?
9	What percentage of the pump station flow can be diverted to the sanitary sewer system if at all?
10	Does the pump station have sufficient area in either the wet well or after the pump to build a pilot diversion?
11	Would the pump station convey flow to the sanitary sewer system via gravity flow or an additional pump.

Questions 1 and 2 initially determine the feasibility of a POTW to accept stormwater flow. POTWs with little excess capacity will not likely take on stormwater discharges. If it is possible to divert water, questions 3, 4, and 5 consider the route necessary to convey water to the sanitary sewer system. Longer distance pilot diversions will likely be cost prohibitive, as well as routes which require acquisition of land or easements for construction. If the POTW does not own the sanitary sewer system, or shares ownership, negotiations for sanitary sewer capacity and the timing of discharges would involve more parties, and likely be more complex. Questions 6, 7, and 8 determine the capacity of the sanitary sewer system at a chosen pilot diversion point, to accept, some, all, or none of the wet or dry weather flow from the diversion. Of particular concern is whether accepting a diversion would increase the risk of a Sanitary Sewer Overflow (SSO). Finally, questions 9 and 10 determine whether the pump station itself is amenable to retrofit for pilot diversion. Pump stations in small areas with limited space for expansion would likely be ill-suited to build a flow control device for gravity flow to a sanitary sewer connection. In stations with small wet well capacity it would be difficult to install new pumps for conveyance.

Table 3-2 below summarizes the selection criteria, and the information needed to apply the criteria.

Table 3-2. Proposed Selection Criteria and Information Needed		
Criteria		Information Needed
Needs	Will the project yield a significant PCB load reduction?	PCB concentrations in sediments from the local drainage; Pump station inventories in GIS and tabular formats Event-mean PCB concentrations in stormwater; TSS and flow measurements; Drainage area assessments
	Will the project provide unique or new information?	Peer review from Technical Oversight Committee
	Does a pilot project fit into the broader regional context of pilot-testing a range of pollutant control strategies, including pollution prevention, site remediations, enhanced sediment management, and stormwater treatment retrofitting strategies?	Peer review from Technical Oversight Committee
Costs and Alternatives	Are the capital and operation and maintenance costs associated with diversion prohibitive?	Site investigations Conceptual designs and drawings Preliminary site-specific cost estimates Treatment and connection costs/charges.
	Are there ways to control upstream sources of PCBs through remediation, removal, isolation, or run-on diversion?	Source identification studies Peer review from Technical Oversight Group
	Can onsite treatment or infiltration retrofits be implemented?	Site investigations, including right-of-way mapping
Acceptability	Is there an accessible POTW willing and able to provide treatment service?	POTW service area map Communication with POTW managers
	Can the pilot diversion be sited within acceptable design criteria?	Pre-design checklist assessment (Table 1)

3.2 Cost and Benefit Analysis of Three Scenarios

This section evaluates three hypothetical scenarios to estimate the costs, grams of PCBs removed, and resulting cost per gram. These scenarios are hypothetical, based on untested assumptions and may not represent actual conditions or costs associated with stormwater pump station diversions in the Bay Area. Additionally, these scenarios are intended to only represent a range of possible costs and benefits that may be expected. Costs and benefits are evaluated in the context of three types of scenarios that are inherently different in scale and implementation timeframes. For those scenarios with longer implementation timeframes, costs can be spread out accordingly and therefore provide an unequal comparison against scenarios with shorter implementation durations. For these reasons, costs should not be used to directly compare the cost efficiencies between scenarios presented, but rather used to assess the range of costs that may be expected for an individual scenario. Constructed Pilot Diversions

Under this scenario, it is assumed that a pilot diversion is constructed which includes operational controls that allow selective pilot diversion of first flush and wet weather events. The pilot diversion is assumed to require minimal distance to tie into the sanitary sewer system. The pilot diversion is assumed to be a gravity feed into a large capacity sewage line, requiring minimal annual O&M costs due to electricity. The receiving POTW has agreed to accept one million gallons per 24-hour storm event no more than eight times during the storm season. It is assumed, for this hypothetical scenario, that the

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

POTW has agreed to waive treatment fees[5]. A pilot diversion and pump system has been constructed which can convey large volumes of flow (750 gpm to deliver one million gallons in 24 hours). Based on Table 2-1, the capital outlay for this project is assumed to be $750,000. The removal effectiveness for PCBs and Hg is assumed to be >95 percent.

If the average PCB concentration in diverted stormwater were 50 ng/L, each million gallons diverted would reduce PCB loads discharged directly to the Bay by 0.2 grams (see Table 2-4). Eight such events each year would annually reduce PCB loads by 1.6 grams. Over twenty years, this would correspond to 32 grams of PCBs (assuming concentrations would remain unchanged over this timeframe).

Assuming that a ten-fold higher stormwater mercury concentration (500 ng/L), this would correspond to a load reduction of 16 grams of mercury per year, or 320 grams over twenty tears.

If the treatment plant provides treatment service for free, then achieving a total load reduction of 32 grams PCBs and 320 grams mercury over twenty years by this approach would result in a capital outlay and operation and maintenance cost of approximately $23,500 per gram of PCBs reduced, and $2,350 per gram of mercury reduced. This estimate is a very crude, demonstrative example that does not consider life-cycle costs, net present worth cost adjustments, or other complexities. The cost per gram would increase substantially if the hypothetical pilot diversion were to be terminated in less than twenty years.

3.2.1 Non-constructed Pilot Diversions

Under this scenario, it is assumed that a wet weather pilot diversion project that does not require the construction of diversion structures, but rather is implemented using check dams and pumps to divert storm flows into storage tanks, and subsequently routing into a sanitary sewer when there is sufficient capacity. Because no capital costs incurred under this scenario, municipalities diverting stormwater have less financial risk compared to the first scenario described. It is assumed that sufficient site area is available to locate ten storage tanks, and that the site area has pavement competent to withstand the weight of ten full tanks. The project is assumed to last for thirty days, and the daily cost of equipment rental and staffing is $6,000, for a total project cost of $180,000 (per Table 2-3). As with the constructed pilot diversion scenario above, treatment fees are assumed to be waived for this scenario[5]. The project is assumed to occur in the wettest months (i.e., January – February), and for the purposes of this scenario is assumed to capture a total of three major storm events, diverting a total of 600,000 gallons of wet weather flows (200,000 gallons each event) having an average PCB concentration of 50 ng/L.

Referring to Table 2-4, each 200,000 gallon pilot diversion event would capture 0.04 grams of PCBs, for a total of 0.12 grams diverted into the POTW. Again assuming 95 percent removal, this would yield a net load reduction of 0.11 grams, or 0.0006 percent of the total currently estimated PCB stormwater load. Although the total project cost is lower compared to construction of a constructed pilot diversion, the cost per gram removed is significantly higher: approximately $1,600,000 per gram of PCBs removed.

Assuming a ten-fold higher Hg concentration (500 ng/L), the net load reduction would be 1.1 grams for this scenario, at a cost of $160,000 per gram.

---

[5] The simplifying assumption that a POTW waives treatment fees is, in fact, unlikely. In most cases, wastewater and stormwater programs are funded through separate sources, and so institutional factors may make such a waiver problematic. As noted in Tables 2-1 and 2-2 above, connection fees typically range from $9,000 to $18,000 per thousand gallons per day, and treatment fees typically range from $300 to $2,400 per MG treated. As a result, these cost estimates for the hypothetical scenarios are llikely underestimated. Other charges may also be assessed, such as East Bay MUD's "wastewater capacity fee" of at least $97.40 per 100 cubic feet per month, or $130,000/MG/month. See, for example: http://www.ebmud.com/our-water/wastewater-treatment/wastewater-treatment-programs/wastewater-rates-charges-and-fees

3.2.2 Conveyance System Cleanout

Under this scenario, it is assumed that a sediment sampling and visual inspection has identified a conveyance with contaminated sediments. A cleanout of the impacted portion of the system takes place over a period of seven days, at a lower cost ($4,000 per day) than the wet weather pilot diversion because the dry weather work can be more easily scheduled. A total of ten kilograms of contaminated sediments having an average PCB concentration of ten parts per million (10 mg /kg) is flushed from the system and captured in a single, 20,000 gallon storage tank, and then discharged into the sanitary sewer. Again, treatment fees are assumed to be waived for this analysis[5]. Under this scenario, the total mass of PCBs removed would be 100 mg, or 0.1 grams. If 95 percent of the PCB load discharge to the POTW is removed by treatment, the net load reduction benefit to the Bay would be 0.095 grams. The total project cost is $28,000. The cost per gram of PCBs removed under this scenario would be approximately $300,000 per gram.

Under this scenario, it is assumed that sediment with 10 mg/kg PCBs have mercury concentrations of 1 mg/kg. This assumption reflects the observations that sediments from old industrial areas that are substantially contaminated with PCB are not typically found in the same locations as sediments impacted by mining waste that have mercury concentrations of 10 mg/kg or more. The corresponding load reduction of mercury would be 0.01 grams, at a cost of $3,000,000 per gram.

Although this third scenario is the most cost-effective, in terms of cost per gram, and also one of the most likely scenarios to be acceptable to a POTW, the overall load reduction is still relatively small – again about 0.0005 percent of the total stormwater PCB load to the Bay. Additionally, this scenario (and non-constructed diversions) allow municipalities to be more adaptive in directing resources where they are most needed. This scenario could, however, be a useful diagnostic tool. If, after conducting the cleanout, follow-up inspections show that contaminated sediments are again found in the conveyance system after the rainy season ends, that would suggest a need to look upstream to possibly identify areas where sediment removal, capping, and/or run-on pilot diversion could be implemented to protect the stormwater conveyance system.

3.3 POTW and Collection System Agency Constraints/Concerns

A draft white paper developed by the Bay Area Clean Water Agencies presents a summary of constraints faced by POTWs when deciding whether or not to accept stormwater discharges for treatment (BACWA, 2009). Those issues have been raised in previous technical reports submitted to the SFB-RWQCB (e.g., Applied Marine Sciences, 2003).

Some of the main constraints faced by POTWs include:

Treatment capacity and conveyance system capacity - The BACWA (2009) white paper noted that most treatment and conveyance system capacity issues could be addressed by restricting diversion flows. Restirctions could be achieved through the design of orifices, weirs, and pumps. As noted in the cost / benefit analysis, treatment and conveyance and capacity issues may limit the load reduction benefits attainable.

Conveyance system ownership and permission of all owners - Not all POTWs own the collection and conveyance systems that serve them. If a different entity than the POTW owns the collection system, it would require another negotiation to enable the diversion. If there are multiple collection system owners, the negotiation could be more complex.

Ordinance prohibitions - The BACWA (2009) white paper notes that:

> "There are few existing agreements and local laws (e.g. ordinances) that relate to stormwater diversions, including a POTW's ability to accept, deny or condition the acceptance of stormwater diversions (e.g. flow restrictions, pretreatment requirements). Most wastewater agencies operating separate sanitary sewers currently forbid the discharge of stormwater into the sanitary system. However, many wastewater agencies have a stipulation in their rules that allow discharges to the sanitary system with the permission of the POTW."

Potential to upset biological processes, especially in advanced treatment plants. Introduction of heterogeneous surface waters puts a POTW at risk of treatment system upsets, particularly in advanced plants where inoculations of foreign bacteria can interfere with microbial communities essential to the treatment process.

Effect of PCB loads on effluent - In its report on the Ettie Street Pump Station diversion project (EBMUD, 2010), EBMUD noted that PCB loads to influent are not 100% removed by the treatment process. As a result, EBMUD stated that the compliance with respect to "PCBs and other pollutants for which the Bay is impaired would require particularly close evaluation for diversion potential." There is only a small, preliminary amount of data available on current concentrations of PCBs in treated effluent (SFRWQCB, 2008) . However, the limited amount of information available indicates that PCB concentrations in treated effluent are likely to be above water quality objectives for PCBs established in the California Toxics Rule.

Effect of PCB loads on biosolids - Initial discussions with the Technical Oversight Committee (July 14, 2010) led to the conclusion that PCB loads from pilot diversion projects may be sufficiently small that they would not significantly change the PCB concentration of biosolids. The preliminary load calculations in Section 3.2 tend to support this – conveyance system and treatment plant capacity would likely become limiting factors before PCB concentrations in biosolids would be a constraint. However, it is worth noting that deliberate introduction of PCBs into sewage treatment systems has strong potential to cause perception problems related to biosolids. For example, a recent incident in Milwaukee, Wisconsin led to the inadvertent introduction of PCB contaminated sediments in to the municipal sewage treatment system during a sanitary sewer system rehabilitation project (Behm, 2009). As a result, commercial production and sale of biosolids from the treatment plant was halted for several months. Recovery from the incident caused the Milwaukee Metropolitan Sewerage District approximately $4 million.

3.4 Conceptual Framework for Crediting PCB Load Reductions

The MRP requires that this FER include "a proposed method for distributing PCBs load reductions to participating wastewater and stormwater agencies." proposed approach for crediting mercury and PCB load reductions to POTWs. This section proposes a method for illustrative purposes, in order to comply with the NPDES permit. Any program of incentives or credits to POTWs would need to be developed with POTW involvement.

The effect of a diversion on compliance would be of particular concern. For example, in its report on the Ettie Street Pump Station pilot diversion project (EBMUD, 2010), EBMUD noted that PCB loads to influent are not 100 percent removed by the treatment process. As a result, EBMUD stated that the compliance with respect to "PCBs and other pollutants for which the Bay is impaired would require particularly close evaluation for pilot diversion potential."

There is only a small, preliminary amount of data available on current concentrations of PCBs in treated effluent (SFB-RWQCB, 2008) . However, the limited amount of information available indicates that PCB concentrations in treated effluent are likely to be above water quality objectives for PCBs established in the California Toxics Rule. The San Francisco Bay PCBs TMDL has established WLAs for PCBs in treated effluent that add up to 2 kg per year for all Bay Area wastewater dischargers combined. The estimated current loads are slightly higher, 2.3 kg per year. The SFB-RWQCB has stated that it expects PCB

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

concentrations in effluent to decrease over time as a result of the fact that PCBs are no longer manufactured or used. Recognizing that pilot diversion projects would increase PCB loads to POTWs, the SFB-RWQCB also included a 1 kg per year WLA to be made available to individual POTWs who agree to accept stormwater for discharge.

IN the staff report accompanying the San Francisco Bay PCBs TMDL, the explanation for the 1 kg per year WLA available for stormwater treatment is as follows:

> "A potential means to reduce urban stormwater runoff PCBs loads will be to strategically intercept and route runoff to municipal wastewater treatment systems. We propose a separate wasteload allocation for discharges associated with urban stormwater runoff treatment via municipal wastewater treatment systems, since such actions will result in increased PCBs loads from municipal wastewater dischargers, and the proposed individual wasteload allocations for municipal wastewater dischargers reflect current performance levels. We propose a wasteload allocation of 0.9 kg/yr, which is the difference between the TMDL of 10 kg/yr and the sum of the other proposed wasteload and load allocations."

The proposed method is to credit the participating stormwater permittee for the estimated load diverted as progress towards attainment of the TMDL wasteload allocation. Participating POTWs would likely seek some form of regulatory protection from effluent limit exceedances or system upsets caused by the pilot diversions. The SFB-RWQCB could consider offering some of the 1 kg per year WLA as an incentive for POTW participation. A crediting ratio could be proposed to allow a small increase in POTW loads in comparison to the stormwater loads removed. For example, if the crediting ratio were 10:1, then the 1.6 grams of PCBs removed annually under Scenario 1 above would allow the participating POTW to increase loads by 0.16 grams per year. A crediting ratio of 10:1 would allow for a 90 percent removal efficiency by the POTW: for every ten additional grams of PCBs in stormwater treated by the POTW, an addtiional one tenth of a gram would be discharged, resulting in a net PCB load reduction. The SFB-RWQCB would likely need to seek input and buy-in on this concept from the United States Environmental Protection Agency, as well as local environmental stakeholders, to incorporate this or any other crediting framework into NPDES permits.

Section 4

Process and Schedule for Pilot Project Implementation

A proposed timeline for pilot project implementation is shown in Table 4-1 below. This FER completes Task 1, which is led by a BASMAA as a regional project. Task 2.0 will begin upon submittal of this FER. Copermittees, with some assistance from BASMAA as needed, would use this report to propose five candidate and five alternate pump stations for pilot projects. A technical memorandum summarizing the candidate and alternate pump stations would be submitted to the SFB-RWQCB by September 15, 2011. After that time, preliminary designs and cost estimates for the pilot diversions would be advanced.

Sampling and analysis plans would be developed though a regional project. Progress would be summarized in Annual Reports submitted by BASMAA to the SFB-RWQCB. The MRP requires a final report to be completed by March 15, 2014.

DRAFT for review purposes only. Use of contents on this sheet is subject to the limitations specified at the end of this document.
G:\Engineering and Construction\Flood\CleanWater\Arleen\Regional\BASMAA\Regional permit\POCs\General C11 & C12\C.11-12f-diversions\Draft FINAL -Pump Station FER 9-13-2010.doc

Table 4-1. Proposed Schedule for Pilot Project Implementation

Task	Programs/ Permittees	Regional	Suggested Start Date	Suggested End Date
1.0 – Feasibility Evaluation				
1.1. Develop draft list of criteria that should be considered when selecting areas or stormwater pump stations for potential pilot diversions to POTWs, and associated data/information needed to apply the criteria.	A	X	May 15, 2010	July 21, 2010
1.2 Develop a preliminary cost and benefit assessment for three (?) types/configurations of areas or pump stations using existing data and information	A	X		
1.3 Develop draft methodologies for distributing loads between POTWs and stormwater programs when diverting areas or pump station discharges to POTWs.	A	X		
1.4 Summarize criteria, cost benefit analysis, and loads methodology in a report and include a time schedule for selection and implementation of pilot diversions.	A	X		Draft – August 11, 2010 Final – September 15, 2010
2. 0 Pump Station Retrofits				
2.1 Apply criteria developed in Task 1.1 and select a minimum of 5 primary and 5 alternate pump stations or areas (2 per county) that will be considered for pilot diversion.	X	A	September 8, 2010	February 28, 2011
2.2. Develop memorandum summarizing pump stations or areas selected in task 2.1 above and a refined cost benefit assessment for these pump stations or areas.	A	X	March 1, 2011	Draft – May 15, 2011; Final – August 15, 2011
2.3 Further scope pilot diversion infrastructure needs, and develop preliminary/conceptual design (5 percent) and engineering for pump stations or areas selected in Task 2.1.	X	A	June 1, 2011	December 1, 2011
2.4 Refine conceptual design into 30 percent level of design and acquire permits/agreements as needed.	X	A	December 1, 2011	December 11, 2012
2.5 Retrofit existing pump stations or areas to allow for pilot diversion to POTW (i.e., construction) under predefined conditions	X	A	January 21, 2013	June 1, 2013
3.0 Monitoring				
3.1 Develop regional sampling and analysis plan (Including a QAPP and SOP) and data reporting templates	A	X	July 1, 2011	June 30, 2013
3.2 Monitor diversions (early implementation may be possible at some stations)	X	A	July 1, 2013	January 31, 2014
3.3 Conduct QA/QC, data analyses	A	X	July 1, 2013	February 28, 2014
4.0 Reporting				
4.1 Summarize pilot diversion project status/progress in Annual Report	X	A	July 1, 2010	September 15, 2014
4.2 Prepare summary report for inclusion in integrated report	A	X	January 2, 2014	March 15, 2014

Notes: A = Assist; X = Task Lead. Monitoring results produced after December 1, 2013 may not appear in the March 15, 2014 Integrated Report submittal.

Limitations

This document was prepared solely for the BASMAA in accordance with professional standards at the time the services were performed and in accordance with the contract between BASMAA and Brown and Caldwell dated June 3, 2010. This document is governed by the specific scope of work authorized by BASMAA; it is not intended to be relied upon by any other party except for regulatory authorities contemplated by the scope of work. We have relied on information or instructions provided by BASMAA and other parties and, unless otherwise expressly indicated, have made no independent investigation as to the validity, completeness, or accuracy of such information.

This document sets forth the results of certain services performed by Brown and Caldwell with respect to the property or facilities described therein (the Property). BASMAA recognizes and acknowledges that these services were designed and performed within various limitations, including budget and time constraints. These services were not designed or intended to determine the existence and nature of all possible environmental risks (which term shall include the presence or suspected or potential presence of any hazardous waste or hazardous substance, as defined under any applicable law or regulation, or any other actual or potential environmental problems or liabilities) affecting the Property. The nature of environmental risks is such that no amount of additional inspection and testing could determine as a matter of certainty that all environmental risks affecting the Property had been identified. Accordingly, THIS DOCUMENT DOES NOT PURPORT TO DESCRIBE ALL ENVIRONMENTAL RISKS AFFECTING THE PROPERTY, NOR WILL ANY ADDITIONAL TESTING OR INSPECTION RECOMMENDED OR OTHERWISE REFERRED TO IN THIS DOCUMENT NECESSARILY IDENTIFY ALL ENVIRONMENTAL RISKS AFFECTING THE PROPERTY.

Further, Brown and Caldwell makes no warranties, express or implied, with respect to this document, except for those, if any, contained in the agreement pursuant to which the document was prepared. All data, drawings, documents, or information contained this report have been prepared exclusively for the person or entity to whom it was addressed and may not be relied upon by any other person or entity without the prior written consent of Brown and Caldwell unless otherwise provided by the Agreement pursuant to which these services were provided.

DRAFT

PREFACE

This working draft technical memorandum (TM) was developed under the direction of the Bay Area Stormwater Management Agencies Association (BASMAA) and its associated member agencies. This TM is a working draft that is only intended to demonstrate initial concepts regarding methods for quantifying mercury and PCB loads reduced from urban stormwater runoff in the San Francisco Bay Area. This TM should not be construed as a complete or finalized product, but rather a work-in-progress. Methods discussed in the TM are a result of a preliminary review of applicable literature and initial loads reduced formula development. The literature review will continue and loads reduced formulas will be updated in the future based on comments received from stakeholders.

DRAFT

EXECUTIVE SUMMARY - TO BE COMPLETED

DRAFT

1.0 INTRODUCTION

Municipalities in the San Francisco Bay Area (Bay Area) implement numerous measures at the local level in an attempt to control pollutants (e.g., mercury, PCBs, trash and pesticides) from entering urban stormwater runoff and receiving water bodies (e.g., local creeks, the Bay, and Pacific Ocean). Additionally, through tracking, lobbying and direct participation in task forces and committees, municipalities support and influence the development of pollutant control measures[1] that are implemented at the State or national level through regulatory solid and hazardous waste programs (e.g., mercury product recycling programs). These control measures serve as the best management practices (BMPs) municipalities and flood control agencies can implement to reduce potential adverse impacts to beneficial uses (e.g., fish consumption, recreation, and fisheries habitat) of water bodies in the region.

The effectiveness of these control measures can be evaluated in many ways (CASQA 2007, Strecker et al. 2001), but generally requires the collection and/or tracking of data and information that is directly related to the desired result or outcome of implementing the control. With regard to urban stormwater runoff, the effectiveness of a control measure is generally measured using one or more of following three methods:

1. Increases in Awareness/Behavior - Estimating or quantifying changes in awareness, knowledge or behavior of individuals or populations of individuals;
2. Loads Reduced from Sources - Quantifying reductions in the mass (loads) of pollutants from sources entering stormwater; and
3. Runoff and Receiving Water Improvements - Empirical measurements of water quality (stormwater or receiving water) improvements.

Since stormwater pollution is an issue generally created by the actions of residents or businesses, Bay Area urban stormwater management programs (stormwater programs) have historically used surveys and inspections to assess changes in awareness or behaviors, or water quality monitoring data to evaluate improvements in runoff or receiving water quality. As an alternative approach, this technical memorandum presents preliminary methodologies to quantify the load reductions for priority Pollutants of Concern (POCs) from specific urban stormwater runoff control measures. These methodologies are presented here in preliminary form, as a way to assess progress towards regulatory goals promulgated as Total Maximum Daily Load wasteload allocations for mercury and polychlorinated biphenyls (PCBs) and incorporated into Provisions C.11 and C.12 of the Municipal Regional Stormwater Permit (MRP).

1.1 Regulatory Background

1.1.1 PCBs and Mercury Total Maximum Daily Loads (TMDLs)

Based on a determination of water quality impairment of the San Francisco Bay by Polychlorinated Biphenyls (PCBs) and mercury, the San Francisco Bay Regional Water Quality Control Board (Regional Board) recently developed Total Maximum Daily Loads (TMDLs) for these pollutants. The purpose of the TMDLs is to attain water quality standards that will protect sport fishing, human health, aquatic organisms, wildlife and rare and endangered species in the San Francisco Bay. To attain water quality

[1] For the purpose of this document, control measures defined as pollution prevention practices, source controls and treatment controls that Permittees conduct or cause to be conducted.

DRAFT

standards, the TMDLs set regulatory targets and a maximum total allowable pollutant load from all sources combined (i.e., TMDL). Loads reductions needed to obtain the TMDLs are assigned to sources through wasteload (point sources) and load (nonpoint sources) allocations. Urban stormwater runoff was identified as a pollutant source in both the PCBs and mercury TMDLs and was therefore assigned wasteload allocations accordingly.

On February 12, 2008, the federal Environmental Protection Agency approved a Basin Plan amendment incorporating a Total Maximum Daily Load (TMDL) for mercury in San Francisco Bay (Mercury TMDL) and an implementation plan to achieve the TMDL. The amendment was formerly adopted by the Regional Board, the State Water Resources Control Board, and the state Office of Administrative Law. Mercury TMDL targets include: 1) a Baywide suspended sediment mercury concentration of 0.2 mg mercury per kg dry sediment; 2) a large fish target of 0.2 mg mercury per kg fish tissue that applies striped bass; and, 3) a small fish target of 0.03 mg mercury per kg fish for protection of wildlife (i.e., piscivorous birds).

The U.S. Environmental Protection Agency approved a TMDL for PCBs in the San Francisco Bay on March 29, 2010. The Basin Plan amendment incorporating this TMDL and an implementation plan to achieve the TMDL was formerly adopted or approved by the Regional Board, the State Water Resources Control Board, and the state Office of Administrative Law. The PCBs TMDL includes one target, a fish tissue target of 10 ng of Total PCBs[2] per g of fish tissue (white croaker or shiner surfperch).

TMDL Wasteload Allocations

To reach the TMDL targets described above and obtain water quality standards in the Bay for mercury and PCBs, the pollutant reductions are required from each source causing or contributing to Bay impairment. For mercury, a 43% reduction of total mercury discharged to the Bay from all sources combined is required. The largest mercury reductions are required from the Guadalupe River (legacy mining), Central Valley watershed, and urban stormwater runoff. For PCBs, a 24 kg/yr (~70%) load reduction of total PCBs in discharges to the Bay is required from all sources combined to obtain water quality standards. The largest PCB load reductions are required from the Central Valley watershed and stormwater runoff.

The PCBs and mercury TMDL Staff Reports (Regional Board 2006, 2008) provide estimates of pollutants loads from urban stormwater runoff. Additionally, wasteload allocations (i.e., allowable annual discharges) for urban stormwater runoff are assigned by county to Bay Area stormwater programs. Stormwater programs identified in the TMDLs that represent Permittees to the Municipal Regional Stormwater NPDES Permit (see next section) include:

- Santa Clara Valley Urban Runoff Pollution Prevention Program
- Alameda Countywide Clean Water Program
- Contra Costa Clean Water Program
- San Mateo Countywide Water Pollution Prevention Program
- Fairfield-Suisun Urban Runoff Management Program
- City of Vallejo & Vallejo Sanitation and Flood Control District

[2] Based on the use the term "Total PCBs" in the PCBs TMDL, Total PCBs is defined as either: 1) sum of Aroclors; 2) sum of the individual congeners routinely quantified by the Regional Monitoring Program (RMP) for Water Quality in the San Francisco Estuary; or 3) sum of the National Oceanic and Atmospheric Administration (NOAA) 18 congeners converted to total Aroclors.

DRAFT

Mercury and PCB TMDL loads, wasteload allocations (WLA), and load reductions assigned to these stormwater programs are included in Table 1-1. Pollutant load reductions represent the goal that stormwater programs should strive to attain through stormwater control measure implementation.

Table 1-1. Mercury and PCB loads, wasteload allocations and load reduction goals for Bay Area Phase I stormwater programs.

Fairfield-Suisun Urban Runoff Management Program[2]	3.1	1.6	**1.5**			

[1]Vallejo Sanitation and Flood Control District
[2]Includes the City of Fairfield and Suisun City
[3]The PCB TMDL assigns a combined allocation to "Solano County", which only includes discharges from the cities of Vallejo, Fairfield, Suisun City
[4]Load reductions presented in the table were calculated for each stormwater program by subtracting the applicable WLA (originally based on relative populations) from the pollutant load (originally based on relative population).

Wasteload allocations (WLAs) for urban stormwater runoff programs presented in Table 1-1, implicitly include all current and future permitted discharges within the geographic boundaries of municipalities and unincorporated areas. Permitted discharges include those covered under municipal stormwater NPDES permits, and discharges attributable to the California Department of Transportation (Caltrans) roadways and non-roadway facilities and rights-of-way, atmospheric deposition onto the surface of the watershed, public facilities (e.g., schools), properties adjacent to stream banks, industrial facilities, and construction sites.

1.1.2 Municipal Regional Stormwater Permit Requirements

On December 1, 2009, the Municipal Regional Stormwater NPDES Permit (Order R2-2009-0074), also known as the Municipal Regional Permit (MRP), became effective. The MRP applies to all 76 large and medium municipalities (cities and counties) and flood control agencies in the San Francisco Bay Region. In provisions C.11 and C.12, the MRP requires Permittees to implement a series of control measures at full or pilot-scale that are intended to reduce mercury and PCBs in urban stormwater runoff . These control measures include:

- Collection and Recycling of Mercury-containing Devices (Mercury)
- Investigations and Abatement of Sources in Drainages (Mercury & PCBs)
- Evaluations of Enhanced Municipal Sediment Management Practices (Mercury & PCBs)
- Evaluations of On-Site Stormwater Treatment via Retrofits (Mercury & PCBs)

DRAFT

- Diversions to Publicly Owned Treatment Works (Mercury & PCBs)
- Regional Risk Reduction Program Implementation (Mercury & PCBs)
- Identification of POCs During Industrial Inspections (PCBs)
- Evaluations of PCB-Containing Material Manage Practices during Building Demolition and Renovation (PCBs)

In addition to these, Permittees have historically and continue to implement control measures that provide additional reduction in pollutant loads. These control measures include:

- Street Sweeping;
- Stormwater Drainage System Maintenance (e.g., removal of material and sediments from catch basin, drop inlet and pump stations);
- Sediment Management in Channels and Water Bodies;
- New and Redevelopment Controls (e.g. low impact development);
- Public Outreach and Participation; and,
- Tracking and Participating in Regulatory Processes (e.g., bans and recycling requirements of pollutant-containing devices)

Provisions C.11.g and C.12.g require Permittees to develop and implement a monitoring program to quantify mercury and PCB loads reduced through the implementation of these (and other) control measures. Consistent with the TMDLs, load reductions and progress toward urban stormwater runoff WLAs may be demonstrated through one of three methods:

1. Quantify through estimates the average annual mercury load reduced by implementing pollution prevention, source control and treatment control efforts required by the provisions of this permit or other relevant efforts; or
2. Quantify the mercury load as a rolling five-year average using data on flow and water column mercury concentrations; or
3. Quantitatively demonstrate that the mercury concentration of suspended sediment that best represents sediment discharged with urban runoff is below the target of 0.2 mg mercury/kg dry sediment.

Permittees are moving forward on studies to demonstrate loads reduced and WLA progress using each of the methods described above. Water quality monitoring activities conducted through the *Regional Monitoring Program for Water Quality in the San Francisco Bay (RMP)* and the *Bay Area Stormwater Management Agencies (BASMAA) Regional Monitoring Coalition (RMC)* are currently attempting to estimate changes in pollutant loads (Method #2) and concentrations (Method #3). However, due to the diffuse nature of mercury and PCBs in the San Francisco Bay watershed, observable trends in loads and concentrations in creeks and rivers draining to the Bay could take decades. Quantification of loads reduced through pollution prevention, source controls and treatment controls (Method #1) is the focus of this memorandum.

1.2 Purpose and Scope

Methodologies presented in this document are intended to comply with Provisions C.11.g and C.12.g of the MRP. Additional purposes of the loads reduced quantification methods described in this memorandum include:

DRAFT

- Providing MRP Permittees with methodologies to assess progress towards WLAs assigned to urban stormwater runoff in the PCBs and mercury TMDLs;
- Assessing the effectiveness of pollution prevention programs, source control activities and treatment controls currently implemented in the Bay Area; and,
- Developing concepts for developing baseline levels of control measure implementation and commensurate load reductions, which will allow "new or enhanced" load reduction to be quantified.

1.3 Memorandum Organization

This technical memorandum is organized into four sections: 1) Introduction, background and purpose; 2) Mercury and PCB uses, sources and loadings; 3) Loads quantification methods overview, key assumptions and guiding principles; 4) Factsheets for each control measure that include quantification methods, formulas, assumptions, and data inputs and tracking needs; and, 5) References for all citations.

DRAFT

2.0 MERCURY AND PCB USES, SOURCES AND LOADINGS

2.1 Historical and Current Uses and Sources

2.1.1 Polychlorinated Biphenyls (PCBs)

Polychlorinated biphenyls are mixtures of up to 209 individual chlorinated compounds (known as congeners). PCBs were manufactured in the United States and used widely from the late 1920s through the 1970s. Due to their non-flammability, chemical stability, high boiling point and electrical insulating properties, PCBs were used in hundreds of industrial and commercial applications including electrical, heat transfer, and hydraulic equipment; as plasticizers in paints, plastics and rubber products; in pigments, dyes and carbonless copy paper and many other applications. Because of their persistent qualities, and physical and chemical characteristics, PCBs are found in environmental media worldwide, including air, sediment from street sweeping and stormwater conveyance systems, sediment and water from flood control channels and receiving waters, and urban stormwater runoff.

The U.S. total production of PCBs by Monsanto has been reported to be approximately 640,000 metric tones (de Voogt and Brinkman 1989). Production peaked in 1970 at approximately 30,000 tones or about 6% of the total U.S. production (Figure 2-1). Approximately 57% of total production occurred between 1960 and 1974 and 73% of the U.S. production occurred between 1955 and 1977. Overall, it appears that total production is proportional to total consumption in the U.S. (Breivik et al, 2002). However, although total consumption of PCBs in the U.S. (and Bay Area) continues to be at zero due to the ban in 1977, PCBs still remain in use in certain equipment and devices (e.g., transformers) and may possibly continue to contribute to urban stormwater runoff in the near future.

Figure 2-1. Annual production of PCBs in the U.S. from 1930 to 1970 (USEPA 1987).

2.1.2 Mercury

Mercury is a naturally occurring persistent, bioaccumulative metal that can be present in the elemental, inorganic or organic forms in the environment. Historically, mercury has been used in a variety of products. Primary among the over 3,000 historical industrial uses in the U.S. were battery manufacturing and chlorine-alkali production. Paints and industrial instruments have also been among the major uses. Mercury is also used in laboratories for making thermometers, barometers, diffusion pumps, and many other instruments, including mercury switches and other electrical apparatuses. Mercury is used as an

electrode in some types of electrolysis and in some types of batteries (mercury cells). Gaseous mercury is used in mercury-vapor lamps (e.g., fluorescent tubes) and advertising signs. Mercury is also the basis of dental amalgams and preparations, and can be a byproduct of burning fossil fuels and refining petroleum.

Mercury production and consumption in the U.S. have decreased dramatically since its use in gold production peaked in the mid/late 1800's (Figure 2-2). In the Bay Area, production was almost entirely from the mercury-rich New Almaden Mining District in Santa Clara County. Consumption of mercury in the U.S. has a similar trend as production. As illustrated in Figure 2-3, mercury consumption has also reduced substantially from 1970 to 2000 (Sznopek 2000), and the mass of mercury in the most current products and devices such as light bulbs and auto switches appear to also be decreasing (NEWMOA 2008). These decreases in mercury uses may assist MRP Permittees in reducing loads of mercury to the Bay.

Figure 2-2. Mercury production in the U.S. (dark line) and New Almaden Mining District (dotted line) between 1850 and 2000.

Figure 2-3. Mercury use in the U.S. between 1970 and 2000 (Sznopek 2000).

2.2 Contributions of Pollutant Mass to Stormwater from Sources

In collaboration with BASMAA member agencies, McKee et al. (2006) conducted a thorough literature review on sources and loads of mercury and PCBs entering urban stormwater and developed a mass balance (or conservation of mass) conceptual model based on this information. The intent of the model was to assist managers by providing a framework for identifying the most important mercury and PCBs uses and sources that likely impact Bay Area stormwater runoff. Although disparate information was used to develop the model, it provides the current best estimate of the mass of PCBs and mercury that is contributed to urban stormwater under a steady state scenario. The model also serves as context for management decisions, especially for mercury given its ongoing use (although reduced) in the urban environment and transport via atmospheric deposition. The following sections present the inventory of mercury and PCB sources to urban stormwater runoff based on the current understanding of PCB and mercury uses and linkages to stormwater.

2.2.1 PCBs

As illustrated in Figure 2-4, McKee et al. (2006) estimate that erosion from the surface of the urban watershed is the largest source of PCBs to Bay Area urban stormwater. Watershed surface erosion includes diffuse sources of sediment in urban areas associated with construction sites, vacant lots, unpaved foot paths, and wear debris from road and building surfaces, and represents the mass of PCBs associated with 50+ years of legacy accumulation on the surface of the watershed. Building demolition and remodeling, PCBs that continue to be in use in equipment and devices, and transformers and large capacitors represent the next largest sources. Smaller sources include atmospheric deposition and identified industrial contaminated areas.

Figure 2-4. Comparison of relative mass inputs of PCBs to Bay Area urban stormwater runoff based on estimates from McKee et al. (2006).

2.2.2 Mercury

Similar to PCBs, McKee et al. (2006) estimate that erosion from the surface of the urban watershed is also the largest source of mercury to Bay Area urban stormwater (Figure 2-5). However, unlike PCBs, atmospheric deposition of mercury to the Bay watershed is estimated to provide a much larger proportion (27%) of the total load to urban stormwater. This suggests that mercury from atmospheric deposition may continue to play an important role in loadings of mercury to the Bay from stormwater. Accidental breakage during transport or disposal of instruments such as barometers, hydrometers, manometers, pyrometers, sphygmomannometers and thermometers, or switches and thermostats that contain relatively large masses of mercury is also suggested to be a large source of mercury to stormwater. Based on these estimates, fluorescent lamps and identified industrial sites with relatively elevated mercury concentrations are far less of a source to stormwater.

Figure 2-5. Comparison of relative mass inputs of mercury to Bay Area urban stormwater runoff based on estimates from McKee et al. (2006).

One property that distinguishes mercury from PCBs is the fact that mercury bioaccumulation occurs primarily after transformation to methylmercury (methylation). Recent scientific studies have identified monitoring tools to quantify the fraction of mercury most susceptible to methylation – the "reactive mercury" fraction of the total mercury measurement (Marvin-DiPasquale et al. 2009). Studies have also shown that mercury from atmospheric deposition is primarily reactive mercury (Butler 2007). This could mean that stormwater may contain a relatively larger fraction of reactive mercury compared to purely terrestrial sources. If so, water quality benefits could be attained in receiving waters by measures that

reduce the fraction of reactive mercury present in the total load. Although there is not sufficient monitoring data at present to make the case for loads reduced or avoided based on reducing the fraction of reactive mercury, that information may be developed over time and submitted to the Water Board for consideration.

DRAFT

3.0 METHODS OVERVIEW, GUIDING PRINCIPLES AND KEY ASSUMPTIONS

This section provides an overview of key concepts, guiding principles and assumptions incorporated into quantitative methods presented in section 4.0 for determining mercury and PCB loads reduced due to control measure implementation. Quantitative methods for evaluating the effectiveness of urban runoff stormwater programs and control measures have been documented by CASQA (2007) and Strecker et al. (2001). These methods were reviewed and incorporated to the extent possible into loads reduced quantification methods presented in the next section. Additionally, information gained through previous evaluations of urban stormwater control measures for PCBs and mercury, sediment and water quality data collected in the Bay Area, and mercury and PCB use and source information described below were heavily utilized.

3.1 Literature Review

3.1.1 Evaluations of Urban Stormwater BMPs for PCBs and Mercury

The San Francisco Estuary Institute (SFEI) received a grant under the Proposition 13 Coastal Nonpoint Source Program to review and evaluate available existing literature on: 1) historical and current PCB and mercury uses, sources, and transport pathways to urban stormwater runoff; 2) PCB and mercury concentrations in stormwater, including considerations of sediment particle sizes; and, 3) current and potential implementation of best management practices (BMPs) used to reduce loadings of sediment-associated contaminants in urban stormwater. In a series of reports completed as part of the project, uses, sources and conceptual models of mercury and PCB in the urban environment and stormwater (McKee et al. 2006; Rothensberg et al. 2010); geographical distributions of mercury and PCBs in Bay Area sediments (Yee and McKee 2010); and realized and potential control measure effectiveness (Mangarella et al. 2008; SFEI 2010) were documented. Additionally, factors that affect the treatability of these pollutants and the efficacy of treatment devices in removing mercury and PCB from stormwater in the drainage network were summarized (Yee and McKee 2010; SFEI 2010). These studies provide the most complete picture on the effectiveness of pollution prevention, source and treatment control measures of control measures to reduce mercury and PCBs in urban stormwater runoff, and therefore associated results and conclusions were heavily relied upon in the development of quantification methods presented in this technical memorandum.

3.1.2 Pollutant Characterization Studies

As described above, geographical distributions in concentrations of mercury and PCBs in watershed sediments throughout the Bay area are summarized in Yee and McKee (2010). A portion of these data were collected by municipal stormwater programs through initial studies (EOA 2002, ACCWP 2002) and follow up case studies focused on PCBs (Citiations), and evaluated during the development of quantification methods. These data were most useful in developing average concentrations of PCBs and mercury in sediment within stormwater drainage systems (e.g., catch basins, drop inlets and pump stations), which were need to quantify average loads of these pollutants removed via drainage system maintenance (i.e., sediment removal).

3.1.3 Street Sweeping Studies

Throughout the past three decades, scientists and engineers have conducted numerous studies designed to assess the effectiveness and efficiencies of municipal street sweeping programs (EOA 2007). These studies have been previously summarized by EOA (2007) as part of a study designed to calculate

DRAFT

pollutant loads removed via street sweeping in Contra Costa County, and Mangarella et al. (2008) as part of a desktop evaluation of control measure scenarios to reduced PCBs and mercury in bay Area stormwater. Lessons learned from these studies were incorporated into loads reduced calculations for street sweeping that are presented in section 4.0. Additional information on PCB and mercury concentrations in materials collected by street sweepers in the Bay Area, composition of the material, sediment particle sizes, and geographical distributions based on land uses and age-of-urbanization were also heavily utilized.

3.1.3 Additional Mercury and PCB Use and Source Information

Information on current and historical uses of mercury and PCBs was also obtained during the literature review. Specifically, to develop load reduction estimates for pollution prevention activities (e.g., recycling programs) the number and volume of devices, equipment and materials that contain mercury and PCBs, and the current and historical mass of these pollutants in each device was obtained. Information from reports on mercury flow analyses (Barr Engineering 2001), device recycling rates (ALMR 2003, DTSC 2008, USEPA 2009, CIWMB 2009), content (NEMA 2008, DTSC 2008) and emissions (Barr Engineering 2001, USEPA 2008) were utilized. Bay Area specific air emission and deposition rates of mercury were also obtained (Rothensberg 2010; Tsai and Hoieneke 2001) to assess load reductions due to improved deposition of mercury onto the Bay watershed.

3.2 Control Measures Evaluated

The following sections briefly describe the control measures initially identified by Permittees as those that should be considered for development of loads reduced methodologies. Based on the availability of information on baseline, current and anticipated implementation levels, pollutant concentrations associated with loads removed, and control measure effectiveness, Permittees may choose to develop quantification methods for additional control measures.

3.2.1 Pollution Prevention

Pollution prevention programs and activities are intended prevent pollutants that are present within materials, devices and equipment from entering the environment and contributing to stormwater pollution. Pollution prevention control measures specific to mercury and PCBs are those that reduce the quantities of these pollutants in products and equipment through voluntary or regulatory approaches (e.g., mercury thermometer recycling programs), prevent accidental release or spills into the environment (e.g., industrial facility inspections), or assist in the recycling of materials that contains these pollutants (e.g., fluorescent lamps, switches, thermostats and transformers). These controls are implemented either directly by Permittees and associated solid waste programs in the Bay Area, or by other regulatory programs in which Permittees actively support, advocate or assist in implementing. More specific descriptions of pollution prevention measures anticipated for implementation are included in section 4.0.

Loads reduced quantification methods for the following pollution prevention control measures are included in this document:

- Fluorescent Lamp Recycling (Mercury)
- Thermostat Recycling (Mercury)
- Reduction of Pollutants from Local Atmospheric Sources (Mercury)

DRAFT

The effectiveness of these measures with respect to stormwater runoff is not easily evaluated given that it is difficult to determine to what extent such mercury and PCBs in these materials would enter urban stormwater compared to other disposal options (e.g., landfills, sanitary sewer system). Therefore, uncertainties remain in loads reduced estimates for pollution prevention measures. Additional control measures for which loads reduced quantification methods may be developed in the future include: stormwater inspections at industrial and commercial facilities (PCBs and mercury), thermometer and auto switch recycling (mercury) and building demolition and renovation waste management (PCBs).

3.2.2 Source (Institutional) Controls

There is no universally accepted definition of "source control" as it pertains to stormwater management. Some practitioners refer to source controls as "non-structural controls", and many times they are confused with pollution prevention measures described in the previous section. For the purpose of this document, source controls are defined as institutional non-treatment measures that remove pollutants directly from streets, contaminated properties, stormwater conveyance systems, channels or receiving waters once they have already entered the environment.

For decades, MS4s have implemented source controls that have directly or indirectly helped to improve water quality in the Bay Area. For example, street sweeping on roads and parking lots, although mainly targeted at removing trash and other road related debris, also removes pollutants like PCBs and mercury that strongly attach to particles. Source controls have also helped to establish (and limit) the baseline load condition depicted in the PCB and Mercury TMDLs through load and wasteload allocations. Loads reduced quantification methods for the following source (institutional) control measures are included in section 4.0:

- Street Sweeping (Mercury and PCBs)

Quantification methods will also likely be developed for stormwater conveyance system maintenance, sediment management in channels and water bodies, hydromodification controls and low impact development (LID). Methods for quantifying contaminated property remediation (mercury and PCBs) may also be developed as additional data on the effectiveness of this control measure is evaluated through pilot projects implemented as part of BASMAA's Clean Watersheds for a Clean Bay (CW4CB) project that is intended to comply with MRP requirements.

Because these actions physically remove pollutants from the environment, the process of quantifying the effectiveness of source controls is much more straight-forward and intuitive than pollution prevention activities. Additionally, as described in the previous section, scientist and engineers have conducted many studies aimed at quantifying the effectiveness of source controls. These studies provide numerous datasets and information to base loads reduced quantification tools described in this document.

3.3.3 Treatment Controls

Stormwater treatment controls are engineered devices or systems that can be installed or built in place to enhance the capture of pollutants. Treatment controls have a variety of modes of operation including those that slow down the movement of water, remove sediment and associated contaminants through filtering, settling, or otherwise separating sediment from flowing water, or adsorb and incorporate the substance into some kind of media (e.g. carbon, resin, or living plant material). For the purposes of this document, treatment controls include both those installed or built on-site or within a public right-of-

DRAFT

way, and diversions of stormwater (wet and dry weather) runoff to publically owned treatment works (POTWs).

A variety of treatment controls have been implemented throughout the Bay Area to control stormwater impacts on receiving waters (LFR 2004). The impetus for implementation of these controls, however, was not associated with concerns of PCBs or mercury and effectiveness monitoring was generally not conducted in a manner to yield load reduction estimates. Additionally, little to no data are available outside of the Bay Area on the effectiveness of treatment controls to reduce PCBs or mercury in urban runoff (McKee et al. 2006), other than scenarios described in Mangarella et al. (2008) that were based on their current understanding of demonstrated performance of various treatment controls for reductions of total suspended solids (Winer 2000, CASQA 2003, CalTrans 2004, ASCE and USEPA 2008, CalTrans 2010) and PCB and mercury settling studies (Yee and McKee 2010). Based on these sources, Figure 3-1 provides the estimated median BMP effluent concentrations of a number of stormwater treatment controls and is provided here primarily to represent the relative effectiveness of these controls types.

Figure 3-1. Estimated concentrations of total suspended solids (TSS) for various stormwater treatment controls (Mangarella et. al 2008).

Based on the limited data available on treatment controls with regard to their effectiveness in reducing PCB and mercury loads in urban stormwater runoff, quantitative methods for these control measures are not included in this technical memorandum at this time. That said, as described in section 1.1.2, Permittees will be implementing a variety of BMP effectiveness projects, treatment controls and diversions to POTWs at pilot-scales during the term of the MRP through the CW4CB project. Information collected on the effectiveness of these control will assist Permittees in developing load reduction quantification methods. As information becomes available, Permittees, stormwater programs or BASMAA may choose to update section 4.0 with fact sheets describing methods for quantifying the loads reduced via treatment controls.

3.4 Load Reduced Quantification Methods Overview

Quantification methods for assessing mercury and PCBs loads reduced that are presented in section 4.0 were based on a robust review of published and grey literature conducted through this and previous projects (see section 3.1). Quantification methods are intended to assist MRP Permittees in assessing loads of mercury and PCBs reduced through control measures that they have directly implemented (e.g., street sweeping, or assisted in causing the control measure to be implemented (e.g., changes in regulations). This section provides an overview of the guiding principles, key assumptions and concepts behind the methods presented in section 4.0. As quantification methods evolve through trial implementation, assumptions and concepts presented in this section should be adjusted accordingly.

3.4.1 Guiding Principles

Reductions in pollutant loads can be quantified in many ways. To provide transparency in the thought process behind the quantification methods presented in section 4.0, principles that guided the development of these methods are presented below.

- **Quantification methods are constrained by the extent of information available** – Only the information readily available on control measure effectiveness, degree of control measure implementation, concentrations and masses of pollutants in materials/devices/equipment, and baseline loads and loads reduced can be used to develop quantification methods and track annual load reductions. In some cases, information is very limited and assumptions therefore have to be made. Although these assumptions create uncertainties in load reduction calculations, if stated clearly and transparently, assumptions can be tested and revised accordingly as methods evolve.
- **Methods should be as simple and data inputs as tractable as possible** – As a general principle in creating the loads reduced formulas presented in section 4.0, the amount of information that Permittees are required to track as inputs to the formula was considered. In most cases, data that Permittees or stormwater programs will need to track and input into the loads reduced formulas consists of information they collect and submit to the Water Board as part of their Annual Reports. In limited cases, additional information included in reports submitted to State of California by other public agencies or private entities may need to be obtained to provide a complete picture of loads reduced from urban stormwater runoff during a specific year. Such cases are identified in the fact sheets.
- **Pollutant loads reduced targets serve as the goal to achieving WLAs** – The mercury and PCB TMDLs include both baseline loads (circa 2003) and wasteload allocations (WLAs) for urban stormwater runoff. The difference between the two is assumed to be the pollutant load that stormwater programs (and associated Permittees) need to reduce on an annual basis (see section 1.1.1) through control measure implementation. Realistically, however, the pollutant load discharged from urban stormwater runoff to the Bay fluctuates (possibly higher or lower) between years depending rainfall/runoff patterns, pollutant mobility, changes in sales and content of pollutant containing devices, and the degree of control measure implementation. Methods that can be used to estimate annual loads include mass-balances, empirical monitoring and simple or dynamic modeling. That said, given the inherent variability and uncertainties in quantifying urban runoff loads to the Bay on an annual basis, regardless of the method used , it is assumed for the purposes of assessing progress toward WLAs that the annual average loads of PCBs and mercury included in the TMDLs provides the baseline for which loads reduced will be measured, at least until new monitoring and modeling approaches developed through the

Regional Monitoring Program (RMP) Small Tributary Loading Strategy (STLS) yield updated loads information for PCBs and mercury.

- **Baseline levels of control measures implemented at the time loading estimates were developed (i.e., 2003) are implicitly incorporated into pollutant load estimates from urban runoff to the Bay** – Sediment and water quality data used to establish baseline loads in the TMDLs were collected circa 2003. As a simplifying assumption, control measures implemented (at associated pollutant loads reduced) at the time these data were collected are assumed to establish the baseline level of implementation for loads reduced by new or enhanced controls are compared. As described below, future enhancements of control measures implemented in 2003, or new control measures that target products/equipment/material that contain mercury or PCBs that are reasonably liable to enter urban stormwater will help further reduce PCB/mercury loads to the Bay and assist Permittees in addressing WLAs.
- **New and enhanced control measures implemented within the geographical boundaries of the Permittees may be quantified as loads reduced, regardless of the implementing entity** – As described in the PCB and Mercury TMDLs (Water Board 2006, 2008), WLAs for urban runoff implicitly include all current and future permitted discharges within the geographic boundaries of municipalities and unincorporated areas including, but not limited to, California Department of Transportation (Caltrans) roadways and non-roadway facilities and rights-of-way, atmospheric deposition, public facilities, properties proximate to stream banks, industrial facilities, and construction sites. Although implementation of control measures to reduce PCBs and mercury in many of the discharges listed above are outside of the direct jurisdiction of MRP Permittees, load reductions attributable to these control measures need to be accounted for in the context of WLAs assigned to stormwater programs. As such, quantification methods presented in section 4.0 (as well as future methods developed) include actions taken by public agencies and private entities that are assumed to directly affect loads of PCBs and mercury in urban stormwater runoff.

3.4.2 Key Assumptions

In addition to the guiding principles above, the key assumptions described below were included in load reduction quantification methods and results. Control measure specific assumptions are included in each fact sheet presented in section 4.0.

- **Control measures are assumed to be independent of each other** – In some cases, the implementation of one control measure could affect the effectiveness of another. For example, reducing mercury air emissions from local sources could affect pollutant accumulation on streets, which in turn could reduce the mass of pollutants available to source controls such as street sweeping. Evaluating the potential interaction of these controls quantitatively was beyond the level of analysis conducted herein, although potential interactions between control measures are identified and discussed in the fact sheets where appropriate.
- **Baseline conditions and control measure effectiveness are assumed to be geographically uniform**– Conditions vary among the various geographical areas that contribute runoff and pollutants to San Francisco Bay. Thus, projecting results obtained by studies conducted at specific locations may not be representative all areas. As a practical matter, however, we assumed that projections to the whole watershed, based on area, land use, or population, were adequate for the development of the proposed methods. As input data are collected to

DRAFT

populate formulas presented, considerations should be given to the spatial representativeness of these data and disaggregated or aggregated as needed.

DRAFT

4.0 LOADS REDUCED QUANTIFICATION FACT SHEETS

This section includes a series of fact sheets that document preliminary loads reduced quantification methods. Fact sheets were developed for a limited number of pollution prevention and source controls, where a reasonable amount of information was obtained through the literature review to develop methods. As such, methods presented in these fact sheets are based on the most currently available information, and are intended to evolve as additional information becomes available. Much of the information reviewed was collected in the San Francisco Bay Area and therefore is applicable to Permittees. Other information used in quantification method development was collected as part of studies conducted in other areas of the U.S., but appear to be applicable to the Bay Area through scaling based on population.

Each fact sheet in this section includes: 1) a brief description pollutant source, 2) summaries of applicable control measures, 2) loads reduced formulas, 3) assumptions and data inputs, 4) future data tracking needs, and 5) references used to establish the methods. Fact sheets in this section include:

<u>Pollution Prevention</u>

- PP-1: Fluorescent Lamp Recycling (Mercury)
- PP-2: Thermostat Recycling (Mercury)
- PP-3: Reduction of Pollutants from Local Atmospheric Sources (Mercury)

<u>Source (Institutional) Controls</u>

- SC-1: Street Sweeping (Mercury and PCBs)

As this technical memorandum evolves through additional review and revisions, fact sheet for other control measures will be included. In particular, fact sheets for stormwater conveyance system maintenance, sediment management in channels and water bodies, hydromodification and low impact development (LID), stormwater treatment controls, and other controls may be developed to document methods.

DRAFT

PP-1: Fluorescent Lamp Recycling (Mercury)

There are two main categories of lamps (i.e., light bulbs) currently used in large quantities in the United States (U.S.) - incandescent and luminescent gaseous discharge lamps (e.g., fluorescent and low-pressure sodium). Incandescent lamps do not contain mercury. Fluorescent lamps, however, contain mercury and are generally available in two types – tubular or compact. Tubular fluorescent lamps are mostly used in commercial or institutional buildings and usage is believed to have generally remained consistent over time. Compact fluorescent lamps (CFLs), however, are mostly used as energy-saving alternatives to incandescent lamps in homes and have their use has increased substantially in recent years (DTSC 2008).

Recycling of mercury in lamps is the primary control measure used to reduce mercury in the environment from this source. Technologies to reclaim mercury from spent lamps through recycling were developed in the U.S. starting in 1989. However, recycling did not drastically increase until the U.S. EPA announced the addition of lamps to the Universal Waste Rule (UWR) in 1999 (ALMR 2003). The State California's UWR became effective on February 8, 2002 and today prohibits the disposal of fluorescent lamps into landfills, regardless of the waste generator (household or business). The California Department of Toxic Substances Control (DTSC) has adopted regulations that require safe management and recycling of fluorescent lamps.

Applicable Control Measures

Methods describe in this fact sheets are applicable to the following urban stormwater runoff control measures, and as such may be used by Bay Area Permittees to assess progress towards WLA established in TMDLs:

- HHW Collection - Household fluorescent lamp recycling in the Bay Area is available at household hazardous waste (HHW) facilities, which are managed by cities, counties and special districts. A list of Bay Area household hazardous waste facilities that currently (2010) provide fluorescent lamp collection/recycling is attached. Information on the number and types of lamps recycled is available through the HHW facility or the California Integrated Waste Management board (CIWMB).
- Collection at Participating Businesses – Businesses throughout the Bay Area (e.g., IKEA, Home Depot and Orchard Supply) are beginning to accept spent fluorescent lamps from customers. Although tracking may be difficult, recycling provided by these businesses could be quantified by Permittees.
- Private Recycling Contractors - Recycling by small and large businesses occurs through private recycling contractors that coordinate directly with businesses that generate large and small quantities of lamps. The availability of information necessary to quantify loads reduced attributable to this control measure is currently unknown.

Loads Reduced Formula

Based on a review of available data and information gained through literature reviews, the following set equations will allow MRP Permittees to determine the mass of total mercury reduced from stormwater as a result of fluorescent lamps recycling conducted in a given year. Please note that the equations are unit-less and will need to be converted appropriately based on standard conversion rates (e.g., milligrams to kilograms).

DRAFT

$$\mathbf{Reduction_{Lamps} = Current_{Lamps} - Base_{Lamps}}$$

where:

$Reduction_{Lamps}$	=	Mass of total mercury reduced from urban stormwater (above baseline), as a result of fluorescent lamp recycling in year of interest
$Baseline_{Lamps}$	=	Average annual mass of total mercury diverted from Bay Area stormwater during a baseline year(s) due to fluorescent lamp recycling
$Current_{lamps}$	=	Mass of total mercury diverted from Bay Area stormwater due to fluorescent lamp recycling in a year of interest

and;

$$\mathbf{Base_{Lamps}} = Lamps_{Base\#} \bullet Lamps_{BaseMass} \bullet Lamps_{Runoff}$$

$$\mathbf{Current_{Lamps}} = Lamps_{Current\#} \bullet Lamps_{CurrentMass} \bullet Lamps_{Runoff}$$

where:

$Lamps_{Base\#}$	=	Average annual number of fluorescent lamps recycled in baseline year(s)
$Lamps_{BaseMass}$	=	Average mass of total mercury in fluorescent and compact fluorescent lamps recycled in baseline year(s)
$Lamps_{Current\#}$	=	Number of fluorescent lamps recycled in a year of interest
$Lamps_{CurrentMass}$	=	Average mass of total mercury in fluorescent and compact fluorescent lamps recycled in a year of interest
$Lamps_{Runoff}$	=	% of total mercury mass in fluorescent lamps that contributes to the urban stormwater load of mercury to the Bay when the lamp is broken (see below)

and;

$$\mathbf{Lamps_{Runoff}} = Dep_{Lamps} \bullet Trans$$

where:

$Dep_{\mathbf{Lamps}}$	=	Average % of total mercury in fluorescent and compact fluorescent lamps that is deposited onto the surface of the watershed when the lamp is broken
Trans	=	Average % total mercury deposited onto the surface of the watershed when the lamp is broken that is transported by stormwater to the Bay

Assumptions and Data Inputs

Baseline Loads Reduced (2003)

- Baseline Level of Recycling ($Lamps_{Base\#}$) - The average annual number fluorescent lamps recycled from 2000 through 2003 provides the baseline number of lamp that were recycled prior to the TMDL baseline year of 2003. Estimated total number of fluorescent lamps recycled by in the U.S. businesses and households in 2003 are based on estimates by ALMR (2003). Estimates for the U.S. were normalized by population to the geographical area covered by the Municipal Regional Permit (MRP). Table 4-1 provides baseline (2003) recycling rates.

- Baseline Mercury in Lamps ($Lamps_{BaseMass}$) – The mass of mercury (kg) in lamps can vary based on the lamp type, size, manufacturer and date manufactured. Considerations are given to changes in the mass of mercury per bulb that has likely occurred between 2003 and the year of interest by including a baseline concentration ($Lamps_{BaseMass}$) and a concentration for the current year of evaluation ($Lamps_{CurrentMass}$). The mass of total mercury in lamps in 2003 are assumed to average 21 mg per lamp (US EPA 1998).

DRAFT

Table 4-1. Estimated baseline (2000-2003) number of fluorescent lamps recycled in the jurisdictional boundaries of Bay Area MS4s.

Geographical Area/Entity	Households (20%)	Businesses (80%)	Total
United States	*2,680,000*	*150,080,000*	*152,760,000*
Alameda Countywide Clean Water Program	153,393	613,572	766,965
Contra Costa Clean Water Program	105,109	420,436	525,545

[1]Vallejo Sanitation and Flood Control District
[2]Includes the City of Fairfield and Suisun City

Current Loads Reduced (Year of Interest)

- Current Mercury in Lamps ($Lamps_{CurrentMass}$). The average mass of mercury in a lamp appears to have decreased post-2003 (baseline) due to the increase in CFL usage by households. Specifically, the National Electrical Manufacturers Association (NEMA) announced that under the voluntary commitment, effective April 15, 2007, participating manufacturers will cap the total mercury content in CFLs that are under 25 watts at 5 milligrams (mg) per unit, and CFLs that use 25 to 40 watts of electricity will have total mercury content capped at 6 mg per unit (NEMA 2009). Based on this substantial decrease in mercury mass in CFLs, each bulb recycled is assumed to have an average mass of 5.5 mg. New fluorescent tubes are also assumed to have 5.5 mg on average.
- Current Level of Recycling ($Lamps_{Current\#}$) – The number of fluorescent lamps recycled in the year of interest represents the current level of effort towards meeting WLAs assigned in the TMDL. Recycling efforts are managed by HHWs, participating stores, and private companies for small and large waste generators (US EPA 2009). Recycling efforts are expected to increase substantially over the next decade (US EPA 2009, DTSC 2008).

Baseline and Current Loads Reduced

- % Mercury from Broken Lamps that is Deposited on Watershed (Dep_{Lamps}) – The percentage of mercury in a broken lamp that is assumed to be deposited onto the surface of the watershed is based on a Barr Engineering (2001) study conducted in Minnesota and Wisconsin that focused on the fate of mercury from household products, combined with a partitioning analysis. The authors estimated 37% of the amount of mercury in lamps volatizes into the atmosphere, resulting from breakage, transfer and transit, as well as air emissions following disposal in landfills, combustion, and incineration. For the purposes of loads reduced calculations, we assume that 100% of the mercury that volatilizes into the atmosphere is deposited onto the surface of the watershed.
- % of Mercury Transport by Stormwater (Trans) – the average % imperviousness of Bay Area is an important factor because imperviousness is one of the key mechanisms for stormwater transport. Runoff coefficients are based on the % of imperviousness of a given land use. Based on the literature review conducted in support of this technical memorandum development, there remains a need for an average runoff coefficient for the "urban portion of the Bay" to

complete this variable. As an initial percentage, we suggest using a 32% estimate based on modeling conducted as part of a Mercury Air Deposition Study by Tsai and Hoenicke (2001).

DRAFT

PP-2: Thermostat Recycling (Mercury)

Thermostats are commonly used in most homes and commercial facilities to regulate room temperature. Older mechanical thermostats often contained elemental mercury in glass bulbs called ampoules. Through the mishandling of thermostats during demolition and waste transport, ampoules can break and mercury can be emitted to the surface of the watershed. Once in the watershed, mercury is available for transport to the Bay via urban stormwater runoff.

The sale of mercury thermostats was prohibited in California beginning on January 1, 2006 (SB 633). Based on this prohibition, the mass of mercury available to urban stormwater from thermostats is expected to decrease overtime. That said, there are roughly 19.8 million mercury thermostats currently in service in California (TRC 2009), suggesting that near-term contributions of mercury to urban stormwater runoff from thermostats may be important.

Applicable Control Measures

Loads reduced through the implementation of the following urban stormwater runoff control measures may be quantified and used by Bay Area MS4s to assess progress towards WLA established in TMDLs:

- HHW Thermostat Collection - Mercury thermostat recycling has been available through HHW facilities for a number of years and continues to be utilized by residents in the Bay Area.
- Recycling by Wholesalers/Retailers - California's *Mercury Thermostat Collection Act of 2008* (AB 2347) requires that by 2009 manufacturers establish a collection and recycling program for out-of-service mercury-added thermostats. The Thermostat Recycling Corporation (TRC) serves as the collection and recycling program for manufacturers in California (TRC 2010). The TRC provides collection containers to HVAC wholesalers, thermostat retailers, and HVAC contractors for a one-time charge. Collection containers are provided by the TRC to HHW facilities at no cost.
- Other Recycling Efforts – Although likely limited, other recycling activities conducted within the geographical boundaries of the MS4 may be quantified.

For the purposes of assessing progress towards urban stormwater runoff TMDL wasteload allocations, mercury thermostat recycling that occurs through any of these mechanisms described above may be included in loads reduced calculations.

Loads Reduced Formula

Based on a review of available data and information gained through literature reviews, the following set equations will allow MRP Permittees to determine the mass of total mercury reduced from stormwater as a result of thermostat recycling conducted in a given year. Please note that the equations are unit-less and will need to be converted appropriately based on standard conversion rates (e.g., milligrams to kilograms).

$$\mathbf{Reduction_{Therm} = Current_{Therm} - Base_{Therm}}$$

where:

$Reduction_{Therm}$	=	Mass of total mercury reduced from urban stormwater (above baseline), as a result of mercury thermostat recycling in year of interest
$Base_{Therm}$	=	Average annual baseline mass (kg) of total mercury diverted from Bay Area stormwater due to mercury thermostat recycling

DRAFT

$Current_{Therm}$ = Mass of total mercury diverted from Bay Area stormwater due to mercury thermostat recycling in year of interest

and;

$$\mathbf{Base_{Therm}} = Therm_{Base\#} \bullet Therm_{BaseMass} \bullet Therm_{Runoff}$$

$$\mathbf{Current_{Therm}} = Therm_{Current\#} \bullet Therm_{CurrentMass} \bullet Therm_{Runoff}$$

where:

$Therm_{Base\#}$ = Average annual number of mercury thermostats recycled in baseline year(s)

$Therm_{BaseMass}$ = Average mass of total mercury in mercury thermostats recycled in baseline year(s)

$Therm_{Current\#}$ = Number of mercury thermostats recycled in year of interest

$Therm_{CurrentMass}$ = Average mass of total mercury in mercury thermostats recycled in year of interest

$Therm_{Runoff}$ = % of total mercury mass in mercury thermostat that contributes to the urban stormwater when a mercury thermostat is broken (see below)

and;

$$\mathbf{Therm_{Em}} = Dep_{Therm} \bullet Trans$$

where:

Dep_{Therm} = Average % of total mercury in thermostats that is deposited onto the surface of the watershed when the thermostat is broken

Trans = Average % total mercury deposited onto the surface of the watershed that is transported by stormwater

Assumptions and Data Inputs

Baseline Loads Reduced

- Baseline Level of Recycling ($Therm_{Base\#}$) – The average annual number of mercury thermostats recycled from 2000 through 2003 provides the baseline number of thermostats that were recycled prior to the TMDL baseline year (i.e., 2003). The annual average number of mercury thermostats that were recycled by U.S. businesses and households during this time is based on data from TRC (2008). Estimates for the U.S. were normalized by population to the geographical area covered by the Municipal Regional Permit (MRP). Table 1 provides baseline (2000-2003) recycling rates.

DRAFT

Current Loads Reduced (in Year of Interest)

- Current Level of Recycling ($Therm_{Current\#}$) – The number of thermostats recycled in the year of interest represents the current level of effort towards meeting WLAs assigned in the TMDL. Recycling efforts managed by a combination of the TRC, wholesalers and HHWs within areas covered under the MRP may be counted towards this effort.

Baseline and Current Loads Reduced

- Mercury in Thermostats ($Therm_{Base/CurrentMass}$) – the amount of mercury in a thermostat is determined by the number of ampoules. There are generally one or two ampoules per thermostat (average is 1.4) and each ampoule contains an average of 2.8 grams of mercury (TRC 2008). Therefore, each thermostat recycled is assumed to contain approximately 4.0 grams of mercury.
- % Mercury in Thermostats that is Deposited on Watershed (Dep_{Lamps}) – The percentage of mercury in a thermostat that when broken is assumed to be deposited onto the surface of the watershed is based on a Barr Engineering (2001) study conducted in Minnesota and Wisconsin that focused on the fate of mercury from household products, combined with a partitioning analysis. The authors estimated 37% of the amount of mercury in lamps volatizes into the atmosphere, resulting from breakage, transfer and transit, as well as air emissions following disposal in landfills, combustion, and incineration. For the purposes of loads reduced calculations, we assume that 100% of the mercury that volatilizes into the atmosphere is deposited onto the surface of the watershed.
- % of Mercury Transport by Stormwater (Trans) – the average % imperviousness of Bay Area is an important factor because imperviousness is one of the key mechanisms for stormwater transport. Runoff coefficients are based on the % of imperviousness of a given land use. Based on the literature review conducted in support of this technical memorandum development, there remains a need for an average runoff coefficient for the "urban portion of the Bay" to complete this variable. As an initial percentage, we suggest using a 32% estimate based on modeling conducted as part of a Mercury Air Deposition Study by Tsai and Hoenicke (2001).

DRAFT

PP-3: Local Atmospheric Sources (Mercury)

Local (e.g., crematoria) and global (e.g., coal power plants in Asia) emissions of mercury can enter the Bay Area air basin and deposit directly onto the San Francisco Bay or on land surfaces within the local San Francisco Bay watershed. Mercury from air emissions may also be exported beyond the San Francisco Bay Area. The mass of mercury deposited onto the Bay is explicitly accounted for in the Mercury TMDL. Mercury deposited onto the surface of the watershed, however, is included in the urban stormwater load and associated wasteload allocation in the TMDL.

Based on an assessment of local air sources in the Bay Area conducted by the San Francisco Estuary Institute (SFEI) through a Proposition 13 grant, local air sources of mercury (e.g., crematoria and Portland cement plants) may be significant contributors of mercury found in urban stormwater runoff. The total estimated emissions of mercury from all air local sources within the San Francisco air basin are estimated at 214 kg/yr (CARB 2010). The emissions from the one Bay Area portland cement manufacturer (i.e., Lehigh Hanson Permanente Cement Plant) located in western Santa Clara County are estimated at 61 kg/yr (Rothenberg et al. 2010). Annual emissions from the approximately 40 crematoria in the nine county San Francisco Bay Area[3] have been estimated to range from a most probable value of 12 kg/yr to a worst case of 47 kg/yr (Lindquist and Bateman 2000). The primary source of the mercury in the crematoria emissions is assumed to be dental fillings.

Applicable Control Measures

Loads reduced through the implementation of the following control measures that directly affect mercury loads from urban stormwater runoff may be quantified and used by Bay Area MS4s to assess progress towards WLA established in the Mercury TMDL:

- New Emission Standards for Portland Cement Plants – The U.S. EPA has proposed *National Emission Standards for Hazardous Air Pollutants from the Portland Cement Manufacturing Industry* that is currently under review. BASMAA and SCVURPPP have provided comment letters to U.S. EPA regarding the proposed adoption regarding the potential nexus between emissions at the plant and mercury in urban stormwater runoff.
- Reduction in Mercury Emissions from Crematoria - Mercury has been widely used in the dental industry in amalgam fillings for teeth for decades. Substantial decreases in the use of mercury in dental amalgam due to increased consumer awareness of mercury use in fillings and the availability of more viable alternatives has been documented since 2003 (IMERC 2010). Continued reductions in the use of dental amalgam over time, may in turn reduce mercury emissions from crematoria/

Load Reduced Formula

Based on a review of available data and information gained through literature reviews, the following set equations will allow MRP Permittees to determine the mass of total mercury reduced from stormwater as a result of reductions in air emissions conducted in a given year. Please note that the equations are unit-less and will need to be converted appropriately based on standard conversion rates (e.g., milligrams to kilograms).

[3] Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano and Sonoma

DRAFT

$$\mathbf{Reduction_{AirEm} = Base_{AirEm} - Current_{AirEm}}$$

where:

$Reduction_{AirEm}$	=	Mass of total mercury reduced from urban stormwater baseline attributable to mercury air emission reductions in a year of interest
$Base_{AirEm}$	=	Average annual baseline mass of total mercury in Bay Area stormwater attributable to local mercury air emissions
$Current_{AirEm}$	=	Mass of total mercury in Bay Area stormwater attributable to local mercury air emissions during the year of interest

and;

$$\mathbf{Base_{AirEm}} = AirEm_{Base\#} \bullet AirEm_{BaseMass} \bullet Dep_{AirEm} \bullet Trans$$

$$\mathbf{Current_{AirEm}} = AirEm_{Current\#} \bullet AirEm_{CurrentMass} \bullet Dep_{AirEm} \bullet Trans$$

where:

$AirEm_{Base\#}$	=	Number of crematory or portand cement manufacturers in baseline year(s)
$AirEm_{BaseMass}$	=	Average annual mass of total mercury emitted from crematory or portand cement manufacturers in baseline year(s)
$AirEm_{Current\#}$	=	Number of crematory or portand cement manufacturers in year of interest
$AirEm_{CurrentMass}$	=	Mass of total mercury (kg) emitted from crematory or portand cement manufacturers in year of interest
Dep_{AirEm}	=	Average % of total mercury mass in emissions from crematory or portand cement manufacturers that is deposited onto the surface of the watershed
Trans	=	Average % of total mercury mass deposited onto the surface of the watershed that runs off into urban stormwater (based on runoff coefficients)

Assumptions and Data Inputs

Baseline Loads

- Baseline Number of Air Emission Facilities ($AirEm_{Base\#}$) – In 2003, there were 31 crematoria (see Table 4-3) and one portand cement manufacturer in the geographical area subject to the MRP.
- Mass of Mercury Emitted from Facilities during Baseline Years ($AirEm_{BaseMass}$) - Emission estimates for crematoria are based on dental statistics and the average amount of mercury used in amalgams. Annual emissions from the approximately 40 crematoria in the nine county San Francisco Bay Area are assumed to be 12 kg/yr (most probable number), or an average of 0.3 kg/yr of mercury per crematoria (Lindquist and Bateman 2000). Mercury emissions from the Lehigh Hanson Permanente Portland Cement Plant located are estimated at 61 kg/yr in 2009 (Rothenberg et al. 2010). For the purposes of establishing baseline, this mass of mercury in 2009 was assumed to also be emitted in 2003.

Current Loads (in Year of Interest)

- Number of Air Emission Facilities in Year of Interest ($AirEm_{Current\#}$) – Due to the closing of crematoria or portland cement manufacturing plants, the number of facilities emitting mercury in the Bay Area may change overtime. Tracking of these businesses should be conducted accordingly to insure the most up-to-date information is used in loads reduced calculations.
- Mass of Mercury Emitted from Facilities during Year of Interest ($AirEm_{CurrentMass}$) – Mercury in crematoria emission may change in the future due to the reduction in the number and size of mercury amalgam fillings used. If literature suggests that the number or size of mercury-based

DRAFT

filling decreases, the estimated 0.3 kg/yr should be refined to account for this decrease. Likewise, if regulations go into place for portland cement manufacturers, the estimated mass of mercury emitted from this source should be revised. In the absence of new information or regulation, the baseline mass of mercury emitted from these facilities should be used to calculate the mass emitted during the year of interest.

Baseline and Current Loads Reduced

- % of Total Mercury in Emitted that is Deposited onto the Watershed (Dep_{AirEm}) – Based on our understanding of air deposition of contaminants, only a percentage of local mercury emissions are deposited onto the surface of Bay watershed. Predicting this percentage through field sampling or modeling, however, is extremely complex and results are typically highly variable and uncertain (USEPA 2001). Therefore, we provide a conservative assumption of 20% of the mercury emitted from these sources is deposited on the surface of the watershed in the Bay Area.
- % of Total Mercury Mass Deposited that Runs Off (Trans) – the average % imperviousness of Bay Area is an important factor because imperviousness is one of the key mechanisms for stormwater transport. Runoff coefficients are based on the % of imperviousness of a given land use. Based on the literature review conducted in support of this technical memorandum development, there remains a need for an average runoff coefficient for the "urban portion of the Bay" to complete this variable. As an initial percentage, we suggest using a 32% estimate based on modeling conducted as part of a Mercury Air Deposition Study by Tsai and Hoenicke (2001).

DRAFT

SC-1: STREET SWEEPING (MERCURY AND PCBS)

Street sweeping is conducted by most, if not all, Bay Area municipalities. The traditional purpose of street sweeping is to remove trash and debris that collect in the gutters at the edge of streets. However, street sweeping also removes sediment and associated pollutants such as mercury and PCBs that would otherwise be transported to the Bay via urban stormwater runoff. Although many studies[4] have attempted to assess the effectiveness of street sweeping activities, there continues to be disagreement among stormwater practitioners as to whether sweeping efficiency equates to improvements in the quality of stormwater runoff. Pollutant removal effectiveness of street sweeping may be directly affected by sweeper type, operation (i.e., speed), frequency and inabilities to sweep near curbs due to parked vehicles. Additionally, land uses and proximities to pollutant sources and hot spots may influence the concentration and mass of pollutants removed. These factors make developing pollutant reduction estimates for street sweeping challenging at best. As a practical matter, however, it is difficult to argue from a qualitative perspective that much if not all the material picked up by a sweeper would have otherwise been mobilized and transported by stormwater runoff.

Applicable Control Measures

Pollutant loads reduced through the implementation of the following urban stormwater runoff control measures may be quantified and used by Bay Area MS4s to assess progress towards WLA established in the PCB and Mercury TMDLs:

- Increases in the Pollutants Collected via Standard of Street Sweeping– Permittees may increase the volume of pollutants collected via modification to their existing street sweeping program. Modifications may include: 1) increasing the frequency of street sweeping; 2) enforcing parking violations on street sweeping days; or 3) purchasing new more efficient sweepers.
- Targeted Street Sweeping in Areas with Elevated Pollutants – Based on previous source studies conducted by Permittees, stormwater programs and SFEI, PCB (and to some extent mercury) concentrations are heterogeneous in the Bay watershed. In compliance with the MRP, pilot studies are currently being developed to test control measures (i.e., source investigations, stormwater treatment retrofits, and diversions to POTWs) in selected areas. These areas may also serve as locations where Permittees may chose to target enhanced street sweeping in the future.

Loads Reduced Formula

Based on a review of available data and information gained through literature reviews, the following set equations will allow MRP Permittees to determine the mass of total mercury and PCBs reduced from stormwater as a result of street sweeping conducted in a given year. Please note that the equations are unit-less and will need to be converted appropriately based on standard conversion rates (e.g., milligrams to kilograms).

[4] See citations in the references section and EOA 2007 for a summary of street sweeping studies.

DRAFT

$$\mathbf{Reduction_{Streets} = Current_{Streets} - Baseline_{Streets}}$$

where:

$Reduction_{Streets}$	=	Mass of total mercury or PCBs reduced from urban stormwater (above baseline), as a result of street sweeping in year of interest
$Base_{Streets}$	=	Average annual mass of total mercury or PCBs diverted from Bay Area stormwater due to street sweeping in baseline year(s)
$Current_{Streets}$	=	Mass of total mercury or PCBs diverted from Bay Area stormwater due to street sweeping in year of interest

and;

$$\mathbf{Base_{Streets}} = Streets_{BaseMass} \bullet Streets_{\%Sed} \bullet Streets_{BaseVol} \bullet F$$

$$\mathbf{Current_{Lamps}} = Streets_{CurrentMass} \bullet Streets_{\%Sed} \bullet Streets_{CurVol} \bullet F$$

where:

$Streets_{BaseMass}$	=	Average (or measured) concentration of mercury or PCBs in street sweeping sediments collected in baseline year(s)
$Streets_{BaseVol}$	=	Average volume of street sweeping material collected in baseline year(s)
$Streets_{CurrentMass}$	=	Average (or measured) concentration of mercury or PCBs in street sweeping materials collected in year of interest
$Streets_{CurrentVol}$	=	Volume of street sweeping material collected in year of interest
$Streets_{\%Sed}$	=	% of "sediment" (by volume) in street sweeping material that has constituent PCBs or mercury attached
F	=	Factor for converting street sweeping sediment volume to dry mass

Assumptions and Data Inputs

Baseline Loads Reduced (2003)

- Concentration of Mercury/PCBs in Street Sweeping Sediment in Baseline Years ($Streets_{BaseMass}$) – "Average" concentrations (also called typical concentration values) of PCBs and mercury in street sweeping sediments have been developed through a combination of studies in Contra Costa (EOA 2007), Alameda (Salop and Akashah 2004) and Solano (EOA 2006) counties. Through these studies, pollutant concentrations were compared to sweeper type, land use and age-of-urbanization to determine if significant relationships exist. Based on the results, concentrations of PCBs in street sweeping sediments appear to be dependent upon the very coarse age-of-urbanization categories assigned to cities in Contra Costa and Alameda Counties where street sweeping characterization occurred (Figure 4-1- To be completed). Bay Area age-of-development categories include:
    - Early 20th Century – Represents the earliest and most extensive degree of urbanization/industrialization. May include municipalities where shipping and railways were used extensively for transporting industrial materials. Example cities include Richmond, Hayward, Oakland and Martinez.
    - Mid-Century – Represents the intermediate range in both time and degree of urbanization/industrialization. Example cities include Pinole, Concord, Orinda and Walnut Creek.
    - Late 20th Century – Represents the geographical area with the most recent urbanization. Includes areas where heavy industry never or minimally existed. Example cities include San Ramon, Livermore, Dublin, Brentwood and Clayton.

DRAFT

Other factors appeared to have little to no effect on pollutant concentrations or the particle sizes of sediment collected (EOA 2007). Based on these results, high (75th percentile), average (mean), and low (25th percentile) PCB and mercury concentrations for the three age-of-urbanization categories were developed for use in loads reduced estimates (Table 4-4). To apply these concentrations, Permittees should determine which age-of-urbanization category best fits their municipality based on development patterns and degree of industrialization. Permittees may also choose to use default concentrations of total PCBs (0.094 mg/kg) or mercury (0.14 mg/kg), dry weight, or develop their own average concentrations based on methods similar to those used in Bay Area studies.

Table 4-4. Average (mean), low (25th percentile) and high (75h percentile) estimates for PCBs and mercury in street sweeping material collected by MRP Permittees.

Constituent (mg/kg)	Municipality's Age-of-Urbanization								
	Early 20th Century			Mid-Century			Late 20th Century		
	Low	Ave	High	Low	Ave	High	Low	Ave	High
Total PCBs	0.10	**0.18**	0.22	0.01	**0.03**	0.44	0.01	**0.03**	0.44
Total Mercury	0.17	**0.25**	0.32	0.05	**0.11**	0.14	0.03	**0.05**	0.07

- Average Volume of Street Sweeping Material Collected in Baseline Years ($Streets_{BaseVol}$) - The average volume of street sweeping material collected by Permittees has been reported annually to the Water Board via annual compliance reports for over a decade. Volumes are typically visually estimated by municipal maintenance staff and can be variable from year to year. For each Permittee, the volume of street sweeping material collected from 2000 to 2003 will be used as baseline for the purposes of calculating loads reduced.

Current Loads Reduced (Year of Interest)

- Average (or measured) Concentration of Mercury or PCBs in Street Sweeping Materials Collected in Year of Interest ($Streets_{CurrentMass}$) – Average concentrations of PCBs and mercury in street sweeping sediments based on recent studies are presented in Table 1. These concentrations (or default) concentrations should be used by Permittee as "current" concentrations unless new information is collected. Additionally, average concentrations may be replaced with site specific data collected through field studies.
- Volume of Street Sweeping Material Collected in Year of Interest ($Streets_{CurrentVol}$) - The volume of street sweeping material collected by Permittees should continue to be tracked and reported on an annual basis. To maintain comparability with baseline volumes, volumes should continue to be estimated in a similar manner as in previous years (visually).

Baseline and Current Loads Reduced

- % of Street Sweeping Material that has PCBs or Mercury Attached ($Streets_{\%Sed}$) – It is generally believed that sediment-associated pollutants adsorb to smaller sediment grain sizes due to the increased surface area available. However, it is currently unknown what

DRAFT

grain size fractions in street sweeping material constitute the largest percentage of pollutants. This issue continues to be studied and information gained through future investigation will assist in defining the proportion of street sweeping material which is heavily associated with sediment-associated pollutants. For the purposes of developing loads reduced calculations, information gained through EOA (2007) and Salop and Akashah (2004) were utilized to establish that on average 60% of street sweeping material collected is < 2mm and therefore represents a large portion of the pollutant mass in street sweeping material (CH2MHill 1982, Bannerman 1983, Brinkman 1999, Walker and Wong 1999). (Please note that sweeper technology has also advanced considerably over the past 20 years with the emphasis on designing sweepers to remove fine sediments and associated pollutants, if Permittees acquire sweepers that are believed to be significantly more effective at removing fine sediments, this 60% factor presented here should be reconsidered).

- Factor for Converting Street Sweeping Sediment Volume to Dry Mass (F) – The material collected during street sweeping is typically reported in volumes (cubic yards). However, to calculate pollutant loads reduced, a volume to mass conversion factor must be applied. FEECO International developed volume to mass conversion factors for a variety of waste materials in support of the California Integrated Waste Management Act of 1989. These factors continue to be utilized by the California Integrated Waste Management Board (CIWMB 2003). Although the conversion factors may not be representative of every material collected by every Permittee, they are the best currently available. The volume to mass conversion factor is 918.4 kg per cubic yard (CY) of material collected.

RMP Special Study Proposal: Synthesis of Information on Mercury
Estimated Cost: $75,000
Oversight Group: TRC, CFWG
Proposed by: Jay Davis, SFEI

PROPOSED DELIVERABLES AND TIME LINE

Deliverable	Due Date
Draft outline	December 2010
Draft report	May 2011
Final report	August 2011

BACKGROUND AND JUSTIFICATION

The RMP Mercury Strategy has funded a significant body of work to address the first two questions in the Strategy (listed below). This included three years of intensive monitoring of spatial and temporal patterns in mercury in small fish (a total budget of $450,000), a two-year study of mercury isotopes ($115,000), and a two-year study of passive samplers for aqueous methylmercury – "DGTs" – ($80,000). The results of these studies are either just being evaluated now (isotopes and DGTs) or will be available in December 2010 (the three-year dataset on small fish). In addition, extensive monitoring of other indicators of spatial patterns, temporal trends, fate, and effects have been conducted by RMP and other programs and projects in the last few years. Our state of knowledge has been advancing rapidly.

The RMP Mercury Strategy has articulated management questions to guide a long-term program of studies to support the goal of identifying and reducing high leverage pathways and thereby reducing mercury impairment in the Bay. The studies conducted to date are providing partial answers to some of the questions in the Strategy, but it is clear that we have not yet answered all of them. The optimal next steps to take in answering the questions, however, are unclear. A prudent next step to ensure effective use of RMP funds would be to thoroughly evaluate and synthesize all of the information acquired in the last several years and to use this synthesis as the basis for a plan for the next few years of mercury studies.

The complex biogeochemistry and spatial and temporal dynamics of mercury and especially methylmercury pose a challenge for such a synthesis effort. A large body of information on the various aspects of mercury science has been generated in the Estuary in the past few years. An interdisciplinary approach to the synthesis is called for, with the collaboration of a team spanning the different branches of mercury science. It will be important to include tidal wetlands within the scope of the review, given their potential influence on regional patterns of contamination in the Bay and the potential importance as a zone of methylmercury impact.

APPLICABLE RMP MANAGEMENT QUESTIONS

The most relevant questions for this synthesis are the questions articulated specifically for the Mercury Strategy.

1. Where is mercury entering the food web?
2. Which processes, sources, and pathways contribute disproportionately to food web accumulation?
3. What are the best opportunities for management intervention for the most important pollutant sources, pathways, and processes?
4. What are the effects of management actions?
5. Will total mercury reductions result in reduced food web accumulation?

OBJECTIVES AND APPROACH

The goal of the synthesis effort will be to produce a technical report that answers, to the extent possible, the Mercury Strategy questions based on the information that has accumulated to date. Other questions may also be addressed. Stakeholder input on an outline of the report will be obtained as a first step in the project.

A considerable body of information generated by the RMP and other programs has accumulated in recent years. Some of the datasets to be covered in the review are listed below.

- Status and Trends: RMP (Sport fish, Avian eggs, Sediment, Water), USGS Clapper rail feathers
- RMP Mercury Strategy: Small fish, Isotopes, DGTs
- Effects:RMP/CALFED Avian egg work, USFWS Rail work, Effects on fish
- Fate: RMP (cores, methylmercury budget)
- Loading Studies: Central Valley loads (RMP, Region 5), Small tributaries (loading studies, BMP study), atmospheric deposition (global, local), POTWs (Region 2, WERF, Sacramento regional)
- Wetlands: SBSP, Petaluma, Hamilton, Suisun Marsh, Crissy Field, Twitchell Island

Stakeholder suggestions on additional datasets to include will also be encouraged.

The synthesis will also evaluate progress relative to the Conceptual Model of Mercury in San Francisco Bay developed by Tetra Tech (2006) for the Clean Estuary Partnership.

The findings of this synthesis will be incorporated into an article to be published as in a special issue of a journal featuring synthesis papers for seven major ocean regions as part of the Coastal and Marine Mercury Ecosystem Research Collaborative (C-Merc), sponsored by the Dartmouth College Toxic Metals Superfund Research Program. C-Merc has convened a team of scientists and stakeholders to work together over a two-year period to gather and analyze data and publish a series of papers related to the inputs, cycling, and uptake of mercury in marine ecosystems. The other ocean regions to be covered include the Mediterranean, the tropics, the open ocean, the Gulf of Mexico, the

Gulf of Maine, and the arctic. Other papers on global mercury topics (e.g., mercury isotopes, climate change, health effects) will also be included in the special issue. The RMP effort will benefit from the synergy that comes from sharing and comparing data from San Francisco Bay with data from other parts of the world. The use of RMP funds will be strictly limited to answering the management questions identified by RMP stakeholders. Any work for C-Merc beyond that scope will be funded by SFEI. C-Merc will pay for travel to participate in workshops with other C-Merc authors.

Pollutants of Concern

STORMWATER INSPECTORS' GUIDANCE MANUAL

■ Purpose

The purpose of this manual is to provide guidance to municipal stormwater inspectors on inspecting industrial/commercial facilities for three pollutants of concern, i.e., copper, mercury and Polychlorinated Biphenyls (PCBs)

Organization of Guidance Manual

This manual is organized into five sections:

1. Regulatory Background – This section provides information on the regulations and permits that require agencies to inspect industrial/commercial facilities for the three pollutants of concern (POCs)
2. POC Matrix – This section identifies facilities and potential sources of copper, mercury and PCBs.
3. POC: Copper– This section, identifies facilities and potential copper sources, and identifies BMPs that should be implemented at the facilities. The focus of this section is to meet MRP requirements for copper control BMPs at industrial facilities.
4. POC: Mercury – The focus of this section is to identify products that contain mercury that may be found at industrial and commercial facilities and identify proper disposal/recycling and spill cleanup BMPs.
5. POC: PCBs – This section provides information on PCB regulations, PCB containing equipment, BMPs that should be implemented and guidance on referring facilities to regulatory agencies as appropriate.

PCBs IN CAULK PROJECT
REVISED WORKPLAN

TAKING ACTION FOR CLEAN WATER:
BAY AREA TMDL IMPLEMENTATION

Agreement #09-305-550
between the State Water Resources Control Board
and the Association of Bay Area Governments
(ARRA restart of original Prop 50 grant agreement #09-305-550)

Revision prepared by San Francisco Estuary Partnership, December 2009

Original workplan submitted and approved July 2007

PCBs IN CAULK PROJECT
REVISED WORKPLAN

INTRODUCTION

This workplan describes revisions to activities for the PCBs in Caulk project, which is one part of the San Francisco Estuary Partnership (SFEP)'s grant-funded Taking Action for Clean Water project (Bay Area TMDL Implementation). The original workplan was submitted in July 2007. The revisions to this workplan are based on delays incurred by the state bond freeze and significant progress on the issue of PCBs in caulk since the original workplan submission. The original workplan is included at the end of this document for reference.

The Taking Action for Clean Water project undertakes water quality improvement actions to protect California coastal waters and to implement San Francisco Bay Area TMDLs for sediment, urban pesticides, and polychlorinated biphenyls (PCBs). Taking Action for Clean Water was originally funded by the Proposition 50 Coastal Nonpoint Source Pollution Control Program, and the project commenced in April 2007. California's bond freeze put the project on hold in December 2008. Funding to restart this project has been provided by the American Recovery and Reinvestment Act of 2009 and the Clean Water State Revolving Fund, through an agreement with the State Water Resources Control Board. The PCBs in Caulk Project works to improve management of PCBs that remain in Bay Area structures to prevent release into urban runoff.

The project was originally called the Structural PCBs project. We have changed the name to PCBs in Caulk project for clarity.

BACKGROUND

Elevated PCB levels threaten the health of people and wildlife consuming fish from San Francisco Bay. A TMDL to address PCB impairment of all segments of San Francisco Bay has been adopted by the San Francisco Bay Regional Water Quality Control Board. The San Francisco Bay PCBs TMDL Project Report found that urban runoff was one of the major sources of PCBs loads to the Bay and concluded that controlling PCBs sources in urban runoff was one of two top priorities for TMDL implementation.[1]

Based on this conclusion, the Clean Estuary Partnership (CEP) evaluated available data on sources of PCBs in urban runoff and recommended approaches for addressing two major sources: past PCBs releases that have contaminated soil and sediments and PCB-containing historic building materials, specifically uncontained materials like sealants, caulking and paint.[2] This project builds on the building materials portion of the CEP report.

The CEP report found that when PCB-containing building materials fail or structures in which they occur are remodeled or demolished, PCBs are released onto the ground and can be washed

[2] Larry Walker Associates, TDC Environmental, and Ann Blake (2006). *PCB TMDL Implementation Plan Development*. Prepared for CEP.

off by urban runoff. A survey by the Swiss government of 1,348 buildings constructed between 1950 and 1980 found that almost half of the buildings contained PCBs; almost 10% contained sealants with PCB concentrations exceeding 10% by weight; and that the total PCBs reservoir was an estimated 50-150 metric tons.[3] A less rigorous study was conducted in Boston with similar findings.[4] A Swedish study found that significant quantities of PCBs were released into soil and water runoff during building remodeling.[5]

Management practices have been developed that can prevent PCBs releases from building materials into urban runoff.[6] Both the Swiss and Swedish governments have developed active programs to manage PCB-containing building materials in response to public health concerns (related both to direct exposures and to the adverse effect of PCBs on Europe's fisheries).

PROJECT TEAM AND ROLES

To complete the PCBs in Caulk project, SFEP is partnering with a core project team that includes BASMAA (Bay Area Stormwater Management Agencies Association), the San Francisco Regional Water Quality Control Board, and subcontractors including San Francisco Estuary Institute (SFEI) and TDC Environmental, LLC:

- SFEP will provide project management and coordination, as it does for more than forty projects under a range of local, state, and Federal grants and contracts. SFEP is a project of the Association of Bay Area Governments (ABAG), dedicated to developing and facilitating collaborative regional programs and projects that promote the health of the San Francisco Estuary.
- BASMAA represents and promotes coordinated, consistent stormwater management among urban runoff/stormwater programs for municipalities throughout the Bay Area. BASMAA staff will help coordinate this project with municipal efforts to reduce PCBs in runoff. They will help connect the project to relevant municipal departments such as building permits and inspection. BASMAA staff experience conducting other PCBs studies and projects will inform this project.
- The San Francisco Regional Water Quality Control Board is providing staff input on the project to coordinate with the San Francisco Bay PCBs TMDL and the newly adopted Municipal Regional Permit for Stormwater (MRP, adopted October 14, 2009). The MRP contains stormwater permit regulations for 76 Bay Area municipalities. One requirement of the MRP is for permittees to conduct the same work as outlined in the PCBs in Caulk project, i.e., sample at least ten locations, pilot-test the BMPs, and develop model implementation ordinances or policies.
- SFEI will conduct the scientific assessment of PCB levels in caulk in Bay Area buildings. SFEI is a non-profit organization whose mission is to foster the scientific understanding needed to protect and enhance the San Francisco Estuary and its watershed. Its staff conducts science studies, synthesizes data and information, and collaborates with other scientists to provide a holistic integration of information from many disciplines to support management activities.

[6] Procedures in other languages have been reviewed and will be translated as appropriate.

- TDC Environmental, LLC is an environmental consulting firm that identified the potential for building materials to be a significant source of PCBs in urban runoff. TDC is providing technical support to SFEP and stakeholders to facilitate effective project implementation based on the latest scientific information
- One additional subcontractor (or team of subcontractors) will be brought on to develop best management practices (BMPs) and an implementation process to prevent release of PCBs from building materials into urban runoff.
- SFEP will convene a stakeholder group that will guide the project and review its products.

STAKEHOLDER WORKGROUP

The stakeholder process for the PCBs in Caulk project includes a workgroup convened by SFEP to assist with project implementation: advising on project direction and review of products. The stakeholder group first met in July 2007 with twenty-plus attendees representing:

- BASMAA
- San Francisco Bay Area municipalities
- Port of San Francisco
- San Francisco Bay Regional Water Board
- California Department of Transportation (Caltrans)
- California Department of Toxic Substances Control
- California Integrated Waste Management Board
- California Office of Environmental Health Hazard Assessment
- U.S. EPA Region 9
- Environmental consultants
- Construction industry
- Environmental nonprofits

A core group will continue to meet periodically to provide guidance during key steps of the project. Ongoing participation is anticipated from (but is not limited to) representatives from U.S. EPA, California Department of Toxic Substances Control, local governments, other agencies, building/construction and demolition industry representatives, and building managers. School districts may join the stakeholder group as well.

Stakeholder meeting points in relation to the development of other products can be found on the new project timeline (following).

PROJECT STRUCTURE AND REVISIONS

Project Structure - Original. The original workplan was approved by the State Water Board in July 2007. It described distinct project phases which were intended to run sequentially, with each successive phase beginning after the preceding phase had been completed. Phases included:

1. The "Local Information Phase," in which SFEI would obtain Bay Area specific information on the presence of PCBs in historic building materials, to help target management actions specifically to the structures most likely to contain PCBs that threaten water quality.
2. The "BMP Development Phase," in which the project would develop (BMPs) and a model implementation process (MIP) to prevent release of PCBs from uncontained building materials into urban runoff. Swiss and Swedish management practices would guide development of Bay Area-specific BMPs.
3. The "Pilot Project Phase," in which BMPs would be piloted in 3-5 municipalities.
4. The "Regional Implementation Phase," in which phased implementation throughout the region would be pursued, with a long-term target of achieving a 10% reduction in PCBs stormwater loads to the Bay.[7]

The initial workplan noted that in practice, some overlap might exist between these conceptual phases; for example, some might begin before others are complete.

Rationale for Changes. The PCBs project has been revised several times, due to difficulties encountered early in the original grant period, the bond freeze period of no work on the project, and external events related to PCBs in caulk that affect this project. Issues and resolutions are summarized below.

Issue: An unforeseen obstacle arose early in the grant period: immediate removal and disposal requirements for PCBs in caulk at levels over 50ppm.

- The project team found that since caulk was not explicitly listed as an exempted use under Toxic Substances Control Act, any sampling that found PCBs over 50ppm would trigger a requirement that the PCB-containing material be removed immediately and treated as hazardous waste. Since the project design included testing materials anticipated to contain PCBs at levels that would often far exceed 50ppm, the immediate cleanup and abatement requirements would incur substantial cost and risk for project sampling partners. The project team discussed the original project plans with potential partners, and became concerned that it would be impossible to find partners willing to sample their buildings for PCBs under those conditions.

Resolution: Liability concerns were addressed through approval to use a blind sampling method, and by increasing the focus on an indicator screening technique and reducing direct sampling.

- In July 2008, the Grant Manager (Susan Gladstone of the San Francisco Regional Board) issued direction that blind sampling would be acceptable: buildings could be sampled without reporting GPS coordinates or other exact identifiers of location.

[7] This target is based on information in Larry Walker Associates, TDC Environmental, and Ann Blake (2006).

- A CEP memo[8] developed with the participation of project suggested using a combination of field screening with portable XRF analysis and confirmation sampling with PCBs measurements by an analytical laboratory. Since XRF screening provides an indicator rather than a direct measurement, using XRF would provide some information about potential PCBs levels in Bay Area buildings but would not necessarily trigger cleanup and liability requirements for sampling partners. In addition, the XRF analyzer device could provide a rapid result and was much less expensive than traditional sampling. The project team was working to shift the balance of sampling towards XRF in late 2008, and stakeholders continued investigations during 2009 under non-grant funds.

Issue: California's bond freeze in December 2008 delayed project implementation

Resolution: The project restarted under ARRA funds in August 2009.

- During the bond freeze, no work took place. Between the grant initiation and the restart, there were numerous turnovers among project staff and stakeholders. Bringing new staff up to speed took time. The project subcontracts also had to be renegotiated.
- The delay also benefited the project in some ways:
    - The project got some external support when the San Francisco Regional Water Board adopted the Municipal Regional Permit (MRP) for Stormwater (October 14, 2009). The MRP (Provision C.12.b) requires its 76 permittees to conduct the same tasks as outlined in this project. This requirement should help reduce the difficulty in finding sampling partners. The MRP requires permittees to implement sampling and analysis at 10 sites around the Bay Area, and to pilot test BMPs at 5 sites around the Bay Area.
    - U.S. EPA began outreach to distribute information about PCBs in caulk in schools. The presence of PCBs in building materials is becoming a widely recognized issue with a higher profile than it had at the start of the project. In September 2009, EPA launched a major campaign for building owners and facilities managers—particularly those at school districts—to test for and manage PCBs in caulk. The increased visibility may help the project team partner with interested school districts or other entities to pilot sampling and BMPs, and renews EPA's commitment to the project.

Project Structure Revisions. The project structure is now reframed from sequential phases to concurrent execution of the Local Information and BMPs Development phases, followed by the Pilot Project phase. The attached project timeline illustrates the sequence and timing of the various steps included in the project.

The original sequential structure included a "go/no-go decision" after Phase 1 (Local Information Phase), intended to ensure that enough PCBs in caulk were found locally to justify the pursuing the remaining project phases. The project team met before the bond freeze to discuss concerns about project timing, and with approval from Grant Manager Susan Gladstone decided that a go/no-go decision was not needed in light of the dramatic increase in work and literature on PCBs in caulk in the three years since the original project proposal, including numerous high-profile remediation projects on the East Coast and guidance from U.S. EPA. Based on this

[8] TDC Environmental, SFEI, et al. (2007). *First Phase Support Information for PCB Portion of Taking Action for Clean Water Grant*. Prepared for CEP.

information it appears safe to assume that PCBs are present in caulking in Bay Area buildings. The Local Information Phase remains in the project, but its purpose is to inform development of management practices by obtaining as much detailed local information as possible about what types of buildings, materials, etc. contain caulking with PCB levels of concern. The revised project structure now has the BMPs and model implementation process being developed concurrently with the local information phase.

In the current organization, implementation trials are scheduled to begin after the BMPs and model implementation process have been developed and been reviewed by the stakeholder group. Restructuring the project allows for maximum time/ flexibility to conduct implementation trials. The economic slowdown has reduced the pace of demolition/renovation activities, so getting started on BMP development earlier allows us to be more opportunistic in seeking sites.

The Regional Implementation Phase has been eliminated from the project because it would not be possible to complete under the remaining time in the grant. The project will prepare for phased regionwide implementation by providing technology transfer to municipalities and appropriate parties and stakeholders. The project team, including BASMAA and the San Francisco Regional Water Quality Control Board, will be involved in discussions regarding next steps for the project after the grant period is completed, including feasibility of regionwide implementation.

In December 2009, SFEP requested extension of the final deadlines from June 2011 to December 2011. These revised end dates will allow meaningful trials of the BMPs developed in earlier phases of the project. The dates listed in the Project Schedule and Deliverables section below are these proposed dates. Some project deadlines have been moved earlier, such as the draft and revised BMPs and draft and revised implementation process.

The project concludes with a final report from SFEI, training materials and technology transfer, and an effectiveness evaluation as part of the final project report by SFEP.

PROJECT ACTIVITIES AND TASKS

Specific project tasks are listed below. These are taken from the grant agreement and are identified by grant task number.

7.5 Decrease Polychlorinated biphenyl (PCB) Contamination in Urban Runoff

7.5.1 Workplan Revision

7.5.1.1 Revise workplan and submit to Project Manager for review.
[this document]

7.5.1.2 Complete final workplan in accordance with Project Manager comments.

7.5.2 Obtain Bay Area specific estimates on PCB loadings to urban runoff from historic building materials.

7.5.2.1 Define procedures to identify structures that contain PCBs in their building materials.

7.5.2.2 Conduct field sampling and chemical analysis, as possible.

7.5.2.3 Analyze data and estimate PCB loadings from representative types of structures.

7.5.2.4 Produce draft report and submit for Project Manager review.

7.5.2.5 Complete final report in accordance with Project Manager comments.

7.5.3 Develop written BMP's and Model Implementation Process

7.5.3.1 Convene stakeholder implementation work group comprised of partner representatives, municipal staff, and regulatory agency staff tasked with providing guidance and reviewing drafts of Project deliverables.

7.5.3.2 Research existing regulatory controls/policies related to managing wastes and hazardous materials during building demolition/remodeling programs.

7.5.3.3 Develop proposed best management practices (BMPs) to reduce or prevent discharge of PCBs during building demolition/remodeling. The BMPs will focus on methods to identify PCB-containing building materials and properly manage those materials through aspects such as handling, containing, transport, and disposal. Provide draft BMPs to work group and Project Manager for review.

7.5.3.4 Finalize BMPs in accordance with comments received and submit to Project Manager.

7.5.3.5 Develop implementation process and define circumstances that would trigger BMP implementation including model municipal regulatory controls/policies/ordinances. Develop training materials, including checklist(s), for building inspectors or other municipal staff who will be implementing BMPs. Provide implementation process and training materials to work group and Project Manager for review.

7.5.3.6 Revise implementation process, training materials, and checklist(s) in accordance with comments received and submit to Project Manager.

7.5.4 Implement up to five (5) trials using the BMPs and implementation process developed.

7.5.4.1 Identify up to five (5) municipalities willing to work with Project staff and Bay Area Stormwater Management Agencies Association (BASMAA) to perform trials of the implementation process and BMPs, as possible.

7.5.4.2 Implement trials to test and evaluate the BMPs and implementation process, as possible.

7.5.4.3 Include status reports on trials in quarterly progress reports.

7.5.5 Prepare for phased region-wide BMP implementation by providing technology transfer to municipalities and other appropriate parties and stakeholders.

7.5.5.1 Revise BMPs implementation process, and training materials based on the lessons learned during the work item 7.5.4 trials. Provide revised BMPs and implementation process to work group and Project Manager for review.

7.5.5.2 Finalize revised BMPs, implementation process, and training materials in accordance with comments received and submit to Project Manager.

7.5.5.3 To prepare for phased region-wide implementation, provide technology transfer to municipalities and other appropriate parties and stakeholders. Submit technology transfer materials to Project Manager.

7.5.6 Conduct effectiveness evaluation in accordance with PAEP and submit to Project Manager.

PROJECT SCHEDULE AND DELIVERABLES

The table below reflects the project schedule and deliverables listed in the grant agreement (with date modifications as proposed). SFEP submitted proposed modifications of several due dates in the contract to the Grant Manager in early December 2009. The request included moving out the final deliverables from June 2011 to December 2011. The additional six months are needed to allow for meaningful trials of the BMPs developed in the early phases of the project. Though enrolling project partners is no longer impossible, it will likely remain difficult, since partners will incur additional costs and liability concerns. The additional time will also help us make robust efforts to secure sampling partners.

The vision for the project is to create a foundation for a majority of Bay Area cities to adopt ordinances or policies requiring the use of the BMPs and implementation process developed in this pilot. We believe the date modifications are essential to creating BMPs which can provide meaningful reductions in PCB loading to San Francisco Bay under the PCBs TMDL and which also can be adopted widely in the future rather than shelved because they are considered overly onerous.

Item	DESCRIPTION	ESTIMATED DUE DATE
SCOPE OF WORK		
7.5.1.1	Draft and Final Workplans - Revision	December 2009
7.5.2.4	Draft Report on PCBs in building materials	September 2010
7.5.2.5	Final Report on PCBs in building materials	November 2011
7.5.3.3 7.5.3.4	Draft and Final Preliminary BMPs for PCBs in building materials	September and October 2010
7.5.3.5 7.5.3.6	Draft and Final Preliminary implementation process; model regulatory controls and/or policies; training materials for PCBs in building materials	October and November 2010
7.5.4.3	Status reports on PCB implementation trials	Quarterly
7.5.5.1 7.5.5.2	Draft and Final Revised BMPs, implementation process, training materials for PCBs	September and October 2011
7.5.5.3	Technology transfer materials for PCBs	November 2011
7.5.6	Effectiveness evaluation	December 2011

PROJECT EVALUATION

The Project Assessment and Evaluation Plan (May 2007) provides a plan for evaluating project successes. Evaluation is based on both output and outcome indicators. Output indicators are designed to provide low-cost, easy to measure, quick-response tracking of project activity levels. Outcome indicators involve monitoring of environmental and other types of data that link directly to the goals of each TMDL being implemented. SFEP will report on output indicators in each quarterly project report. Outcome indicators will be assessed at the end of the project; the project outcome evaluation will be included in the in the final project report.

CONCLUSION

This concludes the revised workplan. The original workplan narrative and timeline graphics are included next for reference.

STRUCTURAL PCBs PROJECT WORKPLAN

INTRODUCTION

This is a workplan for the polychlorinated biphenyls (PCBs)-related actions that comprise a portion of a larger San Francisco Estuary Project (SFEP) grant-funded program, the Taking Action for Clean Water Project. The Taking Action for Clean Water Project will implement water quality improvement actions to protect California coastal waters with Proposition 50 Coastal Nonpoint Source funding. Among the actions to be implemented under the Taking Action for Clean Water Project are activities to improve management of PCBs that remain in Bay Area structures to prevent release into urban runoff; these actions are called the "Structural PCBs Project."

PROJECT OVERVIEW

Background. Elevated PCB levels threaten the health of people and wildlife consuming fish from San Francisco Bay. A TMDL to address PCB impairment of all segments of San Francisco Bay is in development. The San Francisco Bay PCBs TMDL Project Report found that urban runoff was one of the major sources of PCBs loads to the Bay and concluded that controlling PCBs sources in urban runoff was one of two top priorities for TMDL implementation.[1]

Based on this conclusion, the Clean Estuary Partnership (CEP) evaluated available data on sources of PCBs in urban runoff and recommended approaches for addressing past PCBs releases that have contaminated soil and sediments and PCB-containing historic building materials, specifically uncontained materials like sealants, caulking and paint.[2] This project builds on the structural PCBs portion of the CEP report.

The CEP report found that when PCB-containing building materials fail or structures are remodeled or demolished, PCBs are released onto the ground and can be washed off by urban runoff. A survey by the Swiss government of 1,348 buildings constructed between 1950 and 1980 found that almost half of the buildings contained PCBs; almost 10% contained sealants with PCB concentrations exceeding 10% by weight; and that the total PCBs reservoir was an estimated 50-150 metric tons.[3] A less rigorous study was conducted in Boston with similar findings.[4] A Swedish study found that significant quantities of PCBs were released into soil and water runoff during building remodeling.[5]

Management practices have been developed that can prevent PCBs releases from structural materials into urban runoff.[6] Both the Swiss and Swedish governments have developed active programs to manage PCB-containing building materials in response to

public health concerns (related both to direct exposures and to the adverse effect of PCBs on Europe's fisheries).

Project Team. To complete the Structural PCBs Project, SFEP will partner with BASMAA (Bay Area Stormwater Management Agencies Association) and the San Francisco Estuary Institute (SFEI) to develop and implement a best management practices (BMPs)-based source reduction program to prevent release of PCBs from building materials into urban runoff. TDC Environmental, LLC is providing technical support to SFEP and stakeholders to facilitate effective project implementation based on the latest scientific information. SFEP will convene a stakeholder group that it will engage in the project.

Four Project Phases. The Structural PCBs Project will be implemented in four phases.

- In the first phase (the "Local Information Phase"), the San Francisco Estuary Institute will obtain Bay Area specific information on the presence of PCBs in historic building materials. Obtaining Bay Area-specific information will allow management actions to be targeted specifically to the structures most likely to contain PCBs that threaten water quality.
- Using the Swiss and Swedish management practices as a guide, the Taking Action for Clean Water Project will partner with the Bay Area Stormwater Management Agencies Association (BASMAA) and its member cities to develop Bay Area-specific best management practices (BMPs) and a model implementation process (MIP) to prevent release of PCBs from unregulated, uncontained building materials (such as sealants and paints) into urban runoff (the "BMP Development Phase").
- In the "Pilot Project Phase," BMPs will be piloted in 3-5 municipalities.
- Subsequently, regionwide phased implementation will be pursued (the "Regional Implementation Phase"), with a long-term target of achieving a 10% reduction in PCBs stormwater loads to the Bay.[7]
- At the end of the grant-funded portion of the project, SFEP will evaluate project outcomes and complete a final project report.

Please note that some overlap may exist between these phases; for example, SFEP and its partners may begin working with potential sites for the pilot phase of the project before the BMP Development Phase is complete. The attached **Structural PCBs Project Overview** figure provides the framework for the project, lays out the overall project schedule, and shows how the project relates to pre-project activities funded by other agencies.

[7] This target is based on information in Larry Walker Associates, TDC Environmental, and Ann Blake (2006).

PROJECT ACTIVITIES AND TASKS

Specific project tasks are listed below. These are taken from the grant agreement and are identified by grant task number.

6.1 Develop Workplan for Task 6 *[This document]*
- 6.1.1 Prepare draft workplan and submit for Grant Manager review and approval.
- 6.1.2 Complete final workplan in accordance with Grant Manager comments.

6.2 Obtain Bay Area specific information on PCB loadings to urban runoff from historic building materials.
- 6.2.1 Define procedures to identify structures that contain PCBs in their building materials.
- 6.2.3 Conduct field sampling and chemical analysis.
- 6.2.4 Analyze data and estimate PCB loadings from representative types of structures.
- 6.2.5 Produce draft report and submit for Grant Manager review and approval.
- 6.2.6 Complete final report in accordance with Grant Manager comments.

6.3 Develop written BMP's and Model Implementation Process
- 6.3.1 Convene stakeholder implementation work group comprised of partner representatives, municipal staff, and regulatory agency staff tasked with providing guidance and reviewing drafts of project deliverables.
- 6.3.2 Research existing regulatory controls/policies related to managing wastes and hazardous materials during building demolition/remodeling programs. Task may include review of regulations re: PCBs in solid waste.
- 6.3.3 Develop proposed best management practices (BMPs) to reduce or prevent discharge of PCBs during building demolition/remodeling. The BMPs will focus on methods to identify, handle, contain, transport, and properly dispose of PCB-containing building materials. Task may include collecting and reviewing existing dust control BMPs. Provide draft BMPs to work group and Grant Manager for review.
- 6.3.4 Finalize BMPs in accordance with comments received and submit for Grant Manager approval.
- 6.3.5 Develop implementation process to define circumstances that would trigger BMP implementation including model municipal regulatory controls/policies. Develop training materials, including checklist(s), for building inspectors or other municipal staff who will be implementing BMPs. Provide implementation process and training materials to work group and Grant Manager for review.

OLD

045969

6.3.6 Revise implementation process, training materials, and checklist(s) in accordance with comments received and submit for Grant Manager approval.

6.4 Implement three (3) to five (5) trials using the BMP's and implementation process developed.

6.4.1 Identify three (3) to five (5) municipalities willing to work with project staff and BASMAA to perform trials of the implementation process and BMPs.

6.4.2 Implement trials to test and evaluate the BMPs and implementation process.

6.4.3 Include status reports on trials in quarterly progress reports.

6.5 Conduct phased region-wide implementation and provide technology transfer to municipalities and other appropriate parties and stakeholders.

6.5.1 Revise BMPs implementation process, and training materials based on the lessons learned during the work item 6.4 trials. Provide revised BMPs and implementation process to work group and Grant Manager for review

6.5.2 Finalize revised BMPs, implementation process, and training materials in accordance with comments received and submit for Grant Manager approval.

6.5.3 Conduct phased region-wide implementation and provide technology transfer to municipalities and other appropriate parties and stakeholders. Task may include providing information to the California Stormwater Quality Association and CalTrans, both of which have construction BMP manuals.

6.6 Conduct effectiveness evaluation in accordance with Project Assessment and Evaluation Plan (PAEP) and submit to Grant Manager.

KEY DECISION POINTS

The project involves an estimated eleven key decision points. Four attached figures (**Structural PCBs Project Key Decision Points**) identify key decisions and their anticipated timing, by project phase, for the entire project.

STAKEHOLDER GROUP

The stakeholder process for the Structural PCBs Project will include a workgroup convened by SFEP to assist with project implementation. The workgroup will meet periodically to provide guidance during key steps of the project. The workgroup is anticipated to include (but is not limited to) representatives from the following organizations and interest groups:

045970

- BASMAA
- San Francisco Bay Area municipalities
- San Francisco Bay Regional Water Board
- California Department of Transportation (Caltrans)
- California Department of Toxic Substances Control
- California Integrated Waste Management Board
- California Office of Environmental Health Hazard Assessment
- U.S. EPA Region 9
- Construction industry
- Environmental nonprofits

The Estuary Project will also involve other stakeholders to the extent appropriate, such as the Bay Area Air Quality Management District, the California Department of Health Services, and Cal –OSHA. The attached **Structural PCBs Project Overview – Key Times for Stakeholder Engagement** figure shows, by calendar quarter, when stakeholder engagement is anticipated. Stakeholder review and input to project work products will also be sought; the attached figure also lists work products for stakeholder input at each project phase.

PROJECT EVALUATION

The Project Assessment and Evaluation Plan (Draft, May 2007) provides a plan for evaluating project successes. Evaluation is based on both output and outcome indicators. Output indicators are designed to provide low-cost, easy to measure, quick-response tracking of project activity levels. Outcome indicators involve monitoring of environmental and other types of data that link directly to the goals of each TMDL being implemented. SFEP will report on output indicators in each quarterly project report. Outcome indicators will be assessed at the end of the project; the project outcome evaluation will be included in the in the final project report.

PROJECT SCHEDULE AND DELIVERABLES

The table on the next page reflects the project schedule and deliverables listed in the grant agreement. The anticipated project schedule shown in the attached figures is somewhat more aggressive than the schedule required by the grant because SFEP would prefer to have as long as possible for the pilot project and regional implementation phases.

Structural PCBs Project Overview

045971

Structural PCBs Project Key Decision Points - Local Information Phase

Go/No-Go Decision

Make a go/no-go decision on proceeding with the remainder of the project. The decision will be made with stakeholder input on the basis of based on preliminary results from SFEI.

Complete: Q4 2007

Note: If "no-go" is the decision, SFEP will consult with the Water Board to determine appropriate use of unspent funds consistent with the purposes of the grant.

Set priorities & identify structures for data collection

Materials to be Sampled
-Select material types to be sampled. This decision will be made with stakeholder input based on review of recommended priorities in the Technical Memorandum for SAP Support, being prepared with CEP funds
-Establish priorities for sample groupings (e.g., ages, structure types). This decision will be made with stakeholder input based on cost and building categorization information in the the Technical Memorandum for SAP Support. Considerations include ability to obtain data to differentiate/group structures, cost, priorities for information for BMP implementation, and priorities for information for load estimation.

Sampling/Analysis Methods
-Select chemical analysis method(s). This decision will be made with stakeholder input based on review of analytical options in the Technical Memorandum for SAP Support. Considerations may include minimum requirements for detection limits, the concentration below which PCBs are "negligible," costs, which laboratory to use (e.g., EBMUD), and priorities for analytical budget (i.e., is a large number of samples with less analytical precision desired, or vice versa).

Sampling Schedule
-Determine if a single or multiple rounds of sampling will be conducted.
-Decide if a contingency should be set aside for sampling in later project phases (e.g., for confirmatory sampling or to support load estimates.)

Sampling Sites
- Identify specific structures that contain target materials & obtain access for sampling. BASMAA and the stakeholder group are anticipated to play a key role in this step.

1. Project Management

1.1 Project Background

Elevated polychlorinated biphenyl (PCB) levels threaten the heath of people and wildlife consuming fish from San Francisco Bay (RWQCB, 2008). A Total Maximum Daily Load (TMDL) to address PCB impairment of all segments of San Francisco Bay was adopted by the San Francisco Bay Regional Water Quality Control Board in February 2008. The San Francisco Bay PCBs TMDL Project Report (RWQCB 2004) found that urban runoff was one of the major sources of PCB loads to the Bay and concluded that controlling sources of PCBs to urban runoff was one of two top priorities for TMDL implementation. Based on this recommendation, the Clean Estuary Partnership (CEP) evaluated available data on sources of PCBs in urban runoff and recommended approaches for addressing two potentially significant sources, past PCBs releases that have contaminated soil and sediments and PCB-containing historic building materials, specifically uncontained materials like sealants, caulking and paint (LWA et al. 2006). When the building materials fail or buildings are remodeled, residues can be transported away from the building during rainstorms, through landscape irrigation overflows, or by pavement washing (forecourts and footpaths surrounding the buildings) and find their way into the stormwater drainage system. In addition, when buildings are demolished, PCBs may be released onto the ground and can be washed off into stormwater drains by rainfall. While these are logical pathways, we lack data to determine which buildings have PCBs at levels that may be concerning, the magnitude of losses to stormwater, or how PCBs in buildings could be better managed.

A survey of 1,348 buildings in Switzerland constructed between 1950 and 1980 found that almost half of the buildings contained PCBs, almost 10% of the buildings contained sealants with PCB concentrations exceeding 10% by weight, and the total PCBs reservoir in Switzerland was an estimated 50-150 metric tons (Kohler et al. 2005). Less rigorous studies have been conducted in Boston (Herrick et al. 2004) and Toronto (Melymuk et al. 2008) with similar findings; however no such evaluation is known for California. A Swedish study also found that significant quantities of PCBs were released into soil and water runoff during building remodeling (Astebro et al. 2000). Both the Swiss and Swedish governments have developed active programs to manage PCB-containing building materials in response to public health concerns, which relate to both direct exposures and the adverse effect of PCBs on Europe's fisheries.

In 2007 the California State Water Resources Control Board awarded the Association of Bay Area Governments (ABAG) a grant that includes several tasks for implementation of Bay Area Total Maximum Daily Loads (TMDLs). The project was halted under the state bond freeze in December 2008 and restarted under the American Recovery and Reinvestment Act of 2009 (ARRA) through the State Revolving Fund in August of 2009. One of the tasks in the master grant is the PCBs in Caulk Project (referred to herein as the Project), which includes characterizing the use of PCBs in historic building materials in the San Francisco Bay Area. The San Francisco Estuary Institute (SFEI) is the subcontractor for Task 7.5.2.2 of SWRCB Agreement No. 09-305-550-01. This Field Sampling and Chemical Analysis Plan (SAP) outlines procedures to be followed by project personnel to insure usability and representativeness of data

collected through the Project implementation. The SAP will be submitted to the State Water Resources Control Board (SWRCB) as part of the work to complete Task 7.5.2.2 of the master agreement, and under Task 1 of SFEI's subcontract under that agreement, which has a term of January 27, 2010 through December 1, 2011.

1.2 Project Description

The objective of this element of the PCBs in Caulk Project is to obtain Bay Area-specific estimates on PCB loadings to urban runoff from historic building materials. While many structures were historically built with a variety of materials known to contain PCBs, including caulking/sealants, grouts, paints, and flame retardant coatings of acoustic ceiling tiles, the focus of this Project is caulking/sealants that were used between rigid components of buildings and other structures. The results from implementing this SAP will inform the development of BMPs for the handling of PCB-contaminated caulking. This SAP contains information on the data-collection phase of the Project, which will obtain Bay Area-specific information on the presence of PCBs in sealants used in historic buildings and other structures.

In collaboration with Bay Area Stormwater Management Agencies Association (BASMAA), the San Francisco Bay Regional Water Quality Control Board (Water Board), and local municipalities, the San Francisco Estuary Institute (SFEI) will test or sample structures that have the potential to contain PCBs in their exterior sealants or caulking (herein referred to as only 'sealants'). Other members of the Project team will identify buildings and secure permission to test a minimum of ten Bay Area structures. Structures to be tested or sampled will be identified based on structure type, year of construction, and whether or not the sealants have been replaced or renovated since the original date of construction. Based on the results of this identification process, and in cooperation with structure owners, this SAP will be implemented to obtain Bay Area-specific information on the PCB content of sealants. As appropriate, data generated from the sampling phase will be used to support BMP development and implementation. All testing and sampling conducted during the above-mentioned activities will be in compliance with this SAP.

It is likely that sealant testing in participating buildings or structures will occur through the use of a portable X-ray fluorescence (XRF) detector to estimate PCB concentrations. If permission is granted, physical sealant samples will be collected from structures and sent to a qualified analytical laboratory for confirmation of PCB content according to the Project Quality Assurance Project Plan (QAPP).

1.3 Project Organization and Responsibilities

The project will make use of the cooperative efforts of several parties involved in the design and implementation of the various components of the project. The main roles and responsibilities are defined below.

1.3.1. SWRCB Project Manager (Kari Holmes, California State Water Resources Control Board)

The SWRCB Project Manager oversees performance of the project agreement and monitors progress of the project. Technical review will be delegated to Jan O'Hara at the San Francisco Bay Regional Water Quality Control Board.

1.3.2 Project Manager (Athena Honore, ABAG/SFEP)

The Project Manager will be responsible for ensuring that all work performed through the Project is consistent with the project proposal and objectives, and for oversight of all efforts associated with the project. Additionally, the Project Manager will act as the liaison between the Contractor and the SWRCB Project Manager.

1.3.3 Contractor (SFEI)

The Contractor will be responsible for all efforts associated with the data collection phase, including SAP and QAPP development, data and sample collection, data management and interpretation, and reporting. The Contractor is also responsible for oversight of the subcontractor performing the laboratory analysis.

1.3.4 Contractor Project Manager (Susan Klosterhaus, SFEI)

The Contractor Project Manager will be responsible for ensuring that testing and sampling personnel adhere to the provisions of the QAPP and SAP. The Contractor Project Manager is also responsible for custody of any samples collected until receipt by the analytical laboratory.

1.3.5 Data Manager (Don Yee or Jay Davis, SFEI)

The Data Manager will be responsible for receipt and review of all project related documentation and reporting associated with laboratory PCB analysis. The Data Manager will serve as the project quality assurance officer and will be responsible for verifying compliance of all analytical data with the requirements established by the Project QAPP before its use for interpretive purposes.

1.3.6 Project Chemist (Francois Rodigari, East Bay Municipal Utility District)

The Project Chemist at the selected analytical laboratory will be responsible for ensuring that the laboratory's quality assurance program and standard operating procedures are consistent with the Project QAPP, and that laboratory analyses meet all applicable requirements or explain any deviations. The Project Chemist will also be responsible for coordinating with the Data Manager and Project Manager as required for the project. All laboratory analyses will be performed by the East Bay Municipal Utility District, Oakland, CA.

1.3.7 Other Collaborators (Bay Area Stormwater Management Agencies Association, SF Bay Regional Water Quality Control Board)

Bay Area Stormwater Management Agencies Association (BASMAA) and Water Board staff will be involved in the design and implementation of the Project. BASMAA and the Water

Board will coordinate their involvement through the Project Manager, and will be given the opportunity to review and comment on all relevant project documents, including, but not limited to, the project QAPP, SAP, and draft and final reports. BASMAA will serve as liaison between the municipalities and the Project Manager by providing summary information about the project and its objectives to the municipalities that may wish to participate in the project. BASMAA will also attempt to identify structures that meet the structure criteria within each municipality that may be available for testing and/or sampling and will attempt to secure permission from structure owners for testing or sampling.

2. Information Sources

2.1 Prior Investigations of PCBs in Sealants

A technical memorandum prepared for the Project summarized the available information on the use of PCBs in building materials (Moran et al. 2007). Based on information from these assessments, the memorandum made a number of recommendations for the Project, including the following:

- The project should focus on (1) caulking and sealants and (2) paints and coatings, with the caulking and sealants being the higher priority building material of the two.
- A combination of field screening with XRF and confirmation sampling with PCB measurements by an analytical laboratory (using gas chromatography-mass spectrometry or GC-MS) should be used in the investigation of PCB content in the building materials.
- The Project should initially focus its efforts on exterior caulking and sealants used in concrete and masonry structures constructed or substantially remodeled between 1957 and 1977. Testing and sampling should be designed to confirm and narrow the construction date range to ensure that the BMPs developed at a later stage in the Project target the appropriate structure types.

2.2 Use of portable X-Ray Fluorescence (XRF) to Estimate PCB Concentrations in Sealants

A pilot study was conducted in 2009 to determine if a portable XRF analyzer, which estimates the elemental composition of a substance (e.g. chlorine or Cl, not PCBs specifically) can be used as a screening tool to estimate PCB concentrations in sealants. In this study, 20 sealant samples were obtained from buildings predicted to have measurable concentrations of PCBs and analyzed for Cl content using XRF and a suite of PCB congeners using gas-chromatography-mass spectrometry (GC-MS). The results indicated that portable XRF may be most useful for ruling out sealants that do not contain high concentrations of PCBs (≥1%). When XRF did not detect Cl (detection limit average ~0.1%), PCBs were present at concentrations less than than ~0.1% in the sealants. However, in general, the pilot study results suggested that use of portable XRF alone is not a good indicator of PCB content due to a high rate of 'false positives'. That is, when XRF detected elevated Cl (~>0.1%), PCBs were present in only ~20% of the samples (i.e. 20% specificity), indicating the presence of other chlorinated compounds in the sealant samples. When PCBs were present, the relationship between XRF measured Cl and GC-MS measured

PCBs was sufficient such that an adjustment factor could be applied to the XRF Cl data to provide a good estimate of PCB content.

In February and March 2010, a preliminary field survey of ~25 Bay Area structures was conducted in which portable XRF was used to screen intact sealants for Cl content. Cl was detected in eight out of the ten structures surveyed that were thought to have been constructed during the time period when PCBs were commonly added to structural sealants; confirmation of construction dates and the status of sealant renovation was not readily available, however. Cl was also detected in at least one location on all three structures known to have been constructed in the 1990s and 2000s and in three out of five structures with unknown construction dates. These results suggest that chlorinated compounds are prevalent in sealants used in Bay Area building structures that were constructed not only during the time period of known PCB use, but also those constructed over the last thirty years, following the PCB ban in the late 1970s.

In addition to the potential high rate of 'false positives', 'false negatives' are also a concern with the use of portable XRF in this application. In the preliminary field survey conducted in 2010, method detection limits (MDLs) for Cl fluctuated between 728 and 12,795 ppm (0.07 to 1.3%), with a mean MDL of 4095 ppm (~0.4%). The cause of the MDL variability is unknown but is thought to be the result of interference with other elements present in the sample and/or matrix effects. In this context, 'false negatives' may occur when PCBs are present at a concentration below the elevated MDL for Cl (~1%) but above the average MDL (~0.4%). Use of a more sensitive portable XRF instrument would likely reduce the average MDL for Cl to 200 ppm, though it is uncertain at this time whether this instrument will be available for use in this Project.

3. Sample Types and Other Data Collection

3.1 Sampling Design

Preliminary information suggests that the primary use of XRF in this Project will be to rule out sealants that do not contain PCBs in concentrations ≥1% (see section 2.2). XRF may therefore be used to rule out structures from which samples will not be collected for analysis of PCBs by GC-MS.

Exterior sealants from a minimum of ten Bay Area structures will be tested for Cl using a portable XRF analyzer. The number of structures and sites selected is based on the requirement in section C.12.b in the Municipal Regional Stormwater NPDES Permit, which this project seeks to implement. Other members of the Project team, in collaboration with SFEI, will identify structures for testing using the criteria outlined in the technical memo (Moran et al. 2007) and secure permission to test them. If permission is granted, physical sealant samples will also be obtained from structures and sent to a qualified laboratory for PCB analysis according to the Project QAPP. Project budget constraints and the number of structures for which permission to sample is received determine the number of structures to be sampled during the Project.

Testing and sampling will focus on structures constructed between 1957 and 1977, the era when structures are most likely to contain PCB in their sealants (Moran et al. 2007) and, to the extent

feasible and supporting data are available, on sealants used on structure exteriors and those that have not been renovated or remodeled since construction. Structures may include, but are not limited to, transportation infrastructure (e.g. roads, bridges, sidewalks) and/or privately- or publicly-owned buildings. An estimate of the volume and surface area of the sealant on the exterior of each structure will also be determined to estimate the total mass of PCBs in the structure's sealants. This information, along with other site characteristics such as imperviousness, slope, and flow paths to the stormwater system, will be used to estimate potential PCB loadings from structural sealants to urban stormwater runoff.

3.2 Portable X-Ray Fluorescence (XRF) Data

A portable XRF analyzer will be used to estimate the concentration of Cl and other trace elements in sealants on each structure selected for inclusion in the Project. Sealants used around windows, at building/walkway interfaces, and in expansion joints between two abutting pieces of concrete will be targeted since sealants in these locations are most likely to contain PCBs (Moran et al. 2007). A preliminary validation study (section 2) indicated that XRF may be a useful screening tool for PCBs in sealants because it detected Cl when PCBs were present at percent levels in sealants and did not detect Cl when PCBs were less than than ~0.1%. XRF analysis can be conducted on either intact sealant or a sealant sample removed from the structure. However, analysis of a sample removed from the structure may be more reliable due to the difficulty of accessing intact sealants with the XRF (i.e. sealant location often prevents flush contact of XRF with the sealant) and the potential for analytical interference due to the presence of unknown materials behind the sealant (e.g. if the sealant thickness is less than the X-ray penetration depth, the presence of mortar or other material behind the sealant may affect the analysis); the extent to which these situations influence the analysis is unknown. In addition to Cl, other elemental data will be collected for possible determination of an elemental 'fingerprint' for PCBs using portable XRF. The pilot study conducted in 2009 (section 2.2) suggested, however, that the existence of a fingerprint is unlikely.

3.3 Sealants

If permission is granted, sealant samples for PCB analysis using GC-MS will be collected from one or more locations on the structure. Collection of one sealant sample per sealant type on each structure is desirable to fully characterize the PCB content in the structure's sealants. Sampling location(s) and procedures for replacement of the sealant will be conducted with concurrence from the municipality or structure owner. Alternatively, sealant samples may be obtained from structures via 'blind' sampling (i.e. not collected by SFEI). This may involve anonymously transmitting the sealant samples and the corresponding structure information (i.e. structure age and other characteristics but not geographical location) to SFEI.

Budget limitations may prevent the analysis of all sealant samples collected. If necessary, the Project team will select a sub-set of samples for PCB analysis using GC-MS once all samples have been collected.

3.4 QC Blanks (Field Blanks)

Collection of sealant field blank samples has been deemed unnecessary due to the difficulty in collection and interpretation of representative blank samples and the use of precautions that minimize contamination of the samples. Additionally, PCBs have been reported to be present in percent concentrations when used in sealants; therefore any low level contamination (at ppb or even ppm level) due to sampling equipment and procedures is not expected to affect data quality because it would be many orders of magnitude lower than the concentrations deemed to be a positive PCB signal.

3.5 QC Samples (Field Duplicates)

Assessment of within-structure variability of PCB concentrations in sealants is not a primary objective of the Project, therefore field duplicate samples will not be collected. Due to budget limitations, GC-MS analysis of only one sealant sample per sealant type on each structure will maximize the number of Bay Area structures and structure types that may be analyzed in the Project. The selected laboratory will conduct a number of quality assurance analyses (see Project QAPP), including a limited number of sample duplicates, to evaluate laboratory and method performance as well as variability of PCB content within a sample.

4. Field Documentation

Proper documentation of testing and sampling locations and methods is important to interpretation of project results. Data documentation at each location will include information recorded on field data sheets and photographic documentation. If permission is granted to collect physical samples of sealants, information will also be recorded on sample labels.

4.1 Field Data Sheets

A field data sheet will be completed for each structure tested ('Structure Information' form) and each sealant type screened on each structure ('Sealant Information' form; see forms in the Appendix). The 'Structure Information' form will include the type of structure (e.g. commercial building, school, etc.), County in which the structure is located, and the date of construction, if known. The 'Sealant Information' form will include the location/function of the sealant on the structure (e.g. around window or between concrete blocks), whether or not the sealant has been renovated since construction, physical characteristics of the sealant (i.e., level of deterioration, color), as well as all XRF tests for chlorine conducted on the sealant. If physical samples of sealant are collected, the sample ID and post-collection XRF chlorine tests will also be recorded on the 'Sealant Information' form. All information will be recorded in permanent ink. Any changes made to the recorded information will be made using single strike-through and will be initialed and dated by the person making the change.

4.2 Photographic Documentation

A photograph of each type of sealant tested or sampled on each structure will be taken. Photographs of the testing and sample collection process may also be taken. Care will be taken to

avoid capturing information in the photo that could be used to identify the structure location; only close-up photos that record the physical appearance/condition of the material and the material function (e.g. sealing cement blocks in a walkway or joining cement blocks in a building) are necessary. The photo number will be recorded on each corresponding testing or sample collection data sheet. All photographs will be stored on the SFEI file server for the project duration.

4.3 Sample Identification

Sealant samples will be assigned unique sample identification codes to provide a method for tracking each sample, and codes will be recorded on sample labels (Appendix). Each sample will be identified by a unique code that indicates the sampling date, structure ID, and sample number. The following is an example of the sample identification code for the samples:

100504-03-1

where: 100504 indicates the sampling date, May 4, 2010;
03 indicates structure #3, which will start at '1' and increase by one in chronological order of sampling;
1 indicates the sample number, which will start at '1' and increase by one consecutively with each sample collected on each structure.

5. Testing and Sampling Procedures

The following section describes the field testing and sampling techniques that will be used in the Project. Procedures for testing sealants using portable X-Ray fluorescence (XRF) and collecting sealant samples are not standardized and minimal detail on sealant sample collection is available in peer-reviewed publications. Sealant sampling procedures were therefore developed in consultation with the XRF company representative and researchers with experience using the XRF on sealants and plastics. Professional judgment was used to develop sealant sample collection methods.

5.1 Sealant Testing and Sampling Procedures

Once a structure has been identified as meeting the selection criteria and permission is granted to perform the testing or collection of sealant samples, an on-site survey of the structure will be used to identify sealants and sealant locations on the structure to be tested or sampled. It is expected that sealants from a number of different locations on each structure may be tested; however, inconspicuous locations on the structure will be targeted for any physical sealant sampling.

5.1.1 Sealant Testing Using Portable X-Ray Fluorescence (XRF)

A portable XRF analyzer (Innov-X Systems, Woburn, MA) will be used as a screening tool to estimate the concentration of chlorine (Cl) and other elements in sealants in many locations on each structure. The analyzer will also be calibrated for Cl using plastic pellet European reference materials (EC680 and EC681) upon first use. The XRF analyzer will be ‘standardized’ using

procedures recommended by the Innov-X representative each time the instrument is turned on and prior to any sealant monitoring. A 30 second measurement in soil/light element analytical program (LEAP) mode will be used. Field personnel will wipe the sealant surface to be sampled with a laboratory tissue to remove any debris that may potentially interfere with the XRF analysis. At least one XRF reading will be collected from each type of sealant present on the structure (e.g., window sealant, joint between concrete blocks, and joint between concrete at base of building and surrounding concrete surface). If Cl is detected, a minimum of two additional readings will be conducted at the same location on the structure to determine analytical variability and at other locations on the structure to determine variability in Cl concentration within sealant type on each structure. The XRF analyzer will record the estimated concentration of a variety of elements in the sealant and the Cl concentration will be recorded on field datasheets. XRF analysis will also be conducted on any sealant samples following their collection from the structure.

5.1.2 Sealant Sampling for Laboratory Analysis

Where permission is granted to collect sealant samples, selection of the appropriate samples to collect will be made at the time of sampling by the Project Manager in consultation with the structure owner. Following XRF analysis on the intact material, a one inch strip (or ~10 g) of the sealant sample will be removed from the structure using a utility knife with a solvent-rinsed, stainless-steel blade. Field personnel will wear Nitrile gloves during sample collection to prevent sample contamination. The sample will be placed on a clean surface, where it will undergo a second XRF analysis. The sample will then be placed in a labeled, laboratory-cleaned glass jar. The samples will be kept in a chilled cooler until returned to SFEI, where the samples will be refrigerated pending delivery under chain-of-custody (COC) to the analytical laboratory. The procedure for replacement of the sealant will be coordinated with each municipality or structure owner.

5.2 Decontamination Procedures

5.2.1 Initial Equipment Cleaning

The sampling equipment that is pre-cleaned includes:

- Glass sample jars
- Utility knife, extra blades
- Stainless-steel spatulas, forceps

Prior to sealant sampling, all equipment will be thoroughly cleaned. Glass sample containers will be factory pre-cleaned (Quality Certified™, ESS Vial, Oakland, CA) and delivered to SFEI at least one week prior to the start of sample collection. Sample containers will be pre-labeled and kept in their original boxes, which will be transported in coolers. Utility knife blades, spatulas, and forceps will be pre-cleaned with Alconox, Liquinox, or similar detergent, and then rinsed with deionized water and methanol. The cleaned equipment will then be wrapped in methanol-rinsed aluminum foil and stored in clean Ziploc bags until used in the field.

5.2.2 Field Cleaning Protocol

Between each use the utility knife blade, spatulas, and forceps will be rinsed with methanol and then deionized water, and inspected to ensure all visible sign of the previous sample have been removed. The clean utility knife, extra blades, spatulas, and forceps will be kept in methanol-rinsed aluminum foil and stored in clean Ziploc bags when not in use.

5.3 Collection of Samples for Archiving

Archive samples will not be collected for this project. The sample size collected will be enough to support additional analyses if QAQC issues arise. Once quality assurance is certified by the QA officer, the laboratory will be instructed to dispose of any leftover sample materials.

6. Sample Handling Procedures

The following protocols were developed to maximize the likelihood that collected samples are representative of the structural sealant's current condition.

6.1 Sample Containers

Where permission is granted, a minimum of one sealant sample will be collected at each structure location. The sealant sample will be transferred into appropriate factory pre-cleaned containers using pre-cleaned forceps.

6.2 Sample Preservation and Storage

At the conclusion of sample processing at each site, all sample containers will be placed in the original container shipping box in a chilled cooler. At the conclusion of each sampling day, all samples will be refrigerated until delivery to the analytical laboratory.

6.3 Sample Custody and Shipment

At appropriate intervals or following the conclusion of sample collection for the Project, samples will be hand-delivered to the analytical laboratory with itemized chain-of-custody (COC) forms. Sufficient sampling information will be recorded in the field that allows tracking sample shipments from field to laboratory and from laboratory through data processing. All samples will be delivered in accordance with laboratory procedures. The following instructions are the most stringent requirements associated with analytical laboratories used for the Regional Monitoring Program for Water Quality in San Francisco Estuary (RMP):

Personnel delivering the samples should ensure COCs (example in Appendix) are filled out completely and legibly and that:

- All samples in shipment are represented on the COC
- All samples on the COC are included in the shipment

- Information on the COC and sample container label (e.g., sample ID, collection date, collection time, analysis) are in agreement
- The COC lists the appropriate project ID and Data Manager
- The COCs are signed by the responsible party

Glass jars holding sealant samples will be transported in the factory provided box. Glass jars will be cushioned to avoid damaging the containers while in transit. The shipping personnel will notify the laboratory in advance of sample delivery. The Project Manager will follow up with the laboratory to verify the shipment was received.

6.4 Laboratory Chain of Custody Procedures

Sample custody transfers to the analytical laboratory at the time of receipt. Upon receipt of the samples, the laboratory sample custodian should first verify sample integrity. Verification should include:

- Presence of custody seal
- Samples at appropriate temperature
- Chain of custody forms in agreement with samples
- Sample containers intact
- Samples labeled appropriately

Any questions on shipments should be brought to the attention of the Project Manager for resolution. Custody procedures followed by the laboratory should then follow laboratory standard operating procedures.

7. Investigation Derived Waste

7.1 Sampling Residuals

Upon completion of the project, the analytical laboratory will dispose of sampling residuals containing ≥50 ppm PCBs following the procedures outlined by the Toxic Substances Control Act (TSCA) for bulk product waste. The disposal of PCB bulk product waste is regulated under 40 CFR § 761.62 of TSCA. Under this provision, PCB bulk product waste must be disposed of in one of two ways: disposal in a permitted solid waste landfill or via a risk-based disposal approval process.

7.2 Personal Protective Equipment

At the conclusion of sampling efforts, field sampling personnel will collect any protective equipment used in the sampling process for appropriate disposal.

7.3 Decontamination Waste

Waste water and methanol produced in the decontamination of the field equipment process will be collected and removed by sampling personnel for proper disposal. No waste water or methanol will be left on-site at the conclusion of sampling.

8. Quality Control for Field Operations

Field personnel will strictly adhere to the Project protocols to ensure the collection of representative, uncontaminated samples. The most important aspects of quality control associated with sample collection are as follows:

- Field personnel will be thoroughly trained in the proper use of sample collection equipment and will be able to distinguish acceptable versus unacceptable samples in accordance with pre-established criteria.
- Field personnel will be thoroughly trained to recognize and avoid potential sources of sample contamination (e.g., uncleaned knife).
- Containers and tools that come in direct contact with the sample will be made of non-contaminating materials (e.g., glass, stainless-steel) and will be thoroughly cleaned between samples.
- Sample containers will be pre-cleaned and of the recommended type
- Field personnel will wear Nitrile gloves and safety eyeglasses when collecting physical sealant samples and cleaning sample collection equipment.

9. Laboratory Analysis

9.1 Laboratory Analytical Methods

Though every effort will be made to collect only those samples which will be analyzed for PCBs, a potential outcome of the project is that, due to budget constraints, not all of the samples collected will be analyzed by the laboratory. The number and types of structures that will be available for collection of sealant samples are not currently known and it is anticipated that not all of the municipalities and/or structure owners may have the opportunity to respond to the request for permission to collect samples prior to the initiation of field sampling. Sampling may therefore occur on an opportunistic basis, potentially resulting in a number of samples that cannot be analyzed for PCBs due to budget constraints (i.e. ‘oversampling’). Samples that represent sealants from a variety of structure types and construction years will be selected for PCB analysis, consistent with project goals.

The samples will be analyzed for PCBs using a modified EPA 8270 protocol (semi-volatile organic compounds by gas chromatography-mass spectrometry). Hold times will follow EPA method 1668 (i.e. one year to extract and one year for extracts if samples and extracts are stored at -10 °C). Samples will be stored in 60 ml or 125 ml wide mouth glass jars until analysis. The minimum sample size is 10 g dry weight. PCB analytical results will be reported as IUPAC congeners. The congener list will include:

- the 40 congeners routinely monitored by the RMP (PCBs 8, 18, 28, 31, 33, 44, 49, 52, 56, 60, 66, 70, 74, 87, 95, 97, 99, 101, l05, 110, 118, 128, 132, 138, 141, 149, l51, 153, 156, 158, 170, 174, 177, 180, 183, 187, 194, 195, 201, and 203),
- PCB 11, a non-Aroclor congener commonly detected in wastewater effluent and environmental samples (Rodenburg et al. 2010),
- the coplanar PCBs 77, 126, and 169, 'dioxin-like' congeners which contribute substantially to the dioxin toxic equivalents observed in San Francisco Bay sport fish.

9.2 Sample Tracking

Sufficient sampling information must be recorded in the field that allows tracking sample shipments from field to laboratory and from laboratory through data processing.

9.3 Data Reporting Requirements

As previously indicated, laboratory personnel will verify that the measurement process was "in control" (i.e., all specified data quality criteria were met or acceptable deviations explained) for each batch of samples before proceeding with the analysis of a subsequent batch. In addition, the laboratory will establish a system for detecting and reducing transcription and/or calculation errors prior to reporting data. Only data that have met data quality criteria, or data that have acceptable deviations explained, will be submitted by the laboratory. When QA requirements have not been met, the samples will be re-analyzed when possible. Only the results of the re-analysis will be submitted, provided they are acceptable.

10. Refinements to the Planned Monitoring

Additional details regarding the planned monitoring will be developed in the future when further information becomes available on realistic sampling sites and scenarios. This will include estimating the numbers of samples anticipated to be sent to a laboratory for PCB analysis during both the characterization and implementation trial phases of the project and associated budget projections (e.g., numbers of samples and associated costs).

The overall objective of the monitoring is to obtain Bay Area-specific information on the presence of PCBs in sealants used in historic buildings and other structures and thereby inform development and testing of BMPs to properly identify, handle and dispose of these materials during renovation and demolition projects. Ancillary objectives may be articulated as further information becomes available, such as developing a relationship between XRF field screening and laboratory analysis results.

8. APPENDIX: ANALYTICAL METHOD FOR PCBS IN SEALANTS 27

1. Project Management

1.1. Project Background

Elevated polychlorinated biphenyl (PCB) levels threaten the heath of people and wildlife consuming fish from San Francisco Bay (RWQCB, 2008). A Total Maximum Daily Load (TMDL) to address PCB impairment of all segments of San Francisco Bay was adopted by the San Francisco Bay Regional Water Quality Control Board in February 2008. The San Francisco Bay PCBs TMDL Project Report (RWQCB 2004) found that urban runoff was one of the major sources of PCB loads to the Bay and concluded that controlling sources of PCBs to urban runoff was one of two top priorities for TMDL implementation. Based on this recommendation, the Clean Estuary Partnership (CEP) evaluated available data on sources of PCBs in urban runoff and recommended approaches for addressing two potentially significant sources, past PCBs releases that have contaminated soil and sediments and PCB-containing historic building materials, specifically uncontained materials like sealants, caulking and paint (LWA et al. 2006). When the building materials fail or buildings are remodeled, residues can be transported away from the building during rainstorms, through landscape irrigation overflows, or by pavement washing (forecourts and footpaths surrounding the buildings) and find their way into the stormwater drainage system. In addition, when buildings are demolished, PCBs may be released onto the ground and can be washed off into stormwater drains by rainfall. While these are logical pathways, we lack data to determine which buildings have PCBs at levels that may be concerning, the magnitude of losses to stormwater, or how PCBs in buildings could be better managed.

A survey of 1,348 buildings in Switzerland constructed between 1950 and 1980 found that almost half of the buildings contained PCBs, almost 10% of the buildings contained sealants with PCB concentrations exceeding 10% by weight, and the total PCBs reservoir in Switzerland was an estimated 50-150 metric tons (Kohler et al. 2005). Less rigorous studies have been conducted in Boston (Herrick et al. 2004) and Toronto (Melymuk et al. 2008) with similar findings; however no such evaluation is known for California. A Swedish study also found that significant quantities of PCBs were released into soil and water runoff during building remodeling (Astebro et al. 2000). Both the Swiss and Swedish governments have developed active programs to manage PCB-containing building materials in response to public health concerns, which relate to both direct exposures and the adverse effect of PCBs on Europe's fisheries.

In 2007 the California State Water Resources Control Board awarded the Association of Bay Area Governments (ABAG) a grant that includes several tasks for implementation of Bay Area Total Maximum Daily Loads (TMDLs). The project was halted under the state bond freeze in December 2008 and restarted under the American Recovery and Reinvestment Act of 2009 (ARRA) through the State Revolving Fund in August of 2009. One of the tasks in the master grant is the PCBs in Caulk Project (referred to herein as the Project), which includes characterizing the use of PCBs in historic building materials in the San Francisco Bay Area. The San Francisco Estuary Institute (SFEI) is the subcontractor for Task 7.5.2.2 of SWRCB Agreement No. 09-305-550-01.

1.2. Project Description

The objective of this element of the PCBs in Caulk Project is to obtain Bay Area-specific estimates on PCB loadings to urban runoff from historic building materials. While many structures were historically built with a variety of materials known to contain PCBs, including caulking/sealants, grouts, paints, and flame retardant coatings of acoustic ceiling tiles, the focus of this Project is caulking/sealants that were used between rigid components of buildings and other structures. The results from implementing this SAP will inform the development of BMPs for the handling of PCB-contaminated caulking. This SAP contains information on the data-collection phase of the Project, which will obtain Bay Area-specific information on the presence of PCBs in sealants used in historic buildings and other structures.

In collaboration with Bay Area Stormwater Management Agencies Association (BASMAA), the San Francisco Bay Regional Water Quality Control Board (Water Board), and local municipalities, the San Francisco Estuary Institute (SFEI) will test or sample structures that have the potential to contain PCBs in their exterior sealants or caulking (herein referred to as only 'sealants'). Other members of the Project team will identify buildings and secure permission to test a minimum of ten Bay Area structures. Structures to be tested or sampled will be identified based on structure type, year of construction, and whether or not the sealants have been replaced or renovated since the original date of construction. Based on the results of this identification process, and in cooperation with structure owners, this SAP will be implemented to obtain Bay Area-specific information on the PCB content of sealants. As appropriate, data generated from the sampling phase will be used to support BMP development and implementation. All testing and sampling conducted during the above-mentioned activities will be in compliance with this SAP.

It is likely that sealant testing in participating buildings or structures will occur through the use of a portable X-ray fluorescence (XRF) detector to estimate PCB concentrations. If permission is granted, physical sealant samples will be collected from structures and sent to a qualified analytical laboratory for confirmation of PCB content according to the this Quality Assurance Project Plan (QAPP).

1.3. Quality Assurance Project Plan Description (QAPP)

This QAPP outlines procedures to be followed by project personnel to insure usability and representativeness of data collected through the Project implementation. The QAPP will be submitted to the State Water Resources Control Board (SWRCB) as part of the work to complete Task 7.5.2.2 of the master agreement, and under Task 1 of SFEI's subcontract under that agreement, which has a term of January 27, 2010 through December 1, 2011.

This QAPP is based largely on the QAPP produced for the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP; Lowe et al. 1999) and the State of California Surface Water Ambient Monitoring Program (SWAMP; Puckett 2002). Though samples collected and analyzed in the Project are very different from those collected by the RMP, the field sampling control and laboratory control procedures contained within this QAPP were

developed to be consistent with those of the RMP to ensure consistency with datasets of potential comparative value, mainly the RMP and other SFEI datasets and the datasets developed by other Bay Area programs collected in conformance with Water Board data requests.

Making environmental management decisions in a scientifically defensible way depends on the sensitivity of the measurement system and the levels of confidence and certainty in the data. The purpose of this document is to maximize the probability that environmental data collected through the Project will meet the expectations of the data users. The Data Quality Objectives (DQOs) presented in this QAPP are intended to maximize the probability that the data actually represent conditions in the environment while minimizing artifacts due to sample collection and processing.

1.4. Project Organization and Responsibilities

The project will make use of the cooperative efforts of several parties involved in the design and implementation of the various components of the project. The main roles and responsibilities are defined below.

1.4.1 SWRCB Project Manager (Kari Holmes, California State Water Resources Control Board)

The SWRCB Project Manager oversees performance of the project agreement and monitors progress of the project. Technical review will be delegated to Jan O'Hara at the San Francisco Bay Regional Water Quality Control Board.

1.4.2 Project Manager (Athena Honore, ABAG/SFEP)

The Project Manager will be responsible for ensuring that all work performed through the Project is consistent with the project proposal and objectives, and for oversight of all efforts associated with the project. Additionally, the Project Manager will act as the liaison between the Contractor and the SWRCB Project Manager.

1.4.3 Contractor (SFEI)

The Contractor will be responsible for all efforts associated with the data collection phase, including SAP and QAPP development, data and sample collection, data management and interpretation, and reporting. The Contractor is also responsible for oversight of the subcontractor performing the laboratory analysis.

1.4.4 Contractor Project Manager (Susan Klosterhaus, SFEI)

The Contractor Project Manager will be responsible for ensuring that testing and sampling personnel adhere to the provisions of the QAPP and SAP. The Contractor Project Manager is also responsible for custody of any samples collected until receipt by the analytical laboratory.

1.4.5 Data Manager (Don Yee or Jay Davis, SFEI)

The Data Manager will be responsible for receipt and review of all project related documentation and reporting associated with laboratory PCB analysis. The Data Manager will serve as the project quality assurance officer and will be responsible for verifying compliance of all analytical data with the requirements established by the Project QAPP before its use for interpretive purposes.

1.4.6 Project Chemist (Francois Rodigari, East Bay Municipal Utility District)

The Project Chemist at the selected analytical laboratory will be responsible for ensuring that the laboratory's quality assurance program and standard operating procedures are consistent with the Project QAPP, and that laboratory analyses meet all applicable requirements or explain any deviations. The Project Chemist will also be responsible for coordinating with the Data Manager and Project Manager as required for the project. All laboratory analyses will be performed by the East Bay Municipal Utility District, Oakland, CA.

1.4.7 Other Collaborators (Bay Area Stormwater Management Agencies Association, SF Bay Regional Water Quality Control Board)

Bay Area Stormwater Management Agencies Association (BASMAA) and Water Board staff will be involved in the design and implementation of the Project. BASMAA and the Water Board will coordinate their involvement through the Project Manager, and will be given the opportunity to review and comment on all relevant project documents, including, but not limited to, the project QAPP, SAP, and draft and final reports. BASMAA will serve as liaison between the municipalities and the Project Manager by providing summary information about the project and its objectives to the municipalities that may wish to participate in the project. BASMAA will also attempt to identify structures that meet the structure criteria within each municipality that may be available for testing and/or sampling and will attempt to secure permission from structure owners for testing or sampling.

1.5 Documentation and Records

All appropriate project-related materials (e.g., field notes, reports, photographs, laboratory reports, etc.) will be delivered to and maintained by the Contractor Project Manager or the Data Manager for the project duration. A discussion of some of the key parts of the documentation process is shown below.

1.5.1 Laboratory Data Reduction and Review

The laboratory analyst who performs the analysis is responsible for reviewing the initial dataset for accuracy and acceptability. Where calculations are not performed by a validated software system, a second reviewer should verify a minimum of 10% of the calculations. The Project Chemist should also check the data report for completeness and errors prior to submission to the Data Manager.

The analytical laboratory will report the analytical data via an analytical report consisting of, at a minimum:

- letter of transmittal
- analytical results in SWAMP format
- quality control results
- chain of custody information
- case narrative
- copies of all raw data

In addition to the printouts supplied by the analytical laboratory, test results should also be delivered to the Data Manager in MS Excel compatible electronic format.

1.5.2 Procedures to Verify Data Integrity

The integrity of the data generated in the laboratory is assessed through the evaluation of the results of the analysis of various quality control (QC) samples by the Data Manager. The numerical criteria for evaluation of these QC samples is specific to the analysis being performed and shall be consistent with laboratory Standard Operating Procedures (SOPs).

1.5.3 Treatment of Outliers

Only data that have met data quality criteria, or data that have acceptable deviations explained, will be submitted by the Project Chemist to the Data Manager. When QA requirements have not been met, the samples will be reanalyzed when possible. Only the results of the reanalysis will be submitted, provided they are acceptable.

1.5.4 Data Management

The Data Manager will review the data deliverables provided by the Project Chemist for completeness and errors. Data will be validated according to this QAPP to ensure that Data Quality Objectives (DQOs) are met. Data will be delivered to the Data Manager or Contractor Project Manager in SWAMP format.

2. Field Sampling

2.1 Sampling Design

Exterior sealants from a minimum of ten Bay Area structures will be tested for Cl using a portable XRF analyzer. The number of structures and sites selected is based on the requirement

in section C.12.b in the Municipal Regional Stormwater NPDES Permit, which this project seeks to implement. Other members of the Project team, in collaboration with SFEI, will identify structures for testing using the criteria outlined in the technical memo (Moran et al. 2007) and secure permission to test them. If permission is granted, physical sealant samples will also be obtained from structures and sent to a qualified laboratory for PCB analysis according to this QAPP. Project budget constraints and the number of structures for which permission to sample is received determine the number of structures to be sampled during the Project.

Testing and sampling will focus on structures constructed between 1957 and 1977, the era when structures are most likely to contain PCB in their sealants (Moran et al. 2007) and, to the extent feasible and supporting data are available, on sealants used on structure exteriors and those that have not been renovated or remodeled since construction. Structures may include, but are not limited to, transportation infrastructure (e.g. roads, bridges, sidewalks) and/or privately- or publicly-owned buildings. An estimate of the volume and surface area of the sealant on the exterior of each structure will also be determined to estimate the total mass of PCBs in the structure's sealants. This information, along with other site characteristics such as imperviousness, slope, and flow paths to the stormwater system, will be used to estimate potential PCB loadings from structural sealants to urban stormwater runoff. Additional information on the sampling design can be found in the 'Field Sampling and Analysis Plan' for the Project.

2.2 Sampling Procedures

Once a structure has been identified as meeting the selection criteria and permission is granted to perform the testing or collection of sealant samples, an on-site survey of the structure will be used to identify sealants and sealant locations on the structure to be tested or sampled. It is expected that sealants from a number of different locations on each structure may be tested; however, inconspicuous locations on the structure will be targeted for any physical sealant sampling.

2.2.1 Sealant Testing Using Portable X-Ray Fluorescence (XRF)

A portable XRF analyzer (Innov-X Systems, Woburn, MA) will be used as a screening tool to estimate the concentration of chlorine (Cl) and other elements in sealants in many locations on each structure. The analyzer will also be calibrated for Cl using plastic pellet European reference materials (EC680 and EC681) upon first use. The XRF analyzer will be 'standardized' using procedures recommended by the Innov-X representative each time the instrument is turned on and prior to any sealant monitoring. A 30 second measurement in soil/light element analytical program (LEAP) mode will be used. Field personnel will wipe the sealant surface to be sampled with a laboratory tissue to remove any debris that may potentially interfere with the XRF analysis. At least one XRF reading will be collected from each type of sealant present on the structure (e.g., window sealant, joint between concrete blocks, and joint between concrete at base of building and surrounding concrete surface). If Cl is detected, a minimum of two additional readings will be conducted at the same location on the structure to determine analytical variability and at other locations on the structure to determine variability in Cl concentration within sealant type on each structure. The XRF analyzer will record the estimated concentration

of a variety of elements in the sealant and the Cl concentration will be recorded on field datasheets. XRF analysis will also be conducted on any sealant samples following their collection from the structure.

2.2.2 Sealant Sampling for Laboratory Analysis

Where permission is granted to collect sealant samples, selection of the appropriate samples to collect will be made at the time of sampling by the Project Manager in consultation with the structure owner. Following XRF analysis on the intact material, a one inch strip (or ~10 g) of the sealant sample will be removed from the structure using a utility knife with a solvent-rinsed, stainless-steel blade. Field personnel will wear Nitrile gloves during sample collection to prevent sample contamination. The sample will be placed on a clean surface, where it will undergo a second XRF analysis. The sample will then be placed in a labeled, laboratory-cleaned glass jar. The samples will be kept in a chilled cooler until returned to SFEI, where the samples will be refrigerated pending delivery under chain-of-custody (COC) to the analytical laboratory. The procedure for replacement of the sealant will be coordinated with each municipality or structure owner.

2.3 Sample Handling and Custody Procedures

Sufficient sampling information must be recorded in the field that allows tracking sample shipments from field to laboratory and from laboratory through data processing and quality assurance. Custody for samples remains with the sampling personnel until time of receipt by the analytical laboratory. Samples will be kept under refrigeration (4 degrees Celsius) until delivery to the laboratory. Samples will be transported to the laboratory in a chilled cooler.

2.4 Field Performance Measurements

Following is a list of field performance measurements that are typically included in sampling protocols.

2.4.1 Field Duplicates

The analysis of field duplicate samples would evaluate within-structure variability of PCB concentrations in sealants, which has not been previously documented. Sealant PCB concentrations have the potential to vary spatially within each structure due to variability in the volume of Aroclor mixture(s) and the type of Aroclor mixture(s) added in each batch of sealant prepared on site during construction.

Assessment of within-structure variability of PCB concentrations in sealants is not a primary objective of the Project, therefore field duplicate samples will not be collected. Due to budget limitations, GC-MS analysis of only one sealant sample per sealant type on each structure will maximize the number of Bay Area structures and structure types that may be analyzed in the Project.

2.4.2 Field Blanks

Collection of sealant field blank samples has been deemed unnecessary due to the difficulty in collection and interpretation of representative blank samples and the use of precautions that minimize contamination of the samples. Additionally, PCBs have been reported to be present in percent concentrations when used in sealants; therefore any low level contamination (at ppb or even ppm level) due to sampling equipment and procedures is not expected to affect data quality because it would be many orders of magnitude lower than the concentrations deemed to be a positive PCB signal.

3. Analytical Methods

3.1 Laboratory Analytical Methods

The samples will be analyzed for PCBs using a modified EPA 8270 protocol (semi-volatile organic compounds by gas chromatography-mass spectrometry). The full analytical method is attached in the Appendix. Hold times will follow EPA method 1668 (i.e. one year to extract and one year for extracts if samples and extracts are stored at -10 °C). Sealant samples will be stored in refrigerators at 4°C in wide mouth glass jars (30, 60, or 125 ml) until analysis. The minimum sample size is 10 g dry weight. PCB analytical results will be reported as IUPAC congeners. The congener list will include:

- the 40 congeners routinely monitored by the RMP (PCBs 8, 18, 28, 31, 33, 44, 49, 52, 56, 60, 66, 70, 74, 87, 95, 97, 99, 101, l05, 110, 118, 128, 132, 138, 141, 149, l51, 153, 156, 158, 170, 174, 177, 180, 183, 187, 194, 195, 201, and 203),
- PCB 11, a non-Aroclor congener commonly detected in wastewater effluent and environmental samples (Rodenburg et al. 2010),
- the coplanar PCBs 77, 126, and 169, 'dioxin-like' congeners which contribute substantially to the dioxin toxic equivalents observed in San Francisco Bay sport fish.

A summary of sampling and analysis specifics are shown in Table 1.

Table 1. Analytical Methods, Hold Times, and Miscellaneous Sampling Information

Matrix	Analyte	Extraction Method	Extraction Hold Time	Analytical Method	Hold Time (after extraction)	Container Type	Min. Sample Weight
Solid	PCBs	EPA 8270	365 days	Modified EPA 8270D	365 days	Glass jar	10 g dry weight

3.2 Data Quality Objectives

Data Quality Objectives (DQOs) and their associated data quality indicators (DQIs, e.g. method blank and matrix spike) for the Project are listed in Table 3 ('Batch QC Requirements) of the Appendix. Information on certified reference materials (CRMs) and the analysis of laboratory

replicate samples is not included in Table 3. A CRM for PCBs in sealants does not exist, therefore a CRM will not be analyzed. Regarding laboratory replicates, a minimum of one per batch of 20 or fewer samples will be analyzed in duplicate and the target performance criteria for these is a relative percent difference (RPD) of <35%. If duplicate samples have a RPD >35%, selected samples may be re-analyzed to investigate variability in PCB concentrations within a sample.

3.3 Analytical and Statistical Control Parameters

3.3.1 Analytical Batches

Samples will be processed in analytical batches, not to exceed twenty samples per any one batch. Laboratory personnel will review the results for the various QA/QC samples immediately following the analysis of each sample batch. These results will then be used to determine when data quality criteria have not been met, and corrective actions will be taken before processing a subsequent sample batch. When data quality criteria are not met, specific corrective actions are required before the analyses may proceed.

3.3.2 Accuracy

Accuracy describes how closely the reported analytical concentration relates to its true environmental value. The "absolute" accuracy of an analytical method can be assessed using Certified Reference Materials (CRMs)[1] only when certified values are available for the analytes of interest. Nevertheless, the concentrations of many analytes of interest may be provided only as non-certified values in some of the more commonly used CRMs. A laboratory fortified sample matrix (commonly called a matrix spike, or MS) and a laboratory fortified sample matrix duplicate (commonly called a matrix spike duplicate, or MSD) will be used both to evaluate the effect of the sample matrix on the recovery of the compound(s) of interest. Therefore, control limit criteria are based on "relative accuracy," which is evaluated for each analysis of the CRM or Matrix Spike by comparison of a given laboratory's values to the "true" or "accepted" and the expected values. In the case of CRMs, this includes both certified and noncertified values. The "true" values are defined as the 95% confidence intervals of the mean.

3.3.3 Precision

The precision of data is a measure of the reproducibility of an analytical measurement when an analysis is repeated. It is reported in Relative Percent Difference (RPD) or Relative Standard Deviation (RSD). Laboratory replicate samples and MS/MSD samples will be run according to the frequency outlined in Table 3 of the Appendix. The Relative Percent Difference (RPD) will be calculated as a measure of precision.

---

[1] Certified reference materials (CRMs) are samples in which chemical concentrations have been determined accurately using a variety of technically valid procedures; these samples are accompanied by a certificate or other documentation issued by a certifying body (e.g., agencies such as the National Research Council Canada (NRCC), US EPA, US Geological Survey, etc.). Standard Reference Materials (SRMs) are CRMs issued by the National Institute of Standards and Technology (NIST), formerly the National Bureau of Standards (NBS).

3.3.4 Sensitivity of the Analytical Method

The method detection limit (MDL) is the ability of a method to distinguish between the analytical noise and the measurement signal and can be used to define the analytical limit of detectability. The MDL represents a quantitative estimate of low-level response detected at the maximum sensitivity of a method.

3.3.5 Completeness

Completeness is defined as "a measure of the amount of data collected from a measurement process compared to the amount that was expected to be obtained under the conditions of measurement" (Stanley and Verner, 1985). Ideally, 100% of the data would be available for interpretation. However, the possibility of data becoming unavailable, for example, due to laboratory error, insufficient sample volume, or samples broken in shipping must be expected. For this project, the target for completeness is 95%.

3.3.6 Representativeness

The representativeness of data is the ability of the sampling locations and the sampling procedures to adequately represent the true condition of the sample sites. Field personnel will strictly adhere to the field sampling protocols to ensure the collection of representative, uncontaminated samples. The most important aspects of quality control associated with chemistry sample collection are as follows:

- Field personnel will be thoroughly trained in the proper use of sample collection equipment and will be able to distinguish acceptable versus unacceptable samples in accordance with pre-established criteria.
- Field personnel will be thoroughly trained to recognize and avoid potential sources of sample contamination (e.g., dirty hands, insufficient field cleaning).
- Samplers and utensils that come in direct contact with the sample will be made of non-contaminating materials (e.g., glass, stainless steel, and/or inert chemical coatings) and will be thoroughly cleaned between sampling stations.
- Sample containers will be pre-cleaned and of the recommended type.

3.3.7 Comparability

Comparability is the degree to which data can be compared directly to other relevant studies. For this investigation, sampling and analytical methods were designed to be comparable to those employed in other studies of PCBs in sealants (references listed in section 1.1 of the 'Field Sampling and Chemical Analysis Plan' for this Project).

4. Laboratory Quality Assurance and Control

4.1 Laboratory Requirements

The analytical laboratory for the Project has the appropriate facilities to store, prepare, and process samples. Moreover, appropriate instrumentation and staff to provide data of the required quality within the project schedule are also required. Laboratory operations must include the following procedures:

- A program of scheduled maintenance of analytical balances, laboratory equipment, and instrumentation.
- Routine checking of analytical balances using a set of standard reference weights (American Society of Testing and Materials (ASTM) Class 3, NIST Class S-1, or equivalents).
- Checking and recording the composition of fresh calibration standards against the previous lot, wherever possible. Acceptable comparisons are < 2% of the previous value.
- Recording all analytical data in bound (where possible) logbooks, with all entries in ink, or electronic format.
- Monitoring and documenting the temperatures of cold storage areas and freezer units once per week.
- Verifying the efficiency of fume hoods.
- Having a source of reagent water meeting ASTM Type I specifications available in sufficient quantity to support analytical operations. The conductivity of the reagent water will not exceed 18 megaohms at 25°C. Alternately, the resistivity of the reagent water will exceed 10 mmhos/cm.
- Labeling all containers used in the laboratory with date prepared, contents, initials of the individual who prepared the contents, and other information, as appropriate.
- Dating and safely storing all chemicals upon receipt. Proper disposal of chemicals when the expiration date has passed.
- Having QAPP, SOPs, analytical methods manuals, and safety plans readily available to staff.
- Having raw analytical data, such as chromatograms, accessible so that they are available upon request. Laboratories will be able to provide information documenting their ability to conduct the analyses with the required level of data quality. Such information might include results from interlaboratory comparison studies, control charts and summary data of internal QA/QC checks, and results from certified reference material analyses. That laboratory should maintain all project related data for a minimum of five years.

4.2 Laboratory Personnel, Training, and Safety

Each laboratory providing analytical support for this project must have a designated on-site QC Officer for the particular analytical component(s) performed at that laboratory. This individual will serve as the point of contact for project staff in identifying and resolving issues related to data quality.

Personnel in any laboratory performing analyses for the project will be well versed in good laboratory practices, including standard safety procedures. It is the responsibility of the particular analytical component project officer, laboratory manager, and/or supervisor to ensure that safety training is mandatory for all laboratory personnel. Each laboratory is responsible for maintaining a current safety manual in compliance with the Occupational Safety and Health Administration (OSHA), or equivalent state or local regulations. The safety manual will be readily available to laboratory personnel. Proper procedures for safe storage, handling, and disposal of chemicals will be followed at all times; each chemical will be treated as a potential health hazard and good laboratory practices will be implemented accordingly.

4.3 Quality Assurance Documentation

The chemical laboratory will be provided with the Project QAPP. In addition, the following documents and information will be current, and will be available to all laboratory personnel participating in the processing of samples:

- Laboratory QA Plan: Clearly defined policies and protocols specific to a particular laboratory, including personnel responsibilities, laboratory acceptance criteria and corrective actions to be applied to the affected analytical batches, qualification of data, and procedures for determining the acceptability of results.
- Laboratory Standard Operating Procedures (SOPs): Containing instructions for performing routine laboratory procedures.
- Laboratory Analytical Methods Manual: Step-by-step instructions describing exactly how a method is implemented in the laboratory for a particular analytical procedure.
- Instrument Performance Information: Information on instrument baseline noise, calibration standard response, analytical precision and bias data, detection limits, etc. This information may be recorded in logbooks or laboratory notebooks or stored electronically.
- Control Charts: Control charts are useful in evaluating internal laboratory procedures and are helpful in identifying and correcting systematic error sources. Contract laboratories are encouraged to develop and maintain control charts whenever they may serve in determining sources of analytical problems.

4.4 Laboratory Performance Audits/Corrective Action

No additional performance audits will be required as part of this Project. However, participation in performance audits or other intercomparison studies are encouraged.

4.5 Laboratory Performance Measurements

Laboratory performance measurements (also known as Data Quality Indicators) are designed to determine whether data quality criteria are met, as defined below.

4.5.1 Method Blanks

Also called laboratory reagent blanks or preparation blanks, method blanks account for contaminants present in the solvents, preservatives, analytical solutions, or other laboratory equipment used during the quantification of the parameter.

4.5.2 Internal Standards

Internal standards account for error introduced by the analytical instrument.

4.5.3 Replicate Samples

Replicate samples of the raw material can be extracted and analyzed to measure laboratory precision or variability of a chemical in the material.

4.5.4 Laboratory Replicate Samples

Laboratory replicate samples are replicates of extracted material that assess the measurement precision.

4.5.5 Matrix Spike Replicate Samples

Matrix spike replicate samples are used to assess both measurement precision and accuracy. They are especially useful when field samples may not contain many of the target compounds because measuring non-detects in replicates does not allow the data reviewer to measure the precision or the accuracy of the data in an analytical batch.

4.5.6 Matrix Spike Samples

Matrix spike samples are field samples to which a known amount of contaminant is added and measured to determine potential analytical interference present in the field sample.

4.5.7 Certified Reference Materials (CRMs)

Analysis of CRMs is another way of determining measurement accuracy, especially if a CRM contains a certified value at concentrations similar to those expected in the samples to be analyzed. These types of samples serve to check if errors are introduced during the analysis process and at what step(s) and at what magnitude(s).

4.6 Laboratory Quality Control Procedures

The performance-based protocols for analytical chemistry laboratories consist of several elements, as follow:

4.6.1 Instrument Calibration

Upon initiation of an analytical run, after each major equipment disruption, and whenever on-going calibration checks do not meet recommended DQIs (Table 3, Appendix), the system will be calibrated with a full range of analytical standards. Immediately after this calibration procedure, the initial calibration must be verified through the analysis of a standard obtained from a source different from the standards used to initially calibrate the instrumentation. This second standard must be prepared independently and should ideally have certified concentrations of target analytes. Frequently, calibration standards are included as part of a run, interspersed with actual samples. However, this practice does not document the stability of the calibration and is incapable of detecting degradation of individual components, particularly pesticides, in standard solutions used to calibrate the instrument. The calibration curve is acceptable if it has a r^2 of 0.990 or greater for all analytes present in the calibration mixtures. If not, the calibration standards, as well as all the samples in the batch must be re-analyzed. All calibration standards will be traceable to a recognized organization for the preparation and certification of QA/QC materials (e.g., National Institute of Standards and Technology (NIST), National Research Council Canada (NRCC), US EPA, etc.).
Calibration curves will be established for each type of analyte and batch analysis from a calibration blank and a minimum of three analytical standards of increasing concentration, covering the range of expected sample concentrations. Only data from quantification within the demonstrated working calibration range may be reported by the laboratory (i.e., quantification based on extrapolation is not acceptable). Alternatively, if the instrument response is linear over the concentration ranges to be measured in the samples, the use of a calibration blank and one single standard that is higher in concentration than the samples may be appropriate. Samples outside the calibration range will be diluted or concentrated, as appropriate, and reanalyzed.

4.6.2 Documentation of Method Detection Limits

The method detection limit (MDL) is the ability of a method to distinguish between the analytical noise and the measurement signal and can be used to define the analytical limit of detectability. The MDL represents a quantitative estimate of low-level response detected at the maximum sensitivity of a method. The Code of Federal Regulations (40 CFR Part 136) gives the following definition: “The MDL is the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.” MDLs will initially be determined according to 40 CFR 136.2 (f) and Appendix B of 40 CFR 136. Determining the MDL with this procedure is elaborate and need not be determined annually provided that:

- No process or method changes have been made.
- Check samples containing an analyte spike at about 2x MDL indicate that the sample is detected. The required frequency of check samples is quarterly. The matrix and the amount of sample (i.e., dry weight of sediment) used in calculating the MDL will match as closely as possible the matrix of the actual field samples and the amount of sample typically used. In order to ensure comparability of results among different laboratories,

target MDL values for the initial chemical analytes have been established for the project. Most are considerably lower than water quality objectives or sediment quality guidelines and provide the foundation for having a high level of certainty in the data.

Laboratories will confirm the ability to analyze low-level samples with each batch. This will be accomplished by analyzing a method blank spiked at 3 to 5 times the method detection limit. Recoveries for organic analyses shall be between 50 and 150% for at least 90% of the target analytes.

4.6.3 Limits of Quantitation

Taylor (1987) states that "a measured value becomes believable when it is larger than the uncertainty associated with it." The uncertainty associated with a measurement is calculated from the standard deviation of replicate measurements of a low concentration standard or a blank. Normally, the MDL is set at three times the standard deviation of replicate measurements, as it is at this point that the uncertainty of a measurement is approximately ±100% at the 95% level of confidence. Values at the MDL may not reflect a signal much above zero and, therefore, are quantitatively not very meaningful. The limit of quantitation (LOQ), as established by the American Chemical Society, is normally ten times the standard deviation of replicate measurements, which corresponds to a measurement uncertainty of ±30% (see Taylor, 1987). By these standard definitions, measurements below the MDL are not believable, measurements between the MDL and LOQ are only semi-quantitative, and confidence in measurements above the LOQ is high. Target MDLs for PCBs in sealant samples are shown in Table 2.

Table 2. Target Method Detection Limits (MDLs) for PCBs in Sealant Samples

Synonym	Analyte	Target MDL (g/kg dry weight)
IUPAC#8	2,4'-DICB	3.6
IUPAC#18	2,2',5-TRCB	6.7
IUPAC#28	2,4,4'-TRCB	1.8
IUPAC#31	2,4',5-TRCB	1.6
IUPAC#33	2',3,4-TRCB	2

IUPAC#209	DECB	5

4.6.4 Record of Certified Reference Material

As CRMs are routinely included in analysis of batches of reputable laboratories, the historical record of results may also serve as a suitable performance indicator.

4.6.5 Routine Analysis of Certified Reference Materials or Laboratory Control Materials

A laboratory control material (LCM) is similar to a certified reference material in that it is a homogeneous matrix that closely matches the samples being analyzed. A “true” LCM is one that is prepared (i.e., collected, homogenized, and stored in a stable condition) strictly for use in-house by a single laboratory. Alternately, the material may be prepared by a central laboratory and distributed to others (so-called regional or program control materials). Unlike CRMs, concentrations of the analytes of interest in LCMs are not certified but are based upon a statistically valid number of replicate analyses by one or several laboratories. In practice, this

material can be used to assess the precision (i.e., consistency) of a single laboratory, as well as to determine the degree of comparability among different laboratories. If available, LCMs may be preferred for routine (i.e., day to day) analysis because CRMs are relatively expensive. As noted in section 3.2, CRMs can not be analyzed in this Project.

4.7 Precision Criteria

Each laboratory is expected to maintain control charts for use by analysts in monitoring the overall precision of the CRM or LCM. Upper and lower control chart limits (e.g., warning limits and control limits) will be continually updated; control limits based on 99% confidence intervals around the mean are recommended. The relative standard deviation (RSD) will be calculated for each analyte of interest in the CRM based on the last 7 CRM analyses. However, as noted in section 3.2, CRMs can not be analyzed in this Project. Precision will be monitored by the analysis of replicate samples and continuing calibration check solutions (Table 3, Appendix).

4.8 Laboratory Replicates for Precision

A minimum of one sealant sample per batch of 20 samples or fewer will be processed and analyzed in duplicate for precision. The relative percent difference between two replicate samples or the relative standard deviation between more than two replicate samples (RPD or RSD respectively) will be less than the DQIs listed in Table 3 of Appendix B for each analyte of interest. Following are the calculations:

$$\text{RPD} = \frac{\text{ABS (rep 1 - rep 2) X 100}}{\text{Average (rep 1, rep 2)}}$$

$$\text{RSD} = \frac{\text{STDEV (all replicate samples) X 100}}{\text{Average (all replicate samples)}}$$

ABS — absolute value
STDEV — standard deviation

If results for any analytes do not meet the DQI for the RPD or RSD, calculations and instruments will be checked. A repeat analysis may be required to confirm the results. Results that repeatedly fail to meet the objectives indicate sample non-homogeneity, unusually high concentrations of analytes, or poor laboratory precision. In this case, the laboratory is obligated to halt the analysis of samples and investigate the source of the imprecision before proceeding. Due to the nature of the samples, sample homogeneity is likely to be the source of such imprecision.

4.9 Accuracy Criteria

Based on typical results attained by experienced analysts in the past, accuracy control limits have been established both for individual compounds and combined groups of compounds (see matrix spike and continuing calibration check solutions, Table 3 in the Appendix). Due to the inherent

variability in analyses near the method detection limit, control limit criteria for relative accuracy only apply to analytes with true values that are >3 times the MDL established by the laboratory.

4.10 Continuing Calibration Checks

Calibration check solutions traceable to a recognized organization must be inserted as part of the sample stream. The source of the calibration check solution shall be independent from the standards used for the calibration. Calibration check solutions used for the continuing calibration checks will contain all the analytes of interest. The frequency of these checks is dependent on the type of instrumentation used and, therefore, requires considerable professional judgment. All organic analyses shall be bracketed by an acceptable calibration check. A calibration check standard shall be run every 12 hours at a minimum.

If the control limits for analysis of the calibration check solution (set by the laboratories) are not met, the initial calibration must be repeated. The calibration check for 90% of the analytes shall not deviate more than ±20% for PCBs. If possible, the samples analyzed before the calibration check solution that failed the DQIs will be reanalyzed following recalibration. The laboratory will begin by reanalyzing the last sample analyzed before the calibration check solution that failed. If the RPD between the results of this reanalysis and the original analysis exceeds precision DQIs (Table 3, Appendix), the instrument is assumed to have been out of control during the original analysis. If possible, reanalysis of samples will progress in reverse order until it is determined that the RPD between initial and reanalysis results are within DQIs. The laboratory will report only the re-analysis results. If it is not possible or feasible to perform reanalysis of samples, all earlier data (i.e., since the last successful calibration control check) are suspect. In this case, the laboratory will prepare a narrative explanation to accompany the submitted data.

4.11 Laboratory Reagent Blanks

Laboratory reagent blanks (also called method blanks, extraction blanks, procedural blanks, or preparation blanks) are used to assess laboratory contamination during all stages of sample preparation and analysis. For PCB analyses, one laboratory reagent blank will be run in every sample batch. The reagent blank will be processed through the entire analytical procedure in a manner identical to the samples. Reagent blanks should be less than the MDL. A reagent blank concentration > 2x the MDL or > 10% of the lowest reported sample concentration for one or more of the analytes of interest will require corrective action to identify and eliminate the source(s) of contamination before proceeding with sample analysis. If eliminating the blank contamination is not possible, all impacted analytes in the analytical batch shall be flagged. In addition, a detailed description of the contamination source and the steps taken to eliminate or minimize the contamination shall be included in the narrative. Subtracting method blank results from sample results is not permitted.

4.12 Surrogates

The usage of the terms “surrogate,” “injection internal standard,” and “internal standard” varies considerably among laboratories. Surrogates are compounds chosen to simulate the analytes of

interest in organics analyses. Surrogates are used to estimate analyte losses during the extraction and clean-up process and must be added to each sample, including QA/QC samples, prior to extraction. Each laboratory must report the percent recovery of the surrogate(s) along with the target analyte data for each sample.

Each laboratory will set its own warning limit criteria based on the experience and best professional judgment of the analyst. It is the responsibility of the analyst to demonstrate that the analytical process is always "in control" (i.e., highly variable surrogate recoveries are not acceptable for repeat analyses of the same certified reference material and for the matrix spike/matrix spike duplicate).

4.13 Internal Standards

For gas chromatography (GC) analysis, internal standards (also referred to as "injection internal standards" by some analysts) are added to each sample extract just prior to injection to enable optimal quantification, particularly of complex extracts subject to retention time shifts relative to the analysis of standards. Internal standards are essential if the actual recovery of the surrogates added prior to extraction is to be calculated. The internal standards can also be used to detect and correct for problems in the GC injection port or other parts of the instrument. The compounds used as internal standards will be different from those used as surrogates. The analyst will monitor internal standard retention times and recoveries to determine if instrument maintenance, repair, or changes in analytical procedures are indicated. Corrective action will be initiated based on the judgment of the analyst. Instrument problems that may have affected the data or resulted in the reanalysis of the sample will be documented properly in logbooks and internal data reports and used by the laboratory personnel to take appropriate corrective action.

4.14 Dual-Column Confirmation

Dual-column chromatography is required for analyses using GC-ECD due to the high probability of false positives arising from single-column analyses. GC-ECD will not be used in this Project, however.

4.15 Matrix Spikes and Matrix Spike Duplicates

A laboratory-fortified sample matrix (a matrix spike, or MS) and a laboratory fortified sample matrix duplicate (a matrix spike duplicate, or MSD) will be used both to evaluate the effect of the sample matrix on the recovery of the compounds of interest and to provide an estimate of analytical precision. A minimum of 5% of the total number of samples submitted to the laboratory will be selected at random for analysis as matrix spikes and matrix spike duplicates. A field sample is first homogenized and then split into three subsamples. Two of these subsamples are fortified with the matrix spike solution and the third subsample is analyzed to provide a background concentration for each analyte of interest. The final spiked concentration of each analyte in the sample will be at least 10 times the MDL for that analyte, as previously calculated by the laboratory. Additionally, the total number of spikes should cover the range of expected concentrations. Recovery is the accuracy of an analytical test measured against a known analyte addition to a sample. Recovery is calculated as follows:

$$\text{Recovery} = \frac{\text{(Matrix plus spike result - Matrix result) X 100}}{\text{Expected matrix plus spike result}}$$

Recovery data for the fortified compounds ultimately will provide a basis for determining the prevalence of matrix effects in the samples analyzed during the project. If the percent recovery for any analyte in the MS or MSD is less than the recommended warning limit of 50 percent, the chromatograms and raw data quantitation reports will be reviewed. If an explanation for a low percent-recovery value is not discovered, the instrument response may be checked using a calibration standard. Low recoveries of matrix spikes may result from matrix interferences and further instrument response checks may not be warranted. This is especially true if the low recovery occurs in both the MS and MSD, and the other QC samples in the batch indicate that the analysis was "in control." An explanation for low percent-recovery values for MS/MSD results will be discussed in the narrative accompanying the data package. Corrective actions taken and verification of acceptable instrument response will be included. Analysis of the MS/MSD is also useful for assessing laboratory precision. The RPD between the MS and MSD results should be less than the target criterion listed in Table 3 of the Appendix for each analyte of interest.

4.16 Field Replicates

The analysis of field replicates and field splits can provide an assessment of both inter-and intra-laboratory precision and variance in the sample matrix at the field site. Field replicates will not be analyzed in this Project (see 'Field Sampling and Chemical Analysis Plan' for more information).

5. Assessments and Project Oversight

5.1 Contractor Quality Control

The Project Manager will ensure that qualified personnel are employed in all phases of project implementation and that all personnel receive appropriate training to complete assigned tasks consistent with project workplans.

5.2 Assessments and Response Actions

No audits of sampling personnel will be required as part of this project. However, before any field sampling is conducted, the Contractor Project Manager will verify that proper equipment is available for all field personnel. This includes sampling equipment, safety equipment, and field measurement equipment (if appropriate). It will also be verified that all personnel involved in field activities have received sufficient training and are able to properly use the equipment and follow procedures. The Project Manager may also verify the application of procedures and equipment periodically. If the Project Manager or Field Program Manager finds any deficiencies, corrective actions will be put in place and reported, and follow-on inspections will be performed to ensure the deficiencies have been addressed.

No audits of analytical laboratories will be performed as part of this project. However, it is

expected that regularly performed audits of the analytical laboratory are conducted through other quality assurance programs (e.g., RMP). The analytical laboratory is responsible for making any corrections needed to address data quality issues relevant to the project and to report these corrective actions to the Data Manager.

5.3 Reports to Management

In addition to the QAPP, the Field Sampling and Chemical Analysis Plan, and reports produced through the implementation of the project, quarterly progress reports will be developed and submitted to the Project Manager by the contractor. These progress reports will document project status, any significant field or laboratory issues, timeliness of scheduled field and analytical activities, any significant QA problems, or other issues, and provide recommended solutions, if applicable.

6. Data Validation and Usability

Data verification and data validation are key steps in the completion of the Project. The Project incorporates the following definitions:

6.1 Data Verification

Data verification is confirmation by examination and provision of objective evidence that specified requirements have been fulfilled. Data verification is the process of evaluating the completeness, correctness, and conformance/compliance of a specific data set against the method, procedural, or contractual requirements.

6.2 Data Validation

Data validation is confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled. Data validation is an analyte-and sample-specific process that extends the evaluation of data beyond method, procedural, or contractual compliance (i.e., data verification) to determine the analytical quality of a specific data set.

6.3 Reconciliation with User Requirements

For laboratory data, when the data are reported to the Data Manager, if there is an outlier, data fails to meet DQIs, or other question arises with the data, the Data Manager is responsible for determining the acceptability of the data in question. Usually, the Project Chemist is contacted directly to resolve any questions. When the Data Manager is satisfied with the accuracy of the laboratory data in question, the data is considered acceptable and may be used as part of the overall dataset.

8. Appendix: Analytical Method for PCBs in Sealants

PCB CONGENERS BY GC/MS

1.0 SCOPE, APPLICATION, AND METHOD CAPABILITIES

1.1 This method is used for the determination of chlorinated biphenyl congeners (PCBs) in sediments, soils, and miscellaneous samples by gas chromatography/mass spectrometry.

1.2 The target analytes and current method detection limit (MDL) values can be reviewed on the Laboratory Service Division web site.

2.0 SUMMARY OF METHOD

2.1 Samples are homogenized and a sub-sample removed for moisture determination.

2.2 Samples (10 g wet weight) are spiked with a surrogate spiking solution and are extracted with 1:1 acetone/dichloromethane using a Dionex ASE extractor (SOP 325).

2.3 The extract is then dried through a sodium sulfate column and concentrated using a J2 Scientific AccuVap. An internal standard is then added to each extract and cleaned up with a one-step GPC.

2.4 An aliquot of the final extract is injected into the gas chromatograph (GC). The analytes are separated by the GC and detected by a mass spectrometer.

3.0 SAMPLE COLLECTION, PRESERVATION AND HOLDING TIMES

3.1 All samples must be iced or refrigerated at <4°C from time of collection until delivery to the laboratory. Store samples in the dark at <-10°C.

3.2 There are no demonstrated maximum holding times associated with the PCBs in solid or other sample matrices. If stored in the dark at <-10°C, solid samples may be stored for up to one year.

4.0 COMMENTS

4.1 Raw data from all blanks, samples, and spikes must be evaluated for interference. Determine if the source of interference is in the preparation and/or cleanup of the samples and take corrective action to eliminate the problem.

4.2 Contamination by carryover can occur whenever high-concentration and low-concentration samples are sequentially analyzed. To reduce carryover, thoroughly wash and rinse glassware, vessels, and syringes between samples. Whenever an unusually concentrated sample is encountered, it

should be followed by the analysis of solvent to check for cross contamination.

5.0 SAFETY

5.1 General laboratory practices for handling organic solvents apply to working with dilute PCB standards. In accordance with Safety SOP 214, use approved eye protection and wear nitrile gloves. Prepare dilutions and spiked samples in a fume hood.

5.2 Chemical and other safety relation information is contained in the Material Safety Data Sheets (MSDS) that are maintained in the Laboratory Library and are available on-line at http://hazard.com/msds/ and http://msds.ehs.cornell.edu/msdssrch.asp.

6.0 INSTRUMENTATION/EQUIPMENT

6.1 Dionex Accelerated solvent extraction (ASE) system- pre-extracted

6.2 Whatman 19.8 mm glass fiber filter (Dionex P/N 047017), or equivalent muffled.

6.3 Aluminum weighing dishes (VWR 25433-008 or equivalent)

6.4 Chromatography columns w/o reservoir, solvent rinsed stopcocks

6.5 Disposable Pasteur pipettes

6.6 Gel-permeation chromatography system - an HPLC pump, an auto sampler, and a fraction collector.

6.6.1 GPC- Chromatographic column- Envirogel GPC Cleanup Column 19mm ID x 300mm Methylene Chloride (WAT036554, or equivalent)

6.7 GC columns- suggested 30 m x 0.25 mm ID 0.25 µm film SPB-octyl capillary column (Supelco 2-4218, or equivalent). Retention time specified in Table 2 must be met prior to performing analyses.

6.8 Automated concentration system – AccuVap Inline & FLX Concentration System or AccuVap EVS

6.9 Perkin Elmer Clarus 500 GCMS, or equivalent, capable of scanning from 50 to 600 amu.

7.0 REAGENTS AND STANDARDS

7.1 Organic-free reagent water - All references to water in this method refer to organic-free reagent water produced by a Millipore Milli-Q system.

7.2 Native congener mix stock solutions for separation of individual congeners on the SPB-octyl column. Purchase Accustandard M1668A-1, M1668A-2, M1668A-3, M1668A-4, M1668A-5, or equivalent. The five solutions, measured individually, allow resolution of all 209 congeners to establish retention times for each congener.

7.3 Individual stock solutions of congeners of interest (Accustandard and Ultra Scientific).

7.4 Internal Standard: Tetrachloro-m-xylene Accustandard S-279-5x

7.5 Surrogate Solution: IUPAC #103 & #198 100ug/mL in isooctane. Accustandard C-103S-TP and C-198S-TP.

7.6 Acetone, methylene chloride and other appropriate solvents - Pesticide quality or equivalent.

7.7 Pelletized diatomaceous earth. Varian 0019-8003 or equivalent. Muffled.

7.8 Sodium sulfate. Muffled.

7.9 Ottawa sand. Muffled.

7.10 Glass Wool. Muffled.

8.0 PROCEDURE

8.1 Instrument Operating Conditions

Initial temperature:	75 °C, hold for 2 minutes
Temperature program:	15 °C/min to 150 °C, 2.5 °C/min to 290 °C, hold 1 min.
Sample volume:	2.5 µL
Injector temperature:	260 °C
Interface temperature:	250 °C
Flow:	1.0 ml/min
Scan Range:	10-62 min at 181-508 amu
Scan Time:	0.35 second

The GC conditions may be optimized for compound separation and sensitivity. Once optimized, the same GC conditions must be used for the analysis of all standards, blanks, and QC samples.

8.2 Preparation of Calibration and Check Standards

8.2.1 Combine and dilute the solutions in section 7.2 to produce at least 5 calibration solutions of the individual PCBs between 50 and 3770 ng/mL or higher if necessary.

8.2.2 A check standard (CCC), containing all congeners of interest is prepared at a concentration of 1000 ng/mL for native compounds and 500 ng/mL for the internal standard and surrogates (IUPAC 103&198).

8.3 Preparation of QC Samples

8.3.1 Spike/LCS standards - Prepare a standard solution containing all the PCBs of interest at concentrations of 1.0 µg/mL. Use 1.0 mL of the 1.0 µg/mL solution for spike blank and matrix spike samples. Use 150 µL for the LCS samples.

8.3.2 Surrogate solution - This solution is added to every sample (client and QC) before extraction. The solution contains congeners 103 and 198 at 0.50 µg/ml. Spike each sample with 1.0 mL.

8.4 Sample Preparation

8.4.1 Samples, duplicates, and matrix spikes are homogenized and a 10 gram subsample is weighed for extraction. Use a smaller sample size if the sample matrix is expected to be dirty or contains very high concentrations of PCBs. An additional subsample of each sediment samples is weighed for% solid determination. The sample for extraction, after weighing, is mixed with pelletized diatomaceous earth until a dry, free-flowing mixture is obtained. This mixture is then placed into an ASE extraction cell. Add the surrogate solution (1.0 mL of 8.3.2) and, if needed, the appropriate amount of spiking standard (8.3.1) to the ASE vessels. Extract the sample with 1:1 acetone/ dichloromethane at elevated temperature and pressure. Total extraction time is ~ 30 min. See SOP 325 for operational details.

8.4.2 The method blank, LCS, and spike blank samples are prepared with 10 grams of muffled Ottowa sand.

8.4.3 The extracts are dried with muffled granular Na_2SO_4.

8.4.4 If an aqueous layer is visible in the extract, slowly add about 16.5 gm of muffled Na_2SO_4 to extract and mix well prior to pouring extract into drying column.

8.4.5 Dried extracts are to be evaporated to dryness and diluted to 2.5 mL of $MeCl_2$ for GPC using an AccuVap.

8.4.6 Prior to GPC, filter the 2.5 mL extract through a 0.45µ PVDF Captiva 3mL columns if necessary.

8.4.7 Add 10 µL of internal standard into every extract. Bring volume to 2.5 mL.

8.4.8 Set up GPC clean-up with inline evaporation per SOP 356.

8.4.9 Remove final extracts promptly upon completion of GPC cleanup and concentration. Replace slit septa caps with crimp caps.

9.0 CALIBRATION

9.1 Mass spectrometer calibration

9.1.1 Supelco SPB-Octyl fused silica capillary column (C/N 24218-U 30m x 0.25mm x 0.25µm film thickness) or comparable should be used.

9.1.2 The GC/MS system must be hardware-tuned to meet the criteria in Table 1 for a 50 ng injection of DFTPP. Analyses should not begin until all these criteria are met. Background subtraction should be straightforward and designed only to eliminate column bleed or instrument background ions.

Table 1
DFTPP Key Ions and Ion Abundance Criteria
(EPA 625 Criteria)

Mass	Ion Abundance Criteria
51	30-60% of base peak of mass 198
68	< 2% of mass 69
70	< 2% of mass 69
127	40-60% of base peak
197	< 1% of mass 198
198	Base peak, defined as 100%
199	5-9% of mass 198
275	10-30% of mass 198
365	> 1% of base peak
441	Present but less than mass 443
442	> 40% of mass 198
443	17-23% of mass 442

9.2 Quantitative analysis

9.2.1 When a compound has been identified, the quantitation of that compound will be based on the integrated abundance of the primary ions (Table 2).

9.2.2 If the %RSD of a compound's relative response factor (initial calibration) is 15% or less, then the concentration in the extract may be determined using the average response factor from the initial calibration data. Alternatively, a linear or quadratic regression with a coefficient of variance >0.998 may be used.

9.2.3 Use the data system to compute the concentration of the analyte in the sample, using an internal standard calibration. Calculate the concentration of the analyte in the initial sample.

Table 2 – Target Analytes, Retention Times, Selected Ions, and References

Compound	Retention Time	m/z	Reference

10.0 QA/QC REQUIREMENTS

10.1 The batch QC Requirements are outlined in Table 3.

10.2 No more than 20 client samples can be included in an analytical batch.

10.3 Compute the percent recovery of the surrogate standard spiking solution using an internal standard calibration method.

10.4 Analyze the method blank immediately after the LCS to analyze freedom from contamination and carryover from the LCS.

Table 3 – Batch QC Requirements

QC Type	Batch Requirement	Acceptance Criteria	Corrective Action
MS tuning check	Prior to analyzing samples	See Table 1 and section 8.5	Retune and adjust the MS
Calibration	Acceptable calibration	RF <20% RSD, or if using 1st or 2nd order regression, =/> 0.998	Correct instrument or standard problem. Recalibrate.
Spike Blank	Fortify at same concentration as MS samples	+/- 30 % recovery	Requires reextraction and reanalysis if more than 10% of the analytes fail to meet acceptance criterion.
Continuing Calibration Check	1 at the beginning of each analytical run, every 12 hrs and at the end of the run. Concentration at cal mid-range.	+/- 20% recovery.	Recalibrate. Rerun with fresh standard if CCC continues to fail. If recoveries are outside of the control limits flag sample with "N".
Low Level Spike Blank (LCS)	1 per batch. Concentration at lowest calibration level.	+/- 50% recovery.	If recoveries are outside of the control limits flag sample with "N".
Method Blank	1 per batch.	Target analytes below MDL.	Reanalyze method blank to confirm. May require re-extraction and reanalysis. Flag detected compounds in samples that are also present in the blank with a "B".

QC Type	Batch Requirement	Acceptance Criteria	Corrective Action
Matrix Spike	1 per batch or 10% of samples. Spike concentration set at the calibration mid-level.	±35% recovery	Flag spiked sample and base with "N", if recoveries are outside control limits.
Matrix Duplicate	1 per batch or 10% of samples.	Acceptance Criteria < 50 % RPD for concentrations > 10 MDL for 90% of analytes	Flag outliers with "*", samples < 10 MDL flagged with a V. Requires re-extraction and re-analysis if more than 10% of the analytes fail to meet the acceptance criterion.

RMP Special Study Proposal: Synthesis of Information on PCBs
Estimated Cost: $53,000
Oversight Group: TRC, CFWG
Proposed by: Jay Davis, SFEI

PROPOSED DELIVERABLES AND TIME LINE

Deliverable	Due Date
Draft outline	December 2010
Draft report	May 2011
Final report	August 2011

BACKGROUND AND JUSTIFICATION

The RMP PCB Strategy Team formulated a PCB Strategy in 2009. The Team recognized that a significant body of new information has been generated since the PCBs TMDL Staff Report was prepared. Some of the important new datasets include:

- Surface sediment data obtained using more accurate analytical methods (high resolution mass spectrometry) and the randomized sampling design
- Water data from the new random design
- Additional trend data from sport fish, bivalves, and bird eggs
- Surprising data from small fish showing higher than expected concentrations
- Additional data suggesting the possibility of toxic effects on avian embryos
- Information on a "new" PCB (PCB 11) that is abundant and ubiquitous
- Information on the entire suite of 209 congeners, now available for several matrices in the Bay

The RMP PCB Strategy has articulated management questions to guide a long-term program of studies to support reduction of PCB impairment in the Bay (see below). The PCB Team recommended two studies to begin addressing these questions. The first recommended study was to take advantage of an opportunity to piggyback on the final year of the three-year small fish mercury sampling in 2010. The second study recommended was a synthesis and conceptual model update based on the information that has been generated since the writing of the TMDL Staff Report. The Team considered this a prudent next step to ensure effective use of RMP funds and to form the basis for a plan for the next few years of PCB studies. The Team outlined the scope for this synthesis effort (see below).

APPLICABLE RMP MANAGEMENT QUESTIONS

The most relevant questions for this synthesis are the questions articulated specifically for the PCB Strategy.

1. What potential for impacts on humans and aquatic life exists due to PCBs?
2. What are appropriate guidelines for protection of beneficial uses?
3. What is the total maximum daily load of PCBs that can be discharged without impairment of beneficial uses?

4. What are the rates of recovery of the Bay, its segments, and in-Bay contaminated sites from PCB contamination?
5. What are the present loads and long-term trends in loading from each of the major pathways?
6. What role do in-Bay contaminated sites play in segment-scale recovery rates?
7. Which small tributaries and contaminated margin sites are the highest priorities for cleanup?
8. What management actions have the greatest potential for accelerating recovery or reducing exposure?
9. What is the most appropriate index for sums of PCBs?

OBJECTIVES AND APPROACH

The goal of the synthesis effort will be to produce a technical report that answers, to the extent possible, the PCB Strategy questions based on the information that has accumulated to date. Other questions may also be addressed. Stakeholder input on an outline of the report will be obtained as a first step in the project.

A considerable body of information generated by the RMP and other programs has accumulated in recent years. Some of the datasets to be covered in the review are listed below.

- Status and Trends: RMP (Sport fish, Bivalves, Avian eggs, Sediment, Water)
- RMP PCB Strategy: Small fish
- Effects:USFWS Avian egg work, UC Davis Effects on fish
- Fate: RMP (cores, multibox model)
- Loading Studies: Central Valley loads (RMP), Small tributaries (loading studies, BMP study), atmospheric deposition (global, local), POTWs (Region 2)

Stakeholder suggestions on additional datasets to include will also be encouraged.

The PCB Team also recommended reviewing and making recommendations related to several other sources of information.

- TMDLs and abatement actions from elsewhere to evaluate lessons learned and whether there are rules or thumb for what works and what doesn't work.
- Information on PCB 11. A related issue is the most appropriate index of total PCBs – whether to include PCB 11 and how many congeners to include in routine measurements and sums.
- The linkage between sediment and sport fish, including an evaluation of why concentrations appear to have declined in bivalves and sediments, but not in sport fish.
- Evaluation of sources using congener profiles.
- Updated estimates of nearshore ambient average concentrations and the inventory of PCBs in various compartments of the Bay ecosystem.
- An update of the Gobas food web model using the new sediment data.
- A review of literature on estuarine degradation rates, which have a large influence on predictions of the rate of recovery of the Bay.

- A review of literature on rates of attenuation of PCB loads from watersheds, which also have a large influence on Bay recovery.

The synthesis will also evaluate progress relative to the report: PCBs in San Francisco Bay: Impairment Assessment/Conceptual Model Report developed by SFEI for the Clean Estuary Partnership (Davis et al. 2006).

Sustainable Conservation

Investor's Circle Update

Dedicated Decade: An Update on the Brake Pad Partnership

From the Bay to the boardroom, the lab to the Legislature, Sustainable Conservation's Brake Pad Partnership has come a long way since its inception over a decade ago. For years, the Partnership – an uncommon alliance of brake manufacturers, stormwater agencies and environmental groups – has worked tirelessly to identify and address the environmental consequences of copper from automobile brake pads. Beyond its specific project scope, the Partnership is a remarkable example of where Sustainable Conservation has been and where we're going.

Copper from automobile brake pads is contributing to the decline of endangered fish such as coho and steelhead by interfering with their ability to identify predators and locate spawning grounds.

COPPER 101

Each time drivers step on their brakes, small amounts of debris are released onto streets, into the air and, eventually, into waterways. No big deal, right? Wrong. California drivers hit their brakes hundreds of millions of times a day – which adds up to a substantial quantity of debris, much of which contains copper. Copper that ends up in streams, rivers and coastal waters is toxic to phytoplankton and disrupts the aquatic food chain. Elevated copper levels are also one of the factors contributing to the decline of salmon populations. What's worse, once copper has been deposited into water, it is extremely difficult – and extremely expensive – to get it out.

High levels of copper are found in urban watersheds across California. Through maximum allowable limits for copper pollution mandated by the State Water Resources Control Board, municipalities within these watersheds are now responsible for taking onerous and costly clean-up measures – and they have to demonstrate significant progress toward compliance by 2018.

Could brake pads be the culprit? Moreover, could they provide the key to an economically viable solution to the problem? Sustainable Conservation set out to investigate.

A COLLABORATIVE APPROACH

Instead of polarizing environmental and industry interests by heading straight to the courtroom, we convinced the various stakeholders to try a

(continued)

"By banning the use of copper in vehicle brake pads, California has the opportunity to again lead the nation in protecting our environment."

Senator Christine Kehoe (D-San Diego), author of Senate Bill (SB) 346

Sustainable Conservation

Investor's Circle Update

An Update on the Brake Pad Partnership

different approach: collaboration. In 1996, Sustainable Conservation convened the Partnership to understand the impact of copper from brake pads on water quality. When joining the Partnership, industry representatives agreed that if science showed copper in brake pads was indeed a significant contributor to water quality degradation, they would voluntarily reduce copper in brake pad formulations.

PIVOTAL OUTCOMES

Over the years that followed, the Partnership conducted rigorous scientific studies to determine the role brake pads play in elevated copper levels within San Francisco Bay Area watersheds. The results of these studies indicate that copper from brake pads accounts for the majority of the human-generated copper in highly urbanized watersheds. With this news, the industry was ready to honor its commitment AND raise the stakes on behalf of the Golden State's environmental and economic health.

NEW DIRECTIONS

By recommending the introduction of state legislation to limit the amount of copper in brake pads, the industry helped steer the Partnership – and Sustainable Conservation – into the policy realm. This initially surprising recommendation ultimately makes great sense: legislation would address environmental and economic concerns by maximizing positive impact on water quality and guaranteeing a level playing field for all brake pad manufacturers. Dynamic solutions are the name of the game at Sustainable Conservation, and the Partnership's willingness to adapt its strategy accordingly speaks to the importance of persistence and flexibility in effecting powerful environmental change.

In early 2009, Sustainable Conservation introduced Senate Bill (SB) 346, authored by Senator Christine Kehoe (D-San Diego), to reduce and eventually remove copper from brake pads sold in California, thereby addressing a serious threat to aquatic health and allowing local governments to meet their obligations under the Clean Water Act. The bill also requires that new brake pads meet all applicable safety and performance standards, and includes provisions to ensure that copper will not be replaced by materials containing other harmful substances.

VICTORY, REGROUPING

SB 346 passed out of the California State Senate on June 3 – a very exciting day! To bolster our chances at success in the State Assembly, the Partnership decided to make SB 346 a two-year bill. For now, the bill is being held in the Assembly Committee on Environmental Safety and Toxic Materials, with the goal of taking it up again in the 2010 legislative session. This additional time will allow the Partnership to further clarify and strengthen the bill, and conduct outreach with and allay concerns for those individuals and organizations currently opposed to the bill (including the car companies). The coming months will also provide an opportunity to formalize implementation and enforcement specifics for the copper reduction program.

THE ROAD AHEAD

Building on a decade of sound science and balanced problem-solving, the Partnership has made extraordinary progress on behalf of California's water quality in 2009. By raising consciousness about the power of our cooperative approach, Sustainable Conservation has already set a positive precedent in the Legislature. In 2010, we hope California will take the next big step by approving and signing SB 346 – a truly collaborative solution to a serious environmental problem. ■

To learn more, visit www.suscon.org/bpp.

After passing out of the California State Senate, SB 346, which aims to effectively eliminate all copper in brake pads sold in California, will go before the State Assembly in 2010.

AMENDED IN SENATE MAY 20, 2009

AMENDED IN SENATE APRIL 23, 2009

AMENDED IN SENATE APRIL 2, 2009

SENATE BILL No. 346

Introduced by Senators Kehoe and Simitian

February 25, 2009

An act to add Article 13.5 (commencing with Section 25250.50) to Chapter 6.5 of Division 20 of the Health and Safety Code, relating to hazardous materials.

LEGISLATIVE COUNSEL'S DIGEST

SB 346, as amended, Kehoe. Hazardous materials: motor vehicle brake friction materials.

(1) Existing law establishes the Department of Toxic Substances Control in the California Environmental Protection Agency, with powers and duties regarding the management of hazardous waste. Existing law, administered by the department, prohibits the management of hazardous waste except in accordance with the hazardous waste control laws, including laws governing the removal of any mercury-containing vehicle light switch from a vehicle, and the regulations adopted by the department. A violation of the hazardous waste control laws is a crime.

046046

The bill, commencing on January 1, 2014, would prohibit the sale of any motor vehicle brake friction materials containing specified constituents in amounts that exceed certain concentrations. The bill, commencing on January 1, 2025, would prohibit motor vehicle brake friction materials exceeding 0.5% copper by weight from being sold in California. The bill, commencing on January 1, 2014, would require all manufacturers of motor vehicle brake friction materials that are sold in this state to obtain a certification of compliance with these requirements from a 3rd-party testing certification agency, and to mark proof of certification on the friction materials. The bill would require a manufacturer of brake friction materials to file a copy of the 3rd-party certification with the department and to pay a reasonable filing fee. A violation of these provisions would be subject to a civil fine of up to $10,000 per violation. Because a violation of these provisions would also be a crime pursuant to the hazardous waste control laws, the bill would impose a state-mandated local program.

(2) Existing law requires the department to adopt regulations to establish a process to identify and prioritize chemicals of concern in consumer products. As part of this process, the department is required to adopt regulations for the evaluation of chemicals of concern in consumer products, including a process for evaluating alternatives.

This bill would direct the department to require vehicle brake manufacturers to comply with the regulations for the department's evaluation of chemicals of concern and, before those regulations are adopted, to ensure that formulations developed to comply with the above content requirements are less harmful to health and the environment.

~~(2)~~

(3) The California Constitution requires the state to reimburse local agencies and school districts for certain costs mandated by the state. Statutory provisions establish procedures for making that reimbursement.

This bill would provide that no reimbursement is required by this act for a specified reason.

Vote: majority. Appropriation: no. Fiscal committee: yes. State-mandated local program: yes.

The people of the State of California do enact as follows:

1 SECTION 1. The Legislature finds and declares all of the
2 following:

046047

(a) Friction materials are an essential component of motor vehicle brake systems and of critical importance to transportation safety and the public safety in general.

(b) Debris from friction materials containing copper in all of its forms, including, but not limited to, elemental copper and all of its alloys and compounds, are generated and released to the surrounding environment in the course of normal brake system operation.

(c) Tens of thousands of pounds of copper and other substances released from brake friction materials enter California's streams, rivers, and marine environment every year.

(d) Copper is toxic to many aquatic organisms, including salmon.

(e) Limits on the copper content of brake friction materials are essential for California cities, counties, and industries to comply with federal Clean Water Act (33 U.S.C. Sec. 1251 et seq.) mandates, including copper water quality standards and copper total maximum daily loads in California's urban watersheds.

(f) Without limits on the copper content of brake friction materials, California taxpayers face billions of dollars in federal Clean Water Act compliance costs.

(g) Changes in the composition of brake friction materials made to comply with copper water quality standards and successfully implement copper total maximum daily loads in California's urban watersheds should meet all applicable safety standards.

SEC. 2. Article 13.5 (commencing with Section 25250.50) is added to Chapter 6.5 of Division 20 of the Health and Safety Code, to read:

Article 13.5. Motor Vehicle Brake Friction Materials

25250.50. For purposes of this article, the following definitions apply:

(a) "Board" means the State Water Resources Control Board.

(b) "Department" means the Department of Toxic Substances Control.

(c) "Motor ~~Vehicle~~ *vehicle*" has the same meaning as "vehicle" is defined in Section 670 of the Vehicle Code.

(d) "Testing certification agency" means an agency approved by the department as qualified and equipped for the certification

046048

of testing of products, materials, equipment, and installations in accordance with nationally recognized standards.

25250.52. On and after January 1, 2025, any motor vehicle brake friction materials exceeding 0.5 percent copper by weight shall not be sold in this state.

25250.54. On and after January 1, 2014, any motor vehicle brake friction materials containing any of the following constituents in an amount that exceeds the following concentrations shall not be sold in this state:

(a) Cadmium and its compounds: 0.01 percent by weight.

(b) Chromium(VI)-salts: 0.1 percent by weight.

(c) Lead and its compounds: 0.1 percent by weight.

(d) Mercury and its compounds: 0.1 percent by weight.

(e) Asbestiform fibers: 0.1 percent by weight.

25250.56. (a) The department shall require vehicle brake manufacturers to comply with *the regulations adopted pursuant to subdivision (a) of* Section 25253 in their development of brake friction materials ~~that comply with Sections 25250.52 and 25250.54~~. In the process of complying with *the regulations adopted pursuant to subdivision (a) of* Section 25253, a manufacturer shall give specific consideration to the cumulative impacts on health and the environment of alternatives that increase the use of nickel, zinc, and antimony.

~~(b) This section does not authorize the department to modify or disregard the requirements in Section 25250.52 or 25250.54.~~

~~(c)~~

(b) Prior to the enactment of regulations implementing Section 25253, a vehicle brake friction material manufacturer shall exercise due diligence to ensure that formulations developed to comply with Sections 25250.52 and 25250.54 are less harmful to health and the environment.

25250.58. The following motor vehicle classes and brakes are exempt from this article:

(a) Military combat vehicles.

(b) Vehicles employing internal closed oil immersed brakes, or a similar brake system that is fully contained and emits no copper, other debris, or fluids under normal operating conditions.

(c) Brakes designed for the primary purpose of holding the vehicle stationary and not designed to be used while the vehicle is in motion.

046049

(d) Motorcycles.

25250.60. (a) Commencing on January 1, 2014, all manufacturers of friction materials used in brakes on new motor vehicles, or as replacement parts, that are sold in this state shall obtain certification from a third-party testing certification agency that each of their formulations for brake friction materials complies with Section 25250.54. A certification shall be valid for no more than three years. Manufacturers shall mark proof of certification on all brake friction materials.

(b) Commencing on January 1, 2025, all manufacturers of friction materials used in brakes on new motor vehicles, or as replacement parts, that are sold in this state shall obtain certification from a third-party testing certification agency that each of their formulations for brake friction materials complies with Sections 25250.52 and 25250.54. A certification shall be valid for no more than three years. Manufacturers shall mark proof of certification on all brake friction materials.

(c) Prior to its products being sold in this state, a manufacturer of friction materials used in brakes on new motor vehicles, or as replacement parts, shall file a copy of the third-party certification of each of its brake friction materials formulations with the department. The department shall charge a reasonable filing fee upon the filing of a copy.

(d) Manufacturers of friction materials used for brakes on new motor vehicles, or as replacement parts, may obtain certification of compliance with the requirements of Section 25250.52 or ~~Section~~ 25250.54 at any time prior to the dates specified in those sections.

(e) The department, in consultation with all interested parties, and on or before January 1, 2012, shall develop all certification and marking criteria required pursuant to this section.

(f) Commencing on January 1, 2014, vehicle manufacturers and retailers of friction materials shall ensure that only brakes certified for sale in this state are offered for sale in this state.

25250.62. (a) A violation of this article, including, but not limited to, offering brake friction materials for sale without first complying with subdivision (c) of Section 25250.60 or the falsification of third-party certification, by vehicle manufacturers, brake friction materials manufacturers, distributors, or retailers,

046050

shall be subject to a civil fine of up to ten thousand dollars ($10,000) per violation.

(b) The department shall enforce this article. The department shall remove from sale in this state any replacement brake friction materials determined to be not in compliance with this article.

(c) In enforcing this article, the department shall not recall automobiles fitted with brake friction materials that do not comply with this article, but the department may impose fines and penalties authorized pursuant to subdivision (a) on automobile manufacturers whose vehicles are fitted with brake friction materials that do not comply with this article.

25250.64. This article does not limit, supersede, duplicate, or otherwise conflict with the authority of the department to fully implement Article 14 (commencing with Section 25251), including the authority to include products in a product registry established pursuant to the regulations adopted pursuant to that article or any testing or labeling requirements imposed pursuant to that article if those requirements are more protective of the public health and environment than those prescribed by this article. Notwithstanding subdivision (c) of Section 25257.1, vehicle brake pads shall not be considered as a product category already regulated or subject to pending regulation for purposes of Article 14 (commencing with Section 25251).

SEC. 3. No reimbursement is required by this act pursuant to Section 6 of Article XIII B of the California Constitution because the only costs that may be incurred by a local agency or school district will be incurred because this act creates a new crime or infraction, eliminates a crime or infraction, or changes the penalty for a crime or infraction, within the meaning of Section 17556 of the Government Code, or changes the definition of a crime within the meaning of Section 6 of Article XIII B of the California Constitution.

Reducing Water Pollution Caused by Vehicle Brake Pads

Brake Pad Copper Control and Total Maximum Daily Loads

- Copper from vehicle brake pads is polluting California's urban waterways.
- There are limited options for intercepting or treating copper pollution.

As of 2006, 51 water bodies across California exceeded the amount for copper allowed under state and federal regulations. The vast majority of this copper comes from vehicle brake pads.

Local agencies, especially financially strapped cities like San Diego, Los Angeles, Sacramento, and San Francisco Bay Area cities, are being forced to deal with this pollution under the U.S. Environmental Protection Agency's Total Maximum Daily Load (TMDL) mandates imposed through regional water quality control boards.

Several municipalities are already facing aggressive TMDL requirements and deadlines for achieving drastic reductions in copper pollution in 18 specific water bodies. Similar requirements are being drafted and are soon expected for all of California's urban areas.

Carefully Crafted Regulation is Imperative

Senator Christine Kehoe has proposed Senate Bill (SB) 346 that would phase out the use of copper in motor vehicle brake pads and would also limit the use of other harmful water pollutants such as lead, mercury, zinc, cadmium and asbestos in brake pads.

- Senator Kehoe's bill is essential for municipal agencies facing tough copper TMDL requirements.

Costly infiltration basins and land-use intensive vegetated strips and swales are the only runoff treatment measures that can remove sufficient amounts of copper to comply with copper TMDLs. High costs and the very large land areas required make these options rarely available in California's highly urbanized areas. As a result, **treating runoff to remove copper is many times more expensive than treatment for other pollutants.** Installing urban runoff copper treatment measures like these would cost California municipalities billions of dollars. Regulating copper content in brake pads is a better and safer alternative.

The Cost of Waiting is Just Too Great

- Any delay in adopting or implementing SB 346 will put municipal agencies at risk.

Unless brake pad copper pollution reduction begins soon, non-compliance with TMDL requirements will be unavoidable. The potential fines for non-compliance are staggering, and many regional water quality control boards have shown a willingness to impose them if they believe no meaningful effort is being made to comply. The risk to municipalities is real – and not one they are willing to take.

Vehicle brake pads are the single largest source of copper in highly urbanized watersheds in California. To achieve compliance with Total Maximum Daily Loads (TMDLs), significant reductions in copper concentrations must occur. Compliance with TMDLs cannot be achieved without the brake pad source control proposed by Senator Kehoe.

SB 346 Protects Residents and Industry

Municipalities have been working for years to encourage manufacturers and other automotive industry leaders to reduce and eventually eliminate copper from brake pads. Those discussions have been productive but have fallen short of any substantive agreement regarding the timelines and leadership necessary to reduce brake pad copper pollution.

SB 346 is necessary to move this critical effort forward.

Domestic and international competition will undercut any attempt to voluntarily reduce copper in brake pads. Manufacturers would be left without the incentives to take advantage of alternative brake pad formulations. Protecting our watersheds from copper pollution through regulated source reduction is the only technically feasible and fiscally responsible solution. Regulation will ensure that source reduction is initiated in a timely fashion.

Display of brake pads

Senator Kehoe's bill:

- **Levels the playing field between all domestic and foreign manufacturers;**
- **Provides cost-effective means for improving water quality and avoiding far more costly treatment alternatives; and**
- **Is the only realistic and fair solution to a complicated threat to our state's water quality.**

A15

SENATOR **CHRISTINE KEHOE** *THIRTY-NINTH SENATE DISTRICT*

FACT SHEET
SB 346 (KEHOE) – Hazardous materials: motor vehicle brake friction materials
As amended June 7, 2010

PROBLEM: Elevated copper levels occur in urban watersheds across California. Dissolved copper is toxic to phytoplankton (the base of the aquatic food chain). It also impairs salmon's ability to avoid predators and return to their home streams to spawn. Scientific studies have shown that the primary source of copper in highly urbanized watersheds is the fine dust generated by the use of vehicle brake pads.

Pursuant to the requirements of the federal Clean Water Act, the Regional Water Quality Control Boards in Los Angeles and San Diego have already imposed severe copper Total Maximum Daily Loads (TMDLs). Similar TMDLs are expected to be imposed on other urban watersheds across the state in the near future. The only technically and economically feasible way for municipalities to comply with these TMDLs is to eliminate copper pollution at its source – vehicle brake pads – no later than 2025. Any attempt to try and remove copper already dissolved in stormwater in highly urbanized areas would most likely require condemnation of large tracts of land and construction of elaborate infrastructure and cost already fiscally strapped local governments billions of dollars statewide with no guarantee that these methods would actually succeed.

SOLUTION: SB 346 would require brake pad manufacturers to reduce the use of copper in brake pads sold in California to no more than 0.5% by 2025. The bill also: 1) creates limits for other brake pad materials, 2) establishes a certification process by a third-party testing agency for compliance and requires the Department of Toxic Substances Control (DTSC) to charge a fee to cover the costs; 4) establishes civil penalties for violations; and 5) creates a Brake Friction Materials Water Pollution Fund into which any fines, penalties, and fees would be deposited. Funds collected would be used to implement the bill, upon appropriation by the Legislature. The goal is to improve California's water quality and allow California stormwater agencies to meet their TMDLs in a timeframe that is aggressive but realistic for brake and vehicle manufacturers.

BACKGROUND INFORMATION:

The bill is sponsored by the City of San Diego and Sustainable Conservation, and is the result of a 15-year effort to understand and address the impact on the environment of brake pad wear debris generated during the use of motor vehicles. A series of interlinked, peer-reviewed laboratory, environmental monitoring, and environmental modeling studies established that brake pads are by far the most significant source of copper in runoff from urban watersheds. Details of these studies can be found at www.suscon.org/brakepad.

SB 346 provides industry with a generous timeline within which to develop and distribute safe and effective copper-free brake friction materials, gives cities and counties the ability to demonstrate that they will meet their copper TMDLs in a timely manner, and removes a serious threat to the health of salmon and other aquatic life in California's urban watersheds.

The Honorable Pedro Nava
Chair, Assembly Committee on Environmental Safety & Toxic Materials
State Capitol, Room 2148
Sacramento, CA 95814

Subject: SB 346 (Kehoe) – Source Control of Copper Water Pollution – Support As Proposed To Be Amended

Dear Assemblymember Nava:

The Bay Area Stormwater Management Agencies Association (BASMAA)[1] strongly supports SB 346 (Kehoe), which will provide California's cities and counties with the tool they need to comply with stringent federal and state water quality mandates and avoid billions of dollars in costs and penalties. SB 346 requires that copper, an extremely significant aquatic pollutant, be reduced to a *de minimis* 0.5% by weight in vehicle brake pads sold in California by 2025. Peer-reviewed scientific studies have established that by far the most significant source of copper in urban watersheds is the fine dust generated from the use of brake pads.

Pursuant to the requirements of the federal Clean Water Act, the Regional Water Quality Control Boards in Los Angeles and San Diego have already imposed severe copper Total Maximum Daily Loads (TMDLs). Similar TMDLs are expected to be imposed on other urban watersheds across the state in the near future. The only technically and economically feasible way for municipalities to comply with these looming deadlines is to eliminate copper pollution at its source – vehicle brake pads – no later than 2025. Any attempt to try and remove copper already dissolved in stormwater in highly urbanized areas would most likely require condemnation of large tracts of land and construction of elaborate infrastructure. This could easily cost already fiscally strapped local governments billions of dollars statewide with no guarantee that these methods would actually succeed.

SB 346 provides industry with a generous timeline within which to develop and distribute safe and effective copper-free brake friction materials while also giving cities and counties the ability to demonstrate that they will meet their copper TMDLs in a timely manner without having to spend billions of dollars to do so. BASMAA and its 96 member agencies are pleased to support SB 346.

Very truly yours,

James Scanlin

A17

Impact of dissolved copper on the olfactory system of seawater-phase juvenile salmon

Estimated cost: **$36,767**

Oversight Group: Exposure and Effects Workgroup

Proposed by: David Baldwin, Environmental Conservation Division, NOAA Northwest Fisheries Science Center

PROPOSED DELIVERABLES AND TIMELINE

Setup, exposures, electrophysiological recordings, and data analysis	June – Sept, 2011
Preparation of report	Sept – Nov, 2011

BACKGROUND

Copper is a ubiquitous contaminant of aquatic systems in urbanized and agricultural areas. In the San Francisco Bay estuary, elevated ambient copper concentrations result from a multitude of anthropogenic sources including, in decreasing order, erosion of buried sediments, inflow from the Sacramento and San Joaquin Rivers, urban and non-urban runoff, anti-fouling marine coatings, urban wastewater, atmospheric deposition, and industrial discharge (CRWQB 2007). Although the source of copper entering the Bay from the Sacramento and San Joaquin Rivers has not been assessed, one possible source is the application of copper-containing pesticides (data available online from the California Department of Pesticide Regulation Pesticide Use Reporting Program www.cdpr.ca.gov/docs/pur/purmain.htm).

In fish, exposures to dissolved copper concentrations that are sublethal are, nonetheless, known to be able to impair peripheral sensory systems (e.g. gustation, mechanosensation, and olfaction). For example, freshwater studies have shown that copper is toxic to fish mechanosensory (Hernandez et al. 2006; Linbo et al. 2006) and olfactory (Hansen et al. 1996; Baldwin et al. 2003) receptor neurons. Furthermore, inhibition of olfactory function is highly correlated with reduced ability to respond to an olfactory alarm cue that triggers anti-predation behavior in juvenile coho salmon (*Oncorhynchus kisutch*, Sandahl et al. 2007). In experiments with predatory cutthroat trout (*Oncorhynchus clarki*), survival of juvenile coho salmon was reduced 3- to 5-fold (McIntyre et al. in prep.). Significantly, these effects on the olfactory system can occur following exposure periods of as little as 30 minutes and increases in dissolved copper concentrations of as little as 3 µg/L (e.g. Baldwin et al. 2003; see Figure).

Dose-response curves and threshold determination for sub-lethal copper olfactory toxicity. Olfactory responses to three different odors were reduced following 30-minute increases in copper. Figure 5 from Baldwin et al. (2003).

Current site-specific copper objectives (SSOs) for San Francisco Bay were derived, in large part, from 96-hour tests on the development of larval *Mytilus edulis*. As per EPA guidance, toxicity tests in site water and standard laboratory waters were compared to account for the local influence of water chemistry on the bioavailability of copper to

relevant ligands in this organism. When considering copper neurotoxicity to peripheral sensory systems of sensitive fish taxa, it is important to realize that water chemistry may not have the same influence as on the development of larval *Mytilus edulis*. In tests on peripheral sensory systems in freshwater fishes, hardness and alkalinity provided little to no protection from copper neurotoxicity (McIntyre et al. 2008; Linbo et al. 2009). This differs from the conventional understanding of the influence of water quality on copper toxicity derived from the Biotic Ligand Model (BLM). Dissolved organic matter (DOC) provided some protection against copper neurotoxicity, but not to the extent expected from BLM-based predictions. These results are likely because the copper dynamics modeled by the BLM are based on interactions with ligands at the fish gill, not at sensory epithelia.

Currently, the copper SSOs are higher than concentrations at which effects on olfactory neurophysiology (Baldwin et al. 2003) and behaviour (Sandahl et al. 2007; McIntyre et al. in prep.) were seen in juvenile coho salmon. However, studies on copper neurotoxicity to peripheral sensory systems have thus far been conducted exclusively in freshwater. Given the uncertainty about the protectiveness of seawater from copper olfactory neurotoxicity, it is difficult to extrapolate effects thresholds to the different water chemistry of marine and estuarine waters. Additionally, differences between the biology of freshwater-phase versus seawater-phase juvenile salmon produce another source of uncertainty. The goal of this study is to determine the impacts of dissolved copper of the olfactory system of seawater-phase juvenile salmon in order to compare these effects to those known for freshwater-phase juvenile salmon and the copper SSOs for the San Francisco Bay estuary.

APPLICABLE RMP OBJECTIVES AND MANAGEMENT QUESTIONS

4.3 What ecological risks are caused by pollutants of concern? This study will determine what levels of dissolved copper pose a risk to the olfactory system of seawater-phase juvenile salmon.

4.6 Which forms of pollutants cause impairment? In addition to being present as free copper ions (Cu^{2+}), dissolved copper will form complexes (i.e. species) with other constituents of water (e.g. hydroxyl ions, carbonates, and dissolved organic molecules). These other species are considered to be much less toxic with respect to acute mortality and development. However, some of them may still be toxic to the olfactory system. The ability of seawater to form copper complexes, therefore, may provide less protection to the olfactory system of salmon than expected based on acute mortality.

5.1 What percentage of the Estuary is supporting beneficial uses? This study will address whether copper SSOs are likely to protect the olfactory system of juvenile salmon in the SF Bay estuary from sublethal impairment.

APPROACH AND OBJECTIVE

This study will be based on previous NOAA studies that measured copper olfactory toxicity in freshwater-phase juvenile salmon (Baldwin et al. 2003; Sandahl et al. 2007; McIntyre et al. 2008). As was done in these previous studies, the impact of copper exposure on the sensitivity of the salmon olfactory system to odors will be measured using direct electrophysiological recordings (electroolfactograms; EOGs) from the olfactory epithelium (Baldwin et al. 2003). While the effect of copper on the EOGs of seawater-phase salmon has not been measured, the methods have been adapted to record EOGs in seawater-phase cutthroat trout (Labenia et al. 2007). The experiments will be performed at the Northwest Fisheries Science Center's (NWFSC) Mukilteo Field Station (Mukilteo, WA) using Chinook salmon (*Oncorhynchus tshawytscha*). Fertilized eggs will be obtained from a local hatchery and reared in freshwater at Mukilteo until fish are the appropriate age for smolting. The majority of the fish will then be transitioned to seawater and maintained in seawater for the duration of the experiment, while a subset will remain housed in freshwater. Water samples will be collected for analyses of water chemistry parameters (e.g. salinity and DOC) and copper concentrations.

Determine the threshold for effects of dissolved copper on the olfactory system of seawater-phase juvenile salmon. The proposed studies are expected to be initiated in June 2011 and should be complete by the end of the fiscal year (October 2011). To determine the effect of copper on the olfactory system, odor-evoked EOGs will be obtained from fish using a standard odorant, the amino acid L-serine. Fish will be either unexposed to copper (controls) or exposed for a short period (30 minutes) to one of at least 3 copper concentrations (ranging from 2-20 µg/L, but higher if needed). Copper-induced changes in the sensitivity of the olfactory system will be measured as a dose-dependent reduction in the amplitude of the odor-evoked EOGs from which an effect threshold for copper can be determined (e.g. see figure above). While the focus of the EOG recordings will be on seawater-phase juvenile Chinook salmon, fish that weren't smolted will be available, if necessary, to confirm the impact of copper on the olfactory system of freshwater-phase Chinook.

Since DOC is known to affect the toxicity of copper to the olfactory system (McIntyre et al. 2008), exposures will be performed at three different DOC concentrations representative of the SF Bay (e.g. 2, 4, and 6 mg/L). To the extent possible, the source of DOC used to amend the local seawater (which is ~2 mg/L DOC) will have copper binding properties similar to that of DOC from the SF estuary. The aim of the study will be to determine the effects threshold for the olfactory toxicity of copper in seawater-phase juvenile salmon at various DOC concentrations in order to compare this with thresholds measured from freshwater-phase salmon and with the copper SSOs in the SF Bay estuary.

REQUESTED BUDGET:

Biological Technician contractor salary (4 months)	$19,767
Equipment	$6,000
Supplies	$3,000
Travel	$2,000
Copper and water analyses	$6,000
Total	**$36,767**

NOAA contributions will include fish, fish husbandry, additional equipment and salary support (e.g. technicians and PI).

Introduction

The overarching goal of the RMP, and the intent of the Small Tributaries Loading Strategy (STLS), is to provide information needed to support water quality management decisions. The STLS was developed to ensure that the RMP is providing the information most urgently needed by managers to reduce loads and impacts of pollutants of concern (POC) entering the Bay from small tributaries.

The objective of this document is to present a planning framework for small tributary loads monitoring within the RMP that is consistent with and complemented by monitoring that will be completed in compliance with the Municipal Regional Permit for stormwater agencies (MRP). Water Board staff have affirmed that MRP provisions relating to POC and sediment loads monitoring would be revised to be compatible with the final version of this *Strategy*. Ideally, the strategy will be incorporated into the permit requirements so that coordination between BASMAA efforts and RMP efforts can be achieved. If the MRP development process is completed after development of this *Strategy*, the methods and studies outlined in this *Strategy* can be incorporated in the MRP language by reference. Implementing this *Strategy* will also consistent with the other RMP Strategies (Mercury, Dioxins, Modeling, and PCBs). These linkages are highlighted throughout.

Small tributaries have been identified in the mercury and PCB TMDLs as contributing significant and controllable loads of pollutants to San Francisco Bay. While mercury, methylmercury and PCBs remain the top priority and the focus of the majority of resources, the Sources Pathways and Loadings Workgroup (SPLWG) has ranked PBDEs as a high priority, and pyrethroids, dioxins (see the *RMP Dioxin Strategy*), selenium, OC pesticides, copper, nickel, and PAHs as medium priority for loads information. There are additional analytes listed in the February 2009 draft tentative order of the MRP that will also be considered (Category 1: Cu_D, POC; Category 2: Se_T, Se_D, NOx, total P and phosphate (PO_4^{3-}). In addition, it is recognized this POC list might evolve year-to-year as more information is gained through, for example, the emerging contaminants workgroup (ECWG) of the RMP. For all these POCs there remain uncertainties in:

- the magnitude of total regional loads,
- which watersheds contribute disproportionately to loads and impacts on local and regional scales,
- the relative importance of atmospheric deposition versus local sources contributing to watershed loads,
- how management can reduce loads, and
- trends in loads.

A premise of this *Strategy* is that it is possible to identify small tributaries that exert a disproportionately large influence on loads and impacts (consistent with the PCB and Hg strategies). Older industrial areas in local watersheds are presently hypothesized to be more polluted with PCBs than other parts of the urban landscape, whereas for

mercury, a broader distribution is hypothesized that includes industrial and commercial areas with higher imperviousness, and older urban areas. This more even distribution is partly because regionally it is estimated that about one third of the mercury load in urban stormwater is derived from atmospheric deposition. An additional premise of this *Strategy* is that the process of identification of sources and control of Hg and PCBs will also help to control other particle bound POCs. If these premises are correct, it will be possible to focus attention on contaminated tributaries and areas within watersheds and reduce mercury, PCB and other POC loads to the Bay and ultimately reduce beneficial use impacts in a cost-effective manner.

The RMP has already conducted loads monitoring for mercury, PCBs, and other POCs in three tributaries (Sacramento River, Guadalupe River, and Zone 4 Line A, a small tributary in Hayward). This *Strategy* aims to build on existing efforts and increase the amount and cost-effectiveness of information generated to answer key management questions while at the same time coordinating with BASMAA studies in relation to MRP compliance.

Management Questions and Priorities

1) Impairment

Which are the "high-leverage" small tributaries that contribute or potentially contribute most to Bay impairment by pollutants of concern?

An understanding of the POC load contributions of individual watersheds to impairment will be essential to developing cost-effective strategies for reducing loads and monitoring progress in load reductions in the context of sensitive areas on the Bay margin and food web uptake. This question ties closely with the *RMP Mercury and PCB Strategies* which identify the need to determine which processes, sources, and pathways disproportionately contribute to food web accumulation. It is anticipated that a focus on linking loads to impairment will help ensure that load reductions actually lead to reductions in exposure and impacts in target species. Implicitly, to answer this question, information will needed that links concentrations or loads from watersheds with key biological processes in the near-field habitats on Bay margin. Before that can be done however, we must first make decisions about which watersheds to study using a ranking derived from the combination of all available information on POC sources, atmospheric deposition, sediment concentrations in stormwater conveyances, and POCs in Bay margin sediment and biota.

2) Loads

What are the loads or concentrations of pollutants of concern from small tributaries to the Bay?

The TMDLs for mercury and PCBs include an allocation for the aggregate loads from urban stormwater runoff. Data collected in compliance of provision C.8.f of the MRP will inform improved measurements of single watershed loads and regional estimates. While load information will be developed for single watersheds, we are emphasizing understanding loading and impairment at the regional scale. This information will be

useful for input into models of the Bay process and recovery time (see the *RMP Modeling Strategy*). A combination of field studies and modeling will be needed to answer this question. There are a few key intermediate questions to be answered. For example, what sampling design is needed (how many samples under what kind of field conditions should be taken to generate loads information)? How many categories of watersheds are there in the Bay Area? How many watersheds in each category should be studied? Which categories should be prioritized for collection sooner than others? What sampling design is needed to characterize loads associated within each watershed category? Although Hg and PCBs are the most urgent and data rich POCs to build a framework of investigation from, like all other components of this *Strategy*, it is assumed that there will be benefits for other POCs.

3) Trends

How are loads or concentrations of pollutants of concern from small tributaries changing on a decadal scale?

Understanding long-term trends in loads is essential to tracking progress toward TMDL wasteload allocations. Provision C.8.d and C.8.f of the MRP describe the intent to track trends through water quality sampling in urban stormwater. Answering this question will require the collection of systematic data in fixed locations. Power analysis will be needed to determine the amount of data needed to see a trend of a given magnitude given reasonable expectations of management effort and environmental variability.

4) Support for Management Actions

What are the projected impacts of management actions on loads or concentrations of pollutants of concern from the high-leverage small tributaries and where should management actions be implemented in the region to have the greatest impact?

Answering this question will require conceptual, and ideally quantitative models of the behavior of POCs in the watersheds, along with an adequate foundation of empirical information (see the *RMP Modeling Strategy (Question 4*)). Data will be needed to populate the internal structure of the models (for example concentrations and loads of POCs associated with land use or source categories) as well as for calibration and verification (e.g., single location time continuous flow and concentration data). In addition to model input data, information on anticipated management actions will be needed: when, where, and what?

Guiding Principles

- Focus on what should be done, rather than what can be done. Implement control measures where they are most likely to impact Bay water quality impairments.
- Seek opportunities for obtaining information on multiple pollutants in a cost-effective manner (e.g., piggybacking).
- Seek areas where collaboration can be maximized.

Definitions

- Small tributary: Rivers, creeks, and storm drains that enter the Bay downstream of the confluence of the Sacramento and San Joaquin rivers.
- Pollutants of concern (POC): Use SPLWG prioritized list and the list provided in provision C.8.f of the MRP and apply budget disproportionately to higher ranked POCs.

Implementation of the STLS

The largest challenge that is unique to the STLS in contrast to the other RMP strategies is the close coordination with the monitoring components in the MRP. We envisage the need for a consensus between the RMP Steering Committee, the Water Board, and BASMAA on which parts of the STLS will fulfill permit requirements and what kind of reporting will be needed by the STLS team in that regard. This decision will provide the general conceptual framework for partitioning activities between RMP work and BASMAA work under the MRP. Although conceptually there will be a need each year to review that decision and alter it as needed, the success of this *Strategy* and the resulting program of observation and information development will be largely reliant on consistency and predictability for staffing and equipment.

Like any planning document, this *Strategy* will require periodic updating as management needs evolve and questions are answered or new questions are generated. In addition, stakeholders are interested in periodic reports that synthesize the data and information developed as a WHOLE. Lastly, stakeholder meetings will be required periodically to inform interested parties of results and make adjustments to the field components of the strategy.

Proposed Tasks to Answer the Management Questions

Task 1: Guadalupe River Model
Funded in 2008 and 2009 - $150,000 over two years. Proposed funding 2011 - $75,000

In 2009 the RMP funded the 2nd year of a two year modeling effort in the data rich Guadalupe River Watershed as a first step towards developing a regional scale model. Guadalupe was chosen because of the abundance of rainfall and runoff data collected by the SCVWD, the abundance of Hg sediment data collected by a number of agencies beginning 1988, and the abundance of suspended sediment and bed load data collected by the USGS. In addition, the RMP/CEP/SCVWD/SCVURPPP has funded SFEI to collect 4 years of Hg, PCB and other POC data during storms. While the model may have local stakeholder uses, the overall intention is to use Guadalupe as a starting point for the development of other watershed models and ultimately a regional scale model. In 2011, the model will be rerun to answer questions like:

- Long term average loads (*Strategy* Question 2)
- Predicting the effects of various BMP scenarios (*Strategy* Question 4)
- Predicting the time to observe trends (Note this would help to refine the sampling plan (Task 3))

Year 1 – Model stormwater flow (Lent and Oram, 2009)
Year 2 – Model suspended sediment, Hg, and PCBs
Year 3 – Model BMPs and loads trends.

Objectives: Improve load estimates for Guadalupe River, develop and calibrate a model for testing BMP scenarios and predicting load trends, and provide tested parameterization of the model to expand the use to other watersheds in the regional context.

Task 2: Z4LA Small Tributaries Loading Study
Funded Water Years 2007, 2008, 2009 - $400,000 over three years.

Beginning in 2007, the RMP funded a second small tributaries loading study in a small urban watershed in Hayward. The intent of this study was to understand loads of POCs entering the Bay from a small industrialized tributary near the Bay margin. This watershed was chosen because it contrasts with Guadalupe River in size, land use, rainfall variation, soil types, and location on the Bay margin. The study uses an intensive single station design employing 5 minute interval stage, rainfall, and turbidity measurement and storm focused ISCO pump sampling and depth-integrated point sampling. So far this study has been funded for three relatively dry years. Preliminary comparisons to Guadalupe reveal similarity of most POC loads normalized to areas during dry years with the exception of Hg, Cr, and Ni which have greater concentrations and loads in the Guadalupe system most likely due to historic mining.

Objective: Improve regional loads estimates for the class of smaller industrial watersheds near the Bay margin.

Task 3: Develop Multi-Year Watershed Loading Sampling Plan
Funded 2009 - $10,000

In order to cost effectively and systematically gather data to answer the *Strategy* questions, a multi-year sampling plan is needed to guide both the RMP and MRP data collection efforts. The aim of this task is to provide the rationale and plan for sampling to address the Strategy questions. This document will have strong linkages to provision C.8.d and C.8.f of the MRP. The sampling plan will need to be updated periodically as management needs change.

Three subtasks will contribute to development of the sampling plan. The sampling plan will reflect the present consensus obtained through ongoing discussions between the Water Board and BASMAA with scientific advisory input.

Objective: Write a sampling plan for small tributaries loads that represents consensus and guides RMP and MRP studies over the next 3-5 years.

Task 3a: Develop Criteria and Rank Watersheds
Funded 2009 - $25,000

The premise of the STLS is that it is possible to identify tributaries where there are controllable sources that exert a disproportionately large influence on loads and impacts. Two key questions in relation to this *Strategy*, and before the Water Board and BASMAA in relation to the MRP, are how many types of watersheds do we have and how many watersheds should be studied to answer the key management questions? A key long-standing recommendation of the SPLWG is to stratify watersheds into broad categories and then to sample one or two watersheds in each category; however due to budget limitations this has never been done. To answer these questions, a list of "representative watersheds" or which in the past have been called "observation watersheds" (Davis et al., 2000) or which in southern California are called "mass emissions sites" (Tiefenthaler et al., 2008) needs to be developed. Data on concentrations in Bay sediment, water, and tissue will be used along with physical parameters such as water depth and circulation patterns to characterize and rank Bay margins. To characterize and rank watersheds, information on PCB and Hg sources and "emission factors" and low and high flow hydrology and loads (McKee and Gilbreath in preparation) will be combined with recent new estimates of watershed specific sediment loads (Lewicki and McKee et al., 2009) to provide hypotheses of sediment concentrations. A weight-of-evidence approach will be used during the ranking process, along with knowledge of opportunities for collaboration, and benefits for multiple pollutants.

Objective: To develop a list of representative watersheds for focused study.

Task 3b: Optimize Sampling Methods for Loadings and Trends
Funded 2009 - $45,000

Management questions and associated hypotheses that are tested by environmental field data require an appropriate field sampling design that is cost effective and achieves the desired outcomes with appropriate confidence. Over the past eight years the SPLWG has implemented loads studies at Mallard Island, the Guadalupe River, and Zone 4 Line A with the objective of increasing our understanding of the sources and processes of sediment and pollutant transport and calculating accurate and precise loads of particle associated POCs. Given increasing costs, the need to estimate loads at more locations in any given year, and the need to show trends (over 5 or more years) as one tool for evaluating whether the TMDL objectives are being met (see provision C.8.f of the February 2009 draft tentative order of the Municipal Regional Permit (MRP)), there is a clear need to evaluate our sampling design and reformulate it as necessary. Using data collected at the three existing load stations, an analysis will be performed to assess the optimal number of samples and style of sampling coupled with loads calculation techniques for assessing loads and determining trends. Methods

similar to those outlined in published works (Leecaster et al., 2002; Ma et al., 2009) will be used. We will also make a cost analysis of each combination so that local managers can assess accuracy versus cost. The simulated sampling techniques will be decided during review of a work plan or, if needed, at a special subcommittee meeting of the SPLWG.

Objective: To determine the optimal sampling design for both loads monitoring and trends detection.

Task 3c: Develop Spreadsheet Model for Regional Loadings Estimates
Proposed funding 2010 - $35,000, $10,000 each year thereafter

"Spreadsheet models" provide a useful and inexpensive tool for organizing data to estimate regional scale watershed loads, our second key management question. They are based on the simplifying assumption that unit area runoff for homogeneous sub-catchments has constant concentrations and thus have advantages over models such as HSPF and SWMM that require large calibration data sets which take money and time to collect. Such a model was developed for the Bay Area previously (Davis et al., 2000) however, at that time, there was only local land use specific data on POCs for a drought period late 1980s and early 1990s, and there were no data on Hg and PCBs. In this task, a GIS based "spreadsheet model" will be developed using more recent local data on land use based concentrations and mass emissions collected in the Bay Area (augmented using recent stormwater literature) and updated annually as more and more data becomes available through implementation of this *Strategy*. The model structure will be based on the published work by Ha and Stenstrom (2008) and is more sophisticated than the SIMPLE model used by Davis et al (2000) because it contains calibration steps.

Objective: Develop a calibrated tool to make regional scale loads estimates of current and future POCs that can be updated annually as new information is developed.

Task 4: Pollutants of Concern Monitoring at a Subset of Representative Watersheds
Proposed funding 2011, 2012, 2013, 2014, and 2015 - $250,000 per year

Provision c.8.f of the revised tentative order of the MRP (February 2009) calls for monitoring to assess inputs of POCs to the Bay from specific local tributaries and urban runoff, to assess progress toward achieving wasteload allocations (WLAs) for TMDLs, and for helping to resolve uncertainties associated with loads estimates for POCs at the regional scale (whole Bay). The objective of this task is to carry out monitoring that achieves these same goals, and addresses *Strategy* questions 1 and 2. An efficient approach to conducting this monitoring will be developed through SPLWG discussions and guided by the multiyear watershed sampling plan (Task 3). With an efficient approach, it should be possible to establish three small tributaries load monitoring stations at a $250,000 / year level of funding but the cost estimate will necessarily be refined after the completion of Task 3b (above). The locations would be decided through

consultation with BASMAA and the Water Board and based partly on Task 3a (Develop criteria and rank watersheds). In year 1, we would install discharge and sediment monitoring equipment at three locations and begin sampling. In year two, the majority of the funds would be applied to collecting field data when all the start up costs would have been expended in the first year. Technical reports would be written in year 3 and year 5 only, to minimize reporting costs.

Objective: Determine loads entering the Bay from representative watersheds and improve regional loads estimates.

Task 4a: Pollutants of Concern Monitoring (Guadalupe River)
Proposed funding 2010 - $43,000. 2013 - $65,000 (if selected for ongoing monitoring)

Data collected previously in the Guadalupe River Watershed left a number of unanswered questions and hypotheses. During the first sampling year, a 1:5 year return storm event occurred. From December 16th 2002 mercury concentrations were elevated for the remainder of the WY. The data supported a number of hypotheses about the causes of high concentrations but the watershed was never sampled under similar conditions. Additionally, the original sampling design did not allow an estimate of Hg or PCBs from urban sources alone. In response to remaining unanswered questions and also the need to carry out systematic repeated sampling to assess trends, the RMP has budgeted funding for sampling every three years. Recently, the RMP began modeling Guadalupe using the HPSF numerical model to understand the source, release, and transport of sediment and contaminants to San Francisco Bay. The Guadalupe River was chosen primarily because of existing data richness and secondarily because of imminent management aimed at reaching loads targets imposed by the Hg TMDLs. Despite data richness, the weakest POC data set is land use specific data during flood flow; more of this kind of data will be collected in Task 4e and are necessary for calibrating the land use specific components of loading models and improving model performance for simulating BMPs.

Objectives: To collect land use specific PCB data at two locations, one mostly non-urban and upstream and one mostly urban and downstream to calibrate the land use components of the HSPF model and provide recommendations for similar efforts elsewhere in the Bay Area.

Task 4b: Pollutants of Concern Monitoring at a Subset of Representative Watersheds – Zone 4 Line A – year 4
Proposed funding 2010 - $150,000

Beginning in 2007, the RMP funded a second small tributaries loading study in a small urban watershed in Hayward. The intent of this study was to understand loads of POCs entering the Bay from a small industrialized tributary near the Bay margin. This watershed was chosen because it contrasts with Guadalupe River in size, land use, rainfall variation, soil types, and location on the Bay margin. The study uses an intensive single station design employing 5 minute interval stage, rainfall, and turbidity

measurement and storm focused isco pump sampling and depth-integrated point sampling. So far this study has been funded for three relatively dry years. Preliminary comparisons to Guadalupe reveal similarity of most POC loads normalized to areas during dry years with the exception of Hg, Cr, and Ni which have greater concentrations and loads in the Guadalupe system most likely due to historic mining.

Objective: Improve regional loads estimates for the class of smaller industrial watersheds near the Bay margin.

Task 4c: Pollutants of Concern Monitoring at a Subset of Representative Watersheds – Reconnaissance

Proposed funding 2010 - $12,000

Conducting loads studies in "observation" watersheds is a long standing recommendation of the SPLWG (see Davis et al., 2001). Recent TMDL reports on PCBs and Hg emphasize the influence of local small tributaries on water quality in the Bay and call for reduced loadings from urban areas. Provision C.8.f of the February 2009 draft tentative order of the Municipal Regional Permit (MRP) describes the need for Permitees to monitor eight watersheds to generate loads information. The watershed ranking study (Task 3a) planned for completion in early 2010, will provide a list of prioritized watersheds for study. Given logistical constraints such as channel form and safety that restrict the practical implementation of a loads monitoring study, a reconnaissance study will be carried out to investigate the potential for safe and successful sampling in the top ranked watersheds in the context of management questions. Note it is possible that some of these locations could overlap with the list of locations developed in Task 4d.

Objective: Document technically feasible and "safe" locations for consideration for future small tributary loads monitoring.

Task 4d: Pollutants of Concern Monitoring at Representative Land Use sites – Rationale Development and Reconnaissance

Proposed funding 2011 - $30,000

In order to develop models capable of testing and forecasting the effects of best management practices (BMPs) on POC trends (management question 4), data must be collected on land use based concentrations and mass emissions to provide a regional calibration data set. In this task we will refine the rationale for such an effort by reviewing literature and discussing potential modeling questions with local agencies. We will identify land use categories of interest in relation to our POC list. Those presently proposed based on the SoCal experience and discussions at strategy team meetings are a) Agriculture , b) Commercial, c) High density residential, d) Industrial, e) Low density residential, f) Open space, g) Recreational, and h) Transportation. There was also discussion of adding a "land use condition" factor such as age and conditions of roads and drainage systems). A list of potential sampling locations will be developed through a review locations sampled by BASMAA agencies in 1989-1995 and use GIS

and aerial photographs to investigate possible locations in high ranking watersheds (Task 3a) taking into consideration the decisions on land use categories to focus on. Lastly, we will carry out a field reconnaissance to investigate the potential for safe and successful sampling. Note it is possible that some of these locations could overlap with the list of locations developed in Task 4c.

Objective: Provide written documentation of the rationale for land use based sampling and a list of potential sampling locations.

Task 4e: Pollutants of Concern Monitoring at Representative Land Use sites
Proposed funding 2012, 2013, 2014, and 2015 - $100,000/year

In order to develop models capable of testing and forecasting the effects of best management practices (BMPs) on POC trends (management question 4), data must be collected on land use based concentrations and mass emissions to provide a regional calibration data set. We propose to follow the published methods of Tiefenthaler et al. (2008) after an initial assessment of data needs based on what is learned from the Guadalupe River model (see task above), and assessment of the usefulness of existing local data (BASMAA 1996; Soller et al, 2003/SCVURPPP 1998/99; McKee unpublished; EBMUD, 2009). Note the budget for this task depends on POC list, number of sites, and proximity to other loads monitoring sites. The cost proposal will be revised based on the outcomes of Task 3a, 3b, 4c, and 4d. The proposed budget would cover the following tasks:

- Purchasing and installing sampling equipment.
- Sampling storm events at each land use site following the outcomes of Task 3b above (sampling method (discrete or composit; number of samples per storm; number of storms per site).

Objective: Characterize land use specific concentrations and loads as basic data for model development and calibration.

Task 5: Dynamic Modeling in a 2nd Selected Representative Watershed
Proposed funding 2012 - $150,000

The *Strategy* calls for developing regional estimates of loads, tracking progress towards loads reductions, and determining the effectiveness of management towards TMDL goals. The completion of the Guadalupe Model (Task 1) will address all these questions but only for one large mercury contaminated watershed. The objective of this task is to address the answers to these key *Strategy* questions in another watershed (likely focusing on one adjacent to a known “high leverage contaminated Bay Margin”). A key outcome will be an assessment of how management might be able to reduce loads in the context of linkage to the processes of uptake on the Bay margin. This task will necessarily need data provided by Task 4a, 4b, and 4c (POC Monitoring at *a Subset of Representative Watersheds* and Task 4d and 4e (*POC Monitoring in Representative Land Use sites)*. At this time, we propose to use the HSPF modeling platform but there

now exists modified spreadsheet models (annual average time step) that might be considered (e.g., Ha et al in review).

Objective: Expand our modeling capability to test BMPs and predict trends in other representative watersheds.

Appendix 1: Water Board Priorities for Loads Monitoring

This table contains Water Board decisions or management questions and SPLWG activities that might be needed to address these decisions/questions. The priorities are the same as those identified in the Sources Pathways and Loading Workgroup 5-year plan and have been developed through a consensus based discussions by the Work Group during 2007 and 2008.

SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
Top	Mercury, methylmercury	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. What is the rate of progress toward TMDL load allocations. MRP requires monitoring of methyl mercury loads from urban runoff.	Local tribs monitoring studies designed to support Bay Margin modeling. Need local trib monitoring and beginning of model development to be able to estimate full watershed loads to assess TMDL progress.	Is the urban runoff (tribs/storm drains) total mercury load from all being reduced consistent with the TMDL load allocations for urban runoff. What is the spatial pattern of such load reductions to guide where more progress is needed.	Need sufficient and representative local tribs monitoring plus development of predictive model to provide refined assessment of loads from all watersheds/storm drains and determine spatial and perhaps temporal patterns?	The overarching issues are: 1) determining progress toward meeting Bay-wide load allocations; 2) determining if there are local impacts from some tribs that would require special attention; and 3) being able to distinguish local tribs/storm drains that contribute disproportionately either to Bay-wide loads or localized impacts at the margins. The modeling and monitoring should be directed at these issues. See narrative sheet as well.
Top	PCBs	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. We also need to understand loads to various segments and gain understanding if those segment-specific loads matter to Bay impairment.	Local tribs monitoring studies designed to support Bay Margin strategy. Need local trib monitoring and beginning of model development to be able to assess full watershed loads and loads by Bay segment.	Are loads of PCBs from all watersheds being reduced consistent with the TMDL load allocations for urban runoff.	Need sufficient and representative local tribs monitoring plus development of predictive model to provide refined assessment of loads from all watersheds/storm drains and determine spatial and perhaps temporal patterns?	See mercury comments.

046086

SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
High	PBDEs	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. What are the loads of PBDEs from all stormdrains and local tribs. We will need baseline loads to track future loading trends. We also would like to gain the understanding of loads by Bay segment as for PCBs.	Local tribs monitoring studies designed to support Bay Margin modeling. Need local trib monitoring and beginning of model development to be able to assess full watershed loads.	Need trends in PBDE loads. If TMDL is developed, we would need refined load estimates for TMDL.	May need similar information as for mercury or PCBs if PBDE TMDL is developed. Otherwise, we would need less detailed information but sufficient monitoring and modeling to PBDE loading trend.	Look for "piggy-back" opportunities in course of doing work on PCBs. We are not sure what the form of the TMDL will look like, but we know that we will need to be confirming loading trajectory at the very least.
SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
Medium	Pyrethroids	Are these compounds being detected and causing toxicity? How widespread is this toxicity? Are these pesticides found in runoff at levels that would impact Bay margins in terms of toxicity?	Need some level of monitoring and trend assessment - coarse assessment and evaluation of Bay Margin load and toxicity.	Are these compounds being detected and causing toxicity?	Need some level of monitoring and trend assessment - coarse assessment.	Potential emerging replacement class of pesticides. Needs: characterize and track possible impacts per implementation plan of Urban Creeks TMDL for pesticide-related toxicity.
Medium	Dioxins	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. We may need rough cut loading estimate to Bay. There may be a need to understand role of atmospheric deposition contributions to trib/storm drain loads. We need improved understanding of presence in runoff and spatial distribution and how relevant are small tribs to Bay impairment.	some similarity to above pollutants plus air deposition monitoring/modeling connection.	The long term needs depend heavily on the nature of the TMDL. If there is a TMDL, we would need at least some assessment of loading trends.	Need some level of monitoring and trend assessment - coarse assessment.	Impairment listing for Bay, assumed benefit from PCB actions. Needs: fill gaps in conceptual model/impairment assessment, including sources, loads; also determine benefits from PCB actions? May eventually need refined load estimates for all types of dioxins (dioxin-like PCBs and the furans). Here too - look for piggy-back opportunities on top of PCB studies. For dioxin: is the loading coming from local or global sources? We will need evidence about this question for TMDL.
Medium	Selenium	We need refined load estimates from local tributaries, probably much more focused on extreme S. Bay at the moment. There could be impairment there and need to understand small trib contribution.	monitoring studies for small tribs in S. Bay to get loading estimates.	Update on local trib load estimates.		North Bay TMDL in development. Needs: refine load estimates from local tributaries. Main focus of monitoring should be S. Bay unless data gaps emerge from N. Bay TMDL development. This is unknown right now.

046087

SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
Medium	DDT, chlordane, dieldrin	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. We also need loading baseline to track trends. Can we do anything to assist recovery that appears to be taking place (any areas needing attention?)? Similar strategy to PBDEs.	Find local sources or major small trib pathways.	Are we still recovering? Trends?		Bay TMDL in development. Needs: refined data to clarify impairment assessment and forecasts. Additionally, characterize loads to Bay in vicinity of areas of elevated legacy pesticides contamination to support Bay Margin modeling strategy. Look for piggy-back opportunities on other work (PCBs). Strategy has many similarities to PBDEs because of phase out of uses and presumed decreasing trends. TMDL may seek to use simple linkage (from PCB?) and largely be based on confirming recovery is underway. Information needs center around needing to confirm that this simple linkage is justified and appropriate and to confirm what additional actions, if any, are needed to assist recovery of the Bay.
SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
Medium	Copper	Monitor local tribs copper load trends. If copper is going up, we would want to know something about spatial pattern. Lower intensity monitoring here is OK. Additional monitoring triggered by increasing Bay trend though.		What is the trend of copper loads from local tribs?	Need some level of monitoring and trend assessment - coarse assessment.	Site-Specific Objectives (SSOs) for all Bay (copper) Need: periodic load confirmations, especially copper, from local tributaries per SSO implementation plan. If Bay levels increase, need more intensive small tribs monitoring perhaps in portion of Bay seeing increase. We may want to look at historical loading data from 90s to see if trend insights possible.
Medium	PAHs	What is the contribution of local tributaries and storm drains to localized problems at the Bay Margins. See dioxin row - very similar approach.				Impairment listing for some portions of Bay or tributaries. Probably need refined load estimates eventually. There is a possibility that threshold of impairment will be driven downward by NOAA. If so, we will have widespread listings. Strategy is similar to dioxins: distinguish local from global sources and ID local sources. Local sources thought to play a big role for this pollutant, though.
Low	Other trace metals (Ag, As, Cd, Cr, Ni, Pb, Zn)	No specific info needs. Can monitoring these provide insights and understanding of loads of other contaminants.				Some local impairment listings. No urgent data needs at present.

046088

SPLWG Priority	Pollutant	Near-term Decision or Management Question (5 years)	Modeling or Monitoring Needs for 5 years	Long-term Decision or management question (10 years)	Modeling or Monitoring Needs for 10 years	Comments
	OP pesticides	Are these compounds being detected and causing toxicity? Low level effort is probably OK here.		Are these compounds being detected and causing toxicity? Confirm trends, assumed decreasing.		Need: ongoing checks of toxicity presence per implementation plan of Urban Creeks TMDL for pesticide-related toxicity
	Nutrients	What are the loads and speciation of those loads (ammonia etc.)from local tributaries in comparison to other sources like POTWs and big rivers? Are these loads causing localized impairments like algal blooms or toxicity? Also, if Bay becomes clearer, might nutrients lead to some eutrophication problems? Finally, how do nutrients impact localized methylation at Bay Margins? Probably good idea to begin building knowledge base with monitoring and modeling.	Monitoring studies to answer the questions posed.	What is the status of the loads from local tribs? Long-range questions are up in the air right now.		We do not know the impairment status for nutrients so there are no imminent regulatory actions. Some loading data may be needed to support development of conceptual model/impairment assessment. There is a possibly linkage to MeHg loads and/or production in receiving waters. They may play an increasingly important role in Bay trophic status if there are long-term Bay changes in terms of clarity from other causes.

046089

Appendix 2 Tools and Methods Applied to-date for Answering Management Questions

This summary was developed to aid discussions in the early meetings of the Small Tributaries Loading Strategy Team

Tools and methods		Previous uses	Spatial and temporal scale	Planned or in progress in the Bay Area	Technical considerations	Stakeholder / implementation concerns
Field monitoring methods	**Bed sediment surveys** (combining bed sediment concentration with estimates of selected watershed sediment loads)	Used to identify and rank drainage systems with regards to POC concentrations. Combined with estimates of sediment loads to make local and aggregate regional estimates of POC load.	Region wide representing "average conditions"	Yes 1. SFEI prop 13 project, 2. Street sweeping studies, 3. City of Richmond source tracking and solution development	Grain size, there is no reliable relationship between POC in deposited sediment and POCs in water column	Cheap but reliability unknown
	Field based loads studies (combining high resolution flow, surrogate measure (turbidity), manual storm water sampling, lab analysis, regression estimator)	Loads: 1. Sacramento River, 2. Guadalupe River, 3. Zone 4 Line A, 4. pilot in Coyote Creek	Single tributaries. Selected climatic years measured. Other climatic year estimated using long term sediment or climatic data	1. Zone 4 Line A (WY 2009), 2. Sacramento River (WY 2010), 3. Guadalupe River (WY 2010)	Limitations: Only works when there is a relationship between turbidity and POCs; Advantages: High accuracy, multiple uses (loads, water quality exceedences, analysis, modeling, trends, future predictions	Expensive, can't afford to do it everywhere, need to decide where to do it and commit for a number of years. Logistic and cost issues in calibrating Suspended Sediment concentration data, affect site aelection.
	Field based loads studies (combining high resolution flow, automated field sampling (ISCO), lab analysis, averaging estimator)	BASMAA load studies for metals and some organics (1989-1991) that also used SWMM modeling to estimate loads (some monitoring continued during 1990's, see SWMM below)	Single tributaries. Selected climatic years measured. Other climatic year estimated using long term sediment or climatic data	Trial planned for Z4LA in WY 2009	If samples are composites will loose information on concentration variation during floods, loads will be less accurate and it will be unknown if each POC load is bias high or low	Cheaper than surrogate method but reliability unknown. If SSC used instead of TSS, logistic and cost issues apply.

046090

Tools and methods		Previous uses	Spatial and temporal scale	Planned or in progress in the Bay Area	Technical considerations	Stakeholder / implementation concerns
Extrapolation methods	**Area based extrapolation** (load measured in one watershed is scaled up to the Bay Area using an area ratio)	Used in PCB TMDL to estimate regional aggregate stormwater loads based on Guadalupe and Coyote Creek data	Region wide representing "average conditions"		Assumes that Guadalupe is characteristic (has average hydrology and land use of the entire Bay Area)	
	Sediment based extrapolation (load measured in one watershed is scaled up to the Bay Area using a sediment ratio)	Used in the Hg TMDL to estimate regional aggregate stormwater loads based on BASMAA bed sediment data	Region wide representing "average conditions"		Assumes that all sediment is sources from the same places in the landscape regardless of watershed geology, hydrology and land use	Cheap but reliability unknown
Modeling methods	**SIMPLE model** (An empirical model combining rainfall, land use, land use runoff coefficient and POC concentrations)	Used to estimate stormwater loads to coastal waters in 2000	Region wide representing "average conditions"		Assumes empirical relationships between climate land use and POC generation. No consideration for physical processes	Cheap but reliability unknown
	Hydrologic Simulation Program-Fortran (HSPF). A one dimensional watershed scale grid based conceptual model with routing.	Calibration/validation studies in a few selected watersheds by some BASMAA agencies. Being applied by Brake Pad Partnership for modeling Cu aggregate loads to Bay..	Single tributaries. Selected climatic years measured. Other climatic year estimated using long term sediment or climatic data	Guadalupe (sophisticated level for investigating BMPs), Z4LA (simple for estimating long term hydrology)	Requires a lot of input data some of which many not be available at desired resolutions making calibration challenging. Handles non-urban land use well	Expensive, but can be used for testing management scenarios and predicting future loads. What is the treadeoff between cost and achievable sensitivity in forecasting compared to mass balance models?

046091

Tools and methods		Previous uses	Spatial and temporal scale	Planned or in progress in the Bay Area	Technical considerations	Stakeholder / implementation concerns
Modeling methods	**Stormwater Management Model (SWMM).** A watershed scale sub-catchment based conceptual model with routing designed for urban areas.	BASMAA (1989-1991) load studies. ACCWP model for Castro Valley Creek watershed was refined for diazinon and copper 1995-2001	Single tributaries. selected climatic years measured. Other climatic year estimated using long term sediment or climatic data		Requires a lot of input data some of which many not be available at desired resolutions making calibration challenging. Handles urban land use well, less flexible for undeveloped (pervious) or mixed watersheds.	Expensive, but can be used for testing management scenarios and predicting future loads
Statistical methods	**Power Analysis using a Monte Carlo simulation developed in Matlab.** Determine the power to detect user defined trends (e.g. 90% in 20 years) in suspended sediment or contaminant concentration.	Leecaster et al 2002 in Santa Ana R. SoCAL. "Assessment of efficient sampling designs for urban stormwater monitoring"	Single tributaries. Selected climatic years measured.	Yes (perhaps 2008 for suspended sediments in Guadalupe if funding approved)	Many assumptions such as no change in data distributions, no change in source characteristics, no change in dilution effects.	Low cost. Useful to inform the debate on sampling design.
	Lake Core analysis. Uses paleolimnology to identify trends in contaminants in urban and pristine (reference) settings at the multi-decadal scale (50 years)	USGS National Urban Runoff Program studies for understanding national scale trends in environmental quality.	Single tributaries but perhaps regional if atmospheric load is the main source. Decadal (50 years)	Yes 2009 (for multi-contaminants if TRC approves funding)		Decadal time scale - regional in scale if atmospheric load is the main signal. Limited to where there are lakes - not at bottom of watershed

WEST VALLEY
CLEAN WATER PROGRAM

September 15, 2010

Mr. Bruce H. Wolfe
Executive Officer
San Francisco Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

Subject: FY2009-2010 Annual Report for the West Valley Communities
- City of Campbell's Urban Runoff Management Program
- Town of Los Gatos' Urban Runoff Management Program
- City of Monte Sereno's Urban Runoff Management Program
- City of Saratoga's Urban Runoff Management Program

Dear Mr. Wolfe:

This Annual Report is submitted on behalf of the West Valley Communities of Campbell, Los Gatos, Monte Sereno, and Saratoga, in conjunction with the Santa Clara Valley Urban Runoff Pollution Prevention Program's Annual Report, pursuant to Permit Provision C.16.a of the Municipal Regional Stormwater NPDES Permit (MRP), Order R2-2009-0074, NPDES Permit No CAS612008 issued by the San Francisco Bay Regional Water Quality Control Board. The Annual Report provides documentation of activities conducted during FY 2009-2010 and consists of the following:

A. Certification Statement
B. Annual Report Form
   - Table of Contents
   - Completed Annual Report Form: Sections 1-15
C. Appendices
   - Index of Attachments

Please contact me at (408) 354-4734 regarding any questions or concerns.

Very truly yours,

Kelly Carroll

Kelly Carroll

West Valley Clean Water Program

Section 2 - Provision C.2 Reporting Municipal Operations

Program Highlights and Evaluation

Highlight/summarize activities for reporting year:

Summary:

Corporation Yard SWPPPP was in place and implemented by July 1, 2010. Participation in SCVURPPP Municipal Operations Ad Hoc Task Group (AHTG) was provided by West Valley Clean Water Program Staff on behalf of our agency, and includes AHTG member discussions and review of AHTG work products [see SCVURPPP FY0910 Annual Report for description of AHTG activities and work products]. Participation in BASMAA's Municipal Operations Committee was provided by SCVURPPP Staff on behalf of our agency [see SCVURPPP FY0910 Annual Report for description of BASMAA Committee activities and work products].

C.2.a. Street and Road Repair and Maintenance

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and provide explanation in the comments section below:

X	Control of debris and waste materials during road and parking lot installation, repaving or repair maintenance activities from polluting stormwater
X	Control of concrete slurry and wastewater, asphalt, pavement cutting, and other street and road maintenance materials and wastewater from discharging to storm drains from work sites.
X	Sweeping and/or vacuuming and other dry methods to remove debris, concrete, or sediment residues from work sites upon completion of work.

Comments:

Continued implementation of Street and Road Repair and Maintenance Performance Standard, including applicable BMPs.

Continued implementation of Rural Roads Performance Standard and applicable BMPs for 'rural type' of roads, which were defined as "roads (and walkways) without curb and gutters."

Contractors/ Vendors working on CIP/ agency projects are required to also follow applicable BMPs.

Staff attended the Program's "Rural Roads Maintenance BMPs" Workshops on [September 25 and 26, 2008 and/or March 23, 2009] presented by Ledwith Watershed Services, which covered in class and in-field training of various erosion and sediment control measures, effective installation and typical failure points.

C.2.b. Sidewalk/Plaza Maintenance and Pavement Washing

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of wash water from pavement washing, mobile cleaning, pressure wash operations at parking lots, garages, trash areas, gas station fueling areas, and sidewalk and plaza cleaning activities from polluting stormwater
X	Implementation of the BASMAA Mobile Surface Cleaner Program BMPs

Comments:
Continued implementation of Street and Road Repair and Maintenance Performance Standard, including applicable BMPs.
Contractors/ Vendors working on CIP/ agency projects are required to also follow applicable BMPs.

C.2.c. Bridge and Structure Maintenance and Graffiti Removal

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of discharges from bridge and structural maintenance activities directly over water or into storm drains
X	Control of discharges from graffiti removal activities
X	Proper disposal for wastes generated from bridge and structure maintenance and graffiti removal activities
X	Implementation of the BASMAA Mobile Surface Cleaner Program BMPs for graffiti removal

Comments:
Continued implementation of Street and Road Repair and Maintenance Performance Standard, including applicable BMPs.
Contractors/ Vendors working on CIP/ agency projects are required to also follow applicable BMPs.

C.2.d. Stormwater Pump Stations

Does your municipality own stormwater pump stations:		**Yes**	X	**No**

If your answer is **No** then skip to **C.2.e.**

(For FY 10-11Annual Report only) Complete the following table for dry weather DO monitoring and inspection data for pump stations[1] (add more rows for additional pump stations):

Pump Station Name and Location	**First inspection Dry Weather DO Data**		**Second inspection Dry Weather DO Data**	
	Date	**mg/L**	**Date**	**mg/L**

(For FY 10-11Annual Report only) Summarize corrective actions as needed for DO monitoring at or below 3 mg/L. Attach inspection records of additional DO monitoring for corrective actions:

Summary:

(For FY 10-11Annual Report only) Complete the following table for wet weather inspection data for pump stations (add more rows for additional pump stations):

Pump Station Name and Location	**Date** (2x/year required)	**Presence of Trash** (Cubic Yards)	**Presence of Odor** (Yes or No)	**Presence of Color** (Yes or No)	**Presence of Turbidity** (Yes or No)	**Presence of Floating Hydrocarbons** (Yes or No)

[1] Pump stations that pump stormwater into stormwater collection systems or infiltrate into a dry creek immediately downstream are exempt from DO monitoring.

C.2.e. Rural Public Works Construction and Maintenance

Does your municipality own/maintain rural[2] roads:		**Yes**	X	**No**
If your answer is **No** then skip to **C.2.f**.				
Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If one or more of the BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:				
	Control of road-related erosion and sediment transport from road design, construction, maintenance, and repairs in rural areas			
	Identification and prioritization of rural road maintenance based on soil erosion potential, slope steepness, and stream habitat resources			
	No impact to creek functions including migratory fish passage during construction of roads and culverts			
	Inspection of rural roads for structural integrity and prevention of impact on water quality			
	Maintenance of rural roads adjacent to streams and riparian habitat to reduce erosion, replace damaging shotgun culverts and excessive erosion			
	Re-grading of unpaved rural roads to slope outward where consistent with road engineering safety standards, and installation of water bars as appropriate			
	Inclusion of measures to reduce erosion, provide fish passage, and maintain natural stream geomorphology when replacing culverts or design of new culverts or bridge crossings			
Comments including listing increased maintenance in priority areas:				

[2] Rural means any watershed or portion thereof that is developed with large lot home-sites, such as one acre or larger, or with primarily agricultural, grazing or open space uses.

C.2.f. Corporation Yard BMP Implementation

Place an **X** in the boxes below that apply to your corporations yard(s):

	We do not have a corporation yard
	Our corporation yard is a filed NOI facility and regulated by the California State Industrial Stormwater NPDES General Permit
X	We certify that we have a current **Stormwater Pollution Prevention Plan (SWPPP)** for the Corporation Yard(s)

Place an **X** in the boxes below next to implemented SWPPP BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of the BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of pollutant discharges to storm drains such as wash waters from cleaning vehicles and equipment
X	Routine inspection prior to the rainy seasons of corporation yard(s) to ensure non-stormwater discharges have not entered the storm drain system
X	Containment of all vehicle and equipment wash areas through plumbing to sanitary or another collection method
X	Use of dry cleanup methods when cleaning debris and spills from corporation yard(s) or collection of all wash water and disposing of wash water to sanitary or other location where it does not impact surface or groundwater when wet cleanup methods are used
X	Cover and/or berm outdoor storage areas containing waste pollutants

Comments:
Corporation Yard SWPPPP is in place and being implemented. The SWPPP has been in place since 1996 and was fully updated in 2004. Implementation includes use of SWPPP recommended BMPs, annual training and yard walk-thru/ self-inspection. The Corp Yard* is included in annual Urban Runoff Inspection Program (see Section 4: IND/Comm Inspection Program). Newly implemented is a Self-Inspection Form, and will yield data/results in then next FY Annual Report.

If you have a corporation yard(s) that is not an NOI facility , complete the following table for inspection results for your corporation yard(s) or attach a summary including the following information:

Corporation Yard Name	**Inspection Date** (1x/year required)	**Inspection Findings/Results**	**Follow-up Actions**
Campbell Service Yard	5/28/10	Review, per SWPPP, during walk-thru included: o Location of SWPPP => in office o Location of Adsorbent Stations => in place, accessible, stocked o Housekeeping BMPs => in place and implemented o Outdoor Storage BMPs (materials, chemicals, waste	• BMP Follow-up: None • Conduct Wet Weather Observation during next rainy season.

		areas) => areas are clean and contained o Outdoor Process BMPs (wash rack, fueling stations) – in place, functioning o Visual inspection of on-site SD/CBs => clear, no evidence of non-stormwater discharges

Section 3 - Provision C.3 Reporting New Development and Redevelopment

C.3.a. New Development and Redevelopment Performance Standard Implementation Summary Report

(For FY 10-11Annual Report only) Provide a brief summary of the methods of implementation of Provisions C.3.a.i.(1)-(8).

Summary:
Not required for this Annual Report

C.3.b. Green Streets Status Report

(All projects to be completed by December 1, 2014)

On an annual basis (if applicable), report on the status of any pilot green street projects within your jurisdiction. For each completed project, report the capital costs, operation and maintenance costs, legal and procedural arrangements in place to address operation and maintenance and its associated costs, and the sustainable landscape measures incorporated in the project including, if relevant, the score from the Bay-Friendly Landscape Scorecard.

Summary:
Currently under consideration as one of SCVURPPP's required Green Street Projects is Campbell's Hacienda Avenue Street Rehabilitation project. The project's concept design for green street components and corresponding grant application have been approved by Campbell's City Council for submission, and are now awaiting response from the Grants Committee [Urban Greening for Sustainable Communities Grant Program]. The Grant Application was submitted with support letters from SCVURPPP and RWQCB.

See Appendix C3: Attachment C3b Grant Application Project Description for a brief description of City of Campbell's proposed project at Hacienda Avenue. Also see SCVURPPP's FY0910 Annual Report Section C.3 New Development and Redevelopment for a description of C3PO AHTG Green Streets Work Group and the BASMAA Development Committee activities [note: there may also be a separate BASMAA report regarding region-wide efforts on this topic].

C.3.b.v.(1) Regulated Projects Reporting Table

Fill in attached table **C.3.b.v.(1)** or attach your own table including the same information

See Appendix C3: Attachment C3bv(1) Regulated Projects Reporting Table

C.3.h.iv. Installed Stormwater Treatment Systems Operation and Maintenance Verification Inspection Program Reporting

(1) Fill in attached table **C.3.h.iv.(1)** or attach your own table including the same information

SEE Appendix C3: Attachment C3hiv Installed Stormwater Treatment Systems Operation/Maintenance Verification Inspection Program Reporting

(2) On an annual basis, provide a discussion of the inspection findings for the year and any common problems encountered with various types of treatment systems and/or HM controls. This discussion should include a general comparison to the inspection findings from the previous year.

Summary:

Inspections of existing facilities indicated that no major issues were encountered and that all facilities appeared to be operating effectively; This year's inspections were consistent with last years.

(3) On an annual basis, provide a discussion of the effectiveness of the O&M Program and any proposed changes to improve the O&M Program (e.g., changes in prioritization plan or frequency of O&M inspections, other changes to improve effectiveness program).

Summary:

Due to limited inventory, annual inspections are currently conducted at each facility; however as inventory, field conditions, and/or staffing levels change, adjustments to frequency may need to be incorporated into the program.

Section 4 – Provision C.4 Industrial and Commercial Site Controls

C.4.a.ii Legal Authority

(For FY 09-10 Annual Report only) Do you have adequate legal authority to obtain effective stormwater pollutant control on industrial sites?	X	**Yes**		**No**

If **No**, explain:

C.4.c.ii.(5) Enforcement Response Plan

(For FY 09-10 Annual Report only) Have you developed and implemented an Enforcement Response Plan by April 1, 2010?	X	**Yes**		**No**

If **No**, explain:

Program Highlights

Provide background information, highlights, trends, etc. For FY 09-10 Annual Report describe steps taken to revise your program to meet new data tracking and reporting requirements.

Continued integrated Stormwater/Urban Runoff Inspections with Santa Clara Department of Environmental Health (SCC DEH) in Food Facilities and with Santa Clara Fire Department/HazMat (SCC FD) for Industrial/Commercial inspections. Met with SCC FD for annual review of program, types of facilities to be inspected and changes due to MRP. Met with SCC DEH in a series of meetings to review program and prepare for a comprehensive training session on the MRP, stormwater inspection requirements and filling out new inspection forms. Conducted Training for DEH inspectors on Urban Run-off, including focus on POC Litter/trash. Met again with SCC DEH to review reporting and data requirements for new MRP/ Annual Reporting Format.

Participation in IND/IDDE Ah Hoc Tack Group was provided by West Valley Clean Water Program Staff on behalf of our agency, and includes AHTG member discussions and review of AHTG work products. See SCVURPPP FY0910 Annual Report, Section C.4. Industrial and Commercial Site Controls for a description of activities of the IND/IDDE AHTG and the BASMAA Municipal Operations Committee.

C.4.b.i. Business Inspection Plan

(For FY 09-10 Annual Report only) Do you have a Business Inspection Plan?	X	**Yes**		**No**

If No, explain:

C.4.b.iii.(1) Potential Facilities List

List below or attach your list of industrial and commercial facilities in your Inspection Plan to inspect that could reasonably be considered to cause or contribute to pollution of stormwater runoff.

See APPENDIX C4: Attachment C4biii(1) Potential Facilities List

C.4.b.iii.(2) Facilities Scheduled for Inspection

List below or attach your list of facilities scheduled for inspection during the current fiscal year.

See APPENDIX C4: Attachment C4biii(2) Facilities Scheduled

C.4.c.iii.(1) Facility Inspections

Fill out the following table or attach a summary of the following information.

	Number	Percent
Number of businesses inspected (if known)	409	
Total number of inspections conducted	476	
Violations issued (excluding verbal warnings)	4	
Sites inspected in violation	3	<1%
Violations[1] resolved within 10 working days or otherwise deemed resolved in a longer but still timely manner	4	100%

[1] Total number of violations equals the number of initial enforcement actions (i.e. one violation issued for several problems during an inspection at a site). It does not equal the total number of enforcement actions because one violation issued at a site may have a second enforcement action for the same violation at the next inspection if it is not corrected.

C.4.c.iii.(2) Frequency and Types/Categories of Violations Observed

Fill out the following table or attach a summary of the following information.

Data collected in this section is based on a method of counting rather than being captured while in the field. During the past year, new forms and guidelines have been put in place to be consistent in the future Annual Reports and MRP requirements.

Type/Category of Violations Observed	Number of Violations
Actual discharge (e.g. non-stormwater discharge)	1
Potential discharge (e.g. BMPs not in place or ineffective)	3

C.4.c.iii.(2) Frequency and Type of Enforcement Conducted

Fill out the following table or attach a summary of the following information.

	Enforcement Action (as listed in ERP)[1]	Number of Enforcement Actions Taken	% of Enforcement Actions Taken[2]
Level 1	None/incident resolved	0	0
Level 2	Education/Cooperation	4	<1%
Level 3	Warning Notice (NTC)	0	0
Level 4	Notice of Violation/ Legal Action	0	0
Total		4	<1%

Notes:

[1]Agencies to list specific enforcement actions as defined in their ERPs.

[2]Percentage calculated as number of each type of enforcement action divided by the total number of enforcement actions.

C.4.c.iii.(3) Types of Violations Noted by Business Category

Fill out the following table or attach a summary of the following information.

Data collected in this section is based on a method of counting rather than being captured while in the field. During the past year, new forms and guidelines have been put in place to be consistent in the future Annual Reports and MRP requirements.

Business Category[1]	Actual Discharge Violations	Potential Discharge Violations
Food Facilities	0	1
Automotive	1	2

Notes:

[1] List your Program's standard business categories.

C.4.c.iii.(4) Non-Filers

List below or attach a list of the facilities required to have coverage under the Industrial General Permit but have not filed for coverage:

No industries identified as non-filers during scheduled inspections during this fiscal year

C.4.d.iii Staff Training Summary

Training Name	Training Dates	Topics Covered	No. of Inspectors in Attendance	Percent of Inspectors in Attendance
DEH Urban Run-off Inspector Training	06-16-10	Appropriate BMPS, POC and new inspection reporting forms and procedures	8	88%

West Valley Clean Water Program

Section 5 – Provision C.5 Illicit Discharge Detection and Elimination

C.5.a.ii Legal Authority

(For FY 09-10 Annual Report only) Do you have adequate legal authority to prohibit and control illicit discharges and escalate stricter enforcement to achieve expedient compliance?	X	**Yes**		**No**

If **No**, explain:

C.5.b.ii.(4) Enforcement Response Plan

(For FY 09-10 Annual Report only) Have you developed and implemented an Enforcement Response Plan by April 1, 2010?	X	**Yes**		**No**

If **No**, explain:

Program Highlights

Provide background information, highlights, trends, etc. For FY 09-10 Annual Report describe steps taken to revise your program to meet new data tracking and reporting requirements.

Made map(s) of the MS4 publicly available by July 1, 2010; continued to implement a collection system screening program; Participation in SCVURPPP's IND/IDDE Ad Hoc Task Group (AHTG) was provided by West Valley Clean Water Program Staff on behalf of our agency, and includes AHTG member discussions and review of AHTG work products;.and SCVURPPP staff provided participation in the BASMAA Municipal Operations Committee. Refer to the C.5 Illicit Discharge Detection and Elimination section of Program's FY 09-10 Annual Report for description of activities of the IND/IDDE AHTG and the BASMAA Municipal Operations Committee.

C.5.c.iii Complaint and Spill Response Phone Number and Spill Contact List

List below or attach your complaint and spill response phone number and spill contact list.

See APPENDIX C5: Attachment: C5ciii Construction-Illegal Discharge-Industrial Contacts

Contact	Description	Phone Number

C.5.d.iii Evaluation of Mobile Business Program

Describe implementation of minimum standards and BMPs for mobile businesses and your enforcement strategy. This may include participation in the BASMAA Mobile Surface Cleaners regional program or local activities.

Description:

Response to complaints/ observations of illicit discharges is thru WVCWP, who follows ERP procedures and conveys appropriate information, such as BMPs recommended by BASMAA Mobile Surface Cleaners Program. Municipal Staff and contractors are directed to utilize the same Mobile Surface Cleaner BMPs. See also SCVURPPP's FY 0910 Annual Report, Section C.5 Illicit Discharge Detection and Elimination, for a description of efforts by IND/IDDE AHTG and the BASMAA Municipal Operations Committee to address mobile businesses.

C.5.e.iii Evaluation of Collection System Screening Program

Provide a summary or attach a summary of your collection screening program, a summary of problems found during collection system screening and any changes to the screening program this FY.

Description:

Continued with efforts to inspect the storm drain system and clean at least 50% of the system. Meetings with the contractor to modify data collection, to separately report man-made debris (litter) from leaves/natural debris, and to begin tracking storm drain markings Data and field reports will be used during the next cycle of system inspection and cleaning. Efforts are also underway to maximize system cleaning areas based on priority/need rather than simple geographic boundries, and which takes into account probable trash capture device locations. See also SCVURPPP's FY 0910 Annual Report, Section C.5 Illicit Discharge Detection and Elimination, for a description of the IND/IDDE AHTG activities, including development of *collection system screening program guidance*.

C.5.f.iii.(1), (2), (3) Spill and Discharge Complaint Tracking

Spill and Discharge Complaint Tracking (fill out the following table or include an attachment of the following information)

	Number	Percentage
Discharges reported (C.5.f.iii.(1))	9	
Discharges reaching storm drains and/or receiving waters (C.5.f.iii.(2))	2	22%
Discharges resolved in a timely manner (C.5.f.iii.(3))	9	100%

C.5.f.iii.(4) Summary of major types of discharges and complaints
Provide a narrative or attach a table and/or graph.
See APPENDIX C5: Attachment: A.C.5.f.iii(4) Summary of IDDE by Incident Type.

Section 6 – Provision C.6 Construction Site Controls

C.6.a.iii Legal Authority

(For FY 09-10 Annual Report only) Is your agency's legal authority adequate for C.6 compliance?	X	**Yes**		**No**
If **No**, explain:				

C.6.b.ii.(3) Enforcement Response Plan

(For FY 09-10 Annual Report only) Was your Enforcement Response Plan developed and implemented by April 1, 2010?	X	**Yes**		**No**
If **No**, explain:				

C.6.e.iii.1.a, b, c Site/Inspection Totals

Number of sites disturbing < 1 acre of soil requiring storm water runoff quality inspection (i.e. High Priority) (C.6.e.iii.1.a)	**Number of sites disturbing ≥ 1 acre of soil** (C.6.e.iii.1.b)	**Total number of storm water runoff quality inspections conducted** (C.6.e.iii.1.c)
Data not captured this year	Data not captured this year	Data not captured this year

C.6.e.iii.1.d Construction Activities Storm Water Violations

BMP Category	Number of Violations[1]	% of Total Violations[2]
Erosion Control	Data not captured this year	Data not captured this year
Run-on and Run-off Control	Data not captured this year	Data not captured this year
Sediment Control	Data not captured this year	Data not captured this year
Active Treatment Systems	Data not captured this year	Data not captured this year
Good Site Management	Data not captured this year	Data not captured this year
Non Stormwater Management	Data not captured this year	Data not captured this year
Total		

Notes:
[1]Count one violation in a category for each site and inspection regardless of how many violations/problems occurred in the BMP category.
[2]Percentage calculated as number of violations in each category divided by total number of violations in all six categories.

C.6.e.iii.1.e Construction Related Storm Water Enforcement Actions

	Enforcement Action (as listed in ERP)[1]	Number Enforcement Actions Taken	% Enforcement Actions Taken[2]
Level 1	No action/ no incident found	Data not captured this year	
Level 2	Verbal Warning and/or Education	Data not captured this year	Data not captured this year
Level 3	Notice to Comply	Data not captured this year	Data not captured this year
Level 4	Notice of Violation/ Administrative Action/ Penalties	Data not captured this year	Data not captured this year
Total			

Notes:
[1]Agencies should list the specific enforcement actions as defined in their ERPs.
[2]Percentage calculated as number of each type of enforcement action divided by the total number of enforcement actions.

C.6.e.iii.1.f, g Illicit Discharges

	Number
Number of illicit discharges, actual and those inferred through evidence (C.6.e.iii.1.f)	Data not captured this year
Number of sites with discharges, actual and those inferred through evidence (C.6.e.iii.1.g)	Data not captured this year

C.6.e.iii.1.h, i Violation Correction Times

	Number	Percent
Violations fully corrected within 10 business days after violations are discovered or otherwise considered corrected in a timely period (C.6.e.iii.1.h)	Data not captured this year	Data not captured this year
Violations not fully corrected within 30 days after violations are discovered (C.6.e.iii.1.i)	Data not captured this year	Data not captured this year
Total number of violations for the reporting year[1]	Data not captured this year	Data not captured this year

Notes:

[1]Total number of violations equals the number of initial enforcement actions (i.e. one violation issued for several problems during an inspection at a site). It does not equal the total number of enforcement actions because one violation issued at a site may have a second enforcement action for the same violation at the next inspection if it is not corrected.

[2]Calculated as number of violations fully corrected in a timely period after the violations are discovered divided by the total number of violations for the reporting year.

[3]Calculated as number of violations not fully corrected within 30 days after the violations are discovered divided by the total number of violations for the reporting year.

C.6.e.iii.(2) Evaluation of Inspection Data

Describe your evaluation of the tracking data and data summaries and provide information on the evaluation results (e.g., data trends, typical BMP performance issues, comparisons to previous years, etc.).

Description:

While in-field observation and enforcement of stormwater / construction site BMPs have been conducted as a matter of routine, formal tracking and inspection reports are new implementation levels effective with the MRP. During FY0910 efforts were focused on the development and review of SW Inspection Data Collection Forms and corresponding data tracking tables thru participation in SCVURPPP's C3PO AHTG. Training and use of new county-wide inspection forms is scheduled for implementation during FY1011 and will be reflected in the next Annual Report.

C.6.e.iii.(2) Evaluation of Inspection Program Effectiveness

Describe what appear to be your program's strengths and weaknesses, and identify needed improvements, including education and outreach.

Description:
Generally contractors working in the area are well aware of stormwater/urban runoff protection BMPs, so typical issues that come up are quickly addressed/resolved before a discharge occurs. In FY 09-10 efforts were focused on the development and review of SW Inspection Data Collection Forms and corresponding data tracking tables thru participation in SCVURPPP's C3PO AHTG. Training and use of new county-wide inspection forms is scheduled for implementation during FY1011 and will be reflected in the next Annual Report. In Los Gatos, a limited number of inspections were conducted while field testing early versions of data collection forms to introduce inspectors to their use and field test SOP for recording data in preparation for Annual Report. WVCWP will provide training to inspectors on the new SCVURPPP data collection forms and excel data tracking spreadsheets in Fall 2010 and subsequently inspections with the new forms will begin. Participation in the SCVURPPP's Construction Ad Hoc Task Group (AHTG) was provided by WVCWP and includes review of AHTG products; Participation in the BASMAA Development Committee was provided through SCVURPPP. Refer to SCVURPPP's FY0910 C.6 Construction Site Control section of the Annual Report for a description of activities of the Construction AHTG and the BASMAA Development Committee.

C.6.f Staff Training Summary

Training Name	Training Dates	Topics Covered	No. of Inspectors in Attendance	Percent of Inspectors in Attendance
SCVURPPP Annual Inspector Training	10/21/09	Construction Site Inspection Training • Current construction site regulations & responsibilities • effective erosion and sediment control BMPs • inspection procedures See SCVURPPP FY09-10 Annual Report for more details.	2	Data not tracked in this format this year
SCVURPPP Construction Stormwater Management Workshop	1/19/10 and 1/20/10	Construction Management: Stormwater • How to comply with the New Statewide Construction General Permit • Simple and effective stormwater BMPs (Best Management Practices) for small and large construction projects • Selecting and maintaining BMPs during construction • Monitoring and reporting requirements • Post construction stormwater management	2	Data not tracked in this format this year

		techniques See SCVURPPP FY09-10 Annual Report for more details.		
SCVURPPP Annual C3 Workshop	6/8/10	Complying with New Stormwater Requirements for New and Redevlopment Projects See SCVURPPP FY09-10 Annual Report for more details.	3	Data not tracked in this format this year

West Valley Clean Water Program

Section 7 – Provision C.7. Public Information and Outreach

C.7.b.ii.1 Advertising Campaign

Summarize advertising efforts. Include details such as messages, creative developed, and outreach media used. The detailed advertising report may be included as an attachment. If advertising is being done by participation in a countywide or regional program, refer to the separate countywide or regional Annual Report.

Summary:

Centralized advertising campaign for stormwater/urban runoff is conducted through SCVURPPP and BASMAA. The following reports summarize countywide advertising efforts conducted during FY09-10 and are included in the Program's FY0910 Annual Report Section C.7 Public Information and Outreach:

- FY 09-10 Watershed Watch Campaign Annual Campaign Report
- FY 09-10 Watershed Watch Partner Report
- FY 09-10 Watershed Watch Web Statistics ReportActive participation in SCVURPPP's AHTG is through West Valley Clean Water program, whose staff provides review and input on deliverables and strategies. In addition, local advertising is carried out through West Valley Clean Water Program (WVCWP), is directed towards specific POCs and demographic characteristics of the West Valley Communities of Campbell, Los Gatos, Monte Sereno and Saratoga. WVCWP's main strategy in recent years is to move away from paid 'advertisements,' and focus on placing selected articles in local municipal newsletters (mailed and/or online), local newspaper and developing target specific 'give-away' items for distribution at events. The give-away items which are bundled w/literature, are incentives to take the printed information and 'motivate the recipient to action.' WV CWP also 'advertises' at various municipal facilities with posters and flyers for local and municipal sponsored events. WVCWP also supports and utilizes the Watershed Watch website to advertise local events (i.e., Mercury take back events). Details regarding local advertising and material distribution efforts are included in Appendix C7.

SEE APPENDIX C7: Attachment C7bc Local Advertising and Media Relations

C.7.b.iii.1 Pre-Campaign Survey

(For the FY 10-11 Annual Report only) Summarize survey information such as sample size, type of survey (telephone survey, interviews etc.). Attach a survey report that includes the following information. If survey was done regionally, refer to a regional submittal that contains the following information:

Not required for this Annual Report

- Summary of how the survey was implemented.
- Analysis of the survey results.
- Discussion of the outreach strategies based on the survey results.
- Discussion of planned or future advertising campaigns to influence awareness and behavior changes regarding trash/litter and pesticides.

Place an **X** in the appropriate box below:

	Survey report attached
	Reference to regional submittal:

C.7.c Media Relations

Summarize the media relations effort. Include the following details for each media pitch in the space below, AND/OR refer to a regional report that includes these details:

- Topic and content of pitch
- Medium (TV, radio, print, online)
- Date of publication/broadcast

Summary:

Media Relations for stormwater/urban runoff is conducted through SCVURPPP and BASMAA. The following separate report developed by BASMAA summarizes media relations efforts conducted during FY 09-10:

- BASMAA Media Relations Final Report

This report is included within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report

Active participation in SCVURPPP's AHTG is through West Valley Clean Water program, which provides review of deliverables and strategies; for example WVCWP staff participated in AHTG review and provided feedback on bus ads for anti-litter campaign, participated in development and review of a video ad for the anti-litter campaign.

Local media coverage is coordinated through West Valley Clean Water Program (WVCWP), and focuses press release/articles on local events addressing specific POCs and BMPs of interest to the demographic characteristics within the West Valley Communities. Media coverage in the WV area consists of 3 local weekly papers (Campbell Reporter, Los Gatos Weekly, Saratoga News), four Municipal Newsletters (printed/mailed, e-delivery and online available), municipal website postings and postings in municipal facilities. Press Releases to local papers typically involve a local event or occurrence which provides an opportunity to highlight a POC and corresponding pollution prevention measure which residents can employ. Articles in municipal newsletters typically provides an opportunity to inform residents of POCs in a more direct or restrictive manner, as well as provide BMP options for preventing polluted discharges to the storm drain system and creeks. In addition to urban runoff specific articles, municipal newsletters often carry other relevant topics to stormwater, such as HHW, composting or solid waste. Use of municipal websites for conveying information tends to be more abbreviated sound bites, quick tips or notification of events. This type of communication works best with time sensitive and transient information. For examples and details regarding local press and media related efforts **SEE APPENDIX C7: Attachment C7bc Local Advertising and Media Relations.**

C.7.d Stormwater Point of Contact

(For FY 09-10 Annual Report only, unless changes made) Provide details of website or phone number used as the point of contact. Report on how the point of contact is publicized and maintained. If any change occurs in this contact, report in a subsequent Annual Report.

Contact Summary:

The main stormwater pollution prevention point-of-contact to the general public is publicized and maintained thru the West Valley Clean Water Program, joint urban runoff program for City of Campbell, Town of Los Gatos, City of Montes Sereno and City of Saratoga.

WVCWP website address: http://www.cleancreeks.org

WVCWP general information e-mail: info@cleancreeks.org

WVCWP general information phone number: 408.354.5385

Contact information is publicized on locally created and distributed materials and articles, on SCVURPPP outreach materials and websites (which is maintained by the Program and their authorized agents).

Collectively, with other SCVURPPP co-permittees, the Watershed Watch Campaign provides a hotline (1-866-WATHERSHED) and online ability to make inquiries, report illegal discharges and find volunteer opportunities (www.mywatershedwatch.org).

C.7.e Public Outreach Events

Describe general approach to event selection. Provide a list of outreach materials and giveaways distributed.

Use the following table for reporting and evaluating public outreach events

We work together with three other west valley communities through our joint urban runoff program, West Valley Clean Water Program (WVCWP) and SCVURPPP to collectively meet Public Outreach Event participation levels. Event selection (type of event and level of support/hosting) is based upon pollutant of concern, applicability, and ability to influence local residents. WVCWP also participates in SCVURPPP's WEO AHTG and its various sub-groups, and typically provides staffing for various SCVURPPP events. See SCVURPPP's Table "C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report" summarizing countywide Public Outreach events.:

For local events highlighting urban runoff and stormwater pollution prevention, the level of effort for support is largely based upon an estimated return on effort – the first level of effort is utilization/leveraging of an existing event. Utilization of an existing/related municipal event (i.e., municipal Public Works Open House event), dictates that stormwater messages be general topics with highlights of common POCs -like litter and pesticides. Typically such an event lends itself simply to dissemination of literature and requires a high content of 'give-aways' to entice visitors in engagment of information sharing. Leveraging a broader based county-wide or nationally recognized event (like Pollution Prevention Week) provides a better opportunity to focus on POCs and gain a higher return of audience interaction; plus there is the added benefit to 'scale' – higher visibility /publicity without exponential increase of cost or resources. The second level of effort is a partnership or co-hosting of an event, where efforts are shared. Examples are our partnership with schools for school-yard/creek clean-ups and co-hosting Mercury Thermometer Exchange Events. The third level of effort is solely hosting an event for the single purpose of stormwater information dissemination and/or public participation (i.e., trash hot spot clean-up, staff training).

For more information on local Public Outreach Events see **APPENDIX C7: Attachment C7egh Events**

Event Details	**Description** (messages, audience)	**Evaluation of Effectiveness**
Provide event name, date, and location. Indicate if event is local, countywide or regional.	Identify type of event (e.g., school fair, farmers market etc.), type of audience (school children, gardeners, homeowners etc.) and outreach messages (e.g., Enviroscape presentation, pesticides, stormwater awareness)	Provide general staff feedback on the event (e.g., success at reaching a broad spectrum of the community, well attended, good opportunity to talk to gardeners etc.). Provide other details such as: • Estimated overall attendance at the event. • Number of people that visited the booth, comparison with previous years • Number of brochures and giveaways distributed • Results of any spot surveys conducted
Event: Car Wash Fundraising Event	Type of Event: private -fundraising [Susan G.	Feedback: This event was successful and the group

Dates: 7/26/09 Location: Del Taco Parking Lot, Campbell Local, private event Fundraiser,	Komen Cancer "Walk for Life"] Audience: residents Message: prevent runoff pollution from car washing	returned in June 2010 to borrow the Kit again. Estimated Attendance: 4 adults managed the car wash; unknown how many cars passed thru, however organizer was satisfied with amount of funds raised for each day.
Event: Pollution Prevention Resource Fair Date: 9/23/09 Location: Campbell Community Center Local event, part of National Event (Pollution Prevention Week)	Type of Event: Thermometer Exchange, battery recycling, eyeglasses drop-off, cell-phone recycling, and medications disposal. Audience: residents. Message: stormwater and pollution, especially mercury pollution (i.e. related to the thermometer and battery recycling opportunity).	Estimated Attendance: 150 residents Items collected: 242.5 lbs of pharmaceuticals 57 thermometers 18 cell phones 95.5 lbs of batteries Brochures & Giveaways Distributed: 99x - reusable bags. 45x -- Native Seed Packets with Healthy Gardens: Naturally Managing Pests flyer 30x -- /10 pollution prevention tri-fold with Watershed Watch Discount Card 44x -- Fly Swatters 18x -- Pest or Pal Activity guide 14x -- Pests Bugging You?
Event: Thermometer Exchange Date: 10/7/09 Location: Saratoga Senior/ Community Center Local, part of POTW regional effort	Type of Event: Thermometer Exchange, battery recycling, eyeglasses drop-off, and cell-phone recycling Audience: residents.in particular senior citizens; Message: stormwater and pollution, especially mercury pollution (i.e. related to the thermometer and battery recycling opportunity).	Feedback: This event was successful with Saratoga's senior citizens; they appeared to be residents who had a number of glass thermometers that needed to be properly disposed of. Estimated Attendance: 126 residents Items collected: 216 mercury thermometers
Event: Thermometer Exchange Date: 4/11/10 Location: Los Gatos Farmers' Market Local, part of "Keep Los Gatos Beautiful" Month .	Type of Event: Thermometer Exchange Audience: residents, in particular senior citizens; Message: stormwater and pollution, especially mercury pollution (i.e. related to the thermometer and battery recycling opportunity).	Feedback: Due to very rainy weather at this outdoor event, it turned out to not be very productive. Extensive outreach/advertising had been conducted. Estimated Attendance: 10 residents stopped at booth, despite rainy conditions. Items collected: 1 mercury thermometer was

		collected. Brochures & Giveaways Distributed: 10x - HHW Tri-fold 1x – Medication Disposal 1x - Seafood Watch Guide – Spanish 1x - Seafood Watch – Sushi Guid 1x – What You Don't Know About Mercury 8x – Grease Scrapers 4x – Grow It Guide 4x – 10 Most Wanted Bugs 1x – Wonder of our Water Works
Event: Arbor Day Date: Location: City of Campbell Local, part of national recognition of Arbor Day and Earth Day	Type of Event: Annual event recognizing efforts to preserve trees. Audience: residents Message: The value of trees, and encourage planting of trees appropriate to the area (pest resistant, etc.).	Feedback: Well attended by students and residents
Event: Arbor Day Date: 4/22/10 Location: City of Saratoga, Azule Park Local, part of national recognition of Arbor Day and Earth Day	Type of Event: Annual event recognizing efforts to preserve trees. Audience: residents, youth/children Message: The value of trees, and encourage planting of trees appropriate to the area (pest resistant, etc.).	Feedback: Well attended by students and residents Estimated Attendance: 60 attendees Brochures & Giveaways Distributed: 5x – "You are the Solution to Water Pollution" 15x – "Kids Guide to Backyard Bugs" 18x – "Pests Bugging You" brochures 38x – "Original Pest Control" fly swatters
Event: Arbor Day Date: 4/30/10 Location: Town of Los Gatos, Belgatos Park Local, part of national recognition of Arbor Day and Earth Day	Type of Event: Annual event recognizing efforts to preserve trees. Audience: residents, youth/children; Targeted the Bel Gatos neighborhood and local schools. Message: The value of trees, and encourage planting of trees appropriate to the area (pest resistant, etc.).	Feedback: This year was a celebration of the Town's 30th year to have been named a "Tree City USA". Town staff planted 30 trees at various park locations in recognition of this honor. Estimated Attendance: 100 elementary schoolchildren from Mulberry School – pre-K through 5th grade and many residents Brochures & Giveaways Distributed: 14x – "Soil Matters" booklets 8x – "Stream Care Guide" booklets

		12x – "Pests Bugging You" brochures 14x – "Clean It Guides" 80x – "Original Pest Control" fly swatters 50x – "Get the Scoop – Don't Pollute" pencils 100x – "Pest or Pal" Activity guides/booklets
Event: Bike to Work Day 2 Date: May 13, 2010 Locations: City of Campbell Municipal offices Local, part of regional/national recognition	Type of Event: Annual event held on the third Friday of May across the United States and Canada that promotes the bicycle as an option for commuting to work. Audience: Municipal employees Message: Encourage people to try bicycle commuting as an alternative to driving, which can help reduced various forms of pollution, including copper pollution in waterways.	Feedback: Muni offices received positive feedback from staff who participated in the event.
Event: Bike to Work Day 2 Date: May 13, 2010 Locations: Town of Los Gatos Municipal offices Local, part of regional/national recognition	Type of Event: Annual event held on the third Friday of May across the United States and Canada that promotes the bicycle as an option for commuting to work. Audience: Municipal employees Message: Encourage people to try bicycle commuting as an alternative to driving, which can help reduced various forms of pollution, including copper pollution in waterways.	Feedback: Muni offices received positive feedback from staff who participated in the event.
Event: Watershed Watch Car Wash Event Date: May 19, 2010 Location: Delta Queen Classic Car Wash, 981 E Hamilton Ave, Campbell Regional/ Countywide	Type of Event: Type of Event: Car Wash Audience: Residents/ car wash customers Message: Impacts of car washing on stormwater pollution.	Feedback: Due to a rainy day forecast, attendance was low at this event. Estimated Attendance: 45 vehicles Brochures & Giveaways Distributed: 34 Watershed Brochures (gen outreach) 49 Watershed Watch Discount Cards
Event: Los Gatos Public Works Open House Date: 5/19/10 Location: Town of Los Gatos Corporation Yard Local, part of regional/national recognition	Type of Event: Municipal Outreach and Education Audience: Residents, Students (3rd Grade) Message: ,General stormwater pollution, w/ demonstration using Enviroscape	Feedback: This event was well-attended. Estimated Attendance: 80 Third Grade students,6 teachers and 9 parent chaperones; additionally several members of the public (residents) and a few neighboring municipal staff members Brochures & Giveaways Distributed:

		6x – "Naturally Managing Pests" IPM Fact Sheet 12x – Copper Tri-fold with Discount Card 9x – "Original Pest Control" fly swatter 40x – "Get the Scoop – Don't Pollute" pencils 40x – "Watershed Watch" tattoos
1 Event: Classroom Enviroscape Demonstration Date: 5/20/10 Location: St. Mary's School (K-8), Los Gatos Local	Type of Event: Annual School Outreach Audience: Students (Kdg) Message: ,General stormwater pollution, including: trash/litter, re-usable containers in lunches, pet waste, car washing, pesticides, vehicle fluids and construction dirt.	Feedback: The teachers gave positive feedback, and stated they would like to continue to have WVCWP return each year. Attendance: 28 Students (2 Kindergarten classes), 2 Teachers Brochures & Giveaways Distributed: 28 pencils and "Watershed Puzzles Worksheets"
Event: Car Wash Fundraising Event Dates: 6/26/10 Location: Del Taco Parking Lot, Campbell Local, private event Fundraiser,	Type of Event: private -fundraising [Susan G. Komen Cancer "Walk for Life"] Audience: residents Message: prevent runoff pollution from car washing	Feedback: This is the same group returning to borrow the Kit again. The group has informed WVCWP they would like to make their car wash an annual fundraiser, and continue to utilize the car wash kit. Estimated Attendance: 4 adults plus 4 kids managed the car wash; unknown how many cars passed thru, however organizer was satisfied with amount of funds raised for each day.

C.7.f. Watershed Stewardship Collaborative Efforts

Summarize watershed stewardship collaborative efforts and/or refer to a regional report that provides details. Describe the level of effort and support given (e.g., funding only, active participation etc.). State efforts undertaken and the results of these efforts. If this activity is done regionally refer to a regional report.

Evaluate effectiveness by describing the following:

- Efforts undertaken
- Major accomplishments

Summary:

During FY 09-10, the Program actively supported the Santa Clara Basin Watershed Initiative (SCBWMI), including the Core Group, the Land Use Subgroup, and the Trash Subgroup (now the Santa Clara Valley Zero Litter Initiative, aka ZLI); the Bay Area Macroinvertebrate Bioassessment Information Network (BAMBI); and the Stevens & Permanente Creeks Watershed Council; Information on these efforts is included within the C.7 Public Information and Outreach section of the Program's FY 09-10 Annual Report. WVCWP was also active in the Silicon Valley Anti-Litter

Campaign (SCVAL) and Trash Subgroup (now the Santa Clara Valley Zero Litter Initiative, aka ZLI).

C.7.g. Citizen Involvement Events

List the types of events conducted (e.g., creek clean up, storm drain inlet marking, native gardening etc.). Use the following table for reporting and evaluating citizen involvement events.

Event Details	Description	Evaluation of effectiveness
Provide event name, date, and location. Indicate if event is local, countywide or regional	Describe activity (e.g., creek clean-up, storm drain marking etc.)	Provide general staff feedback on the event. Provide other evaluation details such as: • Number of participants. Any change in participation from previous years. • Distance of creek or water body cleaned • Quantity of trash/recyclables collected (weight or volume). • Number of inlets marked. • Data trends
The following separate reports developed by SCVURPPP and other organizations also include information about citizen involvement events conducted during FY 09-10: • Watershed Watchers: Keeping Our Waterways Clean: FY 09-10 Fourth Quarter Report (includes end-of-year Summary from Alviso Education Center) • Going Native Garden Tour 2010- Summary Report These reports are included within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report. For more information on local Citizen Involvement Events see **APPENDIX C7: Attachment C7egh Events**		
Event: Coastal Cleanup Day 2009 Date: 9/19/09 Location: San Tomas Aquino Creek @ Westmont High, Campbell Local site, part of County-wide effort and International event.	Creek Clean Up Event	Volunteers: 11 Results: • Trash collected: 330 Lbs. • Recyclables: 90Lbs.
Event: Great American Pick-up Date: 5/8/10 Location: City of Campbell, 4 sites	Clean Up Event	Volunteers: 100 Results: • 29 partially-filled bags of recyclables

Local site, part of County-wide Effort		• 52 partially-filled bags of trash Materials Distributed: • 8x – "Soil Matters" literature • 10x – "Pests Bugging You" brochure • 14x – "Clean-It Guides" • 5x – "Mercury – What You Don't Know" brochures • 42x – "Strip" thermometers • 4x Copper Tri-fold w/Discount Card attached • 20x "Original Pest Control" fly swatters • 20x – "2000 Creek Cleanup" bandanas • 12x – Lip Balm • 35x – "Get the Scoop – Don't Pollute" pencils • 3x – "Native Plants" seeds with "10 Most Wanted Bugs" brochure attached
Event: Creek Cleanup Date: 4/17/10 Location: Prospect High School/ Saratoga Creek at Prospect Ave, Saratoga Local Event	Creek Clean Up Event	Students that participated were very enthusiastic. Participants: • 11 Prospect High School students • 1 Teacher • WVCWP & City of Saratoga staff Results: • 14 partially-filled 30 gal. trash bags Materials Distributed: • 5x "Your Copper & Your Creeks" tri-folds (with Car Wash Discount card) • 5x "Native Plants" seeds (with "10 Most Wanted" bug brochures attached) • 5x "Original Pest Control" Fly Swatters • 2x "Don't Litter" license plate covers
Event: National River Cleanup Day 2010 Date: 5/15/10 Location: San Tomas Aquino Creek @ Westmont High, Campbell	Creek Clean-Up Event	Volunteers: 16 (8 of these were families associated with a local elementary school where the Zun Zun assembly was held on 12/10/09). Materials Distributed:

Local site, part of County-wide effort and National event.		• 5x – "You're the Solution to Water Pollution" brochures • 10x – "Adopt a Creek" lanyards • 9x - Re-usable bags (sponsored by Safeway) • 10x – "Watershed Watch" tattoos
Event: Classroom Enviroscape Demonstration Date: 5/20/10 Location: St. Mary's School (K-8), Los Gatos Local	School Outreach	Feedback: The teachers gave positive feedback, and stated they would like to continue to have WVCWP return each year. Attendance: 28 Students (2 Kindergarten classes), 2 Teachers Brochures & Giveaways Distributed: • 28 pencils and "Watershed Puzzles Worksheets"

C.7.h. School-Age Children Outreach

Summarize school-age children outreach programs implemented. A detailed report may be included as an attachment.
Use the following table for reporting school-age children outreach efforts.

Program Details	Focus & Short Description	Number of Students/Teachers reached	Evaluation of Effectiveness
Provide the following information: Name, Grade or level (elementary/ middle/ high)	Brief description, messages, methods of outreach used	Provide number or participants	Provide agency staff feedback. Report any other evaluation methods used (quiz, teacher feedback etc.). Attach evaluation summary if applicable.
The following separate reports developed by SCVURPPP and other organizations also include information about school-age children outreach efforts conducted during FY 09-10: • ZunZun School Assemblies for Watershed Watch Campaign- FY 09-10 Academic Year Final Report • Memorandum- Evaluation of the School Assembly Program- FY 09-10 • Watershed Watchers: Keeping Our Waterways Clean: FY 09-10 Fourth Quarter Report (includes end-of-year Summary from Alviso Education Center) These reports are included as within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report. For more information on local School Outreach Events see **APPENDIX C7: Attachment C7egh Events**			

Program Details	Focus & Short Description	Number of Students/ Teachers reached	Evaluation of Effectiveness
ZunZun School Assemblies for Watershed Watch Campaign	See FY 09-10 Academic Year Final Report for assembly details	Marshall Lane Elementary Campbell 12/10/09 2 Shows 550 students	For full details on effectiveness of the Zun Zun shows in general, see the Program (SCVURPPP) report Section C.7.h. and Memorandum- Evaluation of the School Assembly Program- FY 09-10.
		Capri Elementary Campbell 1/26/09 2 Shows 600 students	
		Foothill Elementary Saratoga 5/25/10 1 Show 380 students	
		Argonaut Elementary Saratoga 6/4/10 1 Show 500 students	
Watershed Watchers Program at Don Edwards Wildlife Refuge in Alviso Grade level: K-8	See Watershed Watchers: Keeping Our Waterways Clean: FY 09-10 Fourth Quarter Report (includes end-of-year Summary from Alviso Education Center)	• Christa McAuliffe School • Village Elementary • Sacred Heart • Rolling Hills • Hillbrook • Blossom Hill	For full details on effectiveness of the Watershed Watchers Program, see the Program (SCVURPPP) report Section C.7.h and the Watershed Watchers Fourth Quarter Report included in the Program Annual Report Appendix 7-5. FY 09-10 WVC Schools which sent field trips to the Watershed Watchers Program:

Creek Cleanup Prospect High School Saratoga 4/17/10	Topic: Trash Description: 600 feet of creek bank, near the High School, were cleaned.	Participants: 11 Prospect High School students 1 Teacher WVCWP & City of Saratoga staff	WVCWP provided trash bags, gloves and litter grabbers for this event. Students handled monitoring tasks during cleanup. 14 partially-filled 30 gal. trash bags were collected. See "C.10 Trash" for details. Participants selected the following 'give-away items: • 5x "Your Copper & Your Creeks" tri-folds (with Car Wash Discount card) • 5x "Native Plants" seeds (with "10 Most Wanted" bug brochures attached) • 5x "Original Pest Control" Fly Swatters • 2x "Don't Litter" license plate covers
Creek Cleanup Sacred Heart School (K-8) Saratoga 5/5/10	Topic: Trash Description: Cleanup of a schoolyard and adjacent creek.	Participants: Appx. 40 students 1 parent WVCWP staff	WVCWP provided trash bags, gloves and litter grabbers for this event. This event was very effective in that 40 students, from a small school, participated – which demonstrated a high level of interest. Students handled monitoring tasks. Results: 10 partially-filled bags of trash were collected. Results were: 20 lbs trash 5 lbs recyclables School yard and .5 - .75 miles of creek and creekbank were cleaned.
Los Gatos Public Works Open House 5/19/10 (3rd Grade students attended)	Topics: Litter, Trash, Pet Waste, Car Washing Description: Municipal Public Works/Operations Open House Event	80 Third Grade students attended.	Attendees chose to take: 6x – "Naturally Managing Pests" IPM Fact Sheet 12x – Copper Tri-fold with Discount Card 9x – "Original Pest Control" fly swatter 40x – "Get the Scoop – Don't Pollute" pencils 40x – "Watershed Watch" tattoos This event was well-attended. Until a few years ago, LG staff took this program directly to the schools, but for the past several years the venue has been changed to recruit students to come to

			the Corp Yard itself. It is rewarding to see this many students make the effort to come to the site and attend the event.
Classroom outreach with Enviroscape St. Mary's School (K-8) 5/20/10	Topics: Litter, reusable lunch items, pet waste, car washing Description: Enviroscape Demonstration and Schoolyard litter pick-up	Presentation was given to 2 Kindergarten classes 28 Students 2 Teacjers 1 Parent	Having a relevant story read prior to the presentation was very effective for a Kindergarten class. The students loved the presentation and really knew the answer to the question "where does the water/pollution go?". The teachers also gave positive feedback, and stated they would like to continue to have WVCWP return each year, 28 "Watershed Puzzles Worksheets" were distributed to the students.
Creek Education program at Audubon Environmental Education Center, 3rrd Grade students Various dates in FY 09-10	Topics: creek, watersheds, habitat, litter Description: Creek Education Field Trip	In FY 09-10 student participation was: • Blue Hills School 64 students 14 parents • Meyerholz & Murdoch-Portal Schools combined 15 students

Section 8 - Provision C.8 Water Quality Monitoring

C.8 Water Quality Monitoring
State below if information is reported in a separate regional report. Municipalities can also describe below any Water Quality Monitoring activities in which they participate directly, e.g. participation in RMP workgroups, fieldwork within their jurisdictions, etc.
Summary During FY 09-10, we contributed to the SCVURPPP Monitoring and Assessment Program which conducts water quality monitoring in Santa Clara Valley creeks and rivers. In coordination with the BASMAA Regional Monitoring Coalition (RMC). In addition, we contribute financially to the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP) and actively participate in RMP committees and work groups. For additional information on monitoring activities conducted by SCVURPPP, BASMAA RMC and the RMP, see the C.8 Water Quality Monitoring section of the Program's FY 09-10 Annual Report. Continued participation in SCVURPPP Monitoring AHTG.

Section 9 – Provision C.9 Pesticides Toxicity Controls

C.9.a Adopt an Integrated Pest Management (IPM) Policy or Ordinance

(For FY 09-10 Annual Report only) Attach a copy of your individual IPM ordinance or policy. **See APPENDIX C9: Attachment C.9.a IPM Policy Plan.**	X	**Attached**		**Not attached,** explain below
If **Not attached**, explain:				

C.9.b Implement IPM Policy or Ordinance

Report implementation of IPM BMPs by showing trends in quantities and types of pesticides used, and suggest reasons for increases in use of pesticides that threaten water quality, specifically organophosphorous pesticides, pyrethroids, carbaryl, and fipronil. A separate report can be attached as evidence of your implementation.

Summary:

All pesticide records are filed and available. Typically, little or none of the pesticides listed above are used as a matter of standard operations,to the maximum extent practicable; use of IPM practices has been in place for a number of years. Analysis and identification of trends tends to be less useful in because one chemical may be used for an isolated pest incident one year, then not used again for several years, or not at all as different IPM practices are put into place.

See APPENDIX C9: Attachment C9b Implementation IPM Policy

C.9.c Train Municipal Employees

Enter the number of employees that applied or used pesticides (including herbicides) within the scope of their duties this reporting year.	15
Enter the number of these employees who received training on your IPM policy and IPM standard operating procedures within the last 3 years.	15
Enter the percentage of municipal employees who apply pesticides who have received training in the IPM policy and IPM standard operating procedures within the last three years.	100%

C.9.d Require Contractors to Implement IPM

Did your municipality contract with any pesticide service provider in the reporting year?	X	**Yes**		**No**

If yes, attach one of the following:

	Contract specifications that require adherence to your IPM policy and standard operating procedures, OR
	Copy(ies) of the contractors' IPM certification(s) or equivalent, OR
X	Equivalent documentation. **See APPENDIX C9: Attachment C9d Contractor Implement IPM** Note: Contractors originally signed when IPM policy went into place, and were reminded of policy annually. However, formal signature to the IPM Policy was not collected as a matter of routine because the same contractor has been used through the years. A new signature form has been created and will be presented for signature to contractor annually.

If **Not attached**, explain:

C.9.e Track and Participate in Relevant Regulatory Processes

Summarize participation efforts, information submitted, and how regulatory actions were affected **OR** reference a regional report that summarizes regional participation efforts, information submitted, and how regulatory actions were affected.

Summary:

During FY 09-10, we participated in regulatory processes related to pesticides through contributions to SCVURPPP, BASMAA and CASQA. For additional information, see the Regional Pollutants of Concern Report submitted by BASMAA on behalf of all MRP Permittees. This Report is included within the Program's FY 09-10 Annual Report.

C.9.f Interface with County Agricultural Commissioners

Provide a summary of improper pesticide usage reported to the County Agricultural Commissioner and follow-up actions to correct violations, if any. A separate report can be attached as your summary.

Summary:

No improper pesticide usage to report

C.9.h.ii Public Outreach: Point of Purchase

Provide a summary of public outreach at point of purchase, and any measurable awareness and behavior changes resulting from outreach (here or in a separate report); **OR** reference a report of a regional effort for public outreach in which your agency participates.

Summary:

The following separate reports developed by SCVURPPP and BASMAA summarize point of purchase outreach efforts conducted during FY 09-10:

- FY 09-10 Store Employee Training Report (SCVURPPP)
- FY 09-10 Store Employee Training Evaluation Summary (SCVURPPP)
- FY 09-10 Store Employee Training Status Table (SCVURPPP)
- FY 09-10 List of Stores in the IPM Store Partnership Program (SCVURPPP)
- FY 09-10 BASMAA "Our Water, Our World" (OWOW) Report (BASMAA)

These reports are included within the C.9 Pesticides Toxicity Control section of Program's FY 09-10 Annual Report.

C.9.h.vi Public Outreach: Pest Control Operators

Provide a summary of public outreach to pest control operators and landscapers and reduced pesticide use (here or in a separate report); **OR** reference a report of a regional effort for outreach to pest control operators and landscapers in which your agency participates.

Summary:

The following separate report developed by SCVURPPP summarizes Public Outreach: Pest Control Operators efforts conducted during FY 09-10:

- FY 09-10 Green Gardener Training Report

This report is included within the C.9 Pesticides Toxicity Control section of Program's FY 09-10 Annual Report.

Section 10 - Provision C.10 Trash Load Reduction

C.10.a.i Short-Term Trash Loading Reduction Plan

(For FY 10-11 Annual Report only) Provide description of actions/tasks initiated/conducted/completed in developing a Short-Term Trash Loading Reduction Plan (due February 1, 2012).

Description:

Not required for this Annual Report

C.10.a.ii Baseline Trash Load and Trash Load Reduction Tracking Method

(For FY 10-11 Annual Report only) Provide description of actions/tasks initiated/conducted/completed to gather trash loading data and in developing a Baseline Trash Load and Trash Load Reduction Tracking Method (due February 1, 2012).

Description:

A summary of Program accomplishments for this sub-provision are included within the C.10 Trash Load Reduction section of Program's FY 09-10 Annual Report.

C.10.a.iii Minimum Full Trash Capture

(For FY 10-11 Annual Report and Each Annual Report Thereafter) Provide description of actions/tasks initiated/conducted/completed in implementing Minimum Full Trash Capture Devices (due July 1, 2014) within individual jurisdictions. Include information on Full Trash Capture Devices installed under Bay-area Wide Trash Capture Demonstration Project administered by San Francisco Estuary Partnership.

Description:

A summary of Program accomplishments for this sub-provision are included within the C.10 Trash Load Reduction section of Program's FY 09-10 Annual Report. In addition, the Program recently finalized a technical report detailing the results of its Pilot Trash Structural Treatment Control Study implemented in 2007. This technical report is also available within the C.10 Trash Load Reduction section of Program's FY 09-10 Annual Report..

C.10.b.iii Trash Hot Spot Assessment

(For FY 10-11 Annual Report and Each Annual Report Thereafter) Provide volume of material removed from each Trash Hot Spot cleanup, and the dominant types of trash (e.g., glass, plastics, paper) removed and their sources to the extent possible. Provide required photo documentation.

Fill out the following table or attach a summary of the following information.

See APPENDIX C10: Attachments C10biii Trash Hot Spot Assessment Photos

Trash Hot Spot	Cleanup Date	Volume of Material Removed	Dominant Type of Trash	Trash Sources (where possible)
WVC02 San Tomas Aquino Crk	05-15-10	25 bags/~300 pounds	Bottles, Aluminum Cans, Convenience Food items, Cigarette butts, other plastic products	Trash accumulation
WVC03 Saratoga Creek	4-17-10	14 bags	Convenience Food items, other plastic products, paper/cardboards, aluminum cans, plastic bags	Trash accumulation/Litter
WVC04 Los Gatos Creek	6-15-10	10 bags/7 pounds	Paper/carboard, plastic bags, misc., cigarette butts	Litter

C.10.d Summary of Trash Load Reduction Actions

Provide summary of new trash load reduction actions or increased levels of implementation of existing actions that were implemented after adoption of the MRP (control measures and best management practices) including the types of actions and levels of implementation, and the total trash loads and dominant types of trash removed from each type of action.

Suggested trash load reduction actions to track and report may include:

- Anti-litter Campaigns
- Anti-litter/Dumping Enforcement Activities
- Curbside Recycling Programs
- Education and Outreach Efforts
- Free Trash Pickup/Dropoff Days
- County HHW Program Activities
- Improved Trash Bin Management
- Inspection/Maintenance of Storm Drain Outfalls
- Litter Pickup and Control
- Removal of Homeless Encampments
- Solid Waste Recycling Efforts
- Source Controls/Bans/Prohibitions
- Storm Drain Operation and Maintenance
- Storm Drain Signage/Marking
- Street Sweeping Activities
- Trash Removal from Receptacles
- Volunteer Creek Cleanups

Type of Trash Load Reduction Action	Date of First Implementation	Level of Implementation (specify if level was increased after MRP adoption)	Total Trash Load Removed by Action	Dominant Types of Trash Removed by Action
Not all trash load reduction actions were tracked by "loads removed" this fiscal year. Once the Trash Load Reduction Tracking Method is developed (see Provision C.10.a.ii), data to fill in this table, including trash loads removed, will be able to be defined and determined for each load reduction action (as feasible). See the Program's FY 09-10 Annual Report for schedule				
Anti-litter Campaign: • SCVURPPP and BASMAA each have Ad Campaigns that address Litter • C/ WVCWP- Zero Litter Initiative participation • C/ WVCWP- Silicon Valley Anti-Litter Campaign (hosted by San Jose)	• See SCVURPP Annual Report • ZLI- 2008 • SVALC- ?2006		N/A	Topics aim to reduce pollution (litter, pesticides) by encouraging better behavior/habits
Anti-litter/Dumping Enforcement Activities	Part of municipal operations as occurs	As is occurs and is necessary; for NPDES purposes, an increased focus has been placed on anti-litter and dumping near and around creeks and from		

		construction sites.		
Education and Outreach Efforts: • Thru SCVURPPP Watershed Watch website, ad campaign, etc • Thru WVCWP – literature, give-aways, Enviroscape presentations, clean-up events, local newspaper articles, newsletter articles, information board in MS PO	In place	For NPDES purposes, additional collaborative efforts have been supported- such as the Watershed Watch Campaign, MyWatershedWatch website (www.mywatershedwatch.org) Per NPDES purposes added/adding support and events for various 'take back' of POC related items (e-waste events, mercury thermometer events, clean-up events)		
County HHW Program Activities	In place	As is occurs and is necessary		
Removal of Homeless Encampment	In place, as needed	As is occurs and is necessary		
Solid Waste Recycling Efforts: • Curbside Recycling Program-Residential [glass, paper, plastic] • By Drop off: oil, batteries, e-waste • Improved Trash Bin Management: Solid Waste moved to single recycle bin with lid (from individual sorting bins w/ no lid) Commercial Cardboard Recycling Program – voluntary (paid for service)	In place	As is occurs and is necessary		
Source Controls/Bans/Prohibitions	Not at this time			
Storm Drain Operation and Maintenance • Inspection/Maintenance of Storm Drain Outfalls	In place – circa 1992	SD cleaning program put into place to meet NPDES requirements; data collection/		

• Storm Drain Signage/Marking		categorization of 'trash/litter' as separate category in 2009, for meeting MRP data collection.		
Street Sweeping Activities	In place – circa 1994			
Trash Removal: Litter Pickup and Control • Downtown • Parks • Public Facilities: City/Town Hall, Community Center, Senior Center, Corporation Yard Free Trash Pickup/Dropoff Days Community Garage Sales	In place – part of municipal services			
Volunteer Creek Cleanups • National River Clean Up Day • Great American Litter Pick-up • Coastal Clean-up • LG Volunteer Program	In place – circa 2003

Section 11 - Provision C.11 Mercury Controls

C.11.a.i Mercury Recycling Efforts

List below or attach lists of efforts to promote, facilitate, and/or participate in collection and recycling of mercury containing devices and equipment at the consumer level (e.g., thermometers, thermostats, switches, bulbs).

Mercury collection and recycling is available throughout the year at locally sponsored events (private fundraisers), through e-waste drop-off events hosted by the waste hauler and drop-off services at the waste hauler and Santa Clara County HHW program.

Extensive local outreach for events, including specific information on mercury pollution, is conducted regularly through WVCWP and solid waste contractor. Event information is included in **APPENDIX C7: Attachments C7egh Events and C7bc Advertising and Media Efforts**.

Outreach by WVCWP includes press releases to local weekly newspapers and to municipal newsletters. Flyers are posted in public places (such as libraries, community centers, senior center, city/town hall) and information is featured on municipal websites.

Pollution Prevention Fair – 9/22/09 – Campbell Community Center

Event included opportunities for recycling: thermometers, batteries and cell phones

Thermometer Exchange – 10/7/09 – Saratoga Community Center

Event included opportunities for recycling: thermometers and batteries

Thermometer Exchange – 4/11/10 –Los Gatos Farmers' Market (part of "Keep Los Gatos Beautiful" event)

Event focused on recycling thermometers

E-Waste Drop-off event for residents

7/18/09 – Campbell United Church of Christ, Campbell
7/25/09 – Los Gatos United Methodist Church, Los Gatos
7/25/09 – City of Saratoga N. Campus, Saratoga
10/17/09 – Campbell United Church of Christ, Campbell
10/17/09 – Los Gatos United Methodist Church, Los Gatos
10/24/09 – City of Saratoga N. Campus, Saratoga
4/10/10 – Campbell United Church of Christ, Campbell
4/17/10 – Los Gatos United Methodist Church, Los Gatos
5/15/10 – City of Saratoga N. Campus, Saratoga

Municipal Facility annual recycling of 'mercury containing products' includes Fluorescent Bulbs and Batteries.

C.11.a.ii Mercury Collection
Provide an estimate of the mass of mercury collected through these efforts, or provide a reference to a report containing this estimate.
Amount collected: The methodologies for estimating the mass of mercury collected through mercury collection and recycling efforts are currently in development and are due to the Water Board by September 15, 2010. Therefore, estimates could not be made for FY 09-10. Estimates of the mass of mercury collected through recycling efforts during FY 10-11 will be provided with the FY 10-11 Annual Report (see FY 10-11 BASMAA Regional POC Report).

C.11.b Monitor Methylmercury C.11.c Pilot Projects to Investigate and Abate Mercury Sources in Drainages C.11.d Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices C.11.e Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit C.11.f Diversion of Dry Weather and First Flush Flows to POTWs C.11.g Monitor Stormwater Mercury Pollutant Loads and Loads Reduced C.11.h Fate and Transport Study of Mercury In Urban Runoff C.11.i Development of a Risk Reduction Program Implemented Throughout the Region C.11.j Develop Allocation Sharing Scheme with Caltrans
State below if information is reported in a separate regional report. Municipalities that participate directly in regional activities to can provide descriptions below.
Summary A summary of Program accomplishments for these sub-provisions are included within the C.11 Mercury Controls section of Program's FY 09-10 Annual Report and/or the BASMAA Regional POC Report.

Section 12 - Provision C.12 PCBs Controls

C.12.a.i,iii Municipal Inspectors Training

(For FY 09-10 Annual Report only) List below or attach description of results of training municipal industrial inspectors to identify, in the course of their existing inspections, PCBs or PCB-containing equipment.

Description:

In FY 09-10, inspector training materials were developed through in-kind contributions of SCVURPPP to BASMAA. Training materials can be found in the BASMAA Regional POC Report.

Through WVCWP, participate in SCVURPPP's AHTG for local applicability of sites [identification of facility types]; also through WVCWP, work with the Industrial/Commercial Site Inspection contractor (see Section 4 Ind/Commercial Discharge Program) to determine which facilities may fall under this category. As sites are identified, they will be inspected and reported upon accordingly. Newly developed training materials by BASMAA will be made available to the Industrial/Commercial Inspection contractor for training implementation.

C.12.a.ii,iii Ongoing Training

***(For FY 10-11 Annual Report** and Each Annual Report Thereafter)* List below or attach description of ongoing training development and inspections for PCB identification, including documentation and referral to appropriate regulatory agencies (e.g. county health departments, Department of Toxic Substances Control, California Department of Public Health, and the Water Board) as necessary.

Description:

Not required for this Annual Report

C.12.b Conduct Pilot Projects to Evaluate Managing PCB-Containing Materials and Wastes during Building Demolition and Renovation Activities
C.12.c Pilot Projects to Investigate and Abate On-land Locations with Elevated PCB Concentrations
C.12.d Conduct Pilot Projects to Evaluate and Enhance Municipal Sediment Removal and Management Practices
C.12.e Conduct Pilot Projects to Evaluate On-Site Stormwater Treatment via Retrofit
C.12.f Diversion of Dry Weather and First Flush Flows to POTWs
C.12.g Monitor Stormwater PCB Pollutant Loads and Loads Reduced
C.12.h Fate and Transport Study of PCBs In Urban Runoff
C.12.i Development of a Risk Reduction Program Implemented Throughout the Region

State below if information is reported in a separate regional report. Municipalities that participate directly in regional activities to can provide descriptions below.

Summary

A summary of Program accomplishments for these sub-provisions are included within the C.12 PCB Controls section of Program's FY 09-10 Annual Report and/or the BASMAA Regional POC Report

Section 13 - Provision C.13 Copper Controls

C.13.a.i and iii Legal Authority: Architectural Copper

(For FY 10-11 Annual Report only) Do you have adequate legal authority to prohibit discharge of wastewater to storm drains generated from the installation, cleaning, treating, and washing of the surface of copper architectural features, including copper roofs to storm drains?		**Yes**		**No**

If **No**, explain and provide schedule for obtaining authority within 1 year:

Not required for this Annual Report.

C.13.b.i and iii Legal Authority: Pools, Spas, and Fountains

(For FY10-11 Annual Report only) Do you have adequate legal authority to prohibit discharges to storm drains from pools, spas, and fountains that contain copper-based chemicals?		**Yes**		**No**

If **No**, explain and provide schedule for obtaining authority within 1 year:

Not required for this Annual Report.

C.13.c Vehicle Brake Pads

Reported in a separate regional report.

A summary of the Program's participation with the Brake Pad Partnership (BPP) is included within SCVURPPP FY0910 Annual Report Section C.13 Copper Controls and/or the BASMAA Regional POC Report." Support of the BPP was extended through WVCWP's letters of support for Senate Bill 346.

C.13.d.iii Industrial Sources Copper Reduction Results

List below or attach annotated lists or tables from your Industrial and Commercial Site Controls portion of this report, that highlight copper reduction results among the facilities identified as potential users or sources of copper, facilities inspected, and BMPs addressed. For FY09-10 describe below or highlight in the C.4 Evaluation portion (if provided) of this report the steps taken to revise your program to meet new data tracking and reporting requirements for implementation levels described in C.13.d.ii.

Summary

In FY 09-10, inspector training materials were developed through in-kind contributions of SCVURPPP to BASMAA. Training materials can be found in the BASMAA Regional POC Report

Through WVCWP, participated in SCVURPPP's AHTG for local applicability of sites [identification of facility types]; also through WVCWP, work with the Industrial/Commercial Site Inspection contractor (see Section 4 Ind/Commercial Discharge Program) to determine which facilities may fall under this category. As sites are identified, they will be inspected and reported upon accordingly. Newly developed training materials by BASMAA will be made available to the Industrial/Commercial Inspection contractor for training implementation.

C.13.e Studies to Reduce Copper Pollutant Impact Uncertainties

Revised. Description reads "State below if information is reported in a separate regional report. Municipalities that participate directly in regional activities to can provide descriptions below."

Summary

A summary of Program efforts (i.e., participation in RMP committee and work group meetings) to develop regional studies *to reduce copper pollutant impact uncertainties* is included within the SCVURPPP FY0910 Annual Report, Section C.13 Copper Controls and/or BASMAA Regional POC Report

West Valley Clean Water Program

Section 15 - Provision C.15 Exempted and Conditionally Exempted Discharges

C.15.b.iii.(1), C.15.b.iii.(2) Planned and Unplanned Discharges of Potable Water

Is your agency a water purveyor?		**Yes**	X	**No**
If **No**, skip to C.15.b.vi.(2):				
If **Yes**, Complete the attached reporting tables or attach your own table with the same information. Describe program highlights below. For FY 09-10 only, describe steps taken to revise your program to meet new monitoring, data tracking and reporting requirements.				
Summary:				

C.15.b.vi.(2) Irrigation Water, Landscape Irrigation, and Lawn or Garden Watering

Provide implementation summaries of the required BMPs to promote measures that minimize runoff and pollutant loading from excess irrigation. Generally the categories are:

- Promote conservation programs
- Promote outreach for less toxic pest control and landscape management
- Promote use of drought tolerant and native vegetation
- Promote outreach messages to encourage appropriate watering/irrigation practices
- Implement Illicit Discharge Enforcement Response Plan for ongoing, large volume landscape irrigation runoff.

Summary:

For county-wide outreach on less toxic pest control and appropriate irrigation practices, refer to SCVURPPP's FY0910 Annual Report Section C7, Public Information and Outreach [reports on the Watershed Watch Campaign and the IPM Store Partnership], and Section C9 Pesticide Toxicity Control [report on the Green Gardener Training Program. Participated in these Program outreach efforts via WVCWP, including review of outreach pieces to be published (print, radio, tv), and review of programmatic reports provided to the Program.

WVCWP published seasonal articles in agency newsletters and posted seasonal information on an Info Board in Monte Sereno Post Office.

Also, promotion of 'less toxic pest control' and 'landscape management,' along with use of drought tolerant and native vegetation, is specifically addressed by WVCWP's distribution of native plant seed packets, which are also 'beneficial bug attractants'. The seed packets, attached to related literature, have proved to be an effective means of encouraging residents to take home literature as well as trial the use of basic IPM measures.

Water conservation has been promoted through articles in municipal newsletters.

CITY OF CAMPBELL

Hacienda Avenue “Green Street” Improvements
Project Description
Urban Greening for Sustainable Communities Grant Program

By
Fredrick Ho

March 15, 2010

Located in the southwesterly portion of the City of Campbell, the mile long Hacienda Avenue is a vital east/west residential collector connecting the more rural San Tomas Area Neighborhood of Campbell to Winchester Boulevard, a north/south arterial that provides connections to Los Gatos, Campbell, and San Jose. The Hacienda corridor also provides a pedestrian and bicycle link from the neighborhood to the Hacienda Percolation Ponds (See Attachment 1) and the extremely popular Santa Clara County Los Gatos Creek Park and Creek Trail. The City, in coordination with the Santa Clara Valley Water District, enhanced the area surrounding the Hacienda Avenue percolation pond at the intersection of Hacienda Avenue and S. Winchester Boulevard. These enhancements provide a much improved site for use as a passive recreational area for nearby residents. Additionally, the intersection of Hacienda Avenue and S. Winchester Boulevard is a potential location for a future VTA facility along the Vasona Light Rail Line.

Due to significant traffic volumes experienced on Hacienda Avenue, combined with a variation in the pavement sections constructed over the years, many under designed for the loads experienced today, Hacienda Avenue has fallen into disrepair. The pavement condition for the majority of Hacienda Avenue is very poor with much of the street in need of major rehabilitation, and some portions requiring actual reconstruction. This street has a predominant street right-of-way of 90-ft, with approximately 70-ft of this area in street pavement. Given its residential surrounding and its wider than necessary pavement width, and the City's commitment to sustainable designs, the City is proposing to develop Hacienda Avenue as a "Green Street". The proposed improvements include installing bike lanes, planting street trees, installing bioswales and other stormwater treatment facilities, narrowing the existing pavement from 70' to 50' and using open space or alternative permeable paving surfaces to allow stormwater infiltration.

Developing Hacienda Avenue as a Green Street will help the City of Campbell comply with its NPDES Permit requirements. However, this project goes beyond permit compliance as highlighted below:

1) Project Size – The project proposes to develop the entire one mile stretch of Hacienda Avenue as a Green Street. To meet Permit requirements, developing only a block would be sufficient.

2) Key Issues Addressed – The Permit requires each green street project to address one of six key green street elements. The proposed Hacienda Avenue Improvement Project goes beyond permit compliance by addressing four of the six key elements. These elements are:

- Stormwater storage for landscaping reuse or stormwater treatment and/or infiltration for groundwater replenishment through the use of natural feature systems;
- Creation of attractive streetscapes that enhance neighborhood livability by enhancing the pedestrian environment and introducing park-like elements into neighborhoods;
- Service as an urban greenway segment that connects neighborhoods, parks, recreation facilities, schools, main streets, and wildlife habitats; and
- Meets broader community goals by providing pedestrian and, where appropriate, bicycle access;

The Hacienda Avenue Improvement Project will also provide multiple other benefits that are not required by the NPDES Permit. These are:

1) Decrease in Air Pollution – Installing bike lanes would encourage use of an alternative transportation mode thereby decreasing air pollution from passenger vehicles. Increased bicycle use would also decrease the consumption and dependency on oil. The project proposes to plant more street trees which would lead to cleaner air and reduce the impact of heat islands leading to decreased energy consumption by nearby residents.
2) Reduce Consumption of Natural Resources & Energy – Narrowing the existing pavement from 70' to 50' would reduce the amount of natural resources and energy associated with manufacture and installation of asphalt and also for maintenance purposes.

3) Reliability of Water Supplies – Use of open space and/or alternative permeable paving methods allow storm water runoff to infiltrate into native soil, removing contaminants before recharging the ground water. This would improve the reliability of water supply.

	Bike Lane	Tree Planting	Infiltration Bioswales	Reduce Asphalt Concrete	Increase Permeable Area
Decrease Air Pollution	X	X		X	
Decrease Water Pollution		X	X		X
Reduce Consumption of Natural Resources & Energy	X	X		X

1. Newsletters, Newspaper Articles, Web Postings

a. Newsletters: WVCWP staff prepares articles for use in municipal newsletters for the 4 WV Communities. Submission of articles depends upon timeliness of newsletter distribution to residents vs topics being covered. Municipal newsletter staff also prepare articles relevant to stormwater issues, as feasible, based on priorities of municipal news.

   - vi. SCVRUPPP
   - vii. Our Water Our World (BASMAA)

- **July 2009 / Summer 2009**

– Created & distributed Press Release on car-washing, use of the WVCWP "Car Wash Kit" for fundraising events, and the upcoming car wash fundraiser in Campbell for Susan G. Komen.

Distribution: to 3 WV weekly newspapers,

- Article printed in the Campbell Reporter (7/23/2009)

- Article printed Saratoga News (7/23/2009).

- Generated calls to the WVCWP office, with questions about the Car Wash Kit.

– Created & distributed Press Release noting presentation of Stormwater Awards to WV Communities, via County-wide program. Press release covered topics related to "Trash" and "IPM".

Distribution: to 3 WV weekly newspapers
4 Municipal Newsletters

- Article printed in Campbell's "Profile" newsletter: Summer 2009 "City Receives Pollution Prevention Awards" which awards presented by CASQA -- details on the Trash Toolbox program, and a link to the "Trash Toolbox" flyer; the award-winning "Green Gardeners" program, -- and the "IPM Innovators Award".

– Created & distributed Press Release: encourage residents to recognize and use 'beneficial bugs' in home gardens in place of pesticides.

Distribution: to 4 Municipal Newsletters

- Article printed in Campbell's "**Profile**" newsletter: Summer 2009 "A Safe Garden" (Beneficial Bugs). The article included photos of beneficial bugs, and links to additional photos and information available on web sites. The article also encouraged residents to obtain free packets of seeds from WVCWP; the sees are for plants that attract 'beneficial bugs'. Information on proper disposal of pesticides was also included.

- City of Monte Sereno Newsletter: July 2009 "15% Water Use Reduction"

The Newsletter included a reminder to residents to reduce water use. Readers were reminded to refer to conservation tips in the previous Newsletter (April 2009) which contained an article on water conservation.

- **Sept. 2009 / Fall 2009**

– Created & distributed 2 versions of a Press release on Pollution Prevention program at Campbell Cmmty Ctr (Thermometer Exchange, battery drop-off, prescription drugs drop-off). Created & distributed PR, including photos of previous events and encouraging a reporter to cover the P2 event, was submitted.

Distribution: to 3 WV weekly newspapers,

- A "Brief"/short article on the event was printed in the Campbell Reporter (DATE?)

– Created and distributed a Press Release encouraging participation in the California Coastal Cleanup event at WVCWP's Westmont site.

Distribution: to 3 WV weekly newspapers and 4 municipal newsletters

- Info on the event was **printed** in the "Briefs" section of the "Campbell Reporter" (9-11-09)
- Info on the event was **printed** in the "Briefs" section of the "Saratoga News" (9-11-09)

– Created and distributed a Press Release on the Thermometer Exchange/ Battery Drop-off event at Saratoga Community Center

Distribution: to 3 WV weekly newspapers

- A "Brief" article on the upcoming event was **printed** in the Saratoga News,(9/22/09).

-Related Article: The Campbell Profile featured a colorful graphic and a short article promoting water conservation, including a link to the website www.save20gallons.org

- Campbell's "Profile" newsletter: Fall 2009 "Water Conservation"

- Saratoga's "**The Saratogan**" Fall 2009 "E-Waste Drop-off Event"

The newsletter included information on the upcoming free E-waste Drop-off sponsored by the City's waste contractor.

- **Jan 2010/ Winter 2010**

-Related Article: Campbell's "**Profile**" newsletter: Winter/Spring 09/10 "Hamilton Median Project" (Water Conservation). This article discusses a median project on a major arterial; the project incorporates the most up-to-date irrigation system, which saves water, and also ensures there will be no runoff in case of a stuck sprinkler head or similar problem. By setting an example of what can currently be done with appropriate irrigation systems, the article encourages water conservation, and discourages over-watering and runoff.

- Created and distributed article alerting residents on the need to keep leaves out of the gutter area and stormdrain system, and to dispose of them properly in the Yard Waste containers.

Distribution: to 4 municipal newsletters

- Campbell's "**Profile**" newsletter: Winter/Spring 09/10 "The Rain is Coming" (Keeping leaves out of gutters/stormdrains)

- **Mar 2010/ Spring 2010**

– Created and distributed Press Release to present Mercury info prior to the upcoming Thermometer Exchange. The Press Release resulted in a "Growing Greener" newsletter devoted to Mercury & HHW information.

Distribution: 4 municipal Newsletters

- Mercury article for Keep LG Beautiful Flyer.doc
- Los Gatos' "**Growing Greener**" newsletter: March 2010 "Taking Charge of Hazardous Waste".
- Los Gatos' Newsletter included articles on:
    - Thermometer Exchange at LG Farmer's Market;
    - upcoming HHW Drop-off events;

- links to HHW info;
- proper drug disposal;
- proper car-washing.

- Los Gatos "**Vista**" Annual Newsletter: Spring 2010 "Safe Disposal of Medications". In response to a flyer on this subject distributed by WVCWP, Los Gatos published a long article on keeping medications out of our waterways. The article discussed the problem of medications as water pollution, and explained proper disposal procedures.

- City of Monte Sereno Newsletter: May/June 2010 "Maintaining Your Pool & Spa"

This full, front-page article discussed all the aspects of potential copper pollution in creeks due to improper draining. It discussed proper drainage methods and alternative, copper-free maintenance methods, and included links ot further info on the Watershed Watch website.

BRIEFS

Free e-waste event Oct. 17 at church

There's a better place than the landfill for unwanted old electronics.

The Campbell United Church of Christ will be taking in those outdated products free of charge at an e-waste event on Oct. 17 from 9 a.m. to 2 p.m. at the church campus, 400 W. Campbell Ave.

Electronics contain harmful chemicals and should be disposed of properly or recycled. The church will accept computers, monitors, keyboards, hard drives, TVs, VCRs, video games and systems, cell phones and batteries for recycling.

Call 408.378.4418.

Open seats on parks and rec commission

Two terms on the city's parks and recreation commission will expire this year, leaving a couple of openings on the seven-member committee.

Applicants must be at least 18 years old and a resident of Campbell. Applications may be picked up at city hall, 70 N. First St., and must be returned by Oct. 30 at 5 p.m. Visit www.cityofcampbell.com or call 408.866.2117.

Plans for park now available on city website

The three conceptual plans for Steppenwolf Family Park can now be viewed online at the city's website, www.cityofcampbell.com/dp.

Several residents got to see the plans in person at a community meeting on Oct. 5, but it's still not too late to submit feedback on the design of the park at 316 Union Ave.

Comments and questions can be submitted to public works@cityofcampbell.com.

BRIEFS

Congregation to honor foreign diplomat

Congregation Beth David will honor Chiune Sugihara, a Japanese diplomat who helped save the lives of approximately 6,000 Jews during World War II. Sugihara died in 1986.

The commemoration will be held Oct. 25 from 1 to 3 p.m. at the synagogue, 19700 Prospect Road. A street sign, "Chiune Sugihara Way," will also be unveiled in the parking lot of the congregation property.

Visit www.jewishvirtuallibrary.org/jsource/Holocaust/sugihara.html.

City to host North Campus grand opening

The city of Saratoga is celebrating the grand opening of the North Campus by hosting an open house for residents on Oct. 23 at 3:30 p.m. A tour of the new multipurpose room will be available.

The city bought the real estate in 2002 and is hoping the multipurpose building will be an attraction for citywide community events.

Contact Nina Walker at 408.868.1259 or nwalker@saratoga.ca.us.

Residents can rid themselves of e-waste

West Valley Collection and Recycling is hosting an e-waste event where Saratoga residents can rid their garages of old and unused electronic items.

Television and computer monitors, laptops, external hard drives, keyboards, mice, printers, DVD players and VCRs, phones and fax machines are some of the acceptable items.

The event will be held Oct. 24 from 9 a.m. to 2 p.m. at the North Campus, 19848 Prospect Road.

BRIEFS

This week is 'Walk to School Week'

Expect to see more children in crosswalks Oct. 5-9 as they participate in "Walk to School Week," a program focusing on teaching children safe walking and biking habits, such as how to cross streets and choose safe routes to school.

The program is part of the "International Walk to School Month," which runs through October. There is also a national "Walk to School Day" on Oct. 7. Visit www.cawalktoschool.com.

City to host thermometer exchange

Exposure to mercury can cause damage to the nervous system, brain, kidneys, liver and immune system. In an effort to rid homes of the dangerous substance, the city of Saratoga is hosting a thermometer exchange.

The event will take place Oct. 7 from 10 a.m. to 2 p.m. in the Joan Pisani Community Center, 19655 Allendale Ave.

Residents can rid themselves of e-waste

West Valley Collection and Recycling is hosting an e-waste event where Saratoga residents can rid their garages of old and unused electronic items.

Television and computer monitors, laptops, external computer hard drives, keyboards, computer mice, printers, DVD players and VCRs, phones, fax machines, electronic toys, typewriters, cameras, stereos and speakers are some of the acceptable items.

The event will be held Oct. 24 from 9 a.m. to 2 p.m. at the North Campus, 19848 Prospect Road.

North Campus Open House

Renovations to the North Campus have been finished! The City will be celebrating completion of the work during an open house on October 23, 2009 at 3:30 p.m. at the North Campus, which is located at 19848 Prospect Road in Saratoga. The event is open to the public and will feature live music, refreshments, and more.

Purchased in 2002, the City has been making improvements to the 2.6 acre site in phases. The first stage of work started in 2007 with improvements to the Administration Building, which is primarily used for meetings and recreation classes.

The second phase of work started last year with renovations to Fellowship Hall. The improvements to the building include a new hardwood floor, a kitchen, fully accessible bathrooms, and more. This work has also included demolition of two unusable buildings on the property, which have been replaced with new landscaping.

The City was able to make the improvements to Fellowship Hall thanks to a generous donation from the House Family Foundation, which was administered by the Saratoga-Monte Sereno Community Foundation.

The City is looking for a new name for the North Campus.
Submit your ideas online at www.saratoga.ca.us by October 23, 2009!

Fellowship Hall at the North Campus

E-Waste Drop Off – Electronics such as computers, monitors, televisions, fax machines, printers, copiers, stereos, phones, and cameras all can contain toxic chemicals and compounds that should not be thrown in the trash. West Valley Collection & Recycling will be offering a free E-Waste drop-off event for residents to get rid of unwanted electronics from 9am to 2pm on Saturday, October 24th, 2009. The drop-off is located at the City of Saratoga's North Campus located at 19848 Prospect Road in Saratoga.

Enroll for Fall Recreation Class!

This fall, the City of Saratoga Recreation Department has classes for all ages and all interests. Youth programs include *My First Art Class*, which begins November 20th and runs through December 18th, as well as *Camp Winter Wonderland* that will be held at the Joan Pisani Community Center over the holiday break for children between 3.5 years to 10 years old. Some of the exciting adult programs include *Salsa & Ladies Latin Styling* with Agnes beginning November 9th and *Brewing 101* at St. Stan's Brewing Company in downtown Saratoga starting November 7th. *For more information, visit http://www.saratoga.ca.us/cityhall/rec/default.asp or call (408) 868-1249.*

Got ideas? Send story ideas or comments about *The Saratogan* to Crystal Morrow at cmorrow@saratoga.ca.us or (408) 868-1275.

GREEN NEWS

Holiday Tree Recycling
December 28, 2009 - January 15, 2010 West Valley Collection and Recycling will pick up holiday trees curbside as a part of their regular collection schedule. Up to 2 undecorated, natural or flocked trees, will be picked up per residence. Trees must be cut into 5 foot lengths and placed 1 foot away from garbage/recycling carts. More Info at 408-283-9250 or www.westvalleyrecycles.com

Spare the Air
Did you know that smoke from wood burning fireplaces is harmful for the environment and our health? Do your part to protect our environment and community by not burning wood in your fireplace this winter. The American Cancer Society and the Bay Area Air Quality Management District have teamed up to provide more information about the dangers of wood smoke.

E-Waste Collection Events
With the holiday season upon us, many households end up with new electronics. It is important that the old ones are disposed of and recycled properly so they do not end up in the landfills. The county's Household Hazardous Waste Program will be sponsoring two e-waste collection events:

January 9, 2010
Lifescan, Inc. (Parking Lot)
1000 Gibraltar Dr.
Milpitas, CA 95035

March 6, 2010
Microsoft (Parking Lot)
1065 La Avenida Street
Mountain View, CA 94043

For more information, please visit www.hhw.org.

Los Gatos: Growing Greener Together

The Town of Los Gatos has been certified as a Green Business. This program, coordinated by ABAG, is a partnership of environmental agencies that assists, recognizes and promotes business and government agencies who operate in a more environmentally responsible way. The key goals of the program are to promote resources conservation and pollution prevention.

At the Town, we take this certification seriously and ask our Town Employees to follow our Green Business Commitments and do the right thing for our environment everyday, while at work in our Town offices. We invite you and your family to join us in our efforts to protect the

2. Material Development: Give-aways and Handout items (including brochures and other stormwater literature)

a. RE-USABLE BAG/ ANTI-LITTER CAMPAIGN

Topic: POC-Trash/Litter

Audience: Residents and Students

Goal: Modify behavior => provide incentive for using re-usable bag thru ease of use (size, convenience) and ownership (personalization of bags)

2 types of re-usable bags, to promote litter reduction efforts; the bags carry the message is "Clean Creeks… It's In Our Hands". Both bags are foldable, and can easily fit in a pocket, purse, or school backpack.

- Blue nylon bag is aimed at residents who would use this instead of a grocery bag**. 250** of these bags have been purchased. They can be distributed with relevant literature inside, depending on the event where they will be featured.
- White canvas is aimed at schoolchildren. **150** of these bags have been purchased. The message is printed on the small carrying bag; on the main bag, children will be able to color in a comic, which conveys a stormwater message. This children's activity portion will be a pilot program for WVCWP; it is being adopted from a similar program at the City of Palo Alto.

b. NATIVE PLANTS/ IPM CAMPAIGN (Beneficial Bugs)

Topic: POC-Pesticides/IPM

Audience: Residents and Students

Goal: Modify behavior => provide alternate option to pesticide usage

In FY 08-09 WVCWP carried out a Pilot Program of purchasing seeds for 4 types of California native plants; species which would attract 'beneficial bugs' to gardens, thus encouraging residents to reduce the use of pesticides. WVCWP developed labels for the seeds, and volunteers helped to package them in 2"x3" l envelopes. The packages were attached to IPM literature. This seed program turned out to be very successful in terms of encouraging residents to pick up the IPM literature. In FY 09-10, the Pilot Program was reviewed, and 3 types of seeds were ordered, and more seed packages and blank labels were purchased. WVCWP is looking into soliciting volunteers to package these seeds for distribution in FY 10-11.

c. Copper Brochure

Topic: POC-Copper

Audience: Residents

Goal: Information dissemination => provide incentive (discount card) to learn and participate in pollution reduction thru typical daily activity (car washing)

WVCWP staff created a Copper outreach tri-fold, since no general Copper outreach material was available. The tri-fold was designed to have the "Watershed Watch Discount Card" attached to it, as a means of encouraging residents to take home the literature (i.e if they wanted the Discount Card, they were also getting the Copper information). This tri-fold with Discount Card has proven to be relatively successful in getting residents to take home literature about copper pollution.

d. CAR WASHING- residential and fundraising

Topic: POC-Copper

Audience: Residents

Goal: Modify behavior => provide mechanism for preventing pollution discharge during chosen activity (car wash for fundrasing)

This tri-fold was forwarded to the Program, along with a request for more public outreach material on 'Car Washing & Copper"; subsequently a Car Washing tri-fold was produced by the Program. WVCWP modified this piece for the WVC by highlighting local contact info on it.

e. Information Cards

Topic: POCs (Trash/Litter, Pesticides, Copper); Creeks and SF Bay as local resource, Watersheds

Audience: Residents, Teachers, Students

Goal: Information dissemination

f. PRESENTATION: "A Stormwater Campaign in Cartoons"

Topic: Conveying BMP and POC message to residents

Audience: Municipal/ Stormwater Staff

Goal: Information dissemination

At the end of FY 08-09, WVCWP staff was invited to present at the EPA National Outreach Conference in Portland on the topic of "A Stormwater Campaign in Cartoons". The presentation was very well received, and WVCWP continues to receive requests for information on this topic. The presentation is posted on the EPA website; WVCWP has shared information via e-mail so that other agencies can initiate advertising campaigns using cartoon characters.

Why keep Copper out of our Creeks ?

1000 sq ft of copper roof, by itself, can lead to

TOXIC CONDITIONS
in a nearby creek
within just 1 rainstorm

How does COPPER get into our Creeks?

Rain, irrigation, hosing down driveways, etc. can all carry pollution from our homes to nearby stormdrains.

STORMDRAINS FLOW DIRECTLY INTO OUR CREEKS

Water flowing into a stormdrain does NOT flow to the Water Treatment Plant— it flows straight into our creeks.

From there, it can enter our groundwater system or San Francisco Bay

Our Copper & Our Creeks

Did you know ... ?

- **COPPER**, even in very small amounts, can be **deadly to life in our creeks** and SF Bay
- **COPPER is common in car brake pads**, and runs into our creeks when we wash cars in driveways & parking lots
- **COPPER** can come from home sources, such as
  - **pool/spa chemicals**
  - **copper garden pieces**
  - **architectural elements**

How can YOU help keep Copper out of creeks ?

Car Washing

Take your car to a commercial car wash

Or, use a commercial 'wash-it-yourself' facility.

This way the dirty water is cleaned and recycled, rather than carrying pollutants straight to a creek.

If you can't use a car wash facility,

at least wash your car on a lawn or gravel area

— this allows dirty water to sink into the soil instead of running straight into a creek.

for Car Wash Fundraiser Events borrow a FREE "Car Wash Kit"

This kit ensures that water from your event will flow to the Water Treatment Plant, rather than straight to our creeks.

Get the kit from West Valley Clean Water Program at:

(408)354-3585
office@wvcwp.org

Pools & Spas

Choose safe algaecides

Check with your pool store for copper-free algaecides.

Drain your Pool or Spa properly

NO: draining into a street, gutter or storm drain

YES: discharge water to a sanitary sewer cleanout.

If you are on a septic system or have no sanitary sewer clean-out, contact your ***wastewater treatment authority***. You may be told to drain the water to a lawn or gravel area.

Residents of Campbell, Los Gatos Monte Sereno and parts of Saratoga, can get direction from:

West Valley Sanitation District at (408) 378-2407

How can YOU help keep Copper out of creeks ?

Around your Home

Choose Copper-free outdoor garden accessories and architecture

Use non-copper weathervanes, birdbaths, gutters, roofing etc.

Copper, when used outdoors, will oxidize. These particles will be washed off by rain and flow straight into creeks.

For existing copper gutters & roofs, create a percolation area at your downspout outlet. The roof runoff can soak into the ground, rather than flowing to the creek.

3. Posters, Flyers

It is common for local events to be publicized via municipal websites and posting of event flyers in municipal facilities.

Municipal Facilities include:

- City/ Town Hall: main building: Planning, Building, Engineering Counter, where development applications and building permits are issued
- Corporation Yard/ Service Center: Location for maint crews and equipment/ vehicles
- Community Center
- Senior Center
- Library
- Other Facility Building: MS Post Office

a. Campbell: Campbell posted flyers at the Community Center, and on the City website for:

   i. Pollution Prevention Event – (9/09);
   ii. Arbor Day (4/10);
   iii. Community Cleanup (5/10);
   iv. Bike to Work Day (5/10);

b. Los Gatos: Los Gatos posted flyers at various municipal buildings and also notified residents of events via the Town website, especially by making use of it's "What's New" e-mail subscription service.

   i. E-waste Drop-off event (10/09);
   ii. Thermometer Exchange (4/10);
   iii. Arbor Day (4/10);
   iv. Bike to Work Day (5/10)
   v. PPW Open House (5/10)

c. Monte Sereno: Monte Sereno posts flyers in the City Hall foyer; in addition, WVCWP posts info and events regularly on a large arrangement in the Monte Sereno City Post Office, which is the spot in Monte Sereno which receives the most foot traffic. Topics included:

   i. Mercury pollution prevention
      a. Mercury Thermometer exchange
      b. Battery recycling
      c. Fluorescent Bulb recycling
   ii. Protect creeks during Car Wash Fundraisers
   iii. Preventing pollution with everyday activities
   iv. Trash/ Litter/ Recycling
   v. Sediment Impacts
   vi. Watershed Watch/Protect our Creeks and Bay
   vii. Clean-up Events
   viii. Arbor Day/ Earth Day Events
   ix. Home Maintenance Tips
   x. Bike to Work
   xi. Copper-Free Pools. Spas, and Fountains
   xii. Pesticide-Free Gardens/ IPM

d. Saratoga: Saratoga posts flyers at various municipal buildings, and also uses the City website's Home Page, RSS news feeds, and web-based calendar to advertise events.

   i. Thermometer Exchange (10/09);
   ii. E-waste collection (10/09);
   iii. Arbor Day (4/10)

Outreach Event Evaluation

Event Name: Mercury Fever Thermometer Exchange

Your Name: Evelyn Broeker Your Program (if applicable): WVCWP

Shift Date: October 7, 2009 Time Started: 10am Time Ended: 2pm

1. Report the materials taken and their estimated quantities distributed at this event. (An attachment is fine.) 75 each of the following:
   a. Re-usable bags (plastic from SaveMart, users can receive 5cents credit at any participating grocery store, not just SaveMart – i.e., Safeway, Genes, etc) [=> covers litter topic]
   b. WW Discount Cards w/ WVCWP brochure on Copper pollution [=> covers POC Copper topic]
   c. Fly Swatter w/booklet on Less Toxic Fact Sheets on Pests (insects, rodents, etc) [=> covers POC Pesticide topic]
   d. Mercury Disposal booklet [=> covers POC Mercury topic]
2. Report the estimated number of attendees you engaged with in "information contacts" or discussions at this event. Approximately 126 attendees; 216 mercury thermometers were collected and this equates to 108 grams of mercury. We also collected a 5 gallon bucket of batteries, 2 cell phones and 7 eyeglasses.
3. Was this event a satisfactory venue? Yes. The location and timing were excellent. Senior citizens are most likely to have mercury thermometers. The Senior Center was also holding a luncheon with a guest speaker and an opportunity to speak with a librarian from El Camino Hospital.
4. How appropriate were the materials for this audience at this event? Quite appropriate.
5. How adequate was the staffing at the event during the time that you were working? Two working at the table and one to actually hand out information.
6. What messages (not materials) did you deliver? Pollution awareness and venues for discarding toxic/hazardous waste. (medicine, sharps, paint, e-waste)
7. What did you learn from interfacing with the public at this event? Some attendees have gardeners and housekeepers which could benefit by extending them the gardening and cleaning information.
8. What giveaway items did you find most useful for this event? Discount Cards w/ WVCWP brochure on Copper pollution and San Jose's polymer material reusable grocery bags.
9. Which giveaway items were least useful for this event? SaveMart's recycled plastic reusable bags.
10. What other literature should have been provided at this event? N/A

Other comments: Have chairs available for senior citizens to complete the onsite evaluation form. Keep evaluation forms brief with a maximum of three questions to include multiple choice answers. Have forms with large print.

Bike to Work – May 13, 2010

BIKE TO WORK DAY
MAY 13, 2010

- ✓ Reduce your carbon foot print for the day.
- ✓ It's fun!
- ✓ It's green!
- ✓ It's a great way to see all those details you miss in the car!

For more information about this event visit the Silicon Valley Bike Coalition at: bikesiliconvalley.org

BIKE TO WORK DAY
MAY 13, 2010

When is the last time you smelled the crisp springtime air during your morning commute? Or pulled into the parking lot with a big smile plastered across your face, pumped with endorphins and ideas? Or lost weight just by going back and forth to work each day?

A HEALTHY BODY – Ride your bike to work, and you no longer need to make time to exercise. Racking up just 3 hours of riding time a week can lead to cutting your risk of heart disease in half. Please consult your doctor before starting any new physical activity.

MORE MONEY – The average annual price of keeping an automobile running: at least $3,000. The cost of running a bike for a year: less than $300. The joy of saving more than two thousand dollars a year: priceless.

CLEAN AIR – Motorized vehicles are responsible for 70% of the carbon monoxide, 45% of the nitrogen dioxide, and 35% of the hydrocarbons people produce. Riding a bike is a simple way to improve the environment.

FREE BREAKFAST

All those who participate in Bike-to-Work Day, including those who walk, carpool or use low fuel vehicles (hybrids, motorcycles, etc.) for their commutes, and those who live within a mile or two of the work place will be honored with a light breakfast to be hosted on the patio outside Greg's office on the morning of Thursday, May 13th from 9:00 AM -10:00 AM.

Please RSVP with Patsy Garcia at PGarcia@LosGatosCA.gov or by calling (408) 354-6832 if you are planning on attending the breakfast.

Great American Litter

PICK UP

Saturday, May 8, 2010
Clean-up: 8:30 – 11:30 AM • Celebration: 12:00 – 1:00 PM

Help clean up litter in the City of Campbell. Register your family, friends, students or service club!
To register for this event, please call (408)866-2145, or visit our website at www.cityofcampbell.com

The City of Campbell's cleanup will focus on four locations: John D. Morgan Park, the freeway on and off ramps at Camden and Highway 17, along the railroad tracks adjacent to Winchester Boulevard, and the Creekside under crossing on the Los Gatos Creek Trail.

Rain or shine, volunteers will be asked to meet at the park at which time they will sign in and then disperse into groups. An agenda and instructions on safety and debris removal will be discussed. Gloves, vests and other tools will be provided.

Volunteers are encouraged to dress appropriately for the event.

Refreshments will be provided in the morning and the event will conclude with a lunch at noon at the park.

Schedule of Events:

Registration	**8:00 – 8:15 AM**	**John D. Morgan Park** **540 W. Rincon Avenue, Campbell**
Orientation	**8:15 – 8:30 AM**	**Welcome and Introductions, safety precautions, group assignments**
Disperse to Cleanup Sites	**8:30 – 11:30 AM**	**Pick up litter in designated areas**
Celebratory Lunch	**12:00 – 1:00 PM**	**Return to John D. Morgan Park, Closing Ceremonies**

For information online, please visit our website at www.cityofcampbell.com.

Car Wash using WVCWP CAR WASH KIT 7/26/09 Location: Del Taco Parking Lot, Campbell	Susan G. Komen Cancer "Walk for Life" organized this event; WVCWP supported the event by providing the Car Wash Kit to prevent runoff pollution.	This event was successful in that the organizers learned about use and benefits of the Car Wash Kit. In fact, the group returned in June 2010 to borrow the Kit again. All volunteers were receptive to using it. In addition, the Kit includes automatic hose shut-off nozzles, which help volunteers learn about water conservation. At the time this Car Wash event took place, no Copper or Car Wash outreach materials had been developed, so copper pollution education was conducted by WVCWP via 'word of mouth'. A Press Release for this event, and use of the Car Wash Kit, was issued by WVCWP. An article ran in the local weekly newspapers (see C.7.c "Media Relations", above). In addition to increasing public awareness, the Kit serves the very important function of keeping the wash water runoff from entering the stormdrain system.
Pollution Prevention Resource Fair Event at Campbell Community Center 9/23/09 Sponsored by City of Campbell, WVCWP and San Jose Environmental Service Dept. The event was open to any SC County residents, but much of the outreach was aimed at the WVC area.	The Fair provided a Thermometer Exchange, battery recycling, eyeglasses drop-off, cell-phone recycling, and medications disposal. WVCWP staffed a table and provided info on stormwater and pollution, especially mercury pollution (i.e. related to the thermometer and battery recycling opportuny). This event is aimed at local residents.	**150** residents attended (appx). Items collected & removed from the landfill stream: **242.5** lbs of pharmaceuticals (14.5 controlled, 228 non-controlled), **57** thermometers **18** cell phones **95.5 lbs** of batteries <u>Brochures & Giveaways Distributed:</u> • 99x - reusable bags. • 45x -- Native Seed Packets with Healthy Gardens: Naturally Managing Pests flyer • 30x -- /10 pollution prevention tri-fold with Watershed Watch Discount Card • 44x -- Fly Swatters • 18x -- Pest or Pal Activity guide • 14x -- Pests Bugging You?

C7egh Events

Thermometer Exchange Event at Saratoga Community Center 10/7/09 Sponsored by City of Saratoga, WVCWP and San Jose Environmental Service Dept. The event was open to any SC County residents, but much of the outreach was aimed at the WVC area.	This event provided a Thermometer Exchange, battery recycling, eyeglasses drop-off and cell-phone recycling. WVCWP staffed a table and provided info on stormwater and pollution, especially mercury pollution (i.e. related to the thermometer and battery recycling opportuny).The event was especially convenient for Senior Citizens whose 'Senior Center' is attached to the Community Center. This event is aimed at local residents.	This event was particularly successful with Saratoga's senior citizens; they appeared to be residents who had a number of glass thermometers that needed to be properly disposed of, and they appreciated the convenience of the location (attached to the Senior Center) and the chance to drop off household batteries at the same time. They did ask to have more chairs available for sitting, the next time this event is held. Event included opportunities for recycling: thermometers and batteries **126** people came to drop off their thermometers and receive some literature on pollution prevention, **216** mercury thermometers were collected, equating to **108** grams of mercury.
Thermometer Exchange Event at Los Gatos Farmers' Market; part of "Keep Los Gatos Beautiful" Month 4/11/10 Sponsored by Town of Los Gatos, WVCWP and San Jose Environmental Service Dept. The event was open to any SC County residents, but much of the outreach was aimed at the WVC area.	This event is aimed at local residents. WVCWP worked with SJ Env. Services Dept and Town of LG to arrange this event as part of "Keep Los Gatos Beautfiul Month". SJ ESD staff a table and provided info on stormwater and pollution, especially mercury pollution (i.e. related to the thermometer recycling opportuny).	**1** mercury thermometer was collected. Due to rainy weather at this outdoor event, it turned out to not be very productive. Extensive outreach/advertising had been conducted, and despite the rain at least 10 people stopped at the booth. WVCWP staff is exploring options for an indoor venue for FY 10-11. Materials distributed were: 10x - HHW Tri-fold 1x – Medication Disposal 1x - Seafood Watch Guide – Spanish 1x - Seafood Watch – Sushi Guid 1x – What You Don't Know About Mercury 8x – Grease Scrapers 4x – Grow It Guide 4x – 10 Most Wanted Bugs 1x – Wonder of our Water Works

C7egh Events

City of Campbell Arbor Day 4/20/2010 Campbell Middle School	This annual event recognizes the City's efforts to preserve trees. It teaches residents about the value of trees while encouraging them to plant trees appropriate to the area (pest resistant, etc.).	
City of Saratoga Arbor Day 4/22/10 Azule Park, Saratoga	This annual event recognizes the City's efforts to preserve trees. It teaches residents about the value of trees while encouraging them to plant trees appropriate to the area (pest resistant, etc.). WVCWP efforts were acknowledged in the mayor's opening statement. PG&E distributed saplings for residents to plant at home. Children attending participated in a "Sustainable Scavenger Hunt". This event is aimed at local residents; youth activities are included to encourage attendance by local children.	60 attendees (appx). Attendees chose to take: 5x – "You are the Solution to Water Pollution" 15x – "Kids Guide to Backyard Bugs" 18x – "Pests Bugging You" brochures 38x – "Original Pest Control" fly swatters
Los Gatos Arbor Day 4/30/10 Belgatos Park, Los Gatos	This was a celebration of the Town's 30th year to have been named a "Tree City USA". Town staff planted 30 trees at various park locations in recognition of this honor. This event is aimed at local residents. The Town did targeted outreach to the Bel Gatos neighborhood, and to local schools.	appx. 100 elementary schoolchildren from Mulberry School – pre-K through 5th grade. Attendees chose to take: 14x – "Soil Matters" booklets 8x – "Stream Care Guide" booklets 12x – "Pests Bugging You" brochures 14x – "Clean It Guides" 80x – "Original Pest Control" fly swatters 50x – "Get the Scoop – Don't Pollute" pencils 100x – "Pest or Pal" Activity guides/booklets

C7egh Events

Bike to Work Day May 13, 2010 Town of Los Gatos & City of Campbell Municipal offices	**Bike-to-Work Day** is an annual event held on the third Friday of May across the United States and Canada that promotes the bicycle as an option for commuting to work. WVC muni offices encourage people to try bicycle commuting as an alternative to driving, which can help reduced various forms of pollution, including copper pollution in waterways. The City of Campbell and the Town of Los Gatos promoted the event to staff, and to their general communities. Flyers were posted, and info appeared on municipal websites.	Town of Los Gatos had appx. 5 staff members who participated. Participants met at "Orchard City Green" (park) for remarks by the City CEO, and refreshments donated by the City Manager.
Car Wash using WVCWP CAR WASH KIT 6/26/10 Location: Del Taco Parking Lot, Campbell	Susan G. Komen Cancer "Walk for Life" organized this event; WVCWP supported the event by providing the Car Wash Kit to prevent runoff pollution.	This event was successful in that the organizers learned about use and benefits of the Car Wash Kit. This group had borrowed the Kit 11 months previously and chose to request it again. All volunteers were receptive to using it. In addition, the Kit includes automatic hose shut-off nozzles, which help volunteers learn about water conservation. In addition to increasing public awareness, the Kit serves the very important function of keeping the wash water runoff from entering the stormdrain system.

Coastal Cleanup Day 2009 9/19/09 San Tomas Aquino Creek @ Westmont High, Campbell Local site; part of County-wide effort and International event.	WVCWP has served as the sponsor for this Creek Cleanup site for a number of years. Outreach has been targeted at different groups, at different times – for example, Westmont High School students, Scout troops, and elementary school students. This event is aimed at local residents; WVCWP also targets schools and Scout troops during outreach.	Volunteers: 11 Trash collected: 330 Lbs. Recyclables: 90Lbs.

C7egh Events

City of Campbell Great American Pick-up 5/8/10	Campbell holds this event annually, and traditionally generates excellent community participation. For the 2010 event, 4 tasks were assigned: **Litter pickup** & graffiti removal from the undercrossing of Creekside of the Los Gatos Creek Trail **Litter pickup** at 3 other sites: • John D. Morgan Park • Hwy 17 from Camden on-ramp to Pedestrian over-crossing • railroad tracks along Winchester Blvd from Hacienda to Kennedy This event is aimed at Campbell residents. City of Campbell does extensive outreach to solicit residents to volunteer for this activity.	Volunteers: 100 Resutls: 29 partially-filled bags of recyclables 52 partially-filled bags of trash Participants chose to take: 8x – "Soil Matters" literature 10x – "Pests Bugging You" brochure 14x – "Clean-It Guides" 5x – "Mercury – What You Don't Know" brochures 42x – "Strip" thermometers 4x Copper Tri-fold w/Discount Card attached 20x "Original Pest Control" fly swatters 20x – "2000 Creek Cleanup" bandanas 12x – Lip Balm 35x – "Get the Scoop – Don't Pollute" pencils 3x – "Native Plants" seeds with "10 Most Wanted Bugs" brochure attached
National River Cleanup Day 2010 5/15/10 San Tomas Aquino Creek @ Westmont High, Campbell Local site; part of County-wide effort and National event.	WVCWP has served as the sponsor for this Creek Cleanup site for a number of years. Outreach has been targeted at different groups, at different times – for example, Westmont High School students, Scout troops, and elementary school students. For this event, outreach was focused on generating interest among families of students from a nearby elementary school (Marshall Lane).	Volunteers: 16 (8 of these were families associated with a local elementary school where the Zun Zun assembly was held on 12/10/09). Two sections of the creek were cleaned: 600 feet on two sides of the creek and another 300 feet on one side of the creek in a different direction. <u>Participants chose to take:</u> 5x – "You're the Solution to Water Pollution" brochures 10x – "Adopt a Creek" lanyards 9x - Re-usable bags (sponsored by Safeway) 10x – "Watershed Watch" tattoos

Program Details	Focus & Short Description	Number of Students/Teachers reached	Evaluation of Effectiveness
Creek Cleanup Prospect High School Saratoga 4/17/10 Saratoga Creek at Prospect Ave.	WVCWP and City of Saratoga staff organized this cleanup of a Saratoga 'Trash Hot Spot', located near Prospect High School. High School students were solicited for the cleanup; those that participated were every enthusiastic. 600 feet of creek bank, near the High School, were cleaned.	Participants: 11 Prospect High School students 1 Teacher WVCWP & City of Saratoga staff	WVCWP provided trash bags, gloves and litter grabbers for this event. Students handled monitoring tasks during cleanup. 14 partially-filled 30 gal. trash bags were collected. See "C.10 Trash" for details. Participants selected the following 'give-away items: • 5x "Your Copper & Your Creeks" tri-folds (with Car Wash Discount card) • 5x "Native Plants" seeds (with "10 Most Wanted" bug brochures attached) • 5x "Original Pest Control" Fly Swatters • 2x "Don't Litter" license plate covers
Creek Cleanup Sacred Heart School (K-8) Saratoga 5/5/10 Wildcat Creek at Saratoga Ave.,	WVCWP and a parent voluteer organized this cleanup of a Saratoga schoolyard and adjacent creek. WVCWP has traditionally worked with Sacred Heart School for a number of years.	Participants: Appx. 40 students 1 parent WVCWP staff	WVCWP provided trash bags, gloves and litter grabbers for this event. This event was very effective in that 40 students, from a small school, participated – which demonstrated a high level of interest. Students handled monitoring tasks. Results: 10 partially-filled bags of trash were collected. Results were: 20 lbs trash 5 lbs recyclables School yard and 0.5 - 0.75 miles of creek and creekbank were cleaned.

C7egh Events

Los Gatos Public Works Open House 5/19/10 (3rd Grade students attended) Town of Los Gatos Corporation Yard	At this annual event, the Town showcases Public Works activities, including stormdrain-related topics. School children are invited, and parents accompany them. WVCWP staff (2) provided stormwater pollution information, and performed hands-on demonstrations with the students, using the Enviroscape Watershed Model. The students learned about pollution from litter, pet waste, car washing, etc. – and learned about appropriate behaviors to help prevent pollution.	80 Third Grade students attended.	Attendees chose to take: 6x – "Naturally Managing Pests" IPM Fact Sheet 12x – Copper Tri-fold with Discount Card 9x – "Original Pest Control" fly swatter 40x – "Get the Scoop – Don't Pollute" pencils 40x – "Watershed Watch" tattoos This event was well-attended. Until a few years ago, LG staff took this program directly to the schools, but for the past several years the venue has been changed to recruit students to come to the Corp Yard itself. It is rewarding to see this many students make the effort to come to the site and attend the event.
Classroom outreach with Enviroscape St. Mary's School (K-8) downtown Los Gatos 5/20/10	WVCWP has given Enviroscape presentations to various classes at St. Mary's for a number of years. St. Mary's requested that WVCWP give a classroom presentation in May. This-presentation was given in support of a science unit. Last year WVCWP donate a book to the school "All the Way to the Ocean. Before the presentation began, the teacher read the book to each class, which provided background information relevant to the hands-on activity. The presentation covered the impact on watersheds of trash/litter/re-usable containers in lunches, pet waste, car washing, pesticides, vehicle fluids, etc. – and behavior changes to help prevent watershed pollution. WV CWP also brought litter grabbers; while one class was involved in the Enviroscape activity, the other class rotated outside to pick up litter and vice versa.	Presentation was given to 2 Kindergarten classes 28 Students 2 Teacjers 1 Parent	Having a relevant story read prior to the presentation was very effective for a Kindergarten class. The students loved the presentation and really knew the answer to the question "where does the water/pollution go?". The teachers also gave positive feedback, and stated they would like to continue to have WVCWP return each year, 28 "Watershed Puzzles Worksheets" were distributed to the students.

C7egh Events

Creek Education program at Audubon Environmental Education Center, 3rrd Grade students Various dates in FY 09-10 MeClellan Ranch, McClellan Ave. at Stevens Creek, Cupertino	3rd Grade Storm Drain Pollution Prevention Program: Creek Education Field Trip City of Saratoga provides funding for students who are Saratoga residents, attending schools in adjoining districts, which participate in this education program. City of Saratoga provides funding for busing students from Blue Hills School; in addition, some Saratoga students attend other local schools, but funding for them is not requested from the City (some travel via car pool). This activity involves a ½ -day creek field trip to Stevens Creek at McClellan Ranch in Cupertino. City of Cupertino provides two docents for creek field trip. Messages include less-toxic pest control and litter prevention. Docents stress the importance of protecting the ecosystem and the habitat for all aquatic life. The field trip helps to encourages protection of habitat for these creatures.	In FY 09-10 student participation was: <u>Blue Hills School –</u> Saratoga residents: 64 students 14 parents <u>Meyerholz & Murdoch-Portal Schools combined:</u> <u>Saratoga residents:</u> 15 students (appx.) (Due to a scheduling conflict, students from <u>McCauliffe Elementary</u> were not able to attend this year).	More than 95% of the students are very enthusiastic about this trip. Students and the parents always are amazed at how much they have learned about the creek and how storm drains can affect creeks.. A large b/w picture for them to identify undesirable activity around storm drains in their neighborhood is distributed. They are encouraged to take this home and share it with their family. On the day of the trip a handout is sent home, with one more reminder about the correct way to dispose of light bulbs and batteries, so that these items do not end up polluting storm drains.

Attachment C- Campbell Contractor Monthly Pesticide Use Summary 14
Attachment D- Annual Department "IPM Plan" Report and Pesticide Inventory 16

Policy Statement

The City of Campbell will carry out its pest management operations using reduced-risk IPM techniques to reduce or eliminate chemicals to the maximum extent. Chemicals will be used only as a last resort for pest management problems. Each department that applies pesticides will maintain an active IPM plan to ensure the long-term prevention or suppression of pest problems with minimum negative impact on human health, non-target organisms, and the environment.

The City will actively pilot non-toxic alternatives for structural and landscape pest control, seeking to use the most recent technology, best management practices, and least toxic methods for all pest control measures.

The City will use appropriate venues to educate staff and the public about its IPM commitment in an effort to role model less toxic approaches to structural and landscaping pest control.

Integrated Pest Management Plan

A. Restricted Chemicals

Pesticides are defined as: any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest. Pests can be insects, mice and other animals, unwanted plants (weeds), or fungi. The term pesticide applies to herbicides, fungicides, rodenticides, molluscicides and other substances used to control pests.

City employees and City contractors will not use the following pesticides: diazinon, chlorpyrifos, or chlorpyralid. Emergency applications may be authorized by the completion of a written request and approval by the Pest Control Advisor.

The purchase of any pesticide by staff is prohibited unless directed by a Pest Control Advisor. Structural pest management actions will be managed and overseen by Community Services Department staff.

B. Annual Storage Inventory and Unwanted Chemical Disposal

An annual storage inventory will be conducted to remove and dispose of any chemicals that are unwanted or that are prohibited from City use by the IPM policy. These chemicals will be disposed through the City's Hazardous Waste Program.

C. Staff Education and Training

The City will provide City-wide IPM training. for City staff who are not applying pesticides as part of their regular job will receive annual outreach from City staff about the City's IPM policy and appropriate procedures for controlling pests.

Applicator training and supervision: City staff who manage pest problems and who apply pesticides as part of their job must be trained according to Department of Pesticide Regulation as outlined in the California Code of Regulations Title 3, Division 6 for pesticide applicators and advisors. Annual "Integrated Pest Management" training will also be provided to all staff who apply any pesticides on the job.

D. Record Keeping and Annual Evaluation

All city staff who apply pesticides will maintain pest management and pesticide application records using the Monthly City Pesticide Use Record (Attachment B). Copies should be sent to the Environmental Programs Manager. Contractors will also send copies of Monthly Contractor Pesticide Use Record (Attachment C) to the Environmental Programs Manager. Pesticide use records will record the amount used, date and location of use, target pest, and biological and mechanical controls used. All records will be made available to the public upon request.

Annual Evaluation - Departments will provide the Environmental Programs Manager with an annual summary of pest management problems and an inventory of banned pesticides (Attachment D). Because this is a County-wide storm water permit

requirement, the West Valley Clean Water Program will be responsible for consolidating the monthly use reports and preparing the annual report.

E. Public Outreach

The City will use appropriate opportunities to communicate with the public about IPM strategies and their benefits. Public outreach will include:

- IPM information provided to schools, residents, and businesses via special events, IPM workshops, advertisements, and point-of-sale (hardware and nurseries).

- Pesticide disposal options: Residential and business pesticide disposal options will be provided and promoted through the City's Household Hazardous Waste Program.

- All IPM and pesticide use records will be made available to the public within one week of request.

F. Contractor Compliance

Campbell's contractors must follow all aspects of Campbell's IPM Plan, including the restrictions contained in "A" above.

G. Department-Specific Components

Departments using pesticides will maintain site-specific plans. Each City Department applying pesticides (Public Works Department and Community Services Department) will develop an IPM plan (*Integrated Pest Management Plan*, Attachment A) which will outline pest management guidelines for the most persistent and frequent pests. The IPM Plans will:

- Use **preventative maintenance** and the most recent best management practices as a primary strategy to prevent key pests and thereby minimize the use of chemical pesticides.
- **Establish inspection procedures for key pests** to monitor pest population and tolerance levels based on the biological, aesthetic, and economic loss each site can tolerate, and set pest population levels at which corrective action should be taken.
- **Use alternative control options** such as (but not limited to): **habitat** management (changing the biological environment), **maintenance practices** (modifying watering, mulching, waste disposal), **physical controls** (mechanical removal, traps and barriers), **biological controls** (use of natural enemies), and re-design (modifying landscape design) to the maximum extent practical.
- Pilot and report on the results of new less-toxic measures for animal or plant pest control.

Attachment A

Department IPM Checklist
Also reference Pest Specific Plans in separate files

Attachment A

Department IPM Checklist and Plan Template

IPM Requirements

Pesticide Use
The following pesticides are prohibited from use: diazinon, chlorpyrifos, and chlorpyralid.

Employee purchase of pesticides:
Employees may not purchase pesticides of any kind without permission of a certified Pest Control Advisor.

Contractors
Contractors will comply with all elements of the City's pesticide plan and must make arrangements with Department staff for reporting.

Annual Responsibilities

Each Department who is responsible for pest management activities must complete or provide the following by February 1 each year:

- ☐ Review Department-level IPM plans for any updates, changes, and for evaluation from previous year.
- ☐ Complete the *Annual Department "IPM Plan" Report and Pesticide Inventory* (Attachment D) and provide to Environmental Programs Manager by February 1 of each year.
- ☐ Provide necessary staff training based on California State Code of Regulations, Title 3 and annual IPM training to City staff on seasonally relevant topics.
- ☐ Pilot new least-toxic IPM strategies.

On-Going Responsibilities

- ☐ Maintain and adhere to Pest Specific IPM Plans.
- ☐ Report all pesticide applications using Attachment B - *Monthly City Pesticide Record.* Route monthly to Environmental Programs Manager.
- ☐ Pilot new least–toxic IPM strategies
- ☐ Submit California State Monthly Summary Pesticide Use reports to County Agricultural Department.

CITY OF CAMPBELL – IPM IMPLEMENTATION

The City is in the process of developing the new "Stojanovich Family Park" which is 1.32 acres, surrounded by apartments, townhomes and condominiums. For this new city park, native plants and pest resistant plants are being used to the maximum extent practicable. Bioswales will be incorporated as a means of mitigating runoff at this site. See the final conceptual design below.

http://www.ci.campbell.ca.us/Recreation/parks/parkinfoStojanovich.htm

Incorporation of native and pest resistant plants are an important component of the City's efforts to reduce pesticide use. In addition, the bioswales will help to prevent runoff that might have carried pesticides and fertilizers off of the park grounds, and into stormdrains.

PESTICIDE USAGE REDUCTION MEASURES: PEST SPECIFIC

Campbell is implementing IPM in the following situations:

1) On-going - Yellowjackets:

• Campbell uses traps as the main means of control.

• Parks Maintenance staff regularly cleans off picnic tables to avoid attracting wasps and ants.

• If a wasp nest in a tree requires treatment, the PCO or Parks staff use a non-residual pesticide, and close the hole in tree so wasps can't return to nest. Parks staff use home insulation spray foam to close the nest/hole; treatment has been successful in preventing return of wasps.

• Staff is using traps which incorporate pheromone to attract wasps, dry fish to bring them into trap, and soap inside trap, which kills in 5-15 seconds

2) On-going - Weeds:

The Parks Dept. has been able to substantially decrease its use of herbicides for turf:

Based upon techniques learned at a previous WVC IPM Training (Cornell University Extension Turf Specialist) the Parks Department purchased a $25,000 dollar "Deep Tyne Aerator" in May 2008. The unit reduces pesticide use on the turf by reducing compaction, increasing water flow through the soil profile and promoting healthier, more vigorous turf that is able to crowd out the broadleaf and other grassy weeds. This has had a positive impact on herbicide use for turf areas in the City. It has also decreased the amount of water needed to irrigate the turf by allowing water to soak deep into the root zone and to encourage deep rooting of the turf grass.

• Campbell has been encouraging the City's tree contractors to dump their wood chips in the City's organic waste area. The wood chips are then used in the City's mulching program to reduce weeds and reduce the watering of trees.

• Campbell purchased a new, more powerful chipper in March of 2010 to increase the efficiency of mulching green waste. The mulch is used in City planters and other areas for weed control wherever possible. This reduces the need for herbicides.

• Work Furlough labor hand hoes weeds where possible.

• Staff has been using the tractor with a boom mower for mowing weeds, instead of spraying herbicides on roadsides and similar areas.

3) On going - Insects:

Since FY 07-08, Campbell Parks Dept. has been using a new **all-organic oil** in the City's tree spray program. The oil has been effective against the target pest, aphids. Due to use of this new oil, the City has been able to reduce the use of pesticides in combating aphids in City trees.

Unfortunately, the City has certain species of street trees with aphid and scale infestations which are difficult to treat. When pesticide use is necessary, a systemic pesticide, injected into the tree is used. This results in the pesticide being taken up by the tree and staying within the tree rather than running off and becoming a pollutant in local streams.

No new insects were identified in FY 09-10.

4) On-going - Gopher Control:

The City has implemented a policy of using mechanical traps for gophers instead of baits thus further reducing the use of pesticides. Currently this program has been successful since there are no gophers in any of the City's parks and facilities.

5) On-going: Rodent control in Facilities

Snap-traps are used for rodent control within City buildings. Appx. 15 roof rats were trapped in FY 09-10. Bait Blox are used at a minimal level, as needed, for back-up. Mice and other rats have not been a problem, due to careful sanitation measures, which help ensure that rodents are not attracted to City facilities. All trash is removed from buildings each evening, and placed in closed dumpsters. Dumpster areas are swept at least weekly.

6) On-going - IPM Solutions:

City staff have participated in implementation of the County computerized "IPM Solutions Database Input/Response", which allows input of a pest problem and a response with IPM solutions. Staff refer to this database as needed.

RESULTS OF PESTICIDE USE REVIEW - FY 09-10:

Campbell has taken a strong stance on pesticide use reduction in recent years, as evidenced by the past extensive involvement in IPM training by City staff, and by the investment in equipment which has helped to reduce herbicide use ((such as Deep Tyne Aerator, Boom Mower, Chipper).

Use of new equipment and new pest management techniques have resulted in a continual decrease in the amount of pesticides used by City of Campbell.

Pesticide Management Summary

With the use of oils in lieu of pesticides, and other ongoing IPM practices, pesticide usage continues to decrease.

As new innovative IPM practices are made known to municipalities they will be implemented to continue to use less pesticides.

The City is raising its threshold limits for the number of insects and weeds in parks and urban forests. This has also led to a decrease in pesticide usage.

- Through use of IPM practices Campbell was able to eliminate use of any Organophosphate pesticides for at least the past 8 years. Campbell has decreased its use of insect-control pesticides by using oils and soaps to control aphids and scale in the urban forest.
- The City is making an effort to stress prevention (prevent weed growth, prevent pest infestations) where possible.
- The City Public Works Dept. has instituted a policy of moving towards installation of more pest resistant trees and shrubs to minimize the need for pesticides; these efforts include removal of certain tree species (such as Tulip and Raywood Ash trees) from the City of Campbell 's approved Street Tree List.
- Campbell is moving into use of IPM, mechanical and cultural controls rather than chemical controls, as much as possible. These controls include use of green waste to make wood chip mulch to prevent weed growth. For the past 5 years, the City has been using its new specialized tractor with boom mower for mowing roadside and park weeds and to avoid spraying. With the purchase of the new aerator and chipper, the City is seeing a reduction in the use of herbicides on its extensive turf areas and landscape planters.

Mr. Bruce H. Wolfe
Executive Officer
San Francisco Bay Regional Water Quality Control Board
1515 Clay Street, Suite 1400
Oakland, CA 94612

Subject: City of Cupertino Urban Runoff Management Program
FY 2009-2010 Annual Report

Dear Mr. Wolfe:

This letter and Annual Report with attachments is submitted by the City of Cupertino, in conjunction with the Santa Clara Valley Urban Runoff Pollution Prevention Program's Annual Report pursuant to Permit Provision C.16.a of the Municipal Regional Stormwater NPDES Permit (MRP), Order R2-2009-0074, NPDES Permit No CAS612008 issued by the San Francisco Bay Regional Water Quality Control Board. The Annual Report provides documentation of activities conducted during FY 2009-2010 and consists of the following:

- 0: Table of Contents
- 0: Certification Statement
- 0: Acronyms
- 1: Permittee Information
- 2: Municipal Operations
- 3: New Development and Redevelopment
- 4: Industrial and Commercial Site Controls
- 5: Illicit Discharge Detection and Elimination
- 6: Construction Site Controls
- 7: Public Information and Outreach
- 8: Water Quality Monitoring
- 9: Pesticides Toxicity Controls
- 10: Trash Load Reduction
- 11: Mercury Controls
- 12: PCBs Controls
- 13: Copper Controls
- 14: PBDE, Legacy Pesticides and Selenium Controls
- 15: Exempted and Conditionally Exempted Discharges

Program Highlights and Accomplishments

In addition to implementing the new MRP, the City of Cupertino maintained its commitment to being a leader in sustainability and environmental protection. The idea exchange between City departments via the City's "Green Team" resulted in the purchase of a new fleet of traditional and electric bicycles, safety gear, and bicycle safety lessons for employees. The alternative transportation was provided to discourage vehicular travel between city facilities and for personal use during work hours.

The City negotiated a new agreement with its franchised hauler, Recology, which City Council approved in May. The new Agreement will be implemented on November 1, 2010. The year-long negotiations from June 2009 to May 2010 entailed several discussions on prevention of illicit stormwater discharges from leaking vehicles, leaking waste bins, the transport of leaking trash compactors, and spills of litter that may occur during collection. The Agreement specifies that the garbage company will clean spills immediately, but cleanup will be addressed, at the latest, within two hours after the spill is noticed or reported. Fines for non-compliance are written into the Agreement to emphasize the seriousness of maintaining clean streets.

To support the new Citywide collection of food waste for processing into compost, Recology has agreed to purchase four hundred backyard home composting bins and give them out, free of charge, to residents who take a home composting class or a Bay Friendly Gardening class. The Earth machine compost bins are very popular and sell for approximately $70. The City has already seen an increase in Cupertino residents registering for upcoming Bay Friendly classes. Bay Friendly Gardening encourages residents to make environmentally friendly gardening choices which focus on protecting the watersheds of San Francisco Bay by, among other things, avoiding the use of synthetic fertilizers, toxic pesticides and non-native or invasive plants.

Public Education, Community Participation and Trash Management

To showcase its environmental programs, a "Cupertino Green" logo was created and applied to the City's compact reusable *Chico* shopping bags purchased to give away at its environmentally themed community events. In September, ten thousand people were expected to visit the three-day Fall Festival where Environmental Programs staff talked to more than 400 adults and children about watershed protection and pollution topics. The City's Earth Day event attracted over six hundred participants to booths with displays on beneficial insects, volunteer water monitoring, Master Composting, Bay Friendly Gardening, native plants, organic foods and interactive presentations for children featuring the Enviroscape watershed model. Over twenty different types of educational materials were taken by attendees at the watershed booth.

Since the inception of annual creek cleanup events in Cupertino in fall of 2008, volunteer participation has increased from approximately 80 participants to over a hundred at both the Coastal Cleanup Day in September and the National River Cleanup Day in May. The events are especially popular among high school students. Environmental Programs staff held two smaller events in March and May for school groups interested in cleaning a creek and learning about trash assessments.

Municipal Operations

In FY 09-10 the City purchased and installed a new state-of-the-art closed loop vehicle and equipment wash rack. The wash rack not only filters and recycles used wash water, but it

harvests rain collected in the structure for use during equipment and vehicle cleaning. Other minor operating procedures were updated after the City began revising its Storm Water Pollution Prevention Plan (SWPPP), last updated in 2004. The new, more detailed SWPPP was submitted to City's Municipal Service Center and Environmental Programs staff for final comments in June.

Planning and New and Redevelopment

Environmental Programs staff met internally several times with Planners in the Community Development Department and Public Works Engineering staff who review C.3 regulated projects and conduct permanent treatment operation and maintenance inspections, to discuss MRP implementation and proposed revisions to the City's Watershed Protection Ordinance. Although the City has the legal authority to enforce current MRP requirements, the updated Municipal Code will add language that more closely aligns with the MRP and will help implement upcoming requirements. Additionally, the City's Planning Division began working on a water efficient landscaping ordinance in December 2009, which was adopted by City Council in June 2010.

Industrial & Commercial Site Controls, Illicit Discharges, and Construction Site Controls

In FY 09-10, Cupertino developed Enforcement Response Plans (ERPs) for its Industrial and Commercial (IND), Illicit Discharge Detection and Elimination (IDDE), and Construction Inspection Programs. These ERPs document consistent and escalating enforcement procedures for all potential or actual illicit discharges. The ERPs represent a collaborative effort between Environmental Programs staff, the City's industrial/commercial (Building Dept) inspectors, the IDDE Inspector (Public Works Maintenance), the Construction Inspector (Public Works Engineering), and the City's Code Enforcement staff, to ensure feasible and efficient enforcement procedures meeting the requirements of the MRP. In addition, Code Enforcement staff worked with the City Attorney to clarify and strengthen the City's ordinance for administrative citation fines (Municipal Code Chapter 1.10). Administrative citation fines start at $100 for the first offense and increase to $500 for a third violation for the same offense. Environmental Programs adopted the administrative citation fine as Level Three in its escalating enforcement procedures. First administrative fines are now applicable to violations that are not resolved within ten business days and have not been granted a time extension due to extenuating circumstances of the violation. To implement the new enforcement procedures the City developed new notices of violation forms and incident report forms.

Hazardous Waste Collection Services

The City of Cupertino currently has about 1,500 residents per year that use the County's residential hazardous waste drop-off service. The City is hoping to double its residential participation in FY 10-11. The negotiations for the new waste management agreement with Recology during FY 09-10 resulted in a separate household hazardous waste contract with Curbside Inc., of Southern California. Curbside will take appointments to collect household hazardous waste from residents including, but not limited to, gardening chemicals, cleaning agents, fluorescent bulbs, batteries, e-waste, pharmaceuticals, and sharps. The new service will cost residents about $0.50 per month for unlimited service appointments. The City will continue to fund its residential participation in the Countywide collection program, but this option will give working families more opportunities to dispose safely of hazardous waste because appointments are made in advance and a "kit" with a large clear plastic bag is sent to the resident who may subsequently load it up and "lock" materials into it with a one-way bag tie and

leave the waste at the front door for collection. Residents need not wait at home for the collection driver to arrive. This residential program will begin on November 1, 2010 when the City's new waste management franchise agreement becomes effective.

Stevens Creek Corridor Restoration Project

The City's Stevens Creek restoration project at Blackberry Farm was opened to the public on July 4, 2009. Before the Annual SCVURPPP C.3 Stormwater Workshop on June 8, 2010, the City was told that the project was this year's site design award winner for public parks. The City's Project Engineer gave a presentation detailing the improvements, including replacement of a large conventional asphalt parking lot with a smaller lot made entirely of porous pavement and vegetated geo-cell parking stalls and a net reduction of over 3 acres of impervious surface. The project also incorporated removal of a diversion dam and low flow stream crossings; relocation of a maintenance facility out of the riparian corridor; realignment, widening, and regrading of the Stevens Creek channel for a more natural meander, greater bank stability, and less down-cutting; and habitat restoration with native plants and trees to complete the new streamside landscape.

Thank you for your review of this Annual Report. Please contact me at 408-777-3242 regarding any questions or concerns.

Very truly yours,

Cupertino Acronyms/Abbreviations

AERC	A full service recycling company facility in Hayward which collects universal waste such as lamps, ballast, batteries, electronic scrap and mercury containing material. AERC Specialists provide regulatory compliance and consulting for handling U-waste.
CESSWI	Certified Erosion Sediment Storm Water Inspector
CIP	Capital Improvement Project
EC	Erosion Control
IDDE Inspector	Illegal Discharge Detection and Elimination Inspector
MRP	Municipal Regional Permit
NPS Inspector	Non Point Source Inspector also called the IDDE Inspector
PCA	Pest Control Advisor
Pub Ed	TAC Public Education Sub Group
PW	Public Works
QAC	Qualified Applicator Certificate. A category of the DPR licensing and certification Program. To be certified, the applicant must demonstrate specific knowledge on topics such as pesticide application drift problems and prevention, soil and water problems resulting from restricted use pesticides, phytotoxicity, potential for environmental contamination, etc.
R-O-W	Right of Way
WV	West Valley (communities)

Program

FY 09 - 10 Annual Report

Section 2

Provision C.2 Municipal Operations

Section 2 - Provision C.2 Reporting Municipal Operations

Program Highlights and Evaluation

Highlight/summarize activities for reporting year:

Summary:

In 2010, Cupertino's 2004 SWPPP was reviewed and completely revised with the help of the City's storm water consultant. Several staff interviews were conducted in the spring along with a detailed Corp yard inspection on May 19th. The resulting final draft including notes on standard operating procedures for the City's new closed-loop vehicle wash pad (with rain harvesting capability) was available for staff on June 30th for comments. The new SWPPP will be finalized by fall of 2010 to reflect several staff changes including a new Street Maintenance Supervisor, hired on July 1, 2010. The City's new Supervisor brings with him ten years of Caltrans experience and a particular interest in educating staff on stormwater BMPs.

Cupertino's Environmental Programs staff participated in the Program's Municipal Operations Ad Hoc Task Group (AHTG) and determined how the City would implement the investigation of eleven (11) screening check points in the City's storm drain system and at strategic outfalls to local creeks; Please see the C.2 Municipal Operations section of Program's FY 09-10 Annual Report for a description of activities of the Municipal Operations AHTG.

C.2.a. ►Street and Road Repair and Maintenance

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and provide explanation in the comments section below:

X	Control of debris and waste materials during road and parking lot installation, repaving or repair maintenance activities from polluting stormwater
X	Control of concrete slurry and wastewater, asphalt, pavement cutting, and other street and road maintenance materials and wastewater from discharging to storm drains from work sites.
X	Sweeping and/or vacuuming and other dry methods to remove debris, concrete, or sediment residues from work sites upon completion of work.

Comments: The Assistant Director of Public Works, Maintenance verified that the Street/Road/Highway Repair & Maintenance BMPs as noted in the City's Urban Runoff Management Plan (2004) Performance Standard for Public Streets are consistently being implemented by City staff. Maintenance workers perform only emergency repairs of streets and roads. Any saw cutting done by City staff or contractors is done using a tool with a built in vacuum. All other work is sent out to bid as a Capital Improvement Project (CIP). Contract specifications require adherence to the City's Performance Standard BMPs and a pre-consultation meeting is held in which stormwater BMPs and requirements are reviewed with the contractor. Minor and emergency repairs may be handled by an on-call contractor. If an on-call contractor, such as *Able*, is used for hydro-flushing and vacuuming storm drains, a City maintenance worker supervises the work and verifies that the BMPs are used effectively. In addition to ongoing training in BMPs, the Environmental Programs Manager met with all divisions of the Public Works Maintenance staff (approximately 70

employees) at a staff training meeting on August 5th 2009 to review BMPs and to discuss the implementation of the upcoming Municipal Regional Permit. The City's IDDE Inspector, a maintenance worker at the City's corporation yard, stays informed about any repairs or maintenance done by City staff and City contractors. He continually observes and ensures that BMPs are being effectively employed. The annual Corp Yard staff training was held on 8/5/09, which included a discussion on how to safely clean up a mercury spill. A poster of the cleanup tips was placed in the Service Center office and a binder-sized copy was provided to include in the corporation yard SWPPP.

C.2.b. ►Sidewalk/Plaza Maintenance and Pavement Washing

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of wash water from pavement washing, mobile cleaning, pressure wash operations at parking lots, garages, trash areas, gas station fueling areas, and sidewalk and plaza cleaning activities from polluting stormwater
X	Implementation of the BASMAA Mobile Surface Cleaner Program BMPs

Comments:

The Assistant Director of Public Works, Maintenance verified that the Sidewalk Plaza Maintenance BMPs as noted in the City's Urban Runoff Management Plan (2004) Performance Standard for Public Streets are consistently being implemented by City staff. Dry methods are used to clean sidewalks. If any water is used to clean sidewalks or plazas, City maintenance workers use the appropriate BASMAA surface cleaning BMPs to prevent soap, oil and other pollutants from entering the storm drains.

This year the City renegotiated its franchise garbage and recycling collection agreement and added language to require that businesses within the City are offered one free debris box cleaning per year. The debris boxes are taken to the hauler's facility for steam and/or pressure cleaning. This was intended to keep debris box discharges to a minimum and to prevent business owners from power washing the debris boxes in their parking lots where the runoff would likely get to the storm drain system.

C.2.c. ►Bridge and Structure Maintenance and Graffiti Removal

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of these BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of discharges from bridge and structural maintenance activities directly over water or into storm drains
X	Control of discharges from graffiti removal activities
X	Proper disposal for wastes generated from bridge and structure maintenance and graffiti removal activities
X	Implementation of the BASMAA Mobile Surface Cleaner Program BMPs for graffiti removal

Comments:

The Assistant Director of Public Works, Maintenance verified that the Bridge and Structure Maintenance BMPs as noted in the City's Urban Runoff Management Plan (2004) Performance Standard for Public Streets are consistently being implemented by City staff. When removing graffiti, maintenance crews do not use sand blasting. Instead, graffiti is covered over with graffiti-resistant paint.

C.2.d. ►Stormwater Pump Stations

Does your municipality own stormwater pump stations:		**Yes**	**X**	**The City of Cupertino does not own any pump stations.**

If your answer is **No** then skip to **C.2.e.**

(For FY 10-11Annual Report only) Complete the following table for dry weather DO monitoring and inspection data for pump stations[1] (add more rows for additional pump stations):

Pump Station Name and Location	**First inspection Dry Weather DO Data**		**Second inspection Dry Weather DO Data**	
	Date	**mg/L**	**Date**	**mg/L**

[1] Pump stations that pump stormwater into stormwater collection systems or infiltrate into a dry creek immediately downstream are exempt from DO monitoring.

C.2.e. ►Rural Public Works Construction and Maintenance

Does your municipality own/maintain rural[2] roads: **The City of Cupertino maintains between 1 to 2 miles of rural roads near Regnart Road. All of these roads are paved and maintained on a regular maintenance cycle.**	**X***	**Yes**		**No**

If your answer is **No** then skip to **C.2.f**.

Place an **X** in the boxes next to implemented BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of the BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of road-related erosion and sediment transport from road design, construction, maintenance, and repairs in rural areas
X	Identification and prioritization of rural road maintenance based on soil erosion potential, slope steepness, and stream habitat resources
NA	No impact to creek functions including migratory fish passage during construction of roads and culverts
X	Inspection of rural roads for structural integrity and prevention of impact on water quality
X	Maintenance of rural roads adjacent to streams and riparian habitat to reduce erosion, replace damaging shotgun culverts and excessive erosion
NA	Re-grading of unpaved rural roads to slope outward where consistent with road engineering safety standards, and installation of water bars as appropriate
X	Inclusion of measures to reduce erosion, provide fish passage, and maintain natural stream geomorphology when replacing culverts or design of new culverts or bridge crossings

Comments including listing increased maintenance in priority areas:

The City does not have any unpaved rural roads. *The combined length of rural roads in Cupertino is between one and two miles, including the western end of Regnart Road, west of Lindy Lane and the section of Stevens Canyon Road southwest of Ricardo Road to the City limit north of the entrance to Stevens Creek County Park. The current conservative estimate of rural roads under the revised definition is approximately two miles. The City will reevaluate this once the Program completes its analysis of the MRP's Rural Roads provisions. Inspection and maintenance of this limited amount of rural roadways are done as part of the City's ongoing street maintenance program or on a complaint basis. The City does not foresee construction of additional rural roads, however if rural County areas are annexed into Cupertino, the new public roads would be designed to minimize impacts to watercourses and water quality. Eleven Public Works Maintenance Workers attended the Program's Rural Road Maintenance training workshop on September 25th, 2008. The Assistant Director of Public Works, Maintenance verified that the Rural Public Works Maintenance BMPs as noted in the City's Urban Runoff Management Plan (2004) Performance Standard for Public Streets are consistently being

[2] Rural means any watershed or portion thereof that is developed with large lot home-sites, such as one acre or larger, or with primarily agricultural, grazing or open space uses.

implemented by City staff whenever work is done in "rural" areas. This past winter mud from one residential lot slid into the rural road on Upland Way in Cupertino. City emergency crews responded and used BMPs to keep mud from entering the storm drain. The City's Public Works Engineer wrote the resident a letter advising the resident to contact a geotechnical engineering firm to investigate the hillside, and provide recommendations for the reparation of the slope, and repair the slope as necessary. In Aug. to Sept 2009, maintenance was completed on rural roads, Lindy Lane and Regnart Rd in Cupertino (the work was done by contractor, O'Grady Paving) to prevent possible road failure. The City's Performance Standard BMPs for Rural Public Works were included in the contract specifications. Additionally, the appropriate BMPs and City requirements were reviewed with the contractor in a pre-construction meeting with City Engineering staff.

The City's rural road maintenance program is based on a 7-year maintenance cycle. However, City maintenance staff and field crews watch for potential problems in this area and report any need for additional maintenance.

During FY 09-10, the City did not replace any culverts and did not design any culverts or bridge crossings. However, during FY 08-09, the City did remove a barrier in Stevens Creek that served as a crossing for vehicles through the creek. During the replacement of the vehicle in-creek crossing, the City and its contractor partnered with the Water District, Dept of Fish and Game and with a naturalist to ensure that any construction was done in a way that would protect wildlife habitat. The new bridge was carefully designed as part of the creek restoration to reduce erosion, increase fish passage, and to restore the natural geomorphology of the creek. The project won a Site Design Award from SCVURPPP in June 2010 for its many beneficial aspects of natural creek restoration and wildlife habitat preservation and for removing acres of asphalt parking lot and replacing it with vegetated geo-cell parking and native landscaping. Any work that the City conducts in the future, near a creek or on a culvert, would be done in conjunction with the Water District and would be designed to prevent erosion and maintain or restore natural creek geomorphology.

C.2.f. ►Corporation Yard BMP Implementation

Place an **X** in the boxes below that apply to your corporation yard(s):

	We do not have a corporation yard
	Our corporation yard is a filed NOI facility and regulated by the California State Industrial Stormwater NPDES General Permit
X	We certify that we have a current **Stormwater Pollution Prevention Plan (SWPPP)** for the Corporation Yard(s)

Place an **X** in the boxes below next to implemented SWPPP BMPs to indicate that these BMPs were implemented in applicable instances. If not applicable, type **NA** in the box. If one or more of the BMPs were not adequately implemented during the reporting fiscal year then indicate so and explain in the comments section below:

X	Control of pollutant discharges to storm drains such as wash waters from cleaning vehicles and equipment
X	Routine inspection prior to the rainy seasons of corporation yard(s) to ensure non-stormwater discharges have not entered the storm drain system
X	Containment of all vehicle and equipment wash areas through plumbing to sanitary or another collection method
X	Use of dry cleanup methods when cleaning debris and spills from corporation yard(s) or collection of all wash water and disposing of wash water to sanitary or other location where it does not impact surface or groundwater when wet cleanup methods are used
X	Cover and/or berm outdoor storage areas containing waste pollutants

Comments:

The City's corporation yard (the Municipal Service Center, or MSC) SWPPP was completely revised in spring of 2010. Staff retirement led to a reorganization of the staff responsibilities, which are documented in the SWPPP.

Two Corp Yard inspections occurred in FY 09-10. The first was on July 14, 2009 to make up for a missed inspection in June 2009. The second was on May 19, 2010. Noteworthy inspection findings are summarized below. The inspection results from both 2008 and 2009 recognized a need to improve vehicle washing facilities. A new state-of-the-art closed loop vehicle and equipment wash rack was completed at the MSC in spring 2010. The wash rack filters and recycles used wash water and also harvests rain collected in the structure for make-up water. Staff training on the new vehicle and equipment wash station was provided in May 2010.

A main finding of the May 19, 2010 Corp Yard inspection was that street sweeping equipment be fixed or replaced to eliminate leakage at the MSC. New sweepers would also improve the efficiency of the city-wide street sweeping program. This option will be considered in the next request for proposal when the City's street sweeping contract goes out to bid before the current contract expires on July 1, 2011

If you have a corporation yard(s) that is not an NOI facility, complete the following table for inspection results for your corporation yard(s) or

attach a summary including the following information:			
Corporation Yard Name	**Inspection Date** (1x/year required)	**Inspection Findings/Results**	**Follow-up Actions**
Municipal Service Center	July 14, 2009	1. Vehicles washed in area when runoff may enter SD 2. Paint chips present in stencil scraping area 3. Rusty water leaking from water truck 4. CB near Warehouse needed cleaning	1. New wash rack completed spring 2010 2. Stencil scraping area tarped beforehand and swept after 3. Crews to park water truck in landscaped/ dirt area until leak fixed 4. Site Manager told of need for CB cleaning
Municipal Service Center	May 19, 2010	1. Spill kit near Fuel Island should include trench drain plug 2. A few vehicles/equip leaking 3. Some dumpster lids open 4. No "No Topping Off" signs at Fuel Island 5. Cigarette butts on ground near Grounds Shop/Sign Rm 6. Street sweeper leaking where parked 7. Surplus equip./materials stockpiled 8. Some inspections undocumented.	1. At end of June 2010, new spill kit installed near Fuel Island contains conical plug to place in trench drain outlet in case of fueling spill/leak 2. In June 2010, absorbent pads placed under leaking tractor and water truck partially repaired. More repair to water truck by end of 2010. 3. By fall 2010, signs to be placed on dumpsters to remind users to keep lids closed. 4. By fall 2010, "No Topping-Off" signs to be placed at fuel pumps 5. By fall 2010, place

			additional cigarette butt receptacles where needed. 6. By end of 2010, street sweeper leaking to be fully controlled. 7. Disposal of surplus equip./materials to occur on an on-going basis. 8. As of June 2010, all inspections to be documented in writing. 9. Pavement sweeping at MSC to be scheduled to occur as part of new sweeping contract.

CUPERTINO GREEN
Program

FY 09 - 10 Annual Report

Section 3

Provision C.3 New Development and Redevelopment

Section 3 - Provision C.3 Reporting New Development and Redevelopment

C.3.a. ►New Development and Redevelopment Performance Standard Implementation Summary Report

(For FY 10-11Annual Report only) Provide a brief summary of the methods of implementation of Provisions C.3.a.i.(1)-(8).

The City began a comprehensive revision of the stormwater ordinance in March 2010. Input has been solicited from City Planners and Public Works Engineer regarding C.3 compliance. Once the draft ordinance revision is complete, anticipated in fall 2010, it will be sent to City Attorney for review. The ordinance is expected to be approved by the City Council by winter 2010-2011.

C.3 Guidance and Impervious Surface Form:

The City's Impervious surface form was revised in May 2010; requiring project applicants to reserve or put aside 4% of a project's developable land at the beginning of a project's design phase. Reserving this space for C.3 stormwater treatment measures remains a key feature of the form and the City's guidance.

On 4-27-2010, new C.3 guidance (two fact sheets) for project applicants was placed at the Planning and Public Works counter and on the City's website. The guidance (borrowed from the City of Sunnyvale) encourages all new and redevelopment projects to protect water quality by considering the given examples of site design and source control measures. PDF files of the guidance for LID and for site design and source controls can be viewed at: http://www.cupertino.org/index.aspx?page=170 under the following heading and document listings:

Development Requirements - Through the use of Low Impact Development (LID) Techniques all Projects Are Encouraged to Include Site Design and Source Control Measures to Reduce Stormwater Runoff Pollution

LID Techniques and Stormwater Pollution Controls

Site Design and Source Control Measures

Training: The City's Environmental Programs Mgr. presented the new C.3 guidance fact sheets and to spoke to Planning Division staff about the upcoming LID requirements in the MRP at a Community Development staff meeting on 5-3-2010. A round table discussion ensued wherein it was determined that planners consider the "Entitlement" step as the final discretionary approval granted by the City before a project is ready to start demolition or construction. Once entitlement has been obtained, the City can no longer place additional conditions of approval on the project. Environmental Programs and Planning staff discussed how the City would prepare for the December 1, 2011 implementation requiring the treatment of runoff with 100% LID measures and requiring projects with 5,000 sf of impervious surface to comply with provision C.3 of the MRP. This C.3 /LID Planner training meeting was attended by the entire Planning staff, including the Dir. of Community Development, the Economic New and Redevelopment Mgr, the City Planner, three Senior Planners, the Associate Planner, and an Assistant Planner.

During FY 09-10, the City's Associate Planner developed a design project for her graduate class incorporating "green street" designs and LID measures in the parking lot and on-street parking area around City Hall. A stressed City budget prevents this pilot project from being considered at this time, but the effort among Cupertino planners to engage in creative thinking to promote LID is evident in Cupertino's Planning Division.

SCVURPPP held its annual C.3 Stormwater Workshop at Cupertino's Quinlan Center on June 8, 2010. Two of Cupertino's Senior Planners and five of the Public Works Engineering and Environmental Programs staff, including those responsible for the review of C.3 projects, attended the workshop. At this event, Cupertino's Steven's Creek Restoration project at Blackberry Farm was announced as this year's site design award winner for public

parks. The City's Project Engineer gave a presentation detailing the improvements, including replacement of over 3 acres of conventional asphalt parking lot with a smaller lot made entirely of porous pavement and vegetated geo-cell parking stalls, and native plants and trees to complete the new streamside landscape. Two areas where concrete crossings were used by vehicles to "drive through" the creek were removed and in their place an environmentally friendly pedestrian and maintenance cart bridge was built.

On October 27, 2009, in an effort to provide co-permittees with a better understanding of feasible rain harvesting, SCVURPPP sponsored, and the City of Cupertino hosted, a webinar on *Rainwater Collection and Case Studies for Sustainable Water Management*. Cupertino's Environmental Programs Mgr and Public Works Engineer responsible for reviewing C.3 projects attended.

C.3.b. ►Green Streets Status Report

(All projects to be completed by December 1, 2014)

On an annual basis (if applicable), report on the status of any pilot green street projects within your jurisdiction.

Please see the C.3 New Development and Redevelopment section of Program's FY 09-10 Annual Report for a description of activities of the C3PO AHTG Green Streets Work Group and the BASMAA Development Committee.

C.3.b.v.(1) ►Regulated Projects Reporting Table

Please see the attached table **C.3.b.v.(1)** for a list of Cupertino's C3 regulated projects that were approved in FY 09-10.

C.3.h.iv. ► Installed Stormwater Treatment Systems Operation and Maintenance Verification Inspection Program Reporting

(1) Please see the attached inspection reporting table C.3.h.iv.(1)

(2) On an annual basis, provide a discussion of the inspection findings for the year and any common problems encountered with various types of treatment systems and/or HM controls. This discussion should include a general comparison to the inspection findings from the previous year.

Summary of findings: Most of Cupertino's eight C.3 regulated projects from previous years have mechanical treatments and/or vegetated bioswales installed on the properties. Whole Foods has dry wells at the end each of the parking lot swales.

Mechanical treatments

The mechanical units have not yet had any maintenance problems.

Swales

The City has learned that swales do not work well in grocery store parking lots due to the heavy pedestrian traffic and the grocery carts that end up being "parked" in the swales. The swales at other properties have not had maintenance problems to date.

Vegetated swales were installed in two areas at a grocery store complex in Cupertino. Several months after construction, the Public Works Inspector field-checked the site and observed the vegetation in the main parking area swales was dying or dead and there was standing water in one swale's downstream drain inlet (dry well) during dry June weather. The problem with standing water was fixed immediately after the store was notified and its maintenance crew cut back on the irrigation schedule for the vegetation in the swales (the additional irrigation was not bringing the vegetation in the swales back to life).

The problem with the bioswale's vegetation was remedied when the property owner's tenant scarified the soil, added amendments, built a two-rail wood fence on either side of the swales with a few intermittent bridge crossings for carts and pedestrians and replaced several parking spaces with additional grocery cart parking stalls. In addition, the swales were replanted with heartier and more drought-tolerant *Juncus Patens* shrubbery, the irrigation system was converted to a drip system, and the landscape installer was hired to maintain the swales after the re-landscaping project was complete. The vegetation in the swales is now thriving and the swales and dry wells appear to be functioning well. This remediation came at a significant cost to the tenant. To further ensure protection of the storm drain system, the City has asked grocery store property manager~~s~~ to provide documentation of annual on-site storm drain inlet cleaning and cleaning of the downstream ends of the swales before the rainy season in fall 2010. The swales, drain inlets, and the additional maintenance documentation will be checked by the City annually, beginning in FY 10-11. In the future, the City will not approve swales in areas with this type of traffic unless additional measures are taken to protect the swales.

(3) On an annual basis, provide a discussion of the effectiveness of the O&M Program and any proposed changes to improve the O&M Program (e.g., changes in prioritization plan or frequency of O&M inspections, other changes to improve effectiveness program).

Summary: The City's Permanent Treatment O&M Verification Inspection Program is conducted entirely by the Public Works Inspector, who also conducts the City's construction site management inspections. The property owner is responsible for maintenance of installed permanent treatments and the City requires that the property owner ensure that maintenance is conducted at least annually with documentation available to the City's Public Works Inspector upon his request. This year, the inspector recommended that property owner contact information be updated annually to facilitate his access to the appropriate responsible party if a business changes owners or if a property owner changes tenants. The contact information was updated in August 2010 and logged in the O&M Inspection Excel spreadsheet. The City had considered converting from Excel to an Access data base for tracking O&M, however the spreadsheet works well and staff are no longer anticipating a change in the near future. No other improvements to the Permanent Treatment O&M Verification Inspection Program are deemed necessary at this time.

With only a few new projects to add to Cupertino's list of eight existing C.3 regulated projects this fiscal year, the City will continue to inspect installed treatments at each completed site in FY 10-11. None of the C.3 regulated projects approved in FY 09-10 were complete as of the end of FY 09-10 and only four of the private C.3 regulated projects approved in earlier years were complete by the end of FY 09-10. Due to the economy, one project was put on indefinite hold and will continue to be inspected as a construction site. In FY 11-12, depending on the number of new C.3 sites, the City may develop criteria for inspecting a subset of these sites annually, as allowed under MRP Provision C.3.h.

For the only Cupertino site thus far that has had maintenance problems with installed treatment measures (the grocery parking lot swales), the City Environmental Programs Manager, Public Works Inspector and Engineering staff were able to meet with the property owner and the tenant several times to agree upon a "re-design" of the failed treatment measure. The City's Municipal Code helped ensure that compliance was met satisfactorily. All other aspects of the City's Permanent Treatment O&M Verification Inspection Program are working well.

Ongoing Permanent Treatment O&M is ensured by a formal written stormwater BMP operation and maintenance agreement with the property owner, as well as requirements in City Municipal Code sections 9.18.150 – 9.18.200, giving the City the legal authority to ensure that the property owner adequately maintains and repairs all installed treatments regardless of the reason for the failure. The stormwater BMP

operation and maintenance agreement provides that, in the event maintenance or repair is neglected, the City has the authority to perform maintenance and/or repair work and to recover the costs from the owner.

A description of the City of Cupertino's PERMANENT TREATMENT O&M Verification Inspection Program for installed C.3 regulated storm water treatment systems is provided below.

Selection of Annual O&M Inspection Sites:

- Permanent installed treatment measures at all C.3 regulated project properties will be inspected annually. The installed treatment measures are inspected by the Public Works Inspector when the project is first completed and annually thereafter.
- In the future, depending on the total number of C.3 regulated properties in Cupertino, the City may develop criteria for inspecting a subset of these sites, as allowed under MRP Provision C.3.h (6).

Permanent Treatment O&M Inspection Program Responsibilities

- Public Works Engineering Division staff review development plans for stormwater quality compliance.
- The Public Works Inspector tracks the permanent treatment construction and performs O&M inspections and enforcement for all C.3 regulated projects using the C.3.b.v. (1) project reporting tables and an Excel inspection results spreadsheet.
- Since the Public Works Inspector field-checks construction of the on-site permanent treatments at C,3 regulated projects and provides the sign-off on grading permits prior to City-approval for site occupancy, he will note when the project is completed.
- The Public Works Inspector submits a Permanent Treatment O&M Inspection summary report for the previous fiscal year to the Environmental Programs Manager by July 30th of each year.
- The Environmental Programs Manager includes Treatment O&M inspection data in the Annual Report.

Permanent Treatment O&M Pre-Inspection Preparation

- The Public Works Inspector reviews the C.3 regulated project reporting table and the Permanent Treatment O&M Inspection records prior to beginning annual inspections.
- The Public Works Inspector or Public Works administrative staff will contact each C.3 regulated site owner/manager to arrange a mutually agreeable inspection appointment, if needed for inspection of the stormwater treatment systems.
- Prior to an initial site inspection, the Public Works Inspector will review the site's Storm Water Management Plan, including applicable as-built construction plans, for permanent treatment information, including types and locations of treatments.
- The Inspector will review the property owner's available site permanent treatment O&M maintenance records and any previous inspection reports.
- The Public Works Inspector will, if needed, review the applicable CASQA or SCVURPPP fact sheets and information on the City's O&M Inspection Program, which may be useful in addressing questions or comments raised during the inspection by the site owners or operators.

Permanent Treatment O&M Inspection and Enforcement Procedures

- Permanent treatment O&M inspection by the Public Works Inspector is conducted and results are documented in the City's permanent treatment O&M inspection Excel spreadsheet.
- If any deficiency is noted, the Public Works Inspector will document it in writing. The written notice of violation will include the O&M inspection results, including a list of corrective actions needed and a compliance schedule. This notice will be sent to the property owner/manager within ten working days of an inspection.
- The Public Works Inspector will provide written notification to the Environmental Programs Manager of any sites with an O&M violation,

including information on location, the nature of violation and the required follow-up.

- The property owner and, if applicable, the site manager, will be instructed to notify the Public Works Inspector within the time period indicated on the Notice of Violation so that the facilities can be re-inspected. The inspector will complete a new inspection, noting whether all recommended maintenance activities have been completed and if any other actions are needed to ensure proper operation of the facility.
- If repairs are not undertaken or are not done properly within the time allocated in the compliance schedule, the City will begin enforcement proceedings as provided in City Code Section 9.18.190.
- Once all necessary repairs have been completed, the Public Works Inspector will note this in the City's Permanent Treatment O&M Excel spreadsheet, including the date remedial work was completed and any other pertinent information (such as if City intervention was required to complete corrective work).

Appendix 3-1

New and Redevelopment and

Permanent Treatment O&M Inspection

Report Tables

C.3.b.v.(1) ►Regulated Projects Reporting Table (part 1) – Projects Approved During the Fiscal Year Reporting Period

Project Name Project No.	Project Location[1], Street Address	Name of Developer	Project Phase No.[2]	Project Type & Description[3]	Project Watershed[4]	Total Site Area (Acres)	Total Area of Land Disturbed (Acres)	Total New and/or Replaced Impervious Surface Area[5] (ft^2)	Total Pre-Project Impervious Surface Area[6] (ft^2)	Total Post-Project Impervious Surface Area[7] (ft^2)
Private Projects										
Apple VP02	19333 Vallco Parkway	Apple, Inc.	1	Redevelopment - Tenant Improvements & Site Improvements	Calabazas Creek	17.83	10.59	461,300	640,404	633,362
St Jude Episcopal Church	20920 McClellan Road	St Jude the Apostle Episcopal Church in Cupertino, CA	1	Redevelopment – Site Improvements	Regnart Creek	3.00	0.58	11,237	62,955	74,192
First Baptist Church of Cupertino	10505 Miller Avenue	First Baptist Church of Cupertino	1	Redevelopment – Site Improvements	Calabazas Creek	3.45	0.69	21,320	53,090	74,410
Public Projects										
None										

[1] Include cross streets.
[2] If a project is being constructed in phases, use a separate row entry for each phase.
[3] Project Type is the type of development (i.e., new and/or redevelopment). Example descriptions of development are: 5-story office building, residential with 160 single-family homes with five 4-story buildings to contain 200 condominiums, 100 unit 2-story shopping mall, mixed use retail and residential development (apartments), industrial warehouse.
[4] State the watershed(s) that the Regulated Project drains to. Optional but recommended: Also state the downstream watershed(s).
[5] State both the total new impervious surface area and the total replaced impervious surface area, as applicable.
[6] For redevelopment projects, state the pre-project impervious surface area.
[7] For redevelopment projects, state the post-project impervious surface area.

C.3.b.v.(1) ►Regulated Projects Reporting Table (part 2) – Projects Approved During the Fiscal Year Reporting Period

Project Name Project No.	Status of Project[8]	Source Control Measures[9]	Site Design Measures[10]	Treatment Systems Approved[11]	Operation & Maintenance Responsibility Mechanism[12]	Hydraulic Sizing Criteria[13]	Alternative Compliance Measures[14/15]	Alternative Certification[16]	HM Controls[17/18]
Private Projects									
Apple VP02	7/13/09 submittal 10/26/09 deemed complete; 1/4/10 final discretionary approval	Inlet stenciling, water-efficient & monitored irrigation, covered trash bins, loading docks draining to vegetated swales.	Protection of existing outfalls without modifications, protection of existing mature trees, new tree species in conformance with SCVWD species guidelines. Landscape areas increased by reducing parking stall	Four (4) Vegetated Swales	O & M Agreement; Corporate Maintenance Division, Apple Inc.	Flow-Based, CA BMP Handbook Approach	None	Yes; Schaaf & Wheeler	No, Project located in an area where HMP not required on projects under 50 Ac.

[8] For private projects, state project application submittal date; application deemed complete date; and, final discretionary approval date. For public projects, state plans and specifications approval date.
[9] List source control measures approved for the project. Examples include: properly designed trash storage areas; storm drain stenciling or signage; efficient landscape irrigation systems; etc.
[10] List site design measures approved for the project. Examples include: minimize impervious surfaces; conserve natural areas, including existing trees or other vegetation, and soils; construct sidewalks, walkways, and/or patios with permeable surfaces, etc.
[11] List all approved stormwater treatment system(s) to be installed onsite or at a joint stormwater treatment facility (e.g., flow through planter, bioretention facility, infiltration basin, etc.).
[12] List the legal mechanism(s) (e.g., O&M agreement with private landowner; O&M agreement with homeowners' association; O&M by public entity, etc…) that have been or will be used to assign responsibility for the maintenance of the post-construction stormwater treatment systems.
[13] See Provision C.3.d. "Numeric Sizing Criteria for Stormwater Treatment Systems" for list of hydraulic sizing design criteria (i.e., 1.a., 1.b., 2.a., 2.b., 2.c., or 3)
[14] For Alternative Compliance at an offsite location in accordance with Provision C.3.e.i.(1), on a separate page, give a discussion of the alternative compliance site including the information specified in Provision C.3.b.v.(1)(m)(i) for the offsite project.
[15] For Alternative Compliance by paying in-lieu fees in accordance with Provision C.3.e.i.(2), on a separate page, provide the information specified in Provision C.3.b.v.(1)(m)(ii) for the Regional Project.
[16] Note whether a third party was used to certify the project design complies with Provision C.3.d.
[17] If HM control is not required, state why not.
[18] If HM control is required, state control method used (e.g., method to design and size device(s) or method(s) used to meet the HM Standard, and description of device(s) or method(s) used, such as detention basin(s), biodetention unit(s), regional detention basin, or in-stream control).

C.3.b.v.(1) ►Regulated Projects Reporting Table (part 2) – Projects Approved During the Fiscal Year Reporting Period

Project Name Project No.	Status of Project[8]	Source Control Measures[9]	Site Design Measures[10]	Treatment Systems Approved[11]	Operation & Maintenance Responsibility Mechanism[12]	Hydraulic Sizing Criteria[13]	Alternative Compliance Measures[14/15]	Alternative Certification[16]	HM Controls[17/18]
			depth with use of 2'-overhangs. Vegetated Swales designed to treat 100% of the site.						
St Jude Episcopal Church	5/4/09 submittal; 10/22/09 deemed complete; 11/24/09 final discretionary approval	Covered trash enclosure, maintenance of CUDO system.	Disconnect downspouts and direct to landscape areas prior to being collected by storm drain system.	Underground retention & infiltration device – (CUDO stormwater infiltration system with perk filter pod system)	O & M Agreement; St. Jude Episcopal Church	Volume Based Urban Runoff Quality Management Approach	None	Yes; Nolte Assoc.	No, Project disturbed less than 1 Ac.
First Baptist Church of Cupertino	3/25/08 submittal; 8/05/08 deemed complete; 11/10/08 final discretionary approval	Pavement sweeping as needed (once every 6 months, min.)	Stormwater from the parking lot is directed to vegetated swales where the stormwater percolates into the ground.	Porous pavement, vegetated swales, percolation trenches.	SWMP	Flow-Based, C.3 Stormwater Handbook	None	Yes; Engeo Incorporated	No, Project disturbed less than 1 Ac.
Public Projects									

C.3.h.iv. ►Installed Stormwater Treatment Systems Operation and Maintenance Verification Inspection Program Reporting

Table of Installed Stormwater Treatment System Operation and Maintenance Inspections

Facility/Site Inspected and Location	Party Responsible[19] For Maintenance	Date of Inspection	Type of Inspection[20]	Type of Treatment/HM Control(s) Inspected[21]	Inspection Findings or Results[22]	Enforcement Action Taken[23]	Comments
10900 N Tantau Avenue (Panasonic)	Larry Wallerstein	6/22/2010	Routine	Porous Pavement Vegetated Swale Vortex Separator Inlet Inserts	No Visible/Apparent Problems	None	APN 316-09-029: New Tenant, spring 2010.
20955 Stevens Creek Blvd (Whole Foods)	Scott Sherman - Store Team Leader	6/22/2010	Routine	Parking lot drains to vegetated swales with dry well inlets at end of swales.	No Visible/Apparent Problems	None	APN 326-31-022 Plants in bioswales are thriving and no standing water in dry wells after successful re-design and landscaping in 2009. Requested annual cleaning records for inlets before rainy season 2010 from store manager.
10495 DeAnza Blvd (Apple)	Maria Moules	6/23/2010	Routine	Vegetated Swale & Vortex Separator	No Visible/Apparent Problems	None	APN 326-33-110 CDS inspection & maintenance done June 2009. No apparent problems.
19620 Stevens Creek Blvd (Market Place)	Edward Chan	6/23/2010	Initial	Vegetated Swale & Vortex Separator	No Visible/Apparent Problems	None	APN 369-06-010 Project recently completed; Will get schedule for annual CDS inspection & maintenance in FY 10-11.
10505 Miller Avenue (1st Baptist Church)	Senior Pastor Robin Davies	6/23/2010	Initial	Vegetated Swale	No Visible/Apparent Problems	None	APN 369-16-026 Project recently completed

[19] State the responsible operator for installed stormwater treatment systems and HM controls.
[20] State the type of inspection (e.g., annual, follow-up, spot, etc.).
[21] State the type(s) of treatment systems inspected (e.g., bioretention facility, flow-through planter, infiltration basin, etc…) and the type(s) of HM controls inspected, and indicate whether the treatment system is an onsite, joint, or offsite system.
[22] State the inspection findings or results (e.g., proper installation, improper installation, proper O&M, immediate maintenance needed, etc.).
[23] State the enforcement action(s) taken, if any, as appropriate and consistent with your municipality's Enforcement Response Plan.

CUPERTINO GREEN
Program

FY 09 - 10 Annual Report

Section 4

Provision C.4 Industrial and Commercial Site Controls

Section 4 – Provision C.4 Industrial and Commercial Site Controls

C.4.a.ii ► Legal Authority

(For FY 09-10 Annual Report only) Do you have adequate legal authority to obtain effective stormwater pollutant control on industrial sites?	X	Yes		No

Chapter 9.18 of the City's Municipal Code, which covers *Stormwater Pollution Prevention and Watershed Protection*, gives the City the legal authority to enforce stormwater protection violations and to require potential violators to improve BMPs. In March 2010, the Environmental Programs Manager and the City's NPDES Consultant began working on revisions to the Code to better align it with the requirements in the MRP. Input has been solicited from the City Planners, the IDDE Inspector, Code Enforcement staff and the Public Works Maintenance Assistant Director. Proposed revisions are expected to be complete by fall 2010 and will be given to the City Attorney for review. The ordinance is expected to be approved and the Municipal Code updated by winter 2010-2011.

C.4.c.ii.(5) ► Enforcement Response Plan

(For FY 09-10 Annual Report only) Have you developed and implemented an Enforcement Response Plan by April 1, 2010?	X	Yes		No

Program Highlights

Cupertino developed an IND Enforcement Response Plan (ERP) by April 1, 2010 and submitted it to SCVURPPP. Subsequently, the IND ERP underwent several revisions to make the process more efficient and to reflect feedback from City's Building Dept. IND Inspection and Code Enforcement staff. City IND Inspectors (Building Dept Inspectors, IIDDE Inspector and as appropriate, Code Enforcement staff) are regularly updated and trained on IND inspection and reporting procedures.

The Environmental Programs Manager and staff meet almost weekly with the Public Works IDDE Inspector, who conducts targeted IND inspections at food facilities and gas stations, in addition to the scheduled annual inspections conducted by Building Dept. IND Inspectors. The Env. Prgms. Mgr. and other Public Works staff have regularly attended the IND/IDDE AHTG meetings for training on IND program procedures and updates and have reviewed and provided comments for IND AHTG products.

Following the adoption of the IND ERP in April 2010, Cupertino began using the SCVURPPP standardized Access IND Database to document <u>all</u> IND investigations and violations. Previously, only industrial Inspections conducted by Building Department Inspectors were entered in the database. The other facility inspections, conducted proactively by the IDDE Inspector, were previously recorded in a manner that did not capture all the facility and investigation information (see table below).

Proactive IND/Commercial Inspections (of the perimeter of the buildings) by IDDE Inspector: From Daily Logs 7/1/09 - 3/31/10
(After 4/1/10 IND Inspections by IDDE Inspector were recorded in the IND Access Database to capture facility type and name for follow up inspections)

Restaurant	102
Vehicle Facility	26
Convenient Store (e.g. 7-11, Q-Mart)	9
Grocery Store/Market	25
Shopping Center: Commercial/Food/Medical Office/etc.	23
Commercial/Retail (e.g. furniture, retail)	3
TOTAL	**188**

C.4.b.i. ► Business Inspection Plan

(For FY 09-10 Annual Report only) Do you have a Business Inspection Plan? See attached Appendix 4-1 [X] Yes [ ] No

In FY 09-10, Cupertino generated a list of all potential businesses to be considered for IND inspections and has developed a list of prioritized facilities that were selected to be inspected during the current permit cycle, based on business type and violation history. This priority list (Business Inspection Plan) will replace the IDDE Inspector's daily proactive inspection s (4-5 inspections per week) in which the inspector would perform routine inspections of facilities with previous violations and facilities that had the potential to violate stormwater requirements. The IDDE Inspector will now perform approximately 2-3 IND inspections per week based on the City's Business Inspection Plan identifying priority facilities. This plan is adaptive and will be revised as facilities are inspected and found unlikely to have stormwater violations and other facilities are prioritized to receive inspections due to business type and conditions and/or violation history. Implementation of the City's Business Inspection Plan utilizes the Santa Clara County Environmental Health's Food Facility Inspectors (DEH), the City's Building Inspectors, the City's IDDE Inspector and the City's Code Enforcement Officers to provide a coordinated team of staff in the field who are trained on the MRP requirements and the City's Enforcement Response Plan.

C.4.b.iii.(1) ► Potential Facilities List

Listed below are industrial and commercial facilities in Cupertino's Inspection that could reasonably be considered to cause or contribute to pollution of stormwater runoff.

In the attached Business Inspection Plan see the following two list sections:

1. C.4.b.iii.(1): Identified List of Industrial/Commercial Facilities (excluding food facilities)

These are the 90 facilities that the City of Cupertino's Building Department/ IND Inspectors will be responsible for inspecting as of FY 10-11, including automotive facilities, dry cleaners, veterinarians, garden centers and other IND/Commercial facilities that have the potential to cause or contribute to stormwater pollution. If any changes occur due to new businesses or business closures this list will be adjusted each fiscal year

2. C.4.b.iii.(1): Food Facilities Inspected Annually by County Dept. of Environmental Health

As of FY 09-10, 260 restaurants and food facilities are located in Cupertino. Each facility will be inspected by DEH. In addition, the City's IDDE Inspector will be responsible for conducting follow-up investigations at violating facilities, as well as performing proactive investigations at some facilities considered high priority due to their business type and/or site performance history.

C.4.b.iii.(2) ►Facilities Scheduled for Inspection

Listed below are Cupertino's industrial and commercial facilities scheduled for inspection during the current fiscal year.

In the attached Business Inspection Plan see the following two list sections:

3. **C.4.b.iii.(2): Industrial/Commercial Facilities Scheduled for Inspection in FY 10-11 (excluding food facilities)**

4. **C.4.b.iii.(2): Food Facilities Scheduled for Targeted Inspection in FY 10-11** (Listed as high priority inspections due to previous violations)

C.4.c.iii.(1) ►Facility Inspections

The following is a summary of inspections conducted at IND/Commercial facilities, including restaurants. Although, Cupertino relies heavily on DEH to conduct restaurant inspections, the City's IDDE inspector also performs routine inspections of restaurants, particularly those that have previous violations.	Number	Percent
Number of businesses inspected (if known) (All IND/Commercial facilities inspected, with duplicates removed)	**315**	
Total number of inspections conducted: Includes 410 food facility inspections conducted by DEH, 126 facilities inspected by Cupertino's IND Building Dept. Inspectors and the IDDE Inspector (see Cupertino's IND Inspection Reporting Table in Appendix 4-2), and 188 proactive inspections (of the perimeter of the building) by the IDDE inspector (see table above in Program Highlights).	**724**	
Enforcement actions (excluding verbal warnings). Prior to April 1, 2010 it was standard practice to issue verbal warnings and provide education for all violations, unless they had a severe impact, or threat, to the storm drain system, which did not occur in Cupertino. Following April 1st the practice will be to provide escalating enforcement for frequent violators and higher levels of enforcement for violations that threaten the storm drain system.	**12**	
Sites inspected in violation. 71 violations occurred out of 724 inspections(71/724x100)	**71**	**9.8%**

Violations[1] resolved within 10 working days or otherwise deemed resolved in a longer but still timely manner	**71**	**100%**

[1] Total number of violations equals the number of initial enforcement actions (i.e. one violation issued for several problems during an inspection at a site). It does not equal the total number of enforcement actions because one violation issued at a site may have a second enforcement action for the same violation at the next inspection if it is not corrected.

C.4.c.iii.(2) ►Frequency and Types/Categories of Violations Observed

Fill out the following table or attach a summary of the following information.

Type/Category of Violations Observed	Number of Violations
Actual discharge (e.g. non-stormwater discharge)	**6**
Potential discharge (e.g. BMPs not in place or ineffective).	**65**

C.4.c.iii.(2) ►Frequency and Type of Enforcement Conducted

Fill out the following table or attach a summary of the following information.

	Enforcement Action (as listed in ERP)[1]	Number of Enforcement Actions Taken	% of Enforcement Actions Taken[2]
Level 1	Verbal Warning	**59**	**83%**
Level 2	Notice of Violation	**11**	**16%**
Level 3	Pre-Administration Citation	**0**	**0%**
Level 4	Administrative Citation Fine	**1**	**1%**
Level 5	Referral to City Attorney	**0**	**0%**
Level 6	Referral to Water Board or Other Agency	**0**	**0%**
Total		**71**	**100%**

Notes:

[1]Agencies to list specific enforcement actions as defined in their ERPs.

[2]Percentage calculated as number of each type of enforcement action divided by the total number of enforcement actions.

C.4.c.iii.(3) ►Types of Violations Noted by Business Category

Fill out the following table or attach a summary of the following information.

Business Category[1] Only business categories for violating facilities listed.	**Actual Discharge Violations**	**Potential Discharge Violations**
Automotive Service/Maintenance	**1**	**5**
Restaurant/Food Facility	**4**	**43**
Retail/Sales (including furniture stores)		**17**
Veterinarian	**1**	

Notes:

[1] List your Program's standard business categories.

C.4.c.iii.(4) ►Non-Filers

List below or attach a list of the facilities required to have coverage under the Industrial General Permit but have not filed for coverage:

There were no industries identified as non-filers during scheduled inspections during this fiscal year.

C.4.d.iii ►Staff Training Summary

Throughout FY 09-10 the Env. Prgm. Mgr. and Environmental Programs' staff met approximately weekly with the IDDE inspector responsible for conducting IND inspections in order to discuss new enforcement and reporting requirements and procedures for IND inspections and violations.

Training Name	**Training Dates**	**Topics Covered**	**No. of Inspectors in Attendance**	**Percent of Inspectors in Attendance** (Cupertino has 5 IND (Building) Inspectors & 1 IDDE Inspector who conducts IND inspections and two inspectors from DEH who work in Cupertino)
IND Bldg Dept Training	11/16/09	Provided HHW brochures for distribution during business inspections and provided information on what to look for when conducting IND inspections.	5 plus the Building Official	100%

Training Name	Training Dates	Topics Covered	No. of Inspectors in Attendance	Percent of Inspectors in Attendance
IND/Comm Ad Hoc Task Group	12/1/09	Discuss and provide feedback on IND inspection and enforcement procedures among co-permittees.	1 Env. Programs staff, who relayed pertinent information to inspectors	Ad Hoc Task Group during FY 09-10 was the equivalent of staff training for the City on the MRP
IND/Comm AHTG	1/12/10	Discuss and provide feedback on IND inspection and enforcement procedures among co-permittees.	Env. Programs staff, who relayed pertinent information back to inspectors	N/A
IND/Comm AHTG	2/2/10	Discuss and provide feedback on IND inspection and enforcement procedures among cities, DEH, and County of Santa Clara at Cupertino City Hall.	1-Senior Building Inspector-who relayed information to other IND inspectors	20%
Procedures Training for IDDE Inspector	2/22/10	Env. Pgrm. Mgr. met with the Assistant Dir of PW Maintenance and the IDDE Inspector to discuss changes to documentation/compliance forms for the City's IDDE Inspector, who also conducts IND follow up and proactive investigations.	Env. Pgrm. Mgr. and IDDE Inspector for IND / Comm. Primarily for restaurant inspections	100%
IND Inspection Training	2/23/10	IND meeting with Env. Prgms. staff and other Co-permittees to discuss and provide feedback on IND inspection procedures and enforcement procedures for violations at Cupertino City Hall.	Cupertino IDDE Inspector attended AHTG	N/A
In-house IND Training	3/4/10	Environmental Prgms. Mgr. met with Building Inspectors to provide an in-house training on IND inspection procedures and the upcoming IND Enforcement Response Plan (ERP).	4 out of 5	80%

Training Name	Training Dates	Topics Covered	No. of Inspectors in Attendance	Percent of Inspectors in Attendance
Annual Restaurant Inspections Update Meeting	4/16/10	DEH inspection and enforcement procedures regarding facilities with urban runoff violations and review of reporting procedures for informing City staff about violations encountered by DEH staff	1 Env Programs staff & DEH Supervisors	N/A City Staff met with DEH Supervisory staff as needed
IND/Comm AHTG	4/20/10	Discuss and provide feedback on IND inspection and enforcement procedures among co-permittees at Cupertino City Hall.	Env. Programs staff who relays pertinent information to inspectors	N/A
IND/Comm AHTG	5/25/10	Discuss and provide feedback on IND inspection and enforcement procedures among co-permittees.	Env. Programs staff who relays pertinent information to inspectors	N/A
Urban Runoff Training	6/16/10	Biennial DEH Inspector & City IDDE Inspector Training. Reviewed inspection BMPs & categories of violations, Reviewed procedures for follow-through and contacting City to report & track violations. Reviewed new forms designed in FY 09-10 to ensure tracking of all stormwater incidents	Env Programs Mgr, IDDE (Comm. food facility) Inspector and all County DEH Inspectors	100% - All available DEH staff & the only City Inspector that conducts food facility inspections

IND Inspection Business Plan

CITY OF CUPERTINO
Environmental Programs Division

Industrial/Commercial Site Control Program
Business Inspection Plan

June 30, 2010

C.4.b.i. BUSINESS INSPECTION PLAN

The City of Cupertino's Industrial and Commercial Business Inspection Plan describes the overall strategy for the City's inspections and provides a prioritized list of IND/Commercial facilities for the City to inspect throughout the duration of the Municipal Regional NPDES stormwater discharge permit (MRP), adopted on October 14, 2009.

LIST OF FACILITIES TO BE INSPECTED AND MONITORED

There are no NOI filers in the City of Cupertino.

A list of targeted businesses has been prepared for the City's commercial and industrial site inspectors. This list includes all facilities identified in the MRP, including, but not limited to: 1) outdoor process and manufacturing areas; 2) outdoor material storage areas; 3) outdoor waste storage and disposal areas; 4) outdoor vehicle and equipment storage and maintenance areas; 5) outdoor wash areas; 6) outdoor drainage from indoor areas; 7) rooftop equipment; 8) food facilities that generate grease; and any other sources that have reasonable potential to contribute to pollution of stormwater runoff.

PRIORITIZATION STRATEGY

Facility inspections are prioritized based on business type, pollutant threat, results of the initial inspection and available history of site performance. Facilities with previous violations, of any enforcement level, are given the highest priority for follow-up inspections and will be inspected annually until two consecutive inspections are conducted without a report of any violations or potential violations.

Types of businesses considered the highest priority include, but are not limited to: 1) restaurants and grease-generating food facilities or stores; 2) vehicle mechanical repair, maintenance, fueling or cleaning facilities; 3) the City's corporation yard, or municipal service center (MSC); 4) nurseries or gardening centers; and 5) dry cleaners.

Cupertino has developed a planned facility inspection list for each fiscal year from FY 10-11 through FY 13-14. The annual lists are available in the City's IND Excel workbook as part of the Business Inspection Plan for the duration of the 2009 MRP. The List included in this submittal includes only businesses that will be inspected in FY 10-11. Each fiscal year, the City will refine the lists based on the inspection results, as well as to add new businesses, or to delete closed businesses.

INSPECTION PLANS

The following inspection plans are included in this document:

1. C.4.b.iii.(1): Identified list of industrial/commercial facilities (excluding food facilities) that will be inspected during the 2009 MRP period. This broad list of potential facilities (as of June 2010) includes ninety (90) IND/Commercial facilities.

2. C.4.b.iii.(1): List of food facilities that are subject to annual stormwater inspections by the County's Dept. of Environmental Health (DEH) according to a written agreement between

DEH and the City. As of June 2010, 260 food facilities in Cupertino are scheduled to be inspected annually. DEH Inspectors are trained to report all stormwater violation resolutions and potential stormwater problems to the City. Additionally, any report from DEH will trigger a follow-up inspection by the City's IDDE Inspector.

3. C.4.b.iii.(2): List of facilities scheduled for Industrial/Commercial inspections during fiscal year 2010 - 2011 (excluding food facilities).

4. C.4.b.iii.(2): List of food facilities scheduled for inspections by the City's IDDE Inspector during fiscal year 2010 -2011. These targeted food facilities will be re-inspected due to a previous violation or other reported concern.

Note: Cupertino's Business Inspection Plan Lists for the years beyond FY10-11 are retained in the City's Environmental Programs' Business Inspection Plan Excel file.

1. **C.4.b.iii.(1): Identified List of Industrial/Commercial Facilities (excluding food facilities)**

	Business Name	Business Address	Business Type

FY 09 - 10 Annual Report

Section 5

Provision C.5 Illicit Discharge Detection and Elimination

Section 5 – Provision C.5 Illicit Discharge Detection and Elimination

C.5.a.ii ► Legal Authority

(For FY 09-10 Annual Report only) Do you have adequate legal authority to prohibit and control illicit discharges and escalate stricter enforcement to achieve expedient compliance?	X	Yes		No

Cupertino has adequate legal authority to prohibit and control illicit discharges and provide escalating enforcement. In addition, in FY 09-10 Cupertino, with the assistance of its stormwater consultant, began rewriting its stormwater ordinance, Chapter 9.18, to align it with the MRP. The revised ordinance is expected to be completed and adopted during the winter of FY 10-11.

C.5.b.ii.(4) ► Enforcement Response Plan

(For FY 09-10 Annual Report only) Have you developed and implemented an Enforcement Response Plan by April 1, 2010?	X	Yes		No

Program Highlights

Cupertino made maps of the MS4 available to the public at the Planning/Building Department Counter at City Hall by June, 2010. In FY 10-11, the maps of the MS4 will be made available to the public via the City's website and advertised in the City's newsletter, the Cupertino Scene. The Env. Prgrm. Mgr. and staff regularly attended the IND/IDDE Ad Hoc Task Group and hosted many of the meetings in Cupertino. Staff regularly reviewed and commented on AHTG products. Staff has met with the City's IDDE inspector on an approximately weekly basis since April 1, 2010 to evaluate the changes to investigation and enforcement response procedures that began with ERP implementation on April 1, 2010. Additionally, staff held several trainings with DEH to ensure that DEH inspectors are adequately reporting all violations involving urban runoff to the City. In FY 10-11 updated maps and current off-hours contacts will be provided to DEH inspectors in order to ensure adequate response and follow-up investigations.

As of April 1, 2010, staff stopped using the SCVURPPP Access database for recording IDDE violations and began entering data in the new Excel IDDE tracking database developed by SCVURPPP in FY 09-10 to facilitate tracking MRP required data. This new format facilitates the prioritization of facilities for inspection, timeframes for follow-up investigations, and identifies repeat violators in order to utilize appropriate escalating enforcement at facilities where violations continue to occur.

Please see the C.5 Illicit Discharge Detection and Elimination section of the Program's FY 09-10 Annual Report for description of activities of the IND/IDDE AHTG.

C.5.c.iii ►Complaint and Spill Response Phone Number and Spill Contact List

List below or attach your complaint and spill response phone number and spill contact list.

Contact	Description	Phone Number
Santa Clara County Fire Department	Hazardous and/or unknown substance response and/or discharge to storm drain	911
Public Works Department	Inspectors respond to hazardous and non-hazardous spills as needed.	408-777-3269; 408-777-3354

Code Enforcement	Code Enforcement officers respond to spills as needed to aid in controlling scene and/or providing enforcement.	408-777-3182
County Communications Dispatch	After-hours contact to notify County Fire, on-call Public Works personnel and/or Code Enforcement officers, depending on the incident type.	408-299-2507

C.5.d.iii ►Evaluation of Mobile Business Program

Describe implementation of minimum standards and BMPs for mobile businesses and your enforcement strategy. This may include participation in the BASMAA Mobile Surface Cleaners regional program or local activities.

The City's IDDE Inspector is trained on the BMPs for mobile businesses developed by the BASMAA Mobile Surface Cleaners regional program. If a mobile business is found in violation of the City's stormwater code, the Inspector would require immediate resolution, whenever possible, and would track the enforcement proceedings as outlined in the City's IDDE ERP. There were no reported or discovered violations by mobile businesses in FY 09-10.

Please see the C.5 Illicit Discharge Detection and Elimination section of Program's FY 09-10 Annual Report for a description of efforts by the IND/IDDE AHTG to address mobile businesses.

C.5.e.iii ►Evaluation of Collection System Screening Program

Provide a summary or attach a summary of your collection screening program, a summary of problems found during collection system screening and any changes to the screening program this FY.

In FY 09-10, the City's IDDE Inspector, who has worked on storm drain maintenance for the City, strategically selected eleven (11) storm drain system check points in Cupertino after consulting the storm drain map and surveying potential check points. These eleven check points were selected because they receive storm water flows from commercial or industrial areas or other areas with a high potential for illicit discharges or debris and litter. These check points, which include several end of pipe outfalls, will be inspected by the IDDE Inspector at least annually in dry weather during FY 10-11 and annually for the duration of the MRP.

Please see the C.5 Illicit Discharge Detection and Elimination section of Program's FY 09-10 Annual Report for description of activities of the IND/IDDE AHTG to develop collection system screening program guidance.

C.5.f.iii.(1), (2), (3) ►Spill and Discharge Complaint Tracking

Spill and Discharge Complaint Tracking (fill out the following table or include an attachment of the following information).
These numbers represent all violations for FY 09-10. However, data were only tracked in the in a manner consistent with MRP requirements after April 1, 2010 when the SCVURPPP-developed Excel IDDE tracking database was adopted by Cupertino. Prior to April 1st, the SCVURPP standardized Access database was used to track IDDE violations. The Excel database will be used to track all incidents in FY 10-11. See Appendix 5-1 for the IDDE Detailed Inspection Reporting Table for FY 09-10.

	Number	Percentage
Discharges reported (C.5.f.iii.(1))	61	
Discharges reaching storm drains and/or receiving waters (C.5.f.iii.(2))	21	35%
Discharges resolved in a timely manner (C.5.f.iii.(3))	61	100%

C.5.f.iii.(4) ►Summary of major types of discharges and complaints

Provide a narrative or attach a table and/or graph.

The three main types of IDDE discharges and complaints in Cupertino are improperly stored construction debris such as rock, dirt, and concrete in streets and gutters; dumping of non-hazardous materials such as cardboard, trash, and food waste outside of food facilities; and food facility oil and grease discharges. Improperly stored construction material has resulted in discharges to the storm drains when the site is being washed, materials have been stored directly on or adjacent to storm drains, or a rain event occurs. All violations of this nature were resolved the same day of discovery by the IDDE Inspector who required immediate removal of debris and BMPs to be put in place. Only one non-hazardous dumping violation resulted in trash, in the form of shredded paper, entering a storm drain. All housekeeping and improper dumping of trash, cardboard, and food wastes in FY 09-10 were resolved by the IDDE Inspector within 48 hours. No oil and grease discharges from food facilities resulted in a discharge to a storm drain. These incidents involved leaking or uncovered tallow bins or poor housekeeping that had oil and grease present, which threatened, but did not reach the storm drain system.

The table below shows the major types of IDDE discharges and complaints from April 1, 2010 to the end of FY 09-10, using the SCVURPPP-developed Excel IDDE tracking database. Prior to April 1st, Cupertino used the SCVURPPP standardized Access Database that had similar incident type categories but was not recorded in a manner consistent with the 2009 MRP requirements. In the bar graph below all actual and potential discharge violation types are summarized for the entire 09-10 FY.

Types of discharges and complaints from 4-1-10 through 6-30-10	Number	Percentage
Tracking soil	3	12%
Landscape material dumping	1	4%
Un-hardened cement discharge	1	4%
Dumpster discharge	1	4%
Pools/Spas/Fountains discharge	1	4%
Abandoned drums discharge	1	4%
Dumping - hazardous	1	4%
Dumping – non-hazardous	10	40%
Food Facility Oil & grease discharge	3	12%
Allowable discharge	3	12%
Totals	**25**	**100%**

*Other includes:
Discharge entered Storm Drain: 2 Sanitary Spills, 1 Unhardened Cement Discharge, 1 Dumpster Discharge; 1 Accidental Spill (milk)
No Discharge to Storm Drain: 2 Surface Cleaning Discharge, 1 Dumpster Discharge, 1 Vehicle Washing, 2 Tracking Soil, 1 Landscape Material Dumping, 1 Dumping-hazardous (paint cans)

Provided public education. Revisited and resolved next day 8/28/09.
10	8/28/09	Oakmont Produce Market	Yes	19944 Homestead Rd	Illicit discharge inspectors	Dumping – non-hazardous	Food Facilities	Verbal Notice	Contacted the owner, Judy Bates, and advised her that all the vegetables, trash, and cardboard needed to be cleaned up and put in the dumpsters and to keep the parking lot clean. Provided public education. Revisited and resolved same day 08/27/09.
11	9/16/09	Oakmont Produce Market	Yes	19944 Homestead Rd	Illicit discharge inspectors	Dumping – non-hazardous	Food Facilities	Verbal Notice	Contacted store manager, Judy Bates, advised her to cleanup all the produce and put it in the dumpster and to keep the area clean. Provided public education. Revisited and resolved same day 9/16/09.
12	9/16/09	Gochi Japanese Fusion Tapas	Yes	19980 Homestead Rd	Other agency	Other-mop water	Food Facilities	Verbal Notice	Contacted the restaurant owner and property owner and advised them they cannot discharge mop water out the backdoor and that they should pour it into a sink or toilet and asked them to clean it up. Provided public education. Resolved same day 9/16/09.
13	9/23/09	Family Denistry	Yes	10090 Pasadena Ave,	Other agency	Dumping – non-hazardous	Commercial	Verbal Notice	Contacted John H. Brown, D.D.S. about the issue and advised him to put shredded paper in plastic bags and into the dumpster and he said he would. Provided public education. Revisited and resolved same day 9/23/09.
14	9/23/09	Yoshinoya Restaurants	Yes	19825 Stevens Creek Blvd	Illicit discharge inspectors	Water line breaks	Food Facilities	Verbal Notice	Contacted owner and advised him to cleanup all the sidewalk and gutter and all the mud. Told him he cannot pump water and mud to the stormdrain and to clean the stormdrain, and he did. Provided public education. Revisited and resolved same day 9/23/09
15	9/24/09	Pho Minh	Yes	10118 Bandley Dr.	Illicit discharge inspectors	Food Facility Oil & grease discharge	Food Facilities	Verbal Notice	Contacted store manager and advised him to clean up all the oil and grease on the ground and the containers. Provided public education. Revisited and resolved same day 9/24/09.
16	9/28/09	The Oaks	Yes	21269 Stevens Creek Blvd	Illicit discharge inspectors	Dumping – non-hazardous	Food Facilities	Verbal Notice	Contacted Henry Laiheis, property manager, advised him to cleanup all the cardboard and trash and put them in the correct dumpsters. Provided public education. Revisited and resolved same day 9/28/09.

Summary of IDDE Inspections
7/1/09 to 6/30/10

	Date	Facility Name	Resolved	Address	Incident Report Source	Incident Type	Incident Source	Enforcement Action	Notes Pertaining to Incident
17	10/28/09	Gamba Karaoke	Yes	19990 Homestead Rd	Other agency-City of San Jose	Grey water discharge	Commercial	Verbal Notice	Contacted Hitoshi Gotani, owner, advised him not to discharge mop water from back door because it goes to the storm drain. Advised him to put it in the sink or toilet. Provided pueducation. Revisited and resolved 10/28/09.
18	10/30/09	Cupertino Square	Yes	10123 N. Wolfe Rd	Other agency	Food Facility Oil & grease discharge	Food Facilities	Verbal Notice	Contacted Michael Gonzales about issue, advised him to cleanup area and steam clean all oil and grease and to put the bottles in the correct toter. Contacted property manager also about issue. Provided public education. Stayed until resolved on 10/30/09
19	11/17/09	Residential Community	Yes	22366 Rancho Deep Cliff	Citizen Complaints	Pools/Spas/Fountains discharge	Residential	Verbal Notice	Contacted Lyle Peddicord, Property Mgmnt, about issue. Told him they cannot discharge pool water to storm drain, they should discharge to sanitary sewer cleanout, with permission from Cupertino Sanitary District. Provided pub. education. Resolved 11/17/09
20	11/18/09	Alexander's Steak House	Yes	10330 N. Wolfe Road	Illicit discharge inspectors	Food Facility Oil & grease discharge	Food Facilities	Verbal Notice	Inspector contacted Cynthia Staehnke, HR & Office Generalist about the discharge, and asked for the discharge to be cleaned up. Also asked for a secondary containment for the 55 gallon tallow container. Provided Public Education & Stormwater Pollution Pollution Prevention info.
21	11/24/09	Residential	Yes	10175 Byrne Ave	Citizen Complaints	Water line breaks	Residential	Verbal Notice	Inspector contacted San Jose Water Company to repair the waterline and provided Public Education Pollution Prevention & Stormwater Watershed Prevention outreach info. Revisted site later in the day on 11/24/09. Resolved.
22	11/24/09	Residential	Yes	10517 Rampert Ave	Citizen Complaints	Other: Excessive lawn over watering	Residential	Verbal Notice	Contacted resident about the over watering and asked to check the sprinklers and timer for less frequent operations to reduce water usage and water running onto sidewalk. Provide PPSPWP outreach material. Revisted site the next day 11/25/09.
23	11/24/09	Yamagamis Nursery	Yes	1361 South De Anza Blvd.	Citizen Complaints	Other: discharge of muddy water	Commercial	Verbal Notice	Inspector contacted Preston Oka, president of the Nerusey and advised him to clean out and unplug the stormdrain. Provided Public Education and Stormwater Pollution Prevention and Watershed Protection outreach material. Revisted site the next day 11/25/09.

Summary of IDDE Inspections
7/1/09 to 6/30/10

	Date	Facility Name	Resolved	Address	Incident Report Source	Incident Type	Incident Source	Enforcement Action	Notes Pertaining to Incident
24	12/2/09	Residential	Yes	10663 Santa Lucia Road	Citizen Complaints	Surface cleaning discharge	Residential	Verbal Notice	Inspector contacted the home owner and advised that he was not allowed wash the chemicals (muraticc acid thiner & turperntine) into the stormdrain. Asked that the gutter and street be cleaned up. Provided Public Outreach info. Inspector stayed onsite until resolved.
25	12/3/09	Walgreens #4416	Yes	20011 Bollinger Road	Illicit discharge inspectors (Non routine)	Dumping – non-hazardous	Commercial	Verbal Notice	Inspector contacted the Store Manager and advised him to clean up the cardboard and trash and place in the cardboard in the dumpster and trash in the compactor. Provided Public Education and Outreach information. Revisted and resolved next day.
26	12/19/09	Residential	Yes	949 Brookgrove Lane	Citizen Complaints	Complaint not found	Residential	No Action	No incident found 12/19/09. Site revisited 12/23/09 and no incident observed again. Some standing water was in the street 5 houses down from site of original complaint. Water appeared clean and nothing unusual was observed.
27	1/4/10	Residential Area	Yes	22034 Pharlop Drive	Other agency	Water line breaks	Residential	Verbal Notice	Contacted San Jose Water Crew leaderand advised to clean up the mud & sediments out of the stormdrain, and to put more gravel and bags to capture the sediment and mud discharging into stormdrain. Provided Public Education & Stormwater Pollution Prevention
28	1/21/10	Cupertino Bakery	Yes	10251 S De Anza Blvd	Citizen Complaints	Accidental spills	Food Facilities	Verbal Notice	Contacted store manager and advised him to cleanup all milk on the ground and storm drain. Provided public ed and stormwater pollution prevention and watershed protection outreach. Revisited and resolved same day 1-21-10.
29	1/28/10	Residential	Yes	21702 Lindy Ln	Citizen Complaints	Dumping – non-hazardous	Residential	Verbal Notice	Contacted owner, Phillip Bjurman, about issue. Advised him to clean up all mud in the street and provide drain inlet and catch basin protection. Provided public ed, stormwater and watershed protection info. Resolved 1-28-10.
30	2/1/10	Residential	Yes	10866 Linda Vista	Citizen Complaints	Dumping – non-hazardous	Residential	Verbal Notice	Contacted the owner and advised him to clean all the dirt off the street and gutter and not to do it again. Provided public education. Stop work order issued by Building Dept.(BG) on 2-1-10. Remained at site until resolved 2-1-10.
31	2/8/10	Think Tank Learning	Yes	10650 Bubb Rd	Citizen Complaints	Sanitary spill or leak	Other/unknown	Verbal Notice	Contacted Cupertino Sanitary District about the issue and they called Able to clean up the gutter, driveway, storm drain, and the line. Provided public education, stormwater pollution prevention and watershed protection info.

Program

FY 09 - 10 Annual Report

Section 6

Provision C.6 Construction Site Controls

Section 6 – Provision C.6 Construction Site Controls

C.6.a.iii ► Legal Authority

(For FY 09-10 Annual Report only) Is your agency's legal authority adequate for C.6 compliance?	X	Yes		No

Chapter 9.18 of the City's Municipal Code, which covers *Stormwater Pollution Prevention and Watershed Protection*, gives the City the legal authority to enforce stormwater protection violations and to require potential violators to improve BMPs. In March 2010, the Environmental Programs Manager and the City's NPDES Consultant began working on revisions to the Code to better align it with the requirements in the MRP. Input has been solicited from the City's Public Works, Building, and IDDE Inspectors. Construction-related revisions cover inclusion of threatened discharges, broadening of prohibited discharges, and the strengthening the violations and penalties sections to support the City's Enforcement Response Plans. The ordinance revision is expected to be completed by fall 2010 and approved by the City Council by winter 2010-2011.

C.6.b.ii.(3) ► Enforcement Response Plan

(For FY 09-10 Annual Report only) Was your Enforcement Response Plan developed and implemented by April 1, 2010?	X	Yes		No

C.6.e.iii.1.a, b, c ►Site/Inspection Totals

See Appendix 6-1 for Construction Inspection Details related to C.6.e.iii.1.a-i

Number of sites disturbing < 1 acre of soil requiring storm water runoff quality inspection (i.e. High Priority) (C.6.e.iii.1.a)	**Number of sites disturbing ≥ 1 acre of soil** (C.6.e.iii.1.b)	**Total number of storm water runoff quality inspections conducted** (C.6.e.iii.1.c)
1	**4**	**50**

C.6.e.iii.1.d ►Construction Activities Storm Water Violations

BMP Category	Number of Violations[1]	% of Total Violations[2]
Erosion Control	8	20%
Run-on and Run-off Control	0	
Sediment Control	22	55%
Active Treatment Systems		
Good Site Management	10	25%
Non Stormwater Management		
Total	**40**	**100%**

Notes:

[1]Count one violation in a category for each site and inspection regardless of how many violations/problems occurred in the BMP category.

[2]Percentage calculated as number of violations in each category divided by total number of violations in all six categories.

C.6.e.iii.1.e ►Construction related storm water enforcement actions

	Enforcement Action (as listed in ERP)[1]	Number Enforcement Actions Taken	% Enforcement Actions Taken[2]
Level 1	Verbal Warning	7	32%
Level 2	Notice of Violation or Construction Activity Discharge Compliance Notice	14	64%
Level 3	Stop Work Order and/or Pre-Citation Letter	1	4%
Level 4	Administrative Citation Fines		
Level 5	Referral to City Attorney		
Level 6	Referral to Santa Clara County District Attorney and/or Regional Water Quality Control Board		
Level 7	City Remediation of a Nuisance		
Total		**22**	**100%**

Notes:

[1]Agencies should list the specific enforcement actions as defined in their ERPs.

[2]Percentage calculated as number of each type of enforcement action divided by the total number of enforcement actions.

C.6.e.iii.1.f, g ►Illicit Discharges

	Number
Number of illicit discharges, actual and those inferred through evidence (C.6.e.iii.1.f)	1
Number of sites with discharges, actual and those inferred through evidence (C.6.e.iii.1.g)	1

C.6.e.iii.1.h, i ►Violation Correction Times

	Number	Percent
Violations fully corrected within 10 business days after violations are discovered or otherwise considered corrected in a timely period (C.6.e.iii.1.h)	22	100%[2]
Violations not fully corrected within 30 days after violations are discovered (C.6.e.iii.1.i)		
Total number of violations for the reporting year[1]	22	100%

Notes:

[1]Total number of violations equals the number of initial enforcement actions (i.e. one violation issued for several problems during an inspection at a site). It does not equal the total number of enforcement actions because one violation issued at a site may have a second enforcement action for the same violation at the next inspection if it is not corrected.

[2]Calculated as number of violations fully corrected in a timely period after the violations are discovered divided by the total number of violations for the reporting year.

[3]Calculated as number of violations not fully corrected within 30 days after the violations are discovered divided by the total number of violations for the reporting year.

C.6.e.iii.(2) ►Evaluation of Inspection Data

Describe your evaluation of the tracking data and data summaries and provide information on the evaluation results (e.g., data trends, typical BMP performance issues, comparisons to previous years, etc.).

The data this year is misleading because June 2009 through April 2010 the City was operating under the City's URMP standard operating procedures, developed to comply with NPDES urban runoff permit requirements from 2006, which ensured pre- rain season inspections and frequent inspections thereafter. Potential violations were addressed with a verbal warning and remediated within 24 hours or before the next rain event. After April 1, 2010, Cupertino's new Enforcement Response Plan (ERP) procedures required the City to issue a verbal warning for the first offense, a written notice for the second violation of the same type, and a citation with a fine of $100 for a third violation of the same type. After April 1st, there were no repeat violations at a given property. The upcoming FY 09-10 rainy season should reveal if the new ERP is effective or needs refinement. This year, the IDDE Inspector called the Public Works Engineering Inspector about several uncovered material storage violations. These residential violations were quickly resolved and there were no repeat violations at any given site. If these residential sites were scheduled to be active in FY 10-11, they would be inspected as high priority sites due to the previous violations. Since April 1, 2010, all violations have been

resolved within ten days, in fact within two business days.

The majority of construction site violations are due to poor sediment control. The Public Works Inspector has always made sure that violations are resolved immediately or before the next rain event. He conducts pre-rain inspections of all one-acre and C.3 regulated project sites. Cupertino does not have many active large construction sites, which makes it easier for the Inspector to conduct frequent visits and ensure timely compliance. The Inspector has had many years of experience with the City and has taken an interest in attending meetings and workshops to become better educated on the new MRP requirements and the new State General Construction Permit requirements. The results of the first complete year of more stringent penalties for violations at construction sites will be reported in the FY 10-11 Annual Report. At that time, the City's Construction Inspection program will be evaluated to determine the impact of the new requirements, focusing on sediment control at construction sites.

C.6.e.iii.(2) ►Evaluation of Inspection Program Effectiveness

Describe what appear to be your program's strengths and weaknesses, and identify needed improvements, including education and outreach.

On October 12, 2009, the Public Works Engineering Inspector completed a pre-rain/storm field check at each of the four sites disturbing over 1 acre of land and at the one active C.3 regulated project.

The City's Construction Inspection Program is conducted by the City's Public Works Inspector. As a second level of enforcement, five Building Inspectors are trained annually on Stormwater BMPs and use their knowledge during all building permit inspections to ensure that construction at these sites does not contribute to stormwater pollution or erosion. If they notice any potential violations Building Inspectors require the property owner and contractor to comply within 24 hours. During FY 10-11 Building Inspectors logged 10 potential violations. None of the sites monitored had repeat violations during fiscal year 09-10. Since they are busy with building inspections, if a site requires follow-up the next day or if the violation requires additional time to resolve, Building Inspectors will contact the City's IDDE Inspector and he will respond immediately. All violations of this type are resolved within 24 hours. The inspectors log violations and their verbal or written warnings into an Access database, but these inspections are not required to be reported as part of Cupertino's Construction Program. Most of these issues could be considered IDDE incidents, except that in most cases instead of reporting the potential violations for investigation they make sure that the site is in compliance. City staff from four divisions collaborate to enforce construction inspection compliance: Engineering (one Public Works Inspector), Building (five building permit inspectors), Maintenance (one IDDE Inspector) and Code Enforcement (four code enforcement officers). Each of these city employees is trained on the City's stormwater permit requirements, making the collaborative effort strong, efficient, and thorough.

During FY 09-10, the City adopted stringent construction inspection enforcement procedures to make it possible for all inspectors to apply stricter penalties to repeat offenders. The new procedures make it easier to document and refer City Code violations to Code Enforcement for an administrative fine ($100) after issuing a verbal warning and a written warning. If additional violations occur for the same offense, the monetary penalty can be increased to $200 for the same violation within a twelve-month period and $300 for a third violation within twelve months. On March 31, 2010, the Environmental Programs Manager notified the Code Enforcement Division of the City's new Enforcement Response Plans and advised them of a possible increase in citations coming from stormwater violations. Environmental Programs staff met with Code Enforcement staff and the IDDE Inspector on April 12th to ensure that the Enforcement Response Plan procedures would be implemented effectively. Subsequently, due to Code Enforcement's helpful feedback and willingness to take on more of the tasks involved with issuing the citations, the City's Enforcement response plans and newly revised forms underwent a few more changes. Since April 1st the procedures have been tested and

enforcement procedures are more effective than they have been in previous years. The City will evaluate the new Enforcement Plan during the upcoming fiscal year to determine if any further adjustments to these procedures are necessary.

C.6.f ►Staff Training Summary

Training Name	Training Dates	Topics Covered	No. of Inspectors in Attendance	Percent of Inspectors in Attendance
Construction AHTG	11/17/2009	BMP inspections; Excel tracking of construction inspections; and legal authority.	1 PW. Inspector, & Env. Prgm. Mgr,	N/A
Construction Stormwater Management Compliance Workshop", co-sponsored by SCVURPPP and SFEP.	1/19, 2010	SF Estuary Project; the MRP; Water Board Inspection Prog in Santa Clara County; SWPPP State and municipal requirements; Sediment, Erosion Control & Const Site pollution prevention; developing a SWPPP site map and Erosion Control Plan	Public Works Inspector and City's IDDE Inspector	100%
Certified Erosion Sediment Storm Water Inspector (CESSWI) workshop	Winter 2010	Certification covers knowledge of requirements for the US EPA NPDES storm water permit program; proficiency in Site Safety, Communication, Documentation, Inspector Duties, and Plan Management; and a full understanding of Best Mgmt Practices' (BMPs): purpose, objective, targeted pollutants, applications, limitations, implementation considerations, inspection criteria, and maintenance.	PW. Inspector (passed exam and became CESSWI)	100%
Construction AHTG	2/10/2010	Training to identify high priority sites.	Env Prog. Mgr & Public Works Inspector	N/A

CUPERTINO GREEN
Program

FY 09 – 10 Annual Report

Section 7

Provision C.7. Public Information and Outreach

Section 7 – Provision C.7. Public Information and Outreach

C.7.b.ii.1 ►Advertising Campaign

Summarize advertising efforts. Include details such as messages, creative developed, and outreach media used. The detailed advertising report may be included as an attachment. If advertising is being done by participation in a countywide or regional program, refer to the separate countywide or regional Annual Report.

Summary:

The following separate reports developed by SCVURPPP summarize countywide advertising efforts conducted during FY 09-10: These reports are included within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report.

Highlights of the Program's accomplishments of FY 09-10 PI/P projects and ongoing projects from previous years are described in the sections below according to permit requirements.

The following separate reports developed by SCVURPPP summarize countywide advertising efforts conducted during FY 09-10:

- FY 09-10 Watershed Watch Campaign Annual Campaign Report
- FY 09-10 Watershed Watch Partner Report
- FY 09-10 Watershed Watch Web Statistics Report

These reports are included within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report.

- Public Outreach Events
- Citizen Involvement Events – Watershed Watchers Program at the Don Edwards San Francisco Bay National Wildlife Refuge, and funding for advertising the National River Cleanup Day.
- School Age Children Outreach ZunZun School Assemblies and Watershed Watchers
- Program at the Don Edwards San Francisco Bay National Wildlife Refuge.

Regional Activities

- BASMAA Media Relations Project
- BASMAA IPM Store Partnership Program
- BASMAA Regional Advertising Campaign

Program Campaigns are as follows:

- Litter/TV – Litter Advertising
- Litter messages "Litter is Water Pollution"
- Car Wash Radio and Web Ads
- Green Gardener Class Radio Ad - Green Gardener Classes –Cupertino advertised the Green Gardener Classes on the city's website, and the Cupertino Scene articles.

- Web/Online Ads
- Facebook-Fan-Web Ads
- Watershed Watch Discount Cards
- Pool Brochure – Cupertino included on City website
- Car Wash Brochure – Cupertino included on City website
- Litter Transit Ads –Cupertino contributed additional funding toward the Santa Clara Valley Urban Runoff Prevention Program Watershed Watch Anti-Litter/Storm Drain Awareness Transit Advertising Campaign.
- IPM Advertising- "Watch Out for Pesticides" radio ads promoting the use of IPM practices

The City of Cupertino continues to participate in the WEO Ad Hoc Task Group and assist with ongoing implementation of Watershed Education and Outreach Campaign, including campaign development and staff support for special projects. Cupertino's Environmental Programs Assistant is the Co-Chair of this Committee. Cupertino's Environmental staff provides personal evaluation of WEO projects, and supports funding campaigns for programs at Alviso Ed Center, ZunZun water education performances in local schools, and Our Water Our World IPM Store Partnership

The City participates in Program's Mercury Pollution Prevention Outreach Work Group & conducts local implementation of the Mercury Pollution Prevention Plan including public education on: 1) negative health and environmental impacts of mercury, and 2) proper disposal of products containing mercury.

As part of the City's Household Hazardous Waste (HHW) campaign, a HHW display was available for viewing from 8/3/09 – 8/31/09 at Cupertino's Quinlan Community Center, prior to Cupertino's annual 8/29/09 HHW Event. Outreach literature included: mercury disposal, fluorescent light bulb disposal, mercury thermometer disposal, prescription medicine & syringe/needle drop off locations & other HHW services for residents & small businesses.

During the month of April 2010 , as part of the City's Pesticide & Watershed Pollution Campaign, a display that also included mercury disposal was available for viewing at Quinlan Community Center .

As part of the City's Auto Pollution Campaign, an Auto Pollution display was available for viewing from 10/5/09 – 11/2/09 at Cupertino's Quinlan Community Center. Outreach included information on water pollution prevention for vehicles, including "Cars Pollute Water Too "and "Keeping it All in Tune," and literature explaining impact of copper pollution from brake pads.

Water District's Stream Care Guide and new Creekwise Guide for creek-side property owners are available from Environmental Programs at Planning counter for residents. Staff developed outreach material on minimizing use of pyrethroids for creekside property owners and landscapers during FY 09-10. Information was provided through flyers and through the Cupertino Scene.

C.7.b.iii.1 ►Pre-Campaign Survey

(For the FY 10-11 Annual Report only) Summarize survey information such as sample size, type of survey (telephone survey, interviews etc.). Attach a survey report that includes the following information. If survey was done regionally, refer to a regional submittal that contains the following information: **Not required for this Annual Report.**

- Summary of how the survey was implemented.
- Analysis of the survey results.
- Discussion of the outreach strategies based on the survey results.
- Discussion of planned or future advertising campaigns to influence awareness and behavior changes regarding trash/litter and pesticides.

Place an **X** in the appropriate box below:

	Survey report attached
	Reference to regional submittal:

C.7.c ►Media Relations

Summarize the media relations effort. Include the following details for each media pitch in the space below, AND/OR refer to a regional report that includes these details:

- Topic and content of pitch
- Medium (TV, radio, print, online)
- Date of publication/broadcast

The following separate report developed by BASMAA summarizes media relations efforts conducted during FY 09-10:

• BASMAA Media Relations Final Report

This report is included within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report..

Summary: (Local Cupertino Media Activity)

Broadcast runs for environmental PSAs and programs on The City Channel and Radio Cupertino

TELEVISION SPOTS through City Channel 26 and AT&T U-Verse-Channel 99
Save the Bay PSA – 5 times weekly (average)
Santa Clara County Watershed PSA – 5 times weekly (average)
Give an Experience PSA – 5 times weekly (between Thanksgiving and New Years only)

TELEVISION PROGRAMS through the City Channel 26 and AT&T U-Verse-Channel 99
Liquid Assets: The Story of Our Water Infrastructure - (90-minute documentary aired approximately 25 times between May 2009 and April 2010)
Cupertino Earth Day 2010 Highlights - (Half-hour program has been airing approximately once a week since May 2010 – includes many interviews with presenters)

RADIO SPOTS – City of Cupertino's AM radio station, broadcasting on the WQGH344 (Radio Cupertino) is the City of Cupertino's AM frequency of

1670 AM.
Reusable Bag PSA – 3 times daily (average)
Give an Experience PSA – 3 times daily (between Thanksgiving and New Years only)

LOCALLY PRODUCED RADIO SPOTS*
Recology Cupertino Expanded Services PSA – 25 times a day (airing since June 17, 2010)
Fluorescent Bulb Recycling PSA – 25 times a day (airs for the entire year)
Electronic Waste Event PSAs – 25 times a day (promotes four events per year)
Compost Pickup PSA – 25 times a day (airs between March and October)

Newsletter, newspaper articles, ads:

Cupertino submits articles/ads to the weekly community newspaper (*Cupertino Courier)* and the City's monthly newsletter (*Cupertino Scene)* providing information on environmental events, watershed protection tips, HHW services, air quality protection, composting and recycling programs. As opportunities are available, place ads in or submit articles to the *San Jose Mercury News*.

***Cupertino Scene* articles:**

Approx. dates and subjects for submittal to monthly newsletter (mailed to all residents and businesses):

- 7/09: Grasscycling, Household Hazardous Waste Event, Safe Needle and Syringe Disposal, Best Ways to Spare the Air, Stopping Global Warming Starts at Home (CFLs, water/energy conservation), Water – Report Suspicious Flows or Pollution discharges, Why Choose Reusable Bags, Need to Drain your Pool?, Watershed Watch- Keep your wash-water out of storm drain, Fix fluid leaks immediately, Change your Oil on time, Is your Gardener a Green Gardener?,
- 09/09: Mercury Thermometer Exchange, Coastal Cleanup Event at Creekside Park and Calabazas Creek, Environmental Day-(Drop-off Event for E-waste, U-waste, etc.), Recycling Compact Fluorescent Light Bulbs, Disposing of used Cooking Oil Recycling, Pesticides and Water Pollution, Backyard Compost workshops,
- 10/09: Pesticides and Water Quality, Copper in Brake Pads, Water Conservation, , Environmental Day-(Drop-off Event for E-waste, U-waste, etc.), Last Chance for Compost, Free Compost Classes, Compost Teachers Needed, Needle and Syringe New Drop off Locations
- 11/09: America Recycles Day-Almost everything can be Recycled, Reusable Shopping Bags, Switch From Wood to Gas, Wood Burning Tips, Get Your Business Certified "Green", Disposing of Used Cooking Oil,
- 12/09: Auto Pollution During Rainy Season, Dispose of Old Computers, Wood Burning Tips, Recycling during the Holidays, Junk Mail Kits, Extra Holiday Trash, Reduce Waste - Give An Experience
- 1/10: Spring Backyard Compost Workshops
- 2/10: How do Cars Contribute to Bay Pollution, Winter Spare the Air, Get Your Cupertino Business Certified "Green", Workshops to Build a Sustainable Garden – Bay Friendly, Dispose of Household Hazardous Waste Conveniently and Free?,
- 3/10: Make a change to compact Fluorescent Light bulbs, Cupertino's electronic & shred Event, Pest Control Info Available, Help Cupertino Grow Green for the Better Good, River Creek Cleanup Event, Free Car Wash Fundraiser Kit, Backyard Composting Classes, Compost Bulk Pickup, Car Washing fundraising Event, The Green @ Home Training Program
- 4/10: Create a Green & Sustainable Garden and Learn to Compost too, Cupertino Earth Day Event, Pest Management, Creek Cleanup Event, Compost Classes, Free Compost Bulk Pickup, think Green, Make A Difference, What's the connection between taking a shower, flushing a

toilet and your southern Bay shoreline?, Shred It & Mercury Exchange Event

- 5/10: Musical Greeting Cards – Do I Recycle it?, Washing Your Car Tips, Keep Out Storm Drains and Waterways Clean, Household Hazardous Waste Disposal, Safe Needle and Syringe Disposal – Drop off Locations, Bring Your Own Reusable Bags When Shopping, Spring Cleaning Garbage Info, River Creek Clean Up Event,
- 6/10: Is Your Gardener a Green Gardener?, Help protect Cupertino's Creeks and Bay – Illegal Dumping/Discharges In or Near Storm Drains, Spring Into Action Exercise Caution When Choosing Pesticides , Best Ways to Spare the Air, Prescription Drop Off Locations

Evaluation: The Scene, the City's newsletter provides an easy way for staff to inform local residents and businesses about issues of civic concern. The Scene is mailed to 26,000 postal customers – all residences and businesses in the City.

Cupertino Courier articles:
Article on the countywide Household Hazardous Waste Program Cupertino Drop-off Event on (8/5/09 8/12/09)

River Community Calabazas Creek cleanup at Creekside Park (4/10 & 5/10))
Coastal Community Calabazas Creek cleanup at Creekside Park (9/16/09))
City of Cupertino's Compost Program & Compost Classes (9/16/09))
Citywide Recycling – Environmental/Recycling Day (9/30/09)
City sponsored Environmental Day (including E-waste, U-waste & Shred Confidential Documents (9/30/09)
City compost site to reopen (3/17/10)
City Hosting E-Waste & Shred It Event (3/17/10)
Cupertino Courier ads:
Household hazardous waste event ads before the August '09 HHW event (8/12/09,8/19/09, 8/26/09)
City of Cupertino's Compost Program & Compost Classes (9/16/09)
Free Backyard Compost Workshops (9/23/09, 9/30/09, 10/14/09, 10/21/09)
Cupertino Environmental Recycling Day (10/7/09, 10/14/09)
Properly dispose of Your Used Home-Generated Sharps at an Approved Location (2/10/10)
Mercury Pollution - Fluorescent Bulb Recycling Take Back Locations. Ads submitted by the County and paid jointly by the cities, and in conjunction with PG&E (2/3/10, 2/10/10, 2/17/010, 2/24/10, 3/3/10, 3/10/10, 3/17/10, 3/24/10)
National River Cleanup Day with Cupertino locations (5/12/10)
Computer and Television Recycling for Cupertino residents (2/3/10, 3/3/10)
Free Compost (3/24/10, 4/16/10)
Bay Friendly Gardening Workshops (4/16/10)
Give an Experience (reduce holiday waste/litter) (12/9/09)

S.J. Mercury articles: Articles and ads in the Mercury are usually submitted by the Program and paid for jointly by the co-permittees.

Provided notices to City employees as a reminder to use less-toxic pest control methods in their own homes, and not to use over-the-counter pesticides on the job unless they are a licensed pest control operator for the City. (8/11/09)

10 Spare the Air emails were sent to City employees informing of Spare the Air Days.

An email was sent to employees on 10/22/09 informing them of the importance of battery recycling and listed locations of battery recycling containers at City Hall, Quinlan, Senior Center, and Service Center.

C.7.d ►Stormwater Point of Contact

(For FY 09-10 Annual Report only, unless changes made) Provide details of website or phone number used as the point of contact. Report on how the point of contact is publicized and maintained. If any change occurs in this contact, report in a subsequent Annual Report.

Contact Summary:

The City's Environmental Services Program Division can be reached by contacting 408 777-3354, which is the main line for the City's Public Works Department. This phone number is advertised on the City's website and on all outreach material. Individual agency points of contact are publicized on Program outreach materials and website and the point of contacts are maintained by the Program and their authorized agents.

The City's Environmental Programs Division web pages are updated with new information on an ongoing basis.

City of Cupertino's Website www.cupertino.org. Environmental Programs Division pages www.cupertino.org/environmental. Changes are made by the City's Web Specialist, Nidhi Mathur (408) 777-3377 or the Environmental Programs Assistant, Lauren Tacke (408) 777-3241.

C.7.e ►Public Outreach Events

Describe general approach to event selection. Provide a list of outreach materials and giveaways distributed.

Use the following table for reporting and evaluating public outreach events

Program staff, the Watershed Watch consultant, and Co-permittees staffed ten outreach events in FY 09-10. Events were selected based upon target audience and attendance. Materials distributed at the events included the following: Less Toxic Pest Management fact sheets, "10 Most Wanted Backyard Bugs" brochures, "Don't Plant a Pest" brochure, "You are the Solution to Water Pollution "brochures, "Clean Cars & Clean Creeks" brochure, and giveaways (e.g. flyswatters, OWOW magnets, notepads, and temporary tattoos). The flyswatters have the Watershed Watch website and hotline number and the words "The Original Earth-Friendly Pest Control" printed on them. The beanbag game for children was used at most of the events. Event staff distributed more than 5,000 outreach materials and giveaways.

Cupertino Events & Participation:

Event Details	**Description** (messages, audience)	**Evaluation of Effectiveness**
Provide event name, date, and location. Indicate if event is local, countywide or regional.	Identify type of event (e.g., school fair, farmers market etc.), type of audience (school children, gardeners, homeowners etc.) and outreach messages (e.g., Enviroscape presentation, pesticides, stormwater awareness)	Provide general staff feedback on the event (e.g., success at reaching a broad spectrum of the community, well attended, good opportunity to talk to gardeners etc.). Provide other details such as: • Estimated overall attendance at the event. • Number of people that visited the booth, comparison with previous years • Number of brochures and giveaways distributed • Results of any spot surveys conducted

Name: Cupertino's Fall Festival Date: 9/19/09 & 9/20/09 Location: Cupertino City Hall, 10300 Torre Avenue, Cupertino Region: Local	Type of Event: Community Fair and Mercury Thermometer Exchange Audience: Families with children Message: Stormwater pollution prevention, less-toxic pest control, proper disposal of household hazardous waste (HHW), Solid Waste Resource Reduction and Recycling, and Energy Efficiency	General Feed Back: The event was very well attended. Many attendees stopped at the booth to watch the Enviroscape demonstration and collect giveaways.. This is a good event for educating families with children. Estimated Overall Event Attendance: 10,000 visitors 200 visitors at the City's table Number of Brochures Distributed: 688 Mercury thermometers exchanged for non-mercury thermometers : 50
Name: Annual Wildlife Education Day (Audubon Fair) Date: 10/24/09 Location: McClellan Ranch, Region: Local	Type of Event: Wildlife & Environmental Educational Audience: Families with children Message: To preserve, restore and to foster public awareness of native birds and their ecosystems, mainly in Santa Clara County.	General Feed Back: The event was very well attended. This is a good event for educating families with children. Estimated Overall Event Attendance: 500 visitors at the City's table .
Name: Santa Clara County Creeks Coalition Conference Date: November 11, 2009 Location: Cupertino Region: Countywide (City staff attended the event)	Type of Event: Conference on urban stream restoration Audience: Professionals Message: Stormwater pollution prevention Cupertino staff provided outreach materials and meeting space.	General Feed Back: Good attendance at booth Estimated Overall Event Attendance: N/A Number of Brochures Distributed: 184
Name: Cupertino's 2nd Annual Earth Day Film and Fun Festival Date: 4/17/10 Location: Cupertino City Hall, 10300 Torre Avenue, Cupertino Region: Local	Type of Event: Community Earth Day Event Audience: Families with children Message: Message: Stormwater pollution prevention, less-toxic pest control, proper disposal of household hazardous waste (HHW) and Solid Waste Resource Reduction and Recycling	General Feed Back: Well attended event. Many attendees stopped at the booth to watch the Enviroscape demonstration and collect giveaways. This is a good event for educating families with children. Estimated Overall Event Attendance: 600 visitors Number of Brochures Distributed: 650 flyers 25 Mercury thermometers exchanged
Name: Spring in Guadalupe Gardens Date: April 24, 2010 Location: Guadalupe River Park Region: Countywide (City staff worked event)	Type of Event: Community fair, plant sale. Audience: Families with children, homeowners and gardeners Message: Stormwater pollution prevention, less-toxic pest control and, proper disposal of HHW.	General Feed Back: Good attendance at booth. Most people were looking for specific pest control information. The bean bag toss game was used. Estimated Overall Event Attendance: 4,500 Number of Brochures Distributed: 423 Number of Giveaways Distributed: 797
Name: Watershed Watch Car Wash Event Date: May 19, 2010 Location: Delta Queen Classic Car Wash, 981 E Hamilton Ave,	Type of Event: Car Wash Audience: Car wash customers Message: Stormwater pollution prevention, proper car washing.	General Feed Back: Due to a rainy day forecast, attendance was low at this event. Estimated Overall Event Attendance: 45 Number of Brochures Distributed: 34 Number of Watershed Watch Discount Cards : 49

Region: Countywide (City staff worked event)		
Name: Cupertino's Environmental Recycling Day Date:10/17/09, 1/23/10, 3/20/10 Location: De'Anza College Region: Local	Type of Event: Drive through, drop off service. Audience: Cupertino residents Message: encourage extended use of products and to prevent valuable resources into the landfill.	General Feed Back: Very Successful Estimated Overall Event Attendance: 1,068 Number of Brochures Distributed: 0
Outreach Events Reporting Table – see the Program's annual Report Section C.7.e for Programwide activities,		

C.7.f. ►Watershed Stewardship Collaborative Efforts

Summarize watershed stewardship collaborative efforts and/or refer to a regional report that provides details. Describe the level of effort and support given (e.g., funding only, active participation etc.). State efforts undertaken and the results of these efforts. If this activity is done regionally refer to a regional report.

Evaluate effectiveness by describing the following:

- Efforts undertaken
- Major accomplishments

During FY 09-10, the Program actively supported the Santa Clara Basin Watershed Initiative (SCBWMI), including the Core Group, the Land Use Subgroup, and the Trash Subgroup (now the Santa Clara Valley Zero Litter Initiative); the Bay Area Macro invertebrate Bio-Assessment Information Network (BAMBI); and the Stevens & Permanente Creeks Watershed Council. Information on these efforts is included within the C.7 Public Information and Outreach section of the Program's FY 09-10 Annual Report.

Summary:

Cheri Donnelly, Cupertino's Environmental Programs Manager, is the Chair of the Solid Waste Source Reduction and Recycling subcommittee of the Solid Waste Technical Advisory Committee. Much of the work on this committee is surrounding EPS alternatives for restaurants, potential City bans, single use plastic bags and potential city bans, and Bay Friendly gardening activities. Ms. Donnelly is also an active member of the Santa Clara county Zero Waste committee, and the RWRC TAC HHW Subcommittee, and the Santa Clara Valley *Urban Runoff* Pollution Prevention Program Management Committee.

Lauren Tacke, Cupertino's Environmental Programs Assistant is the Co-Chair of the Watershed Education and Outreach Ad Hoc Group. Campaigns and activities include: support of the campaign includes funding for programs at Alviso Ed Center and for ZunZun water education performances in local schools. See Program's Watershed Watch Work Plan for details.

C.7.g. ►Citizen Involvement Events

List the types of events conducted (e.g., creek clean up, storm drain inlet marking, native gardening etc.). Use the following table for reporting and evaluating citizen involvement events.

Event Details	Description	Evaluation of effectiveness
Provide event name, date, and location. Indicate if event is local, countywide or regional	Describe activity (e.g., creek clean-up, storm drain marking etc.)	Provide general staff feedback on the event. Provide other evaluation details such as: • Number of participants. Any change in participation from previous years. • Distance of creek or water body cleaned • Quantity of trash/recyclables collected (weight or volume). • Number of inlets marked. • Data trends
Name: National Coastal Creek Cleanup Day Date:9/19/09 Location: Calabazas Creed @ Creekside Park Region: Local	Type of Event: Citizen Creek Clean Up Event Message: Host annual creek cleanup for local residents to encourage protection of watersheds. Teach volunteers to conduct trash tallying and monitoring, to categorize and quantify types of trash and likely sources.	General Feed Back: Overwhelming high attendance, and successful event. Estimated Overall Event Attendance: 104 Number of Brochures Distributed: 0 Distance of creek cleaned : 2.5 miles Removed approximately 195 pounds of trash and 80 pounds of recyclables from the Creek and surrounding areas at Creekside Park and around some streets near Creek. Cleanups are an effective way of inspiring enthusiasm for creek and water quality protection as well as bringing about an awareness of trash problems in community and how residents can help to prevent these problems.
Name: Cub Scout Pack 492 Wolfe Den Park Clean Up Date: 10/25/09 Location: Memorial Park, Cupertino Focus: Local	Type of Event: Citizen Park Clean up event of trash and litter	General Feed Back: Good attendance Estimated Overall Event Attendance: 8 7 year olds and 8 adults Number of Brochures Distributed: 0
Name: De Anza College Students Creek Clean Up and Education Training on Litter Date: 3/5/10 Location: Stevens Creek Under Hwy 280 ,	Type of Event: Citizen Creek Clean Up and Educational Presentation Coordinated an upper bank Creek Clean Up	General Feed Back: Good attendance Estimated Overall Event Attendance: 20 College Age Students

Cupertino Focus: Local	and interview with De Anza students @ Stevens Creek under Hwy 280.	Distance of Creek Cleaned: 500 ft Staff discussed with the students the major sources of litter to the area, the impacts to water quality, the benefits and importance of providing public outreach, and the role of the City and the region in creating solutions to litter, as a major source of pollution.
Name: Creekwise Workshop Date: March 20 Location: Santa Clara Valley Water District Region: Countywide	Type of Event: Creekwise Workshop provided by the Santa Clara Valley Water District Learn how to protect your watershed, conserve water on your property, minimize urban runoff pollution and be a good neighbor to the creek adjacent to your property.	Number of Attendees: Two Cupertino Residents participated in this workshop
Name: Stanford Church Group Creek Clean Date: 5/8/10 Location: Stevens Creek Under Hwy 280 , Cupertino Focus: Local	Type of Event: Creek Clean Up@ Stevens & Heney Creek. This event was in coordination with the City of Los Altos, which their site is adjacent to Cupertino's Hot Spot.	General Feed Back: Successful Event Estimated Overall Event Attendance: 20 Number of Brochures Distributed: 0 Distance of creek cleaned : 2.5 miles
Name: Bike to Work Day Date: May 13, 2010 Location: throughout Cupertino Region: Santa Clara County/Local	Type of Event: Bike to Work Day (BTWD) is an event to improve air quality, reducing petroleum and consumption event. Audience: BTWD for Santa Clara County. The City promoted the purchase of new bikes (electric and traditional bikes) and bicycle safety training for employees at this event.	General Feed Back: Good attendance in Cupertino Estimated Overall Event Attendance: 236 Number of Brochures Distributed: 0
Name: National River Creek Cleanup Day Date: 5/15/10 Location: Calabazas Creek @ Creekside Park Focus: Local	Type of Event: Citizen Clean Up Event Message: Host annual creek clean-up for local residents to encourage protection of watersheds. Teach volunteers to conduct trash tallying and monitoring, to categorize and quantify types of trash and likely sources.	General Feed Back: Good attendance, and successful event. Estimated Distance of creek cleaned : 2.0 miles Overall Event Attendance: 54 Number of Brochures Distributed: 0 Removed approximately 150 pounds of trash and 225 lbs recyclables from the Creek and surrounding areas at Creekside Park and around some streets near Creek.

		In addition to the 54 volunteers, the City worked together with the Cupertino High School Honor Society's 50 volunteers, totaling 104 volunteers. Instead of two separate sites, both groups cleaned Calabazas and Regnart Creek, and cleaned up litter in high trash areas surrounding Monte Vista and Homestead High Schools, and around convenience stores surrounding those areas, and Target store.
Name: Bay Friendly Gardening to Manage Pests Naturally Date:6/12/10 Location: Quinlan Community Center Focus: Local	Type of Event: Bay Friendly Gardening IPM Class Bay Friendly workshops provide an overview of design and maintenance considerations and practices that will help the participants make smart choices at the nursery. Name: Bay Friendly Gardening classes and Home Composting classes were also held throughout the County and available to Cupertino resident throughout FY 09/10. Date: Ongoing Location: Countywide Focus: Countywide	General Feed Back: The class was cancelled due to low registration signup. The City has established a new approach for Public Outreach classes for 2010, and is evaluating the type of classes, time of year and outreach tools to successful hold Public Outreach classes. A number of classes have been scheduled in 2010 in the City of Cupertino.
Name: Car Wash Kit Participation Date: March, 17, 2010 & June 26, 2010 Location: Cupertino Focus: Local	The City provided a carwash kit to two Cupertino residents/organizations for fundraiser. To help prevent pollution from car wash events, the City purchased a Sudsafe storm drain protection kit that can be borrowed by nonprofit and school groups.	General Feedback: The fundraising events using the City's Car Wash Kit were successful.
Name: Helping Hands Volunteer Clean Up Date: Ongoing Location: Parks & Stevens Creek Corridor Focus: Local	Type of Event: Helping Hands was inspired by the drive and determination of a high school student looking to help out in Cupertino, and boost the appearance of local parks. The volunteers helped with trash removal at Cupertino parks and at McClellan Ranch.	General Feed Back: The Helping Hands Volunteer Projects have been very successful and extremely helpful to the City of Cupertino. Estimated Overall FY 09/10 Attendance: 60 high school students

Citizen Involvement Events – see the Program's annual Report Section C.7.g for Program-wide activities		

C.7.h. ►School-Age Children Outreach

Summarize school-age children outreach programs implemented. A detailed report may be included as an attachment.
Use the following table for reporting school-age children outreach efforts.

SCVURPPP outreach to school-age children is implemented through ZunZun assemblies at local elementary schools and the "Watershed Watchers" program at the Environmental Education Center at the Don Edwards San Francisco Bay Wildlife Refuge (Refuge) in Alviso. The Program sponsors up to 50 ZunZun assemblies at elementary schools in Santa Clara Valley and funds an Interpretive Specialist position at the Refuge for conducting activities and programs about watershed and urban runoff pollution prevention. The Fourth Quarter "Watershed Watchers" Report including the End-of-Year summary is included in the Program Annual Report Appendix 7-5. The ZunZun Final Report is included in the Program Annual Report Appendix 7-7.

The following separate reports developed by SCVURPPP and other organizations also include information about school-age children outreach efforts conducted during FY 09-10:

- ZunZun School Assemblies for Watershed Watch Campaign- FY 09-10 Academic Year Final Report
- Memorandum- Evaluation of the School Assembly Program- FY 09-10
- Watershed Watchers: Keeping Our Waterways Clean: FY 09-10 Fourth Quarter Report (includes end-of-year Summary from Alviso Education Center)

These reports are included as within the C.7 Public Information and Outreach section of Program's FY 09-10 Annual Report."

Local School Outreach Efforts

Program Details	Focus & Short Description	Number of Students/Teachers reached	Evaluation of Effectiveness
Provide the following information: Name Grade or level (elementary/ middle/ high)	Brief description, messages, methods of outreach used	Provide number or participants	Provide agency staff feedback. Report any other evaluation methods used (quiz, teacher feedback etc.). Attach evaluation summary if applicable.
Name: Monte Vista High School Biology Field Trip Location: Blackberry Farm Grade Level: High School 9th	The City's Park and Recreation staff/ Naturalist assists the students of Monte Vista High School to regularly perform water quality monitoring and research	0 No field trips were conducted this year because the usual	This program is typically conducted annually and is very popular with both teachers and students. (Any need to that this events will be reinstated)

	in Stevens Creek (the City's principal creek, 2 blocks from the high school).	site was closed for a creek & park restoration project.	
Name: De Anza College Environmental Studies Field Trips Grade Level: College Location: McClellan Ranch	Four 1 ½ hour presentations were made to students in ES1& ES52 classes regarding Stevens Creek Watershed. Discussion of the effects of non-permeable surfaces, non-point source pollution, and storm water discharge into creeks was included as part of general discussion of watershed concepts.	110	General Feed Back: Instructor finds this field trip a valuable Addition to both ES1 and ES52 (Intro to Environmental Studies and Humans, the Environment, and Sustainability) and plans to return next semester.
Name: Volunteer Projects Grade Level: Elementary & Middle School (4th – 8th) Location: McClellan Ranch	Students pick up trash along creek and nearby streets	40	General Feed Back: Effective in cleaning up creek as well as raising awareness of trash problems in community.
Name: Creek Education Program Grade Level: Elementary 3rd Location: Schools & McClellan Ranch	Creek Education project available to all 3rd grade teachers, including combo teachers and shared position teachers in the Cupertino Union School District: about 100 classes (half are in Cupertino; remaining schools in cities of San Jose, Sunnyvale, Santa Clara, Saratoga, Los Altos) participated this year. Teachers are trained to teach the creek ed. unit to their own classes, and co-lead creek field trip for their students; City's Park & Rec naturalist and the Cupertino's Creek Ed Coordinator prepare the teachers. City provides two docents for creek tours. 3-hr training workshops for teachers; 2-wk curriculum for students taught by teachers, w/ half-day creek field trip.	2,215	General Feed Back: This program is very popular with the Cupertino school district and its teachers. We started the program in 1995, and continue to refine it as needed. During a half hour review of general NPS and creek concepts that precedes the actual creek walk, our docents have the opportunity to observe whether each teacher has, in fact, spent time in the classroom preparing the students for the field trip. Typically, almost all of the students are familiar with the concepts. This past year, 09-10, we had approximately 1,767 students, 102 teachers, and 346 parent volunteers participate in our program.

Name: 4H Entomology Project Grade Level: Elementary -1st – 4th Location: McClellan Ranch	City naturalist met with 4-H members during seven 1 1/2 hr. sessions to learn about insects, insect identification, life-cycles, ecological importance and control alternatives.	15	General Feed Back: This program is effective in helping children overcome fears of insects, develop competency in insect identification, learn ecological importance of insects, and be introduced to some non-toxic pest control alternatives.
Name: Insect and pesticide alternatives information Grade: Adults & Children Location: McClellan Ranch & Quinlan community Center	City naturalist set up hands-on insect display table at Santa Clara Valley Audubon Society's Wildlife Education Day and at Cupertino's Earth Day to familiarize children and adults with common garden insects and spiders, learn about the beneficial aspect of some insects and spiders and to introduce alternative pest control materials	700	This appears to be a duplicate entry: see next item
Name: Garden insect & pesticide alternatives information table at community events Grade: Adults & Children Location: McClellan Ranch & Quinlan community Center	City naturalist set up hands-on insect display table at Santa Clara Valley Audubon Society's Wildlife Education Day and at Cupertino's Earth Day to familiarize children and adults with common garden insects and spiders, learn about the beneficial aspect of some insects and spiders and to introduce alternative pest control materials	700	General Feed Back: This program was effective in engaging participants at event into discussion about insects and spiders, the benefits of some of these organisms in the garden and alternatives to pesticides for dealing with pests.
Name: Monte Vista High School Creek Cleanup Grade: High School Location: Calabazas Creek @ Creekside Park	2 City Staff worked with 8 high school students to clean approximately 200ft of Calabazas Creek. Education was provided on the importance of maintaining clean creeks and instructions were provided on how to perform an RTA.	8	General Feed Back: Program was effective in raising awareness of trash issues and the importance of keeping creeks clean.
Name: Monte Vista High School Interview Grade: High School	Environmental Program Manager met with three high school students to provide an interview for their project about current environmental	3	General Feed Back: Interview was effective in providing information on creek and watershed issues to high school students that would in return take the information back to

Location: Cupertino City Hall	concerns. Topics discussed included: litter in creeks, pesticides, negative impact of sediment and erosion, impervious surface and C.3 requirements.		their classmates.
Name: Monte Vista High School Interview Grade: Children & Adults Location: Calabazas Creek at Creekside Park	Two creek cleanup events were held this year. The National Coastal Cleanup Event and the National River Cleanup Event. Both events had over 80 volunteers that ranged in age from elementary school to adult. Trash and recyclables were collected from Calabazas Creek and adjacent areas at both events.	160	General Feed Back: These cleanup events are effective in removing litter from the creek as well as educating the public on the importance of maintaining clean creeks.
Name: Cupertino Earth Day Event Location: Cupertino City Hall Grade: Children & Adults	Cupertino Environmental Programs staff set up tables at the City's Earth Day Event that included information on environmental issues, city services and programs. The display included continuous presentations with the Enviroscape, bringing the watershed and urban runoff to life in an interactive exercise. The presentations included an introduction to the watershed, urban runoff, and how everything in the street or storm drain has a direct flow path to the creeks and Bay.	150	General Feed Back: The information provided, especially through the Enviroscape presentations, was effective in educating the public on watershed issues such as litter, pesticides, oil, and other sources of urban runoff.
Name: Cub Scout Pack 492 Wolfe Den Park Clean Up Date: 2/5/10 Location: Memorial Park, Cupertino Grade or level: elementary,	Add description?	15	General Feed Back: Good attendance Estimated Overall Event Attendance: 7 scouts and 8 adults
Name: Christa McAuliffe School Date: Throughout FY 09/10 Location: 12211 Titus Ave,	Cupertino assisted Christa McAuliffe School with providing technical staff support with a Waste Audit, recycling		General Feed Back: Students are learning the importance of disposing of their trash via the proper receptacles which deters them from

Saratoga (Cupertino Union School district) Grade Level : K - 8	containers, & labels to assist with the school's recycling efforts.		littering.
Name: Collins Elementary School Date: Throughout FY 09/10 Location: 10300 N. Blaney, Cupertino Grade Level : Elementary	Cupertino assisted Collins Elementary School with providing technical staff support, recycling containers, & labels to assist with the school's recycling efforts.		General Feed Back: Students are learning the importance of disposing of their trash via the proper receptacles which deters them from littering.
Name : ZunZun Musical Assembly Grade or level: Elementary	Interactive, musical school assemblies educating K-6 children about watersheds and pollution prevention.	14,161 students	General Feed Back: ZunZun assemblies were evaluated using postage-paid evaluation cards that were distributed to all teachers present at the performances. The Program received 130 completed evaluation cards from teachers. Overall, the feedback is positive and indicates an increase in the students' knowledge about watersheds and pollution prevention. A few highlights of the evaluations are: • Twenty-two teachers indicated that after the performance, 50% of their students knew what a watershed is; 51 teachers indicated that 75% of their students knew what a watershed is and 28 teachers indicated that 100% of their students knew what a watershed is. • Eight teachers indicated that after the performance, 50% of their students could name a way to prevent pollution in the watershed; 38 teachers indicated that 75% of their students could name a way to prevent pollution in the watershed; and 78 teachers indicated that 100% of their students could name a way to prevent pollution in the watershed. The Final Teacher Evaluation Report is included in the Program Annual Report Appendix 7-7.

Name: Watershed Watchers Program at Don Edwards Wildlife Refuge in Alviso Grade or level: elementary, middle, high school	The Refuge offers a number of interpretive programs to educate children and youth about preventing urban runoff pollution. These include: Bike the Levees; Discover Native Species; Habitat Exploration; Living Wetlands; Marshes, Mud and Plankton; Quackers and Honkers; and Water Everywhere.	80 pre-kindergarteners, 1,359 elementary school students, 33 middle school students, and 199 high school students	Visitor Surveys are used to determine visitor demographics, effectiveness of publicity, and the effectiveness or the Watershed Watchers Program. In addition, an "Urban Runoff Bead Drop" display is used to record actions (e.g., pick up litter, spread the word, take car to car wash) that children promise to do the help keep storm drains clean. Results of both these evaluation mechanisms are summarized in the Watershed Watchers Fourth Quarter Report included in the Program Annual Report Appendix 7-5.
Name: City Response from letters and Interviews from Middle School & High School Students Grade Level: Middle & High School	City responded to the following letters and interviews from Middle & High School Students: **Letters** 3/13/10 -2 Monte Vista High School students - requesting the City to install a trash can to eliminate litter around the high school. 1/20/10 - 3 Monte Vista High School students- Request for legislation in City of Cupertino to reduce plastic bag litter. 3/19/10 - 5 Monte Vista High School students- requesting concern for health and safety of local creeks, the Bay and the ocean 3/12/10 – 2 Monte Vista High School students - Proposal for "Green Education" utilizing Fremont and Cupertino Union School Districts specifically, plastic litter in the ocean education. **Interviews** 2/5/10 Interview by 7 Cupertino High School students at Calabazas Creek.		

	Students asked questions regarding the City's efforts in creating solutions to stormwater pollution, particularly litter issues, global warming, public education/outreach, recycling and reuse. The interview location at a Cupertino Creek allowed for students to see the impacts that our actions have on our waterways and solutions for both the City and residents to take were discussed. 2/8/10 Attended meeting to support Lawson Middle School students in their project on native plants for the community. Lawson Middle School students are working on a native plant program for our community 3/5/10 Interview with 3 De Anza College students at Stevens & Heney Creek. Staff discussed with the students the major sources of litter to the area, the impacts to water quality, the benefits and importance of providing public outreach to individuals of all ages and the role of the City and the region in creating solutions to litter, as a major source of pollution. 5/10/10 Interview with Lawson Middle School students regarding water pollution in China.		General Feed Back: Students and staff cleaned approximately 500 ft. of the creek banks and surrounding area.
School-Age children Outreach Events– see the Program's annual Report Section C.7.h for Programwide activities			

CUPERTINO GREEN
Program

FY 09 - 10 Annual Report

Section 8

Provision C.8 Water Quality Monitoring

Section 8 - Provision C.8 Water Quality Monitoring

C.8 ►Water Quality Monitoring

State below if information is reported in a separate regional report. Municipalities can also describe below any Water Quality Monitoring activities in which they participate directly, e.g. participation in RMP workgroups, fieldwork within their jurisdictions, etc.

During FY 09-10, the City of Cupertino contributed to the SCVURPPP Monitoring and Assessment Program, which conducts water quality monitoring in Santa Clara Valley creeks and rivers in coordination with the BASMAA Regional Monitoring Coalition (RMC). In addition, the City contributes financially to the Regional Monitoring Program for Water Quality in the San Francisco Estuary (RMP) and, through SCVURPPP, actively participates in RMP committees and work groups. For additional information on monitoring activities conducted by SCVURPPP, BASMAA RMC, and the RMP, see the C.8 Water Quality Monitoring section of the Program's FY 09-10 Annual Report.

Local Water Monitoring by Volunteers

Cupertino water monitoring activities, conducted by volunteers, encouraging public participation, are coordinated and managed by the Stevens Creek Permanente Watershed Council. Below is an example of an email "call for volunteers" that the SCPWC sends to members:

> Members meet at the City's McClellan Ranch Parking Lot on Sunday, July 12, 2009 at 9:00 AM for the monthly water quality monitoring event. There, and at eight other sites along Stevens and Permanente Creeks, we will be measuring dissolved oxygen, temperature, turbidity, pH and so forth. Additionally, we will collect small samples of water which De Anza students will later analyze for the presence of coliform bacteria.
>
> It should be a beautiful day and we hope you will come help collect this important data needed to track the health of the creek. You are welcome to join us at all or part of the sites. STEVENS & PERMANENTE CREEKS WATERSHED COUNCIL (SPCWC), PROGRAMS DIRECTOR, PROGRAMS@SPCWC.ORG

Investigation of Sources of Pyrethroid Pesticides in Stevens Creek & Resulting Public Outreach

SCVURPPP staff and Cupertino's IDDE Inspector and Environmental Programs staff met with SPCWC's Executive Director at Cupertino City Hall on July 17, 2009 to discuss dry weather flows into Stevens Creek and the possible sources of pyrethroid pesticides in the creek. (See Program's September 15, 2009 report : "*Investigative Monitoring Project: Potential Sources and Causes of Toxicity in Stevens Creek, Santa Clara County, California*" at http://www.scvurppp-w2k.com/mon_wp.shtml The group reviewed the City's storm drain maps and conducted a field investigation. Environmental Programs staff followed-up by creating a flyer to educate residents in the areas upstream of this section of Stevens Creek about the dangers of using bifenthrin for ant control. The flyer was sent to one gated neighborhood with the understanding that it would be shared with residents at a homeowners' meeting or included in the neighborhood newsletter. City staff also brought the flyer to community environmental events in FY 09-10. Staff have not received any feedback from the gated neighborhood, but residents that attended City events were very interested in using less toxic measures for ant control.

CUPERTINO GREEN
Program

FY 09 - 10 Annual Report

Section 9

Provision C.9 Pesticides Toxicity Controls

Section 9 – Provision C.9 Pesticides Toxicity Controls

C.9.a ►Adopt an Integrated Pest Management (IPM) Policy or Ordinance

(For FY 09-10 Annual Report only) Attach a copy of your individual IPM ordinance or policy.	X	**Attached**		**Not attached,** explain below

The City's IPM Council Resolution, IPM policy and pest specific IPM plans are attached at the end of this C.9 report section.

C.9.b ►Implement IPM Policy or Ordinance

Report implementation of IPM BMPs by showing trends in quantities and types of pesticides used, and suggest reasons for increases in use of pesticides that threaten water quality, specifically organophosphorous pesticides, pyrethroids, carbaryl, and fipronil. A separate report can be attached as evidence of your implementation.

Four Year Comparison Summary of Pesticides Used on City property (in pounds unless otherwise noted):

Active Ingredient	Target Pest	On SF list	Locations	FY 06-07	FY 07-08	FY 08-09	FY 09-10
Bayleton	Fungus	Yes	Greens	0	0	15.3lbs	0
Chlorothalonil	Fungus	Yes	Golf	19.2	0	0	0
Cyfluthrin:	Ants	Yes	Facilities	1.5	0	0	0
Dicomba	Weeds	Yes	Golf	0	21.8	0	0
Fipronil*:	Ants	Yes	Facilities	4 oz.	4 oz.	0.16 oz.	1.6 oz.
Flutonill	Fungus	Yes	Golf	2.10	0	0	0
Fluridone	Weeds	Yes	Golf	0	0.5	0	0
Glyphosate (Roundup)	Weeds	Yes	Various	60.97	71.25	140.21	179.95 lbs
Halosulfuron-methyl	Weeds	No	Golf	0.003	0	0	0
Ipridione	Fungus	Yes	Golf	12.29	7.2	0	0
Isoxaben	Weeds	No	Medians	13.26	10.5	0	92.92 lbs.
Oryzalin (Surflan)	Weeds	No	Medians	65.42	57.84	36.74	135.27 lbs.
Oxydiazon	Weeds	No	Medians	0	0	2.6	0
PCNB for Snow Mold	Snow Mold	No	Golf	0	15	9	0
Pendimethalin	Weeds	Yes	Parks	10.8	24.7	116.62	18.47 lbs.
Penoxsulam	Weeds	Yes	Golf	0	0	.080	0
Propicon Azole	Fungus	Yes	Golf	0.71	0	0	0
Triadimefon	Fungus	No	Golf	0.76	0	0	0

Active Ingredient	Target Pest	On SF list	Locations	FY 06-07	FY 07-08	FY 08-09	FY 09-10
Triclopr	Weeds	Yes	Parks	3	6.0	4 0	5.0
Trifuralin	Weeds	No	Parks	0	.15	0	0

City maintenance staff did not use any organophosphorous pesticides on grounds or medians during FY09-10.

Termidor, which contains the active ingredient fipronil, is used sparingly and only as needed by the City's facilities pest control contractor to control ants in City buildings. Although Termidor does not appear on the SF Reduced Risk Pesticide List, fipronil is present in other approved products, in small concentrations. The only application of Temidor (a total of 1.6 ounces) in FY 09-10 occurred in October 2009. The City's on-call facilities pest-control contractor was called to get rid of an ant infestation at the buildings surrounding Cupertino's City Hall Plaza, including City Hall, the Cupertino Library, and the Cupertino Community Hall, which houses the City Council Chambers. Termidor is not sprayed, but is directly applied to foundations, away from impervious surfaces. In this case, the application areas are surrounded by soil and vegetation; any rain runoff from the treated areas would infiltrate the soil and would not enter the storm drain or parking lot. The 1.6 ounces of fipronil used by the contractor in FY 09-10 was an increase over use in FY 08-09 (0.16 ounces), which was less than the amount used in FY 07-08 (4 ounces). The contractor has found no other effective alternatives to Termidor to control the larger ant infestations, but has been able to avoid any broadcast spraying. In FY10-11 the City's pest contractor expects to use only **EcoSmart products and will test for an effective replacement to Termidor for ant control in public buildings.

** EcoSMART Ant and Roach Killer contains the following active Ingredients: Rosemary Oil (5.00%); Cinnamon Oil (3.00%); and other Ingredients*(92.00%). Other ingredients include *Water, Wintergreen Oil, Mineral Oil, Oleic Acid, Canola Oil, Carbon Dioxide, Vanillin, Lecithin

The Grounds Maintenance Division Supervisor reported that because FY 09-10 was an unusually wet year, his crews used greater amounts of glysophate, oryzalin and isoxaben on medians and in parks than in previous years. There were storms starting in October and lasting well into April. The Streets Dept. used more oryzalin in FY 09-10, as they had tried pendimethalin last year and it did not work well. However, from FY 08-09 to FY 09-10, the amount of pendimethalin used was reduced by 98.15 lbs to 18.47 pounds.

The Grounds Maintenance Department mixes isoxaben with oryzalin as a pre-emergent. The City's Pest Control Advisor selected this mixture as a pre-emergent to keep the weeds from germinating instead of spraying glyphosate (post-emergent) in larger quantities to kill the weeds after they emerge. The two active ingredients, when combined, cover a very broad spectrum of weeds therefore requiring a smaller amount of glyphosate than would otherwise have been needed.

C.9.c ►Train Municipal Employees

Enter the number of employees that applied or used pesticides (including herbicides) within the scope of their duties this reporting year.	**16**
Enter the number of these employees who received training on your IPM policy and IPM standard operating procedures within the last 3 years.	**16**
Enter the percentage of municipal employees who apply pesticides who have received training in the IPM policy and IPM standard operating procedures within the last three years.	**100%**

On June10, 2010, the annual staff and contractor IPM training meeting was held at City Hall. Attendees included the Environmental Programs Manager and Division staff, the City's Public Works supervisor for the Grounds Maintenance Division, the City's Public Works supervisor for facilities, staff from the City's McClellan Ranch property, the pest control contractor for the City's facilities and the City's Golf Course Maintenance Superintendent. In this training meeting, Environmental Programs staff briefed attendees on the requirements and the City's implementation of the MRP. A round-table discussion of IPM practices took place, including a review of the City's IPM policy and pest specific plans. Each of the City's 38 pest specific plans was updated as the group considered options for the upcoming year. The City's Maintenance supervisors are trained annually on the City's IPM requirements and only these supervisors determine which pesticides may be used on City property, if any. All applicators and other staff (32 maintenance workers and City pesticide applicators) received the appropriate County Ag and Dept. of Pesticide Regulation required annual training on January 11, 2010. Of the thirty-two trained, only sixteen employees applied any type of pesticides in FY 09-10 on City property.

C.9.d ►Require Contractors to Implement IPM

Did your municipality contract with any pesticide service provider in the reporting year?	X	Yes		No

If yes, attach one of the following:

X	Contract specifications that require adherence to your IPM policy and standard operating procedures, OR
	Copy(ies) of the contractors' IPM certification(s) or equivalent, OR
	Equivalent documentation.

The City's contract specifications for the City's Golf Course Maintenance Superintendant are attached at the end of this C9 report section, following the City's IPM policy and specific IPM plans. In addition to following the City's contract specifications, the Golf Course Maintenance Superintendant meets annually with Environmental Programs Mgr. to review the City's IPM policy and specific IPM plans related to golf course maintenance.

The City uses an on-call pest control contractor for facilities. The facilities contractor works under the supervision of the City's Public Works Facilities Supervisor. Since the work is on-call and done through a purchase order, the City does not have contract specifications for his work. However, he is trained along with City staff on the City's IPM policy and is required to coordinate with City's Public Works Facilities Supervisor to find the least toxic means of pest control to resolve the City's pest problems. The City's on-call pest control contractor for City facilities attended the staff IPM training meeting on June 10, 2010.

C.9.e ►Track and Participate in Relevant Regulatory Processes
Summarize participation efforts, information submitted, and how regulatory actions were affected or reference a regional report that summarizes regional participation efforts, information submitted, and how regulatory actions were affected.
During FY 09-10, Cupertino participated in regulatory processes related to pesticides through financial contributions to SCVURPPP, BASMAA and CASQA. For additional information, see the Regional Pollutants of Concern Report submitted by BASMAA on behalf of all MRP Permittees. This Report is included within the Program's FY 09-10 Annual Report.

C.9.f ►Interface with County Agricultural Commissioners
Provide a summary of improper pesticide usage reported to County Agricultural Commissioners and follow-up actions to correct violations, if any. A separate report can be attached as your summary.
There was no improper usage of pesticide on City property in FY 09-10 and the City does not allow this. There were no reports of improper use of pesticides within the City during FY 09-10. City employees and contractors adhere to the City's IPM policy and pest specific plans.

C.9.h.ii ►Public Outreach: Point of Purchase
Provide a summary of public outreach at point of purchase, and any measurable awareness and behavior changes resulting from outreach (here or in a separate report); or reference a report of a regional effort for public outreach in which your agency participates.
The following separate reports developed by SCVURPPP and BASMAA summarize point of purchase outreach efforts conducted during FY 09-10: • FY 09-10 Store Employee Training Report (SCVURPPP) • FY 09-10 Store Employee Training Evaluation Summary (SCVURPPP) • FY 09-10 Store Employee Training Status Table (SCVURPPP) • FY 09-10 List of Stores in the IPM Store Partnership Program (SCVURPPP) • FY 09-10 BASMAA "Our Water, Our World" (OWOW) Report (BASMAA) These reports are included within the C.9 Pesticides Toxicity Control section of Program's FY 09-10 Annual Report.

C.9.h.vi ►Public Outreach: Pest Control Operators
Provide a summary of public outreach to pest control operators and landscapers and reduced pesticide use (here or in a separate report); or reference a report of a regional effort for outreach to pest control operators and landscapers in which your agency participates.
The FY 09-10 Green Gardener Training Report developed by SCVURPPP summarizes the Public Outreach: Pest Control Operators efforts conducted during FY 09-10. This report is included within the C.9 Pesticides Toxicity Control section of Program's FY 09-10 Annual Report.

CUPERTINO GREEN

Appendix 9-1

Cupertino IPM Policies and Plans

RESOLUTION NO. 02-188

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF CUPERTINO APPROVING A POLICY REQUIRING AN INTEGRATED PEST MANAGEMENT APPROACH TO PEST CONTROL AT ALL CITY-MAINTAINED FACILITIES

WHEREAS, several pesticides have been found in local creeks and in San Francisco Bay and are understood to be a threat to the environmental health of the Bay Area; and

WHEREAS, governmental agencies are adopting Integrated Pest Management (IPM) policies to allow them to act as role models for using the less-toxic pest management strategies that agencies are asking the public to adopt; and

WHEREAS, the City of Cupertino's recently revised National Pollutant Discharge Elimination System (stormwater) permit requires that all permittees establish an IPM policy and develop and implement an IPM plan that requires a reduced-risk approach to all pest control activities performed at city facilities.

NOW, THEREFORE, BE IT RESOLVED, by the City Council of the City of Cupertino, that a City policy regarding Integrated Pest Management shall be implemented as shown in the attached Exhibit.

PASSED AND ADOPTED at a regular meeting of the City Council of the City of Cupertino this 21st day of October 2002, by the following vote:

Vote	Members of the City Council
AYES:	Lowenthal, Chang, James, Kwok, Sandoval
NOES:	None
ABSENT:	None
ABSTAIN:	None

ATTEST:

Kimberly Smith
City Clerk

APPROVED:

Mayor, City of Cupertino

POLICY TO REQUIRE AN INTEGRATED PEST MANAGEMENT APPROACH TO PEST CONTROL AT ALL CITY-MAINTAINED FACILITIES

POLICY STATEMENT

The City of Cupertino will carry out its pest management operations, at city-owned facilities, and at other facilities where the city is responsible to provide facility and landscape maintenance, using reduced-risk Integrated Pest Management (IPM) techniques.

The city, recognizing that some pesticides may be potentially hazardous to human health and the environment, shall give preference to reasonably available non-pesticide alternatives, and reduced-risk pesticides, when performing pest control activities.

Departments that apply pesticides will follow an IPM plan whose goal is to ensure the long-term prevention or suppression of pest problems, while reducing or eliminating the need for chemical pest controls (to the maximum extent feasible), with minimum negative impact on human health, non-target organisms, and the environment.

The IPM Plan will include pest-specific and site-specific standard operating procedures (describing the IPM approach used to control common pest problems) and monthly pesticide use summaries. The city will prepare a report each year summarizing and evaluating the pest control activities performed by city staff and contractors.

The IPM Plan will also include an outreach component to residential and commercial pesticide users, and mechanisms to discourage pesticide use at new development sites.

No products containing Clopyralid, Diazinon, Chlorpyrifos (Dursban), Chloradane, DDT, Dieldrin or other organophosphates can be used by city staff or a city contractor on city property or property maintained by the city. Currently, these chemicals are not in use at city-maintained facilities.

City staff are to report pest control problems to the Public Works Facilities Supervisor or to the Recreation Supervisor at Blackberry Farm. No unauthorized city staff can purchase pesticides for use at work.

Pest	**1. Anthracnose on Ashes**
Location	Ashes in Rancho Rinconada. Protected tree, although many in Rancho Rinconada have surpassed their lifespan of 50 years. Rancho Rinconada was built in 1954.
Threshold	
Monitoring	
History	City takes no action. Anthracnose causes leaf drop of first leaves. Does not do enough harm to the tree to justify treatment. Degree of infestation depends on climate—which varies from year to year.
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	None

Pest	**2. Anthracnose on Sycamores**
Location	Sycamore trees in Rainbow area and Stelling area
Threshold	
Monitoring	
History	City takes no action. First-out leaves drop. Not enough damage to tree to justify a spray program.
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	None

Pest	**3. Aphids avoided with Aphid-Resistant Flowering Plum**
Location	
Threshold	
Monitoring	
History/ Cultural (prevention)	Flowering plum trees (Prunus) were chosen partially because they would be aphid-resistant. Using variety “Krauter Vesuvius.” On the Street Tree List.
Physical (treatment)	
Biological (treatment)	
Chemical (treatment)	

Pest	**4. Aphids on Ashes in Rancho Rinconada**
Location	Throughout Rancho Rinconada
Threshold	
Monitoring	
History	Aphids infestations appear periodically, probably determined by weather patterns. Infestation intensity varies from year to year. Aphid secretions attract ants to the ashes. Aphid secretions drop onto parked cars, causing public complaints. (Any insecticide spraying would be ineffective and, essentially pointless.) Predatory wasps return and resolve the infestation. Lady bugs have also been used.
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	When necessary, city releases lady bugs and/or predatory wasps.

Pest	**5. Aphids on Raywood Ashes-**
Location	On medians on Homestead. 8-12-08 per Diane: no longer planting these trees; they get fungus easily and they get aphids, although not many aphids for a couple of years. (fungus-limbs die back, cut limbs)
Threshold	
Monitoring	
History	
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	None
Chemical (treatment)	Inject tree with Pointer pesticide.
Active ingredient	Imidacloprid (On San Francisco approved list, 2002)
Brand name	Pointer
Toxicity Category	
Concentration	
Treated Location	Inject into the tree trunk
Appl.technique/ Equipment	Injection equipment
Timing	
Weather	

Pest	**6. Aphids on Lyriodendrum**
Location	On Bubb Rd at Edward Way. Due to problems w/scale and aphids, these trees are no longer planted. Some are removed and replaced with other, more pest-resistant trees. Limited amount of these trees remain. Although they are on the tree list, staff steers people away from using them as they are not a "good" tree.
Threshold	
Monitoring	Watch for when trees start to drip honey dew onto the sidewalk.
History	
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	None
Chemical (treatment)	Inject tree with Pointer. Aphids have not been a problem for a couple of years, therefore treatment is rarely needed. Injection is the preferred treatment compared to spraying, even though it is more expensive and drilling into the tree can negatively impact the tree.
Active ingredient	Imidicloprid (On San Francisco's permitted pesticides list.)
Brand name	Pointer
Toxicity Category	
Concentration	
Treated Location	Tree trunk
Appl.technique/ Equipment	Injection equipment
Timing	
Weather	

Pest	**7. Bermuda grass spreading**
Location	Foothill median, Stevens Crk medians, Memorial Park and Jollyman Park
Threshold	Over-competes with ground covers and shrubs.
Monitoring	Field observation
History	A few areas have been infested with Bermuda grass, which spreads easily. We keep it under control so it doesn't destroy the desired plants.
Cultural	Hoeing and pulling are not effective on a large scale.
Physical	None
Biological	None
Chemical (treatment)	Fusillade II -- selective herbicide for grass control. Not used much. Mike Greg sprayed at The Oaks on Stvens Creek Blvd in '09.
Active ingredient	Fluazifop-P-butyl (Not on SF list)
Brand name	Fusillade II
Toxicity Category	Caution, Category III
Concentration & Rate of Application	1.28 oz/gal.
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	Apply when Bermuda is actively growing. Spot spray in summer when warm and dry.

Pest	**8. Drought-tolerant plants chosen for city facility parking lots**
Location	In parking lots at city facilities
Threshold	
Monitoring	
History	City has planted native, drought-tolerant plants in city facility parking lots to take advantage of their low need for water and infrequent pest problems.
Cultural (prevention)	
Physical (treatment)	None
Biological (treatment)	None
Chemical (treatment)	None

Pest	**9. Fireblight**
Location	Flowering pear trees found around the City, including on Stevens Creek Blvd., near Symantec.
Threshold	Act, if 30% infected. New growth looks scorched.
Monitoring	Field observation
History	Flowering pears contract a bacterial disease called fireblight. Its severity is dependent on weather conditions at time of bloom. Is spread by wind, contaminated shears, and bees.
Cultural	City has planted more-resistant cultivars that still can get infected, but not as bad. The original Kawakami's have Fireblight the worst.
Physical	Prune out infected wood 6" below infection. Sterilize shears. Avoid planting host plants for the disease, such as Rhapiolepis, under flowering pear trees.
Biological	None
Chemical (treatment)	None

Pest	**10. Fruit setting on Crabapples & Olives**
Location	City Hall
Threshold	This is a high-traveled area. The dropped fruits onto sidewalks is not acceptable at all.
Monitoring	Field observations
History	To avoid the mess caused by fruiting trees, the city had sprayed ethephone in flower blooming season to prevent the flowers from setting fruit. Fruits dropping on the sidewalk have been tracked into the building and cause staining on the carpet. Ethephone is considered to be a safe chemical for the operator and for the public. The city will continue this practice.
Cultural (prevention)	Keep trees trimmed.
Physical (treatment)	None
Biological (treatment)	None
Chemical (treatment)	Spray with ethephon to prevent fruit from setting. Not used much.
Active ingredient	Ethephon—3.9%
Brand name	Florel (Not on SF list.)
Toxicity Catgory	Caution (Category III)
Concentration	3 oz. / gal
Treated Location	
Appl.technique/ Equipment	
Timing	Spray the flowers on the trees in bloom.
Weather	70 degrees or lower, to prevent foliage burn

Pest	**11. Mildew resistance**
Location	Crape Myrtle trees
Threshold	
Monitoring	
History/ Cultural (prevention)	City has chosen to plant Crape Myrtle trees because they are mildew resistance and therefore will require little pest control treatment.
Physical (treatment)	
Biological (treatment)	

Pest	**12. Mistletoe on Ashes**
Location	Courts off Mann Dr.
Threshold	8-10 clumps per tree
Monitoring	Field Observation
History	Staff believes that mistletoe may have initially been brought into the area by a person on Oakview Lane who used to sell mistletoe. It's been a problem ever since.
Cultural	None
Physical	Prune out. Sometimes have to remove large branches.
Timing	Prune when trees are dormant, so mistletoe is especially visible.
Biological	None
Chemical (treatment)	**Florel—plant growth regulator; causes abscission**
Active ingredient	Ethephon—3.9% (Not on SF list.)
Brand name	Florel
Toxicity Category	Caution
Concentration & Rate of Application	
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	

Pest	**13. Phytoptera on Cherry trees**
Location	In Memorial Park
Threshold	
Monitoring	
History	Trees were originally planted in a low spot, so they were often water-logged—resulting in phytoptera.
Cultural (prevention)	Staff replanted trees on knolls and solved the problem.
Physical (treatment)	
Biological (treatment)	

Pest	**14. Scale on Burford Holly tree**
Location	Medians
Threshold	
Monitoring	
History /Cultural (prevention)	Scale problem developed. City decided to **remove all** of the Holly trees to avoid future scale problems. (Tree not suited for the site.)
Physical (treatment)	None
Biological (treatment)	None

Pest	**15. Spittle bug on Baccharis**
Location	Mary Ave. on roadside.
Threshold	
Monitoring	
History	Staff applied Orthene systemic. Didn't work. **Removed all** Baccharis to avoid pest problem.
Cultural (prevention)	Removed Baccharis to avoid pest problem.
Physical (treatment)	
Biological (treatment)	

Pest	**16. Tussock Moth on Oaks**
Location	Oaks on Miller Ave.
Threshold	Action needed when tree is 25% infested.
Monitoring	Monitored weekly during the Spring. Usually appears mid to late April. Typically spreads from tree to tree, moving from the southernmost trees, to the north. City staff monitor the Oaks personally.
History	
Cultural (prevention)	
Physical (treatment)	Pruning affected branches is not a good idea.
Biological (treatment)	Previous: Spray with B.t.
Active ingredient	Bacillus thuringinensis (On SF list)
Brand name	Dipel 2X
Concentration & Rate of Application	¼ - ¾ lbs. / 100 gals
Treated Location	As above.
Appl.technique/ Equipment	No longer spray. During the last infestation, the tree was stripped of its leaves and when the leaves returned, the infestation was gone.

Timing	Must be sprayed in morning before 6 a.m. to avoid any spray getting onto cars or people, and to avoid alarming the public by the appearance that a poison is being sprayed. Spray is only effective when applied in March and April, while caterpillars are feeding Usually, one spraying will be enough. If there are several hatchings, a second spraying within a week may be necessary.
Weather	Don't spray in rainy weather.
Chemical (treatment)	None

Pest	**17. Tussock Moth on Wisteria**
Location	Wisteria vines on the DeAnza Blvd. medians; cross streets: Bollinger north to Pacifica
Threshold	Action needed when tree is 25% infested.
Monitoring	Monitored weekly during the spring. Usually appears mid to late April. Typically spreads from tree to tree, moving from the southernmost trees, to the north. City staff monitor the Wisteria personally.
History	Tussock moth has appeared at this site sporadically since 1990. Previously, the city's PCA applied Orthene (a systemic pesticide) or Sevin, to poison the caterpillars. This was effective for one year, but, beginning in 1997, the PCA decided to spray the affected Wisteria with B.t. The results have been good. There has not been a problem since 2000. The reason could be the B.t treatment. The predatory insects are probably extinguished now.
Cultural (prevention)	
Physical (treatment)	Pruning affected branches is not a good idea.
Biological (treatment)	Spray with B.t. Haven't had to spray in years, but would use this technique if needed. No known injection treatment.
Active ingredient	Bacillus thuringinensis (On SF list)
Brand name	Dipel 2X
Concentration & Rate of Application	¼ - ¾ lbs. / 100 gals
Treated Location	As above.
Appl.technique/ Equipment	Spray leaves from ground until the point of runoff (i.e. until leaves are covered with the spray) with a tree gun @ 75 psi or more (as needed for the height of the tree).

Timing	Must be sprayed in morning before 6 a.m. to avoid any spray getting onto cars or people, and to avoid alarming the public by the appearance that a poison is being sprayed. Spray is only effective when applied in March and April, while caterpillars are feeding Usually, one spraying will be enough. If there are several hatchings, a second spraying within a week may be necessary.
Weather	Don't spray in rainy weather.
Chemical (treatment)	None

Pest	**18. Weeds in landscaped areas**
Location	On flowerbeds in parks and on facilities' grounds.
Threshold	
Monitoring	Field observation
History	
Cultural (prevention)	Mulch dirt areas 6" thick with compost or wood chips to prevent weed seed germination. Mow lawns to 3" to shade out any bare areas (except mow shorter on playing fields). Also, mow to 3" b/c of drought.
Physical (treatment)	Hoe weeds. (Done by Elmwood workers.) Staff uses weed-eater in tree wells, and at fence lines. Mow existing weeds to 3" if aesthetically, and functionally acceptable. Longer grass can shade weed seeds and prevent germination.
Biological (treatment)	None
Chemical (treatment)	**Pre-emergents:** Essentially, little pre-emergent herbicide is used in city parks and on city facility grounds. It is not worth the expense of applying pesticides to these large areas.
Active ingredient	
Brand name	
Concentration	
Toxicity Category	
Treated Location	
Appl.technique/ Equipment	

*Timing/*Weather	
Chemical (treatment)	**Post-emergent—Spot spray:** Spot spray Roundup for weeds in landscaped areas. Diane: Spot spray Roundup in landscaped areas with dense low-growing groundcover (e.g. chickweed among Vinca on slope at City Hall). Handpicking would likely not kill root-JB 6/10.
Active ingredient	Glyphosate salts (In SF list)
Brand name	**Roundup**
Toxicity Category	Caution (Category III)
Concentration	2 tbl/gal
Treated Location	Northern slope of city hall.
Appl.technique/ Equipment	Spot spray weeds only using four-gal back-pack sprayer. Do not broadcast spray Roundup.
Timing /Weather	Do not spray Roundup when rain is forecast for the next six hours. Roundup is sprayed after the rainy season, avoiding the chance of herbicide runoff. Roundup breaks down quickly in the presence of sunlight. Roundup binds to the plant when dry. Re-entry is allowed when product is dry.

Pest	**19. Weeds on Cristo Rey (mainly annual grasses) & Regnart Rd (mainly blackberries)**
Location	Cristo Rey Rd. and Regnart Rd.
Threshold	Dry grasses are a fire hazard. Broadleaf weeds (mainly blackberries) become a problem when they encroach onto roadway, and they are also a fire hazard.
Monitoring	Field observation
History	
Cultural (prevention)	Usually mow before July 4th. There is enough room on these roads to safely mow.
Physical (treatment)	Flail mow (mower w/side boom arm). Haven't done in awhile.
Biological (treatment)	None
Chemical (treatment)	None

Pest	**20. Weeds on School Grounds**
Location	City parks staff maintain the playing fields at 8 schools in the city—2 jr. high and 6 elementary.
Threshold	
Monitoring	
History	
Cultural **(prevention)**	Install drip irrigation in some landscaped areas—directly watering the bushes. This prevents water from getting on the unplanted areas. (The water had allowed weed seeds to germinate in the unplanted areas).
Physical **(treatment)**	Hoe weeds with Elmwood crews. Weed beat around trees.
Biological **(treatment)**	
Active ingredient	
Brand name	
Concentration	
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	
Chemical **(treatment)** **Pre-emergents**	

Active ingredient	
Brand name	
Toxicity Category	
Concentration	
Treated Location	
Appl.technique/ Equipment	
*Timing/*Weather	
Chemical (treatment) Post-emergent	Trimac used in diluted, and mixed with fertilizer for control of clover in the big play fields. (Bees are attracted to clover flowers. There is concern about bee stings.)
Active ingredient	2-4, D (Not on SF list.). Level 2 is restricted but product has less than 2%.
Brand name	Trimac
Concentration	Diluted. Concentration?
Toxicity Category	??
Treated Location	Eaton School in the big play fields, and the ground cover.
Appl.technique/ Equipment	
Timing /Weather	Applied in summer, as close to two days before school starts, but never when school is in session.

Pest	**21. Weeds on Stevens Canyon Rd.**
Location	Stevens Canyon Rd., above (south of) McClellan Rd. (Stevens Canyon Rd. is a dangerous stretch for city employees because of the frequent truck traffic and many blind curves. Important to keep road open for quarry truck traffic.)
Threshold	
Monitoring	
History	**Grasses to stabilize:** City staff encourage native and introduced grasses to grow long during the winter along road embankments to stabilize the banks, to slow runoff, and to act as a natural filter. Staff sprays the grasses with diluted Roundup in April to reduce fire danger. The grass rots in place, leaves the roots remaining to stabilize the banks. **Broadleaf encouraged:** At the same time, staff also encourages the growth of broadleaf plant coverage on embankments by using a diluted solution of Roundup, which kills back the grass but lets the wildflowers and other broadleaf plants thrive. Roundup is sprayed after the rainy season, avoiding the chance of herbicide runoff. Roundup breaks down quickly in the presence of sunlight. Note: A very dilutec solution of Round-Up would cause the grasses in an area to die in place while not affecting the broadleaf plants.
Cultural (prevention)	None
Physical (treatment)	Mowing was rejected because it would take too long in a dangerous setting and because some sections have difficult access or are sloped. The road would need to be shut down for 8 hours for mowing—which would be unacceptable. (Note: Do not hoe or disc areas already sprayed with pre-emergents. That would break the chemical barrier and allow weed seeds to germinate.)

Biological (treatment)	None
Chemical **Pre-emergent & Post-emergent**	Roundup (post-emergent) /Surflan (pre-emergent) mix is sprayed before the rainy season, avoiding the chance of herbicide runoff. Roundup breaks down quickly in the presence of sunlight.
Active ingredient	Glyphosate salts and Oryzalin (40%)
Brand name	Round-up Pro / Surflan AS tank mix
Toxicity Category	
Concentration	1 gal Round-up Pro / 100 gal water; 1 gal Surflan AS / 100 gal water
Treated Location	Along both side of Stevens Canyon Rd, in a 10 ft. band on each side; between San Juan Rd. and the city limit line.
Appl.technique/ Equipment	Use sprayer with road-side boom.
*Timing/*Weather	

Pest	22. Weeds in McClellan Ranch Park
Location	McClellan Ranch
Threshold	
Monitoring	
History	Check McClellan Ranch Master Plan for more detail.
Cultural	McClellan Ranch Park is a nature preserve. Therefore, no pesticides or chemical fertilizers can be used in the park. Community gardeners are forbidden to use any pesticides or chemical fertilizers.
Physical	Annual mowing (per JB 6/10) in the center field area used for fire prevention (as required by the fire department) Volunteers will occasionally pull out Vinca by hand along the creek path.
Biological	None
Chemical (treatment)	None

Pest	**23. Weeds in medians**
Location	On medians on Stevens Creek Blvd, DeAnza Blvd., and Wolfe/Miller Ave
Threshold	High visibility areas will remain groomed—with few or no weeds. 0-5% weeds allowed.
Monitoring	Field observation
History	The City maintains vegetative cover on medians for aesthetic reasons, to prevent soil erosion, to trap pollutants, and to slow the rate of storm water runoff. Median areas are typically landscaped with trees, vines, bushes and cobble stones, and therefore, are not mowed.
Cultural **(prevention)**	Mulch dirt areas 4" thick with compost or wood chips to prevent weed seed germination. Where possible, plant low-growing groundcover plants, thick enough to suffocate out weeds or shadow bare areas where weed seeds could germinate (e.g**.** Gazanias on the ends of the medians at DeAnza and Stevens Creek, and the Myoporum on the Stelling Ave. median).
Physical **(treatment)**	Hoe weeds in medians during full maintenance session (with adjoining lane shut down). Hand pull weeds occasionally. Hedge trimmers are also used. (Note: Do not hoe or disc areas already sprayed with pre-emergents. That would break the chemical barrier and allow weed seeds to germinate. Crew has a posted list of recently treated areas that should not be hoed.)
Biological **(treatment)**	none
Chemical **(treatment)** **Pre-emergents**	**Pre-emergents:** Spray bare dirt areas with pre-emergent in spring to kill weed seeds before summer. Pre-emergents must be watered-in to be effective, so time the spraying for just before late spring rains. (The pre-emergents bind to the soil and form a type of barrier (which can be broken by hoeing). Therefore, once dry, the chemicals would not be washed off by rain. Don't apply when windy—to avoid drift.

	One of these four pre-emergents would be used:
Brand name	**Suflan AS (k)**
Active ingredient	Oryzalin 40% (4 lbs active ingredient per gallon of product) (Not on SF list)
Toxicity Category	Caution (Category III) (Not on SF list)
Concentration	
Brand name	**Roundstar (i)**-avoid using due to strong odor.
Active ingredient	???
Toxicity Category	
Concentration	
Brand name	**Gallery (oo) w/Surflan**
Active ingredient	Isoxaben 75% (Not on SF list)
Toxicity Category	
Concentration	
Brand name	**Pendulum**
Active ingredient	Pendimethalin (On SF list-not on 2010 SF list?)
Toxicity Category	
Concentration	
Treated Location	Medians
Appl.technique/ Equipment	City staff use the following equipment when spraying pre-emergents on the median: a 200-gal tank (on a truck) for spraying herbicides.

	Always check equipment for chemical, oil, fuel, or coolant leaks before leaving for the job site. All equipment vehicles are to be fueled at the corporation yard. If a leak or spill does occur, follow the City's Emergency Spill Response Plan.
*Timing/*Weather	Pre-emergents must be watered-in to be effective, so time the spraying for just before late spring rains. No re-entry restrictions are required for these herbicides; pedestrians can cross the median as soon as the chemicals are dry.
Chemical (treatment) **Post-emergent**	**Post-emergent—Spot spray:** Spot spray Roundup for any weeds that germinate following pre-emergent spraying. Roundup is also used as a pre-emergent before rainy season.
Active ingredient	Glyphosate salts
Brand name	**Round-Up Pro**
Toxicity category	Caution, Category III
Concentration	
Treated Location	On medians.
Appl.technique/ Equipment	Do not broadcast spray. Spot spray weeds only.
Timing /Weather	Do not spray Roundup when rain is forecast within 6 hrs. Dried chemical would be bound to the plant by that time. No re-entry restrictions are required for Roundup; pedestrians can cross the median as soon as the chemicals are dry.

Pest	**24. Whitefly on Ashes**
Location	Throughout Rancho Rinconada
Threshold	
Monitoring	
History	Whitefly infestations appear periodically. May be caused by a dramatic weather change. No action is taken by the city. Previously, County Ag released Encarsia wasps (predatory insect) which, together with warmer weather, resolves the infestation. City staff is now responsible for releasing the predatory wasps as well as lady bugs (lady bugs were last used appx. 2 years ago.)
Cultural (prevention)	None
Physical (treatment)	None
Biological (treatment)	Predatory wasps and lady bugs.

Pest	**25. Wooly apple aphid & Tent caterpillar on Pyracantha**
Location	Stevens Creek Blvd. medians across from Memorial Park. Very little Pyracantha present.
Threshold	
Monitoring	
History	Plants became deformed from serious infestation.
Cultural (prevention)	Plants were removed and replaced with non-host plant varieties such as Agapanthus and Rhapiolepis
Physical (treatment)	None
Biological (treatment)	None

Pest	**26. Yellow leaves on Cherry trees**
Location	In Memorial Park
Threshold	
Monitoring	Not a current problem
History	
Cultural (prevention)	Applied zinc and iron. Determined the problem with yellow leaves on cherry trees was a zinc and iron deficiency.
Physical (treatment)	None
Biological (treatment)	None
Chemical (treatment)	Apply fertilizer with iron if needed.

Pest	27. Fungus on Greens (Pink Snow Mold; Summer Patch)
Location	Golf course greens
Threshold	Apply material before mold symptoms show themselves? This application is a preventative to control a predictable, annual winter problem. Once the mold causes damage, preventative measures are not helpful—fungicides must be used.
Monitoring	Daily walking greens
History	Diseases occur on greens due to too low mowing heights, weather conditions, and traffic. Spot treatment (with fungicide) is performed when possible. Several greens on the course are located in shady areas that do not have sufficient natural ventilation to dry off the grass, resulting in an increase in fungal problems. There has been inadequate drainage in the greens areas.
Cultural	Raise mowing heights; whip greens; fertilize with low nitrogen fertilizers and high potassium fertilizer; keep soils in balance. Over-seed any damage on the greens with bent grass seed—less susceptible to snow mold than other types of grass. Installed drainage system in several of the greens and tee-off areas.
Physical	Whip greens (to disturb any dew or sitting water on grass blades that could cause mold to grow)
Biological	None
Chemical (treatment)	
Active ingredient	Pentachloronitrobenzene (contact fungicide-per Don N. 3/30/07)
Brand name	Scotts FFII
Toxicity Category	Category 3; (Not included in San Francisco list. However, approved for use by Diane Mahan 3/31/03)
Concentration & Rate of Applicatn	
Treated Location	All golf course greens
Appl.technique/ Equipment	
Timing	
Weather	

Pest	28. Fungus on Greens (Pink Snow Mold; Summer Patch)
Location	Golf course greens
Threshold	Apply material before mold symptoms show themselves? This application is a preventative to control a predictable, annual winter problem. Once the mold causes damage, preventative measures are not helpful—fungicides must be used.
Monitoring	Daily walking greens
History	Diseases occur on greens due to too low mowing heights, weather conditions, and traffic. Spot treatment (with fungicide) is performed when possible. Several greens on the course are located in shady areas that do not have sufficient natural ventilation to dry off the grass, resulting in an increase in fungal problems. There has been inadequate drainage in the greens areas.
Cultural	Raise mowing heights; whip greens; fertilize with low nitrogen fertilizers and high potassium fertilizer; keep soils in balance. Over-seed any damage on the greens with bent grass seed—less susceptible to snow mold than other types of grass. Installed drainage system in several of the greens and tee-off areas.
Physical	Whip greens (to disturb any dew or sitting water on grass blades that could cause mold to grow)
Biological	None
Chemical (treatment)	
Active ingredient	Thiophanate methyl (granules) (systemic fungicide) This isn't specifically listed for pink snow mold. Haven't used for at least four years.
Brand name	Scotts Systemic Fungicide
Toxicity Category	Category 3; (Included on San Francisco list)
Concentration & Rate of Applicatn	1.35-2.7 lbs per 1000 sq ft.
Treated Location	All golf course greens
Appl.technique/t	Hand spreader; water-in granules—carefully preventing any runoff from greens.
Timing	In morning (because wind is minimal)
Weather	When rain is not likely

Pest	29. English Daisy/Pineapple Weed in Greens
Location	greens
Threshold	Action needed when the putting on greens is interrupted due to too many weeds.
Monitoring	Daily walking the greens.
History	Bellis perennis and soliva sp. Native of Europe used as an ornament in some grass mixtures. For finer turf (i.e. golf turf) it is considered a noxious weed, especially on the coastal areas of the U.S. Has been a perennial problem at Blackberry Farm golf course. Daisy indicates that greens are not draining well. Daisy prefers to grow shallow rooted, in damp, compacted soil. Blackberry has a history of bad drainage throughout.
Cultural	Fertilize the greens to strengthen the grasses to outgrow the daisy.
Physical	Hand removal. Installed drainage system at several of the greens.
Biological	None.
Chemical (treatment)	
Active ingredient	Dicamba (post-emergent, contact herbicide)
Brand name	Scotts K-O-G (granular)
Toxicity Category	Warning—Category 2 (On SF list)
Concentration & Rate of Application	35.5 pounds per acre
Treated Location	Greens
Appl.technique/ Equipment	Hand rotary spreader, allowing broad buffer zone from any surface waters. Special care to prevent any runoff into surface waters.

Timing	When weeds are actively growing.
Weather	75 degrees, maximum; wind less than 5 mph.
Chemical (treatment)	Sapphire used in ’09 and ’10 on fairways and roughs to reduce pesticide quantity with better effectiveness
Active ingredient	
Brand name	
Toxicity Category	
Concentration & Rate of Application	
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	

Pest	**30. English Daisy in Fairways and Roughs**
Location	Fairways and roughs
Threshold	Action needed when weeds are so bad that golfers cannot distinguish between weeds and golf balls.
Monitoring	1) Daily touring golf course 2) Weekly conversations with golf pro.
History	Annually a problem on golf course. May cause golfers to leave golf course to play at another course. In previous years, blanket applications of herbicides were made multiple times. Smaller quantity of Sapphire is used than other pesticides. Now we target the pest and only apply where needed.
Cultural	Fertilize more, so the competition of the grasses crowds the pest out.
Physical	Hand removal.
Biological	None.
Chemical (treatment)	Sapphire
Active ingredient	
Brand name	
Toxicity Category	
Concentration & Rate of Application	
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	

Pest	**31. Weeds in Non-crop areas, using <u>Pendalum</u>** (No longer available 4/2006)
Location	Non-Crop areas in/around Golf Course—along fence lines and around trees
Threshold	Preventative
Monitoring	Daily touring golf course. Apply pre-emergent as season dictates.
History	Weeds have been annual problem. Prevention, using pre-emergent, will result in less application of post-emergent herbicides.
Cultural	Mulch where possible
Physical	Weed-eat and hand removal where possible
Biological	None
Chemical (treatment)	City's Pest Control advisor recommends alternating Surflan and Pendalum to avoid building resistance in weeds. Pendulum is an oil-based formulation of the pre-emergent pendimethalin
Active ingredient	BASF pendimethalin
Brand name	
Toxicity Category	
Concentration & Rate of Application	
Treated Location	
Appl.technique/ Equipment	
Timing	
Weather	

Pest	**32. Weeds in Non-crop areas, using Surflan**
Location	Non-Crop areas in/around Golf Course—along fence lines and around trees
Threshold	Preventative
Monitoring	Daily touring golf course. Apply pre-emergent as season dictates.
History	Weeds have been annual problem. Prevention, using pre-emergent, will result in less application of post-emergent herbicides.
Cultural	Mulch where possible
Physical	Weed-eat and hand removal where possible
Biological	None
Chemical (treatment)	City's Pest Control Advisor recommends alternating Surflan and Pendalum to avoid building resistance in weeds.
Active ingredient	Oryzalin
Brand name	**Surflan A.S**.
Toxicity Category	Category 3 Not in San Francisco list. However, permission from City's Pest Control Advisor 3/31/03
Concentration & Rate of Application	2-4 qts. of product in 50-100 gals. of water per acre
Treated Location	Fence lines and under trees
Appl.technique/ Equipment	Hand sprayers
Timing	In Spring, before weeds emerge
Weather	In wind less than 5 mph.

Pest	33. Weeds in Non-crop area, post-emergent Glysophate
Location	In Non-Crop Areas in/around golf course—along fence lines and around trees
Threshold	When weeds grow too much as to become a danger to the equipment operator. Also, remove poison oak and blackberries for public safety. Don: Can you quantify in some way how many weeds are too many weeds along fence lines and around trees—asthetically speaking?
Monitoring	Daily monitoring.
History	Unsightly weeds have been left to grow too tall in the past. Weed-eating sometimes can be too dangerous that operator may fall into lake or creek. Weed-eating on fence lines can kick back and cause injury to operator.
Cultural	Mulch where possible. Hand removal where possible. Mulching around many of the trees for weed suppression has been successful—avoiding need for herbicides in many cases.
Physical	Weed-eat where possible. Hand removal where possible.
Biological	None
Chemical (treatment)	
Active ingredient	Glyphosate
