- Providing runoff storage measures dispersed uniformly throughout a site's landscape with the use of a variety of detention, retention, and runoff practices.
- Implementing on-lot hydrologically functional landscape design and management practices.

B. Site design BMPs shall offer an innovative approach to urban storm water management, that does not rely on the conventional end-of-pipe or in-the-pipe structural methods but instead uniformly or strategically integrates storm water controls throughout the urban landscape.

16.104.020 Maintaining Pre-Development Rainfall Runoff Characteristics.

A. Priority projects shall control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion. In addition, projects should control runoff discharge volumes and durations to the maximum extent practicable using the site design, source control, and treatment control requirements.

B. Design Concept 1: Minimize Project's Impervious Footprint & Conserve Natural Areas. The following site design options shall be considered and, incorporated and implemented where determined applicable and feasible by the Director of Public Works, during the site planning and approval process, consistent with applicable General Plan policies and other development regulations.

1. Minimize impervious footprint. This can be achieved in various ways, including, but not limited to increasing building density (number of stories above or below ground) and developing land use regulations seeking to limit impervious surfaces. Decreasing the project's footprint can substantially reduce the project's impacts to water quality and hydrologic conditions.

2. Conserve natural areas where feasible. This can be achieved by concentrating or clustering development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural, undisturbed condition. The following list provides a guideline for determining the least sensitive portions of the site, in order of increasing sensitivity. Jurisdictions should also refer to their Multiple Species Conservation Plans or other biological regulations, as appropriate.

a. Areas devoid of vegetation, including previously graded areas and agricultural fields.
b. Areas of non-native vegetation, disturbed habitats and eucalyptus woodlands.
c. Areas of chamise or mixed chaparral, and non-native grasslands.
d. Areas containing coastal scrub communities.
e. All other upland communities.
f. Occupied habitat of sensitive species and all wetlands.
g. All areas necessary to maintain the viability of wildlife corridors. Within each of the previous categories, areas containing hillsides should be considered more sensitive than the same category without hillsides.

3. Construct walkways, trails, patios, overflow parking lots and alleys and other low-traffic areas with permeable surfaces, such as pervious concrete, porous asphalt, unit pavers, and granular materials.

4. Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.

5. Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs.

6. Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.

7. Use natural drainage systems to the maximum extent practicable.

8. Other site design options that are comparable, and equally effective.

Design Concept 2: Minimize Directly Connected Impervious Areas (DCIAs)

Priority projects shall consider, and incorporate and implement the following design characteristics, where determined applicable and feasible by the Director of Public Works.

1. Where landscaping is proposed, drain rooftops into adjacent landscaping prior to discharging to the storm drain.

2. Where landscaping is proposed, drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping.

3. Other design characteristics that are comparable and equally effective.

16.104.030 Protection of Slopes and Channels.

Project plans shall include storm water BMPs to decrease the potential for erosion of slopes and/or channels, consistent with local codes and ordinances and with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers, the San Diego Regional Water Quality Control Board, and the California Department of Fish and Game. The following design principles shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

1. Convey runoff safely from the tops of slopes.

2. Vegetate slopes with native or drought tolerant vegetation.

3. Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.

4. Stabilize permanent channel crossings.

5. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.

6. Other design principles that are comparable and equally effective.

(Continued on Page 27)

Chapter 16.105

SOURCE CONTROL BMPS

Sections:

16.105.010 Providing Storm Drain System Stenciling and Signage.
16.105.020 Designing Outdoor Material Storage Areas to Reduce Pollution Introduction.
16.105.030 Designing Trash Storage Areas to Reduce Pollution Introduction.
16.105.040 Using Efficient Irrigation Systems and Landscape Design.
16.105.050 Incorporate Requirements Applicable to Individual Priority Project Categories.

16.105.010 Providing Storm Drain System Stenciling and Signage.

Storm drain stencils are highly visible source control messages, typically placed directly adjacent to storm drain inlets. The stencils contain a brief statement that prohibits the dumping of improper materials into the urban runoff conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message. Priority projects shall include the following requirements in the project design.

A. Provide stenciling or labeling of all storm drain inlets and catch basins within the project area with prohibitive language (such as: "NO DUMPING – I LIVE IN <<name receiving water>>") and/or graphical icons to discourage illegal dumping.

B. Post signs and prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

C. Maintain legibility of stencils and signs.

16.105.020 Designing Outdoor Material Storage Areas to Reduce Pollution Introduction.

Improper storage of materials outdoors may increase the potential for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the urban runoff conveyance system. Where the priority project plans include outdoor areas for storage of hazardous materials that may contribute pollutants to the urban runoff conveyance system, the following storm water BMPs are required:

A. Hazardous materials with the potential to contaminate urban runoff shall either be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

B. The storage area shall be paved and sufficiently impervious to contain leaks and spills.

C. The storage area shall have a roof or awning to minimize direct precipitation within the secondary containment area.

16.105.030 Designing Trash Storage Areas to Reduce Pollution Introduction.

All trash container areas shall meet the following requirements (limited exclusion: detached residential homes):

A. Paved with an impervious surface, designed not to allow run-on from adjoining areas, screened or walled to prevent off-site transport of trash; and

B. Provide attached lids on all trash containers that exclude rain, or roof or awning to minimize direct precipitation.

16.105.040 Using Efficient Irrigation Systems and Landscape Design.

Priority projects shall design the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential homes.) The following methods to reduce excessive irrigation runoff shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

A. Employing rain shutoff devices to prevent irrigation after precipitation.

B. Designing irrigation systems to each landscape area's specific water requirements.

C. Using flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.

D. Employing other comparable, equally effective, methods to reduce irrigation water runoff.

(Continued on Page 28)

16.105.050 Incorporate Requirements Applicable to Individual Priority Project Categories.

Where identified in Table 2, the following requirements shall be incorporated into applicable priority projects during the storm water BMP selection and design process. Projects shall adhere to each of the individual priority project category requirements that apply to the project (e.g., a restaurant with more than 15 parking spaces would be required to incorporate the requirements for " g. Equipment Wash Areas and "h. Parking Areas" into the project design).

A. Private Roads- The design of private roadway drainage shall use at least one of the following:

1. Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings;

2. Urban curb/swale system: street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter;

3. Dual drainage system: First flush captured in street catch basins and discharged to adjacent vegetated swale or gravel shoulder, high flows connect directly to storm water conveyance system.

4. Other methods that are comparable and equally effective within the project.

B. Residential Driveways & Guest Parking. The design of driveways and private residential parking areas shall use one at least of the following features.

1. Design driveways with shared access, flared (single lane at street) or wheelstrips (paving only under tires); or, drain into landscaping prior to discharging to the storm water conveyance system.

2. Uncovered temporary or guest parking on private residential lots may be: paved with a permeable surface; or, designed to drain into landscaping prior to discharging to the storm water conveyance system.

3. Other features which are comparable and equally effective.

C. Dock Areas. Loading/unloading dock areas shall include the following:

1. Cover loading dock areas, or design drainage to preclude urban run-on and runoff.

2. Direct connections to storm drains from depressed loading docks (truck wells) are prohibited.

3. Other features which are comparable and equally effective.

D. Maintenance Bays. Maintenance bays shall include the following:

1. Repair/maintenance bays shall be indoors; or, designed to preclude urban run-on and runoff; and

2. Design a repair/maintenance bay drainage system to capture all wash water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit, or

3. Other features which are comparable and equally effective.

E. Vehicle Wash Areas. Priority projects that include areas for washing/steam cleaning of vehicles shall use the following:

1. Self-contained; or covered with a roof or overhang;

2. Equipped with a clarifier or other pretreatment facility;

3. Properly connected to a sanitary sewer.

4. Other features which are comparable and equally effective.

F. Outdoor Processing Areas. Outdoor process equipment operations, such as rock grinding or crushing, painting or coating, grinding or sanding, degreasing or parts cleaning, landfills, waste piles, and wastewater and solid waste treatment and disposal, and other operations determined to be a potential threat to water quality by the Copermittee shall adhere to the following requirements.

1. Cover or enclose areas that would be the most significant source of pollutants; or, slope the area toward a dead-end sump; or, discharge to the sanitary sewer system following appropriate treatment in accordance with conditions established by the applicable sewer agency.

2 Grade or berm area to prevent run-on from surrounding areas.

3. Installation of storm drains in areas of equipment repair is prohibited.

4. Other features which are comparable or equally effective.

G. Equipment Wash Areas. Outdoor equipment/accessory washing and steam cleaning activities at priority projects shall use the following:

(Continued on Page 29)

1. Be self-contained; or covered with a roof or overhang;

2. Be equipped with a clarifier, grease trap or other pretreatment facility, as appropriate;

3. Properly connected to a sanitary sewer.

4. Other features which are comparable or equally effective.

H. Parking Areas. To minimize the offsite transport of pollutants from parking areas, the following design concepts shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

1. Where landscaping is proposed in parking areas, incorporate landscape areas into the drainage design.

2. Overflow parking (parking stalls provided in excess of the City's minimum parking requirements) may be constructed with permeable paving.

3. Other design concepts that are comparable and equally effective.

I. Roadways. Priority roadway projects shall select treatment control BMPs following the treatment control selection procedure identified in this division entitled, "Establishing Storm Water BMPs."

J. Fueling Area. Non-retail fuel dispensing areas shall contain the following:

1. Overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area. The fueling area shall drain to the project's treatment control BMP(s) prior to discharging to the storm water conveyance system.

2. Paved with Portland cement concrete (or equivalent smooth impervious surface). The use of asphalt concrete shall be prohibited.

3. Have an appropriate slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of urban runoff.

4. At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

K. Hillside Landscaping. Hillside areas that are disturbed by project development shall be landscaped with deep-rooted, drought tolerant plant species selected for erosion control, satisfactory to the Director of Public Works.

Chapter 16.106

TREATMENT CONTROL BMPS

Sections:

16.106.010 Treatment Control BMPs Objectives.
16.106.020 Design to Treatment Control BMPs Standards.
16.106.030 Volume Based BMPs.
16.106.040 Flow Based BMPs.
16.106.050 Limited Exclusions.
16.106.060 Locating BMPs Near Pollutant Sources.
16.106.070 Restrictions on Use of Infiltration BMPs.

16.106.010 Treatment Control BMPs Objectives.

A. Minimizing a development's detrimental effects on water quality can be most effectively achieved through the use of a combination of site design, source and treatment control storm water BMPs. Where projects have been designed to minimize, to the maximum extent practicable, the introduction of anticipated pollutants of concern that may result in significant impacts to the receiving waters through the implementation of site design and source control storm water BMPs, the development would still have the potential for pollutants of concern to enter the storm water conveyance system. Therefore, priority projects shall be designed to remove pollutants of concern from the storm water conveyance system to the maximum extent practicable through the incorporation and implementation of treatment control BMPs.

B. In meeting the requirements in this section, priority projects shall implement a single or combination of storm water BMPs that will remove anticipated pollutants of concern, as identified by the procedure of this division, in site runoff to the maximum extent practicable. Treatment control BMPs must be implemented unless a waiver is granted to the project by the Director of Public Works based on the infeasibility of any treatment control BMP.

(Continued on Page 30)

16.106.020 Design to Treatment Control BMPs Standards.

All priority projects shall design, construct and implement structural treatment control BMPs that meet the design standards of this section, unless specifically exempted by the limited exclusions. Structural treatment control BMPs required by this section shall be operational prior to the use of any dependent development, and shall be located and designed in accordance with the requirements of this division.

16.106.030 Structural Treatment Control Volume Based BMPs.

Volume-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- Volume of runoff produced from a 24-hour 85th percentile storm event, as determined from isoplovial maps contained in the County of San Diego Hydrology Manual. See County of San Diego's Isoplovial map at http://www..sdcounty.ca.gov/dpw/engineer/flood.htm; or
- Volume of runoff produced by the 85th percentile 24-hour runoff event, determined as the maximized capture urban runoff volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998)*; or
- The volume of annual runoff based on unit basin storage volume, to achieve 90 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial, (1993)*, or
- The volume of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile 24-hour runoff event. Where this option is used, storm events shall be identified by their separation from one another by at least six hours of no rain.

16.106.040 Structural Treatment Control Flow Based BMPs.

As an alternative to volume-based BMPs, structural treatment controls may be designed as flow based BMPs. Flow-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- The maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour for each hour of a storm event; or
- The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity, as determined from the local historical rainfall record, multiplied by a factor of two, for each hour of a storm event; or
- The maximum flow rate of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile hourly rainfall intensity multiplied by a factor of two, for each hour of a storm event.

16.106.050 Limited Exclusions.

A. Proposed restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical sizing criteria requirements listed for structural treatment control volume based BMPs.

B. Where significant redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development, and the existing development was not subject to SUSMP requirements, the numeric sizing criteria discussed for structural treatment control volume based apply only to the addition, and not to the entire development.

16.106.060 Locating BMPs Near Pollutant Sources.

Structural treatment control storm water BMPs should be implemented close to pollutant sources to minimize costs and maximize pollutant removal prior to runoff entering receiving waters. Such BMPs may be located on- or off-site, used singly or in combination, or shared by multiple new developments, pursuant to the following requirements:

(Continued on Page 31)

A. All structural treatment control BMPs shall be located so as to infiltrate, filter, and/or treat the required runoff volume or flow prior to its discharge to any receiving water body supporting beneficial uses;

B. Multiple post-construction structural treatment control BMPs for a single priority development project shall collectively be designed to comply with the design standards for structural treatment control volume based BMPs;

C. Shared storm water BMPs shall be operational prior to the use of any dependent development or phase of development. The shared BMPs shall only be required to treat the dependent developments or phases of development that are in use;

D. Interim storm water BMPs that provide equivalent or greater treatment than is required by structural treatment control volume based BMPs may be implemented by a dependent development until each shared BMP is operational. If interim BMPs are selected, the BMPs shall remain in use until permanent BMPs are operational.

16.106.070 Restrictions on Use of Infiltration BMPs.

At a minimum, use of structural treatment BMPs that are designed to primarily function as infiltration devices shall meet the following conditions[2]:

1. Urban runoff from commercial developments shall undergo pretreatment to remove both physical and chemical contaminants, such as sedimentation or filtration, prior to infiltration.
2. All dry weather flows shall be diverted from infiltration devices except for those non-storm water discharges authorized pursuant to 40 CFR 122.26(d)(2)(iv)(B)(1): diverted stream flows, rising ground waters, uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to

[2] These conditions do not apply to structural treatment BMPs which allow incidental infiltration and are not designed to primarily function as infiltration devices (such as grassy swales, detention basins, vegetated buffer strips, constructed wetlands, etc.)

storm water conveyance systems, uncontaminated pumped ground water, foundation drains, springs, water from crawl space pumps, footing drains, air conditioning condensation, flow from riparian habitats and wetlands, water line flushing, landscape irrigation, discharges from potable water sources other than water main breaks, irrigation water, individual residential car washing, and dechlorinated swimming pool discharges.

3. Pollution prevention and source control BMPs shall be implemented at a level appropriate to protect groundwater quality at sites where infiltration structural treatment BMPs are to be used.

4. The vertical distance from the base of any infiltration structural treatment BMP to the seasonal high groundwater mark shall be at least 10 feet or as determined on an individual, site-specific basis by the Director of Public Works. Where groundwater does not support beneficial uses, this vertical distance criterion may be reduced, provided groundwater quality is maintained.

5. The soil through which infiltration is to occur shall have physical and chemical characteristics (such as appropriate cation exchange capacity, organic content, clay content, and infiltration rate) that are adequate for proper infiltration durations and treatment of urban runoff for the protection of groundwater beneficial uses.

6. Infiltration structural treatment BMPs shall not be used for areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (bus, truck, etc.); nurseries; and other high threat to water quality land uses and activities as designated by the Director of Public Works.

7. The horizontal distance between the base of any infiltration structural BMP and any water supply wells shall be 100 feet or as determined on an individual, site-specific basis by the Director of Public Works.

(Continued on Page 32)

Chapter 16.107

PROVIDING PROOF OF ONGOING BMP MAINTENANCE

Sections:

16.107.010 Maintenance Mechanism to be in Place Before Acceptance.
16.107.020 Maintenance Mechanisms.
16.107.030 Verification Mechanisms.
16.107.040 Maintenance Requirements.

16.107.010 Maintenance Mechanism to be in Place Before Acceptance.

Structural BMPs shall not be considered "effective," and shall not be accepted as meeting the MEP standard, unless a mechanism is in place that will ensure ongoing long-term maintenance of all structural BMPs. As part of project review, if a project proponent is required to include interim or permanent structural BMPs in project plans, and if the Director of Public Works does not provide a mechanism for BMP maintenance, the project proponent shall provide verification of maintenance requirements through such means as may be appropriate, at the discretion of the Director of Public Works, including, but not limited to covenants, legal agreements, maintenance agreements, and/or conditional use permits.

16.108.20 Maintenance Mechanisms.

A. Public equity maintenance. The City Council may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the BMP. Unless acceptable to the City

Council, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City Council may seek protection from liability by appropriate releases and indemnities. The City Council shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City Council shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the facilities. The City Council must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

B. Project proponent agreement to maintain storm water BMPs: The City Council may enter into a contract with the project proponent obliging the project proponent to maintain, repair and replace the storm water BMP as necessary into perpetuity. Security may be required.

C. Assessment districts: The City Council may approve an Assessment District or other funding mechanism created by the project proponent to provide funds for storm water BMP maintenance, repair and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

D. Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City Council may assure storm water BMP maintenance, repair and replacement through conditions in the lease.

E. Conditional use permits: For discretionary projects only, the City Council may assure maintenance of storm water BMPs through the inclusion of maintenance conditions in the conditional use permit. Security may be required.

F. Alternative mechanisms: The City Council may accept alternative maintenance mechanisms if such mechanisms are as protective those listed above.

16.107.030 Verification Mechanisms.

For discretionary projects, the City approved method of storm water BMP maintenance shall be incorporated into the project's permit, and shall be consistent with permits issued by resource agencies, before City approval of discretionary permits. For projects requiring only ministerial permits, the approved method of storm water BMP maintenance shall be incorporated into the permit conditions before the issuance of any ministerial permits. In all instances, the project proponent shall provide proof of execution of an approved method of maintenance repair and replacement before the issuance of construction approvals. Public projects that are not required to obtain permits shall be responsible for ensuring that an approved method of storm water BMP maintenance repair and replacement is executed prior to the commencement of construction. For all properties, the verification mechanism will include the project proponent's signed statement, as part of the project application, accepting responsibility for all structural BMP maintenance, repair and replacement, until a City approved entity agrees to assume responsibility for structural BMP maintenance, repair and replacement.

16.108.40 Maintenance Requirements.

A. Operation & Maintenance (O&M) Plan: A copy of an Operation & Maintenance (O&M) plan, prepared by the project proponent satisfactory to the Director of Public Works shall be attached to the approved maintenance agreement, which describes the designated responsible party to manage the storm water BMP(s), employee's training program and duties, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities, copies of resource agency permits, and any other necessary activities. At a minimum, maintenance agreements shall require the inspection and servicing of all structural BMPs on an

annual basis. The project proponent maintenance entity shall complete and maintain O&M forms to document all maintenance requirements. Parties responsible for the O&M plan shall retain records for at least 5 years. These documents shall be made available to the City for inspection upon request at any time.

B. Access Easement/Agreement: As part of the maintenance mechanism selected above, it shall include a copy of an executed access easement that shall be binding on the land throughout the life of the project, until such time that the storm water BMP requiring access is replaced, satisfactory to the Director of Public Works.

Chapter 16.108

WAIVER OF STRUCTURAL TREATMENT BMP REQUIREMENTS

The requirement of implementing structural treatment BMPs may be waived if infeasibility can be established. A waiver of infeasibility shall be granted only when all available structural treatment BMPs have been considered and rejected as infeasible.

Waivers may only be granted from structural treatment BMP and structural treatment BMP sizing requirements. Priority development projects, whether or not granted a waiver may not cause or contribute to an exceedance of water quality objectives. Pollutants in runoff from projects granted a waiver must still be reduced to the maximum extent practicable.

(Continued on Page 34)

Section 4: Upon adoption of this Ordinance, Appendix "D" of El Cajon Resolution No. 176-02 is hereby superceded and repealed.

Section 5: This Ordinance is adopted pursuant to the authority granted to the City of El Cajon under San Diego Regional Water Quality Control Board Order No. 2001-01, as amended by State Water Resources Control Order WQ 2001-15. This Ordinance encompasses a state-mandated requirement thereunder.

Section 6: This ordinance shall be effective thirty (30) days following its passage and adoption.

PASSED AND ADOPTED by the City Council of the City of El Cajon, California at an Adjourned Regular Joint City Council/Redevelopment Agency Meeting held this 17th day of December 2002, by the following vote to wit:

AYES : Lewis, Kendrick, McClellan, Ramos, Santos
NOES : None
ABSENT : None
DISQUALIFY: None

MARK LEWIS
Mayor of the City of El Cajon

ATTEST:

MARILYNN LINN, CMC
City Clerk

I hereby certify that the above and foregoing is a full and true copy of Ordinance No. 4717 of the Ordinances of the City of El Cajon, California, as adopted by the City Council at the Adjourned Regular Joint Meeting of the City Council/Redevelopment Agency on the 17th day of December, 2002.

Marilynn Linn, CMC, City Clerk

Storm Water Plan 11 25 2002
12/3/02 – First Reading
12/17/02 – Second Reading

El Cajon Pollution Prevention Program

What is a Watershed?

Although "Watershed" is a new term to many people,. its definition is almost as simple as the well-known phrase "water runs downhill." The drain board that carries rinse water into your kitchen sink can be compared to a watershed. On the land, water that does not evaporate or soak into the soil usually drains into ditches, storm drains, streams, rivers, lakes or the ocean. The contiguous area of land from which the water drains to a common point is a watershed.

When you were a child, you probably had a favorite mud puddle where you liked to play. The part of the yard from which the water drained into the puddle was its watershed. Possibly a small stream ran by your house. It may have been dry most of the year or it may have flowed continuously. Water from a few acres drained into that little stream. Those few acres were its watershed. This small stream and others like it ran into a larger one. The land areas drained by the small steams made up the watershed of the larger stream into which they flood. Small watersheds make up the larger ones. The Mississippi River, for example, drains a watershed of about 1,243,000 square miles or approximately 41% of the 48 states comprising the contiguous United States. This large watershed is made up of thousands of smaller ones, including the Tennessee, Ohio, Arkansas and Missouri Rivers.

As shown on Figure 1, the 14.1 square mile area comprising the City of El Cajon lies entirely within the 440 square mile area drained by the San Diego River . Lakes within the San Diego River Watershed include Lakes Murray, Jennings, San Vincente, El Capitan and Cuyamaca. All waters draining within the San Diego River Watershed drain directly into the Pacific Ocean just north of Ocean Beach.

Figure 1 - San Diego River Watershed

The tributary of the San Diego River that drains the El Cajon Valley, called Forester Creek, is our local watershed. So, wherever you live, you are in a watershed. It can be just your own backyard, or an area drained by a system of storm drains, a small creek or by a large river.

You and the other people who live in the watershed are part of the watershed community. So are the animals, the birds, and the fish that live within the watershed. All depend on the watershed, and they, in turn, influence what happens there. What happens within your smaller part of the bigger watershed also affects the larger watershed downstream.

If water runs off the land too fast, it cuts gullies and carries off topsoil. This soil along with other debris the water carries into streams and lakes will pollute the water, ultimately resulting in beach

closures and other problems. As soil fills the lakes or reservoirs, the amount of water they can hold is reduced. Therefore the water supply for your town and your home may be reduced. Although erosion is a natural process, accelerated erosion degrades productivity of the land. Such sediment carried downstream by runaway water may greatly increase the cost of filtering and treating the water you get from the your faucet.

If too much water runs away too rapidly, it causes a flood that damages businesses, homes, roadways and utilities. Flooding may even take lives. When the storm drains, channels and streams become choked with sediment, the flood is more serious because the choked-up channels carry less water.

Storm water runoff can be slowed down or caused to infiltrate into the soil when Storm Water Best Management Practices (BMPs) and other flood- and pollution-prevention measures are put into use throughout the watershed. Some useful Storm Water BMPs are:

- ✓ An overall reduction of paved areas or other surfaces where rainwater cannot soak in.
- ✓ Diversion of drainage of storm water through permeable, “grassy” vegetated swales, either in naturally vegetated areas or developed areas with watershed-friendly landscaping
- ✓ Construction of large or small retention areas can hold back storm water runoff that would otherwise cause flood damage.
- ✓ Installation of irrigation systems that distribute water efficiently, waste less water and thus leave more water for other uses.

City of El Cajon
STORM WATER
Protection Program

If overall runoff can be reduced, urban runoff pollution will also be reduced, and the remaining water will go into streams, lakes, or underground storage to be used in other ways. Since any water filtered through the soil doesn't carry sediment that would clog streams and pollute water supplies, more water will be available to everyone, including wildlife.

El Cajon Storm Water Protection Program

Keep It Clean!

City of El Cajon
Storm Water
Protection Program

Storm Water Guidelines For Car Wash Fundraisers

Although car washing fundraisers are a popular means of raising money for worthwhile causes, there are important environmental issues that, if not properly managed, can negatively impact the aquatic environment and degrade local waterways. When conducting your fundraiser you should follow these guidelines in order to prevent the wash water from entering the storm drains where it flows without treatment of any kind to our streams, rivers and eventually into the ocean.

How does runoff from car wash fundraisers harm the environment?

During a car wash fundraiser, the soapy water used to wash the cars, combines with automotive fluids and residues from the engine, drive train and brakes, and the polluted water flows across the pavement and into nearby storm drains. Alone, one car wash fundraiser event may not create a significant adverse environmental impact. But, collectively, car wash fundraiser events can contribute significant amounts of badly polluted wash water to the storm drain system.

Before beginning your car wash fundraiser:

- ✓ Hold a meeting with all participants to explain the proper procedures that should be followed when conducting these activities.
- ✓ Remove all trash and debris from the car washing area.
- ✓ Use only soaps, cleaners or detergents labeled “non-toxic,” “phosphate free,” or “biodegradable.” The safest products for the environment are vegetable-based or citrus-based soaps.
- ✓ Do not use acid based wheel cleaners or engine degreasers.
- ✓ Select a washing site where the wash water can soak into grass, gravel, or be diverted to nearby landscaping. This will allow the wash water to filter through the vegetation and/or soil instead of flowing directly into a storm drain.
- ✓ If you select a site that drains into a street, block off the storm drain with sandbags and either divert the wash water to an area where the water can pool and evaporate throughout the day or arrange to dispose of the wash water down a sanitary sewer drain.

During the car wash fundraiser:

- ✓ Shake debris from car mats into a trash can or vacuum them. Do not shake dirt from car mats directly onto the ground.
- ✓ Use a bucket of soapy water to clean and re-soap rags or sponges throughout the wash rather than adding more soap directly to rags or sponges.
- ✓ Wring sponges and washrags into buckets, not the ground.
- ✓ Conserve water by using a spray nozzle with an automatic shut off and shutting off or kinking the hose when not in use.
- ✓ Always empty buckets into the sanitary sewer system (e.g., mop sinks or toilets).

After the car wash fundraiser:

- ✓ Remember to clean up and remove sand bags, if used. Have a volunteer walk the perimeter of the site to pick up trash and debris and dispose of it properly.
- ✓ Before you allow anything to go into the gutter or storm drain, stop and think. Storm drains do not go to the public sewer system; they flow directly into storm drains, channels and streams to the ocean.
- ✓ Remember that you are a **Valued Participant** in our City's **Pollution Solution**.

El Cajon Storm Water Protection Program

How You Can Prevent Storm Water Pollution

We can all make a big difference in stopping storm water pollution. Each year significant pollution is created due to careless work habits and lack of awareness about what pollutes our storm drain system. The Clean Water Act makes it illegal to allow any substance other than rainwater to enter the storm drain system. Doing so may lead to monetary fines or prosecution.

Pollution of our waterways will:

- make them unsafe for swimming and other recreational activities
- ruin their appearance
- kill plants and animals that live there

Storm drains should only drain rain.
The storm drain system collects rainwater from storms, and human-activity-related urban runoff from roofs, driveways, sidewalks and streets. All roadside gutters and drainage inlets lead to the storm drain system. And the storm drain water enters our streams, rivers, harbors and ocean. If you place waste near a roadside drainage inlet it will end up in the storm drain. Storm water is not treated – it will appear in the waterways in much the same condition as when you place it there. Remember, "Only Rain in the Drain!"

What pollutes our waterways?
Oil, grease, tar, silt, concrete cutting, cement wash water, water used in cleaning, paint, litter, cigarette butts, animal droppings, detergent and chemical cleaners are all pollutants. Remember that, just because a product is labeled as "biodegradable" does not mean it can be dumped into a storm drain. What can you or your business do to stop pollution?

You can stop pollution from getting into the storm drains by:

- ✓ not hosing waste away - instead sweep it up and dispose of it with your other trash.
- ✓ mopping up any spills immediately and not letting them flow into the storm drain system.
- ✓ making sure that driveways, sidewalks and gutters are clear of debris including leaves and grass clippings.
- ✓ making sure the contaminated water used for rinsing equipment such as paint brushes and containers does not flow into the storm drain system.
- ✓ putting litter in the trash bins - including cigarette butts.
- ✓ picking up all animal droppings.
- ✓ disposing of excess paint and chemicals in the hazardous waste area at landfills.
- ✓ washing your vehicles on the lawn or in a commercial car wash – this stops detergent, oils and grease from getting into the storm drain system.
- ✓ regularly servicing your vehicles - this stops leaking oil and other pollutants from getting into the storm drain system - it only takes one quart of oil to contaminate 250,000 gallons of water.

El Cajon Storm Water Protection Program

Major Causes of Urban Runoff Pollution

What day-to-day activities cause urban runoff pollution? Here are some of the biggest causes:

- **Using automobiles.** Particles in auto exhaust contain toxic organics and heavy metals. Dripping motor oil and wear from brake linings and tires deposit pollutants on streets and highways.
- **Maintaining vehicles.** Vehicle maintenance results in drips and spills of oil, coolant and other fluids. When performed outdoors, these fluids soak into asphalt and concrete pavements until they are washed away with the next storm. Water from washing vehicles outdoors carries pollutants directly to the nearest storm drain.
- **Allowing drainage from the shop floor to flow outside.** Allowing process or clean-up water to drain out onto the street is an often-seen practice that transports pollutants to the storm drain.
- **Cleaning tools or equipment outdoors.** Cleaning or rinsing containers, tools, floor mats or other items outdoors discharges pollutants such as chemicals, detergents, oils, etc.
- **Dumping wastes.** People looking for a "shortcut" to dispose of used oil, paint or other wastes dump them directly into storm drain inlets, causing pollution.
- **Landscaping and grounds maintenance.** Overuse, or indiscriminate use, of fertilizers and pesticides results in these materials running off landscaped areas into storm drains.
- **Allowing dumpster areas to become untidy.** Liquids that leak from dumpsters or garbage left outside the dumpster get washed away during a storm.
- **Building or remodeling facilities.** Disturbing soil and vegetation during construction greatly increases erosion; sediment is a pollutant. During construction, proper material handling and waste disposal is especially important because much of the work is performed in areas subject to rainfall.

Effects of Urban Runoff Pollution

What are the consequences of these activities? The most immediate effects can be seen: many creeks have an oily sheen near storm drain outfalls, litter is left behind by receding waters after a storm, layers of oil-and-grease-laden sediments accumulate, and dead animals are occasionally found on beaches.

But the most serious effects are more subtle. Some toxic substances affect critical life stages of certain organisms. Even if we do not usually see, or think about, these organisms (such as algae or mussels) they are part of the food supply for other plants and animals, including fish and birds. Pollutants in the aquatic environment disrupt the food chain. Some toxins bioaccumulate, which means organisms further up the food chain will concentrate the toxins in their tissues. This is why the State Health Department has recommended restrictions on human consumption of some species of fish and birds found in the Bay. Other effects of urban runoff pollution include contamination of water supply sources and loss of recreational activities such as fishing, swimming, and boating.

People can still stop storm water pollution because people cause it. By making small changes in the way we live and work, we can reduce the pollution we produce.

El Cajon Storm Water Protection Program

What is the El Cajon Storm Water Protection Program?

The City of El Cajon is involved in a program designed to ensure cleaner urban storm water runoff, thereby protecting our region's streams, rivers, beaches and the ocean. In that effort, we have entered into a partnership with nineteen other regional agencies in order to better:

- ✓ Educate and inform the public about urban runoff pollution
- ✓ Encourage public participation in community and clean-up events
- ✓ Work with industries and businesses to encourage pollution prevention
- ✓ Require construction activities to reduce soil erosion and water pollution
- ✓ Require developing projects to include pollution controls that will continue to operate after construction is complete

We also work within our own Municipal Departments and Divisions to ensure that our municipal maintenance and development projects are designed to reduce or eliminate pollution.

How is Our Program Funded?

Businesses and residents within the City of El Cajon fund the Storm Water Protection Program as part of our Wastewater Treatment Program. The Storm Water Protection Program also includes maintenance functions, like street sweeping and storm drain cleaning, to help keep our streams, rivers, beaches and ocean cleaner.

Debris in the Washington Channel

Why Are We Concerned About Urban Runoff?

Before the City of El Cajon area was developed, most rainfall fell onto natural areas and the water soaked into the ground. Over the last century, we've changed the landscape dramatically by adding roads, buildings and drainage pipes. Rainfall that once soaked into the ground now flows quickly along street gutters and into storm drains and drainage channel. These artificial rivers then discharge into our streams and rivers without treatment of any kind. Runoff from everyday urban and suburban activities also adds to this runoff. These activities include:

- ✓ Vehicle washing
- ✓ Landscape irrigation
- ✓ Cleaning around buildings, parking lots and streets

Along the way, the fast-moving urban runoff picks up pollutants such as pesticides, herbicides, fertilizers, eroded soil, and oil and grease from cars. These pollutants make their way into our streams and rivers where they pollute the water where they endanger the lives of both plants and animals. Eventually, this affects all of us, since we eat the fish and use the rivers, beaches and ocean for recreation. Some of us in the El Cajon area also drink treated river water.

How Can You Help?

There are many ways for El Cajon area residents, students, community groups and businesses to get involved in pollution prevention efforts. We need volunteers to help us get the word out. Take the first step by practicing pollution prevention in your own home or business. Then, join us in the many activities and events sponsored throughout the greater El Cajon area. Always remember, **"You Are the Pollution Solution."**

For More Information

Contact the El Cajon Storm Water Protection Program at (619) 441-1653, or visit our web site at www.ci.el-cajon.ca.us, and click on the Storm Water Information link.

El Cajon Storm Water Protection Program

Keeping Our Watershed Healthy

The health of a stream depends on the quality of the water that flows through it. To care for the stream, we must also care for all the land that drains to it. The name for the area or unit of land draining into a common stream or river is a *watershed*.

Everything in the watershed affects the water in the stream. Hazardous chemicals, automotive products, pesticides, herbicides, fertilizers, pet wastes, excessive soil erosion and air pollution all contribute to water pollution. These pollutants don't have to be dumped directly into the water to cause a problem. They can be washed from streets, lawns, roofs or outside storage areas by rainfall, eventually ending up in streams, rivers and the ocean.

The storm drain inlet or gutter in the street outside your home carries water into a network of storm drains that lead directly to the San Diego River or one of its tributary streams. Storm drains are completely separate from the sewer system, because sewer systems handle wastewater from your sinks, tubs and toilets. Storm drains do not go to a treatment plant but into our streams, rivers and ultimately the ocean.

Resulting impacts of water pollution can range from the obvious, such as oil floating on the water to the loss of wildlife due to habitat destruction that may go unnoticed.

Everyone in our community has a part in protecting our watershed and preventing water pollution. While the contribution of one home to water pollution may be small, the combined effect of an entire neighborhood can be substantial. Here are some suggestions that will help in keeping our watershed clean:

- ✓ Use chemical fertilizers and pesticides sparingly. When applied excessively, they can be washed into a nearby storm drain by your sprinklers or rain, thereby damaging aquatic life. Even lawn clippings contain these pollutants. Leave them on the lawn as natural fertilizer or compost them.
- ✓ Keep automobiles “drip-free” and in good operating condition. This helps keep oil and air pollution out of water sources. Wash cars at commercial car washes that drain to the sewage treatment plants instead of your driveway that drains to the storm drain system.
- ✓ Dispose of hazardous household wastes such as paints, solvents, used oil and cleaning products properly. The City of El Cajon contracts with Waste Management, Inc. to accept residential household hazardous waste for FREE on the second and fourth Saturday of each month and by APPOINTMENT ONLY. Residents can drop off no

more than 15 gallons or 125 pounds of household hazardous waste. Call (619) 596-5100 to schedule an appointment time.

The choice is ours. Do we want a watershed that keeps our steams, rivers, beaches and ocean healthy? Or do we want a watershed that struggles to survive?

Remember that, "**You are the Pollution Solution**." You play a very important role in keeping our streams, rivers, beaches and ocean clean. For more information, visit our web site at www.ci.el-cajon.ca.us and click on the "Storm Water Information" link.

Sewage Spill Reference Guide

Your Responsibilities as a Private Property Owner

How a Sewer System Works

A typical sanitary sewer system is constructed of a network of pipes, laterals and mains connecting to each building and transporting sewage to a wastewater treatment plant (see diagram to the right).

A property owner's sewer pipe is called a **sewer lateral** and connects to a larger city-maintained pipe called a sewer main typically located in the street.

As stated in the El Cajon Municipal Code, **sewer laterals are the responsibility of the property owner** and must be maintained by the property owner for the entire distance from the house to the sewer main.

What is a Sewage Spill?

Sewage spills occur when the wastewater being transported via underground pipes overflows through a manhole, cleanout, or broken pipe. Sewage spills can cause health hazards, damage to homes and businesses, and threaten the environment, local waterways, and beaches.

Common Causes of Sewage Spills

Grease builds up inside and eventually blocks sewer pipes. Grease gets into the sewer from food establishments, household drains, as well as from poorly maintained commercial grease traps and interceptors. Grease is a common cause of sewer pipe blockages, especially in commercial and industrial areas.

Large objects such as paper towels, rags, disposable diapers or children's toys can contribute to a blockage.

Structural problems caused by tree roots in the lines, broken or cracked pipes, missing or broken cleanout caps, or undersized sewers can cause blockages. Blockages by roots are a common cause of blockages in residential areas.

Infiltration and inflow impacts pipe capacity and is caused when groundwater or rainwater enters the sewer system through pipe defects and illegal connections.

You Are Responsible for a Sewage Spill Caused by a Blockage or Break in Your Sewer Lines!

Time is of the essence in dealing with sewage spills. You are required to **immediately:**

- ✓ **Control and minimize the spill.** Keep spills contained on private property and out of gutter, storm drains and public waterways by shutting off or not using the water.
- ✓ **Use sandbags, dirt or plastic sheeting** to prevent sewage from entering the storm drain system.
- ✓ **Clear the sewer blockage.** Always wear gloves and wash your hands. It is recommended that a plumbing professional be called for clearing blockages and making necessary repairs.
- ✓ **Notify the El Cajon Department of Public Works** by calling (619) 441-1653 during business hours, or call the Police Department Communications Center 24-hour number at (619) 579-3311.

You May Be Liable

Allowing sewage from your home, business or property to discharge to a gutter or storm drain may subject you to penalties and/or out-of-pocket costs to reimburse our city for clean-up efforts and enforcement actions.

What To Look For

Sewage spills can be a very noticeable gushing of water from a manhole or a slow water leak that may take time to be noticed. Investigate suspicious looking wet areas. Look for:

- ✓ Drain backups inside the building.
- ✓ Wet ground and water leaking around manhole lids on to your street.
- ✓ Leaking water from cleanouts or outside drains.
- ✓ Unusual strong offensive odors from wet areas near sidewalks, external walls, or landscaped areas.
- ✓ Slow draining or clogged sinks and toilets

Be Cautious

Keep people and pets away form the affected area. Untreated sewage has high levels of disease-causing viruses and bacteria.

How You Can Prevent Sewage Spills Before They Happen

- ✓ Never put grease down garbage disposals, drains or toilets.
- ✓ Perform periodic cleaning to eliminate grease, debris and roots in your house plumbing and sewer lateral.
- ✓ Repair any structural problems in your sewer system and eliminate any rainwater infiltration or inflow into your plumbing system.
- ✓ Do not dispose of paper towels, or other large objects in toilets.

El Cajon Public Works Department, and the Citywide Storm Water Protection Program

Working Together to Cope with Sewer Backups

GENERAL INFORMATION

Sewer backups create stressful and emotional situations for any homeowner or renter. In some cases sewer backups may cause health and safety concerns as well as significant property loss. A proper response to a sewer backup can greatly minimize damage to your property, diminish the threat of illness and help keep our stream, rivers, lakes and beaches clean.

The City of El Cajon makes every effort to be responsive to a resident's needs and concerns when a sewer backup occurs. The City has a sewer crew whose sole duty is to inspect, clean and maintain sewers on a daily basis. Sewer maintenance personnel are available on a 7-day-a-week, 24-hour-a-day basis to minimize the possibility of sewer problems. Unfortunately, because a sewer is not a closed system, many things put into the sewer can clog the system. Large amounts of grease from restaurants and disposable (and cloth) diapers are two common items that cause problems. Other factors can cause backups as well, such as tree roots, which can grow into and obstruct the system, or a broken or collapsed pipe.

Although the City of El Cajon has adopted rules prohibiting the discharge of any substance likely to cause a sewer obstruction, and distributes educational materials to the public about the problems they cause, there is really no way we can absolutely prevent blockages from happening.

Many homeowners' insurance policies exclude damage resulting from sewer backups. However, some insurance companies do provide sewer backup coverage**. If you are concerned about the possibility of a sewer backup and want to insure that you are covered, the City urges you to check with your home insurer regarding the availability of sewer backup insurance**.

CONTACT INFORMATION

If you experience a sewer problem, please call the Department of Public Works at (619) 441-1653 during normal business hours (M–F, 8am to 5pm), or call (619) 579-3311 on non-business weekday hours or on Saturday, Sunday and Holidays. When you call, please state that you are reporting a sewer backup or overflow emergency, and be prepared to provide the details. Backed up sewer lines, line breaks, sewage odors and overflowing manholes are considered an emergency.

If the problem is in the sewer lateral, the homeowner or business is responsible for correcting the problem. The owner of the property is responsible for maintaining and cleaning the sewer lateral from the building (or home) to the City's sewer main, including the connection on the sewer main. Locating the lateral is also the responsibility of the property owner. The City of El Cajon Public Works and Community Development Departments have records showing the location sewer main and lateral lines through public improvement plans or filed plumbing permits. Plumbers may also have special locating equipment, which may be very helpful to your task.

If the problem is in the sewer lateral, whom do you call for help? You will need to call a plumber or a sewer/drain cleaning service. Check your Yellow Pages or Business White Pages. You will need to contact and hire your own plumbing service. The City of El Cajon cannot make a recommendation. And although promptly correcting the plumbing problem is of great importance, it may be in your best interests to obtain several estimates.

REMEMBER TO CALL THE DEPARTMENT OF PUBLIC WORKS FIRST before calling a plumber. We will check the sewer main and inform you of our findings. If the problem is not in the City main you will be advised to contact a plumber or a sewer/drain cleaning service.

LATERAL vs. MAIN

What is a Sewer Lateral? A sewer lateral is the pipeline between the City-maintained sewer main, usually located in the street, and the building the sewer lateral serves. As it is defined in the El Cajon Municipal Code, the sewer lateral is owned, maintained and repaired by the property owner, including any part of the sewer lateral, which extends into streets, alleys or other public easements.

More often than not, the cause of a backup in your lateral is from items that the line is not meant to handle, such as kid's toys, underwear, towels, diapers, paper products (other than toilet paper), keys and even false teeth. To avoid flushing these items, remember to close the toilet lid. What you flush down your toilet may not affect you, but it might cause problems for your neighbors! Another possible cause would be roots in your lateral. The lateral is the responsibility of the owner of the property from the house to the sewer main.

WAYS TO PREVENT BACKUPS IN YOUR LATERAL AND IN THE CITY MAIN

The property owner can do many things to prevent his lateral from backing up. Remember too, that the very same things can help to prevent backups in the City main as well. If everyone would be careful about how they dispose of certain products, our systems would be a great deal more efficient, cause fewer backups, cost us all less money, and prevent a lot of misery. Here's a brief summary of some important sewer "Do's and Don'ts"

- ✓ **Grease:** Cooking oil should be poured into a heat-resistant container and properly disposed of in the trash after cooling to room temperature. Some people assume that washing grease down the drain with hot water is satisfactory. This grease goes down the drain, cools off, and solidifies either in the property owner's line, or in the main sewer. When this happens, the line constricts, and eventually clogs.
- ✓ **Paper Products:** Paper towels, disposable (and cloth) diapers, and feminine products cause a great deal of problems in the property owner's lateral as well as in City sewer mains. These products do not deteriorate quickly, as does bathroom tissue. They become lodged in portions of the lateral or main, eventually causing a sewer backups. These products should also be disposed of in the trash.
- ✓ **Roots:** Shrubs and trees, seeking moisture, will make their way into sewer line cracks. These roots can cause extensive damage. They may start out small, getting into a small crack in the pipe; but as the tree or shrub continues to grow, so does the root. After time, this causes your sewer line to break, which in turn allows debris to hang up in the line, thus causing a back up. One way to prevent roots from entering your line is to replace your line and tap with new plastic pipe. Another alternative is to be careful about planting shrubs or trees near your sewer line.
- ✓ **Sewer Odor:** Another concern that property owners have is that they can smell sewer odors inside their house or building. There are many ways to prevent this from occurring. Under each drain in your plumbing system, there is a loop of pipe called a "P-Trap". If there is water in this fitting, odors or gasses from the sewer cannot enter through the drain from either the property owner's lateral or

the City main. Periodically check to make sure that unused floor drains, sinks etc. have water in the "P-trap". Another way to prevent sewer odor is to ensure that the vents, which are located on your roof, are free from bird nests, leaves, or other debris. When these vents are clear, the sewer odors will escape through these vents.

- ✓ **Illegal Plumbing Connections:** Do not connect French drains, sump pumps and other flood control systems to your sanitary sewer. It is illegal, and debris and silt will clog your line. Consult a plumber to correct any illegal connections.
- ✓ **Needles:** Unfortunately, some people dispose of hypodermic needles in the sewer system. The presence of these needles in the wastewater collection system presents special and possible deadly problems for wastewater collection and wastewater treatment employees. **PLEASE DO NOT FLUSH NEEDLES.** The proper method of disposal is to re-cap the needle and put it into a "sharps container". This could be any rigid plastic container such as a bleach bottle. When it is full, tape the container securely, and call your local pharmacy for advice on proper disposal methods. **PLEASE DO NOT FLUSH THEM DOWN THE TOILET OR THROW THEM INTO THE TRASH!**
- ✓ **Install a Backwater Prevention Valve:** A backwater valve can prevent or greatly reduce the possibility of a sewer backup. A backwater valve is a fixture installed into a sewer line, and sometimes into a drain line, in the basement of your building to prevent sewer backflows. A properly installed and maintained backwater valve works on a one-way system, sewage can go out, but cannot come back in. Property owners are responsible for the installation and maintenance of backwater valves. The cost to install one is dependent upon the type of plumbing in your home and the difficulty of installation. A qualified plumber can assist you in determining your needs.

FREQUENTLY ASKED QUESTIONS

Q: What is the City's responsibility regarding private sewer laterals and private on-site sewer systems?

A: The property owner is fully responsible for maintaining adequate sewage flow to and through the sewer lateral and/or private on-site sewer system, from the property structure to and into the City-maintained sewer main. When failure or stoppage of a privately maintained sewer occurs, City crews will respond only to check the sewer main to verify that the main is open and sewage is flowing. If the sewer main is found to be clear, it is the responsibility of the property owner to call a licensed plumber or drain cleaning service to correct the problem. Verbal assistance and answers to questions can be received by calling the Department of Public Works at (619) 441-1653 during normal business hours (M-F 8am to 5pm), or (619) 579-3311 on other weekday hours, Saturdays, Sundays or Holidays.

Q: If I notice a foreign substance flowing into a storm drain inlet, whom should I call?

A: If you notice a foreign substance flowing into a storm drain inlet, please call the El Cajon Storm Water Protection Program at (619) 441-1653 to report the location, or call the 24-hour, 7-day-a-week San Diego Regional Storm Water Hotline at (888) 846-0800.

Q: What if my sewer backs up?

A: If you experience a sewer backup, call us at (619) 441-1653 during normal business hours (M-F 8am to 5pm), or (619) 579-3311 on other weekday hours, Saturdays, Sundays or Holidays. We will dispatch a maintenance crew to your address to determine if the stoppage is in the City main or your sewer lateral. If the City main is found to be clear, it is the responsibility of the property owner to call a plumber or sewer/drain cleaning service to correct the problem. The property owner is responsible for maintaining adequate flow to and through the sewer lateral from the property structure to and into the City sewer main. If the blockage is in the City main we will fix it as quickly as possible and keep you informed about what is being done.

Q: What about the mess?
A: A sewer backup can lead to disease, destruction of your valuables, damage to your house, and electrical malfunctions. Prompt cleanup of affected property can help minimize the inconvenience and damage.

After any sewer backup or overflow, you should immediately arrange for the cleanup of your property. Here are some useful things to remember:

- ✓ Take before-and-after photos of the affected areas
- ✓ Itemize any property losses
- ✓ Wet-vacuum or remove spillage
- ✓ Mop the floors and wipe walls with soap and disinfectant
- ✓ Flush out and disinfect plumbing fixtures
- ✓ Steam clean or remove carpet and drapes
- ✓ Repair or remove wallboard or wall covering
- ✓ Clean up appliances or ductwork

PRIVATE SEWER LATERAL and PRIVATE ON-SITE WASTEWATER SYSTEM

BEST MANAGEMENT PRACTICES (BMPs)

Private sewer laterals and privately maintained on-site wastewater systems, such as those owned and maintained by Homeowner Associations, carry untreated sewage containing numerous pollutants, including harmful bacteria and excessive nutrients. Improperly maintained private sewer laterals and on-site wastewater systems can break, clog, or malfunction, resulting in an overflow and discharge or raw sewage. Raw sewage poses an extremely high risk to the health of our streams, rivers, beaches and the oceans, as well as the health of members of our community.

Think before putting anything in the storm drain. Remember, the ocean starts at your front door.

Required BMPs:

- ✓ Dispose of grease in trash, not in the sink drain. Blockages caused by grease in sewer lines cause the majority of sewer main and lateral overflows.
- ✓ Private sewer laterals shall be cleaned, maintained or replaced to prevent seepage and spills.
- ✓ On-site wastewater systems, whether private or connected to public sewer systems, shall be flushed, maintained, repaired or replaced to the maximum extend practicable (MEP) to prevent seepage and spills.
- ✓ Spills from private sewer laterals and on-site wastewater systems shall be contained and cleaned up in a manner that minimizes any release of pollutants to the Storm Water Conveyance System or Receiving Waters.
- ✓ Any release from a private sewer lateral or on-site wastewater system that enters the Storm Water Conveyance System or Receiving Waters shall be immediately reported to the City.
- ✓ Failed sewer laterals or on-site wastewater systems must be immediately repaired or replaced. Contact the City for information concerning permits and approval requirements.

This information sheet is distributed as part of the El Cajon Storm Water Protection Program

PROCLAMATION

"POLLUTION PREVENTION DAYS"
May 16th and August 29th, 2007

WHEREAS, *storm water management services provided in our community are an integral part of our residents' everyday lives. The support of an understanding and informed citizenry is vital to the efficient operation of storm water management programs; and*

WHEREAS, *the health, safety and comfort of this community greatly depends on these services. The quality and effectiveness of these services, as well as their planning and implementation is vitally dependent upon the efforts and skill of storm water management staff; and*

WHEREAS, *the efficiency of the qualified and dedicated personnel who staff the storm water management division is materially influenced by the people's attitude and understanding of the importance of the work they perform.*

NOW, THEREFORE, *I, Mark Lewis, Mayor for the City of El Cajon, together with the City Council, do hereby proclaim the days of May 16th and August 29th, two thousand and seven to be "POLLUTION PREVENTION DAYS" in the City of El Cajon. We further call upon all residents and civic organizations to acquaint themselves with the issues involved in providing our services and to recognize the contributions which public works officials make every day to our health, safety, comfort, and quality of life.*

Signed this eighth day of May, two thousand and seven.

Mayor

LIST OF ACTIVITIES AND EVENTS

Date	Activity/Event	Estimated Number of Participants
04/25/05	Tire Recycling Day	Approximately 26 participants and collected between 18-21 tires for recycling
04/26/05	Dumpster Demonstration	Approximately 12 participants
04/27/06	Fundraising Car Wash Demonstration	7 participants and contacted approximately 9 people
04/28/06	St. Madeline's Cleanup Demonstration	Approximately 11 participants
04/29/06	A-1 Power Washing Demonstration	Approximately 8 participants

Business License and Storm Water Programs

Goal: Use information collected and stored in the Business License database to support the Storm Water Program inspection and public outreach components and potentially increase revenues for the Business License Program.

Process:

1. Business License database is provided to the Storm Water group in a read-only format to gather business address; type of business; SIC code; number of employees. (Support Storm Water inspection component)

2. Storm Water staff match information to Storm Water inspection database. Generate a list of corrections for the Business License database. (Potentially increase revenue)

3. Storm Water staff use Business License information to confirm Business License Database information. (Potentially increase revenue and Support Storm Water inspection component)

4. Develop a Storm Water informational sheet for Business License applicants. The Business License staff would hand out the informational sheet at the time. (Supports Storm Water outreach component)

Edit Rights (fields):

When errors are discovered in the Business License database, corrections can be made by either:

1. Printing out the data the correct for use by Business License staff to make the appropriate changes.

OR

2. Grant limited edit rights to the Storm Water staff for certain fields (Business Name; Address Number; Street Prefix (N, S, E or W); Street Name; Suite Number; Zip Code; Contact Person's Name; Contact Person's Telephone Number; Description of Business SIC; and Business License No.).

CITY OF EL CAJON
INVENTORY OF MUNICIPAL FACILITIES

HIGH PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Civic Center, City Hall and Plaza	200 E. Main Street	Washington Channel
2.	Fire Station No. 9	1301 N. Marshall Avenue	Forester Creek
3.	Public Works Maintenance Division Office	1050 Vernon Way	Forester Creek
4.	Vehicle Maintenance Facility	1060 Vernon Way	Forester Creek

MEDIUM PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Animal Control	1275 N. Marshall Way	Forester Creek
2.	Fletcher Hills Park, Recreation Center and Pool	2345 Center Place	Fletcher
3.	Parks Office	154 Rea Avenue	Washington Channel
4.	Performing Arts Center	110 E. Main Street	Washington Channel
5.	Wells Park, Recreation Center and Maintenance	1153 E. Madison Avenue	Forester Creek
6.	Parks Storage Garage	148 Rea Avenue	Washington Channel

LOW PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Albert Van Zanten Park	1495 Greenfield Drive	Broadway Channel
2.	Bill Beck Park	Pierce Street and Wagner Drive	Broadway Channel
3.	Bostonia Park and Recreation Center	1049 Bostonia Street	Forester Creek/ Broadway Channel
4.	Cajon Valley Middle School Park	750 Park Avenue	Forester Creek/ County Ditch
5.	Community Policing Division	165 E. Park Avenue	Forester Creek
6.	El Cajon Community Center	195 E. Douglas Avenue	Forester Creek
7.	Fire Station No. 7	695 Tyrone Street	County Ditch
8.	Fire Station No. 8	842 N. Third Street	Forester Creek
9.	Fire Station Park	Tyrone Street and Westwind Drive	Forester Creek
10.	Fire Station/ Department Administration	100 E. Lexington Avenue	Forester Creek
11.	Hillside Park and Recreation Center	840 Buena Terrace	Fletcher Hills Parkway/ Fanita Channel Basin/ Forester Creek
12.	John F. Kennedy Park and Recreation Center	1675 E. Madison Avenue	County Ditch
13.	Judson Park	Magnolia Avenue and Park Avenue	Forester Creek
14.	Museum (Knox House)	280 N. Magnolia Avenue	Forester Creek
15.	Office	1034 Magnolia Avenue	Washington Channel
16.	Pistol Range	Gillespie Field	Washington Channel
17.	Police Department	100 Fletcher Parkway	North Forester Creek
18.	Police Department Detectives	1035 Pioneer Way	Forester Creek/ Broadway Channel
19.	Prescott Promenade Park	200 Block of Main Street	County Ditch
20.	Renette Park and Recreation Center	935 S. Emerald Avenue	County Ditch
21.	Tuttle Park	379 Chase Avenue	County Ditch

Storm Water Quality Checklist
For Municipal Facilities

Site Name:_____ Location:_____

Contact:_____

Date:_____ Type of Inspection: ☐ Routine Site Inspection

Weather Information: ☐ Prior to Forecast of Rain Event

Storm Start Date and Time:_____ Storm Duration:_____hours ☐ 24-hr Period During Extended Storm Event

Time Since Last Storm:_____hrs/days Rainfall:_____inches ☐ After Rain Event

Inspector Name and Title:_____

Inspector Signature:_____

Pollution Prevention BMPs	N/A	Yes	No	Comments / Corrective Action
Erosion and Sediment Control				
Is existing vegetation preserved?				
Are seeding and planting of native plants and trees considered?				
Are geotextiles and organic mats used for soil stabilization?				
Roadway and Bridge Maintenance				
Are streets swept and clean?				
Is street sweeping frequency adequate for the area?				
Municipal Vehicle Maintenance Facilities				
Are vehicles/equipment parked/stored in designated areas?				
Are vehicles and equipment regularly inspected for leaks and spills?				
Are detected leaks/spills contained and repaired as soon as possible?				
Landscaping Maintenance				
Are safer, alternative products used or considered?				
Is weather considered for landscaping activities?				
Are certified professionals used to handle, apply, and distribute pesticides, herbicides, and fertilizers?				
Is there an IPM used?				
Maintenance of MS4				
Is the mechanism for detecting and removing IC/ID situations implemented?				
Is the MS4 inspected, maintained, and repaired?				
Is a stenciling and sign program used to warn of effects of illegal dumping?				
Sewer Blockage Response				
Is there mechanism for identifying, containing, controlling, and repairing sewage leaks and spills?				
Is hazardous waste disposed of properly?				
Waste Management				
Is there a waste reduction program in place?				
Are wastes segregated for proper storage and disposal?				

Are dewatering activities controlled and managed appropriately?				
Is groundwater tested prior to disposal?				
Is the public educated and encouraged to participate in appropriate stormwater activities?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Housekeeping				
Is the area clear of visible trash/debris and impervious surfaces free of sediment?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are points of ingress/egress to public and private roads free from sediment, debris and mud from tracking?				
Are materials stored in their designated areas?				
Are dry methods used to clean?				
Employee Training				
Have employees been trained in basic stormwater management and BMP implementation?				
Visual Inspections				
Are visual inspections of the site conducted and documented on a regular basis?				
Are the discharge locations free of significant erosion or sediment transport?				
Improved Operation and Maintenance				
Are drainage control structures free of litter and debris?				
Waste Disposal and Recycling				
Are there designated areas for recycling of metal, tires, antifreeze, and used oil?				
Are waste containers covered?				
Are areas near or around waste containers free of leaks or spills?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are hazardous wastes stored and disposed appropriately? (in labeled, secondary containment; 55-gallon drums in a secured, designated area)				
Is secondary containment free of spills and rainwater?				
Preventive Maintenance				
Are there procedures for replacing used or worn materials or equipment prior to failure?				
Record Keeping				
Is there onsite storage of documented inspections, BMP evaluations, and audits?				
Is there onsite documentation of employee training?				
Is there an onsite SWPPP or other Pollution Control Document?				
Does the SWPPP adequately reflect the current site conditions and the construction operations? If not, explain required SWPPP revisions.				
Spill Prevention and Response				
Are there spill kits near outside stored materials, wastes, and recycling areas?				
Are spill response procedures clearly posted?				
Are employees trained in preventing spills?				

Material Inventory Procedures				
Are inventories of 30 days materials onsite?				
Material Storage Practices				
Are outside stored materials stored off the ground and covered or in appropriate containers? (Flammables stored in a flammables cabinet; antifreeze in double-walled container or in secondary containment)				
Visual evidence of spills, staining, or leaks from outside stored materials are not evident				
Storage Tanks				
Are outside above ground storage tanks double-walled or in secondary containment?				
Visual evidence of leaks or spills in the area are not visible				
Outside Storage				
Are materials stored outside under cover or in containers?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are outside material storage areas free of visual evidence of spills or runoff?				
Loading and Unloading				
Are loading and unloading areas free of litter and visual evidence of spills?				
Sediment and Erosion Control				
If sandbags are used, are they placed appropriately for the conditions?				
Are temporary soil stabilization measures installed and in working order?				
Is dust control necessary and implemented?				
Are soil stockpiles properly stored?				
Is inlet protection available for all operational storm drain inlets?				
Vehicle and Equipment Maintenance				
Is there a covered or inside area designated for vehicle and equipment maintenance?				
Are leaking vehicles stored inside or drip pans used for outside storage?				
Vehicle and Equipment Washing				
Is there a designated covered or inside area or commercial facility for washing vehicles and equipment?				
Park BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are grass clippings mulched or bagged for disposal?				
Are vegetation trimmings gathered and disposed as solid waste or recycled as mulch?				
Are sidewalks and parking lots cleaned using dry methods to collect and use as mulch or dispose as solid waste?				
Recreation BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Is pool water tested or treated for chlorine before discharge?				
Is pool filter backflush discharged to the sanitary sewer?				
Are pool chemicals stored inside and in appropriate				

containers?				
Non-Stormwater BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Non-Storm Water Management				
Is the site free of evidence of illegal connections and illicit discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				
Other				
No other potential storm water pollution issues or concerns exist. If no, explain below.

STORM WATER ADMINISTRATIVE CITATION PROGRAM CRITERIA

1. Issue a Warning (followed by a letter, when possible)
   a. Whenever a discharge of pollutants is imminent or the potential exists, but the discharge has not yet entered the storm drain conveyance system (street, gutter, catch basin, etc.)
   b. Whenever a BMP is not effective for the pollutant or discharge and other BMP alternatives are available.
   c. Whenever a discharge origin cannot be determined through factual, investigative, or empirical evidence. Provide a cleanup schedule to be used as future enforcement.
   d. Small residential projects of less than 500 square feet of disturbed soil.
   e. An approved erosion and control plan has been issued and BMPs are partially implemented.
   f. Whenever activities are conducted in the right-of-way and no BMPs are implemented.
   g. Whenever a discharge of fully recoverable pollutants are discharged into the City's storm drain system (street and gutter only).

2. Issue a Citation
   a. Whenever there is a sewage overflow. (e.g. blockage; clean-out cap was removed to allow sewage to discharge into the street and storm drain).
   b. Whenever there is a discharge of unrecoverable pollutants into the storm drain conveyance system (street, gutter, catch basin, etc.)
   c. A Warning was previously issued (verbal or written).
   d. Any direct discharge into Forester Creek specifically any material which contains a 303(d) listed pollutant adopted by the State of California.(pH, TDS, and fecal coliform).
   e. An approved erosion and control plan has been issued and no BMPs are implemented.
   f. An egregious act of discharge (e.g. illegal dumping)

3. Issue a Penal Code Violation (PC374.3, 374.4, 374.7)
   a. When a First Citation was previously issued and this is a repeat violation.
   b. When the discharge is executed in the presence of any City Staff or after being told to cease operations. (waste, sewage, and litter discharges)
   c. Any direct discharge into Forester Creek, specifically material containing pollutants for which a 303(d) listing has been adopted by the State of California.(pH, TDS, and fecal coliform).

4. Issue a Stop Work Order
   a. For construction sites that received a warning and a first violation for discharging pollutants due to ineffective or proposed, but not yet implemented BMPs.
   b. A discharge of pollutants into the storm drain system, in addition to a citation, that requires immediate corrective action or mitigation.

5. Refer to Regional Board
   a. Repeated violations by a private citizen, property owner, or business for discharges to the storm drain system.
   b. A refusal to mitigate, remediate, or clean a spill or discharge of pollutants that will enter or have entered City MS4.

Landscaped Areas: ☐ Yes ☐ No

Potential for Over-watering (scale of 1-10): _____

D. BMP Assessment

D.1 Pollution Prevention

BMPs	N/A	Yes	No	Comments
Is the parking area free of fresh leaks and old leaks/stains cleaned to MEP?				
Are spill kit materials readily available and clearly marked?				
Is pollution prevention a topic of the employee training?				
Are recycled products used at the site?				
Are there pollution prevention posters or other visual aides placed in a noticeable area for employees and patrons?				
Is there a pollution prevention plan or other such similar plan in place?				
Is there a water conservation policy for irrigation and business use?				
Is waste disposal a topic of the employee training?				
Is spill training conducted?				
Is there emergency training?				
Is there a voluntary inspection program?				
Is there a grease interceptor?				
Is there a preventive maintenance program for equipment?				

D.2 General

BMPs	N/A	Yes	No	Comments
Is the site free of litter and debris?				
Are discharge locations free of sediment and debris?				
Are parking lots, sidewalks and streets free of sediment and debris?				
Are roof downspouts directly away from areas of potential pollutants?				

D.3 Landscaping

BMPs	N/A	Yes	No	Comments
Are adequate erosion prevention measures employed? (vegetation or physical stabilization)				
Are irrigation systems programmed to minimize over-watering and runoff?				
Are stockpiles of soil or landscape waste equipped to prevent runoff transport?				

D.4 Materials and Wastes

BMPs	N/A	Yes	No	Comments
Are adequate trash containers provided?				
Are adequate recycling containers provided?				
Is the trash/recycling area enclosed and free of litter and debris?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are outdoor material storage areas adequate (covered area with secondary containment)?				
Are outdoor storage containers properly labeled?				
Is there an accessible spill response kit?				
Are storage tanks equipped with secondary containment?				
Is secondary containment free of spills and rainwater?				
Are loading and unloading areas free of spills and debris?				

D.5 Equipment and Vehicles

BMPs	N/A	Yes	No	Comments
Are exposed parking areas free of significant spills and leaks?				
Are heavy equipment and vehicles stored in garages or under canopies?				
Are vehicle maintenance activities conducted within contained areas (garage, canopy, work shop)?				
Are vehicle-fueling areas covered and are storm drain inlets protected from spills and leaks?				
Is vehicle washing preformed in a contained area where runoff does not enter the MS4?				
Are biodegradable soaps used for cleaning activities?				

D.6 Construction

BMPs	N/A	Yes	No	Comments
Are adequate erosion prevention measures employed throughout the site? (vegetation or physical stabilization)				
Are adequate sediment control BMPs employed throughout the site? (sandbags, gravel bags, inlet filters)				

D.7 Food Establishments

BMPs	N/A	Yes	No	Comments
Does facility have a grease trap or grease interceptor?				
Are deep fryer oil-recycling drums stored properly?				
Are storm drain inlets free of grease and other food debris?				

D.8 Non-Storm Water Management

BMPs	N/A	Yes	No	Comments
Is the site free of evidence of illicit connections and illegal discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				

D.9 Other

BMPs	N/A	Yes	No	Comments
Are there any other potential storm water pollution issues or concerns? If yes, explain below.				

City of El Cajon Inspector

City of El Cajon Industrial and Commercial Inspections

1. INTRODUCE YOURSELF AND THE INSPECTION TEAM

2. SUMMARIZE THE EL CAJON STORM WATER PROGRAM
   - A. USE THE LOGO AS A FOCUS POINT EMPHASIZING PREVENTION
   - B. PERMIT ISSUED FEB. 21, 2001 COUNTY-WIDE TO 20 COPERMITTEES
   - C. BASICALLY PERMIT REQUIRES PROTECTION OF WATER QUALITY
   - D. INCLUDES ALL TRIBUTARIES TO MAJOR STREAMS, RIVERS, AND OCEAN
   - E. FORESTER CREEK IS THE CITY OF EL CAJON'S MAIN STREAM AND IS FURTHER PROTECTED FOR VARIOUS POLLUTANTS (BACTERIA, DISSOLVED POLLUTANTS, AND PH)
   - F. COMPLIANCE REQUIRES DILIGENCE BY CITY AND PARTNERSHIP WITH BUSINESSES AND CITIZENS
   - G. BUSINESS INSPECTIONS ARE A REQUIREMENT OF THE PERMIT
   - H. GOAL IS TO WORK TOGETHER TO MAKE THE PERMIT REQUIREMENTS WORK FOR ALL.
   - I. ENFORCEMENT (ALSO A REQUIREMENT) IS THE TOOL USED WHEN COLLABORATION DOESN'T WORK (DISCUSS ENFORCEMENT).
   - J. CITY ORDINANCE IS THE ENFORCEMENT TOOL
   - K. CITY FEES

3. SUMMARIZE THE INSPECTION PROCESS AS FOLLOWS:
   - A. ASK INITIAL QUESTIONS
   - B. WALK FACILITY BOUNDARY
   - C. REVIEW OUTSIDE ACTIVITIES
   - D. DISCUSS EXISTING OR MISSING BMPS
   - E. COMPLETE CHECKLIST
   - F. PRINT
   - G. DISCUSS FINDINGS AND CORRECTIVE ACTIONS
   - H. SIGN INSPECTION FORM
   - I. MAKE A COPY FOR CITY FILES
   - J. SCHEDULE ANY FOLLOW-UP VISITS
   - K. **THANK** THE FACILITY FOR THEIR COOPERATION

4. TOOLS TO USE DURING INSPECTION
   - A. LISTEN TO ALL ISSUES FROM THE FACILITY – SOME MAY HAVE MERIT.
   - B. OFFER EXPERIENCES AND MATERIALS OR PROCEDURES USED FROM OTHER SIMILAR BUSINESSES
   - C. BE FIRM WITH THE REQUIREMENTS
   - D. DO NOT RECOMMEND PRODUCTS

No Exposure" Conditional Exemption For Industrial Facilities

The proposed USEPA rules will establish a conditional exemption called a "No Exposure Exemption" for owners and operators of industrial facilities who can show that industrial materials, material handling operations and industrial processes, are not exposed to stormwater. Essentially, this exemption replaces the previous exemption for "light industry" which was remanded to USEPA from federal court to further define and substantiate the justification for such an exemption. A written certification will be required to be submitted to the permitting authority every three years on a form supplied by the authority. This potential conditional exemption applies to all industrial categories regardless of type, except construction sites and sources individually designated. The conditions for qualifying for the No Exposure Exemption will include the following:

1. Notification to the permitting authority at the beginning of each permit term;
2. Must allow the permitting authority or municipality to inspect the facility and to make the results of inspection public;
3. Upon request, submit a copy of the certification to the municipality in which the facility is located; and
4. Sign and certify the certification.

The permitting authority will still retain the legal authority to require the owner or operator of an industrial facility to apply for an individual or general NPDES permit if it determines that the discharge is, or may reasonably be, causing or contributing to a violation of a water quality standard, or is or may be interfering with the attainment or maintenance of a water quality standard, including a designated use.
In connection with the No Exposure Exemption being considered, USEPA is seeking comments on the issue of how to define "no exposure." Several important issues are listed for further review (but are not part of this proposed rule), including:

1. How to account for stormwater runoff from parking lots, roof tops, lawns and other non-industrial areas of an industrial facility;
2. Whether the construction of impervious surfaces, such as roofs to achieve no exposure that significantly increase stormwater runoff volume should be regulated to prevent adverse impacts to the receiving water simply due to increased quantity of flow;
3. Whether air emissions from roof vents or stacks should be considered in the evaluation of no exposure; and
4. Whether tight non-leaking drums, barrels or dumpsters are sufficient to quality for the no exposure exemption, or should there be a "potential to leak" evaluation included.

Fact Sheet

Storm Water Regulations and Industrial Activities

Background

In November 1990, the Environmental Protection Agency (EPA) adopted regulations requiring National Pollutant Discharge Elimination System (NPDES) permits for storm water discharges from certain industrial sites. In California, the State Water Resource Control Board and the nine Regional Water Quality Control Boards (RWQCB) are responsible for administering the storm water permit program. The following questions and answers are meant to give the reader an overview of the requirements and Best Management Practices required. Since the regulations are very complex, please contact your local/municipal staff for information specific to your situation.

Who needs a permit?

The EPA storm water regulations state that certain storm water discharges "associated with industrial activity" need permits. This definition is complex and sometimes confusing. In general, you may need an NPDES permit if:

- ☐ Your industry is listed by EPA; and
- ☐ Storm water from rain or snow melt leaves your site through a "point source" and reaches surface waters either directly or through storm drainage. A point source discharge refers to a natural or human-made conveyance of water through such things as pipes, culverts, ditches, catch basins, or any other type of channel.
- ☐ In addition, you may need a permit if you are involved in construction activities; including clearing, grading and excavation activities that disturb five or more acres of land.

What permits are required?

The RWQCBs oversee a series of permits to address the particular stormwater activities specified by EPA. Three of these permits applicable to industrial activities are:

- ☐ General Construction Permit for construction activities that disturb one or more acres
- ☐ General Industrial Permit for businesses that are involved in a list of activities specified by Standard Industrial Classification (SIC) Code; and
- ☐ Urban Runoff Permits for Phase I communities.

Industries may be regulated by all three permits depending on the location and the activities of the business.

What does a general permit require?

The two general permits have some similar basic requirements. You must:

- ☐ Submit a Notice of Intent and the appropriate fees to the RWQCB prior to initiation of the activities.
- ☐ Generate a Storm Water Pollution Prevention Plan (SWPPP) according to the RWQCB requirements addressing the potential for discharges and how to prevent or reduce their impacts to the environment using Best Management Practices. (http://www.swrcb.ca.gov)
- ☐ Monitor storm water by collecting a "grab" sample as specified in the permit.
- ☐ Strive to meet receiving water requirements when Total Maximum Daily Limits (TMDLs) are involved.
- ☐ Review and update your Storm Water Pollution Prevention Plan annually or when project activities change from the original plan.

What does a municipality's permit require of an industrial business?

- ☐ Comply with the applicable general permit(s) requirements.
- ☐ Review of the SWPPP for compliance with the municipality's urban runoff permit.
- ☐ Inspection of the facility for compliance with the municipality's urban runoff permit for implementation of applicable BMPs.
- ☐ Compliance with the municipality's urban runoff permit using applicable BMPs.

Regulated industries

Any industry within a municipality's jurisdiction will be required to comply with that jurisdiction's requirements.

What Best Management Practices are required?

In general, the following bullets are the Source Control BMPs required by municipalities in the San Diego County region. To assist in implementation, each BMP lists the industrial activities where the BMP is applicable and should be implemented.(See Note Below)

☐ Non-Storm Water Discharges

- Storing Hazardous Waste Outdoors
- Washing Vehicles and Equipment
- Fueling Vehicles and Equipment
- Repairing Vehicles and Equipment
- Planting Landscape
- Watering Landscape
- Maintaining Landscaped Areas
- Storing Materials Outdoors including Rood Storage
- Cleaning Windows and Buildings
- Parking Lot Maintenance
- Painting and Disposal of Paint Wash Liquids
- Recycling Area Maintenance
- Liquid Material Transfer
- Solid Material Transfer
- Spills of Petroleum or Other Oils
- Cleaning Outdoor Areas
- Power Wahsing Ourdoor Areas
- Loading Dock Maintenance
- Used Oil Recycling
- Cleaning of and Around Storm Drain Systems
- Fire Sprinkler System Repair and Maintenance

☐ Spill Prevention, Control, and Cleanup

- Storing Hazardous Waste Outdoors
- Washing Vehicles and Equipment
- Fueling Vehicles and Equipment
- Repairing Vehicles and Equipment
- Planting Landscape
- Watering Landscape
- Maintaining Landscaped Areas
- Storing Materials Outdoors including Rood Storage
- Cleaning Windows and Buildings
- Parking Lot Maintenance
- Painting and Disposal of Paint Wash Liquids
- Recycling Area Maintenance
- Liquid Material Transfer
- Solid Material Transfer
- Spills of Petroleum or Other Oils
- Cleaning Outdoor Areas
- Power Washing Outdoor Areas
- Loading Dock Maintenance
- Used Oil Recycling
- Cleaning of and Around Storm Drain Systems
- Fire Sprinkler System Repair and Maintenance

☐ Vehicle & Equipment Fueling

- Fueling Vehicle and Equipment
- Spills of Petroleum or Other Oils

☐ Vehicle & Equipment Repair
- Repairing Vehicles and Equipment
- Washing Vehicles and Equipment

☐ Outdoor Loading/Unloading
- Loading Dock Maintenance

☐ Outdoor Liquid Container Storage
- Storing Hazardous Waste Outdoors
- Maintaining Trash Enclosure Area
- Storing Materials Outdoors including roof storage
- Liquid Material Transfer

☐ Outdoor Equipment Operations
- Repairing Vehicles and Equipment

☐ Outdoor Storage of Raw Materials
- Planting Landscape
- Storing Materials Outdoors including Roof Storage
- Spills of Petroleum or Other Oils

☐ Waste Handling and Disposal
- Storing Hazardous Waste Outdoors
- Washing Vehicles and Equipment
- Fueling Vehicles and Equipment
- Repairing Vehicles and Equipment
- Planting Landscape
- Watering Landscape
- Maintaining Landscaped Areas
- Storing Materials Outdoors including Rood Storage
- Cleaning Windows and Buildings
- Parking Lot Maintenance
- Painting and Disposal of Paint Wash Liquids
- Recycling Area Maintenance
- Liquid Material Transfer
- Solid Material Transfer
- Spills of Petroleum or Other Oils
- Cleaning Outdoor Areas
- Power Washing Outdoor Areas
- Loading Dock Maintenance
- Used Oil Recycling
- Cleaning of and Around Storm Drain Systems
- Fire Sprinkler System Repair and Maintenance

☐ Building and Ground Maintenance
- Planting Landscape
- Maintaining Landscaped Areas
- Storing Materials Outdoors including Rood Storage
- Cleaning Windows and Buildings
- Parking Lot Maintenance
- Cleaning Outdoor Areas
- Power Washing Outdoor Areas
- Loading Dock Maintenance

Cleaning of and around Storm Drain Systems

☐ Parking/Storage Area Maintenance
Parking Lot Maintenance
Spills of Petroleum or Other Oils
Cleaning Outdoor Areas

☐ Drainage System Maintenance
Spills of Petroleum or Other Oils
Cleaning Outdoor Areas
Cleaning of and around Storm Drain Systems

NOTE: Implementation is based on feasibility, location, and special circumstances.

For Further Assistance

To obtain further information on storm water permits, please contact storm water program staff in your area or the RWQCB regional office nearest you. Locations and phone numbersfor the RWQCB can be found at http://www.swrcb.ca.gov/rwqcb9/.

The Green Wrench Guide

Stormwater Best Management Practices for the Automotive Industry

Definitions

Best Management Practices (BMPs):	Techniques or controls used to prevent or reduce the discharge of pollutants into stormwater, receiving waters, or the stormwater conveyance system.
Dry Cleaning Methods:	Methods of cleaning surfaces that minimizes the use of water. Examples include sweeping, vacuuming, and using hydrophobic mops and rags.
Illegal Connection:	An unauthorized pipe, facility, or other device connected to the storm drain system or receiving waters. Devices that convey pollutants may be illegal even if they were permitted at the time of installation.
Illegal Discharge:	The unauthorized discharge of pollutants or non-stormwater into the stormwater conveyance system or receiving waters.
Pollutants:	Anything that can cause or contribute to water quality degradation.
Pollution Prevention:	Practices that minimize or eliminate the generation of pollutants at the source.
Receiving Waters:	Any water bodies including the Pacific Ocean, lakes, streams, lagoons, rivers, reservoirs, and intermittent waters such as vernal pools and seasonal dry creeks.
Stormwater Conveyance System (storm drain system):	Any public or private drainage system (non-sewage) including streets, curbs, gutters, inlets, ditches, pipes, channels, culverts, streams, etc.

Thank you to The City of San Francisco for the original Green Wrench Guide concept.

Background

What is Stormwater Pollution

When water flows over work areas, parking lots, streets, and other surfaces, it picks up pollutants and carries them into the storm drain system. This system is designed to prevent flooding by transporting water away from urban areas. Water and all the contaminants that it collects eventually flow without treatment through the storm drain system to our streams, lakes, and the ocean where we swim and fish. This polluted runoff harms inland freshwater wildlife and habitats, and in some cases causes, beach closures and makes our fish and shellfish unsafe to eat.

The Storm Drain System and the Sewer System are NOT Connected

In San Diego County, wastewater and surface runoff are discharged into two separate underground systems. Wastewater that is disposed to a toilet, sink, or a piped sewer drain flows into the sanitary sewer system where it is filtered and treated. Water runoff that leaves your business via driveways, sidewalks, parking lots, streets, gutters, storm drain inlets, drainage ditches, and concrete channels flows into a separate storm drain system. Anything that enters the storm drain system eventually flows untreated and unfiltered into our creeks, bays, lagoons – and ultimately the ocean. The things you do at work are directly connected to the health and safety of our citizens and the environment.

Your Responsibilities

As required by federal and state laws, the County of San Diego, the Unified Port District, and each of the 18 incorporated cities in the County have adopted local stormwater management ordinances to protect our water resources. *These ordinances prohibit the discharge of pollutants into the storm drain system.* Pollutants typically associated with automotive maintenance and repair activities include antifreeze, fuels, waste oils, solvents, and paints. Other pollutants commonly contributing to stormwater pollution include sediment, fertilizers, pesticides, and litter. As a business owner or operator, you are legally responsible for ensuring that these and any other potential stormwater pollutants are properly managed. To do so, you will need to select and use Best Management Practices that are specific to your business activities.

A storm drain outlet which flows unfiltered directly into a local stream.

Background

Best Management Practices (BMPs)

Best Management Practices, commonly called BMPs, are actions you can take to prevent pollutants from leaving your facility. In general, there are two main types of BMPs:

- **Source control BMPs** keep pollutants from entering runoff. Examples include preventive maintenance and routine sweeping.

- **Treatment control BMPs** remove pollutants from runoff before it reaches the storm drain system. Common examples are storm drain filters and oil / water separators.

Source control BMPs are often preferable because they are usually simpler and more cost-effective. One of the main types of source control BMPs is "pollution prevention". Pollution prevention methods (process changes, materials substitution, waste reduction) help to limit the amount of pollutants that are generated, thus eliminating the need to manage or remove them. Pollution prevention BMPs can help your business to run more efficiently and can save you money.

Using the BMPs described in this booklet will help you to satisfy regulatory requirements and to preserve and protect San Diego's waterways. Successfully meeting this challenge will require the active participation of all employees at your business. To assist your employees in understanding these requirements, please have them read and review this Green Wrench Guide. Also have your employees sign and date the training log included on pages 19 and 20 of this guide so that you will have a record of their training activities.

BMPs and Your Business

This guide is designed to help you think about ways to manage potential stormwater pollutants associated with your business activities. It provides information on minimum requirements, and includes suggested pollution prevention tips for the automotive industry. It is organized according to the following activity types:

- **Facility Audits**
- **Employee Training**
- **Spill Management and Reporting**
- **Vehicles and Equipment**
- **Good Housekeeping**
- **Hazardous Waste Recycling and Treatment**

This guide is not intended to address all regulatory requirements pertaining to your business. Local jurisdictions may have additional, more specific stormwater BMP requirements. Pages 17 and 18 of this guide list additional contact information where you can obtain more information on stormwater and other regulatory requirements.

Thank you for helping to keep the San Diego region a great place for people to live and visit!

Facility Audits

Conducting your own facility audit is the best way to make sure that you stay in compliance with stormwater requirements. This can also save you money by identifying process and procedural improvements (waste prevention, etc.) to make your business activities more efficient. Be sure to address the following key areas during your audits:

- **Illegal Connections** - Inspect your business for connections that may convey pollutants to the storm drain system or receiving waters. An illegal connection is an unauthorized pipe, facility, or other device connected to the storm drain system, and may be illegal even if it was permitted at the time of installation.

- **Inlet and Discharge Points** - Identify the location of storm drain inlets on or down-gradient of your business or property. Mark these locations on a facility map and keep it posted in a common work area. Ensure that employees are shown these areas during training sessions.

- **Review of Activities** - Identify and use specific BMPs for activities with the potential to cause spills or releases of pollutants (oil, grease, fuel, etc.). Use the BMPs presented here as a guide for compliance, but don't stop there. Continue to seek out other sources of BMP information through the internet, professional associations, industry publications, etc. – you can never know too much.

- **Documentation** - Document any corrective action taken after your audit. Documentation is your key to demonstrating compliance. Be sure to include revised business practices and procedures in your employee training.

Employee Training

An effective stormwater management training program promotes employee ownership of problems and solutions. Employees are more likely to respond to training when they understand the impact of their daily activities on water quality. By involving your employees, their feedback will help implement needed actions to reduce stormwater pollution.

- Train all employees on stormwater BMPs and pollution prevention. Maintain training records on site; record the date of each training session and include a sign-in list of those who attended. Perform refresher trainings on a regular basis.

- Post signs around your shop reminding employees of BMPs and pollution prevention tips. This will also help to create awareness for your customers.

- Train employees about the proper use, handling, and disposal of all hazardous materials. Make sure all employees have current licensing and certification for their specific job duties.

- Teach employees how to control, contain, and clean up spills. Demonstrate how to properly use spill response kits.

You can stay informed about current regulations by joining trade associations and subscribing to trade journals and magazines. At trade association meetings and workshops, you will have the opportunity to learn about new pollution control practices and to network with others in your industry. Being involved will help you share ideas with others and will keep your training program up to date.

Spill Management and Reporting

It is always best to prevent spills, but be ready when they occur. Keep spill kits readily available, preferably near work areas where spills are most likely to occur. Make sure all employees know where these materials are kept and how to properly use them to contain and immediately clean up spills. Whenever possible, use dry methods such as sweeping, vacuuming, mopping or absorbents (if absorbents are used, they may have to be disposed of as a hazardous waste). Spilled hazardous materials (antifreeze, gasoline, solvents, etc.) need to be managed as hazardous wastes. Make sure your employees are aware of any special requirements that apply to hazardous material disposal.

Use the following guidelines within 24 hours of occurrence for reporting spills:

- Report any spill or discharge that cannot be completely contained or cleaned up prior to entering the storm drain system. To report spills and discharges, call the Regional Stormwater Hotline at **(888) 846-0800**.

- If the spill involves hazardous substances, call the Department of Environmental Health (DEH), Hazardous Materials Division at **(619) 338-2284**.

Always call **911** if the spill presents an immediate threat to public health or the environment.

Vehicles and Equipment

This section describes core BMPs for vehicle fluid management, engine and parts cleaning, vehicle and equipment washing, and body repair and painting. No matter which of these activities you are doing, it is important to always protect storm drain inlets on or down-gradient of work areas. Cover inlets with plastic or other impermeable material to prevent the entry of spilled fluids or wash water. Tape or weigh down the edges to keep the protective material in place.

Vehicle Fluid Management

Antifreeze, waste oil, and used solvents are hazardous wastes and must be stored, managed, and disposed of in accordance with all local, state, and federal laws.

- Whenever possible, drain vehicle fluids indoors or within covered areas, and only over floors that are constructed of a non-porous material such as concrete. Asphalt and dirt floors are not acceptable because they absorb spilled or leaked fluids.

- Use drip pans, containers, or other methods of drip and spill containment.
- Take extra precautions to prevent spills while draining fluids from vehicles. Transfer waste fluids to a labeled waste storage container as soon as possible.
- Provide drip pans under stored vehicles and those with known leaks. Drain fluids from disabled or stored vehicles as soon as possible to prevent leaks and spills.

- Transfer any fluids from drip pans or collection devices to designated waste storage areas regularly.
- Store vehicle fluids in separate, sealed, and leak-proof containers.

Vehicle & Equipment Washing

- Never discharge wash water or rinse water to a storm drain system or receiving water. Wash vehicles and equipment in designated areas. Use wash racks whenever possible.
- Use a spray nozzle or rinse bucket to conserve water and minimize discharge water.
- Whenever possible, use biodegradable soaps.
- Consider the use of a wash water recycling system to minimize wastewater from car washing.
- Use an oil / water separator or similar treatment system to remove oil, grease, and solids when discharging to the sanitary sewer.
- Use a commercial car wash facility if you are not able to meet the minimum standards described in this guide.
- Contact your local sewer agency for discharge information to the sanitary sewer. Use of oil / water separators and wash water recycling systems may have special discharge requirements.

OIL/WATER SEPARATOR

An oil / water separator is designed specifically to remove petroleum products, and can also remove solids. As the mixture enters the separator, the vehicle fluids float to a collection trough and the water flows into the sewer system. Solids settle to the bottom of the separator. Bottom sludges are often contaminated with heavy metals and other pollutants and must be managed as a hazardous waste.

Engine and Parts Cleaning

- Designate specific areas in your service bays for parts cleaning. Do not wash or rinse parts outdoors.
- Use aqueous cleaning solutions instead of solvents whenever possible. Recycle used solutions through a licensed hazardous waste hauler.
- Avoid using hose-off degreasers; never allow runoff to enter the storm drain system. Instead, brush off loose debris and use damp rags to wipe down parts. Manage used rags through a rag service or as hazardous waste.
- Clean parts in self-contained sinks or drum units when working with solvents. Inspect part washing units daily for leaks and make repairs immediately.

- Allow parts to drain over the solvent sink or drum, rather than allowing the solvents to drip or spill onto the floor. Never discharge the rinse solution into the sewer system.

- Recycle wastewater from steam cleaning or pressure washing activities. Discharges of wash water into the storm drain system are prohibited.

Body Repair and Painting

- Conduct work indoors or under cover when possible. If this cannot be done, take other precautions to prevent discharges from work areas.

- Inspect damaged vehicles for fluid leaks and use drip pans where necessary.

- Regularly clean work areas using dry methods. Use a shop vacuum or sweep up dust and debris. Do not vacuum flammable liquids.

- Allow wet sanding debris to dry overnight on the shop floor and sweep or vacuum it the next day. Liquid must not be discharged to the storm drain system. Consider investing in sanders with an attached vacuum system to capture dust at the source.

- Conduct painting only in approved, enclosed areas equipped with vacuum hoods and filters.
- Minimize paint and thinner waste by carefully calculating paint needs based on surface area and by using the proper sprayer cup size.
- Collect water used to control over-spray or dust in the paint booth and recycle or dispose of it properly. Clean spray guns in a self-contained unit and recycle or properly dispose of the cleaning solution.
- Check with your local fire agency and the Air Pollution Control District for additional information and permit requirements for spray booths, coatings, and emissions.

Good Housekeeping

"Good Housekeeping" refers to the routine practices you can use to maintain a clean work environment, and to prevent pollutants from entering our waterways. These practices include the use of dry cleaning methods for floor and paved surfaces, waste management practices, and grounds maintenance.

Floors and Paved Surfaces

- Sweep or vacuum your shop floors frequently. Use mops instead of hosing down work areas.
- Consider using a three mop system as described below:

1. Remove any spilled oil using a hydrophobic (oil absorbing) mop and wring out oil into a bucket labeled "Oil Only". Add the waste oil from this bucket to your waste oil drum or tank where it can be recycled. Keep the oil mop and the "Oil Only" bucket readily available in the work area for any future oil spills.
2. If antifreeze is spilled, use a regular mop and wring out the antifreeze into a bucket labeled "Coolant Only". Recycle the spilled material with other used antifreeze. Use rags sparingly for small spills or to dry a work area. Use a rag service or manage the rags as a hazardous waste.

3. Use a regular mop and bucket with detergent as a final rinse and use water sparingly. Dispose of wash water to an oil / water separator or the sewer.

- Never pour mop water onto paved areas, such as parking lots, sidewalks, street gutters, or storm drains.
- Oil / water separators must be regularly inspected and cleaned.
- Do not hose down fuel-dispensing islands; use only dry clean-up methods. Absorbent used for fuel spills should be promptly swept up and disposed of as hazardous waste.

Material and Waste Management

- Materials and waste such as fuels, solvents, batteries, and oils must be stored off the ground and in areas where they will not be exposed to rain water.
- If possible, provide overhead coverage for all outside hazardous materials or waste storage areas. If overhead coverage is not available, then cover stored materials with an impervious material such as a plastic tarp.
- Store batteries indoors and place used batteries in plastic trays to contain any potential leaks. Recycle used batteries regularly.
- Sweep parking lots and areas around your facility regularly. Do not hose down these areas. Provide trash cans with lids in your parking lot to discourage littering.
- Keep trash storage and disposal areas clean and free of debris. Inspect trash storage areas weekly. Maintain dumpsters and other containers in good condition and keep them securely closed when not in use.

- Contact your local solid waste hauler for recycling options and containers.
- Post "No Dumping or Littering" signs around your property.

Rooftops and Landscaped Areas

- Clean the rooftops of your buildings at least once before the rainy season. Cover any materials that are stored on the roof to protect them from rainwater.
- Maintain landscaped areas so that dirt and sediment do not reach the sidewalk or street.
- Apply pesticides and fertilizers according to label instructions and do not apply prior to rain. Consider using less toxic alternatives to pesticides and fertilizers whenever possible.
- Recycle or dispose of green waste properly.
- Properly berm and cover soil stockpiles.
- Ensure that sprinkler heads are adjusted properly to prevent over-irrigation and water runoff.

Hazardous Waste Recycling and Treatment

Please call the County of San Diego, DEH Hazardous Materials Duty Specialist at **(619) 338-2231** for incompatible waste storage and on-site hazardous waste treatment requirements.

Recycling

- Reuse and recycle solvents, paints, oil filters, antifreeze, motor oil, batteries, water, and lubricants whenever possible.
- Segregate wastes – it saves money! Combining different types of hazardous wastes will limit your recycling options and can be dangerous. A licensed hazardous waste hauler can provide information on hazardous waste storage and disposal costs.
- Label waste barrels and drums in accordance with all local, state, and federal laws and regulations. This will also help to remind employees to separate wastes and to recycle.

On-Site Waste Treatment

- Consider self-contained, zero discharge treatment alternatives that incorporate wastewater recycling.
- Choose treatment systems that are effective, but easy to maintain and repair.
- Properly maintain and service all pre-treatment equipment, including oil / water separators.

How to Reach Us

Regional Stormwater Hotline

To report spills and discharges to the storm drain system, call **(888) 846-0800**.

General Information

For additional information regarding water quality in the San Diego region, please use the resources listed below.

project clean water

THINK BLUE

You're the solution to storm drain pollution.

Protecting our beaches, bays, and watersheds

How El Cajon Residents and Businesses Can Help Keep Our Beaches Clean!

Many things about our local storm drains won't be as easy to ignore anymore. Over the past several years, a number of San Diego County coastal cities have posted permanent signs warning the public to stay clear of storm drain outlets at about 20 separate San Diego area beaches. The reason: **Contaminated water** flowing onto beaches from storm drain outlets poses a serious health danger to unsuspecting beach goers.

The first of the pollution warning signs was posted in late November of 1996 during a press conference at Tourmaline Surf Park in Pacific Beach. Temporary beach closures have also been required at Tourmaline Surf Park as well as beaches at Windansea and Avenida de la Playa in La Jolla Shores. Since then, as additional storm water information has been gathered, dozens of coastal storm drain outlets along beaches have been posted with similar warnings, at locations from Oceanside to Imperial Beach.

Trash and Debris in Forrester Creek – January of 2006

Often, children are at the highest risk of exposure because they play in the moist, soft sand fed by storm drain outlets near our beaches. The polluted water at these sites may be clear, have no objectionable odor, and still be contaminated. Parents are unaware of these serious health conditions because there are no obvious danger signs.

Public officials have long known that our stream and river waters become polluted from runoff during storms, because they take water samples from our streams and ocean. But they did not find out until the mid- to late-1990s that the dry weather storm drain flows often exceed public health standards.

Water is considered unfit for human contact when total bacteria, or fecal coliform bacteria, an indicator of contamination from human or animal wastes, exceeds critical levels. Investigators from various local agencies have so far been unable to pinpoint any particular source or sources for the storm drain and beach contamination. Instead, it is suspected that the source may be of a more ordinary nature. For example: someone washing a load of diapers and improperly disposing of the dirty wash water into the storm drain. Or perhaps a neighbor or friend walking a dog and then not properly disposing of the pet droppings. Such occurrences can raise bacteria levels enormously. It is this understanding of how we affect our own world that makes public education on our environment so important.

In the past, pollution investigators have traced storm water pollution to a variety of sources, ranging from people who illegally connected their sewage systems to storm drains, to recreational vehicle owners who dump holding tanks into our storm drains and streams. Anyone who observes illegal dumping into storm drains can assist investigators by calling the 24-hour Regional Storm Water Hotline at (888) 846-0800, or the City of El Cajon Storm Water Protection Program during business hours at 441-1653 to report the dumping event.

We all live in the same world, drink the same water, and breathe the same air. Because of this, people often wonder what they can do in their everyday lives to stop pollution. Below are some helpful hints on how you can help stop pollution and keep our beaches and storm water clean. **Remember, you are the Pollution Solution!**

Here Are Some Pollution Solutions!

In Your Home. . .

- ✓ Buy household cleaning products that are labeled "nontoxic."
- ✓ If you have to use toxic products, such as paint, solvents, and cleaners, use them carefully, according to directions provided on the container, and store them properly.
- ✓ Never put unwanted hazardous materials in the trash can. Instead, take them to local collection sites for safe disposal.

In your Yard and Garden. . .

- ✓ Read the labels of pesticides, herbicides, and fertilizers carefully. Use them sparingly and follow the directions on the container. Do not apply these substances if rain is forecast. Store all chemicals carefully in a safe place. Dispose of products that are no longer needed at a household hazardous materials collection location.
- ✓ Use a broom to clean up leaves, clippings, and litter from patios, sidewalks, and driveways. Do not use a hose because such cleaning will result in these materials ending up in the storm drain. Put litter and other debris in the trash can. Compost plant cuttings and leaves and reuse as a soil amendment in your garden.
- ✓ Collect and properly dispose of all wastes, including animal wastes, in your yard. Remember that you need to do this on a regular basis, and especially before the next rainfall washes the contaminants into the soil or storm drain.

Your Vehicle. . .

- ✓ Recycle used CRANKCASE OIL and ANTIFREEZE.
- ✓ Have your vehicle regularly inspected for leaks. Maintain it in good condition to reduce the chance of oil, antifreeze, and brake fluid leaking onto the street and into the storm drains.
- ✓ Help reduce exhaust emissions by keeping your vehicle properly tuned and in good working order. Carpooling also helps reduce emissions. Pollutants from engine exhaust contain many toxic chemicals that collect on streets, roofs, sidewalks, and parking lots. They are washed into the storm drains by rain, irrigation, and wash water.
- ✓ Use a shutoff nozzle on your hose when you wash your car. Use water and cleaners sparingly. Use biodegradable detergents or soaps instead of detergents containing phosphates whenever possible. Use a bucket and sponge to wash your vehicle. This reduces water runoff to the storm drains. Or better yet, take your vehicle to a Car Wash.

Join the Pollution Patrol. . .

- ✓ You can help control pollution by helping us find and educate those who are misusing our storm drains. We must all work together to keep our streams, rivers, reservoirs, bays, and beaches clean and pollution free for the creatures that live there, and for ourselves.
- ✓ Illegal Dumping: Call the El Cajon Storm Water Protection Program at 441-1653 or report the incident to the storm water link at www.ci.el-cajon.ca.us to report dumping of fuel and other hazardous substances in storm drains. Let's all work together to keep our community AND the beaches clean!

Pet Pollution Can Be a Serious Problem!

When John and Gloria pause for a minute on their daily dog walk, they leave behind in public places a surprising amount of bacteria-filled waste. It seems like such a small amount when you think it's just your dog out there, but it really does add up. Many people don't realize how important it is to take care of their pet waste so it stays out of our storm drains, streams, rivers, beaches and ocean.

The act of John and Gloria walking with their dog is a very common residential activity. Studies show that about half of all dog owners walk their dogs in public places, and about 40 percent of them fail to clean up after their pets.

In an community the size of El Cajon (about 100,000 people and 10,000 dogs), dogs generate about two and a half tons (5,000 pounds) of feces per day. That's nearly two million pounds a year. Since a significant percentage is not properly disposed, that's a lot of bacteria in our neighborhoods, storm drains and watershed. According to even the most conservative estimates, all this pet waste can cause serious environmental harm unless it is properly controlled.

Dog and cat waste left on the ground can be washed into our neighborhood storm drains, all of which drain directly into natural water bodies without treatment of any kind. There the waste contributes to all sorts of problems, such as sick children and mucky waterways choked with algae that suffocates fish and can sometimes be poisonous to humans.

The same bacteria that make pet waste dangerous to people in parks can make the water unsafe for swimming or drinking. Children and others can get sick if they dunk their heads or accidentally get a mouthful of polluted water. And when waste gets into shellfish beds, it can make clams and oysters unsafe to eat.

Dog Poetry

If taking care of number two
is number one to you,
then picking up your doggy doo
should matter lots to you.

So scoop the poop and bag it
and place it in the trash;
your doggy doo reflects on you,
It's what your puppy passed!

Children and others who play in yards or in parks where pets eliminate waste can pick up illnesses from disease-causing bacteria and parasites. These include diarrhea, fever, muscle aches, headaches, vomiting, roundworms and toxoplasmosis (a parasite carried by cats that can cause birth defects if a woman becomes infected during pregnancy). Other pets can get sick too.

How You Can Make A Difference And Keep Our Water Clean!

When walking with your pet, take a plastic bag or paper cup along and dispose of the waste properly by:

- ✓ Flushing pet waste down the toilet, or
- ✓ Putting pet waste in the household trash after securely wrapping it. (Never put pet waste in a landscape waste container or the compost bin), and
- ✓ Be aware of and follow the Storm Water Management Ordinance that governs pet waste cleanup. The Storm Water Management Ordinance states, *"Pet waste shall not be disposed to the storm water conveyance system or receiving waters."* Remember that, if not cleaned up and disposed of properly, pet waste will eventually find its way into the storm drain system.

Pet Waste Pledge Card

I Pledge to do my part to protect water quality in El Cajon by:

- ✓ Picking up after my pet
- ✓ Properly disposing of pet waste by flushing it down the toilet or disposing of it in the trash
- ✓ Encouraging others to do the same

Do You Know How Many Dogs Live In El Cajon?

- Around 10,000 registered dogs reside in the City of El Cajon.
- These dogs create approximately 5,000 pounds of pet waste per day!
- Pets, as well as humans, can catch diseases through coming into contact with infected pet waste.

The number of pets in El Cajon is much greater than the number of wild animals that once lived here. If we kept just a few pets their waste might not be much of a problem. But we keep a lot of dogs and it is estimated that there are even more cats than dogs.

You wouldn't want to live in a city that lacked a public sewer system. With as many dogs living in the City of El Cajon, not cleaning up and properly disposing of pet waste can be a pollution problem. You can be an important part of the pollution solution.

Join the Storm Water Pollution Team. Report any violations or other problems you witness by contacting the El Cajon Storm Water Protection Team at (619) 441-1653 or calling the Regional 24-hour Storm Water Hotline at 1-888-846-0800. Information and articles are also available at the El Cajon Storm Water Website at http://www.ci.el-cajon.ca.us/dept/works/stormwater.html.

We All Need to Protect Our Watershed

The health of a stream depends on the quality of the water that flows through it. To care for the stream, we must also care for all the land that drains to it—its *watershed*.

San Diego River - Downstream from El Cajon
You have an important role in its preservation!

Everything in the watershed affects the water in the stream. Hazardous chemicals, automotive products, pesticides, fertilizers, pet wastes, excessive soil erosion and air pollution all contribute to water pollution. These pollutants don't have to be dumped directly into the water to cause a problem. They are washed from streets, lawns, roofs and even out of the air by rainfall—eventually ending up in wetlands, streams and lakes.

The storm drain or gutter in the street outside your home carries water into a network of storm drains that lead directly to San Diego River. Storm drains are separate from the sewer system, because sewer systems handle wastewater from your sinks, tubs and toilets. Storm drains do not go to a treatment plant but into our streams, rivers and ultimately the ocean.

Resulting impacts of water pollution can range from the obvious, such as oil floating on the water to losses of wildlife due to habitat destruction that often goes unnoticed.

What You Can Do to Help

Everyone has a part in protecting our watershed and preventing water pollution. While the contribution of one home to water pollution may be small, the combined effect of an entire neighborhood or city can be substantial. Here are some suggestions we all can use to help keep our watershed clean:

- ✓ Use chemical fertilizers and pesticides sparingly. When applied excessively, they can be washed into a nearby storm drain by your sprinklers or rain-damaging aquatic life. Even lawn clippings contain these pollutants. Leave them on the lawn as natural fertilizer or compost them.

- ✓ Keep automobiles in good condition and drive as little as possible. This helps keep oil and air pollution out of water sources. Wash cars at commercial car washes that drain to the treatment plants instead of your driveway that drains to the creeks.

- ✓ Dispose of hazardous household wastes such as paints, solvents, used oil and cleaning products properly. The City of El Cajon contracts with Waste Management, Inc. to accept residential household hazardous waste for FREE on the second and fourth Saturday of each month and by APPOINTMENT ONLY. Residents can drop off no more than 15 gallons or 125 pounds of household hazardous waste. Call (619) 596-5100 to schedule an appointment time.

The choice is ours—do we want a watershed that keeps our steams, rivers, beaches and ocean healthy, or a watershed that struggles to survive? **Remember that you are the Pollution Solution!**

Why It's Important to Keep Trash, Sediment and Debris Out of Our Storm Drains

Each year, the City of El Cajon conducts twice-yearly cleanups of all city storm drain inlets and drainage channels to remove trash, sediment and debris. In addition to this the City has developed a comprehensive street sweeping program with a twice-a-week sweeping cycle for commercial areas, a once-a-week sweeping cycle for industrial areas, and a biweekly sweeping cycle for residential areas. The City adheres to this sweeping schedule except when weather or equipment availability makes adherence to the sweeping schedule impossible. During times when street sweeping is impossible, City staff conduct "Storm Water Patrols" to identify localities where more limited, localized cleanups can be accomplished. As a result of the effort, City crews collect several thousand cubic yards of trash, sediment and debris each year in our efforts to keep our streets and storm water systems clean.

So, Why Is All That Trash In The El Cajon Drainage Channels?

Yet, in spite of these efforts, trash and debris continues to collect in our drainage channels and storm drains in large amounts, polluting the water and creating an unsightly mess. The reasons behind this trash accumulation range from problems with the homeless living in the drainage channels to thoughtless littering by average citizens. The intent of this article is to address the problem of littering so that all El Cajon residents can understand the importance of not littering, and by doing so, become a part of our community's solution to storm water pollution.

Trash in the Washington Channel

An analysis of the trash removed from City streets, storm drains and drainage channels reveals that a majority of the trash originates from sales at fast food restaurants, convenience stores, and take-out delicatessens. Well more than half of the trash removed consists of disposable beverage cups and food wrappers. Below are helpful hints for both business owners and customers to ensure that trash finds its was into trash trucks instead of finding its way into our streets, storm drains, drainage channels and ultimately the beaches.

What You Can Do As A Business Owner….

Contaminants from your facility can contribute to polluted runoff when floors and outside areas such as sidewalks, patios and parking lots are not maintained or cleaned properly. Make an effort to educate your customers by speaking to them about not littering, or by posting some signs.

Hints On Keeping Floors and All Outside Areas Clean:

- Keep all outside areas (dumpsters, parking lots, etc.) free of trash and debris, and regularly clean them to prevent pollutant buildup.
- Use absorbent for liquid spills, then sweep or use a slightly wet mop to finish cleaning outside areas.
- Regularly inspect and clean out grease traps.
- Avoid spilling onto floors or other surfaces through good housekeeping.
- Control litter by sweeping and picking up trash on a regular basis.
- Never dispose of wash waters to the storm drain.
- Use "dry" cleaning methods (sweeping, vacuuming, etc.) on sidewalks and parking lots and dispose of waste properly.
- Use damp mop to clean floors, and contain the wash water for proper disposal (sewer, on-site treatment, etc.).
- Label all storm drain inlets "No Dumping".
- Clean up spills immediately to minimize safety hazards and deter spilling.
- Train all employees. Your success depends on an effective training program.

What Works In Parking Lots:

- Use dry cleaning methods to clean parking lot pavement – absorbents, brooms, or wire brushes.
- Clean up sediments and other solids from parking lots immediately to prevent them from blowing or washing away.
- Mechanically remove loose debris before washing the lot with water.
- Dispose of parking lot debris properly. To determine the proper disposal method, contact the facility that you expect to take the material to for disposal.
- Clean parking lots early in the day if heavy rains are forecast.
- Assign numbered parking spots for each driver or vehicle. This helps to identify leaking vehicles so they can be repaired.
- Pressure wash pavement only when necessary. Avoid the use of acids and other harsh cleaners.
- If pressure washing is used, wash with water only. Be aware that dissolved pollutants or cleaning products can travel through underlying soils and contaminate groundwater.

Keep The Trash inside Trash Bins or Trash Cans:

- Don't put liquids in trash bins or trash cans.
- Place trash bins or trash on concrete surfaces.
- Keep lids tightly closed to keep the rain out.
- Assign someone to regularly clean up the ground around trash bins.
- If a trash bin or trash can leaks, immediately repair or replace it.
- Make sure that storage containers are in good condition and lined with a material that will not deteriorate.
- Trash bins or trash cans stored outside should be watertight, rodent-proof, and protected from tampering.

What You Can Do As A Food Take-Out Customer:

- Make sure you collect and properly dispose or recycle all trash.
- Talk with business owners if you see trash disposal problems at a business, or call the El Cajon Pollution Prevention Program at (619) 441-1653.
- Speak with others about the importance of not littering.
- Participate in community-sponsored cleanups.

As a concerned citizen, you can be proud that you are part of the Solution to Storm Water Pollution and not part of the problem. Remember, "Only Rain in the Drain!"

For more information, contact the El Cajon Storm Water Protection Program at (619) 441-1653, or use your web browser to access our program at:

http://www.ci.el-cajon.ca.us/dept/works/stormwater.html

Over-Irrigation Can Cause Storm Water Pollution

Even though El Cajon receives about 13 inches of precipitation on an average year, storm water is a problem for the city and many of its residents. The sometimes short, intense rain storms can cause flooding and soil erosion. Runoff from parking lots, buildings and other impervious surfaces can cause water to pool up in the streets.

These are some of the more obvious problems because they are on the surface for all to see. But there are some much less obvious problems and these have to do with the pollutants carried by storm water.

Storm water drained from El Cajon's paved streets, parking lots, driveways buildings and construction sites discharges with little or no treatment to our storm drain system. This runoff can also pollute the ground water that eventually finds its way into our streams, rivers and beaches. It also dramatically increases storm drain maintenance costs.

The City's storm drains are intended to collect and convey only one thing: uncontaminated storm water. Anything that is spilled, dumped or deposited on a landscaped area or paved surface will be washed into the storm drain if it is not cleaned up before the next storm event. Over-irrigation of landscaped areas flushes pollutants, including herbicides, pesticides, fertilizers, bacteria and any other pollutants residing on vegetation or in soil, causing dry weather flows of polluted urban runoff.

Recent dry-weather testing of runoff in the northwesterly, downstream portion of Forrester Creek has yielded fecal bacteria counts that are unacceptably high. Fecal bacteria originate in the waste of warm-blooded animals. Follow-up investigations have not located a point source for the bacteria, and a probable explanation is that the high bacteria counts result from the flushing of bacteria-laden soil in landscaped and paved areas in typical neighborhoods around our city.

It is very difficult to keep paved surfaces entirely free of contaminants. Automobile traffic and wind do their parts to spread dust and debris. But we can easily do something about many human and pet activities that pollute storm water.

Rather than institute an expensive storm water treatment program, the El Cajon Storm Water Protection Program is asking for your help in keeping contaminants out of our storm water. If we all do our part, we can significantly reduce the storm water pollution loads to the river and ground water. Here's some tips on how you can help:

- ✓ Pick up all pet waste and either flush it down the toilet or place it in the trash
- ✓ Check your landscape irrigation to insure that you are not over-saturating the soil or causing irrigation runoff
- ✓ Read and follow all instruction when applying herbicides, pesticides and fertilizers
- ✓ Collect and compost or recycle all green waste. Remember, it contains the herbicides, pesticides and fertilizers you have applied to your landscape
- ✓ Be sure and collect all trash and debris around your yard before it can be washed or blown away

Simply stated, we need keep sediments, trash, debris and other contaminants off of paved surfaces and out of our storm drains. Remember, you are the Solution to Storm Water Pollution.

For more information, contact the El Cajon Storm Water Protection Program at (619) 441-1653, or use your web browser to access our program at:

http://www.ci.el-cajon.ca.us/dept/works/stormwater.html

City of El Cajon
Storm Water Protection Program

Pet Pollution Can Be a Serious Problem!

When John and Gloria pause for a minute with their dog on their daily walk, they leave behind a surprising amount of bacteria-filled waste. It seems like such a small amount when you think it's just your dog out there, but it really does add up. Many people don't realize how important it is to take care of their pet waste so it stays out of our storm drains, streams, rivers, beaches and ocean.

The act of John and Gloria walking with their dog is a very common residential activity. Studies show that about half of all dog owners walk their dogs in public places, and about 40 percent of them fail to clean up after their pets.

Only Rain in the Drain!

In a community the size of El Cajon (about 100,000 people and 10,000 dogs), dogs generate about two and a half tons (5,000 pounds) of waste per day. That's nearly two million pounds a year. Since a significant percentage is not properly disposed, that's a lot of bacteria in our neighborhoods, storm drains and watershed. According to even the most conservative estimates, all this pet waste can cause serious environmental harm unless it is properly controlled.

Dog and cat waste left on the ground can be washed into our neighborhood storm drains, all of which drain directly into natural water bodies without treatment of any kind. The waste contributes to all sorts of problems, such as sick children and mucky waterways choked with algae that suffocates fish and can sometimes be poisonous to humans.

Dog Poetry

If taking care of number two,
Is number one to you,
Then picking up your doggy doo,
Should matter lots to you.

So scoop the poop and bag it,
And place it in the trash;
Your doggy doo reflects on you,
It's what your puppy passed!

The same bacteria that make pet waste dangerous to people in parks can make the water unsafe for swimming or drinking. Children and others can get sick if they dunk their heads or accidentally get a mouthful of polluted water. And when waste gets into shellfish beds, it can make clams and oysters unsafe to eat.

Children and others who play in yards or in parks where pets eliminate waste can pick up illnesses from disease-causing bacteria and parasites. Do You Know How Many Dogs Live In El Cajon?

- Around 10,000 dogs reside in the City of El Cajon.
- These dogs create approximately 5,000 pounds of pet waste per day!
- Pets, as well as humans, can catch diseases through coming into contact with infected pet waste.

The number of pets in El Cajon is much greater than the number of wild animals that once lived here. If we kept just a few pets and keep them mostly indoors, their waste might not be much of a problem. But we keep a lot of dogs and it is estimated that there are even more cats than dogs.

You wouldn't want to live in a city that lacked a public sewer system. With as many dogs living in the City of El Cajon, not cleaning up and properly disposing of pet waste can be a pollution problem. You can be an important part of the pollution solution.

A “How-To” Guide to Car Wash Fundraisers

How can a car wash pollute our creeks?

A car wash is a great way to have fun while raising funds for your school or community group. However, did you know that when soapy water enters the storm drain system it flows directly to the nearest creek? Soap, even if it is biodegradable, is a pollutant that can be harmful to fish and other aquatic life that depend on clean water for their survival. In addition to soap, car wash water carries pollutants dislodged by the washing process, such as dirt, oil, and other toxic automotive fluids into our storm drains, creeks and rivers.

Is it possible to host a car wash that will not pollute our storm drains, creeks and rivers?

Yes, you just have to select a site where the wash water can be collected and disposed of to the sanitary sewer or soaked into a landscaped area without entering a storm drain. The City of El Cajon can help you determine if the site is appropriate and offer suggestions on how to dispose of the water.

How do I keep car wash water from entering the storm drain system?

There are several ways you can do this. Use your imagination and the ideas below to figure out what will work best.

- One way is to temporarily block off the storm drain, collect the water, and use a small sump pump to remove the water to either a vegetated area or into a clean out opening to the sanitary sewer.
- Wash the cars in a place where the natural drainage pattern will route wash water into a vegetated area such as a lawn or vacant lot. Be sure to have the owner’s permission if wash water is draining onto a neighboring property. You might be able to use sand bags, rolled towels, hoses, or other materials to divert the surface runoff to the vegetated area.

How do I seal off a storm drain?

Many parking lots have grated inlets placed in low areas. If the grate can be removed, remove it and place a sheet of heavy plastic over the inlet that extends beyond the edges. Replace the grate. Then put a heavy rubber mat or a lighter rubber mat with weights on it over the grate. Be sure to form a tight, waterproof seal that will keep all water out of the storm drain. If the grate cannot be removed place plastic sheeting and then rubber mats over the top of it. Rolled up towels can be placed around the edge of the mat to increase the “water tightness.”

Some parking lots drain through openings in the side of the curbs called curb inlets. These inlets can be sealed off with a sheet of heavy plastic topped with sand bags or other weights. Again, be sure the seal is tight before you start washing cars.

If the car wash site drains into the street and then into the storm drain, be aware that sealing storm drains in the street is not allowed. It can create a traffic hazard and also endanger those running the pump. You must use a storm drain inlet on private property and be sure that you have the owner's permission to work there.

Where do I get a sump pump?

Sump pumps are available at equipment rental stores for $15-$20 per day. (They are commonly used to remove water from basements or other low places where water collects.) Or perhaps someone in your group has a pump or a wet vacuum that can be used for the event.

Is any other equipment necessary?

You will need a hose to carry water from the pump to either the sanitary sewer clean out or the vegetated area. An extension cord will probably be needed along with a source of electricity. A broom may also be handy to sweep water towards the pump or to spread the water out so it will evaporate.

Does the pump need to be turned on all the time?

No. Some pumps will automatically turn on when the water level reaches a certain depth. Otherwise, someone has to be responsible to turn the pump on and off as water accumulates and is pumped away. A pump that is left running without water flowing through it to cool the motor can overheat and be damaged.

Once the car wash is over can soap residue harm creeks?

Yes. Rain can wash the soap into the storm drain system where it can then pollute creeks. Remember that biodegradable soap is harmful to fish and wildlife until it degrades. This process can take considerable time. It is a good idea at the end of the car wash, while the storm drain seals are still in place, to thoroughly rinse down the wash area and properly dispose of the rinse water.

This all sounds pretty complicated. How can I be sure that our car wash is set up properly?

The City of El Cajon Storm Water Program is available to answer your questions and even evaluate a site with you. We can offer suggestions and help you determine the best way to keep wash water out of the storm drain system. Call the El Cajon Storm Water Protection Program at (619) 441-1653 for assistance.

Sewage Spill Reference Guide
Your Responsibilities as a Private Property Owner

How a Sewer System Works

A typical sanitary sewer system is constructed of a network of pipes, laterals and mains connecting to each building and transporting sewage to a wastewater treatment plant (see diagram to the right).

A property owner's sewer pipe is called a **sewer lateral** and connects to a larger City-maintained pipe called a sewer main typically located in the street.

As stated in the El Cajon Municipal Code, **sewer laterals are the responsibility of the property owner** and must be maintained by the property owner for the entire distance from the house to the sewer main.

What is a Sewage Spill?

Sewage spills occur when the wastewater being transported via underground pipes overflows through a manhole, cleanout, or broken pipe. Sewage spills can cause health hazards, damage to homes and businesses, and threaten the environment, local waterways, and beaches.

Common Causes of Sewage Spills

Grease builds up inside and eventually blocks sewer pipes. Grease gets into the sewer from food establishments, household drains, as well as from poorly maintained commercial grease traps and interceptors. Grease is a common cause of sewer pipe blockages, especially in commercial and industrial areas.

Large objects such as paper towels, rags, disposable diapers or children's toys can contribute to a blockage.

Structural problems caused by tree roots in the lines, broken or cracked pipes, missing or broken cleanout caps, or undersized sewers can cause blockages. Blockages by roots are a common cause of blockages in residential areas.

Infiltration and inflow impacts pipe capacity and is caused when groundwater or rainwater enters the sewer system through pipe defects and illegal connections.

You Are Responsible for a Sewage Spill Caused by a Blockage or Break in Your Sewer Lines!

Time is of the essence in dealing with sewage spills. You are required to **immediately:**

- ✓ **Control and minimize the spill.** Keep spills contained on private property and out of gutter, storm drains and public waterways by shutting off or not using the water.

- ✓ **Use sandbags, dirt or plastic sheeting** to prevent sewage from entering the storm drain system.

- ✓ **Clear the sewer blockage.** Always wear gloves and wash your hands. It is recommended that a plumbing professional be called for clearing blockages and making necessary repairs.

- ✓ **Notify the El Cajon Department of Public Works** by calling (619) 441-1653 during non-holiday business hours (8am to 5pm, M-F), or call the Police Department Communications Center 24-hour number at (619) 579-3311. City forces can help in containing and capturing the sewer spill, but we need your telephoned notification. The City of El Cajon is currently required by California State Law to report any and all known sewage spills to a State-wide reporting system, regardless of whether they occur on private or public lands.

You May Be Liable

Allowing sewage from your home, business or property to discharge to a gutter or storm drain may subject you to penalties and/or out-of-pocket costs to reimburse our City for clean-up efforts and enforcement actions.

What To Look For

Sewage spills can be a very noticeable gushing of water from a manhole or a slow water leak that may take time to be noticed. Investigate suspicious looking wet areas. Look for:

- ✓ Drain backups inside the building.
- ✓ Wet ground and water leaking around manhole lids onto your street.
- ✓ Leaking water from cleanouts or outside drains.
- ✓ Unusual strong offensive odors from wet areas near sidewalks, external walls, or landscaped areas.
- ✓ Slow draining or clogged sinks and toilets

Be Cautious

Keep people and pets away from the affected area. Untreated sewage has high levels of disease-causing viruses and bacteria.

How You Can Prevent Sewage Spills Before They Happen

- ✓ Never put grease down garbage disposals, drains or toilets.
- ✓ Perform periodic cleaning to eliminate grease, debris and roots in your house plumbing and sewer lateral.
- ✓ Repair any structural problems in your sewer system and eliminate any rainwater infiltration or inflow into your plumbing system.
- ✓ Do not dispose of paper towels, or other large objects in toilets.

The City of El Cajon

California

PROCLAMATION

"POLLUTION PREVENTION DAYS"
May 16th and August 29th, 2007

WHEREAS, *storm water management services provided in our community are an integral part of our residents' everyday lives. The support of an understanding and informed citizenry is vital to the efficient operation of storm water management programs; and*

WHEREAS, *the health, safety and comfort of this community greatly depends on these services. The quality and effectiveness of these services, as well as their planning and implementation is vitally dependent upon the efforts and skill of storm water management staff; and*

WHEREAS, *the efficiency of the qualified and dedicated personnel who staff the storm water management division is materially influenced by the people's attitude and understanding of the importance of the work they perform.*

NOW, THEREFORE, *I, Mark Lewis, Mayor for the City of El Cajon, together with the City Council, do hereby proclaim the days of May 16th and August 29th, two thousand and seven to be "POLLUTION PREVENTION DAYS" in the City of El Cajon. We further call upon all residents and civic organizations to acquaint themselves with the issues involved in providing our services and to recognize the contributions which public works officials make every day to our health, safety, comfort, and quality of life.*

Signed this eighth day of May, two thousand and seven.

Mayor

- ❑ Yard waste (leaves, grass, etc.)
- ❑ Uncovered dirt and gravel pile(s).
- ❑ Construction debris
- ❑ Trash
- ❑ Other

Be a Clean Water Leader

Storm water pollution is a problem that affects all of us. With a growing population of more than 95,000 residents and approximately 14 square miles of urbanized development, keeping our waters clean from pollutants has become increasingly difficult. With thousands of storm drain inlets, and nearly 100 miles of storm drain pipes and channels to clean and maintain, we need your help.

When it rains, water flows over across our yards and into our streets carrying pollutants into our storm drains. The problem is that storm drains are not connected to the wastewater sewer treatment plant. So, what's in the streets flows directly into our creeks, rivers and the ocean, without treatment.

Last year, too many of our beaches and bays were closed or posted as unsafe for swimming. As our City

Be a Clean Water Leader

Storm water pollution is a problem that affects all of us. With a growing population of more than 95,000 residents and approximately 14 square miles of urbanized development, keeping our waters clean from pollutants has become increasingly difficult. With thousands of storm drain inlets, and nearly 100 miles of storm drain pipes and channels to clean and maintain, we need your help.

When it rains, water flows over across our yards and into our streets carrying pollutants into our storm drains. The problem is that storm drains are not connected to the wastewater sewer treatment plant. So, what's in the streets flows directly into our creeks, rivers and the ocean, without treatment.

Last year, too many of our beaches and bays were closed or posted as unsafe for swimming. As our City

Leaders have said, “this is more than an inconvenience; it is a civic embarrassment.” **Discharging pollutants to the City's storm drain system is in violation of Title 13.24 of the El Cajon Municipal Code and violations can result in substantial fines.**

But, as a City resident, you can make a difference. By becoming a Clean Water Leader, both on the job and in your community, you can help make our stream, rivers and beaches free of pollution. When you're at home, share your knowledge with neighbors and family. As you drive to work, be aware of any illegal discharges. And, if you do see an illegal discharge, report it. In the City of El Cajon you can **call the City of El Cajon at (619) 441-1653, or the 24-hour Storm Water Hotline at (888) 846-0800**.

Whether at home or at work, by adopting some simple Best Management Practices (BMPs), you can stop pollutants from being generated and entering our storm drain system.

- ✓ Use dry clean-up methods for spills and outdoor cleaning. Vacuum, sweep, and use rags or dry absorbants. Properly remove and dispose of this material when the spill is absorbed.
- ✓ Properly label, store and dispose of hazardous wastes. Rake, sweep up, and place all debris (dust, litter, sediment, etc.) from your yard or near your property into a trashcan.
- ✓ Use a mop only when water is needed.

As you perform your daily activities be proactive. Assess the activity from a storm water pollution point-of-view and ask yourself; “does this activity, directly or indirectly, generate pollution?” And, “how can I get the job done and prevent debris from entering into the storm drain collection system?”

LETTER OF PERMISSION FOR I LOVE A CLEAN SAN DIEGO (ILACSD) TO STENCIL STORM DRAIN INLETS IN THE CITY OF EL CAJON

This letter gives permission to ILACSD staff and volunteers to apply the message "No Dumping…I Live Downstream" and a depiction of a dolphin or duck to the curb area directly adjacent to storm drain inlets within the City of El Cajon. Validity of this letter of permission is for two years from the date of this letter, unless otherwise notified.

We would like to thank I Love A Clean San Diego for their efforts in this important program, which will help the City of El Cajon in educating the public regarding storm water runoff and pollution prevention.

All storm drain stenciling activities should be coordinated with our Storm Water Program staff, the City Manager's Office and the Police Department to properly identify neighborhood within our city where inlets would benefit from being stenciled and to secure areas for volunteers to park cars and safely coordinate activities. City Storm Water staff can be contacted as described below.

Should you have any questions or require additional information, please contact Jaime Campos at (619) 441-5554, jcampos@ci.el-cajon.ca.us or Robert W. Griswold at (619) 441-1704, bgriswold@ci.el-cajon.ca.us

Program Assessment Form
Land-Use Planning for New Development and Redevelopment Component (F.1.)

QUANTITATIVE ASSESSMENT: **1/31/08**

Activity	Quantity	Units	Comments
Number of projects subjected to SUSMP requirements	28	#	Include ministerial and discretionary projects

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of your department's component over the past year.
(General Plan or ordinance revisions, procedure/approval process changes, SUSMP guidance material)

Continued to work with the Planning Department to established procedures and ensure that all projects submitted to the Planning Department are reviewed for SUSMP requirements. Inspected all projects that completed the SUSMP treatment requirements.

2. Summarize the educational and outreach activities the Planning Department has conducted over the past year to educate staff, community planning groups and the public on water quality principles.

Continued to conducted one-to-one training with City Planning and Building staff.

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Continued developing an in depth review process of condominium conversion projects to identify those that should be required to comply with SUSMP requirements.

4. Other comments.

Program Assessment Form **1/31/2008**
Construction Component (F.2.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Explanations (if needed)
Number of high priority construction sites identified	20	#	
Number of high priority construction sites targeted for inspection	20	#	
Number of high priority construction sites inspected	20	#	
Number of medium priority construction sites identified	10	#	
Number of medium priority construction sites targeted for inspection	10	#	
Number of medium priority construction sites inspected	10	#	
Number of low priority construction sites identified	101	#	
Number of low priority construction sites targeted for inspection	0	#	
Number of low priority construction sites inspected	24	#	
Total number of construction sites in compliance or on a compliance schedule	54	#	
Number of facilities referred to RWQCB for enforcement of State General Construction Permit	0	#	

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Construction Component over the past year.
(Procedure changes, new requirements, ordinance revisions, guidance material developed/adopted)

Improved spreadsheet to keep a better inventory of construction projects in the City (i.e. high, medium, and low priority). City gave 21 enforcement actions noted at construction projects, (5) five of which were monetary citations.

2. Summarize the internal and external educational and outreach activities the Construction Component has conducted over the past year.

Conducted informal training while insepcting construction sites or during complaint investigations. The City also educates every proponent of projects about storm water over the front counter of the Public Works Department.

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Will continue to ensure implementation of minimum BMPs at priority construction sites to keep using the inventory spreadsheet to improve the construction inventory list.

4. Other comments.

Program Assessment Form **1/31/2008**
Existing Development - Municipal Component (F.3.a.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Comments
Number of high priority municipal facilties	**5**	#	
Number of high priority municipal facilities targeted for inspection	5	#	
Number of high priority municipal facilities inspected	5	#	
Number of medium and low priority municipal facilities inspected	0	#	
Quantity of material removed from MS4	1,654	cubic yards	direct measure; report in cubic yards.
Quantity of debris removed that could have enter MS4 (i.e. street sweeping, litter removal)	5,113	cubic yards	direct measure; report in cubic yards.

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Municipal Component over the past year.

Completed a 100% cleaning of all City storm drains, open-channels and conveyances, including curb-inlet boxes.
Sweept 18,781 miles of curbed streets.
Cleaned 210 miles of sanitary sewers.

2. Summarize the educational and outreach activities the Municipal Department has conducted over the past year to educate staff on water quality principles.

Conducted training to Public Works Maintenance and Parks Maintenance Employees. Training sessions were also conducted for Public Works inspectors and police officers.

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Continue to conduct the removal of homeless encampments within the City's storm drain system

4. Other comments.

Continued to conducted monitoring and maintenance of the trash and debris fence

Program Assessment Form **1/31/2008**
Existing Development - Industrial Component (F.3.b.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Explanations (if needed)
Number of high priority facilities identified	26	#	
Number of high priority facilities targeted for inspection	26	#	
Number of high priority facilities inspected	26	#	
Number of medium and low priority industrial facilities inspected	0	#	
Number of facilities in compliance or on a compliance schedule	26	#	All high priority facilities were in compliance.
Number of facilities referred to RWQCB for enforcement of State General Industrial Permit	0	#	

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Industrial Component over the past year.

Inspected all High Priority Industrials, verified Minimum Required BMP implementation at each site, obtained and reviewed monitoring data from all High Priority Industrials

2. Summarize the internal and external educational and outreach activities the Industrial Component has conducted over the past year.

Provided brochures and other information to industrial facilities during inspections or in response to complaints/referrals

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Through inspections, ensure that: 1) all high priority industrials facilities are implementing minimum BMPS; 2) identify and inspect new industial facilities; 3) conduct followups to previous years inspections as necessary; and 4) collect water quality data and tabulate for review and comparison to other water quality data to help establish priorities for future inspections, investigations source identification and planning actions

4. Other comments.

Future Action: compare Industrial facility wet weather monitoring data to municipal wet weather monitoring data to evaluate potential impacts of industrial storm water discharges to receiving waters during rainy season

Program Assessment Form **1/31/2008**
Existing Development - Commercial Component (F.3.c.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Explanations (if needed)
Number of high priority facilities inspected	136	#	
Number of medium and low priority commercial facilities inspected	0	#	
Number of facilities in compliance or on a compliance schedule	136	#	

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Commercial Component over the past year.

1) Inspected Auto Repair and Service Facilities
2) Verified implementation of minimum BMPs

2. Summarize the internal and external educational and outreach activities the Commercial Component has conducted over the past year.

1) Provided Posters and Brochures to Vehicle Repair and Service facilities during inspections
2) Discussed water quality issues at facilities during investigations of complaint/referrals

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Focus on facilities that have failed to fully implement the minimum BMPs and conduct inspections based on new Municipal Permit R9-2007-0001

4. Other comments.

Program Assessment Form **1/31/2008**
Existing Development - Residential Component (F.3.d.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Comments
Quantity of HHW materials collected	236,890	Pounds	direct measure. Information can be obtained from the jurisdiction's Annual Report of Household Hazardous Waste Collection Information, as required by the California Integrated Waste Management Board on CIWMB Form 303 (see: http://www.ciwmb.ca.gov/HHW/Reporting/). Information on waste oil collected by Certified Used Oil Recycling Collection Centers throughout the jurisdiction may also be available directly from the Collection Centers, although their statutory reporting requirements are limited.

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Residential Component over the past year.

Collection of 236,890 pounds of household wastes removed and disposed of properly.
An increase from last year.

2. Summarize the educational and outreach activities the Residential Component has conducted over the past year to educate staff, community groups and the residents on water quality principles.

Pollution Prevention Days, several throusand attendees

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Further refinement of the Residential BMP program
Take advantage of new opportunities to present or participate
in outreach events, conferences, training etc

4. Other comments.

Program Assessment Form **1/31/2008**
Education Component (F.4.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Explanation (if needed)
Number of storm water education/instructional materials/brochures distributed	190,000	#	Equals number of brochures printed (assuming # printed = # distributed).
Number of public employee training events regarding storm water principles	8	#	While # of employees trained might prove more informative, Permit Section I.1.b.(4) asks for "education efforts conducted."
Number of storm water-related instructional workshops / outreach events conducted	1	#	Equals number of events directed at the public-at-large, not public employees.

1. Describe the major accomplishments of the Education Component over the past year.

Distributed 38,000 copies of the City newsletter; Articles covered:
1) How El Cajon Residents and Businesses Can Help Keep Our Beaches Clean;
2) Over Irrigation Can Cause Storm Water Pollution;
3) Pet Pollution Can Be a Serious Problem;
4) We All need to Protect Our Watershed;
5) Why It's Important to Keep Trash, Sediment and Debris Out of Our Storm Drains

2. Summarize the storm water educational materials developed over the past year.

1) 190,000 Articles in city newsletter (five articles @ 38,000 copies each)
2) 39,000 Mailers in sewer invoices (three articles @ 13,000 copies each)

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Continue to focus on trash and debris management

4. Other comments.

Program Assessment Form **1/31/2008**
Illicit Discharge Detection and Elimination Component (F.5.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Comments
Number of dry weather sampling locations monitored	33	#	
Number of illicit connections eliminated or on a compliance schedule	0	#	none identified this year
Number of illegal discharges eliminated or on a compliance schedule	54	#	Number of illegal discharges eliminated, no discharges are on a compliance schedule.
Number of stormwater complaints / referrals received	128	#	

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the IC/ID Component over the past year.

1) Investigated 100% of complaints/referrals
2) Eliminated 100% of valid investigations
3) Three Sewage Spills from Publically owned lines
4) Six Sewage spills from Privately owned lines

2. Summarize the internal and external educational and outreach activities the IC/ID Component has conducted over the past year.

1) Face-to-face during complaint/referrals
2) Continual refresher training for Public Works,facilities, and parks maintenance staff as needed

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

1) Increase dry weather monitoring and special study events to better identify sources
2) Coordinate volunteer cleanup events with the ECCDC
3) Continue focus on 303d list pollutants

4. Other comments.

Program Assessment Form **1/31/2008**
Public Participation Component (F.6.)

QUANTITATIVE ASSESSMENT:

Activity	Quantity	Units	Explanation (if needed)
Number of opportunities provided which enabled the public to participate	**3**	#	Career Day at office, Pollution Prevention Days, San Diego River Days 2007, National Pubic Works Week

QUALITATIVE ASSESSMENT:

1. Describe the major accomplishments of the Public Participation Component over the past year. Also, describe the mechanisms used for public participation.

Participated in Career Day, hosted Pollution Prevention Week and continued to participate in Regional and Watershed efforts to inform the Public of Storm Water and Watershed requirements. Published 5 articles with 38,000 distributed copies of the City newsletter potentially reaching 190,000 residents.

2. Summarize the internal and external educational and outreach activities the Public Participation Component has conducted over the past year.

Included 3 sewer bill inserts with 39,000 distributed copies
190,000 potential impressions from City Newletter Articles on Storm Water

3. Summarize new activities or improvements to be implemented next year as a result of your self assessment.

Continued focus on trash and debris from entering the storm drain system.
Provide storm water materials for all new and renewed business license applicants.

4. Other comments.

APPENDIX B

Reports of Illicit Discharges/Complaints 2006-2007

	Date	Complaint Classification	Complaint address	Complaint	Referral/Complaint	Telephone	City Action
1	07/05/06	Residential	1405 Sunnyland Ave	Resident complaint of concrete wash water being dumpted in gutter	Estaban Gomez	619-977-2735	Property owner contacted and advised to cease concrete washing and to clean gutter. Educational info. Supplied.
2	07/06/06	Commercial	767 Arnele	Hertz employees washing cars at rear of building	John Phillips		Site inspection found hose and shopvac at rear of building. Office manager contacted and advised to cease vehicle washing. Advised of BMPs and vehicle washing info.
3	07/07/06	Construction	1385 Main St E	Fountain cleaning water discharged to ground through construction area with no BMPs. Discharg enters unprotected channel entrance.	C. Bonner		Property owner contacted and issued a citation for discharge. Corrections made the next day
4	07/13/06	Commercial	1402 Pioneer Way	Landscape erosion possibly entering the storm drain	Eric Craig PL		Site inspection found no storm water issues.
5	07/13/06	Commercial	1754 Main St E	Washing cars behind the Magic Dry Cleaners allowing water to discharge into channel.	Julio Vidals	619-462-3500	Site ispection found no carwashing activty. A garden hose was outside rear building. Contacted the business owner who admitted to washing cars occasionally. He was advised to cease activity. Issued storm water information.
6	07/17/06	Residential	956 Wiggins St	Citizen complaint of a vehicle parked on the street in front of residence leaking a large amount of fluids.	Anonymous/ Phone		Site inspection found car parked in front of residence leaking large amount of fluid onto ground. Property owner was contacted and advised to clean pavement and place a drip pan under the vehicle.
7	07/17/06	Commercial	210 El Cajon Blvd	Employees at American Recycling washing lot, allowing water to enter street and other properties.	Firas ?	619-593-9898	Site inspection found evidence of recent lot washing. Employee contacted and advised to insruct owner to cease washing activity unless BMPs are implemented to prevent further discharges.
8	07/19/06	Construction	321-25 Van Houten Ave	Driveway and Handicap construction with no BMPs as required per erosion control plan.			Property owner contacted and advised to implement required BMPs. Gravel bags installed immediately to protect storm drain inlet at corner. Engineering dept. to follow up to completion of project.
9	07/19/06	Commercial	9349 Bond Ave	Regional Water Board checking status of business operations at Next Generation Gel Coat and Orion Custom Boats for their records.	Don Perrin	858-467-2969	Property found to be located in SD County.
10	07/24/06	Commercial	Fletcher Parkway	Referral from DMAX of significant overwatering in the planters in the north portion of the parking lot of Fletcher Hills Town and Country Plaza	Jaime Campos		7/24/06 Site inspection found a large amount of water standing in the parking lots and running freely at along the alley at the rear of the complex.

Reports of Illicit Discharges/Complaints 2006-2007

	Date	Complaint Classification	Complaint address	Complaint	Referral/Complaint	Telephone	City Action
11	08/01/06	Residential	1237 Mona Pl	Trash bins left in the street after pick up on Fridays	Gerald Fernandez	619-203-9363	Site inspection found two trash bins out in front of property no storm water concerns noted. The case was referred to zoning enforcement.
12	07/26/06	Construction	353 Park Ave	Hosing off parking lot at construction site with no BMPs in place to prevent discharge	Craig Bonner		Contractor advised to immediately cease lot washing activity unless proper BMPs are implemented. Written warning issued.
13	07/31/06	Residential	1957 Falmouth Dr	Citizen complaint of a vehicle parked on the street in front of residence leaking a large amount of fluids. Concerned due to minor rain event pollution potential.	Randy Fromm	619-838-7111	Site inspection found a black BMW parked on the street in front of residence with a metal pan under the engine. Oil stains found on the pavement on both sides of the street. Contacted resident and advised to relocate vehicle to driveway and put absobent material on stains.
14	08/02/06	Residential	1141 Naranca	PW crew working in concrete storm channel at rear of property found gray water discharge pipe from washing machine in rear yard extending into channel.	Pat Jackson		Contacted tenants, issued storm water educational materials and told to remove the pipe. Suggestion was made to relocate the pipe to a vegetated area of the rear yard.
15	08/03/06	Residential	684 Cuyamaca	Complaint of 3 large piles of dirt stored in the steet on Wagner St. The dirt is being moved into the rear yard.	Jim Uribe	619-447-0138	Inspected the site on Wagner and found a large pile of dirt in the street with no BMPs on place. Two tractors were moving the dirt to fill in a pool in the rear yard
16	08/07/06	Residential	1575 Lily	Operating a concrete cutting business out of the home; trucks parked on the street; washing concrete in street.	Julie Greeniaus	619-444-4720	Site inspection found small amount of concrete debris in street in front of house. No washing in progress. Contacted resident and issued verbal warning to cease all concrete cleaning activity in street. No Home business operation.
17	08/10/06	Construction	930 Jamacha	Contractor pumping ground water with sediment into street; inadequate BMPs allowing discharge into curb inlet.	C. Bonner		Contractor contacted on site advised to immediately cease ground water discharge and dry clean area of all sediment. Instructed to direct discharge to on site location.
18	08/11/06	Residential	138 Ruth Ct	Citizen complaint of janitorial service, home business, dumping chemicals into drainage grate at corner.	Cynthia Anderson	619-588-6039	Site inspection found no evidence of chemical discharge, contacted owner and issued residential/ mobile business educational material. Said he would also educate his staff.
19	08/15/06	Residential	868 Pearl Pl	Resident complaint that neighbor has drain pipe from camper in rear yard discharging into open concrete storm channel.	Swan Rotchforn	619-579-7288	Site inspection found black ABS pipe from rear yard extending into storm channel. Camp trailer in rear yard in close proximity to the pipe. Door tag left with instruction to contact City. Also referred to Zoning Enforcement.

	Date	Complaint Classification	Complaint address	Complaint	Referral/Complaint	Telephone	City Action
20	08/17/06	Commercial	1110 El Cajon Blvd	PW staff observed a discharge of vehicle wash water from the rear of 1100 El Cajon Blvd crossing the sidewalk and entering the street.	Don Perrin		Contacted the owner of Rent 4 Less Car Rental at 1110 El Cajon Bl.on site. HE admitted to washing cars behind the neighboring business. He was advised to cease all washing activity unless proper BMPs could be installed. He was issued stormwater and vehicle washing educatinal materials.
21	08/18/06	Commercial	1900 Weld Blvd	A discharge of a white substance, possibly concrete, from the neighboring property flowed onto county property.	Eric Nelson, Airport Eng.	596-4825 or 778-2002	A site inspection found that the discharge originated at RCD Suspension. The business owner said it was from drywall work. A written warning was issued to clean the area.
22	08/23/06	Commercial	1451 Johnson Ave	Discharge of sediment and concrete from ground plumbing work, No BMPs for dirt pile.	C. Bonner		Contacted on site plumbing contractor and told to immediately cease discharge, install BMPs for concrete wash and around base of dirt pile
23	08/25/06	Commercial	1261 E. Main St	Prior Citation for similar violations----Lot wash water allowed to discharge into stormwater conveyance, open grease bin and dumpster.	C. Bonner		Constacted manager advised to cease all lot washing unless water can be reclaimed or use dry method. Told to keep dumpster and grease bin closed
24	08/28/06	Residential	197 Lindell Ave	Complaint of tar pot being cleaned on the street and an open container of oil on the side of the house.	Steve Barker	619-440-7927	Met with complainant on site. No tar pot present. Only minor oil on pavement. No evidence of other discharges. Small oil container uncovered at right side of the driveway.
25	08/29/06	Residential	195 Marsden Ct	Stockpile of dirt from pool installation has no BMPs to prevent sediment discharge to street.	Paul Schlitt	619-527-3938	Contacted pool contractor on site and advised to install BMPs around the base of the dirt pile and cover if the pile is to remain.
26	08/31/06	Construction	333Wells Ave	Using hose to wash sediment from paved areas	C. Bonner		Contacted Priest Development staff and advised to cease using water to clean paved areas. A written warning was issued.
27	08/31/06	Residential	2364 Rippey St	Grading in back yard a 5ft drop and is a potential for erosion	Mrs. Hector	619-589-0284	Contacted property owner on site. Minor grading in sloped rear yard, pool work no potential for any discharge. Rear yard slopes to vegetated canyon.
28	09/01/06	Residential	2526 Carlow St	Extensive landscaping, washing silt and dirt into gutter and storm drain.	Ted Tanner	619-337-9721	Contacted property owner on site. No active but evidence of recent discharge of sediment in street. Owner advised to cease use of water to clean concrete surfaces. Issued residential educational materials.
29	09/05/06	Residential	1629 Greenfield Dr	Complaint that a resident has paved an area next to the roadway causing a change in the plow pattern.	Mr. C. W. McFarland	619-647-8483	Site inspection found no storm water issues. Complainant was advised.

Reports of Illicit Discharges/Complaints 2006-2007

	Date	Complaint Classification	Complaint address	Complaint	Referral/Complaint	Telephone	City Action
30	09/06/06	Construction	1543 Lexington E	Observed large piles of dirt and concrete in driveway from construction activity with no BMPs in place.	Craig Bonner		Contactedcontractor on site and advised ot either remove the piles or install BMPs for stock piles.
31	09/08/06	Residential	433 Avocado Blvd	PW staff observed a resident using a hose to wash debris from the parking lot with no BMPs in place to prevent a discharge.	Dave Garrett PW		Made on site contact with the resident. There was no active diacharge. She was given educational materials and advised to use a dry method to clean the lot.
32	09/08/06	Residential	605 Mollison S.	Public Works staff observed sewage overflowing in the parking lot and driveway and discharging into the street.	Bill Brockman PW		Public works crew contained flow and used vac to remove. Property management was contacted for plumbing service.
33	09/11/06	Commercial	1164 2ND St N	Observed an employee of Blue Meanie Records working on the irrigation system and allowing water to run into the street.	Craig Bonner		He was advised to re-adjust to sprinklers and shorten the running time. He complied.
34	09/13/06	Commercial	178 Main St E	Anonymous complaint of a discharge of water into the alley at the rear of the building.		619-672-8803	Site inspection found water to be from air conditioning condensate.
35	09/13/06	Commercial	148 Main St E	Observed discharge of wash water into alley at the rear of the business. Grease bin soiled with grease and open.	Craig Bonner		Contacted manager and advised to ceace all washing and to clean and close the grease bin.
36	09/15/06	Commercial	401 Main St W	Observed employee powerwashing the building and parking lot with no BMPs in place to prevent discharge to street.	Craig Bonner		Contacted employee and advised to cease power washing until proper BMPs are installed. Issued educational materials and suggested using a dry method to clean the lot.
37	09/20/06	Industrial	1050 Pioneer Way	White solution was accidentally released from Divix - #1 In Golf Accessories. The solution turned out to be a lubricant for machine shop equipment.	David Cammall (County of San Diego)	619-338-2489	Todd Jones - President of Divix (800) 221-3354 was contacted by County HazMat and the City of El Cajon and instructed to hire a certified HazMat Clean Up Company to clean up spill. Enforcement Actions 2006-2007

	Citation Date	Component	Business Name	Mailing Address	Violation Address	Administrative Citation #	Written Warning or Monetary Citation	BMP Violated	Corrective Actions	Follow-up and Corrections Complete
1	07/07/06	Commercial	De L Fuente Cadillac	5440 Moorhouse Dr #4000, San Diego 92121	1385 E Main St	PW 0321	Monetary Citation	Failure to implement erosion control plan, no BMPs for sediment control, non-stormwater discharge into storm water conveyance	Instructed to implement BMPs per erosion control plan.	BMPs installed and maintained.
2	07/26/06	Construction		2102 Concours, El Cajon	535 Park Ave	PW 0319	Written Warning	Using garden hose to wash paved lot with no BMPs in place.	Immediately stopped using water to clean lot.	Contractor swept remaining areas of the lot.
3	08/08/06	Residential	Brundage Bone Concrete	1630 Pellesier Rd, Colton Ca. 92324	777 Oro St	PW 0331	Written Warning	Discharge of concrete wash water into street.	Discharge immediately halted and the street and gutter cleaned of all residue.	Same Day
4	08/18/06	Commercial	RCD Suspension	1900 Weld Blvd	Same	PW 0356	Written Warning	Business owner unaware that drywall contractor discharged residue onto ground allowing flow to enter neighboring property.	Business owner advised to clean all drywall residue using a dry method.	Appropriate aducational materials were issued to the owner.
5	08/25/06	Commercial	Rally's Hamburger	1261 Main St	Same	PW 0355	Monetary Citation	Failure of business manager to implement BMPs to prevent lot washing water from entering stormwater conveyance system. Also open grease bin and dumpster.	Advised to cease all lot washing and close dumpster and bin.	Hose removed from business. Will sweep lot in future. Containers remain closed.
6	08/31/06	Construction	Priest Development Corp.	333 Wells Ave	Same	PW 0416	Written Warning	Subcontractors using a large hose to wash sediment off paved area on Park Ave side of project. BMPs, gravel bag chevrons, were ineffective in preventing sediment from entering storm drain inlets.	Discharge immediately halted and the street and gutter cleaned of all residue.	BMPs installed and maintained properly.
7	09/21/06	Commercial	Por Favor Mexican Restaurant	148 Main St	Same	PW 0413	Written Warning	Discharge of wash water into alley, open and soiled grease bin.	Advised to cease all lot washing and close bin.	No further discharges. The owner purchased a shop vac.
8	09/29/06	Commercial	Priest Development Corp.	333 Wells Ave	Same	PW 0357	Monetary Citation	Discharge of sediment due to hose washing and broken irrigation line. No BMPs in place to prevent discharge	Immediately stopped using water to clean pavement. Irrigation line repaired	Additional sweeping of paved areas conducted.
9	10/04/06	Industrial	Divix	1050 Pioneer Way #G	Same	PW 0359	Monetary Citation	Discharge of lubricant into storm drain system.	Pipe draining lubricant repaired and moved to another location away from doorway.	Same Day
10	10/11/2006	Industrial	W & C Arban Inc.	1481 Wood Hill St., El Cajon	856 Fesler St.	PW 0358	Monetary Citation	Discharge of pollutants leaking from illegally occupied camp trailer on property. Zoning enforcement follow-up.	All fluids and hook-ups removed from the trailer.	Trailer later entirely removed from the property.
11	11/02/06	Commercial	Westfield Parkway	415 Parkway Plaza	Same	PW 0315	Written Warning	Washing trash containers and enclosure allowing water to enter lot drain.	Immediately stopped washing trash containers.	Containers now washed inside enclosure and waste discharged to sanitary sewer.
12	11/03/06	Commercial	Health Link Transportation	1068 Broadway	Same	PW 0415	Warning	Stockpile of horse manure discharging into storm channel.	Advised to remove a manure adjacent to the storm channel.	All manure removed and used for landscaping.

APPENDIX E

E. SPECIAL INVESTIGATIONS – FORRESTER CREEK IMPACT STUDY

For the fourth year, the City conducted upstream/downstream monitoring of dry weather constituents of concern in Forrester Creek. The monitoring was conducted on July 3, 2007 and August 2, 2007 to assess the relative amount of pollutants discharged within the jurisdictional boundaries of El Cajon into Forrester Creek. The upstream location is at the County boundary, specifically at Greenfield Avenue and I-8 west onramp intersection, behind southeast corner of 1699 East Main Street. Flow at the upstream sample was approximately 2 gallons per minute. During rain events, flow from Crest and other unincorporated County areas discharge directly into the City of El Cajon without treatment. To date, no analytical data have been collected for wet weather flows.

Table 1

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Nitrate (mg/L NO_3-N)
Upstream	8/02/07	2.0	26.7	7.6	1.28	1.61	8.14
Downstream*	7/3/07	281	27.8	8.3	9.91	2.35	1.92

Table 2

Site	Date	Total Hardness (mg/L$CaCO_3$)	Oil & Grease (mg/L)	Total Coliform (MPN/100 mL)	Fecal Coliform (MPN/100 mlL)	Enterococcus (MPN/100 mL)	Total Dissolved Solids (mg/L)	Total Organic Carbon (mg/L)
Upstream	8/02/07	579	nd	2,200	500	270	1,150	5.2
Downstream*	7/3/07	649	nd	30,000	5,000	800	1,400	14.1

nd = not detected

The following is a summary of the upstream/downstream results:

- No detections of metals
- Reactive phosphorous upstream was 0.07 mg/L, downstream was 0.07 mg/L
- Detections of ammonia upstream was 0.1 mg/L, downstream was 0.3 mg/l
- Detergents were detected at 0.38 mg/L upstream, and 0.5 mg/L downstream

Notable Results and Reasoning

Increase in flow to 281 gallons per minute from upstream to downstream Concentrations of many constituents decrease from upstream to downstream; this includes nitrate, total organic carbon (TOC), total dissolved solids (TDS). Increase in the concentrations (from

upstream to downstream) of pH, turbidity, conductivity, ammonia, dissolved oxygen, total hardness, total coliforms, fecal coliforms, enterococcus, and surfactants.

The City does not have an explanation for the increase in flows or the significant increase in dry weather flow contributions within City boundaries. The City will need to continue to conduct further dry weather investigations to develop enough data to establish baseline conditions (for current channel configurations) and to develop priorities for more detailed investigations for pollutant and dry weather flow sources.

Re: 2007 Forester Creek Impact Study
City of El Cajon, California

Dear Mr. Campos:

Enclosed please find our report for the City of El Cajon 2007 Forester Creek Impact Study. This project, conducted since 2004, is an additional study of the water quality in Forester Creek as it passes through El Cajon. The contents include field screening data, analytical laboratory test results, and analysis of the collected data.

It has been our pleasure working with the City of El Cajon on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Forester Creek Impact Study

Forester Creek runs parallel to Interstate 8 as it enters the east side of the City of El Cajon (City). It then turns north after passing SR-67, flowing through the area around Gillespie Field before entering the City of Santee. Eventually, Forester Creek enters the San Diego River just east of the junction of SR-52 and SR-125, within the City of Santee.

The purpose of this study was to investigate how water quality in Forester Creek is affected as it flows through the City of El Cajon. To gauge this, one sample was collected from the creek near where it enters the City from the east (upstream), and another sample was taken where the creek exits the City in the north (downstream). Table 1 shows the locations of these two sites. Water quality parameters in the upstream and downstream samples can be compared to see how the City itself contributes to pollutant loads. Also, it should be noted that the downstream location is the same as that used for dry weather Site 5. Therefore, the 2007 dry weather data from Site 5 was used in this study in order to alleviate the need to take an additional downstream sample and to minimize the costs of this study.

This year the upstream location was observed to be dry at the first few visits of the site. After a few weeks of monitoring a sample was collected. The same field and laboratory analyses employed during the standard dry weather program in El Cajon were conducted for the upstream and downstream samples. No constituents tested in the field at either of the two sites were measured above their respective dry weather action levels. The value for pH increased from 7.6 upstream to 8.3 downstream. While both values are within the acceptable range for pH (6.5 to 9.0), the higher downstream value is likely a result of the wide, shallow flow and significant amount of algal growth at that site. Typically, the pH increases during daylight hours in areas with those characteristics, as sunlight stimulates algal photosynthesis and carbon dioxide is removed from water. The ammonia concentration at the downstream site was higher than that at the upstream site: 0.3 mg/L and 0.1 mg/L, respectively.

In contrast with 2005 and 2006, levels of the three types of bacterial indicators evaluated were significantly higher at the downstream site than at the upstream site. Total coliform count rose from 2,200 MPN/100mL to 30,000 MPN/100 mL, but both numbers improved from last year. Fecal coliform and enterococci were significantly higher at the downstream location than they were at the upstream site and the downstream numbers are higher than in 2006. The level of Total Dissolved Solids (TDS) was slightly higher and the level of Total Organic Carbon (TOC) was significantly higher at the downstream site. Surfactants, oil and grease, and dissolved copper, cadmium, lead, and zinc were not detected by the laboratory at either location. Field analytical and laboratory data are presented in Table 2 and Table 3, respectively.

Similar to previous years, Forester Creek had a very small flow at the upstream site and much higher flow as it exits the City. As a result of this, a direct comparison of upstream and downstream constituent concentrations can be misleading. Nearly all the water and its constituents that flow in Forester Creek (where it runs through the City of El Cajon) actually originate within the City. Perhaps a more meaningful comparison would be, not between upstream and downstream sites, but rather between years at the same site.

In comparing the results of this year's analyses with previous years it is important to note that the upstream sampling location has changed over the four years of this project due to the variable nature of the flow coming into the City. When Forester Creek receives no water from outside the city limits the sampling location may be moved slightly downstream to the nearest

location with flowing or ponded water (see Table 4). The upstream site's field and laboratory analyses from 2004 to 2007 are found in Table 5 and Table 6, respectively. The results of this year's upstream analysis indicate that pre-existing bacterial counts in Forester Creek as it enters the City are much reduced from previous years (Table 6). However, the downstream fecal coliform counts were higher than in recent years (Table 8). The remaining results for the downstream site are relatively similar to previous years' field and laboratory analyses, as seen in Table 7 and Table 8.

Table 1 Forester Creek Study Site Locations

Site ID	Location	Description	Primary Land Use	Secondary Land Use	Hydrologic Unit	Latitude	Longitude
Upstream	Greenfield Avenue and I-8 west onramp intersection, behind southeast corner of Exxon station at 1699 East Main Street	Concrete Channel	Commercial	Residential	907	32.81185	-116.91795
Downstream*	Adjacent to the Weld Boulevard Trolley Station, southeast of the Marshall Avenue/Cuyamaca Street intersection	Concrete Channel	Commercial	Industrial	907	32.82665	-116.98226

Table 2 Field Analytical Data for Forester Creek Sites

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Surfactant (mg/L MBAS)	Ammonia (mg/L NH_3-N)	Nitrate (mg/L NO_3-N)	Reactive-Phosphorus (mg/L PO_4-P)	Dissolved Oxygen (mg/L)

Notes and Definitions

S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
S-02	The surrogate recovery for this sample cannot be accurately quantified due to interference from coeluting organic compounds present in the sample extract.
QR-08	The RPD between the MS and MSD did not meet the acceptance criteria, however both did have acceptable recoveries. Sample data not affected.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

Mission Statement:
The Public Works Department is a maintenance and engineering organization, and an integral part of the municipal government of the City of El Cajon. Dedicated to public service, we operate, maintain, repair and preserve the public assets, public buildings and parks and open lands owned by the residents of El Cajon. We do this to enhance the quality of life in El Cajon, facilitate commerce, and protect the safety of our residents and visitors.

Description:
Provide compliance with the Regional Water Quality Control Board s 2001-001 Municipal Permit. Major components include training of City personnel, inspection of commercial and industrial businesses, inspection of construction sites, public outreach, dry weather storm water testing, and conditioning of new development and redevelopment to comply with storm water regulations.

Prior Fiscal Year Highlights:
The goal of the Municipal Permit is to improve receiving water quality and determine the threat to human health and the environment using the maximum extent practicable controls. The Fifth Permit Year Annual Report listed the following major accomplishments:

Continued enforcement program for City Ordinances 4686 [Jurisdictional Urban Runoff Management Program (JURMP)] and 4717 [Standard Urban Storm Water Management Program (SUSMP)]. The City conducted 23 storm water related enforcement actions composed of written warnings and monetary citations.

Continued implementation of a City-Wide Integrated Pesticide Management Program.

Expanded the scope of its Dry Weather Monitoring Program with the preparation of a new Request for Proposal.

Conducted upstream/downstream dry weather analysis in Forrester Creek.

Inspected and provided educational materials to 255 industrial and commercial businesses.

Minimized sediment and trash in the storm drain system, using street sweeping to the maximum extent practicable. Collected 2,686 cubic yards of materials from 15,482 miles of streets swept.

Collected 1,813 cubic yards of materials from city inlets, culverts, concrete-lined channels, and catch basins.

Provided training for Community Police staff, Fire Department staff and Public Works Maintenance staff.

Conducted joint training sessions with the City of Santee and the County of San Diego.

Actively participated in the Regional Management Committee, Outreach Workgroup, WURMP development, and Regional Monitoring Workgroups.

Served as the lead copermittee to the San Diego River Watershed and developed and coordinated activities within the watershed.

Conducted Pollution Prevention (P2) Days at the El Cajon Classic Car Show to assist with Storm Water educational efforts.

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

Conducted inspections of 15 high priority construction sites, 26 high priority industrial facilities, 229 Food service establishments, and four municipal facilities.

Began implementation of Geographic Information System (GIS).

Reached out to community members on a wide range of urban runoff and storm water quality topics through 300,000 copies of articles, brochures, mailers, and over-the-counter sources.

Goals:

- Expand existing and add new programs as necessary to comply with the significantly increased oversight, inspection, tracking, monitoring and reporting requirements contained in the newly-adopted permit.
- Create and adopt new activities and program upgrades to comply with the new Municipal Permit.
- Continue to achieve compliance on construction sites.
- Work towards developing a GIS Enterprise System and Storm Water data layers.
- Maintain compliance with all requirements of the current Municipal Storm Water Permit through continued implementation of the Jurisdictional Urban Runoff Management Program (JURMP) and the Watershed Urban Runoff Management Program (WURMP).

The Major Program Goals for JURMP Component are:

Municipal Component

- Conduct training for all City Departments and employees.
- Conduct comprehensive inspections at all municipal facilities.
- Implement and document Best Management Practices (BMPs) - street sweeping, storm drain cleaning, sewer and road maintenance.
- Develop City-specific environmental indicators for accurate measurement of Urban Runoff Program effectiveness.
- Establish defined measurements and actions to address watershed requirements, and develop watershed management procedures.
- Conduct a comprehensive review and evaluation of the Storm Water web page. Create and post all outreach documents and information brochures to ensure easy availability to all interested parties. Establish a process to periodically review and update the web page with the latest information and news pertaining to storm water requirements, BMPs and important contact information.

Industrial and Commercial Component

- Inspect approximately 1,200 businesses and establish prioritization for future oversight.
- Conduct follow-up inspection for facilities not in compliance.
- Educate facility owners and personnel.
- Focus on specific commercial/industrial activities for pollutant discharges and waste collection and handling BMPs.
- Develop and implement procedures (with other jurisdictions) to identify, educate and inspect mobile businesses (auto detailers, power washers, etc).

Residential Component

- Expand the topics for educational and outreach materials for distribution to the public.
- Expand efforts to provide information brochures on BMPs used for yard care, auto repair, car washing, and pet waste.
- Investigate all storm water or spill complaints submitted to the City Manager from the public.
- Identify the actual or potential high priority water quality pollutant sources and develop source specific

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

activities to reduce or eliminate those pollutant sources.
- Implement two short-term and one long-term water quality activity to address the highest priority water quality problems**.**

Construction Component
- Provide increased oversight on all grading projects to ensure compliance with erosion control plans.
- Provide education and outreach to all developers on new municipal and state requirements.
- Implement and enforce strict sediment and erosion control measures on all grading sites.
- Report and document sites of non-compliance.

Illicit Discharge Detection and Elimination Component
- Conduct dry weather field screening and analytical monitoring.
- Conduct follow-up investigations.

Land Development Review
- Review project development for compliance with SUSMP ordinance and JURMP.
- Coordinate conditions of approval to ensure permit compliance.

The Major Program Goals for the WURMP Program are:
- Provide leadership in the San Diego River Watershed.
- Create a mechanism to share costs amongst all the copermittees within the San Diego River Watershed.
- Collaborate with other jurisdictions on watershed-wide education and outreach events.
- Conduct a comprehensive water quality assessment of Forrester Creek and the San Diego River in cooperation with the other jurisdictions.
- Identify the actual or potential high-priority water quality pollutant sources and develop source specific activities to reduce or eliminate those pollutant sources.
- Implement two short-term and one long-term water quality activity to address the highest priority water quality problems.

Financial Comments:
Salaries & Benefits: The decrease of □177,133 is primarily due to a reallocation of personnel costs to other programs.
Materials, Services and Supplies: The increase of □163,687 is primarily due to increased testing and updates to the San Diego River Watershed Management, Watershed Urban Runoff Management, and the Jurisdictional Urban Runoff Management Programs. A one-time cost of □50,000 has also been budgeted for data input for the Geographic Information System. These increases are offset by decreases in fleet/equipment maintenance and vehicle replacement.
Capital Outlay: GPS Survey equipment, ArcGIS Server 9.2, CAD software package, and Sungard Pentamation eCommunity PLUS Arcview GIS interface software

APPENDIX G

G. IDENTIFICATION OF INEFFECTIVE MEASURES

Permit Section I.1.g requires that the City identify in its JURMP Annual Report any management measures proven to be ineffective in reducing urban runoff pollutants and flow. During this report period, the City did identify a number of measures that are discussed in the improvement sections of each Component, but are summarized below.

1. Municipal
    a. Add in the inspection sheets a section that includes BMP Implementation.
2. Industrial
    a. High Priority ranking by proximity to a major drainage channel is the primary consideration.
    b. Continue to conduct inspections tracking BMP Implementation
3. Commercial
    a. High Priority ranking by proximity to a major drainage channel is the primary consideration.
    b. Continue to conduct inspections tracking BMP Implementation
4. Residential
    a. Residential Education may best be tackled by the East County Cities group.
5. New Development
    a. Few of the known Post-Construction (structural) BMPs can be designed into El Cajon development. Focus on putting more emphasis on implementing low impact development BMPs.
6. Construction
    a. Discontinue use of hay bales
    b. Discontinue use of gravel bags for perimeter control
7. Illicit Discharge Detection and Elimination
    a. Investigate bacterial detections when all three (coliform, fecal coliform, and enterococcus) detections exceed the action levels AND are in the ratios indicating a potential discharge.
    b. Investigate pH only when a significant change (greater than 3 pH units) is measured.
    c. Investigate nitrate detections rather than TDS.
8. Education
    a. Provide a booth with information regarding the City of El Cajon's Storm Water Program at the yearly Fire Department Open House Event.
    b. Education may best be tackled through the East County Cities group.
9. Public Participation
    a. Public Participation may best be tackled through a Watershed or Regional effort.
10. Program Assessment

a. At this time, address 303(d) pollutants, only
b. Address Levels 1 through 4 only if empirical data is available.
Estimate only if there is an exceedance of a 303(d) listed pollutant.

APPENDIX H

H. Identification of Water Quality Improvements or Degradation.

Water Quality

For PY6, an upstream and downstream monitoring was conducted in Forrester Creek during the dry weather monitoring. The upstream sample was collected at the City/County boundary. The downstream sample was collected near the Weld Street Trolley Station. Analytical results are discussed in Section F.5 and a copy of the report is attached in Appendix E. Wet weather monitoring in PY6 included three storm events. Pollutants of concern include the 303(d) listed pollutants for Forrester Creek as well as many of the dry weather constituents.

Additional Parameter Assessment

Conductivity values indicate the total concentration of ions in an aquatic system and the ability of water to conduct electricity. This parameter can be used to assess the mineral content of water or to help determine the presence of dissolved pollutants. Therefore, Total Dissolved Solids (TDS) is directly related to Conductivity as it measures the ionic composition of the receiving water body.

The TDS concentration in a body of water is affected by many different factors. A high concentration of dissolved ions is not, by itself, an indication that a stream is polluted or unhealthy. It is normal for natural streams to dissolve and accumulate high concentrations of ions from rock and soil formations. However, since Forrester Creek is mostly all lined with concrete with very few natural segments, the Conductivity/TDS values are a result of:

- Sediment at all sampling sites
- Evaporation in the channel, concentrating TDS
- Temperature increases in shallow low flows causing higher solubility
- Nitrates and phosphates slightly increase conductivity

Tracking Conductivity is similar to tracking TDS. The average Conductivity values over the last six years are shown in Figure 1. With the exception of 2005 and 2007, a general declining trend line in conductivity correlates to reducing TDS as an impact to Forrester Creek and a move toward restoration of Basin Plan water quality requirements.

APPENDIX I

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
	DISCHARGE PROHIBITIONS		
B.3.	Identify discharges not to be prohibited and BMPs required for treatment of discharges not prohibited	Examine the list of non-storm water discharges in B.2. of the Order and determine which discharges are a significant source of pollutants to waters of the US. For the discharges that will not be prohibited a BMP must be implemented to prevent or reduce pollutants to the MEP.	**Engineering**
B.5.	Examine field screening results to identify water quality problems resulting from non-prohibited water discharges, including follow-up problems	Establish an active dry weather analytical monitoring program to identify water quality problems from non-prohibited discharges. Follow-up investigations will be implemented to identify and control non-prohibited discharges.	**Public Works, Engineering**
	RECEIVING WATER LIMITATIONS		
C.2.a.	Notify SDRWQCB of discharges causing or contributing to an exceedence of water quality standards	Report in the annual report any discharges that are causing or contributing to an exceedance of an applicable water quality standard. The report must include existing BMPs and additional BMPs to be implemented to prevent or reduce pollutant discharges and BMP implementation schedule.	**Engineering**
	LEGAL AUTHORITY		
D.1.	Establish, maintain and enforce legal authority to control pollutant discharges	Review of Order 2001-01 and establishment of ordinances, statutes, permits etc to enforce the prohibitions and compliance requirements of the Order	**City Attorney**
D.2.	Establish, maintain and enforce legal authority to control pollutant discharges	Provide to SDRWQCB a statement certified by City Attorney that the City has adequate legal authority to implement and enforce each of the requirements contained in 40 CFR 122.26(d)(2)(I)(A-F) and Order 2001-01	**City Attorney**
	JURISDICTIONAL URBAN RUNOFF MANAGEMENT PROGRAM		
	LAND USE PLANNING FOR NEW DEVELOPMENT AND REDEVELOPMENT		
F.1.a.	Assess General Plan	Include water quality and watershed protection principles and policies into the General Plan to direct land-use decisions and require implementation of consistent water quality protection measures for all development projects.	**Planning**
F.1.b.	Modify Development Project Approval Processes	Modification of process to ensure that pollutants and runoff from development will be reduced to the maximum extent practicable.	**Planning, Engineering**
F.1.b.(1)	Modify Development Project Requirements	Modify development project requirements (conditions of approval) to ensure pollutants and runoff from development are reduced to the maximum extent practicable and that receiving water quality objectives are not violated throughout the life of the project.	**Planning, Engineering**
F.1.b.(2)	Standard Urban Storm Water Mitigation Plans (SUSMPs) Model Development	Participation with other copermittees to collectively develop a model SUSMP	**Engineering**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
F.1.b.(2)	SUSMP Adoption	Adopt a City SUSMP based upon the model SUSMP that meets the requirements in Order 2001-01, section F.1 .b.(2), including a) Priority Development Project Categories (e.g. restaurants, commercial developments 100,000 square feet or more), b) BMP Requirements, c) Numeric Sizing Criteria, d) Equivalent Numeric Sizing Criteria, e) Pollutants of Concern, f) Implementation Process, g) Restaurants Less than 5,000 square feet, h) Waiver Provision, i) Infiltration and Groundwater Protection	**Planning, Engineering**
F.1 .c.	Revise Environmental Review Processes	Review current environmental review process and make amendments to include water quality effects and identification of appropriate mitigation measures. See Order section F.1 .c. for example questions for checklists.	**Planning**
F.1.d.	Internal Education Efforts Focused on New Development and Redevelopment	Establish and maintain an education program to ensure that planning and development review staffs have an understanding of water quality laws and regulations applicable to development projects, connection between land-use decisions and water quality impacts, how impacts to receiving water quality can be minimized	**Planning, Engineering**
F.1.d.	External Education Efforts Focused on New Development and Redevelopment	Establish and maintain an education program to educate project applicants, developers, contractors, community planning groups and property owners of water quality laws and regulations applicable to development projects, connection between land-use decisions and water quality impacts, how impacts to receiving water quality can be minimized	**Planning, Engineering**
	CONSTRUCTION COMPONENT		
F.2.	*Existing Municipal Development*	*Implement a municipal component to prevent or reduce pollutants in runoff from municipal land use area and activities.*	
F.2.a.	Pollution Prevention	Implement pollution prevention methods and require their use by construction site owners, developers and contractors	**City**
F.2.b.	Grading Ordinance Update	Review and update grading ordinance, including pollution prevention, source control and structural treatment BMPs to be implemented during all construction activities	**Planning, Engineering**
F.2.c.	Modify Construction and Grading Approval Process	Modification of process to ensure that pollutants and runoff the development will be reduced to the maximum extent practicable, including modifying grading project requirements (conditions of approval)	**Planning, Engineering**
F.2.d.	Source Identification	Annually develop a watershed based inventory of all construction sites, integrated into GIS.	**Planning, Engineering**
F.2.e.	Threat to Water Quality Prioritization	Prioritize the above mentioned inventory based upon threat to water quality, see criteria in Order 2001-01.	**Planning, Engineering**
F.2.f.(1)	Establish BMPs	Designate a set of minimum BMPs for three classifications of water quality threat, high, medium, and low construction sites.	**Engineering**
F.2.f.(2)	BMP Implementation	Implement or require the implementation of the above mentioned minimum BMPs at each construction site.	**Planning, Engineering**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
F.2.f.(4)	Special BMP Requirements	Implement or require the implementation of additional controls for sites tributary to a section 303(d) impaired water body, coastal lagoon or other environmentally sensitive areas	**Planning, Engineering**
F.2.g.(1)	Inspection of Construction Sites	Conduct construction site inspections for compliance with the City's ordinances, permits, and Order 2001-01. Inspections will include review of the site erosion control and BMP implementation plans.	**Engineering, Contract Services**
F.2.h.	Enforcement of Construction Sites	Enforce ordinances and permits at all construction sites.	**Code Enforcement**
F.2.i.	Reporting of Non-compliant Sites	Provide oral and written notification to SDRWQCB of non-compliant sites.	**Code Enforcement**
F.2.j.	Internal Education Focused on Construction Activities	Establish and maintain an education program to ensure that construction, building and grading review staffs and inspectors have an understanding of water quality laws and regulations applicable to construction and grading activities, connection between construction activities and water quality impacts, how erosion can be prevented, and how impacts to receiving water quality can be minimized.	**Planning, Engineering, Contract Services**
F.2.j.	External Education Focused on Construction Activities	Establish and maintain an education program to ensure that applicants, contractors, developers, and property owners have an understanding of water quality laws and regulations applicable to construction and grading activities, connection between construction activities and water quality impacts, how erosion can be prevented, and how impacts to receiving water quality can be minimized.	**Planning, Engineering**
	EXISTING DEVELOPMENT COMPONENT		
F.3.a.	*Existing Municipal Development*	*Implement a municipal component to prevent or reduce pollutants in runoff from municipal land use area and activities.*	
F.3.a.(1)	Pollution Prevention (Municipal)	Implementation of the pollution prevention methods by municipal personnel	**City**
F.3.a.(2)	Source Identification (Municipal)	Annually develop a watershed based inventory of all municipal land use areas and activities which generate pollutants, integrated into GIS.	**Planning, Engineering**
F.3.a.(3)	Threat to Water Quality Prioritization (Municipal)	Prioritize the above mentioned inventory based upon threat to water quality, see criteria in Order 2001-01.	**Engineering**
F.3.a.(4).a.	Establish BMPs	Designate a set of minimum BMPs for three classifications of water quality threat, high, medium, and low municipal sites.	**Engineering**
F.3.a.(4).b.	BMP Implementation	Implement or require the implementation of the above mentioned minimum BMPs at each municipal area or activity.	**Public Works, Fire, Community Services, Engineering**
F.3.a.(5)	Maintenance of Municipal Separate Storm Sewer System (Municipal)	Establish and implement a schedule of maintenance of all structural controls and for the municipal separate storm sewer system.	**Public Works**
F.3.a.(6)	Management of Pesticides, Herbicides and Fertilizers (Municipal)	Implement BMPs to reduce the contribution of pollutants associated with the application, storage and disposal of pesticides, herbicides and fertilizers from municipal areas and activities to MS4s.	**Contract Services**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
F.3.a.(7)	Inspection of Municipal Areas and Activities (Municipal)	Inspect high priority municipal areas and activities annually.	**Public Works, Fire, Community Services, Engineering**
F.3.a.(8)	Enforcement of Municipal Areas and Activities	Enforcement of storm water ordinance for all municipal areas and activities.	**Public Works, Fire, Engineering, Community Services**
F.3.b.	*Existing Industrial Development*	*Implement an industrial component to prevent or reduce pollutants in runoff from municipal land use area and activities.*	
F.3.b.(1)	Pollution Prevention (Industrial)	Implementation of required industrial pollution prevention methods.	**City**
F.3.b.(2)	Source Identification (Industrial)	Annually develop a watershed based inventory of all industrial sites within the City which generate pollutants, integrated into GIS.	**Engineering, Finance**
F.3.b.(3)	Threat to Water Quality Prioritization (Industrial)	Prioritize the above mentioned inventory based upon threat to water quality, see criteria in Order 2001-01.	**Engineering**
F.3.b.(4)	Establish BMPs	Designate a set of minimum BMPs for three classifications of water quality threat, high, medium, and low industrial sites.	**Engineering**
F.3.b.(4)	BMP Implementation	Implement or require the implementation of the above mentioned minimum BMPs at each industrial site.	**Engineering**
F.3.b.(5)	Monitoring of Industrial Sites	Require industry to conduct a monitoring program from all high threat industrial site.	**Engineering**
F.3.b.(6)	Inspection of Industrial Sites	Conduct industrial site inspections for compliance with City's ordinances, permits and Order 2001-01.	**Engineering, Code Enforcement**
F.3.b.(7)	Enforcement of Industrial Sites	Enforcement of storm water ordinance for all industrial sites.	**Code Enforcement**
F.3.b.(8)	Reporting of Non-compliant Sites (Industrial)	Provide oral and written notification to SDRWQCB of non-compliant sites.	**Code Enforcement**
F.3.c.	*Existing Commercial Development*	*Implement a commercial component to prevent or reduce pollutants in runoff from commercial sites.*	
F.3.c.(1)	Pollution Prevention (Commercial)	Implementation of required commercial pollution prevention methods.	**City**
F.3.c.(2)	Source Identification (Commercial)	Annually develop a watershed based inventory of all commercial sites within the City which generate pollutants, integrated into GIS.	**Engineering, Finance**
F.3.c.(3)	Establish BMPs	Designate a set of minimum BMPs for three classifications of water quality threat, high, medium, and low commercial sites.	**Engineering**
F.3.c.(3)	BMP Implementation	Implement or require the implementation of the above mentioned minimum BMPs at each commercial site.	**Engineering**
F.3.c.(4)	Inspection of Commercial Sites and Sources	Conduct commercial site inspections for compliance with City's ordinances, permits and Order 2001-01.	**Code Enforcement, Contract Services**
F.3.c.(5)	Enforcement of Commercial Sites and Sources	Enforcement of storm water ordinance for all commercial sites.	**Code Enforcement**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
F.3.d.	*Existing Residential Development*	*Implement a residential component to prevent or reduce pollutants in runoff from residential sites.*	
F.3.d.(1)	Pollution Prevention	Implementation of required residential pollution prevention methods.	**City**
F.3.d.(2)	Threat to Water Quality Prioritization (Residential)	Identify high priority residential areas and activities (e.g. automobile repair, auto washing, disposal of pet waste)	**Engineering**
F.3.d.(3)	Establish BMPs	Designate a set of minimum BMPs for high priority residential areas and activities.	**Engineering**
F.3.d.(3)	BMP Implementation	Implement or require the implementation of the above mentioned minimum BMPs at high priority residential areas and activities.	**Engineering**
F.3.d.(4)	Enforcement of Residential Areas and Activities	Enforce storm water ordinance for all residential areas and activities.	**Code Enforcement**
	EDUCATION COMPONENT		
F.4.	Education Component	Implement an education component using all media as appropriate to measurably increase the knowledge of the target communities regarding MS4s, impacts to receiving waters and potential BMP solutions for the target audience and to measurably change the behavior of target communities. The following target communities will be the focus of the education efforts: 1) Municipal departments and personnel, 2) Construction site owners and developers, 3) Industrial owners and operators, 4) Commercial owners and operators, 5) residential community, general public and school children, and 6) Quasi-Governmental Agencies/Districts.	**Planning, Engineering**
F.4.	Education Component	Assess target communities in the City and develop public education and outreach program to efficiently educate the target communities.	**Planning, Engineering**
F.4.	Education Component	Implement public education and outreach program (e.g. restaurant program, targeted informational brochures, informational signs, etc.)	**Planning, Engineering, Finance**
	ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT		
F.5.a.	Illicit Discharges and Connections	Establish a program to actively seek and eliminate illicit discharges and connections into the City's MS4.	**Public Works, Engineering**
F.5.b.	Dry Weather Analytical Monitoring	Conduct dry weather monitoring of MS4 outfalls to detect illicit discharges.	**Public Works, Engineering**
F.5.c.	Investigation/Inspection Follow-Up	Based upon dry weather monitoring results, investigate and inspect any potential illicit connections or other sources of non-storm water.	**Public Works, Engineering**
F.5.d.	Elimination of Illicit Discharges and Connections	Eliminate all illicit discharges, discharge sources and connections immediately upon detection.	**Public Works, Engineering, Code Enforcement**
F.5.e.	Enforce Ordinances	Implement and enforce ordinances, orders, or other legal authority to prevent and eliminate illicit discharges and connections to MS4.	**Code Enforcement**
F.5.f.	Prevent and Respond to Sewer Spills (Including from private laterals) and Other Spills	Prevent, respond to, contain and clean up all sewage and other spills that may discharge into the MS4 from any source.	**Public Works**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
F.5.g.	Facilitate Public Reporting of Illicit Discharges and Connections -- Public Hotline	Promote, publicize and facilitate public reporting of illicit discharges or water quality impacts through developing and implementing a public hotline.	**Engineering, Contract Services**
F.5.h.	Facilitate Disposal of Used Oil and Toxic Materials	Facilitate the proper management and disposal of used oil, toxic materials and other household hazardous wastes. This component will include educational activities, public information activities and establishment of collection sites operated by the City or private entity.	**City Manager's Office**
F.5.i.	Limit Infiltration From Sanitary Sewer to MS4	Implement controls and measures to limit infiltration of seepage from municipal sanitary sewers to MS4s. This effort will include overall sanitary sewer and MS4 surveys and routine preventative maintenance of both.	**Public Works**
	PUBLIC PARTICIPATION COMPONENT		
F.6.	Establish Mechanism for Public Participation	Organize a stakeholders group that will participate in the implementation of the JURMP	**Planning, Engineering**
	ASSESSMENT OF JURISDICTIONAL URMP EFFECTIVENESS COMPONENT		
F.7.a.	Long-term Assessment Strategy	Develop a long-term assessment strategy for the JURMP to include effectiveness.	**Engineering**
F.7.b.	Assess JURMP Effectiveness	Use the strategy developed to assess the effectiveness of the JURMP.	**Engineering**
	FISCAL COMPONENT		
F.8.	Develop Funding Plan	Determine most appropriate funding options to pursue.	**Finance, Engineering**
F.8.	Conduct Fiscal Analysis of Urban Runoff Management Program in its Entirety	Analyze the expenditures necessary to accomplish the NPDES Program and identify sources of funds proposed to meet the program requirements.	**Finance, Engineering**
	Implement Effort to Secure Long-Term Funding	Once the most appropriate option is determined, develop and implement effort to insure successful implementation.	**Finance, Engineering**
	COPERMITTEE COLLABORATION		
N.1 .a.	Execute Formal Agreement Which Provides Management Structure for Meeting Order Requirments	Collaborate with copermittees to execute a Memorandum of Understanding or Joint Powers Authority	**City, Engineering**
N.1.b.	Develop Standardized Formats for All Required Reports of the Order	Collaborate with copermittees to establish a standardized format to submit reports for the order	**City, Engineering**
Attachment B	Develop Previous Monitoring and Future Recommendations Report	Collaborate with copermittees to develop a report summarizing all past wet weather monitoring results and make recommendations for future monitoring activities.	**City, Engineering**
Attachment B	Develop Receiving Waters Monitoring Program	Collaborate with copermittees to develop a receiving waters monitoring program.	**City, Engineering**
Attachment B	Implement Receiving Waters Monitoring Program	Collaborate with copermittees to implement a receiving waters monitoring program.	**City, Engineering**
Attachment E	Develop Dry Weather Analytical and Field Screening Monitoring Map and Procedures	Develop an MS4 map, select dry weather monitoring stations, and develop dry weather analytical monitoring procedures	**Public Works, Engineering**

JURMP Program Summary (PY6)

Order 2001-01 Sections	Program Element	Activities	Responsible Department(s)
Attachment E	Conduct Dry Weather Analytical and Field Screening Monitoring	Conduct monitoring as developed, including follow up monitoring	**Public Works, Engineering**

El Cajon Storm Water Program Contact List (PY6)

Department	Contact Name	E-mail Address	Phone Number	Fax Number	Example of Responsibilities
Public Works	Rob Turner	rturner@ci.el-cajon.ca.us	(619) 441-1781	(619) 579-5254	Overall URMP oversight
Engineering	Michael Griffiths	mgriffiths@ci.el-cajon.ca.us	(619) 441-1785	(619) 579-5254	Oversees Public Works, Land Development process. Coordinates Implementation of BMPs and provides SWPPP review and engineering conditions of approval.
Storm Water Manager	Jaime Campos	jcampos@ci.el-cajon.ca.us	(619) 441-5554	(619) 579-5254	Generally oversees the assessment process and facilitates updates and changes to the URMP.
Planning Department	Barbara Ramirez	bramirez@ci.el-cajon.ca.us	(619)441-1771		Implementation of the land use component and facilitation of public education in regards to new. development.
Finance	Joyce Nevarez	jnevarez@ci.el-cajon.ca.us	(619)441-1543		Identify and secure sources of funds for implementation of the URMP.
Code Enforcement	Craig Bonner	cbonner@ci.el-cajon.ca.us	(619) 441-1663	(619) 579-5254	Code enforcement activities, public outreach programs and education activities
Code Enforcement & Erosion Control Plan/ SUSMP Review	Blake Behringer	bbehringer@ci.el-cajon.ca.us	(619) 441-1666	(619) 579-5254	Code enforcement activities and review of Erosion Control and SUSMP Plans for City projects and Private Development Contracts
Public Outreach	Robert Griswold	bgriswold@ci.el-cajon.ca.us	(619) 441-1704	(619) 579-5254	Facilitate public outreach programs and education activities.

APPENDIX J

Maintenance Summary for El Cajon Sewers - FM = Flush/Maintenance; JM = Rodding/Maintenance

Basin	MH1 Page	MH1 Number	MH1 Type	MH2 Page	MH2 Number	MH2 Type	Maint Date	Length (ft.)	Maint Type	Cycle (Mo)	PY6 Footage

Appendix B
1. Reports of Illicit Discharges/Complaints
2. Inspections Conducted
   a. Municipal
   b. Commercial – Industrial
   c. Construction
3. Enforcement Actions
4. (No Content)

Appendix C
1. Contact List for El Cajon Storm Water Staff (PY1)
2. (No Content)

Appendix D Sewer Maintenance Summary (PY1)

EXECUTIVE SUMMARY

The City of El Cajon in the Context San Diego County and the San Diego River Watershed

The City of El Cajon (City), located in east San Diego County, is the eastern-most incorporated City within the San Diego River Watershed (Watershed). With 14.48 square miles and nearly 97,000 citizens, the City plans with other regional jurisdictions and acts locally to maintain the health of the San Diego River Watershed. A healthy watershed means thriving environmental communities and a state of well being among its constituency. Maintaining watershed health is achieved through compliance with Federal Clean Water Act requirements as stated in the San Diego County Municipal Storm Water Permit, Order No. R9-2007-0001, through water quality monitoring, biological assessments, and municipal vigilance to balance growing human demands with a healthy environment.

Permit Year 2007-2008 (PY 2007-08 and also PY1 of the new permit) is the year in which the San Diego Region Order No. R9-2007-0001 (new municipal permit) renewed Order No. 2001-001. The renewed municipal permit was adopted in January 24, 2007, and PY 2007-08 portends to be the first year in the new municipal permit's cycle. Efforts started with jurisdictional planning and implementation, proceeded to local program assessment and continues to evolve into multi-jurisdictional and watershed actions. The City is transitioning to the new municipal permit and continued the Permit Year 2006-07 focus of assessing program component effectiveness from Best Management Practices (BMP) implementation and determining how preventive measures affect watershed health from a local perspective. Many of the program's components have developed into BMP programs, whereby inspections can determine effectiveness of pollution reduction measures.

This Annual Report presents the City's efforts during the 2007-08 reporting period. Covered in this Report is the move toward adaptive management of the updated Jurisdictional Urban Runoff Management Program (JURMP) implementation and integration of general watershed principles for the San Diego River Watershed into local planning. Both the San Diego River Watershed Urban Runoff Management Plan (WURMP) and the City's JURMP were updated and submitted to the San Diego Regional Water Quality Control Board (RWQCB) on March 24, 2007, as required by the new municipal permit and extension. It is the responsibility of the City to balance jurisdictional and watershed requirements and maintain a healthy watershed within its jurisdiction.

Critical for the rest of the new permit cycle are Watershed adjustments to the City's Storm Water Pollution Prevention Program and deciding where best to place City efforts that will minimize or eliminate polluted runoff. Forrester Creek, the main tributary drainage channel in El Cajon, is a listed 303(d) waterbody with impairments for pH in the upper part (El Cajon and San Diego

County) and for total dissolved solids (TDS) and fecal coliform in the lower portion within the City of Santee). El Cajon considers these three impairments to be the center of the Clean Water Act objective "to restore the Nations Waters" to a chemical balance able to support the State's Basin Plan designations for fishable and swimmable waters.

A *BMP to Pollutant Reduction Diagram* was developed to connect BMPs to pollutants that are targeted for reduction as a result of their listing as 303(d) pollutants in Forrester Creek. This diagram and discussion is provided in the Introduction in Section 1.

This JURMP Annual Report for PY1 consists of 15 Sections, and is organized as follows:

Section 1 - Introduction. Describes the purpose of this Annual Report, the overall vision of the City, goals and objectives of the Storm Water Pollution Prevention Program; the regional integration of Watershed Health; assessment of program effectiveness to guide future actions, and Forrester Creek-specific criterion that relate to San Diego River Watershed and River health.

Section 2 - Development Planning Component. Lists the planning actions reviewed and the role of storm water in re-defining new development designs and describes the ways of confirming that commitment to storm water becomes a design reality.

Section 3 - Construction Component. Summarizes reviews of Erosion Control Plans, inspections of high priority sites, interactions with other City departments, and conditions during rainfall events.

Section 4 - Municipal Component. Summarizes the activities for municipal facilities, the sanitary sewer program, capital improvement projects affecting storm water quality, and municipal staff training.

Section 5 – Industrial and Commercial Component

- **Industrial Component**. Summarizes the activities conducted to assess the effectiveness of implemented industrial BMPs and better define the pollutants affecting storm water quality.
- **Commercial Component.** Summarizes the inspections, enforcements, and educational efforts to assess the effectiveness of implemented BMPs and better define the pollutants affecting storm water quality by business type.

Section 6 - Residential Component. Summarizes the challenges with educating the public, interactions with citizens, educational efforts, and enforcement at the residential level.

Section 7 - Illicit Discharge Detection and Elimination Component. Summarizes the City's dry weather program that identifies illegal dumping and illicit connections to the storm drain system. This year an upstream/downstream analytical assessment was completed for dry weather.

Section 8 - Education Component. Summarizes programs implemented by the City to educate municipal employees, developers and contractors, business owners, the general public, and other priority groups

Section 9 - Public Participation Component. Summarizes the outreach efforts coordinated on a regional level through the Outreach Workgroup.

Section 10 - Fiscal Analysis Component. Reviews and compares previous storm water expenditures while projecting future program funding requirements.

Section 11 - Effectiveness Assessment Component. Provides summary tables for the existing and development components indicating estimated and actual pollutant-containing material reductions at the source or from preventive measures.

Section 12 – Special Investigations. Summarizes any special investigations that may have been conducted during the current reporting period.

Section 13 – Non-Emergency Fire Fighting. Summarizes non-emergency fire-fighting activities/training conducted during the current reporting period.

Section 14 – JURMP Revisions. Summarizes any changes or revisions to the JURMP that may have occurred during the current reporting period.

Section 15 - Conclusions and Recommendations. Summarizes the conclusions stated from each component and makes overall program conclusions and provides recommendations for future permit years.

Appendices contain City-developed checklists, guidance documents, outreach materials, lists of priority businesses or sites, and presentations to City staff and the local community. Additionally, the Dry Weather Monitoring report is provided as an attachment.

The City achieved a number of important accomplishments during this reporting period, both in its role as a Copermittee, and through participation (and eventual leadership role) in the implementation of general watershed principles. Across the City, businesses and citizens, together, function within the JURMP and watershed to assist in identifying storm water issues and help prevent pollution from being discharged.

City Action Highlights include:

- Continue with a strong Enforcement program for City Ordinances 4686 (JURMP) and 4717 (Standard Urban Storm Water Management Program (SUSMP) requirements).
- As a City with little open space and a propensity for redevelopment, the City pursues common sense approaches to go beyond Permit compliance and achieve defensible, cost-effective storm water management practices for businesses and citizens through the SUSMP conditioning process.
- Continued implementation of a City-Wide Integrated Pesticide Management Program.
- The City continued an expanded scope of its Dry Weather Monitoring Program. Additional information along concrete lined areas focuses on business districts or municipal areas. In doing so, it has made substantial strides in detecting and eliminating discharges and characterizing receiving waters and other conveyance discharges within its jurisdiction.
- Conducted upstream/downstream dry weather analysis in Forrester Creek to quantify the amounts of pollutants discharged within the City's jurisdiction.

- Inspected 142 High Priority Commercial Establishments for compliance with the City's Municipal Code and issued 7 warnings and 2 citations to commercial business for various violations of the City's storm water ordinance. The City conducted monthly inspections at all priority construction sites during the dry season and weekly inspections during the wet season.
- The City issued a total of 15 warnings and 14 citations for various violations of the City's storm water ordinances.
- Conducted inspections at 18 high priority construction sites. The inspections revealed several violations or compliance issues and the City issued 6 written warnings.
- Conducted inspections at 69 high priority industrial sites. The City also collected industrial storm water monitoring data from those industrial facilities subject to the State General Industrial Storm Water Permit and conducting the required annual storm water monitoring. The City intends to review the industrial storm water data to evaluate potential contributors to water quality problems.
- The City's inspection programs emphasized clean trash storage and disposal areas; power washing BMPs; and maintenance of sewer laterals in addition to the minimum required BMPs.
- the City of El Cajon was presented the **Sewage Collection System of the Year Award** for collection systems under 250 miles in length by the California Water Environment Association (CWEA). The award represents professional acknowledgement of decades of superior maintenance of the El Cajon Municipal Sewer System by many City workers.

- The City's comprehensive street sweeping program swept 21,180 miles of streets and collected 3,483 cubic yards of materials from City streets. Sediment and silt account for 45% of the total, organic material accounted for 37%, trash accounted for 16% and the "Other" category accounted for 2%.
- Collected 1,720 cubic yards of materials from City inlets, culverts, concrete-lined channels, and catch basins.
- Actively participated in the Management Committee, Outreach Workgroup, Regional Monitoring Workgroup and WURMP

Development Workgroup.

- Continued active participation with the East County Cities Workgroup.
- Continued its efforts to reach out to community members on a wide range of urban runoff and storm water quality topics through approximately 209,000 copies of articles, brochures, and mailers.
- Conducted over-the-counter assistance and provided personalized residential BMP information to homeowners for small additions and remodels, pools and retaining wall projects.

This reporting period is one of continued program assessment and focus of local actions to move toward a watershed protection program. This last year, the City continued to meet the new challenges of working within a watershed. The City continues in the role of the Lead Copermittee for the San Diego River Watershed. The City feels strongly that it has made significant strides looking within its jurisdictional boundaries as well as organizing inter-jurisdictional programs. Continuing improvement and refinement is the name of this storm water pollution prevention program as we continue to gather information and experience about how City activities affect the local receiving waters and the health of the San Diego River Watershed.

This Annual Report provides programmatic information and further steps in connecting activities to a significant movement for improving receiving water quality by the City of El Cajon. Over the last year, the City has continued its effort at linking municipal activities to receiving water quality. Additional connections to receiving water quality from the implementation of BMPs will follow as information is gathered and assessed using a Long-Term Assessment process over the next several years.

A listing of storm water contact personnel is provided as part Appendix C to help facilitate communication within the City and for the public and outside agencies to contact the appropriate City staff.

CERTIFICATION

"I Certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

1.8 ORGANIZATION AND CONTENT OF ANNUAL REPORT 16

SECTION 1 INTRODUCTION

Our Environment:
It's a Living Thing!

With each Permit Year (PY), the City of El Cajon reviews, assesses, and progresses towards a watershed approach to protect surface waters from urban runoff pollution. A continued emphasis towards identifying sources of pollutants and minimizing specific 303(d) impacts to Forrester Creek is the focus of this 1st year in the Permit Cycle (Order No. R9-2007-0001).

The typical steps for developing a pollution prevention and source control program are summarized below and discussed in more detail in Section 11, Effectiveness Assessment.

1. **Identify the issue.** Define each issue.
2. **Identify and assess sources.** Sources are identified by prioritizing based on location and type of business.
3. **Determine available control strategies**. To identify possible control strategies for each source.
4. **Evaluate control strategies**. To determine which control strategies are most likely to achieve measurable results.
5. **Establish a goal.** A goal may be set at any point during the development process. The goal is the desired outcome.
6. **Implement program.** Part of program implementation is selection of an effectiveness measurement tool to assess the program.
7. **Evaluate effectiveness.** Based on the effectiveness measurement, determine what has been learned.
8. **Modify program.** The results of the effectiveness measurement will help to determine the future direction for the program.

Described in this First Permit Year (PY1) Annual Report is the implementation and collected information for each Permit component. Sections 2 through 11 highlight component accomplishments, activities, or areas of achievement for Development and Planning; Construction; Municipal; Industrial and Commercial Development; and Residential Development; Education and Outreach; Illicit Discharge, Detection and Elimination; Public Participation, Effectiveness Assessment; and Fiscal Analysis.

1.1 REGULATORY FRAMEWORK

Background

The City of El Cajon's (City) Jurisdictional Urban Runoff Management Plan (JURMP) was developed pursuant to Order No. 2001-001, National Pollutant Discharge Elimination System

(NPDES) Permit No. CAS0108758, the area-wide municipal separate storm sewer system (MS4) permit. The MS4 permit was established pursuant to Section 402(p) of the Federal Clean Water Act, which requires all point source discharges of pollutants into waters of the United States, including discharges from municipal separate storm sewer systems, to be regulated by a NPDES permit. On January 24, 2007, the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), adopted Order No. R9-2007-0001, NPDES Permit No. CAS0108758 (Permit), to the City and 20 other Copermittees, for discharges of urban runoff from MS4s into the receiving waters within the SDRWQCB's jurisdiction.

The City is a participant and partner in the San Diego River Watershed along with the Cities of La Mesa, Poway, San Diego, Santee, and the County of San Diego. A watershed approach to storm water pollution provides the wider view of runoff impacts and requires jurisdictional approaches to include neighboring jurisdictions in future planning and reporting efforts.

The PYs are summarized as follows:

- PY1 - February 21, 2001 through June 30, 2002, a comprehensive JURMP was developed.
- PY2 - July 1, 2002 through June 30, 2003, the initial implementation and assessment of programs.
- PY3 – July 1, 2004 through June 30, 2005, reassessment of initial implementation with refinements and reimplementation, as necessary.
- PY4 – July 1, 2004 through June 30, 2005, implementation was taken to the next level of refinement based on performance.
- PY5 – July 1, 2005 through June 30, 2006, as the City's programs mature, the City focused on watershed issues, including pollution prevention and education and continued to refine and improve the City's programs.
- PY6 - July 1, 2006 through June 30, 2007, preparing for issuance of a new permit containing watershed/regional permit requirements supported and subsidized by jurisdictional efforts.

<u>Current and Future</u>

- PY1 - July 1, 2007 through June 30, 2008, modifying and enhancing the storm water program to comply with the new Municipal Permit, R9-2007-001. New comprehensive JURMP prepared to create a detail framework of the program under the new permit.

1.1.1 Water Courses and Receiving Waters

The definition of the City's Storm Drain System is broad enough to include streets, gutters, inlets, catch basins, channels (lined and unlined), creeks, and streams. Our storm drain system starts at a facility's property line to the public right-of-way. By making such a distinction, it is clear to maintenance and storm water crews when it is the responsibility of the City to clean spills or illegal dumping of materials. If such a discharge occurs on private property and the discharge enters the City storm drain system, the property and business owner/contractor is contacted and educated on storm water requirements for their type of business. Property and business owners are charged for cost-recovery of City staff involvement.

The goal of PY1 and future program years will be a continuing focus on impairment of Forrester Creek with the ultimate goal of eliminating the impairment on Forrester Creek, and meeting the objective of the Clean Water Act to maintain and restore the chemical, physical, and biological integrity of the Nation's waters.

Table 2 lists the major storm water conveyance systems and describes the type of channel. Most conveyance systems are concrete-lined, making them easy to maintain, but present other types of challenges such as:

- Elevated pH (above 9)
- Shelter for homeless populations
- Trap for air blown trash and debris
- Easy target for illegal dumping

Table 2 – Storm Water Conveyance Systems

Water Courses	Type of Channel
Forrester Creek	• Open, concrete-lined trapezoidal channel • Underground culvert
Broadway Channel	• Open, concrete-lined channel • Underground culvert
Washington Channel	• Open, concrete-lined channel • Underground culvert
County Ditch	• Open, concrete-lined channel • Underground culvert • Open, natural-lined channel
Fanita Channel	• Underground culvert • Open, concrete-lined channel
Third Street Lateral	• Open, concrete-lined channel • Underground culvert
Fletcher Parkway Channel	• Open, concrete-lined channel • Underground culvert • Open, natural-lined channel

The picture to the left shows the City boundaries, Forrester Creek and the major channels within the City.

1.1.2 Approach and Changes to the Program

Approach

As the City becomes more experienced with its own programs and with what is working and what is not, the City modifies the implementation and management of its Storm Water Program. This Adaptive Management is a dynamic process of improving management activities incrementally, as decision makers learn from experience and better information and analytical tools become available. It involves checking progress made in achieving water quality goals, adjusting the management decisions accordingly, rechecking and readjusting – all the while incorporating new data and scientific knowledge. Beginning in early 2008, the City of El Cajon is developing a Storm Drain Master plan. Once complete, the Storm Drain Master Plan will provide the City with additional tools to assess and achieve water quality objectives. Adjustments to goals and objectives are expected to occur due to unforeseen circumstances and an unpredictable future.

One approach the City continues to implement (through education and training) is to change pollution prevention from the conventional recycle, reduce and reuse, to measures that target pollution prevention at the pollutant source. For Storm Water Pollution Prevention, consideration is given both to flow reduction measures and pollution source controls. Where water acts as the primary conveyor of pollution, pollution prevention measures can reduce pollution impacts by preventing pollutants from entering the flow, or by controlling the flow. In the development of an effective pollution prevention or management strategy, it is critical to understand how water cycles through the air and soil to ensure that measures are selected and implemented in an appropriate manner.

Changes to the Storm Water Program

Program Year 1 (PY1), and continuing into the next permit cycle, will be a continuing period of transition from purely jurisdictional to a jurisdictional/watershed approach. A few of the modifications include:

The San Diego River Flows Across Padre Dam

- Promoting a Clean Community, Healthy Watershed;
- Maintaining Watershed and River Health in the San Diego River Watershed;
- Focusing on 303(d) pollutants to restore Forrester Creek water quality;
- Continuing to assess the potential for increased flow from New or Re-Development projects and reduce flow from the current flow of approximately 234 gallons per minute during the dry season (double last year's dry weather flow rate).
- Coordinating with the City of Santee for the trash and debris fence while the Forrester Creek Restoration project is under construction;
- Prioritizing activities in coordination with other East County Cities;
- Collecting information on upstream and downstream conditions to better assess areas (zones) where pollution is more probable or prevalent;
- Review of the analytical methods and a comparison to what information is actually needed to determine pollutant loads.

The City of El Cajon's Storm Water Pollution Prevention Program looks to pollution solutions in the form of Best Management Practices, proven procedures, or other new technologies. Table 1 (next page) lists the water quality and quantity issues in El Cajon and the possible solutions provided by the Jurisdictional Urban Runoff Management Plan (JURMP) components that comprise the Storm Water Pollution Prevention Program.

Table 1 – Storm Water Pollution Prevention Program Components

Water Quality or Quantity Issues	Pollution Solution
• Increased runoff (volume, frequency and duration) with impervious ground cover.	• Runoff control for flood and erosion protection (**New Development and Construction**) • Measures to maintain existing discharge rates. (**New Development/Redevelopment**)
• Increased base flows in streams due to changes in land use.	• Provide measures to maintain infiltration **(New Development/Redevelopment)** • Provide extended detention of runoff for low flows. (**New Development/Redevelopment**)
• Increased pollutant loadings with runoff.	• Provide measures to reduce pollutant sources, or remove pollutants, by settlement, absorption or filtration. (**Municipal, Industrial, Commercial, Residential Existing Development/Redevelopment**)
• Stream bed and bank changes due to erosion.	• Infiltration for control of runoff volume.(**New Development/Redevelopment**) • Rate of runoff control for erosion protection (**Construction/Redevelopment**)

Stronger move toward prevention of polluted discharges – distinguishing pollutant reduction from Pollution Prevention (recycle, reduce, reuse) activities, while connecting BMPs with the pollutant being reduced. A BMP to Pollutant Reduction Diagram is provided below and is the mainstay for the Existing and Development (including Construction) Components. This part of the transition occurred after Copermittees submitted a Framework for BMP Implementation in October 2003.

Inspection data collected under the original system designed by DMax Engineering was translated into BMP implementation results. The BMP implementation results data can be used to help prioritize follow-up actions, including inspections and education efforts in PY1.

BMP to Pollutant Reduction Diagram (See Following Page for Details)

Pollutant to BMP Table
BMPs target the reduction or elimination of a primary pollutant (sediment or fecal coliform) or pollutant group (oil & grease).

↓

Facilities and BMP Table
Individual Facilities are Required to Implement the Minimum BMPs

↓

Summarize Facility Types with Pollutant Reduced Table
Combines Table 1 and 2 to connect pollutant to (high priority) facility type, such as industrial, commercial/restaurants, municipal, residential area, or SUSMP/Parking Lot through the implementation of BMPs. Allows the calculation of percentages for implemented BMPs for high priority facilities.

↓

Transition to Effectiveness Assessment
Percentages between 80-100 overall implementation are used to calculate a quantity of pollutant(s) prevented from entering the storm drain system and thus reduction in pollutants ultimately discharged.
Reasonable Assumption: If inspection was impromptu, results observed on inspection day, in general, represent conditions at the facility for the entire year.
Calculations: Determine an *average* (typical for facility) discharge of the pollutant containing material.

The BMP to Pollutant Reduction Diagram demonstrates how BMPs are connected to pollutants that are connected to water quality. Our difficulty lies in quantifying those pollutant reductions with accurate and defensible results. In Section 11.0, estimates as well as empirical data are used to assess the effectiveness of the City's Storm Water Program by showing how much pollutant-containing materials were diverted toward a better disposal avenue.

1.2 COMMITMENT AND PARTICIPATION

The City of El Cajon is committed to promoting the concept and practice of preventing pollution at the source. Preventing pollution will prevent environmental problems. This saves the public and private sector from loss of resources and the costs to correct environmental damage. Urban runoff management requires the simultaneous pursuit of several objectives. The City is committed to:

- Enforcement of the Municipal Codes for Urban runoff (ECMC 13.10) and New or Site Re-Development (ECMC 16.100).
- Prevention of pollutant discharges into Forrester Creek as part of the San Diego River Watershed.
- Protection of water quality, aquatic species, and watershed ecosystems.
- Promotion of environmental quality and social well-being.

1.2.1 Jurisdictional Implementation

Pollution Prevention continues to be the focus of the City's JURMP and Storm Water Pollution Prevention Program for businesses and citizens. Compiled information on amounts of pollutants prevented from entering the storm drain system has a direct correlation to any decrease in pollutant loads from entering receiving waters. Pollutant amounts removed from streets, roadways and the storm drain system, or that have been recycled, have a direct correlation to water quality.

Land use consists of residential, commercial, industrial, municipal, and educational with recreational facilities. The City is at a "built-out" stage where most construction is redevelopment. Successful implementation of the City's Standard Urban Storm Water Management Program (SUSMP) supports the reduction in flow from a pollution prevention perspective. Development and redevelopment proposals that trigger the SUSMP requirements must submit plans consistent with reducing flow and impervious areas and must consider storm runoff treatment before the project will receive final City approval and proceeding to actual construction.

1.2.2 East County Cities Teamwork

Beginning in PY2 and continuing through PY6 and PY 1 of the new Permit, the East County Cities Workgroup gathered to discuss and tackle issues specifically afflicting the eastern part of San Diego County. Some of these East County challenges include:

- Tackling storm water issues from a "sand" perspective
- Highly transient populations

- Locally-focused City Management
- Boxed-in, built-out Development

1.2.3 Regional Teamwork

The City participated in regional efforts to promote storm water management practices and educate businesses and citizens to conduct business and daily lives with respect for water quality. When possible, the City attended or was an active participant in the following events.

- Management Committee Meetings
- Outreach Workgroup
- Regional Residential Outreach Selection Committee and Workgroup
- BMP Implementation Workgroup **
- East County Cities Workgroup (a.k.a., San Diego River Watershed Workgroup) **
- Regional Monitoring Workgroup

** - Chaired Workgroup

1.3 WATERSHED AND RIVER HEALTH

As stated in the Clean Water Act, the objective is to maintain and restore the chemical, physical, and biological integrity of the Nation's waters. To address this objective, watershed and river health for the San Diego River can be described in terms of unique biophysical, socio-cultural, and economic characteristics. Biophysiochemical components are a watershed's elements and functions (its chemical, physical, and biological processes), while socio-cultural and economic components are the values and benefits provided by a functioning healthy watershed. The water quality aspect and stream flow (as hydrological patterns) of the biophysiochemical component list and the recreational/esthetic values of the socio-cultural and economic components are the only subjects directly addressed in our City's permit under Order No. R9-2007-0001.

Biophysiochemical:

- Basin geomorphology
- Hydrological patterns (stream flow addressed in Municipal Permit)
- Water quality (addressed in Municipal Permit)
- Biotic community and habitat

Socio-Cultural and Economic:

- Breakdown and recycling of pollutants
- Regulation of storm water discharges
- Groundwater and aquifer recharge
- Recreational and esthetic values (addressed in the Basin Plan, but included in Municipal Permit by reference)
- Habitat values (protected species, fisheries, etc.)

In general, the factors that determine ecosystem and watershed health are universal. A healthy watershed is one in which these components are maintained with thriving and balanced

communities. An immutable characteristic of upper Forrester Creek is the concrete lining of this channel. In the 1960's, Forrester Creek was modified with a concrete channel in order to provide flood control for the expansion of the Interstate Highway easterly toward El Centro.

In a built-out urban area such as the City of El Cajon, defining and achieving creek, river and watershed health is complicated by a highly altered landscape (concrete channelization of Forrester Creek, highly urbanized, little open-space) and continued urban-infill and growth within and upstream of its jurisdiction. Nonetheless, the City has a vision and initially a broad goal for watershed and river health. The vision states the desired future for the city with respect to watersheds and waterways. The goal states that the City ultimately aims at maintaining watershed and river health for water quality and hydrological patterns, quantitatively and qualitatively.

Although it is unrealistic and infeasible to re-create the environmental conditions that existed before the City's development, it is prudent to consider predevelopment conditions when assessing the health of Forrester Creek and the San Diego River. Information about historical conditions is useful in understanding current watershed processes and functions that are essential to downstream watershed and river health. In fact, healthy downstream conditions may best be served by continual efforts by the City to reduce and eliminate pollutant discharges to Forrester Creek, to the maximum extent practicable.

1.4 WATERSHED PLANNING

The City recognizes the importance of watershed management as a guiding principle for its water quality management of the San Diego River Watershed. As required by Permit Section J, a Watershed Urban Runoff Management Plan (WURMP) was developed during PY2 and refined during subsequent permit years. As a member of the San Diego River Watershed, the City attended and participated in establishing the Watershed program for the San Diego River area.

There is a learning curve to transitioning certain activities from a jurisdictional to a watershed approach.

The picture to the left shows El Cajon as part of the inland watershed area. Much has been discussed during this PY1 and an outline for the future watershed management is in place. The coming year will be one of implementation bringing new challenges to the storm water programs.

1.4.1 Water Quality and Stream Flow

Water quality has long since been the focus of many watershed programs. However, those programs and regulations have focused mostly on the chemical aspects of water quality, such as the concentrations of metals and organics, without considering how water quality is affected by the physical habitat in a stream or river. Water quality is greatly affected by the amount of large wood in the waterway, the river or stream's substrate (coarse gravel or fine sediment), the amount of native vegetation in floodplains and other aspects of physical habitat.

Physical habitat, in turn, is shaped in part by the larger forces of stream flow and hydrology. It has long been understood that the influence of stream flow, hydrology, physical habitat and water quality help determine which species are present within a watershed and the abundance, productivity and diversity of those species. For these reasons and others, the City defines its functional disposition in the watershed and river health as providing/conveying sustainable stream flow and hydrology and restoring and preserving water quality.

- **Stream Flow and Hydrology**: Maintain, or as necessary reduce, dry weather flow conditions using the Standard Urban Storm Water Management Plan to prevent an increase in runoff due to development and redevelopment projects, thereby protecting and improving watershed and stream health, channel function and public health and safety.
- **Water Quality:** Protect and improve surface water and groundwater quality and meet or surpass state and federal water quality standards and regulations.

Improving water quality within the City's jurisdiction will contribute to overall watershed health and will help keep the watershed as healthy as possible. John Muir said it best, "*When we try to pick out anything by itself, we find it hitched to everything else in the universe*".

1.5 GEOGRAPHICAL INFORMATION SYSTEM (GIS)

PY1 is the fifth year for using a Geographical Information System to present the location of El Cajon within the San Diego Watershed (See Figures following within this section). Base maps and information obtained from SanGIS provided the basic information to start layering jurisdictional and regional information. Deciding on the types of data and what needs to be shown are the biggest questions to answer.

In PY6 (2006/2007) the City created a new full-time GIS position to assist the Storm Water Program. The City is planning on implementing and developing an Enterprise GIS. To achieve this goal the City is currently dedicating more resources to a growing GIS staff and a new server.

One of the main benefits of GIS is improved management of your organization and resources. A GIS can link data sets together by common location data, such as parcel numbers, which helps departments and agencies share their data. Storm Water staff identified the Business License database as information easily integrated into a GIS to show and list the parcels within 200 feet of the five (5) major El Cajon drainage channels. The saying, "better information leads to better decisions" is true for GIS. A GIS is not just an automated decision making system but a tool to query, analyze, and map data in support of the decision making process.

The GIS maps presented in this PY1 Annual Report are used as tools by storm water staff to aid in the making of decisions that will be crucial to the direction of the Storm Water Program. Three maps follow this page showing:

- San Diego County Regional Watersheds
- San Diego River Watershed with a focus on El Cajon
- City of El Cajon showing Residential (green), Commercial (red), Industrial (pink), and School Districts (blue).

The information can be presented succinctly and clearly in the form of a map and accompanying report, allowing decision makers to focus on the real issues rather than trying to understand the data.

1.6 SIGNIFICANT ACCOMPLISHMENTS

The following significant accomplishments were completed and helped to maintain Watershed and River Health. Elimination of pollution is mainly due to routine scheduled municipal maintenance activities, municipal and commercial education efforts, outreach to the public and daily contact with citizens. The following is a summary of the major investments in reducing pollutant loads to receiving waters.

- Continued to implement and refine the Enforcement program for City Ordinances 4907 (JURMP) and 4908 (Standard Urban Storm Water Management Program (SUSMP) requirements). Streamlined enforcement activities with the inspection database to better coordinate and design correction actions.
- Continued to improve an inspection program for construction, commercial and industrial facilities based on Best Management Practices (BMP) implementation. Tracking BMP implementation and ensuring that all minimum required BMPs are installed and maintained properly helps ensure that pollutants are not discharges from those facilities. (List is continued following the three pages of GIS Maps).

Regional Watershed Map

SD River Watershed Map

El Cajon GIS Map

- Inspected and provided educational materials to well over 200 industrial and commercial businesses for compliance with the City's Municipal Code and the State's General Permits for construction and industrial activities.
- The City's comprehensive street sweeping program swept 21,180 miles of improved streets and collected 3,483 cubic yards of materials from City streets. About half (45%) of the material collected this year was sediment and silt. Many areas were swept twice per week.
- Collection of over 1,720 cubic yards of materials from City inlets, culverts, concrete-lined channels, and catch basins;
- The City formally trained 90 building, planning, middle management, and engineering staff on SUSMP requirements. Public Works staff completed before and after evaluations to assess the absorption of knowledge during retraining efforts
- Conducted joint training sessions with the City of Santee, City of Lemon Grove, and the County of San Diego to initiate a cooperative effort with neighboring jurisdictions.
- Reached out to community members on a wide range of urban runoff and storm water quality topics through approximately 209,000 copies of articles, brochures, mailers, and over-the-counter sources.

1.7 RWQCB Compliance Reviews and Inspections

During this reporting period, interaction between the City and RWQCB staff was mainly limited to written comments on PY5 (2005/2006) Annual Report. Comments have not yet been received for the PY6 (2006/2007) Annual Report.

1.8 Organization and Content of Annual Report

The Permit requires the submittal of an Annual Report to the SDRWQCB. This Annual Report covers the single permit year activities between July 1, 2007 and June 30, 2008. The Dry Weather Monitoring for 2007 was completed in June 2007, and the entire report is included with this PY1 Annual Report.

The PY1 Annual Report presents and discusses implementation of the City's JURMP with a look at trends, BMP implementation, and overall JURMP effectiveness. Organization of the PY1 Annual Report is as follows:

- Executive Summary and Report Certification
- Section 1 - Introduction
- Section 2 - Development Planning Component
- Section 3 - Construction Component
- Section 4 - Municipal Component
- Section 5 - Industrial and Commercial Component
- Section 6 - Residential Component
- Section 7 - Illicit Discharge Detection and Elimination Component
- Section 8 - Education Component
- Section 9 - Public Participation Component
- Section 10 - Fiscal Analysis Component
- Section 11 - Effectiveness Assessment Component
- Section 12 - Special Investigations
- Section 13 - Non-Emergency Fire Fighting
- Section 14 - JURMP Revisions
- Section 15 - Conclusions and Recommendations

Charts, graphs, figures, and pictures are used to demonstrate the fulfillment of Permit and JURMP requirements or to highlight a special program accomplishment and event. Appendices provide additional information to validate activities or procedures.

Specific importance is placed on the assessment of JURMP implementation as this process is essential to determine if the City's program is reaching the Permit goal of improving receiving water quality. Some practices and structures (BMPs) listed in the JURMP to reduce or eliminate pollutants may prove to not be as effective as anticipated. An iterative process of BMP development, implementation, monitoring, and assessment focuses the JURMP such that JURMP programs are sufficiently comprehensive and effective to achieve Permit requirements and program objectives.

2.4 REVISED ENVIRONMENTAL REVIEW PROCESS 11

2.5 DEVELOPMENT PLANNING OUTREACH EFFORTS 11

2.6 REGULATORY COMMENTS 11

SECTION 2 DEVELOPMENT PLANNING COMPONENT

2.1 INTRODUCTION

Over the last few years the City of El Cajon (City) implemented procedures to minimized the short and long-term impact on receiving water quality from new development and redevelopment. Major steps were taken to accomplish this goal under Order No. 2001-001. The City completed the requirements of the plan which include the following four components:

1. Assessment of General Plan
2. Modification of Development (Project Approval Process)
3. Revision of Environmental Review Process
4. Conducted Education Efforts Focused on New Development and Redevelopment

During PY2007-08 the process continued to evolve to incorporate requirements under new Municipal Permit Order No. R9-2007-0001. The City adopted updated Ordinances to comply with new requirements.

2.2 ASSESSMENT OF GENERAL PLAN

The General Plan provides a jurisdictional framework for directing land use and development decisions within the City of El Cajon. Therefore, it is important that the General Plan include provisions to address water quality. The City incorporates elements into the General Plan that provide an adequate foundation for controlling land use and development in a manner consistent with water quality objectives required by the Municipal Permit Order No. 2007- 001 (Permit).

On January 14, 2003, Resolution No. 10-03 was approved amending the General Plan and adding storm water runoff policies and objectives. The amendment is consistent with the City's Jurisdictional Urban Runoff Management Plan (JURMP) and provides policy and objectives dealing with storm water runoff to guide decision-making as mandated in the Permit. A copy of Resolution No. 10-30 is included in Appendix A.2. A copy of the General Plan is shown on the following page.

El Cajon General Plan/Sphere of Influence/Watershed - August of 2008

Sweetwater River Basin

2.3 MODIFICATION OF DEVELOPMENT

2.3.1 Development Project Approval Process

Development becomes a project once the applicant completes planning action forms that describe the type of development proposed. The planning action is routed to many departments including Storm Water. Consolidated comments from Public Works are attached directly to the project as a list of conditions to the proposed planning action. Conditions are then reviewed and accepted by City Council making them enforceable. The City does not issue building permits until all requirements addressing water quality are fulfilled. Similarly, the City does not grant a final occupancy certificate until all storm water requirements are completed.

To protect our natural resource waterways, the City has continued ordinance development and implementation to address water quantity and quality. New and Redevelopment projects are reviewed for applicable BMPs to attain:

- Reduction in paved areas
- Maximize infiltration
- Detain or retain flows to reduce the speed at which water discharges to natural areas, and break Directly Connected Impervious Areas (DCIAs).
- Minimize potential pollutants from reaching the Municipal Separate Storm Sewer System (MS4) from grading and other construction activities by meeting the provision specified in Section D.2 of the Permit.
- Require Industrial applicants subject to California's statewide General NPDES Permit for Storm Water Discharges Associated with Industrial Activities to provide evidence of coverage under the General Industrial Permit.
- Require project proponents to provide proof ensuring ongoing long-term maintenance of structural Treatment Control BMPs.

2.3.2 Standard Urban Storm Water Mitigation Plan

The City participated with other Copermittees in revising and updating the BMP requirements that were listed in the Model Standard Urban Storm Water Mitigation Plan (SUSMP) that was submitted to the Regional Water Quality Control Board (RWQCB) in February 2002. Consequently, the City revised and updated Ordinance 4717 adopted on December 2002 to implement local SUSMP to reduce pollutants and runoff flows from all new development and significant redevelopment. The City recently adopted Ordinance 4908, which defines the enforceable Municipal Code 16.60 for New and Re-Development pursuant to Program R9-2007-0001.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's Local SUSMP. As of the writing of this annual report, the HMP is being developed by a consultant and regional workgroup and the draft HMP is projected to be completed in January 2009. After receiving comments from the RQWCB on the draft HMP, the final HMP will be prepared. The final HMP will be added to the Local SUSMP after approval by the Regional Board. No priority projects in the City of El Cajon have met HMP criteria as of yet, no projects have disturbed more than fifty acres, and the City does not anticipate any projects that will in the future.

Projects triggering the New and Re-Development SUSMP requirements are:

- Housing projects with greater than 10 units
- Commercial developments greater than 1 acre
- Heavy Industry
- Automotive repair shops
- Restaurants
- Hillside developments greater than 5,000 square feet
- Environmental Sensitive Areas
- Parking lots 5,000 square feet or more or with 15 or more parking spaces potentially exposed to urban runoff
- Streets, roads, highways, and freeways greater than 5,000 square feet
- Retail Gas Outlets

Projects trigger the SUSMP requirements during the initiation of a planning action or environmental investigation brought on by the California Environmental Quality Act (CEQA). The Storm Water section of Public Works reviewed a total of 74 planning actions, 10 of which were categorized as high priority SUSMP projects (please refer to Appendix A.2 for a list). The City also carried over 9 SUSMP projects that are in varying degrees of development, design, or construction from previous years. Planning actions and New Development projects are tracked using a MS Excel spreadsheet.

An example Storm Water Mitigation Plan (SWMitP) that includes a list of SUSMP conditioning requirements are given to SUSMP priority projects at the earliest planning stage (please refer to Appendix A.2 for sample SWMitP). BMPs and the pollutants that are targeted for reduction or elimination to the maximum extent practicable (MEP) are listed in Table 1.

Table 1 – BMP to Pollutants for New and Re-Development Projects

BMP	Primary Pollutants	303(d) Pollutants
Site and Facility Design	Flow	
Site Design and Landscape Planning – SD-10	Flow	
Efficient Irrigation – SD-12	Nutrients	**TDS** **Nutrients**
Storm Drain Signage – SD-13	Trash Oil & Grease Toxics	
Pervious Pavements – SD-20	Sediment Oil & Grease	**TDS**
Trash Storage Areas – SD-32	Trash Bacteria	**Bacteria**
Vehicle Washing Areas – SD-33	Metals Detergent	**TDS**
Detention Basin - TC-22	Trash Sediment Metals Bacteria Oil & Grease Organics	**TDS** **Bacteria** **Nutrients** **ODS (Oxygen Demanding Substance)**
Vegetated Swale – TC-30	Sediment Metals Oil & Grease Organics	**TDS** **Nutrients** **ODS**
Bioretention – TC-32	Sediment Oil & Grease Nutrients Trash Metals Bacteria Organics	**TDS** **Nutrients** **Bacteria** **ODS**
Media Filter – TC-40	Sediment Trash Metals Bacteria Oil & Grease Organics	**TDS** **Bacteria** **ODS**
Water Quality Inlet Filter – TC-50	Oil & Grease Trash	
Vortex Separator – MP-51	Trash Sediment	
Drain Inserts – MP-52	Trash Oil & Grease	
Underground Concrete Retention - Proprietary	Flow	

SUSMP projects must identify pollutants of concern based on anticipated and potential pollutants generated from the proposed project and implement BMPs that target the reduction or elimination of the identified pollutants to the MEP. Anticipated and potential pollutants generated by land use type are shown in Table 2.

Table 2 – Anticipated and Potential Pollutants Generated by Land Use Type

Priority Project Categories	Sediment	Nutrients	Heavy Metals	Org Cpds	Trash & Debris	ODS	Oil & Grease	Bacteria & Viruses	Pesticides
>10 SFR	X	X			X	X	X	X	X
>1 acre Commercial	P	P		P	X	P	X	P	P
Heavy Industry	X		X	X	X	X	X		
Automotive			X	X	X		X		
Restaurants					X	X	X	X	
Hillside Development	X	X			X	X	X		X
Parking Lots >5000 sq. ft.; >15 stalls	P	P	X		X	P	X		P
New Streets > 5000 sq. ft.	X	P	X	X	X	P	X		P
Retail Gas Outlets			X	X	X	X	X		
> 5,000 sq ft Redevelopment	X	P	P	P	X	P	P	P	P
X- anticipated ODS – Oxygen Demanding Substances P – Potential									

Once potential pollutants of concern are identified for the proposed SUSMP project, BMPs must be selected from a list of required and project specific BMPs provided below in Table 3. All site design criteria are applied to every SUSMP project while source and treatment controls are dependent upon site location and type of pollutants.

Table 3 – Site Specific BMPs

	New Development (Including Re-Development)									
	Home Subdivisions >10 units	Heavy Industry >1 acre	Commercial Development >1 acre	Automotive Repair Shops	Restaurants	Hillside Development > 5,000 sq ft	ESAs	Parking Lots >15spaces; > 5,000 sq ft	Street, road, highways, and freeway >5,000 sq ft	Retail Gasoline Outlets
General Site Design (Apply All)										
Control Peak Runoff Rates	X	X	X	X	X	X	X	X	X	X
Minimize impervious Areas	X	X	X	X	X	X	X	X	X	X
Conserve Natural Areas	X	X	X	X	X	X	X	X	X	X
Protect/slopes/and channels	X	X	X	X	X	X	X	X	X	X
Minimize effective imperviousness	X	X	X	X	X	X	X	X	X	X
SOURCE CONTROLS (Apply all that are Applicable)										
Storm Drain Message and Signage*	X	X	X	X	X	X	X	X	X	X
Outdoor storage area design		X	X	X	X					X
Trash Storage Area Design		X	X	X	X					X

Repair/maintenance bay design				X						
Vehicle/Equipment/Accessory washing area design				X						
Fueling Area Design										X
Proof of Control Measure Maintenance	X	X	X	X	X	X	X	X	X	X
TREATMENT CONTROLS (Apply at least two)										
Inlet Filters**	X	X	X	X	X	X	X	X	X	X
Grass Strip Filter	X	X	X	X	X	X	X	X	X	X
Grass Swale Filter	X			X		X	X	X	X	
Detention/Infiltration Basin	X		X	X	X	X			X	
Porous Pavement Detention	X		X		X	X		X		
Porous Landscape Detention	X	X	X		X			X	X	
Infiltration Trench	X		X				X	X		
Media Filter	X	X	X				X	X		
Proprietary Controls						X				X
Other										

For PY2007-08, seven (7) projects completed construction and included Treatment Control Best Management Practices. Projects with SUSMP requirements that were completed and inspected for BMP implementation in 2007-08 are listed in Table 4. For the current inventory of all sites with Treatment Control BMPs and BMP implementation infeasibility analyses please refer to Appendix A.2.

Table 4 – Application of SUSMP Structural BMPs for Completed Projects

	Detention Basin/Area	Inlet Filters	Landscaped/ pervious strip or swale	Infiltration basin/swale	Hydrodynamic Separator	Proof of Maintenance
298 Fletcher Pkwy.- Home Depot	NA	X	NA	X	X	X
Saddlebrook Way/Ct.- McNeil Ranch Subdivision	X	NA	X	NA	NA	X
1470 E. Madison Ave.- Fire Station #8	NA	NA	X	NA	NA	X
343 E. Main St. - New Commercial Building	NA	X	X	NA	NA	X
1401 E. Main St.- De La Fuente Cadillac	X	X	NA	NA	X	X
335 N. Second St - Taco Bell	NA	NA	X	NA	NA	X
Wisconsin Cottages Subdivision	X	X	X	X	NA	X

The Wisconsin Cottages project will be elaborated as an example of SUSMP BMP implementation. This project was a new subdivision consisting of seven single-family dwellings and a new private street. This project had two SUSMP triggers; the street was greater than 5000 square feet and the project was within 200 feet of a storm channel designated as an ESA. The structural BMPs that were implemented consisted of treatment and detention. The street flow was directed toward the southwest corner of the property where it would enter a 3’x3’x24’ sand media filter with a 4” perforated pipe at the bottom. This pipe then connected to a 36”x36” catch basin directly after the sand media filter. The catch basin had an open grate with a catch basin inlet filter that would treat any runoff that would pond on the sand media filter due to high-flow storms. This whole system then connected to an underground detention vault that was sized for a 10-year storm event. This vault then connected to an 18” RCP that connected to the channel. In the extreme southwest corner of the property was another 36”x36” catch basin, also with a catch basin inlet filter, that would capture any excess runoff that the aforementioned system could not contain.

2.3.3 Waiver Provisions

In the event that a Priority Project is unable to meet the treatment control BMP sizing requirements outlined in the City’s SUSMP, the City has the authority to issue a wavier. In order to receive a waiver for treatment control BMP sizing requirements, the project must prove that all available treatment control BMPs have been determined to be infeasible for the site. If a waiver of infeasibility is issued, the City will notify the RWQCB within five days of granting the wavier. The following information will be provided to the Regional Board:

- The name of the City employee granting the waiver
- The name of the developer receiving the waiver
- The location of the site

- The reason for granting the waiver
- A description of the BMPs required for the site

The City has never granted such a wavier to a Priority Project in the past and does not anticipate granting waivers in the future; however, if waivers are necessary, the City may choose to develop a waiver mitigation program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the projects' watershed.

Table 5 – BMP Implementation Summary

BMP	Percent Implemented	Pollutant Prevented
Control Peak Runoff Rates	100	Flow
Minimize Impervious Areas	100	Flow
Conserve Natural Areas	100	Flow
Protect Slopes and Channels	100	Sediment
Minimize effective imperviousness	100	Flow
Storm Drain Message and Signage	71	Trash Oil & Grease
Trash Storage Areas	100	Trash Oil & Grease
Repair/Maintenance Bay Design	100	Oil & Grease
Proof of Maintenance	100	Trash Oil & Grease
Inlet Filter(s)	100	Sediment Trash Oil & Grease
Grass Strip or Swale (Biofiltration)	71	Flow Sediment Oil & Grease Trash
Detention Basin/Area	67	Flow Sediment Oil & Grease Trash
Hydrodynamic Separation System	40	Trash Sediment Oil & Grease
Infiltration Strip/Area	29	Flow Sediment Oil & Grease Nutrients (**TDS**)

Note on Table 5: Percentages of BMPs implemented, shown in Table 5, are based on the number of applicable sites. For example, if there were three hillside Development projects and all three-implemented slope stabilization, that would be all of the applicable projects. A 100% implementation equates to those applicable sites and not to all sites.

2.4 REVISED ENVIRONMENTAL REVIEW PROCESS

The City of El Cajon revised CEQA forms and checklists to include questions related to water quality issues. The City reviews all projects for CEQA; one project completed the revised forms for PY2007-08. The forms are attached in Appendix A.2.

2.5 DEVELOPMENT PLANNING OUTREACH EFFORTS

Education efforts for disseminating information to planners, developers, and contractors on the JURMP requirements for new and significant redevelopment is provided through one-on-one and group discussions at the time of the various discretionary plan reviews and checks, during BMP development, and at time of obtaining the building permit. Topics include:

- Federal, state, local water quality laws and regulations
- Connection between land use decision and water quality goals
- New and Redevelopment requirements
- Water quality impacts from development (urbanization)
- Methods for minimizing impacts of development on water quality.
- Implementation of SUSMP requirements

2.6 REGULATORY COMMENTS

As of the writing of this report, no regulatory comments have been received for JURMP Annual Report 2006-07.

SECTION 3 CONSTRUCTION COMPONENT

3.2	Prevention of Polluted Runoff	2
3.3	Updates to Ordinances	3
3.4	Modification of Construction and Grading Approval Process	3
3.5	Priority Construction Sites And Source Identification	3
3.6	BMP Implementation and Requirements	4
3.7	Inspection	7
3.8	Enforcement	12
3.9	Construction Outreach and Education	12
3.10	Improvements and Regulatory Comments	13

SECTION 3 CONSTRUCTION COMPONENT

3.1 INTRODUCTION

Construction in the City of El Cajon is a constant activity. Whether it is a 500 square foot remodeling project or a multi-single family residential subdivision, a minimum list of construction BMPs must be in place prior to any earth disturbance or material storage. With a City built out to its current borders, the City experiences re-development activities more so than new development. However, clearing currently developed lands and re-development is at the heart of this community's construction and revitalization efforts.

Park Avenue Subdivision During 2007-08

3.2 PREVENTION OF POLLUTED RUNOFF

The City uses the CalTrans Construction Site BMP Manual together with the California Best Management Practices (BMPs) Handbook as guidance for the application of appropriate BMPs. An emphasis on pollution prevention is the easiest and most convenient set of BMPs to implement and achieve the elimination of polluted discharges. The following prevention practices are part of the minimum set of BMPs for construction sites.

- Prevent sediment and other polluted runoff – Design a sediment basin to trap runoff for zero discharge, specifically for larger construction sites with enough room for sizing adequate basins.
- Prevent bacteria discharges – Place portable sanitary facility in secondary containment and secure to the ground or stable structure. Prevents tipping and loss of bacteria (fecal coliform) containing material.
- Prevent alkaline (greater than 10.0 pH) runoff – Require properly designed and installed Concrete Washout areas and encourage concrete contractor to haul away concrete waste. Concrete waste disposal should be at an offsite location with adequate control measures.

The City works closely, often one-on-one, with developers at the counter and field discussing ways to prevent pollution from entering the storm drain. The pollution prevention practices are required for any applicant looking for a building permit.

Copies of construction handouts provided by the building department and additional information given to developers, contractors, and homeowners at the time of Erosion Control Plan submittal can be found in Appendix A.3.

3.3 UPDATES TO ORDINANCES

In accordance with Section D.2.a of the Permit, the City Municipal Code Title 13 Chapter 13.10 *Storm Water Management and Discharge Control* was updated in 2008 to comply with the new grading requirements. The City Municipal Code Title 13 Chapter 13.10, Section 13.10.140; and Chapter 15.64, *Grading*, work together in addressing land disturbance, demolition, and construction activities for the elimination of sediment and other pollutants from discharging into the City's storm drain system.

3.4 MODIFICATION OF CONSTRUCTION AND GRADING APPROVAL PROCESS

Shortly after the Chapter 13.10 was updated, the City assessed and modified the local construction and grading permit approval process to comply with Section D.2.a of the Permit. All construction projects are required to go through a storm water review process. Construction and grading projects are required to implement measures to ensure that pollutants from the construction site are reduced to the Maximum Extent Practicable (MEP) and will not cause or contribute to an exceedance of water quality objectives. The City does not allow clearing of vegetation matter or grading activities until all necessary environmental clearances, including water quality, are secured and a grading, drainage, and erosion/sediment control plan is prepared, reviewed and approved by the City. During the review process, the City ensures that all applicable grading and storm water ordinances are fully implemented as required per El Cajon City Code Title 13, Chapter 13.10, Section 13.10.140; grading ordinance Chapter 15.64 and Chapter 16.60. The City does not issue Building Permits until requirements addressing storm water and water quality have been fulfilled.

3.5 PRIORITY CONSTRUCTION SITES AND SOURCE IDENTIFICATION

Periodically the City reviews the list of high priority construction projects to update the list for close monitoring and inspection of construction activities and BMPs implementation for reducing or eliminating pollution from entering the City's storm drain system. High priority status is applied to projects that pose a potential threat to water quality or location. Priority is also given to SUSMP projects that are complete and need to have the storm water controls verified and the maintenance plans reviewed. Table 1 lists the selection of BMPs that must considered and the appropriate BMPs installed at all high priority projects. See Section 3.8 for any Enforcement Actions. In PY1 the City had 15 medium priority construction projects and 18 active high priority construction projects, including 16 SUSMP projects. Also in PY1 the City approved 137 low priority projects for construction. A list of all active high priority construction sites is given in Appendix B.2. No project was required to have advanced treatment during construction as none were classified as an exceptional TTWQ.

3.6 BMP IMPLEMENTATION AND REQUIREMENTS

The City established minimum BMPs that must be implemented at all construction sites regardless of the water quality prioritization. The City developed a list of BMPs required at all construction sites. This list first appeared in the JURMP as Appendix C, but has recently been revised and updated to comply with Order R9-2007-0001. BMPs specifically prevent, remove, or eliminate a pollutants or group of pollutants from entering the storm drain system.

Table 1, below, lists the minimum required BMPs for construction sites, the primary pollutant eliminated and the potentially affected 303(d) pollutant. Eliminating pollutants meets the Clean Water Act and Permit objectives for maintaining the biological, physical, and chemical integrity of the State's waters, while a "no impact" condition meets the restoring requirement of the Clean Water Act objective.

A first step toward connecting construction activities to water quality is shown in the following table. The next step is to quantify how many sites are compliant with the minimum BMP requirements. Table 1 summarizes the minimum BMP requirements and the pollutants that each targets for prevention (including minimization of grading activities), removal or elimination. Table 2 lists the different types of construction projects and the minimum BMPs required for each category. Table 3 connects and quantifies the number sites compliant with the required BMPs. In Section 11, the Effectiveness Assessment of the Construction Component will draw on this connection between BMP implemented and pollutant to determine if the program activities adequately reflect a move toward improving water quality or have little effect on water quality.

Table 1 – BMP to Pollutant

BMP	Application	PRIMARY POLLUTANT REMOVED	303(d) Pollutant Impact
Silt Fence (SC-1)	Perimeter Control to remove sediment and debris in runoff	Sediment	TDS
Desiltation Basin (SC-2)	Captures sediment runoff and eliminates sediment runoff	Sediment	TDS
Gravel Bag Barrier (SC-6)	Perimeter Control for pavement to pavement. Removes sediment runoff	Sediment	TDS
Fiber Roll (SC-5) or Coconut Fiber Blankets	Erosion Control for slopes to prevent sediment runoff	Sediment	TDS
Stabilized Construction Entrance (TC-1)	Tracking control for imperviousness to pavement to prevent sediment tracking into streets	Sediment	TDS
Street Sweeping (SC-7)	Tracking control for paved areas. Collects/removes sediment tracked onto pavement	Sediment	TDS Phosphorus
Material Storage (WM-1)	Material coverage and containment or pavement or impervious surfaces to eliminate polluted runoff	Stucco, paints, concrete	pH TDS

BMP	Application	PRIMARY POLLUTANT REMOVED	303(d) Pollutant Impact
Solid Waste (WM-5)	Trash/debris coverage and containment. Prevent trash runoff	Trash, debris*	Bacteria Phosphorus
Concrete Washout (WM-8)	Containment and disposal of concrete washout. Prevents concrete runoff	Concrete-laden waters	pH TDS
Sanitary Waste (WM-9)	Containment of sanitary waste. Prevents bacteria runoff	Bacteria	Fecal coliform
Vehicle/Equip Management (NS-8, NS-9, NS-10)	Containment of petroleum fluids. Prevents oil & grease runoff	Oil & Grease	TDS

***** Pollutant being monitored by East County Cities
"-" Designates "no impact" on levels of 303(d) pollutants; supports Clean Water Act objective to maintain or restore water quality

---

Implementation is measured through onsite inspections. Success of that implementation depends on stage of project at time of contact, materials presented, BMP selection and developer motivation to comply with construction requirements. The City provides a Storm Water Guideline to developers for Construction Projects. This simple, easy to use guide lists the construction BMPs to use for construction activities that would occur outdoors and potentially affect storm water quality.

Associations, such as the Building Industry Association (BIA), have assisted in disseminating information to contractors and builders. Those construction personnel who do not belong to associations receive BMP information at the time of permit application or permit issuance. There is a noticeable difference between Storm Water savvy developers and those just starting their first storm water compliance experience. The City is working towards optimizing interactions at the Public Works counter. Landscaping as early as possible is emphasized regardless of season. This information is provided to contractors as permit issuance and during each scheduled inspection. BMPs must be appropriate for site-specific conditions. Installing BMPs for the sake of compliance is not complying with MEP.

There are four categories of construction projects:

1. Pools, remodels, and additions
2. Single Family Residences, Condo Conversions, and Subdivisions
3. Hillside Development
4. Commercial/Industrial

The minimum required BMPs per category of construction are shown in Table 2, on the next page.

The next steps complete the BMP cycle. By verifying during inspections that the BMP is:

a. Present as required – indicates changes in knowledge and awareness.
b. Implemented properly and functioning correctly – indicator of behavioral changes.

Printed materials are available at the Public Works Department making over-the-counter interactions into educational opportunities. A City BMP guide, edited summaries of application JURMP sections, and personalize service functions as the City's implementation tools. To prioritize effectiveness efforts, the City focuses on the prevention and elimination of the 303(d) pollutants to address the restoration requirement of the Clean Water Act and our Municipal Storm Water Permit. Overall Effectiveness of the Construction Component is provided in Section 11.

Table 2 – Required BMPs for Construction Sites

Required Construction BMP	Construction Type			
	Pools, Remodels, Additions	SFR Subdivisions	Hillside Development	Commercial and Industrial
Silt Fence - SC-1	X	X	X	X
Storm Drain Inlet Protection (+filter fabric) SC-10	X	X	X	X
Sediment Basin or Trap SC- 2 or 3		X	X	X

X = Required; Implemented; and Verified

3.7 INSPECTION

The City inspects all high priority projects monthly during the dry season and weekly during the wet season. Inspections are completed using the form provided in Appendix A.3. In PY1, the City had 19 high priority projects, all of which were fully or partly active construction sites during the permit year. SUSMP projects are now considered high priority construction projects and are inspected on the same schedule. All projects are inspected prior to completion of the projects to verify proper and complete installation of storm water controls and review any long-term maintenance plans. Six SUSMP projects were completed during PY1 and one abandoned. All projects designated medium priority are inspected monthly during the Wet Season, on an as-needed basis during the Dry Season and in response to a complaint received from City staff or the general public. All projects designated low priority are constantly inspected by the Building Department personnel for there own Building Code requirements. The Building Staff has also been trained by the Storm Water Department to recognize when to contact Storm Water personnel over improper construction BMPs. The City had 6 medium priority projects under construction and approved 137 low priority projects for construction in PY1.

Table 3 – Percent Implemented and Verified for High Priority Sites

BMP	Percent Implemented	Discharge during Rain	Corrective Action	Citation
Silt Fence	97	No	Yes	Yes
Storm Drain Inlet Protection	97	No	Yes	No
Sediment Basin	98	No	Yes	No
Check Dams	97	No	Yes	No
Fiber Rolls	98	No	Yes	No
Gravel Bag Berm	98	No	Yes	Yes
Street Sweeping/Vacuum	95	No	Yes	Yes
Stabilized Construction Entrance	97	No	Yes	Yes
Hydroseeding	76	No	Yes	No
Geotextiles and Mats	95	No	Yes	No
Material Delivery and Storage	96	No	Yes	No
Stockpile Management	91	No	Yes	No
Solid Waste Management	98	No	Yes	No
Concrete Waste Management	100	No	No	No
Sanitary Waste Management	99	No	Yes	No

Table 3, on the previous page, shows the percentages of minimum BMPs implemented at high priority constructions, verified through inspections. The percentages are calculated from the inspection reports. The percentage indicates the number of sites that implemented the required BMP at the time of inspection. A "Yes" under corrective action indicates that specific conditions noted during the inspection warranted actions by the contractor, such as maintenance or BMP improvements.

Inspection of construction sites in PY1 verified that most construction sites implemented BMPs. Deficiencies were resolved through discussions between City staff, project construction personnel, corrective actions, and through enforcement actions. If corrective actions were needed, the construction site either completed the corrective action at the time of inspection or a follow-up visit was scheduled to verify the completion of corrective actions. When corrective actions are not completed in a timely manner, enforcement actions are issued. In PY1 the City had multiple enforcement actions related to construction inspections and follow-ups. Table 5 provides information about these enforcement actions. Enforcement actions are further discussed in Section 3.8 and a list of enforcement actions categorized by components (i.e. construction, commercial, industrial, etc) is attached in Appendix B.3.

Public Works inspectors inspect the CIP projects for Storm Water compliance on an as-needed basis. This may be as frequently as weekly, or even daily, but generally no less than twice per month (when the inspectors are on the job for non-storm water related inspections) while the project is active.

Table 5 – Construction Enforcement Actions

CONSTRUCTION ENFORCEMENT ACTIONS								
	Date	Business Name	#	Street / Location	Complaint/ Observations	City Action	Enforcement Action	Corrections Completed
1	08/23/07	One Stop Construction	247	N. First St.	Sub-contractor using water to clean pavement with water entering the street and drain.	Contractor advised to cease using water to clean paved areas. Told to use a dry method.	Monetary Citation	Yes
2	12/05/07	Education Center Annex	750	Main St	Contractor failed to install and maintain required BMPs	Written warning issued to the contractor. Advised to cease tracking sediment and sweep the street and sidewalk of all sediment.	Written Warning	Yes 12/13/07
3	12/07/07		528	Emerald Ave	Lot graded with no BMPs in place to prevent sediment discharge.	Left violation notice on door during site inspection. F/U required. 12/12/07 Met contractor on site, told to install construction entrance silt fencing at rear lot.	Verbal Warning	Yes 12/13/07
4	12/13/07	Ballantyne Glen		Ballantyne	Relocation of construction entrance causing significant tracking onto Cedar St., failure to implement BMPs listed on erosion control plan.	Met with the contractor on site, written warning issued with 24hrs to comply with erosion control plan. New construction entrance moved to Cedar.	Written Warning	Yes
5	12/19/07	ECO Construction	855	Portland	Power washing parking lot, and unprotected dirt stock piles on lot.	Contacted the contractor on sit. Told to cease using power washing equipment and use dry method to clean the lot. Verbal warning issued.	Verbal Warning	Yes
6	12/20/07		1338	Naranca Ave	Failure to comply with ECP, no BMPs installed, no response in a timely manner.	Property owner/ contractor told to immediately install BMPs maintain them.	Monetary Citation	Yes
7	01/04/08		360	First St	Regional Water Board checking condition of condo-conv. With concerns re: No BMPs on site and debris/piles piles.	Met with the contractor on site. He will bring site into compliance. Some gravel bags at rear to reduce run-off.	Verbal Warning	Required BMPs installed
8	01/04/08		642	Mollison	RWQCB found debris piles, uncovered bin, dirt in lot and two unprotected storm drain inlets.	Property owner contacted and said he would have corrections made by the end of the day.	Verbal Warning	Debris piles removed, inlets protected
9	01/04/08	BK Mechanical Systems	1719	Main St	PW staff saw contractor using water to clean sediment from paved areas.	Contacted the contractor to ld to cease and use a dry method to clean or install proper BMPs to prevent sediment discharge.	Verbal Warning	Yes
10	01/08/08		1338	Naranca St	Lot for new development built up altering drainage and causing flooding in complainants rear yard.	Building plans are active. Current enforcement action in progress for BMPs implementation. Complainant contacted 1/10/08	Monetary Citation	N/A

	Date	Business Name	#	Street / Location	Complaint/ Observations	City Action	Enforcement Action	Corrections Completed
11	01/09/08	Natural Environmental Landscaping	1185	Marline Ave	Landscaping contractor observed power washing the paved areas of this dev. proj.; discharge did not enter a drain inlet.	The contractor was told to cease using water to clean without BMPs. Suggested to use dry method.	Verbal Warning	Yes
12	01/16/08		1688	Main St	Co. Health Insp. Stated contractor in process of cleaning out building and using high pressure water to clean asbestos from interior with no BMPs at drain inlets. Minimal discharge to the storm water system.	Contractor instructed to cease using water to clean areas and to install fabric filters at all lot drains. No current discharge was observed.	Verbal Warning	Yes
13	02/27/08	Suncoast Homes	1341	Main St	Failure to maintain BMPs and sediment tracking.	Contacted the business owner and advised to cease sediment tracking and improve all BMPs.	Monetary Citation	Yes
14	03/10/08	Jacoba Sunshine LLC	921	Sunshine	Motorhome on site discharging to open sewer, No BMPs in place at this Condo Conv., evidence of recent discharge of sediment laden water in driveway.	The contractor, Wilson Pulido was contacted and agreed to meet on site.	Verbal Warning	BMPs installed
15	04/08/08	Caddy Shack rennovation	351	Main St	Building renovation, asphalt removed, stock piles, tracking with no BMPs in place.	Owner/contractor was contacted on site and told to install construction entrance and perimeter control.	Written Warning	Yes
16	04/17/08		1905	Marshall Ave	Sediment tracking and general BMP maintenance.	New asphalt surface. Inspector will notify job foreman to sweep all paved areas and conduct maintenance on perimeter BMPs.	Verbal Warning	Yes
17	04/21/08	Jacoba Heritage LLc	642	Mollison	Failure to maintain required BMPs at condo conversion	Contractor contacted on site and advised to maintain BMPs and dry clean all paved areas.	Written Warning	Yes
18	04/21/08	Jacoba Heritage LLc	360	First St	Failure to maintain BMPs at condo conversion.	Contractor advised on site to maintain all BMPs, remove all debris piles and sweep regularly.	Written Warning	Yes
19	05/05/08	Suncoast Homes	1341	Main St	Sediment tracking and general BMP maintenance on Melody Ln. side of property.	Contacted construction staff and advised to immediately clean all sediment and install proper BMPs.	Monetary Citation	Yes
20	06/06/08		198	Main St	Renovation debris at old Albertson's piled at rear of building with no BMPs in place to protect drain inlets.	Contacted site supervisor and advised to remove a surface debris and dust using dry method and to provide storm drain protection.	Verbal Warning	Yes

3.8 ENFORCEMENT

In PY1 the City had 20 enforcement actions pertaining to inspection follow-ups or complaints received for construction activities, 5 of which resulted in a monetary administrative citation. The City conducted follow-up inspections for all enforcement actions to verify that proper and complete corrective actions were taken in a timely manner. Corrective actions are needed to fix or improve a BMP even though that BMP may be implemented as written.

Administrative Citations are issued for discharges to the City's storm drain system. Most construction sites implement the minimum BMPs and inspections verified that the BMPs were effective in reducing or eliminating discharges to the storm water conveyance system. A list of enforcement actions categorized by components (i.e. construction, commercial, industrial, etc) is attached in Appendix B.3.

Other non-compliance issues, except as described above, were not experienced during PY1, although some deficiencies were noted during construction inspections. Deficiencies were resolved through discussions between City staff, project construction personnel, corrective actions and through citations. All violations and deficiencies were corrected in a timely manner.

None of the violations resulted in threats to the environment or human health and notification to the Regional Board was not required.

3.9 CONSTRUCTION OUTREACH AND EDUCATION

Education of construction contractors and developers is conducted primarily through the permitting and inspection processes. The City's building department has the first contact with contractors and developers when a building permit application is completed. The following steps are taken by Building Division and Public Works/Storm Water staff:

1. Building Permit Application.
2. A Storm Water "Hold" is placed on the property.
3. Developer or contractor is given a Storm Water handout.
4. Discuss with developer or contractor, in detail, minimum BMPs and implementation requirements.
5. Developer or contractor generates an Erosion Control Plan plus any additional storm water requirements as necessary.
6. Review Erosion Control Plan and any additional requirements, comment, direct developer or contractor to make changes prior to approval.
7. Inspect according to priority.
8. Address Corrective Actions.

In PY1, the City reviewed and commented on 10 SUSMP projects, 17 Storm Water Mitigation Plans, 19 condominium conversion projects and 137 Erosion Control Plans for small projects. The City inspects all completed SUSMP projects to confirm proper installation of storm water controls and review the long-term maintenance plans. Copies of the Construction handouts and an example Erosion Control Plan Checklist for additions and remodels (small projects) are included in Appendix A.3.

Compliance is assessed through inspections by storm water staff or a City contractor. Inspections are completed on a scheduled frequency depending on the season. As mentioned above, during the rainy season high priority construction projects are inspected on a weekly basis.

3.10 IMPROVEMENTS AND REGULATORY COMMENTS

- Generating improvements increases program efficiencies by harvesting those BMPs that work and discarding those that do not.

Improvements

Improvements to the Construction Component include:

- Inlet Protection - Add a layer of filter fabric, then gravel bags, secure with orange cones
- Continue to focus inspection efforts on BMP implementation to facilitate Effectiveness Assessment.
- Continue to use BMP Implementation Inspection Checklist to list minimum required BMPs for construction
- Continue to include SUSMP projects in the High Priority category.
- Continue to inspect construction of SUSMP projects as High Priority construction.
- Perimeter control – Use silt fence as primary perimeter control
- Hay bales are not to be used anywhere

BMP improvements are needed as follows:

- Road Work – Vacuum any water used; no filtering allowed
- All Construction Entrances must have adequate aggregate size (Minimum 2-3”)

Regulatory Comment

As of the writing of this report no comments have been received for Annual Report PY2006-07.

4.5 Improvements and Regulatory Comments 21

SECTION 4 MUNICIPAL COMPONENT

4.1 INTRODUCTION TO MUNICIPAL FACILITY ACTIVITIES

As required by Section 4 of the Municipal Permit, existing municipal facilities must prevent or reduce pollutants in urban runoff by implementing a City-designed program to address specific outdoor activities that have the potential to impact water quality. Municipal facilities include streets, public parking lots, flood control devices, parks/recreation, administration and other public buildings, maintenance and storage areas, police, and fire/safety stations. Activities at any one of these facilities may have the potential for discharging pollutants as urban runoff or during a rain event. The Municipal Component of the JURMP defines a comprehensive program to reduce the potential for polluted discharges through:

- Pollution Prevention activities,
- Best Management Practice (BMP) implementation,
- Storm Water Inspections, and
- Recycling

Homeless

Of specific note are the Homeless that are not only a social problem, but become an uncontrollable water quality problem. Homeless encampments exist in storm water channels because of easy access and good outdoor weather conditions nearly year round. Although prevalent in the storm drain channels, the homeless are difficult to detect in the underground storm drain system comprised of reinforced concrete boxes and even more difficult to permanently remove. Detection is conducted through weekly/monthly inspections of popular entry places and complaints to the Storm Water Complaint Hotline. Removal is accomplished through police enforcement and the homeless have an option for other housing with the City's new interim housing project. The City cleans all of its channels at least twice annually and encampments are removed at that time, however, the encampments are often re-established once the channel maintenance in that area is finished.

The photograph above emphasizes the enormous amount of materials associated with homeless encampments in the storm drain channel. Other than the visible pollutants of trash and debris, there are also the less collectable, non-visible pollutants from human waste.

The list of major pollutants associated with the homeless living in these underground flood control devices are:

- trash, (a monitored pollutant for East County)
- debris, and
- fecal coliform (a listed 303(d) pollutant for Forester Creek).

Our dry weather-monitoring program is designed to capture information on the homeless and track elevated levels of fecal coliform. During PY1, D-Max Engineering undertook an investigation of fecal coliform and other constituents in the El-Cajon-area watershed. Results of the investigation were inconclusive, but did provide great insight into tracking bacteria in dry weather runoff. Specifics can be found in Section 7 of the Annual Report and Appendix A.7 of this Annual Report. The City will continue its efforts to reduce or eliminate the impacts caused by the homeless encampments within storm drain channels.

As in past years, Storm Water staff and City Maintenance crews teamed with Community Police and Interim Housing (a joint venture between Hammon Properties and Shadow Mountain Church) to move inhabitants into temporary housing, followed by clean up of storm drain channels. For those homeless willing to improve their situation, the Interim Housing group provides a “Hand Up” rather than a hand out. Those who wish to continue living in the City’s storm drain system are detained, but eventually find new living places on the street. A County-wide, long-term solution to the homeless is not yet definable for storm water.

4.1.1 Prevention of Polluted Runoff

Anytime pollution is prevented from entering the storm drain system, less pollution must be managed at end-of-pipe. The following prevention activities and corresponding BMPs are fully implemented at one or more of the many municipal facilities located within the City. As noted in Introductory Section, the focus of PY1 is continued BMP implementation such that prevention of polluted runoff is achieved to the Maximum Extent Practicable (MEP). The primary pollutants of concern for this prevention effort are the 303(d) impairments of Forester Creek that include pH, total dissolved solids (TDS) as nitrates; and fecal coliforms. The only impairment associated with the City of El Cajon or the upper section of Forrester Creek is pH. Further discussion of pH origin and any corrective actions are presented at the end of this section. Trash and debris is a specific issue being addressed as part of a watershed effort with the City of Santee.

When pollution is prevented from entering the storm drain system, it is either collected or eliminated. Collection requires management of gathered wastes, while elimination is true prevention, but much more difficult to accomplish. The following municipal activities encompass collection and elimination activities.

1. Erosion and sediment control prevents soils and sediments from washing away during rain events. BMPs implemented for City Improvement Projects to control erosion and sediment during project activities are as follows:

- Preservation of existing vegetation
- Scheduling of projects
- Seeding and planting of native plants and trees that are draught resistant and do not contribute to discharges of vegetative matter to the City's MS4.
- Establish plant ground cover before removing erosion or sediment controls.

2. Roadway and street maintenance activities preserve these facilities for a longer, useful existence. Many maintenance activities keep pollutants from entering the storm drain system. Listed below are the maintenance activities with the gross amounts of pollutants collected. Pollution removed equates to preventing polluted runoff that could be transported in urban runoff or storm water discharges.

- Street sweeping and cleaning – Swept over 21,180 miles of curbed streets and removed 3,483 cubic yards of materials that were disposed as solid waste. There is a total of 337 curb-miles of streets and a total of 483 lane-miles withinin the City. As state in greater detail in the JURMP, some areas are swept on a more frequent basis. By collecting 3,483 cubic yards of trash, debris, and sediment, these pollutants did not enter the storm drain system and did not further impair Forrester Creek.
- Collected 39 cubic yards from spills and other miscellaneous operations
- Completed 58 special sweeps at the request of citizens or City staff, collecting 29 cubic yards of material. This is higher than the number of special sweeps conducted during PY6 (i.e., 52 special sweeps and 26 cubic yards).

3. Municipal vehicle maintenance facilities provide a valuable service in keeping the City's vehicles in top running condition. Maintenance activities are conducted in a manner to keep pollutants from entering the storm drain system. Listed below are the activities and their designated areas.

- Conduct vehicle maintenance indoors or under canopies
- Area designated for washing vehicles is covered and wash water drains to an oil/water separator before discharging to the sanitary sewer
- Area designated for rinsing street sweepers directly discharges to the sanitary sewer
- Recycling motor fluids (oil and antifreeze), tires, batteries, and metal

4. Landscaping maintenance activities beautify our parks, recreation, and administration buildings. Pollution prevention maintenance activities include:

- Collection of grass clippings and discarded as solid waste
- Sweep or blow residual clippings onto turf areas
- Clean City-owned patio and plaza areas using a machine that contains the cleaning liquids.
- Aerate soil frequently to encourage rain penetration and infiltration
- Maintain an Integrated Pesticide Management (IPM) program

5. Maintenance Procedures for MS4s includes inspecting and maintaining MS4 by cleaning, removing sediment, debris and vegetation; repairing or replacing damaged and failing structures; and stenciling/posting signs at storm water inlets and conveyance systems. Approximately 1,720 cubic yards were collected during PY1. Maintenance crews responded to 20 requests by city staff and citizens to maintain the storm drain system. A work survey request (WSR) is completed for each of the requests and filed at the Maintenance Yard on Vernon Way.

- Storm Drain Inlet/ Catch Basin cleaning
- Storm Drain system repair and maintenance

6. Building Maintenance activities at Municipal facilities prevent pollution by collecting debris, dirt, and organic materials before rain events transport this material to the storm drain system. Wash water is disposed into the sanitary sewer and dry methods are used to collect materials to dispose as solid waste. The following are completed on a weekly schedule:

- Sweep and clean parking lots
- Clean sidewalks
- Sweep and clean entry ways
- Control irrigation runoff and over-spray

7. A Sewer Maintenance program assists in preventing sanitary sewer spills and prevents sewage from entering the storm drain system using the following plans and BMPs:

- Identify and respond to overflow spills and leaks
- Contain and properly dispose of spilled sewage for public and private sewer overflows

- Repair damaged and leaking public sewer lines
- Identify potential problem areas, such as sewer lines in isolated, hard-to-access canyons, or sewer lines at end-of-life condition, for inclusion in annual Capital Improvement Projects
- TV inspection of sewer main lines
- Annual cleaning of main sewer lines
- Quarterly (3-month) cleaning of sewer siphons, trouble spots and problem manholes
- Quarterly (3-month) rodding and descaling of problem sewer lines

During PY1 the City cleaned 219.4 miles of sanitary sewer main line, while experiencing five public sanitary sewer overflows. As a result of these public sewer overflows, 80 gallon of sewage reached the storm drain. Of the 80 gallons reaching the storm drain, 30 gallons were recovered and returned to public sewer. The City also responded to 13 private lateral sewage spills and recovered 194 gallons of sewage. No sewage from private sewer spills with City response reached the storm drain.

During PY1, the City of El Cajon was presented the **Sewage Collection System of the Year** Award for collection systems under 250 miles in length by the **California Water Environment Association (CWEA)**. The award represents professional acknowledgement of decades of superior maintenance of the El Cajon Municipal Sewer System by many City workers.

4.1.2 Roads, Streets, Highways, & Bridges

The following are major City accomplishments during PY1 for roads, streets, highways, and bridges:

- Used the recently installed permanent wash rack for street sweepers to allow more time for cleaning equipment.
- Followed a strict preventive maintenance schedule for the new Elgin Crosswind street sweeper.
- Swept Downtown District twice per week.
- Swept non-Downtown Business and Commercial areas once per week
- Swept Residential areas and medians twice per month

City Maintenance crews collected a total of 3,483 cubic yards of material from street sweeping. Figures 1 and 2 show the distribution of material by type, cubic yard amounts, and percentages for materials. Total cubic yards of materials increased in PY1 due to continued use of the Elgin Crosswind street sweeper. The total volume of trash, silt and organic material increased, compared with PY6, although the increase was small. Figure 2, below provides a summary chart for relative volumes and Figure 3 provides a comparison to amounts collected in previous years.

Figure 1

Comparing the percentages of materials collected in the streets with those from the channels, it is worth noting that about 250% more trash is collected in the street sweeping operations (557 cubic yards) than is recovered in channel cleaning operations (223 cubic yards). This difference may be due to the types of trash. The elimination of trash is best addressed at the source or generator. For the City of El Cajon, street trash is typically generated in highly commercialized areas that include restaurants, convenient stores, and department-like stores. Continuing as a major priority into the next Permit Year will be an ongoing effort to keep the downtown areas trash-free and street-clean. These prevention efforts are a partnering effort with the El Cajon Community Development Corporation (ECCDC) and businesses in the downtown area.

Currently, ECCDC hires the St. Madaline Sophies students to pick up trash and cigarette butts in the downtown area. During PY1, the ECCDC and storm water staff organized community functions to increase public awareness and improve downtown areas. “Lend a Hand” days were scheduled throughout PY1.

Figure 2

Figure 3

4.1.3 MS4 Maintenance

The City's Municipal Separate Storm Sewer System (MS4) functions to collect and convey surface runoff. Maintenance of this system is necessary for continuous transport of rainwater to prevent flooding and to drain urban flows away from populated areas and prevent flooding.

Figure 4

Work Service Requests (WSRs) document maintenance activities on the storm drain system. For PY1, 20 WSRs were completed for both emergency and non-emergency repairs/maintenance to the MS4. WSRs cover any type of needed maintenance and are available to all contacting our Municipal Maintenance Yard, located at 1050 Vernon Way, El Cajon.

The City's MS4 includes:

- Streets
- Gutters
- Storm Drain Inlets/ Catch Basins
- Underground pipes
- Culverts
- Rock-lined channels
- Concrete channels
- Unlined Creeks

Implementation of the JURMP Municipal Component in PY1 resulted in:

- Trash/debris removal from storm drain conveyance system (defined above) completed annually as specified in the JURMP. Total removed is 1,720 cubic yards. For types of pollutants removed see Figure 4.
- Maintained 51 storm drain inlet filters located in the public right of way.
- Met JURMP requirements by cleaning catch basins, culverts, and concrete channels once for PY1 in the major channels and once for the minor channels. The Conservation Corps completes the cleaning for Hunter's Run and Cypress Channel.
- Flow line vegetation maintenance completed one time during PY1 (tree maintenance along major channels and median maintenance).
- Cleaning of Homeless waste and trash completed two times during PY1.

As education and outreach efforts become increasingly effective, amounts of trash and debris removed from the MS4 should be reduced. As shown in Figure 3 above, quantities of trash, sediment and organics increased from the 06-07 period to the 07-08 period. The City does not have an explanation for this trend. Pollution prevention is the focus of the Municipal Component of the Storm Water Program, and a reduction in the amount of pollutants entering the storm drain system from City of El Cajon streets should be expected.

Interior of Sewer Main Televising Van

4.1.4 Sanitary Sewer System

Continuity and consistency describes the City annual cleaning and maintenance of the sanitary sewer system. Few conditions occur when crews needed redirection from the normal routine. The El Cajon sewage collection system, consisting of nearly 195 miles of municipally owned sewer mains, is a transportation-only utility with the sewage treated at the Metro Wastewater Treatment Plant in Point Loma, San Diego. El Cajon's outfall sewer main transports sewage from the City, Wintergardens Sewer District, and Padre Dam/Lakeside/Alpine Sewer District.

The City of El Cajon has an aggressive maintenance program to prevent sewer overflows. An important maintenance goal is to flush and maintain the entire system at least once every 18 months which requires the flushing of 148 miles of sewer main each year. For PY1, maintenance crews cleaned 219.4 miles of sewer line in 12 months. Difficult areas, where solids, grease accumulate or root intrusion is a problem, are on a more aggressive schedule of flushing and rodding every 3 months.

As part of the aggressive preventive maintenance program, the City televises sewer mains when:

- A new sewer tap is installed

- New difficult areas are suspected
- Determining the type of maintenance or repair needed

There were five public sewer overflows from City-owned sewers for PY1. Sewer system activities and discharges are reported annually to the San Diego Regional Water Quality Control Board and the California Integrated Water Quality System (CIWQS), among others. In April of 2003, the City internally started tracking reported overflows from private sewer laterals, where homeowners or businesses require immediate system repair. Response to the private sewer overflow includes reimbursing the City for any storm drain cleanup costs due to the overflow into the public right-of-way.

New-Generation Sewer Vactor Truck

An indispensable tool in preventing sewer blockages and overflows

For PY1, 13 private sewer spills were reported or detected by municipal staff. In all, 194 gallons of sewage liquids were recovered and disposed of in the sanitary sewer. With private sewer spills, municipal crews estimate how long the spill was active and document an estimated number of unrecoverable gallons.

4.1.5 Corporate Yard

The City of El Cajon has one Corporate Yard located at 1050 Vernon Way. Four separate Public Works Divisions are located at this facility, as follows:

- Public Works Maintenance Division - coordinates maintenance for streets, storm drains, drainage channels and public sewers;
- Facility Maintenance Division – maintains City buildings and related facilities;
- Fleet Maintenance Division – maintains City vehicles, and
- City Parks Division – maintains City parks, median, landscapes and urban forest.

It takes coordination and collaboration for these crews to work in the public interest maintaining and improving the health, safety, convenience and quality of life for the City's citizens and visitors.

The Maintenance Division of Public Works maintains the city's infrastructure. Fleet and Facilities Management is part of Administrative Services and maintains the City’s buildings, vehicles and equipment. The Parks Department controls and maintains parks, recreational areas, and other City-owned landscaped areas.

Annual inspections of each area is completed and corrective actions discussed with Department Management. An annual inspection was completed during June of 2008. Improvements at the Corporate Yard include:

New Vacuum Technology in Street Sweeping

Cleaning the Elgin Crosswind Sweeper in the New City Wash-down Facility.

- Monthly visual inspections are conducted.
- Secondary containment has been implemented in all storage areas.
- Berms were constructed around the wash and waste discharge areas.
- Employees received training on storm water, dealing with the homeless, pesticide training, and managing hazardous materials.

The annual inspection of the Corporate Yard uncovered a few needed Corrective Actions as follows:

- Maintain recordkeeping for training and inspections as defined in the Corporate Yard SWPPP.
- Post procedures on use of Spill Kits.

The sample of the Checklist for Municipal Site Inspection is contained in Appendix A.4.

4.1.6 Municipal Airfield

Gillespie Field, located at 1720 Joe Crosson Drive, is the local airfield and governed by the San Diego County Airport Authority and the Federal Aviation Administration. The City of El Cajon inspects this facility for compliance with the Municipal Permit as well as the General Industrial Permit. Some of the new BMPs include:

Gillespie Field - A County Airport Facility

- Wash racks with discharges hooked to the sanitary sewer. Use of manually adjusted shut-off valves eliminating flows to the sanitary sewer during rain events.

- Spill kits placed throughout the airport.

4.1.7 Parks and Recreation

A City-Maintained Park Area Near City Hall

The Parks Division maintains, improves, protects, and develops the City's parks, landscaped median islands, public building grounds, and the urban forest for the benefit and enjoyment of the community. Maintenance of these nearly 120 acres is overseen by a well-trained, full-time staff that performs any necessary maintenance on a daily basis. Attractive public open spaces and well-maintained parks help to make El Cajon a better place to live, and encourages civic pride. Staff continually strives to promote a Cleaner Community through maintaining a Healthy Watershed while providing the community the highest quality and level of service possible.

Parks and Recreation areas prevent pollutants from entering the storm drain system, by implementing BMPs such as:

- Providing Pet Waste Bags at Dog Park located at Wells Park
- Blowing organic cuttings and sediment onto grass and disposing collected wastes properly
- Use of mop and buckets to clean up after special City events (Cajon Classic Car Show and Friday Concerts on the Green)
- Requiring Qualified Applicator Certificates and 20 hours of training for the safe and effective use of pesticides.
- Requiring Contractors that steam-clean or power-wash to capture, collect, and contain wash liquids, then dispose into the sanitary sewer.

4.2 MUNICIPAL BMPS

The City has developed a list of minimum BMPs for Municipal crews to use while maintaining the following categories of municipal-owned and managed facilities. Not counting streets, alleys, storm drain or sewer easements, there are 31 separate municipally maintained facilities within the City. Overall, the categories of Municipal facilities are as follows:

- Roads, Streets, Parking Facilities
- The Multiple Separate Storm Sewer System (MS4)
- Corporate Yard
- Municipal Buildings, Parks, Recreational Facilities, and Landscaping

Each minimum required BMP is connected in some way to a primary pollutant that is reduced or eliminated to the maximum extent practicable (MEP) when that BMP is implemented as written. Table 1 lists the Municipal BMPs that may be applied to municipal activities and areas, the primary pollutant(s) either reduced or eliminated and the 303(d) pollutant that may also be prevented. Not all BMPs listed in Table 1 are required for the 31 Municipally-operated areas.

Table 2 lists the four major municipal areas with their minimum required BMPs and whether they were implemented. An "X" for the BMP indicates the BMP is required.

Inspections complete the BMP cycle by:

- Confirming proper BMP Implementation (present as written in the California BMP Handbooks or by City of El Cajon Storm Water Staff)
- Verifying that the BMPs are maintained (during inspection) (See Table 2 in Section 4.2.1 for inspection results)

This Annual Report takes an important step in connecting activities, BMPs, and pollutant reduction to support the Assessment of JURMP Effectiveness contained in Section 11. The connection is shown by the following diagram.

Table 1 BMPs to Pollutants for Municipal BMPs

BMP	Application	Primary Pollutant Reduced or Eliminated	303(d) Pollutant Reduced
Non-Storm Water Discharges – SC10	Addresses any discharge that is not storm water	Varies	pH; TDS; Fecal Coliform
Spill Prevention Control and Cleanup – SC11	Addresses spills	Varies	pH; TDS; Fecal Coliform
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22	Controls motor fluids	Oil & Grease Metals	-
Loading/Unloading – SC30	Controls the loading and unloading of materials	Varies Trash	-
Liquid Container Storage – SC31	Controls discharges from outdoor liquid containers	Oil & Grease pH	pH
Raw Material Storage – SC32	Controls the outdoor storage of raw materials.	Metals	-
Waste Handling and Disposal – SC34	Controls any discharges from the collection, storage, and disposal of waste materials.	Varies Trash	-
Safe Alternative Products – SC34	Encourages the use of less toxic materials	Pesticides Fertilizers	-
Building and Grounds Maintenance	Addresses General Housekeeping and preventative maintenance	Fertilizers Trash/debris	TDS
Parking Lot and Storage Maintenance – SC43	Addresses sweeping and general maintenance of parking lots	Trash/debris Sediment	-
Drainage System Maintenance – SC44	Requires routine cleaning of the storm drain system	Trash/debris Sediment	-
Employee Training	Requires employees be trained in specific topics	Trash/debris	-
Storm Drain System Signage	Requires signs at storm drains or receiving waters	Trash/debris Fecal Coliform	Fecal Coliform
Private Sewer Lateral Maintenance	Requires routine maintenance of the sewer lateral	Fecal Coliform	Fecal Coliform TDS
Over-watering of Landscape	Requires overspray and over watering to be eliminated	Nitrates	TDS

"-" indicates no impact, positive or negative, to the Forester Creek 303(d) pollutants of TDS, fecal Coliform, and pH.

4.2.1 Municipal Site BMP Implementation and Verification

As defined in the JURMP, five of the 31 Municipal-maintained areas are considered high priority due to their location, size, and/or potential to impact water quality. This includes the Civic Center-City Hall Plaza complex, Fire Station No. 9, Parks Storage Garage, Public Works Maintenance Division Office, and the Vehicle Maintenance Facility. These five are inspected annually. Annual inspections of high priority municipal areas are conducted to verify if the minimum required BMPs are implemented. An "X" under the minimum required BMP indicates the BMP is:

- A minimum Requirement
- Implemented per written or required specification
- Verified during inspection

Table 2 on the next page lists the minimum required BMPs and Municipal Functions.

Table 2: Required & Implemented BMPs for Municipally-Maintained Areas

MUNICIPALLY-MAINTAINED AREAS	Roads, Streets, Parking Facilities	MS4	Corporate Yards	Municipal Buildings, Parks, Recreational Facilities and Landscaping
Non-Storm-Water Discharges - SC10	X	X	X	X
Spill Prev/Contl/ Clean - SC11	X	X	X	X
Vehicle & Equipment Fueling - SC20				
Vehicle & Equipment Cleaning - SC21			X	
Vehicle & Equipment Repair - SC22			X	
Loading /Unloading - SC30			X	X
Liquid Container Storage - SC31				X
Raw Materials Storage – SC32	X		X	
Equip Operations - SC33			X	
Waste Handling/ Disposal - SC34		X	X	X
Safer/Alternative Products - SC35			X	X
Contam/Erod Areas - SC40			X	X
Building/Grounds Maintenance - SC41			X	X

MUNICIPALLY-MAINTAINED AREAS	Roads, Streets, Parking Facilities	MS4	Corporate Yards	Municipal Buildings, Parks, Recreational Facilities and Landscaping
Building Repair/ Construction - SC42				X
Parking/Storage Maintenance - SC43			X	X
Drainage System Maintenance - SC44	X	X	X	X

Mulching - City of El Cajon				X
Over-water Activities - City of El Cajon				X

X = Minimum Requirements

4.2.2 Implementation Analysis and Further Assessment

Table 3 summarizes the implemented BMPs for the five high priority Municipal Facilities where formal inspection and BMP usage was verified. It is important to note that no illegal discharges or spills were reported for any of the 31 City-owned or maintained areas.

Table 3 Percent BMP Implemented

BMP	Percent Implemented	Pollutant Prevented
Non-SW Discharge	100	Various: **Fecal Coliform**
Spill Prevention/Control/Cleanup	100	Various
V&E Cleaning	100	Metals
V&E Repair	100	Oil & Grease
Loading/unloading	100	Various
Liquid Container Storage	100	Oil & Grease
Raw Materials Storage	100	Pesticides
Equipment Operations	100	Oil & Grease
Waste Handling/Disposal	100	Bacteria
Safer/Alternative Products	100	Pesticides
Contaminated/Erodible Areas	100	Sediment
Building/Grounds Maintenance	100	Trash, Debris
Building Repair/Construction	100	Metals
Parking/Storage Maintenance	100	Oil & Grease, Trash, Debris
Drainage System Maintenance	100	Sediment, Trash, Debris
Employee Training	100	All
Public Participation and Education	100	Trash, Debris
Street Sweeping	100	Sediment, Trash, Debris
Sewer System Maintenance	100	**Fecal Coliform**
Vegetation Controls	100	Sediment
Preservation of Existing Vegetation	100	Sediment
Seeding and Planting	100	Sediment
Mulching	100	Sediment
Over-watering Activities	97	**TDS (Nitrate)**

(Highlighted – 303(d) listed pollutants)

The City Hall complex has an ever-existing issue with irrigation over spray and broken sprinkler lines due to large public visitor population and the homeless. Problems are fixed immediately, although never eliminated

The above information is used in Section 11 to support an Effectiveness Assessment of the Municipal Component and further define areas where improvements can be made.

4.3 PESTICIDE, HERBICIDE, AND FERTILIZER MANAGEMENT

4.3.1 Pesticide Regulatory Program – Integrated Pest Management

The City has adopted a Pesticide, Herbicide, and Fertilizer Management program as follows:

- Maintain a running inventory of pesticides, herbicides, and fertilizers,
- Implement a schedule for application of pesticides, herbicides, and fertilizers,
- Use an Integrated Pesticide Management (IPM) approach,
- Track use of pesticides, herbicides, and fertilizers,
- Train or license (Qualified Applicator Certificate) City personnel who apply pesticides, and
- Continuously train City personnel on BMPs.

The City maintains 120 acres, including landscaped medians, parkway trees, parks and public grounds and performs scheduled maintenance of all areas on a daily basis. Weed control is conducted along public streets and along storm water channels. Crews use concentrated pesticides and herbicides, both solid and liquid, as follows: Pre-emergent (Pre-E) at 96 pounds, 8 gallons; Post-Emergent at 1.5 lbs., 142 gallons (including Roundup); Contact Chemicals at 8 lbs., 28 gallons; and Pool Chemicals (chlorine and muriatic acid) at 183 lbs., 5,725 gallons.

Figure 6

To maintain the City's Park and Recreation areas, 7,565 lbs. of fertilizer were used on turf and landscape. Fertilizer applications consisted of polymer coasted slow release fertilizer. All fertilizers are applied using professionally trained City personnel utilizing BMPs. Applications are documented with fertilizer use reports.

4.4 MUNICIPAL STAFF TRAINING, SPECIAL EVENTS AND NOTABLE ACTIONS

New hires for City municipal staff receive New Employee Orientation Training that includes a module on storm water quality issues and concerns. In PY1 all Public Works crewmembers attended storm water training sessions conducted during September and October of 2007. Additionally, all members of the El Cajon Police Department, Community Policing staff received storm water training in during April of 2008.

PUBLIC WORKS WEEK

Public Works Week emphasizes the importance of Street Maintenance, Sanitary Sewer and Storm Water system flushing, and other Emergency and Non-Emergency Services provided by Public Works Maintenance and Operations crews. Public Works Week highlights the equipment used to complete these tasks. In PY1, Public Works was celebrated during the week of May 18, 2008. The public, including students from nearby schools, were invited to view equipment and speak with Public Works crewmembers.

TRASH FENCE

The City of El Cajon is the first major jurisdiction within Forrester Creek watershed. Consequently, pollutants and trash that enter the storm drain system are carried downstream to the City of Santee where the Creek has not been improved. In response to the City of Santee's Forrester Creek Restoration Project, the City of El Cajon completed a bid and initial scouting for the placement of a trash and debris fence. The trash fence must be able to withstand forces from flows reaching 22 feet per second and hold heavier floating debris. Installation was accomplished in the fall of 2005 and the trash fence has been in service since. The picture to the right shows trash and debris captured by the fence during a rainfall event.

Forrester Creek Trash Fence

WEB PAGE

The City of El Cajon added new content to a Storm Water Web Page that is part of the El Cajon, Municipal Web Site. The Hotline for the City and County plus reports, brochures, and guidance documents can be accessed from Portable Document Format files (PDF files) on the web site.

4.5 IMPROVEMENTS AND REGULATORY COMMENTS

The following are the major improvements completed for PY1.

- Installed 42 additional storm drain inlet filters throughout areas in the City where trash and debris has been identified to be a problem. This is in addition to the 51 existing storm drain inlet filters installed in previous years.
- Continued the improvement and functionality of the trash and debris fence for Forrester Creek, located upstream from Gillespie Field.
- Reviewed Storm Water Program for Capital Improvement Projects.
- Continued implementation of GIS to assist with maintenance of storm drain systems and the sanitary sewer system.
- Continued training to implement a program for monthly self-inspection of Municipal Facilities.
- Continued to conduct maintenance of the existing storm drain inlet filters.
- Continued development of specific environmental indicators for accurate measurement of Urban Runoff Program effectiveness.
- Established defined measurements and actions to address watershed requirements and develop watershed management procedures.

There were no regulatory comments received for the Municipal Component of the JURMP for PY6.

SECTION 5 INDUSTRIAL & COMMERCIAL COMPONENT

5.1 INTRODUCTION

Industrial

The Industrial Component was revised at the end of PY3, adjusting the program to a Best Management Practices (BMP) implementation and verification task. Industrial inspections are the focus of the City's Industrial Component with the goal being to verify the presence of BMPs, proper implementation and maintenance and check that the facility has filed a Notice of Intent and has a Storm Water Pollution Prevention Plan pursuant to the General Industrial Permit, if required.

Proper implementation and maintenance of appropriate BMPs at industrial facilities will eliminate or reduce the discharge of pollutants from an Industrial site and prevent pollutants from entering the City's storm drain system. The City redesigned the inspection sheet to emphasize the use of BMPs for specific, potential pollutant producing activities. Industrial activities either have the potential to affect storm water runoff or have no direct or apparent affect. Industrial operations conducted in a manner that prevents the discharge of pollutants or pollutant contact with storm water should not have any impact on water quality. The City's focus is on identifying those industrial activities that have an actual or potential impact on water quality, requiring implementation of appropriate BMPs and periodic inspections of industrial facilities to verify compliance with City, state and federal water quality requirements.

Outdoor industrial activities have the greatest potential to impact receiving waters through outdoor storage, loading/unloading, fueling areas, vehicle/equipment maintenance, solid/hazardous waste storage, and parking lot runoff. A Storm Water Quality Inspection form to document routine, follow-up, and compliance inspections is provided in Appendix A.

Commercial

Commercial facilities are those facilities that are designated by the County or by the City as a commercial facility with activities that may potentially affect the quality of receiving waters. In previous years, the City identified commercial facilities within its jurisdictional boundaries, and has categorized different commercial types for education, inspection and follow-up as

After the *Framework for BMP Implementation* was completed in October 2003, the Commercial Component was restructured into a BMP implementation program similar to other Existing Development (Municipal, Industrial, and Residential). Implementation, verified during onsite inspections, determines whether a BMP is either fully implemented or requires Corrective

Action. A fully implemented BMP is counted towards preventing, eliminating, or reducing pollution discharged to the maximum extent practicable (MEP).

5.2 STATIONARY IND. & COMMERCIAL SALES/SOURCES/EQUIPMENT

5.2.1 Background

In 2002, the City developed a Jurisdictional Urban Runoff Management Program (JURMP) document as required by the San Diego Regional Water Quality Control Board (RWCQB) Order No. 2001-01. As part of this program, the City was required to conduct industrial and commercial storm water compliance inspections to assess the implementation of the minimum best management practices (BMP) required in the industrial and commercial section of the JURMP. On January 24, 2007, the updated Municipal Permit, Order No. R9-2007-0001 was adopted. This new Municipal Permit required each Copermittee, including the City, to update its JURMP document, including the industrial and commercial component, to comply with the new requirements.

The requirements of the new Municipal Permit went into effect in March 2008. The industrial and commercial component of the City's storm water program was conducted under the Order No. 2001-01 requirements for the first part of the 2007-2008 fiscal year and under the new Municipal Permit requirements for the latter part of the 2007-2008 fiscal year. Though the new Municipal Permit only required 50 percent of the high Treat to Water Quality (TTWQ) sites to be inspected during the first year of implementation, the City of El Cajon chose to inspect 100 percent of its inventoried high TTWQ industrial and commercial businesses. This helped the City meet an additional new Municipal Permit requirement that 20 percent of the total number of facilities on the City's inventory be inspected during the first year of program implementation. To meet the conditions of the previous permit, the City chose to inspect all industrial facilities that are covered or are known to require coverage under the General Industrial Permit (Industrial Permit). Additional details on how the City met the requirements listed above are included in Section 5.2.2 of this report.

City staff conducted inspections and also contracted a consultant to assist with routine inspections during the 2007-2008 reporting period. A total of 211 industrial and commercial facilities received site visits. A list with more detailed information of these site visits can be found in Appendix B.2.b of this report.

5.2.2 Source Characterization

The City's watershed-based inventory of all industrial and commercial facilities was reprioritized during the JURMP update in March 2008 and includes 1074 stationary commercial and industrial sites, of which 149 were recognized as being high TTWQ. Information was obtained from the City's business license listings and the California Department of Water Resources list of Permittees covered under the General Industrial Permit. The inventory will be updated annually through reviewing business license records for new businesses, performing routine

inspections and responding to reported incidents. All facilities selected for inspection in the City's JURMP document were visited or accounted for.

5.2.3 Best Management Practice Requirements

Pollution prevention for industrial and commercial facilities eliminates the management of pollution and reduces the management of pollution and ultimately leads to a cleaner, healthier watershed. Although Best Management Practices for Commercial Facilities are used as a primary mechanism for reducing commercial discharges of pollutants into regional MS4s, the educational effort to change the way businesses conduct business is the final objective. The City encourages industries to apply pollution prevention tactics, such as the BMPs listed in Table 1, below. Storm Water staff disseminate this information during inspections, letters, and enforcement actions. The following pollution prevention methods shall be considered and implemented to the MEP where applicable:

- Reduce quantity of toxic materials used or substitute less-toxic materials
- Use minimal cleaning water to decrease wastewater generation
- Display pollution prevention methods prominently to remind or instruct employees and customers
- Implement a spill response plan
- Segregate and recycle wastes
- Provide a schedule of preventive maintenance procedures
- Reduce waste through more efficient production processes
- Recycle wastes as part of the production process (most preferred), off site or on site (least preferred)
- Treat wastes on site to decrease volume and/or toxicity
- Dispose of wastes properly
- Continually train employees as needed

Table 1 – Prevention BMPs

Prevention BMP	Prevention Mechanism	Primary Pollutant Prevented	Prevention of impact to 303(d) pollutant
Spill Prevention, response, control, and cleanup	Prevents spills, controls spills	Oil & Grease pH	pH
Raw Material Storage	Prevents pollutants on outdoor material storage from discharging	Oil & Grease	_
Safer Alternative Products	Encourages use of less toxic materials	Pesticides Fertilizers	TDS
Good housekeeping of outdoor activity areas	Prevents pollutants from entering the storm drain	Oil & Grease	TDS

Prevention BMP	Prevention Mechanism	Primary Pollutant Prevented	Prevention of impact to 303(d) pollutant
	system.		
Employee Training	Prevents discharges, spill response	Oil & Grease	pH Fecal Coliform
Private Sewer Lateral Maintenance	Preventive maintenance of sewer lateral prevents sewage overflows	Fecal Coliform Enterococcus Nitrates	Fecal Coliform TDS

5.2.4 Program Implementation

5.2.4.1 Priority Industrial-Commercial Sources

Industrial
Each year, industrial sites are re-prioritized to get an accurate picture of the number and types of industrial sites within the City's jurisdiction. Prioritization involves two steps: initially classifying a facility as being a high TTWQ based on site information; and subsequently confirming or reclassifying it based on field observations and additional information. The former step has been accomplished administratively using the data provided in the inventory of industrial sites. The latter step was completed following the initial inspection of each industrial facility.

Additionally, pollutants were listed with the activities associated with industrial outdoor activities to assist in the selection of the most appropriate BMPs. This initial connection of pollutants, BMPs, and activities will be used to correlate water quality with JURMP requirements in the Annual Report. Below, in Table 2, is the City's listing of activities with the potential pollutants.

Table 2 – BMPs to Pollutants for Industrial Facilities

BMP	Application	Primary Pollutant Addressed	303(d) Pollutant Impact
Non-Storm Water Discharges – SC10	Addresses any discharge that is not storm water	Varies depending on discharge	-
Spill Prevention Control and Cleanup – SC11	Addresses spills	Varies depending on spill	-
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22	Controls motor fluids	(Petroleum) Oil & Grease Metals	-
Loading/Unloading –	Controls the loading and	Varies depending on	-

BMP	Application	Primary Pollutant Addressed	303(d) Pollutant Impact
SC30	unloading of materials	the materials Trash	
Liquid Container Storage – SC31	Controls discharges associated with outdoor liquid containers	(Petroleum) Oil & Grease pH	pH
Raw Material Storage – SC32	Controls the outdoor storage of raw materials.	Metals	-
Waste Handling and Disposal – SC34	Controls any discharges from the collection, storage, and disposal of waste materials.	Varies depending on the waste material Trash	-
Safe Alternative Products – SC34	Encourages the use of less toxic materials for cleaning, disinfecting, or other functions	Pesticides Fertilizers	-
Building and Grounds Maintenance	Addresses General Housekeeping and preventative maintenance	Fertilizers Trash/debris Sediment	TDS
Parking Lot and Storage Maintenance – SC43		Trash/debris Sediment	-
Drainage System Maintenance – SC44		Trash/debris Sediment	-
Employee Training		Trash/debris	-
Storm Drain System Signage		Trash/debris Fecal Coliform	Fecal Coliform
Private Sewer Lateral Maintenance		Fecal Coliform Debris	Fecal Coliform TDS
Over-watering of Landscape		Nitrates	TDS

"-" indicates no impact positive or negative to the Forrester Creek 303(d) pollutants of TDS, fecal Coliform, and pH.

Commercial

A majority of the City's commercial sites can be categorized as shown in Table 3. Of specific concern are those businesses located near storm water channels. Activities from the commercial sites with the associated pollutants are shown in the following table.

Table 3 – Commercial BMPs to Specific Business Produced Pollutants

Business Type → **BMP ▼**	**Restaurants**	**Automotive Establishments**	**Retail Gasoline Outlets**	**Mobile Washing Businesses**
Non-Storm Water Discharges – SC10	Organics Trash	Oil & Grease Metals	Oil & Grease Metals	Oil & Grease, Metals
Spill Prevention Control and Cleanup – SC11	Trash Oil & Grease Organics/Bacteria	Trash Oil & Grease Metals	Trash Oil & Grease	TDS Metals
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22		Trash Oil & Grease Metals		Oil & Grease Metals TDS
Loading/Unloading – SC30	Organics/Bacteria Oil & Grease	Oil & Grease	Oil & Grease	
Liquid Container Storage – SC31		Oil & Grease		
Raw Material Storage – SC32		Oil & Grease

Employee Training	Organics/Bacteria Oil & Grease Trash	Trash Oil & Grease	Trash Oil & Grease	
Private Sewer Lateral Maintenance	Pathogens/Fecal Coliform TDS	Fecal Coliform TDS		
Over-Watering	TDS	TDS	TDS	

5.2.4.2 Backgroud BMP Requirements and Implementation

Industrial

Commitment to BMP requirements is listed in the City's JURMP and meets the requirements of the Municipal Permit. Implementation includes selection/application, dissemination of information, and evaluation of implementation at the facility. An "X" indicates the BMP is: Required by the City of El Cajon as a minimum BMP – Level 1 by the Industrial facility – Level 2 (Provided BMP information). These two levels were completed in previous permit years.

The next steps include:

- Implementation as observed during the onsite inspection – Level 3 (Verified in pervious permits years under permit 2001-001.)
- Connection to a specific Primary pollutant and any 303(d) pollutants identified for Forrester Creek to support an Effectiveness Assessment – Level 4 (Verified in pervious permits years under permit 2001-001.)

In past years the City applied "A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites" to implement BMPs at industrial sites. BMP selection and application began at JURMP development with a minimum number of BMPs. These minimum requirements were incorporated into the industrial/commercial inspection checklist.

Table 5 – Required Industrial BMPs

Required Industrial BMPs	
Non-SW Discharges - SC10	X
Spill Prevention/Control/Cleanup - SC11	X
V&E Fueling - SC20	X
V&E Cleaning - SC21	X

Storm Drain System Signage - Permit	

Required Industrial BMPs	
Private Sewer Lateral Maintenance - City of El Cajon	X
Over-water Landscape - City of El Cajon	X

5.2.4.3 Updated BMP Requirements

Pollution prevention methods are cost-effective BMPs that eliminate or reduce the generation of pollutants at their sources. Industrial and commercial facilities produce a range of pollutants, both indoors and outdoors, that can threaten human and environmental health if washed into the storm drain system by way of urban runoff. Businesses can benefit from pollution prevention methods by reducing labor time associated with excess pollutant waste handling, thereby re-directing labor time more efficiently to production, as well as the accompanying costs of storage, disposal or treatment.

The following pollution prevention methods are considered and implemented to the MEP where applicable:

- Reduce quantity of toxic materials used or substitute less-toxic materials
- Use minimal cleaning water to decrease wastewater generation
- Display pollution prevention methods prominently to remind or instruct
- employees and customers
- Implement a spill response plan
- Segregate and recycle wastes
- Provide a schedule of preventive maintenance procedures
- Reduce waste through more efficient production processes
- Recycle wastes as part of the production process (most preferred), off site or on site (least preferred)
- Treat wastes on site to decrease volume and/or toxicity
- Dispose of wastes properly
- Continually train employees as needed

In addition to the methods listed above, the City of El Cajon also reserves the authority to require a Storm Water Pollution Prevention Plan (SWPPP) for any Industrial or Commercial facility within its jurisdiction that discharges significant pollutants into receiving water bodies.
In addition to the pollution prevention BMPs described above, the City has also established minimum BMPs for all industrial and commercial sites. Businesses are required to use an effective combination of general BMPs and activity-specific BMPs. General BMPs, including structural and non-structural BMPs, are required of all facilities and are included in Appendix A.5 (General BMPs for Industrial/Commercial Facilities). Businesses are required to use an effective combination of general BMPs and activity-specific BMPs. General BMPs and Activity-Specific BMPs are required where applicable and are briefly listed below.

- **General BMPs**
  - Non-Structural BMPs
    Non-Structural BMPs aim to prevent pollutants from coming into contact with storm water or authorized non-storm water discharges. Many of these methods already exist as part of the standard operating procedures for a site:
    - Good housekeeping
    - Preventive maintenance
    - Material handling and storage of materials
    - Employee training
    - Solid waste (non-hazardous) handling and recycling
    - Record keeping
    - Self inspection/quality assurance
    - Spill response
  - Structural BMPs
    Structural BMPs consist of specialized equipment, structural components, or engineered technologies that can be used when non-structural BMPs are ineffective. Structural BMPs are site specific; therefore the facility operator needs to evaluate each proposed use. Proper installation and regular maintenance of structural BMPs are imperative to their effectiveness. Examples are as follows:
    - Overhead coverage of outdoor work areas or chemical storage.
    - Retention ponds, basins, or surface impoundments that confine storm water to the site.
    - Berms and concrete swales or channels that divert run-on and runoff away from pollutant sources.
    - Secondary containment structures.
    - Treatment controls, e.g., infiltration devices and oil/water separators, to reduce pollutants in storm water or authorized non-storm water discharges.

- **Activity-Specific BMPs**
  Appropriate BMPs will depend on the type of activities, pollutants, and potential source of pollutants. The BMP requirements for the following activities and areas are relatively common at industrial and commercial sites and required by the City.

  - Hazardous materials storage (incl. tanks)
  - Solid waste storage
  - Loading/unloading
  - Fueling
  - Wastewater treatment
  - Landscaping/ grounds keeping
  - Vehicle maintenance
  - Parking lots
  - Process water pre-treatment
  - Equipment storage
  - Washing of Equipment/Vehicles
  - Rooftops

5.2.4.4 Additional Controls for Ind. & Commercial Sites/Sources

Forrester Creek, which flows through the City, is 303(d) listed for fecal coliform, low dissolved oxygen, phosphorus, and TDS. The City has not identified any industrial or commercial facilities that are likely to be significant sources of fecal coliform or TDS. As a proactive measure, however, the City has assigned higher priorities to concrete and stone cutting businesses, as they may contribute to elevated TDS levels. Similarly, the City assigned higher priorities to animal-related businesses, which may be sources of fecal coliform if animal waste is not disposed of properly. The City also assigned higher priorities to commercial businesses associated with fertilizer use (i.e. nurseries, greenhouses, etc.) since low dissolved oxygen and elevated phosphorus levels are commonly associated improper fertilizer use and/or storage.
As mentioned in Section 1 of this document, the City has chosen to designate major channels within the City as ESAs. Major channels within the City are typically concrete, and hold no significant environmental value, however. The City has chosen to designate these areas as ESAs as a proactive measure to protect downstream water quality. During inspections of businesses that drain to 303(d) listed receiving waters or other ESAs, the City will conduct more detailed investigations into whether the businesses are potential sources of the pollutants of concern or may otherwise negatively impact the ESA. If a business is believed to be a significant source of key pollutants and the standard BMPs listed above are not adequate, the City will require additional BMPs so that discharges of the key pollutants of concern will be reduced to the MEP.

5.2.4.5 Sites Selected for Inspection

As previously mentioned, to meet the requirements of both the previous permit and the new Municipal Permit, the City decided to inspect all high TTWQ industrial and commercial facilities. The City also selected 62 additional sites to meet the Municipal Permit requirement that 20% of the City's inventory receive inspections during the first year of program implementation. Those additional sites were mainly chosen from the medium TTWQ inventory and were selected largely based on perceived potential for having relatively significant outdoor exposure. The overall TTWQ prioritization process is based on a number of factors including, but not limited to, history non-compliance with storm water regulations, whether or not the facility has significant outdoor exposure of storage or activities, distance to receiving water body, total area of the site, and whether the business is required to obtain coverage under the Industrial Permit. The TTWQ prioritization process is described in more detail in the City's JURMP document.

A total of 237 sites were selected for inspection. The City chose to conduct inspections of a number of facilities with General Industrial Permit (Industrial Permit) coverage, and the consultant inspected not all of the sites listed in the table below. A summary of the facilities visited by both the City and consultant is listed in Table 6, below, a detailed description of the inspections conducted are included in Appendix B.2.b of this report. The sites selected for inspection include at least 20% of the City's industrial and commercial inventory and at 100% of the City's high TTWQ industrial and commercial facilities.

Based on experience, the inspection process for industrial and commercial facilities is often more efficient when appointments are not scheduled. This allows inspectors to inspect neighboring businesses rather than driving longer distances from business to business to meet scheduled appointments; it also eliminates time spent on the phone scheduling. In general, scheduling is conducted for industrial facilities that have or are required to have Industrial Permit coverage so that the proper facility personnel can be present for the inspection and materials such as SWPPPs and monitoring plans are located and easily accessible for review when the inspector arrives.

Inspectors were able to visit 26 additional sites in the City. A total of 237 facilities received site visits during the 2007-2008-inspection program.

TABLE 6 - SUMMARY OF BUSINESSES SELECTED FOR INSPECTION

Facility Category	Initial List	Percentage of Total Inventory
High TTWQ Industrial	43	4%
High TTWQ Commercial	106	10%
Other sites initially selected for inspection	62	6%
Additional sites selected and visited after accounting for all initially selected sites	26	3%
Stationary Inventoried Sites Visited or Accounted For*	**237**	**23%**

* "Accounted For" means that the business was inspected, visited and found to not need an inspection, or found to not need an inspection when called to schedule a site visit.

5.2.4.6 Industrial Inspections

As detailed in the City's JURMP, a total of 69 industrial facilities were selected for inspection, 43 of which were designated as high TTWQ. The City inspected 24 of these industrial facilities. One of these facilities, Solo Cup Company, was listed under an additional name on the City's inventory, AJM Packaging Corporation; AJM Packaging Corporation was removed from the City's inventories. Of the remaining 45 industrial facilities selected for inspection, two facilities, Cajon Valley School District and Grossmont Union High School District, were not visited because each facility is subject to the new Phase II storm water permit regulations and is therefore not in the City's jurisdiction. The remaining 43 industrial facilities selected for inspections were visited. During the course of these inspections one facility was moved to the commercial inventory, 11 businesses were moved from the commercial inventory to the industrial inventory, and eight previously unassigned businesses were added to the industrial inventory. Therefore, a total of 61 industrial facilities received site visits. A breakdown of the industrial site visits is included below:

- 37 businesses received full inspections
- 14 businesses were found to have moved out of the City
- 7 were businesses located out of the City's jurisdiction
- 3 were found to be conducting activities for which they should not be included on the City's inventory

At each of the inspected sites, an inspection form was completed to document the result of the site visit, and that data was entered into the inspection database to ensure an accurate inventory. As part of the inspection process, the assigned SIC code(s) were assessed to determine if they appropriately described the businesses' activities and threats to water quality.

In addition to looking at general BMP implementation and SIC code(s), Industrial Permit compliance status was evaluated. There were several cases of Industrial Permit-related non-compliance noted during the 2007-2008 inspection program. Industrial Permit-related non-compliance noted at the industrial facilities is discussed below, and table in Appendix A.5 entitled "General Industrial Permit Compliance Status" summarizes all Industrial Permit-related non-compliance.

Seven businesses were found to require coverage under the Industrial Permit but had not yet filed a Notices of Intent (NOI):

> **Curb and Vent Mfg., Inc.**, **East County Metal Supply**, **Fatboy Fiberglass and Welding**, **G Marble and Granite Company**, **L&S Fabricators DBA Fabcom**, **Lite Stone Concrete**, and **Russo Tile and Marble Inc.**

These businesses were all directed to file an NOI and develop a SWPPP and monitoring program. The City will conduct follow up to assure compliance with these Industrial Permit requirements.

5.2.4.7 Commercial Inspections

As detailed in the City's JURMP, a total of 142 commercial facilities were selected for inspection. During the course of inspections, five businesses were moved from the commercial inventory to the industrial inventory, 11 businesses were moved from the industrial inventory to the commercial inventory, and 12 previously unassigned businesses were added to the commercial inventory. As previously mentioned, D-MAX conducted additional commercial inspections for the City and 19 commercial facilities not previously selected for inspection were visited. Therefore, 179 commercial facilities were visited by D-MAX. One of these sites, Pastuer Cafe, was visited on a number of occasions but was closed for remodeling. A breakdown of the remaining 178 site visits is included below:

- 123 businesses received full inspections
- 32 businesses were found to have moved from the City
- Seven businesses were found to be outside the City's jurisdiction
- Six businesses could not be contacted
- Five businesses were found to be conducting activities for which they should not be included on the City's inventory
- Three businesses were found to be mobile and no aspects of the business were available for inspection
- Two facilities were found to be duplicates of other facilities on the City's inventory

At each site that received a site visit, whether it was a full or partial inspection an inspection form was completed to document the result of the site visit. The Industrial and Commercial Database has been updated to reflect information obtained during the inspection program.

Assigned SIC code(s) were assessed to determine if they appropriately described the businesses' activity; and changes were made accordingly.

5.2.4.8 Compliance and Enforcement

The follow-up priority classification section on the inspection form was designed to classify the level of necessity to perform a follow-up inspection at the facility. "Priority 1" follow-ups are given to facilities for which an active illicit connection or illegal discharge was observed. In these cases City's storm water personnel immediately instructed discharger to stop the discharge and an administrative citation was issued. "Priority 2" follow-ups typically have serious BMP-related issues. "Priority 3" follow-ups are given to facilities for which relatively minor BMP-related issues were observed.

A total of 20 businesses, 2% of the facilities inspected, were found to be "Priority 1" or "Priority 2". Follow up inspections were scheduled and, whenever possible, investigations were conducted immediately.

As specified in the City Ordinance, the City is able to use various warnings and actions to correct a facility/activity and enforce the JURMP. For PY1, the City further coordinated and partnered with industry to implement and enforce the requirements of the JURMP and City Municipal Code. Enforcement generally is initiated with a verbal warning and followed up by a written warning. Enforcement using Administrative Citations was incorporated in May 2003. Appendix A.5 lists criteria for issuing Citations, document entitled "Storm Water Administrative Citation Program Criteria" and Appendix B.3 shows the list of enforcement actions taken by the City in PY2007-08.

5.2.4.9 Education

During inspections, business representatives were educated regarding storm water issues both through verbal interaction with the inspectors, and the distribution of printed storm water educational materials, when appropriate. In particular, the utilization of verbal interaction is extremely influential because it is individually tailored by the inspector to the specific issues and concerns of the facility and the facility representative. It prompts the facility representative to think about issues directly related to his or her daily actions as it applies to business activities. The inspector was able to provide information specific to the facility, which is beneficial to the facility representative due to the site-specific information. This information can help give the facility representative the proper tools to implement BMPs applicable to their business.

Printed educational materials were also distributed to businesses during inspections unless the facility representative declined to receive them. In addition to the educational materials distributed during inspections, the City sent a letter notifying each business selected for inspection of the upcoming inspection and instructing them that they were required to implement the corrective actions recommended by the inspector. Educational materials distributed included storm water posters specifically designed for automotive and restaurant activities. Also provided, when necessary, were NONA/NEC paperwork and NOI paperwork. Each have a separate cover sheet with instructions on how to file, and contacts in case any questions arise. A summary of the types and numbers of educational materials distributed is presented below. In some cases, educational material was not applicable to the business activity and was therefore not provided.

TABLE 7
EDUCATIONAL MATERIALS DISTRIBUTED

Educational Material	Number Distributed
Restaurant Poster	53
Automotive Poster	20
NOI handout	5
NONA/NEC Paperwork	2
Inspection Notification Letter	211

5.2.5 Stationary Ind. & Commercial Sites/Sources Effectiveness Assessment

5.2.5.1 Common BMP Implementation Deficiencies

Most BMP-related deficiencies observed during the inspection process were minor. Some of the more common issues include uncontained litter, debris, and sediment around the site and in the parking lot and dumpster area. Another common BMP deficiency included open dumpsters, which were often times due to the dumpster lids being pinned against the enclosure by the waste disposal company or dumpsters lacking lids. The most common issues for restaurants were poorly maintained dumpster and grease recycling areas.

5.2.5.2 SIC Code Changes

Changes of SIC code(s) were recommended for a total of 69 inspected facilities during the 2007-2008 inspection program. SIC codes are often assigned when a business applies for a business license, and sometimes can be incorrect due to insufficient information about specific business activities. Inspected businesses not included in the City's JURMP inventory were also assigned SIC code(s) to best reflect business activity. In many cases, changes in SIC code(s) were made to reflect changes in business activities. Appendix A.5 presents a table entitled "List of High Priority Industrial-Commercial Facilities" that lists these facilities.

5.2.5.3 BMP and Storm Water Knowledge Assessment

Each facility that received a full inspection was assigned a rating to reflect the level of BMP implementation noted at the site and a separate rating to reflect the facility manager/responsible party's level of storm water knowledge.

The knowledge assessment ratings were designed to gauge knowledge of storm water pollution prevention and implementation of effective BMPs; they were assigned based on how many of the following questions were answered correctly:

- *What is storm water?*
- *What is the difference between the storm drain system and the sanitary sewer system?*
- *Where does storm water flow?*
- *Is storm water treated prior to discharge?*
- *What are examples of pollutants?*
- *Is sediment a pollutant?*
- *Do you know what good house keeping or best management practices are?*
- *Do you know what NPDES is or means?*

Individuals who answered all of the aforementioned questions correctly and demonstrated an in-depth knowledge of storm water pollution prevention measures and the NPDES Storm Water Program were rated "Level 5". Individuals who answered four or more of the aforementioned questions correctly, and had a strong basic understanding of storm water pollution prevention but did not know or understand what the NPDES Storm Water Program was received a "Level 4" rating. A "Level 3" rating indicated an individual who answered three questions correctly, "Level 2" indicated one or two correctly answered questions, and a "Level 1" rating indicated that the individual was not able to answer any of the questions correctly.
At the conclusion of each inspection, the inspector evaluated his or her notes and corrective actions and assigned each facility a BMP assessment rating. The following provides a breakdown of how BMP assessment ratings were designated:

- "Level 5": All required general and activity specific BMPs had been implemented effectively. If available, monitoring results indicated that all constituents sampled were below established benchmarks.
- "Level 4": BMPs had been implemented effectively but the dumpster lid was observed open and/or oil stains were noted in the general parking lot not associated with the business' activities. If available, the monitoring data indicated that one or two constituents were slightly above the established benchmarks.
- "Level 3": BMPs had been implemented with the exception of two corrective actions noted, aside from dumpster lids being open or oil stains in the general parking lot. If available, monitoring data indicated that one constituent consistently exceeded the established benchmarks.
- "Level 2": Minimal BMP implementation was in place. Three or more corrective actions were noted, with the exception of dumpster lids being open or oil stains in the general parking lot. No illegal discharge or illicit connection was noted. If available, monitoring data showed concentrations of two or more constituents well above the established benchmarks.
- "Level 1": A violation of one or more of the City's Storm Water Ordinances (illegal discharge, illicit connection, failure to properly implement required BMPs) was noted. BMP implementation was poor.

Table 8, below, provides a statistical summary of BMP and knowledge assessments during the 2007-2008 inspection program. Figure 2, at the end of this report, shows the ESAs in the City as well as a distribution of BMP assessment scores assigned during the inspection program.

TABLE 8
STATISTICAL SUMMARY OF KNOWLEDGE AND BMP ASSESSMENT SCORES

Overall Program Scores	**Knowledge Assessment**	**BMP Assessment**
AVERAGE Rating	**2**	**3**
MEDIAN Rating	**1.5**	**3**
# of "Level 1" Ratings	80	20
# of "Level 2" Ratings	25	11
# of "Level 3" Ratings	34	81
# of "Level 4" Ratings	21	36
# of "Level 5" Ratings	0	12

Graphs 5-1 and 5-2 display relative score frequencies for BMP implementation and storm water knowledge from this inspection program. Graph 5-1 shows that the bulk of facilities inspected in 2007-2008 tend to have BMP scores distributed around the peak at 3, with the average BMP implementation score being 3. Graph 5-2 shows the average and median scores for the storm water knowledge assessment, 2 and 1.5, respectively, for the 2007-2008 year. The relative BMP implementation and knowledge score frequencies for each facility type, industrial and commercial, for 2007-2008 are displayed in Graphs 5-3 and 5-4, respectively. In future years, when more data is available, knowledge and BMP assessment scores may be analyzed to illustrate any trends in the data.

GRAPH 5-1

BREAKDOWN OF BMP ASSESSMENT SCORES BY FACILITY TYPE FOR 2007-2008

GRAPH 5-4
BREAKDOWN OF STORM WATER KNOWLEDGE ASSESSMENT SCORES BY FACILITY TYPE FOR 2007-2008

5.3 MOBILE SOURCES ELEMENT

5.3.1 Background

Illegal discharges tend to be the major area of concern with mobile businesses. Due to the nature of their activities, mobile businesses are regulated somewhat differently than other businesses. Mobile businesses can be difficult to identify because many do not have City business licenses. Additionally, new mobile businesses are started and previously existing mobile businesses go out of business on a relatively regular basis. For the reasons listed above and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option.

5.3.2 Source Characterization

The mobile businesses known to operate within the City's jurisdiction are noted on the City's commercial inventory. The following business types are addressed by the mobile sources element of the City's industrial and commercial program.

- Mobile automobile or other vehicle washing
- Pest control services
- Mobile carpet, drape or furniture cleaning
- Mobile construction trades
  - Painting and coating
  - Cement mixing or cutting
  - Masonry
  - Other contractors
- Landscaping
- Pool and fountain cleaning
- Power washing services

Because not all mobile businesses have obtained business licenses in the City or have a base of operations in the City, the City expects that a continual process of refining and updating its inventory will be needed. Sources for such inventory updates will include reported incidents, general observations by City staff, and available business licenses. The City intends to participate if and when a regional inventory and/or tracking system for mobile businesses is developed.

5.3.3 Best Management Practice Requirements

5.3.3.1 Updated BMP Requirements

All BMPs required for stationary sources; listed in Section 5.2.4.1, 5.2.4.2, and 5.2.4.3 of this report; are also required for mobile business where applicable. The most important BMPs for most mobile businesses typically involve non-Storm water discharge control and spill prevention, control, and cleanup.

5.3.3.2 Additional Controls for Mobile Sources

Regardless of where the activity occurs, the City categorically prohibits illegal discharges from mobile businesses. Aside from washing, cleaning, or other activities that may cause illegal discharges, mobile businesses are not likely to conduct activities that produce significant pollutant discharges. If in the future the City finds that even in the absence of illegal discharges the activities of mobile businesses are contributing pollutants of concern to a CWA section 303(d) impaired water body segments or are negatively impacting ESAs, additional controls will be required for those activities. Further, if the City has reason to believe that mobile businesses are generating significant illegal discharges in a given area of the City that is tributary to a 303(d) listed water body (and the discharges contain pollutants causing the impairment) or is within, directly adjacent to, or directly discharges to a water body within an ESA, City staff may more regularly visit those areas and/or take other actions to address the illegal discharges.

5.3.4 Education and Outreach

The City of El Cajon provides information and outreach regarding storm water quality to mobile business owners and operators. Businesses are given educational materials outlining pollution prevention methods and other BMPs related to their activities prior to issuance of a business license and during inspections. Inspectors also give recommendations to businesses, where appropriate. Because a specific element of the industrial and commercial program is being newly developed for this revised JURMP, it is anticipated that some mobile businesses are not aware of storm water requirements and that education will need to be a significant portion of the program. The educational program is described in more detail in Section 8 of this report.

5.3.4.1 Owner/ Operator Notifications

As indicated in the City of El Cajon updated JURMP, the City is working towards notifying the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

5.3.4.2 Inter-Jurisdictional Cooperation

As of the writing of this report, an inter-jurisdictional program for the regulation of mobile businesses is under development but has not been finalized. It is likely that such a program will be developed and in place in the future, and the City plans to participate in that program. The program may include creation of a regional inventory of mobile businesses, standardization of BMP requirements across jurisdictions, sharing of enforcement action information, and/or the development and distribution of standardized educational materials.

5.3.4.3 Staff Training

Staff responsible for conducting storm water compliance inspections and enforcement of mobile sources is trained on inspection and enforcement procedures and BMP implementation as they relate to mobile businesses. City staff is also be encouraged to be vigilant for illegal discharges from mobile businesses when working in the City and to report businesses that are not in compliance to the storm water hotline.

5.3.4.4 Inspections

Mobile sites/sources are inspected by the City on as needed basis. The most common triggers for these inspections are anticipated to be receipts of incident reports and direct visual observations by City staff. The inspections will generally follow the same procedure as stationary facilities, described in Section 7.2.4.4 of the updated JURMP, although the main focus of most mobile business inspections will be on discharge control BMPs.

5.3.4.5 Enforcement

Most violations associated with mobile businesses have been historically attributed to illegal discharges. The City's enforcement approach to such discharges will require the discharge to be stopped and cleanup of discharged materials when applicable and feasible. Education is also provided to operators who are not aware of the City's storm water requirements. Businesses that do not possess the materials necessary to implement the required BMPs are required to demonstrate to the City that they have obtained such materials and can properly use them before the City allows such businesses to resume operations in the City. Mobile businesses that do not have City business licenses are required to obtain licenses. A detailed list of all enforcement actions taken by the City is included at Appendix B.3 of this report.

5.4 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements from PY1 experience includes:

- Review dry weather monitoring and BMP implementation results to prioritize future commercial inspections.

- Continue to stock several portfolios of storm water information for staff to distribute businesses during annual inspections and to provide the public during business license applicant requests for information on new applications or renewals.

No regulatory comments have been received for the Commercial and Industrial Component of the 2006/2007 Annual Report.

SECTION 6 RESIDENTIAL COMPONENT

INTRODUCTION

Pollution prevention is the focus of the JURMP Residential Component to prevent pollutants from residential activities from entering the storm drain system. Education is the best approach to implementing this component of the JURMP as the goal is to change behavior and perceptions. The City is successful in implementing the collection of household wastes and promoting used oil recycling. Each pound of household waste and used oil collected equates to one pound less of waste/pollutants that could be disposed improperly and pollutants enter the storm drain system.

6.1 PREVENTION OF POLLUTED RUNOFF

Preventing pollution is easier and less costly than treating wastes at the end of the pipe. The following pollution prevention BMPs are sent to residents via brochures in sewer billings and during face-to-face contact when a complaint or referral is investigated.

- Conduct automobile repair and maintenance under cover or with drip pans; recycle oil.
- Divert automobile wash liquids to landscaping.
- Store unused automobiles under cover; use absorbent pads or drip pans for leakage.
- Maintain garden and yard using natural remedies and drought-tolerant plants.
- Use less toxic products for home care/maintenance.
- Dechlorinate swimming pool water before releasing.
- Dispose of pet waste in the trash.
- Don't use the street as your storage area for dirt, mulch, landscaping plants.
- The street is not a disposal area for concrete or paint washout, or hosing off driveway.

Table 1 – Prevention BMPs

Prevention BMP	Prevention Mechanism	Primary Pollutants Prevented	Prevention of 303(d) pollutant
Composting	Reduces the amount of waste in the trash	Organics	
Use of a Professional Car Wash	Eliminates dirty, soapy water from the storm drain	Metals Detergents	**TDS**
Organic gardening	Eliminates fertilizers and pesticides	Nutrients Pesticides	**TDS**
Take a bag when walking the dog.	Eliminates dog waste from the Public Right of Way	Fecal Coliform Enterococcus Nitrates	**Fecal Coliform** **TDS**

6.2 PRIORITY RESIDENTIAL SOURCES

Residential areas discharging directly to a major storm drain channel are the focus for pollution sources. Priority sources are directly related to 303(d) pollutants identified in Forrester Creek and the San Diego River. The following table connects sources with 303(d) pollutants. These same 303(d) pollutants are used in Section 11, Program Effectiveness Assessment to estimate the potential amounts of pollutant eliminated through prevention, intervention, and other BMP implementation.

6.3 BMP REQUIREMENTS

In addition to the pollution prevention BMPs, above, the following are encouraged in residential areas. Home improvement projects can cause side affects, like mud flowing into the street (see picture to the right). However, with an effective combination of BMPs applied to the maximum extent practicable, simple home projects can meet the City's BMP implementation requirements without much effort or expense.

Table 2 connects the use of BMPs with the prevention, reduction, or elimination of pollutants.

Table 2 – BMP to Pollutants for Residential Areas

BMP	Application	Primary Pollutants	303(d) Pollutants
Automobile Repair & Maintenance	Use Drip Pans Recycle Oil	Oil & Grease	
Automobile Washing	Use Commercial Car Wash	Metals Detergents	**TDS**
Automobile Parking	Use Drip Pans	Oil & Grease	
Garden and Yard Care	Compost or recycle waste	Organic Material	**TDS**
Home Care and Maintenance	Use Household Hazardous Waste Programs	Metals Toxic Substances	
Pet Waste Disposal	Take a bag when walking the dog	Fecal Coliform	**Fecal Coliform**
Private Lateral Maintenance*	Clean lateral every few years	Fecal Coliform Enterococcus Pathogens	**Fecal Coliform** **TDS**
RV Parking & Maintenance	Use a legal dump station	Fecal Coliform Enterococcus Pathogens	**Fecal Coliform** **TDS**

Some changes in behavior are noticed, but although the message has been out there for several years, it is still new to many citizens. The Clean Community; Healthy Watershed, and Healthy Garden; Healthy Home (Integrated Pest Management) concepts will be continuing messages for subsequent permit years.

6.4 BMP IMPLEMENTATION

Commitment to BMP requirements is listed in the City's JURMP and meets the requirements of Permit Section 6.3, BMP Implementation. Implementation includes selection/application, dissemination of information, and evaluation of implementation at the facility.

The list of minimum BMPs for residential areas tracks along with pollution prevention concepts. Understanding through education is the basis for changing behavior in the residential community. By changing the way the residential community completes tasks around the home, benefits to water quality will be realized through wet weather monitoring. The common major routes for educating the citizens and disseminating information is through newsletters, sewer billing inserts, and City "drive-abouts" where information is delivered directly to target audiences.

The following BMPs are provided to citizens through one-on-one visits, newsletters, sewer billing inserts and citizen complaints/referrals. Copies of brochures, newsletter articles, and flyers are included in Appendix A.6.

- Automotive Repair
- Car Washing
- How You Can Prevent Pollution from Entering the Storm Drain System
- Mobile Detailer BMPs
- PowerWashing
- Clean up After Your Pets
- Lawn and Garden Care
- Keeping Our Environment Clean!
- Over-Irrigation Can Cause Storm Water Pollution
- Washing Your Car
- What's the Problem with Pet Waste
- Keeping Our Yards and Our Storm Water Clean
- Trash and Street Sweeping Update
- Trash in Our Strom Drains
- Maintaining your Private Sewer Lateral
- Everything that goes into Our Storm Drains…Ends up in the Ocean
- Why It's Important to Keep Trash, Sediment and Debris Out of Storm Drains
- Pool Maintenance BMPs
- Creating Community by Keeping Our Storm Water Clean

Table 5 - Required BMPs for Residential Areas

		Automobile Repair Maintenance	Automobile Washing	Automobile Parking	Garden & Yard Care	Home Care & Maintenance	Pet Waste Disposal	Private Lateral Maintenance	RV Parking & Maintenance
RESIDENTIAL	Vehicles & Equipment	X	X	X					X
	Home and Garden				X	X	X	X	
	Pets						X		
	Private Sewer Lateral					X		X	

Minimum required BMPs for the Residential Component are grouped into four (4) basic categories as shown in Table 5. It is only through consistent, simple messages, will the citizens start to implement the BMP identified for the activities around their homes.

An area where Storm Water staff are collaborating with the police department is RV Parking and Maintenance. Police Department staff assist Storm Water staff in locating areas where dumping is occurring. The resulting outreach effort should help East County residents to reduce the number of illegal dumping events within this region of the watershed.

As illustrated above, over-watering from many different homeowners' landscaping can have an impact on the landscaping and may result in a significant source of water in the street. What seems of little importance from one home combines with runoff from other homes forming small rivers that can move materials stored in the right-of-way or pollutants illegally discharged. Homeowners are encouraged to save water and money by adjusting sprinkler heads to reduce or eliminate overspray. When over-watering is discovered, an attempt is made to contact the responsible party. Door hangers are left with instructions when homeowners are not home. Staff schedule a return date to discuss the measures that can be taken by homeowners. When over-watering discharges decrease, there is a reduction of:

- the amount of water discharged to Forrester Creek
- the amount of pollutants transported to Forrester Creek during "No Rain" days

Improvement in decreasing over-watering will be measured by the amount of Forrester Creek flow leaving the City of El Cajon at the jurisdictional boundary to Santee. Flows measured during the dry weather program are an indication of daily flows. The PY2007-08 dry weather flow into Santee was measured at 234 gallons per minute, as measured at Dry Weather Station No. 5. Overall flows have been on the decrease in all permit years since PY2004-05, inclusive, and may indicate that outreach and education efforts that discourage over-irrigation are becoming effective. Additional flow measurements may be taken during the next annual cycle. The full Forrester Creek Study is contained in Appendix A.12.

6.4.1 Outreach to Residents

The City used various types of educational materials to distribute information and discuss the JURMP requirements with residents when responding to complaints or investigating a discharge. Brochures were provided to residents during face-to-face discussions concerning complaints and referrals. The City newsletter has included five articles concerning routine activities where receiving waters may be impacted by pollutants. The newsletter is freely available for residents

and industrial/commercial business owners on a semi-annual basis. Two such printings were completed in PY1 and covered the following activities for residents:

- Residential Repair, Restoration and Remodeling BMPs
- Pet Pollution Can Be a Serious Problem
- What Is Storm Water Runoff?
- Residential Solutions to Storm Water Pollution, and
- Auto Care, Pet Waste, and Parking Lot and Trash Storage Area BMPs

The City printed and distributed 38,000 copies, each, of the spring and fall newsletters with five articles in total contained in both newsletters. As a result, residents are becoming more aware. An indication of this awareness is the increase in the number of complaints and referrals from the private sector. As the public and municipal staff gains more knowledge and awareness of urban runoff, additional increases in complaints and referrals are expected. Education of staff and residents is productive.

6.4.2 Recycling and Waste Collection Services

Keeping household wastes out of the storm drain system requires the implementation of a coordinated pickup program with a licensed facility to handle the wastes according to appropriate State and Local regulations. The City uses Waste Management to schedule routine and requested pickups for household wastes. Figures 1, 2, 3, and 4 show the total amount of household wastes, the type of wastes collected, recycled materials from curbside pickup (commercial and residential) and total amount of waste collected. There was 24 Household Hazardous Waste, Electronic Waste and Universal Waste Collection Event where a total of 3,181 participants dropped off over 209,813 pounds of materials. A total of 268,923 pounds of household hazardous waste was collected (Figure 1). Figure 2 shows the percentages of material types taken to the collection events.

A total of 91,659 tons of wastes were collected from residential, commercial and industrial areas (Figure 3). A total of 13,205 tons of materials were recycled from the curbside-recycling program, this program only includes residential areas.

Figure 1 – Household Hazardous Waste Collection

Figure 2 Percentages of HHW Type

Figure 3

Figure 3 shows the amounts, in pounds, of waste collected for Commercial and Residential. Waste collected equates to pollutants not discharged to the storm drain system.

6.4.3 Opportunities for Community Involvement

The El Cajon Community Development Center (ECCDC) prints and circulates a newsletter to the downtown area businesses on a quarterly basis. Additionally, the ECCDC prints a Clean & Safe report that covers actions to keep the downtown area clean and safe. The downtown Clean Team works to keep the community clean and performs a daily litter removal, maintenance, and landscaping activities. Saint Madelines School provides the student workers who detail the downtown street and sidewalk areas by collecting cigarette butts, trash, and debris. Spills are reported directly to ECCDC for immediate removal and disposal.

Figure 4

Recycling is a community effort. A total of 17,423 tons of recyclables (includes newspapers, glass, plastic, tin and aluminum) were collected through residential pickups in 2007-08. Figure 4 indicates the amounts, in tons, of materials recycled through residential, commercial, and industrial recycling efforts for 2007-08. Amounts recycled are not placed in landfills or available for discharge to the storm drain system.

6.5 COMPLIANCE AND ENFORCEMENT

The City has a variety of enforcement actions upon discovering a residential action that may potentially affect the quality of receiving waters. Verbal warnings (with written documentation), written warnings, orders to abate and correct, and monetary fines are in the legal authority of the City. There are two routes of discovering illegal residential activities. One is through complaint/referral process. Complaints are received through direct contact with City staff, through the City Manager's office and through the City's Website (via e-mail). The other is during scheduled City monitoring and observations of other routine City department activities.

Depending on whether an actual discharge has occurred or there is a potential to discharge, a written warning or Administrative Citation is issued. Corrective actions are verified and the resident re-contacted for any further questions.

6.5.1 Complaints Received

Complaints are received through the City's or County's Hotline number or funneled through the City Manager's office. Since the inception of the City's Enforcement Program, citizens take opportunities to inform municipal staff of their concerns during other routine activities. Investigations usually occur within 24 hours of complaint receipt with a follow-up phone call informing the complainant of the investigative results. Complaints were tracked using a simple table and software programs. A table in Appendix A.6 lists residential complaints tracked in PY1.

6.5.2 Investigation and Enforcement

Each complaint is investigated by Storm Water staff. Contact with the potential discharger is focused on stopping the polluting activity and educating the citizen about our storm drain system and water quality.

Table 6 – Enforcement Actions

BMP Violated	Written Warnings	Administrative Citations	Actions	Follow-up
Automobile Repair & Maintenance	0	0	No Action	None
Automobile Washing	0	0	No Action	None
Home Care and Maintenance	3	0	Stopped Activity	Completed
Private Lateral Maintenance	0	0	No Action	None
RV Parking and Maintenance	0	0	No Action	None
TOTAL	3	0		

Written warnings followed each verbal warning in the form of a letter requesting corrective action or enforcement by the Administrative Citation Form (See Appendix A.3b for Enforcement Criteria and Forms). Letters are used only when additional information and explanations are needed to get compliance from the potential discharger. A list of the enforcement actions issued to residents is included in Attachment D.

6.6 Notable City Actions

Pollution Prevention Days

The City of El Cajon hosted two "Pollution Prevention Days" events on June 4 and June 18, 2008 in downtown El Cajon. The events were scheduled to correspond with the "Cajon Classic Cruise" event, which attracts thousands of attendees each day. Of the thousands of people attending, hundreds of people approached our booth and received educational materials, flyers, and discussed issues related to the automotive-related event (e.g., tire recycling, waste management, fundraising car washes and power washing). See Appendix A.6 for

additional photographs of this event.

Condominium Conversions

The next wave of residential communities is the conversion of apartment dwellings into Common Interest Developments or Condominiums. Restarting a small developed community is a perfect opportunity to introduce or reintroduce storm water protection activities at the development level. The following are required of condominium conversion projects

- A Storm Water Site Plan that includes a map of the current storm drain system and a list of the internal and external improvements proposed prior to sale. Control of materials, upgrades to the drainage system and treatment should be discussed.
- A Storm Water Maintenance Plan for Condominiums
- A Private Sewer Lateral Report, and
- Water Quality additions to the Covenants, Conditions, and Restrictions

6.7 IMPROVEMENTS AND REGULATORY COMMENTS

Throughout the year, the City adjusts JURMP Components based on experience and the need to correlate JURMP activities with water quality. As the Storm Water Pollution Prevention Program moves into a BMP implementation program and the reduction of pollutants discharged into the storm drain system, existing residential neighborhoods become a pivotal group to assist in making the water quality improvements a reality.

6.7.1 Improvements

Improvements for the Residential Component is more challenging as citizens view the storm water regulations as an infringement on individual rights. Choosing the correct approach and picking an area that is more beneficial to water quality takes thought and planning. Based on previous experience, the proposed actions for PY1 include:

- Continue partnering with the El Cajon Community Development Corporation in reaching out to the community
- Meet with new development Homeowner Associations to distribute storm water information
- Target apartment complexes for controlling trash and maintaining the Private Sewer Lateral.
- Follow up with condominium HOAs and apartment complex management companies to ensure that private satellite sewer systems are being maintained

6.7.2 Regulatory Comments

There were no regulatory comments received for the Residential Component of the JURMP for PY6.

8.3 MEASURING CHANGES IN KNOWLEDGE AND BEHAVIOR 7

8.4 IMPROVEMENTS AND REGULATORY COMMENTS 7
8.4.1 Improvements 7
8.4.2 Regulatory Comments 7

SECTION 8 EDUCATION COMPONENT

8.1 EDUCATION AND OUTREACH

The goal of the education component is an informed and knowledgeable community. It is crucial to the success of a storm water management program for City staff and the community at large to have easy access to reliable and accurate storm water information. Without a shared, common knowledge base of local water quality and urban runoff information, it is difficult to obtain public support for local storm water quality programs. The storm water educational materials need to be detailed and comprehensive enough to support a shift in individual daily actions while allowing community groups to back specific water quality measures. As with all the other components of this storm water pollution prevention program, maintaining and restoring the chemical, physical and biological integrity of state waters is the ultimate outcome.

If reduction is the goal, then prevention is the theme for the Storm Water Pollution Prevention Program. The Education Component continues to emphasize the basics topics, such as:

- The difference between the sanitary sewer and the storm drain system; and
- The street and storm drainage system is not your garbage disposal system; and
- Making small changes individually, adds up to big changes in our rivers and at the beaches.

The other part of a successful storm water program is an involved and committed municipal staff that contacts the public about potentially damaging discharging activities. Storm Water staff diligently works to educate the citizens and businesses within the City jurisdiction on water quality and ways to prevent pollution from entering the storm drain system. The goals of the City's education and outreach program are to raise awareness of urban runoff and change the behavior of citizens and businesses. The progression of topics will lead to Watershed concepts as the basics in storm water are grasped by the general public.

8.1.1 Education and Outreach Events

Educating staff and the public is the best way to effect change in people's behavior. It is clear that there is broad-based public support for a cleaner and healthier environment. When people can connect with and learn more about our storm water program, our program earns the respect our citizens and community leaders for protecting our water quality. An effective "learn and earn" outreach program should be both regional and jurisdictional, since a pooled effort regionally is able to educate on a more impressive scale. Additionally, since we all live in a watershed, storm water pollution and the protection of receiving waters defy jurisdictional boundaries. As the San Diego River Watershed Copermittees move toward a Watershed-based approach to storm water management, education and outreach efforts will follow watershed strategies on a regional basis. As shown above, the City of El Cajon developed a Storm Water "Watershed" Logo to promote pollution prevention and protection of water quality.

8.1.2 Jurisdictional Accomplishments

Outreach accomplishments during PY1 include the following list of education and outreach efforts.

- "Pollution Prevention Days" – Two Wednesdays in June of 2008 (June 4 and June 18, 2007). The events carried the "National Pollution Prevention Week" (P2 Week) theme and the events were scheduled to correspond to peak attendance days for a local automotive-related event called the "Cajon Classic Cruise." Information relating to the event was also posted to the City of El Cajon Website. Both residents and business owners were encouraged to attend
- Continue to work with the El Cajon Community Development Corporation (ECCDC) to close and protect dumpsters, keep trash areas clean, and encourage good housekeeping habits in the downtown area
- Storm Water Education and Outreach Document Portfolios were prepared and issued to selected municipal staff with high probability of contact with citizens on storm water pollution prevention issues. This included staff tasked with commercial and industrial site inspections, construct site inspections, complaint investigations and SUSMP plan review. The use of the storm water information portfolio has allowed the storm water program to connect with citizens, staff and other interested parties in a new and detailed manner
- "Fire Safety Open House" This day-long, Saturday event included booths, educational information and formal and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. It is estimated that approximately 3,000 visitors attended this event.
- SUSMP Training

8.1.3 City Staff Training

Municipal staff at the Public Works Department, City Hall, Fire Department, and the El Cajon Community Development Corporation Ambassador's staff were trained to refresh the basic

storm water topics of pollution prevention and use of BMPs. Planners and engineering staff were trained in low impact development training, more specific, the implementation of pervious surfaces. Additionally, other municipal staff was given the basics in storm water training including:

- What is a Watershed and what Watershed do we live in.
- Why is keeping our water clean important.
- The different types of pollutants and where these pollutants originate.
- The difference between the storm drain system and the sanitary sewer system.
- What can be done at work and at home to eliminate polluted runoff during rain events and all yearlong.

Municipal crews are given door hangers to use during their daily routine activities in the City. An example of a door hanger is provided in Appendix A.6. The door hanger alerts the resident to the potential discharge that exists on or near their property. Possible solutions and phone numbers for reporting discharges are provided.

8.1.4 Special Community Presentations

POLLUTION PREVENTION DAYS

The City of El Cajon hosted two "Pollution Prevention Days" events during June of 2008; a copy of the Proclamation is attached in Appendix A.8. Many thousands of people attended each of the P2 Day events. The two Wednesday events included booths, educational information and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. The El Cajon Community Development Corporation (El Cajon CDC) also participated in our P2 Days event and distributed information on revitalizing and keeping our community clean.

EL CAJON FIRE DEPARTMENT FIRE AND SAFETY OPEN HOUSE

On October 6, 2007, the City participated in the El Cajon Fire Department "Fire and Safety Open House." This day-long, Saturday event included booths, educational information and formal and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. It is estimated that approximately 3,000 visitors stopped by, many of them visiting the storm water booth as they passed through.

INDUSTRIAL FACILITY WORKSHOP – CITY OF CAJON AND INDUSTRIAL ENVIRONMENTAL ASSOCIATION (EIA)

The City of El Cajon participated in a training session sponsored by the EIA and the San Diego East County Economic Development Council on March 28, 2008. The session was designed to informed industrial facilities within the City of El Cajon's jurisdiction about changes that were made to the City's Storm Water Ordinance based on the new municipal permit. The main topics of discussion were new municipal permit requirements, inspections, and the implementation of storm water BMPs. Over 30 representatives of major industrial facilities attended the workshop. A copy of the agenda for the workshop is attached in Appendix A.8.

8.1.5 Regional- and Watershed-Related Outreach

The regional outreach workgroup focused its budget of $40,000 towards in-kind contribution to develop a Regional Residential Outreach Program that would address regional issues and would aid in a transition from a jurisdictional- to a watershed-related program approach. All Copermittees contribute funds towards the outreach workgroup to benefit a coordinated regional pollution prevention program. PY1 funds were used to develop a framework for the Regional Residential Outreach Program that would target audiences and provide information on barriers to, and benefits of changes in behaviors. The City of El Cajon served on the committee during development of the RFP, and continued in PY1 as a member of the interagency Committee developing the Regional Residential Outreach Program.

The events coordinated by the Outreach Workgroup and paid for by all Copermittees included a Storm-Water- and Watershed-related booth at the San Diego County Fair that displayed and provided information to those attending the San Diego County Fair.

8.1.6 Educational Materials Jurisdictional Distribution

The City developed brochures on the following subjects for distribution to the public:

- permit and ordinance requirements
- the difference between storm drains and sanitary sewers
- Pollution prevention strategies
- Car Washing. Including strategies for Car Wash Fundraisers
- Pet waste BMPs
- Equipment and vehicle maintenance and repair
- Maintenance of private sewer laterals.

The City printed 38,000 copies of two semiannual newsletters containing 5 articles and reaching potentially 190,000 different readers. A summary of the topics covered in the 5 articles is included in Section 6, Residential Component, of this report. Storm water logos assist the City in getting the attention of citizens and businesses. Logos are a way to make a lasting impression with citizens and businesses. One storm water logo used by the City is shown to the right.

The City of El Cajon also partnered with Waste Management to send 18,000 separate mailed brochures, titled "Water Pollution Prevention", to all customers in El Cajon. The brochure had information to help customers understand how their daily activities, including over-irrigation, can result in polluted urban runoff. A copy of this brochure is included in Appendix A.6.

Through the course of PY1, a number of contacts were made to the public using articles, newsletters, sewer bill inserts, brochures, mailers, radio and TV Ad's, and movie slides highlighted below. Copies of brochures, fliers, and newsletter articles are contained in Appendix A.6. The following table indicates the types and quantity of outreach impressions.

Table 5

Material Type	Number Distributed
Articles/Newsletters	190,000
Article with Waste Management	18,000
Brochures	480
Over-the-Counter	350
TOTAL	**208,830**

Commercial

Education of commercial facility owners and their employees occurs through the use of brochures oriented specifically to a type of activity. Written warnings are accompanied with a brochure on the activity as well as distribution of these brochures as outreach opportunities arise during business and construction site inspections, and complaint investigations. Approximately 385 brochures of various types were distributed as summarized below. More one-on-one distributions were completed this year as the City expanded its role in inspections, complaint

investigations and the daily routines of residential communities. The following brochure topics were distributed during PY1.

- Vehicle and equipment washing and cleaning (35 copies)
- Vehicle and equipment operation, maintenance, and repairs (35 copies)
- Car Washing Guide (25 copies)
- What's Cookin Guide (125 copies)
- Green Wrench Guide (120 copies)
- Power Washing Guide (40 copies)
- Private Sewer Lateral maintenance (50 copies)
- Construction Best Management Practices (50 copies)

Industrial

Industrial facilities revise and refine their BMP requirements through the annual inspection process. The following are discussed and informational brochures are shared when necessary.

- Prevention of Non-Storm Water discharges
- Good Housekeeping Practices
- Vehicle and Equipment Washing, Repair, and Fueling
- Loading and Unloading of materials
- Solid and Hazardous Waste Management
- Spill Prevention and Response
- Building and grounds maintenance
- Parking Lot maintenance
- Storm drain system maintenance
- Private Sewer Lateral Maintenance

8.2 LEADERSHIP ACTIVITIES AND PARTNERSHIPS

The City's major roles for educ ating the community include:

- Continue in partnerships with the Cities of Santee and La Mesa as well as the County of San Diego in training staff on storm water management to incorporate storm water reviews at the beginning of the Planning level review.
- Maintain a relationship with the El Cajon Community Development Corporation and their Community Ambassadors and Clean Team. The Community Ambassadors are employees that develop connections with businesses and the community that will promote a cleaner and safer city. The Clean Team are students of St. Madelines

Sophie school and are happy to assist in various community tasks. The Clean Team picks up cigarette butts along the sidewalk and gutter that the City's street sweeper cannot collect.

- Collaborated with the El Cajon Community Development Corporation to provide basic storm water rules to vendors at the Cajon Classic Cruise events.
- Conducted storm water training to El Cajon Community Development Corporation ambassadors.
- Established a collaborating relationship with "I Love a Clean San Diego" to conduct future storm drain stenciling, as needed
- Worked with the County of San Diego and others to oversee the preparation of a Regional Residential Outreach Program. Completion of work on the development of this program was a goal of the 2007/2008 Copermittee Outreach Workgroup. Implementation will continue into the next reporting year.

8.3 Measuring Changes in Knowledge and Behavior

A basic measurement of increased knowledge is a test of that knowledge. The City's test is an increase in referrals and reports from municipal staff. The number of complaints and referrals from citizens, staff, and county hotline was equivalent to last year. The Regional Outreach Program funded by this year's Copermittee Outreach budget will develop a very detailed baseline of community awareness, and the barriers to and the benefits of changes in behavior.

8.4 Improvements and Regulatory Comments

Changes to the City's Storm Water Program are initiated through gathered experience and regulatory comments. Improvements are commitments generated by the City to modify the activities in ways dictated by direct or indirect experience. Regulatory comments are requests or directives to address potential deficiencies in the JURMP.

8.4.1 Improvements

The following are proposed improvements for the next Permit Year (July 1, 2007 through June 30, 2008).

- Coordinate expanded outreach and education effort the local public schools.
- Coordinate outreach and public participation activities for Public Works Week.
- Collaborate with East County Cities on municipal training and business-related workshops.
- Expand distribution of outreach materials in sewer bills.

8.4.2 Regulatory Comments

No regulatory comments have been received for the Education Component of the JURMP Annual Report for PY6.

SECTION 9 Public Participation Component

Introduction **1**

9.1 Regional Participation **1**
9.1.1 Regional and Local Storm Water Hotlines 2

9.2 Improvement and Regulatory Comments **3**
9.2.1 Improvements 3
9.2.2 Regulatory Comments 3

SECTION 9 PUBLIC PARTICIPATION

INTRODUCTION

Public participation is an essential element of a successful Urban Runoff Management Program, but is more highly effective as a Watershed Component. Due to the nature of participation by organizations such as "I Love a Clean San Diego", watershed concepts are more easily introduced to participants from the entire watershed and not just a small segment of the population in one particular community. Wherever Copermittees' efforts can be combined to produce better results, it is a win/win situation for jurisdictions, the watershed and the communities they contain.

Educational efforts set the stage for getting the public involved with scheduled Storm Water Pollution Prevention events or interested in following the minimum required BMPs at home or business. Since prevention through familiarity and participation is the best solution to pollution, the public fulfills participation requirements by:

- Participating in storm drain stenciling,
- Reporting of discharge incidents using the City Manager's Office or the City and County hotline,
- Participating in events that collect or recycle hazardous waste and used oil , and
- Participating in local and regional cleanup events

9.1 REGIONAL PARTICIPATION

On a regional basis, the City of El Cajon is the lead for the San Diego River Watershed Planning Group and is a member of the Watershed Lead Committee. A grant funded the San Diego River Watershed Planning Group where the stakeholders meet to discuss potential issues for the Watershed. A database of information is in progress for stakeholders to use during their planning efforts.

The City attends Project Clean Water meetings on the San Diego River Watershed to maintain contact with the stakeholders as well as participate in jurisdictional/local decision-making. The City of El Cajon also chairs the San Diego River Watershed Copermittee meetings, which are also opened to the public. In 2007/2008 the San Diego River Park Foundation and the San Diego River Conservancy had regular representation.

As stated in last year's annual report, the City of El Cajon contacted the "I Love A Clean San Diego" (ILACSD) organization and gave permission to staff and volunteers to apply the message "No Dumping . . . I Live Downstream" and a depiction of a dolphin or duck to the curb area directly adjacent to storm drain inlets within the City. A letter of permission is attached in Appendix C.

9.1.1 Regional and Local Storm Water Hotlines

The wastewater and sewage that drain from inside your house is treated and cleaned before it enters the ocean, but the storm drains in the street flow directly to the ocean, rivers, and lakes without any treatment. It is therefore very important that no one be allowed to dump waste of any kind onto street surfaces, drainage pipes and ditches, or into storm drains - they are only for rainwater.

The City and County have a Hotline used by the public to report potential illicit discharges and connections. The Hotline phone number is provided in informational brochures to residents and businesses and is posted on the City Website. Public participation is an essential part of an illicit discharge elimination program. Many illicit discharges are one-time occurrences that may not be observed by City staff. Concerned citizens can help stop illicit discharges by reporting them to the City. The following provides the details of those Hotlines.

- ✓ **City of El Cajon Storm Water Hotline, (619) 441-1653**

The City Storm Water Hotline provides access Monday through Friday 8 a.m. – 5 p.m. and complainants are directed to the appropriate staff person. The City's hotline currently provides information in English and Spanish.

The City continued updating its Storm Water Web Page to contain the most recent brochures and reports. Documents are retrieved and opened using Abode Acrobat to open the posted PDF files. The Storm Water Web Page is "Quick Linked" from the City of El Cajon Home Page with links to a list of documents and other important websites.

- ✓ **County Storm Water Hotline, 1-888-846-0800**

The County storm water hotline is answered Monday through Friday, 8:00 a.m. – 5:00 p.m. and provides services in both English and Spanish and a voice mail message for 24-hour public access. Relevant complaints received through the County hotline are forwarded to the City Storm Water Protection Program.

9.2 IMPROVEMENT AND REGULATORY COMMENTS

Changes and improvements to the City's Storm Water Participation Program are initiated through gathered experience and regulatory comments. Improvements are commitments generated by the City to modify the participatory activities in ways dictated by direct or indirect experience. As the focus of the program shifts to multi-jurisdictional participation on a watershed level, changes and improvements to the storm water program will be necessary. Regulatory comments are requests or directives to address potential deficiencies in the JURMP.

9.2.1 Improvements

The following are proposed improvements for the next Permit Year (July 1, 2008 through June 30, 2009).

- Focus the City's efforts on programs and activities that will have an impact on the watershed, its health, the 303(d) pollutants and their sources
- Participate in an expanded El Cajon Fire Department Open House by including a Storm Water Program informational booth and additional displays to inform and engage children on water quality issues.
- Coordinate the City's efforts with the other San Diego River Copermittees (City of La Mesa, City of San Diego, City of Santee and County of San Diego).
- Participate in additional Watershed-wide educations efforts
- Distribute pollutant-specific brochures throughout the watershed

9.2.2 Regulatory Comments

No regulatory comments have been received for the Public Participation Component of the JURMP Annual Report for PY1.

SECTION 10 FISCAL ANALYSIS

INTRODUCTION 1

10.1 PROJECTED FISCAL YEAR 2008-09 EXPENDITURES 1

10.2 FUNDING SOURCES AND RESTRICTIONS 3

10.3 LONG-TERM FUNDING ISSUES AND STRATEGIES 3

10.4 IMPROVEMENTS AND REGULATORY COMMENTS 4

SECTION 10 FISCAL ANALYSIS

INTRODUCTION

A fiscal analysis of the JURMP provides a vital assessment of resources for the current and upcoming Permit Years. The analysis identifies adequate support and how resources are divided to support and fortify the JURMP and WURMP efforts. Fiscal years (FY) correlate with the same timeframe as permit years (PY). For PY 2003-04, the City Storm Water staff developed a separate budget from other Public Works activities and sufficient to run the Storm Water Program. The Program continues to be adequately funded through the City's Sewer Fund. This funding source has been used since PY 2004-05 and will continue to be used for PY 2008-09.

10.1 PROJECTED FISCAL YEAR 2008-09 EXPENDITURES

The following table shows actual expenditures from permit year 2001-02 through 2007-08 and the proposed 2008-09 budgets for the City's Urban Runoff Management Program.

Item	01-02	02-03	03-04	04-05	05-06	06-07	07-08	Proposed 08-09
Salaries (including benefits)	425,000	455,000	436,000	561,473	533,487	550,856	712,696	753,548
Professional and Technical Services	120,000	0	61,000	60,000	56,600	413,000	405,000	355,000
Dry Weather Monitoring Program	26,000	24,000	31,000	35,000	53,000	83,000	150,000	75,000
Equipment/Capital Outlay	11,000	8,000	8,000	25,000	7,500	37,000	117,650	0
Vehicles & Equipment	19,000	20,000	20,000	20,000	31,000	25,900	10,209	10,209
Supplies	4,000	11,750	11,700	12,000	13,000	9,700	9,700	12,900
Computer/GIS	9,000	0	0	80,000	85,000	53,500	90,000	75,000
TOTAL	**614,000**	**518,750**	**567,700**	**793,473**	**779,587**	**1,172,956**	**1,495,255**	**1,281,657**

Due to decreases in overall funding from the State of California, City department reduced budgets by 25% in PY 2002-03. Budgets increased steadily from 2003-04 through 2006-07 under Municipal Permit Order 2001-001. The increase in PY 2007-08 was a result of allocating resources in anticipation of fulfilling requirements for Municipal Permit R9-2007-001. The proposed budget for PY 2008-09 is slightly lower than the previous PY due to the completion of one-time requirements under the new permit.

The City's NPDES Urban Runoff Management Program funding was sufficient to meet the JURMP requirements in PY 2007-08 and will be sufficient to meet requirements in PY 2008-09. The City met its projected goal of continuously executing plans, procedures, and processes to implement JURMP requirements and assess the effectiveness of programs that were implemented.

Higher amount of funds were spent during PY 2001-02 and PY 2007-08 because of the development and update of the Jurisdictional Urban Runoff Management Plan (JURMP), and the creation and update of storm water municipal codes for enforcement, all requirements of municipal permit 2001-001 and R9-2007-0001 respectively. PY 2002-03 was the first year of implementation under Municipal Permit 2001-001 and the programs written in the JURMP were tested in the field. Modifications to program components caused an increase in expenditures during PY 2003-04 and PY 2004-05 budget which contained some capital expenditures that were started in PY 2002-03 and PY 2003-04 such as a Geographical Information System dataset for map generation and a trash fence to collect trash and debris in Forrester Creek before discharging to Santee. From PY 2005-06 through PY 2007-08, spending gradually increased to support a Geographical Information System. Overall a general increasing trend of funds have been allocated from PY 2001-02 through PY 2008-09 to sustain a viable storm water program.

Listed in the following table are Additional Services and Projects supporting JURMP Permit requirements from PY 2001-02 through PY 2007-08. The substantial rises of PY 2006-07 and PY 2007-08 budgets are mostly attributed to increases in CIP projects related to storm drain pipe replacement projects, installation of water quality improvements, development of wastewater and storm drain master plans.

Service/Project	2001-02	2002-03	2003-04	2004-05	2005-06	2006-07	2007-08
Street Sweeping	268,000	313,000	319,000	368,930	420,739	450,385	458,500
Capital Improvements (Total) - Installation of Storm Drain Inlet Filters - Replace Drainage Pipe - Replace Sewer Pipe - Major Drainage Channel Repair - Road/Drainage Improvements - Drainage and Wastewater Master Plans	1,000,000	1,300,000	1,700,000	1,136,770	1,076,122	1,573,732	3,425,000
TOTAL	**$1,268,000**	**$1,613,000**	**$2,019,000**	**$1,518,770**	**$1,496,861**	**$2,024,117**	**$3,883,500**

10.2 FUNDING SOURCES AND RESTRICTIONS

The budget for PY 2007-08 included a Storm Water Program Manager, 1 part-time senior engineering technician, 1 junior engineer, 1 GIS technician, 1 compliance officer, and 2 maintenance workers. For PY7 the program includes a Storm Water Program Manager, one full-time Storm Water Compliance Officer, one junior engineer, one part-time senior engineering technician, one GIS technician, one part-time engineering intern, and public works maintenance staff. The City also has an open contract with two consultants to provide as-needed services to ensure the City meets its JURMP implementation requirements.

10.3 LONG-TERM FUNDING ISSUES AND STRATEGIES

Each year the City evaluates and prioritizes the areas in the City where improvements are needed. Many improvements assist the JURMP in protecting receiving water quality. This past

year, multiple CIPs improved storm water quality by preventing pollutants from entering the storm drain system. They are as follows:

- Sewer main replacements and enlargements at various locations.
- Installation of storm drain inlet filters at targeted source point locations.
- Corrugated metal pipe repair and replacement in various locations.
- Storm drain repair and replacement in various locations.
- Drainage channel fencing improvements at various locations.
- Major storm drain channel repair.

The following are proposed improvements budgeted for the next Permit Year (July 1, 2008 through June 30, 2009). The following table lists major line items for the PY 2008-09 budget.

Item	Proposed Budget 2008/2009
City of El Cajon Urban Runoff Management Program	1,281,657
Street Sweeping	462,785
Capital Improvements	4,565,000
TOTAL	**$6,309,442**

In the long-term, funding will continue to be a question. The City is constantly challenged with doing more with less after a continual decline in general fund budgets. For PY2007-08, the City completed all inspections with existing staff complemented by the assistance of a consultant to meet requirements under permit R9-2007-0001.

10.4 IMPROVEMENTS AND REGULATORY COMMENTS

Working efficiently is the goal of the jurisdiction urban runoff management program. Completing onsite inspections, tracking enforcement actions, and complaint/referral information allows the City to reduce the amount of time and paper to complete significant portions of the Municipal, Industrial, Commercial, and Land Use Planning JURMP Components.

For WURMP activities, the City will be coordinating with the other San Diego River Watershed Copermittees to complete watershed water quality activities and education activities. Working together eliminates duplicative efforts and enhances the effect across a wider range of people and geographical area.

No regulatory comments were received during PY2006-07 for the City's Fiscal Analysis.

SECTION 11 PROGRAM ASSESSMENT

11.1 INTRODUCTION

The City began using the standardized program effectiveness assessment soon after it was developed by the Copermittees during the last permit cycle. The City also participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs. Due to a variety of complications on a regional level, that process could not be completed prior to the submittal of the City's JURMP, so the City prepared its own effectiveness assessment approach and measures.

Since the submittal of the JURMP in March 2008, no additional progress has been made on regionally standardized approaches to program effectiveness assessment. It is likely that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will revisit the issue of standardized assessment metrics and procedures in the near future. The City anticipates participating in the process of developing such regional standards and incorporating work products produced into its own local program effectiveness assessment system.

Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

The City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics were provided in Section 13 of the City's 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

11.2 EFFECTIVENESS ASSESSMENT RESULTS

The new Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1 through Level 4 outcomes are discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Level 1

Level 1 is documenting activities. Sections 1 through 10 of this PY1 Annual Report list activities, storm water controls, and when possible the quantity of pollutants collected and diverted from entering the storm drain system, viewed as a reduction in pollution-containing materials potentially available for discharge into the storm drain system. Existing and New Development, Construction, and Illicit Discharge Illegal Connection are the areas where quantifiable amounts of pollutants are reported as collected and removed from entering the storm drain system. By completing collection activities, the City maintains compliance with the Municipal Permit requirements.

11.2.2 Level 2 and 3

See the tables 11-3 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

11.2.3 Level 4

The primary goal of BMP implementation is to reduce the loading of pollutants to urban and storm water discharges. Pollutant load estimation is the first direct characterization of water quality through JURMP activities. Regionally, San Diego River Watershed receiving water quality results are from the major outfall to the Pacific Ocean. In the future, Watershed monitoring at the jurisdictional lines will at least assign responsibility of pollutant loads, but will not determine a reduction in pollutants. The best approach is to make sure wet weather and dry weather results do not exceed action levels.

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs reliable load estimation methods have not yet been developed.

11.3 ASSESSMENT OF PROGRAM MEASURES

Basic assessment of program measures begins with City-based questions. First, starting with what is known, then shifting to what is wished to be learned, and finally what was learned. During the first step, the "what is known" are the measurements compiled from each of the JURMP components. Measurements such as the amount of material removed during street sweeping or cleaning of catch basins are direct measurements of pollution diverted from entering waterways. At sometime it may become appropriate to compare measurements to previous years, average measurements, or assess trends to assist with potential pollutant loads removed from a particular origin. Dry weather monitoring results are direct measurements of pollutants in urban runoff, but only partially address measurements of receiving water quality.

Sources, selected BMPs, measurements, and other indicators, identified in the previous Sections of this Annual Report for each of the Existing and New Development Components, report completed activities and achieved goals as required by Order No. R9-2007-0001 and the City's updated JURMP. In summary, the City completed program implementation as designed in the JURMP and is incompliance with the activity-based permit requirements.

11.3.1 Direct Measures of Program Activities

For many years, the City tracked efforts from various collection agencies with four types of direct measures, as follows:

- Street Sweeping,
- MS4 Cleaning,
- Oil Recycling, and
- Household Hazardous Waste Collection

In general, the City tracks these measures because they provide an important indication of the types and amounts of materials and wastes that are diverted from the MS4 through various means. Street Sweeping and MS4 Cleaning directly removes materials from the pathway of rainwater and urban runoff. Oil Recycling re-routes used oil from illegal disposal to refineries where it is ultimately reused. The Household Hazardous Waste program collects wastes that may otherwise be improperly disposed, potentially to the MS4.

a. Street Sweeping

The Department of Public Works collected an estimated 3,483 cubic yards of debris during its street sweeping activities (21,180 miles of curbed streets). This year, the City's street sweeping efforts have been consistent with previous years and slightly higher than PY2006-07. Were it not for these efforts, the debris collected would be swept away during rain events. Collection provides important long-term water quality benefits.

b. MS4 Cleaning

In PY2007-08, all of the City's storm drains were cleaned by the Department of Public Works and California Conservation Corps, resulting in the removal and proper disposal of 1,720 cubic yards of material from the storm drain system. As a whole, the City's effort increased over last year's effort.

c. Recycling of Household/Commercial Waste and Oil Recycling

Recycling in El Cajon has good participation, but could always do better when the numbers are compared for recycled materials (17,925 tons) and waste (91,660 tons). Trends in waste collection will continue to be tracked .

Oil recycling is tracked by independent recyclers (e.g. Jiffy Lube) and Waste Management for curbside pickup of used oil. Waste Management provided their 303 state report which includes recycling efforts. For PY2007-08, Waste Management did not report any oil or oil products in their 303 reports. However, Waste Management did recycle 70,010 pounds of oil base paint, 3,276 pounds of batteries, 72,400 pounds of latex paint, and 3,750 pounds of antifreeze.

d. Household Hazardous Waste Collection

Waste Management of El Cajon collects the Household hazard waste for the City's jurisdiction. In PY2007-08 an estimated 268,323 pounds of waste household waste were collected as opposed to 236,890 pounds collected in PY2006-07, 198, 015 pounds in PY2005-06, an estimated 277,000 pounds of household hazardous waste and recyclables were collected at 19 events in PY2004-05, and PY2003-04 reported 127,827 pounds of household hazardous waste and recyclables collected. As a whole, the City's effectiveness in collecting HHW from its residents has increased consistently and significantly over the years.

11.3.2 Indirect Measures

In most instances, changes to receiving water quality cannot be directly compared to collection activities. However, many indirect measures have value in tracking the effectiveness of specific program activities, and may have additional utility in assessing long-term water quality changes. Many of these measures are reported and discussed throughout this Annual Report. To track and evaluate the effectiveness of its program implementation over time, the City has compiled summary statistics for several of measures.

Table 11.1

Indirect Measure		2007-2008
Complaints	Total Number received	154
	Number of Referrals from Other Departments	62
	Number of Enforcement Actions	29
Staff Training	City Staff Trained	87
Outreach	Outreach events conducted	4
	Number of Presentations	1
	Audience @ presentations	30

a. Complaints and Referrals

In this reporting period, the City received a higher number of complaints than last year from other City departments, citizen calls, and county referrals. The City and County hotlines are described in Section F.3.d (Existing Development – Residential). As previously discussed, this trend underscores the effectiveness of the City's outreach and staff training efforts. Compared to previous years, it is believed that more of the City's citizens and staff were aware of storm water violations and understood what to do when water quality concerns were observed.

b. Staff Training

Levels of staff training during this reporting period were expanded to those of previous years. Although the City has made an important commitment to staff training under the previous and current Permit (see JURMP Section 8, Education), the consistency of these numbers also demonstrates the City's past commitment to training its staff. Training of staff with implementation responsibilities is not a new part of the City's storm water programs. However, the scope of these and other programs has significantly increased.

c. Outreach

This year, the City conducted a number of one-on-one discussions at the Public Works front counter with building and planning applicants and with commercial businesses and industrial facilities during inspections and complaints. Together, these increased face-to-face conversations demonstrate that the City is effectively implementing its outreach and education programs; details are provided in Section 8 (Education). The City also conducted training sessions targeting industrial facilities and private interest groups.

11.3.3 Program Activities and Water Quality

Presenting a direct connection between pollutant load reduction and Storm Water Pollution Prevention Program activities continues to advance, but still is very much under development. Copermittees have created a Framework document containing the six (6) Levels of Assessment. The PY2002-03 Annual Report addressed Levels 1 through 4. However, divination only generated numbers that could not be supported by calculation or program actions. For PY2007-08, a slightly modified approach brings the assessment much closer to connecting activities with water quality. Amounts of pollutant-containing materials prevented from entering the storm drain system provides solid numbers while adding percentages of facilities known (through inspection) to be implementing minimum required BMPs and reduces the estimation factor.

11.4 LONG-TERM ASSESSMENT

The Annual Assessment indicates the City is meeting the requirements specified in their JURMP and collecting data associated with those program activities. At some point, a connection between activity completed and pollutant loading in receiving waters will become a reality.

A Long-Term Assessment must answer key questions to guide future activities and build into the current program, the additional reporting requirements in order to connect program activities with actual improvement in receiving water quality. The Long-Term Assessment is conducted once every five years (permit renewal cycle) as changes to permits may change approaches and programs.

Table 11.2

Program Activity	Annual Questions	Permit Questions (Every 5th year)
Water Quality Assessment	What are the high priority quality problems and where do they occur? What constituent(s) is(are) causing the problems?	What are the changes to discharge and receiving water quality in my Watershed?
Program Planning	What are the priority sources of pollutants? What BMPs are needed to control	Are the current programs providing the information necessary to produce targeted

Program Activity	Annual Questions	Permit Questions (Every 5th year)
	these pollutants? What are the targeted outcomes for the BMP Implementation? What are the projected Load Reductions from these implemented BMPs?	outcomes?
Program Assessment	Were targeted outcomes achieved? What BMPs should be changed or should other BMPs added? Are costs associated with implementation feasible?	Is the cost worth the water quality changes?
Integrated Assessment	How well are the parts of the program working together? What other links can be made?	What other relationships between activities and water quality are evident?

Answers to the above questions come from further analysis of each existing component area. Tables of estimated pollutant loads removed are provided below. Areas where pollutant removal rates are high will be the areas to focus program efforts. Modifications to JURMP activities will be the result of this assessment.

Level 4 Pollutant Load Reductions are provided in the following four tables for existing development. Estimates of average load reduction per event was the most difficult to find support evidence. Using the best knowledge available, the magnitude of total pollutants reduced is the most powerful in assessing the degree of success for the City's storm water program.

LEVEL 4 Assessment

Each of the following tables provides an estimate (supported with empirical data) for the amount of pollutant-containing materials prevented from entering the MS4 due to the activities of the Storm Water Pollution Prevention Program implemented in the City of El Cajon. As there is only one receiving water body in El Cajon, Forester Creek impairments were used as the constituents of concern when estimating possible amounts of pollutant-containing material prevented or a reduction in the amount of pollutant that could have discharged into Forrester Creek. Only Existing Components were assessed through Level 4 as the most qualitative and quantitative information is available in these areas. The following paragraphs discuss assumptions incorporated into calculating the amounts provided as "Total" for each Existing Component.

Trash was added to the assessment due to the Forester Creek Improvement Project in Santee. The City of El Cajon installed a trash and debris fence in PY 2005-06 to capture trash from creek flows.

General Assumptions

There are a number of general assumptions within each table. Of most importance is the understanding that the amount (estimated or actual) removed or eliminated from discharging into the storm drain system is the amount of the material or liquid and does not equate to actual pollutant loads reduced. Secondly, the margin of error in these values is very high as most numbers were calculated using information available. Data quality is not necessarily a concern. This is an effort in determining where best to place education efforts and focus each program component.

Municipal

At 18 municipal maintained areas (parks, City Hall, schools), staff cleaned area of pet waste, three times per year. Collection at each area was approximately one pound of pet waste. Pet waste does not equate to one pound of bacteria.

The City maintained 100% of laterals at approximately 24 buildings. No sewer overflows were experienced at City facilities. Pounds were estimated using 10 pounds (no factual basis other than one gallon of water equals 8 pounds) equaling one gallon of sewage. Private laterals not cleaned annually may experience stoppage depending on usage and care. Approximate gallons potentially dischargeable is 2 gallons times 10 equals 20 pounds time 24 buildings equals 480 pounds. Error with this calculation is high.

Total dissolved solids from Municipal areas originate mainly from fertilizers applied by staff. There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation effort that reduces overspray. All activities reduce the amount of TDS available for discharge to the storm drain system.

Municipal activities do not use materials or generate waste that would increase pH and as such is listed as “not applicable”.

Trash reduction at City facilities is a consistent effort with approximately 80 to 90% of the 400 City employees ensuring trash is placed in appropriate containers. One pound of trash per year per person is estimated. This amount may be estimated too high.

One park within the City, Wells Park, has an area designated as “Dog Park” where citizens can take their dogs to walk and bags to collect pet waste are provided for cleaning after their dogs. The Parks Department collected approximately 20.8 tons of pet waste during PY2007-08.

Total amounts of pollution prevented from entering the storm drain system do not equate to improved water quality; however, the amounts calculated are possible estimated high.

Industrial

At any one time there may be 80 to 100 industrial facilities conducting industrial activities within the City of El Cajon. It is estimated that 100% of these facilities are maintaining their private laterals and do not spill portable container fluids. This information was noted during industrial inspections. If each facility is preventing one overflow of 5 gallons times 10 pounds, then 50

pounds times 80 facilities equals 4,000 pounds of bacteria- containing materials did not discharge to the storm drain system.

Total dissolved solids from Industrial areas originate mainly from fertilizers applied by contracted staff to landscaped areas (usually a very small area compared to the total industrial site). There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation effort that reduces overspray. All activities reduce the amount of TDS available for discharge to the storm drain system.

Based on inspections and enforcement of the industrial community, pH-affecting substances are reduced from entering the storm drain system through the implementation of BMPs as required by the General Industrial Permit. Amounts estimated have no factual basis.

Trash reduction at Industrial facilities is based on industrial inspections, although no factual amounts are readily available.

Total amounts do not equate to reduction in receiving water body loads, as no empirical data is available. However, amounts reduced appear reasonable, based on observations during inspections and the two enforcement actions taken at industrial facilities during this Permit Year.

Commercial

There were at least 123 commercial facilities conducting activities with the high potential to discharge bacteria-containing liquids. Of those facilities, it is estimated that 50% of these facilities are maintaining their private laterals and do not spill portable container fluids. This information was noted during commercial inspections. If each facility is preventing one overflow of 2 gallons times 10 pounds, then 20 pounds times 62 facilities equals 1,248 pounds of bacteria- containing materials that did not discharge to the storm drain system. This may be estimated high.

An extrapolated number of 30 was used since it is unknown how many overflows result in prevention of discharge. Responses to actual discharges are larger volumes increasing the pounds per event to 50.

Total dissolved solids from Commercial areas originate mainly from fertilizers applied by contracted staff or lease company personnel to landscaped areas (usually a very small area compared to the total commercial site). There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation effort that reduces overspray. All activities reduce the amount of TDS available for discharge to the storm drain system.
Commercial activities observed during inspections do not use materials or generate waste that would increase pH and as such is listed as “not applicable”.
Trash reduction at Commercial facilities is based on inspections, although no factual amounts are readily available.

Total amounts do not equate to reduction in receiving water body loads as no empirical data is available. However, amounts reduced appear reasonable, based on observations during inspections.

Residential

Bacteria source reductions for dog owners, homeowners, and Recreational Vehicles (RVs) is purely speculation, although the numbers of potential targets is accurate, based on circulated printed educational materials. However, enforcement actions indicate few reported sewage overflows from residential areas. Amounts calculated are estimated too high and should be adjusted with more factual information in future Permit Years.

Total Dissolved Solid and Trash reductions are also speculation based on information materials circulated throughout the City in the Spring and Fall newsletters. Amounts estimated are reasonable. Based on City observations, only a few neighborhoods have trash problems. These areas will be targeted in the next Permit Year.

* = Total amounts calculated appear reasonable with the exception of bacterial-containing materials. Factual information is not readily available for this element and estimations are high.

New Development

Only trash and TDS were addressed for New Development as a small-scale post-construction BMP data is not yet available. Speculations on the amount of trash are associated with post-construction BMPs provided, although no corroborating evidence could be found. Numbers calculated appear reasonable.

Construction

Most of the pollutant reductions at construction sites involve sediment. Based on the inspections completed, bacteria from Port-o-lets, pH from concrete washout, and trash rarely require a corrective action. Estimations of pollutant-containing material prevented are low and may be adjusted.

11.5 PROGRAM ASSESSMENT SUMMARY

Estimated Pollutant Load Tables indicate that Residential Areas continue to have the greatest potential for pollutant removal activities. Nearly three to seven times higher than the other areas, the residential community has the largest potential for reducing pollutants from entering the City's receiving waters.

Each component has been addressed as follows for strengths and improvements. Effective is viewed as meeting the Municipal Permit implementation and reporting requirements.

Component	Effective	Strength	Improvement
Municipal	Yes	Education (Training)	Continue to coordinate with East County Cities whenever possible.
Industrial	Yes	Assessment of BMP Implementation	Revise Inspection Form – BMP- based; condense; regional consistency.
Commercial	Yes	Assessment of BMP Implementation	Continue to work with the El Cajon Community Development Center.
Residential	Yes*	Outreach and Education	Contact property owners directly.
New and ReDevelopment	Yes	Process	Implement new Permit requirements such as LID.
Construction	Yes	Inspections	Develop a special workshop for East County Developers.
Illegal Discharge Detection and Elimination	Yes	Monitoring	Increase frequency and monitoring points. Add jurisdictional wet weather sampling points at beginning and ending boundaries for pollutant loading allocations.
Education	Yes	Team Efforts	Continue efforts and team with East County Cities or Watershed whenever possible.
Public Participation	Yes	Team Efforts	Continue efforts to team with Region whenever possible.

* Face-to-face contact is effective but slow moving.

11.6 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements are discussed throughout the Program Assessment section and are summarized above. No regulatory comments were received during PY2007-08 for the City's Assessment and Jurisdictional URMP Effectiveness Component.

SECTION 12 SPECIAL INVESTIGATIONS

12.1 INVESTIGATION OF NITRATE-NITROGEN 1

12.2 FORRESTER CREEK IMPACT STUDY 5

SECTION 12 SPECIAL INVESTIGATIONS

12.1 INVESTIGATION OF NITRATE-NITROGEN

Special investigations were conducted in PY2007-08 to identify potential sources of nitrates in (2) two dry weather-monitoring locations. The purpose of the investigation was to evaluate the potential source of nitrate concentrations found to be above action levels during past dry weather monitoring events. The following comment and response is provided as background information.

The comment below was received for Annual Report PY2005-06 and the adjunct response was included in the IDDE Section of the JURMP Annual Report for PY2006-07:

Annual Report Section 8.0 (Illicit Discharge, Detection, and Elimination):
Comment:

7. The Annual Report states that the above-action level nitrate-nitrogen concentrations obtained at several monitoring sites were attributed to groundwater infiltration. In your response to this letter, please provide data supporting the statement that groundwater in the vicinity of the monitoring sites has elevated concentrations of nitrate-nitrogen.

Response:

During the dry weather field screening and analytical monitoring program for 2005-2006 two sites, monitoring locations 30 and 37, exceeded above action levels. Site 30 is a manhole in front of the Boys and Girls Club on Madison Avenue, and Site 37 is a catch basin located on the east side of South Second Street, across from the mobile home community situated between E. Main street and Lexington Avenue. Site 30 is directly downstream of Site 37, and there are no significant connections along the extension of the pipe between both monitoring locations. An aerial image displaying sampling sites and locations is attached in the Appendix.

A follow-up investigation was conducted and photo-documented on November 9, 2007; the investigation consisted of taking water samples at both sampling sites and upstream for analysis of nitrates. Please refer to the Storm Drain Map – Page 26 and the photographs included in the Appendix as part of this response. The investigation mainly focused on finding potential sources of nitrate on the upstream pipe system, consisting of monitoring site 37 (Photo 1) that samples a sixty-six (66) inch corrugated steel pipe (CSP) (Photo 2). The 66-inch CSP extends eastward to Jamacha Road where it reaches a transitional structure at the western side of Jamacha Road. At this transitional structure two lines come together under Jamacha Road. The northeast branch extends up to Main Street via an arch steel pipe and was observed with minimal flow insufficient for sampling (Photo 8) and the eastern branch extends under Jamacha Road via a reinforced concrete box (RCB) (Photo 9). The RCB reaches another transitional structure at the eastern side of Jamacha road where again two lines come together; the eastern line consists of an arch corrugated steel pipe (Photo 10) that accepts water from a trapezoidal open channel, water flow was visible. The southeasterly line did not have sufficient flow to gather a water sample and

based on previous dry weather monitoring results the reinforce concrete pipe (RCP) does not have a history of nitrate levels above action levels.

During the follow-up investigation, and to have access to the entire length of the pipeline upstream, City of El Cajon Public Works Maintenance Personnel entered the 66-inch CSP via the catch basin at sampling site 37 and collected a total of four (4) water samples for analyses. The samples were taken at site 37 and along the eastern length of the pipeline upstream. One sample was collected at sampling site 30. Photo-documentation developed during the investigation as well as an aerial image depicting the approximate sampling locations is provided in the Appendix A.12. The results of the upstream investigation are summarized in the table below:

Sampling Site No.	Date	Time	Location	Description	Temp. ºC	pH	Conductivity mS/cm	Nitrate (Lab) NO3-N, mg/L
37	11/9/07	9:30	Second Street, next to mobile home community entrance between East Main Street and Lexington Avenue	Catch Basin	21	7.6	2.13	10.6
37_1	11/9/07	9:45	Underground lateral pipe, inside mobile homecommunity	Lateral pipe	20.7	7.3	1.98	10.6
37_2	11/9/07	10:40	Grossmont Union High School Adult Training School Parking lot	Catch Basin	21.5	7.2	2.06	12.0
37_3	11/9/07	12:00	East of Burger King Parking lot	Concrete Channel	18.6	10.2	1.17	0.09
30	11/9/07	13:20	Madison Avenue, between Roberta Avenueand Roselle Avenue, in front of the Boys and Girls Club.	Manhole	20.1	7.6	2.01	11.6

It was concluded after analyzing the monitoring results for the field investigation that the main source of flow and nitrates is potentially located within the segment of the pipe between Jamacha Road and the catch basin at the Grossmont Union High School Adult Training Center (Training Center). Furthermore, with no significant flows discharging into this segment of the pipe from the two laterals at the Training Center and from the curb inlet opening and arch pipe at Jamacha Road, the flows may potentially seep from outside the pipe via the corroded segments of the pipeline.

The City of El Cajon conducted subsequent field investigations and facility inspections of the Training Center and commercial center; both areas drain directly or indirectly to the segment of the pipe suspected to be the source of nitrates. The Training Center is composed of classrooms, offices and storage. The two clay pipes identified in Photos 4 and 6, discharge water from landscaped and parking areas at the Training Facility via catch basins. No significant flows were

observed at the time of field inspections. No storage of any fertilizers was identified at the site. The commercial center north of the 66-inch pipe has various eating and drinking establishments as well as other types of commercial facilities that conduct business at indoor settings. The commercial center has some landscaped areas but do not appear to be large enough to be sources of high nitrates. Evidence of over irrigation or leaking valve(s) was noted during the field inspection and business owners were warned and asked to contact their landscape maintenance personnel to adjust and fix irrigation systems to prevent over spray and excessive runoff from landscaped areas. Follow-up inspections confirmed that a leaking valve had been fixed and the runoff from landscaped areas resolved. The City will continue to remain vigilant of the facilities that drain to the 66-inch pipe. At the time following the investigations, no conclusive evidence was gathered to indicate a clear source point for nitrates. The City also explored the possibility of groundwater being the source of water seeping from outside the pipe.

To find if groudwater is indeed seeping into the 66-inch pipe, the City researched existing information on groundwater in the area. The City of El Cajon contacted the San Diego County Department of Environmental Health and Department of Site Assessment and Remediation to gather any existing data. Both of these entities were not able to provide direct information, but provided the City with advice on where to find groundwater data. County staff directed the City to research the State Water Resource Control Board (SWRCB) Program – GeoTracker. This program, available via the Internet, has underground storage sites identified with reports and analytical data.

Using GeoTracker the City identified twenty (20) sites that have or had monitoring wells around the vicinity of monitoring site 37. An exhaustive research of the sites and data demonstrated that many of the sites did not have groundwater information and a few sites only report on analytical data for compounds dealing with aromatic hydrocarbons and not nitrates. No production wells were identified around the vicinity to check for nitrate data. Only one site, within approximately 2 blocks away of site 37, at the northeast corner of East Main Street and Second Avenue has existing monitoring wells. The City contacted the business owner/manager about granting the City permission to collect groundwater samples to analyze for nitrates, the request was denied. The property manager mentioned that legal staff had to be involved to grant permission.

Historical groundwater depths range from 8 to 11 ft in depth around the vicinity of sampling site 37. The approximate invert elevation of the 66-inch pipe ranges from 6 ft to 7 ft in depth. The City is working with a consultant to collect groundwater samples via the drilling of hydropunch borings or to continue to pursue the collection of samples through existing monitoring wells around the vicinity. On January 14, 2008, the City contacted Ms. Christina Arias from the Regional Water Quality Control Board to explain timing constraints. As a result of the conversation, it was agreed that the City would submit the results of groundwater sampling shortly after groundwater samples can be collected, analyzed, and the data evaluated.

Closure Response:
In July 2008, the City conducted groundwater sampling at two locations in the City. The purpose of the study was to evaluate the potential source of nitrate concentrations found to be above action levels during past dry weather monitoring events.

A brief summary of steps taken during this project is presented below:

- Contracted with D-Max Engineering, Inc. to provide assistance in conducting additional investigation.
- Prepared a drilling application and submitted it to the County of San Diego, Department of Environmental Health, and coordinated with DigAlert prior to drilling.
- D-Max Engineering, Inc. sub-contracted with Tri-County Drilling Inc. to excavate two boreholes in the vicinity of existing dry weather Site 37, where nitrate exceedances have consistently been detected over the years. One borehole was located on the unpaved portion of South Second Street south of Site 37. The other borehole was drilled inside the School District parking lot at Jamacha Road. The City coordinated with the School District to obtain permission for drilling on its property and City's easement.
- The borings were drilled down past 20 feet. The groundwater table was estimated at 9 to 10 feet deep, and hydropunch samples were collected and sent to EnviroMatrix to be analyzed for Nitrate, Total Nitrogen, Fecal and Total Coliform, Enterococcus, Total Dissolved Solids (TDS), and Total Phosphorous. The results are summarized in the table below. Refer to Appendix A.12 for report from D-Max Engineering, Inc. and laboratory reports.

Analyte	Reporting Limit	Site A	Site B	Units
Nitrate as N	0.05	17.4	16.7	mg/L
Nitrate/Nitrite as N	0.05	17.4	16.7	mg/L
Total Kjeldahl Nitrogen	0.5	ND	.5	mg/L
Total Nitrogen	0.5	17.4	17.2	mg/L
Phosphorus, Total	0.05	0.26	0.1	mg/L
Total Dissolved Solids	20	1,200	1,590	mg/L
Total Coliforms	2	2	230	MPN/100mL
Fecal Coliforms	2	2	230	MPN/100mL
Enterococcus	2	ND	ND	MPN/100mL

Notes: "ND" – Not detected at or above the reporting limit.
Red text indicates the result is above the Dry Weather Monitoring Program action level.

The Dry Weather Monitoring Program action level for nitrate is 10.0 mg/L. At both sites the results exceeded this action level, and groundwater elevations are high enough to influence the storm drain system. Previous investigations by the City have found seepage into the storm drainpipes in these areas as well; that seepage was found to have high levels of nitrate as well. Additionally, previous Dry Weather Monitoring Program upstream investigations have found that the storm drain system upstream of the area in which seepage has been noted either is dry or

has water with levels of nitrate well below the action level. These findings indicate that the high exceedance of nitrates at Site 37 is groundwater infiltration. Site 30 is located downstream of Site 37).

12.2 FORRESTER CREEK IMPACT STUDY

For the five years, the City conducted upstream/downstream monitoring of dry weather constituents of concern in Forrester Creek. The monitoring was conducted on August 11, 2008 to assess the relative amount of pollutants discharged within the jurisdictional boundaries of El Cajon into Forrester Creek. The upstream location is at the County boundary, specifically at Greenfield Avenue and I-8 west onramp intersection, behind southeast corner of 1699 East Main Street. Flow at the upstream sample was approximately 3 gallons per minute. During rain events, flow from Crest and other unincorporated County areas discharge directly into the City of El Cajon without treatment. To date, no analytical data have been collected for wet weather flows.

Table 1

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Nitrate (mg/L NO_3-N)
Upstream	8/11/08	3.0	26.0	7.5	1.85	1.77	8.68
Downstream*	8/11/08	234	22.0	8.7	5.57	2.80	2.12

Table 2

Site	Date	Total Hardness (mg/L$CaCO_3$)	Oil & Grease (mg/L)	Total Coliform (MPN/100 mL)	Fecal Coliform (MPN/100 mlL)	Enterococcus (MPN/100 mL)	Total Dissolved Solids (mg/L)	Total Organic Carbon (mg/L)
Upstream	8/11/08	420	nd	1,300	1,300	1,300	1,670	11.9
Downstream*	8/11/08	480	nd	5,000	1,300	40	1,120	45.5

nd = not detected

The following is a summary of the upstream/downstream results:

- Nitrates were detected at 8.68 mg/L upstream, and 2.12 mg/L downstream
- Reactive phosphorous upstream was 0.07 mg/L, downstream was 0.03 mg/L
- Detections of ammonia upstream was 0.1 mg/L, downstream was 0.3 mg/L
- Surfactants were detected at 0.25 mg/L upstream, and 0.25 mg/L downstream

Notable Results and Reasoning

Increase in flow to 234 gallons per minute from upstream to downstream. Downstream flows have decreased for the past two years. Concentrations of many constituents decrease from upstream to downstream; this includes nitrate, reactive phosphorus, total dissolved solids (TDS), enterococcus. Increase in the concentrations (from upstream to downstream) of pH, turbidity, conductivity, ammonia, dissolved oxygen, total hardness, and total coliforms.

The City does not have an explanation for the increase in flows or the significant increase in dry weather flow contributions within City boundaries. The City will need to continue to conduct further dry weather investigations to develop enough data to establish baseline conditions (for current channel configurations) and to develop priorities for more detailed investigations for pollutant and dry weather flow sources.

SECTION 13 NON-EMERGENCY FIRE FIGHTING FLOWS

INTRODUCTION 1

13.1 BEST MANAGEMENT PRACTICES 1

13.2 EDUCATIONAL METHODS 2

13.3 IMPROVEMENTS AND REGULATORY COMMENTS 2

SECTION 13 NON-EMERGENCY FIRE FIGHTING

Introduction

Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. BMPs and educational methods will be used to reduce the discharge of pollutants to the MEP.

13.1 BEST MANAGEMENT PRACTICES

The City has already developed and implemented a program to reduce pollutants from non-emergency fire fighting flows, in accordance with Section B.3. of the Permit. BMPs will be implemented when conducting the following activities:

- Regular Maintenance of Fire and Emergency Vehicles and Equipment
- Training Exercises
- Facilities Maintenance
- Post-Emergency Rehabilitation of Response Equipment

These activities will be conducted in a way to either minimize or eliminate the discharge of pollutants to the MS4. Detailed descriptions of BMPs are given for each activity below:

Regular Maintenance of Fire and Emergency Vehicles and Equipment

- Vehicles and equipment will be cleaned where runoff will be directed either to the sanitary sewer system or to a drain with an oil/water separator system
- Vehicles and equipment will be cleaned where runoff will pond and evaporate and/or where runoff will filter through landscaped areas
- Used-oil, hydraulic fluids, and antifreeze will be stored in containers for recycling or will be disposed as hazardous waste
- Spill kits will be available to promptly cleanup and contain leaking or spilled vehicle fluids
- Use of soaps, cleaners, and detergents will be minimized, and general cleaning solutions will be disposed of into the sanitary sewer system
- Caustics, flammables, and solvents will be contained and disposed of properly as hazardous waste

Training Exercises

- Water used in training exercises will be directed to landscaped areas whenever possible, and runoff from the training exercises will not be allowed to discharge to the MS4.
- Live fire training activities will be pre-planned to allow integration of barriers to off-site runoff that could contribute to non-storm water discharges

Facilities Maintenance

- Impervious areas such as apparatus floors, maintenance bays, driveways, patios, and walkways will be swept to remove debris. Debris will be placed in the trash. Interior

floors will be mopped as necessary, and the wastewater discharged into the sanitary sewer system or onto landscaped areas
- Landscaped areas will be maintained as required to reduce introduction of leaves and other landscape waste into the MS4
- Irrigation systems will be monitored and maintained as required to reduce irrigation water from going off-site
- Spills will be cleaned up using spill kits provided at the work site, and disposal of spilled material will be in accordance with applicable regulations
- Spills that require a cleanup beyond the ability of the on-site employees will be reported to the City Department of Public Works for assistance with appropriate resources
- Maintenance and repair of structures will be conducted using methods that do not contribute pollutants to the MS4
- General non-hazardous cleaning solutions will be disposed of in a utility sink that drains into the sanitary sewer system

Post-Emergency Rehabilitation of Response Equipment
Tools, fire hoses, ladders, and other equipment utilized at the scene of an emergency will be restored to a response-ready state in a manner that does not delay the ability of the apparatus to be available for another emergency response. The use of water that could contribute to storm water discharges may be used unless another practical and immediately available method is identified.

13.2 EDUCATIONAL METHODS

The Storm Water Division provided training to 34 Fire Department Personnel in PY2007-08. Details of the City's educational programs are provided in Section 8 of this document.

13.3 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements from PY1 experience includes:

- Implemented additional Municipal training to increase City employee knowledge of Best Management Practices to help ensure that non-emergency fire fighting activities to not add to polluted runoff.
- Expanded maintenance Best Management Practices for fire fighting equipment and facilities.

Regulatory comments are not applicable to this portion of the JURMP update. Non-Emergency Fire Fighting is a new component of the annual update.

SECTION 14 JURMP REVISIONS

14.1	INTRODUCTION	1
14.2	ADMINISTRATIVE AND LEGAL PROCEDURES	1
14.3	NON-STORM WATER DISCHARGES	1
14.4	DEVELOPMENT PLANNING COMPONENT	2

14.13	EFFECTIVENESS ASSESSMENT COMPONENT	11

SECTION 14 JURMP REVISIONS

14.1 INTRODUCTION

This section identifies the location in the JURMP of any changes made to the JURMP in order to meet the requirements of the new Municipal Permit.

Updated land use information and listings of ESAs based on more recent information have been provided in the introduction. The regulatory background discussion has been updated to provide information about the Municipal Permit.

14.2 ADMINISTRATIVE AND LEGAL PROCEDURES

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
Section 1	Section 2	Moved information on administrative and legal procedures to its own section	Separate section for this information has been included in the County's JURMP format
		Added information about the City's enforcement procedures	Provides information that can be referenced when discussing enforcement in other sections within the JURMP
		Added organization chart	Required by Municipal Permit

14.3 NON-STORM WATER DISCHARGES

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
1.5.1	3.2	Moved prohibited discharges information to new section	Required by Municipal Permit
1.5.2	3.3	Moved allowable discharges information to new section	Required by Municipal Permit
13.1	3.4.1	Moved non-emergency fire fighting BMP information to new section	Required by Municipal Permit

14.4 DEVELOPMENT PLANNING COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
Intro	4.1	Complete rewrite, added new goals of the component	Old intro not applicable to Municipal Permit
6.1	4.2	Added list of current water quality and watershed protection principles in the General Plan	Required by Municipal Permit
		Added additional land use planning implementation information	Required by Municipal Permit
6.2	4.4.3	Updated minimum requirements for all development projects	Required by Municipal Permit
		Added definition of "legal prior approval"	Provides clarification of what projects are subject to updated requirements
	4.2.4	Updated and moved discussion of the City's SUSMP	Old JURMP was outdated
	4.4.2	Added Description of the City's SUSMP and general requirements for all SUSMP projects	Required by Municipal Permit
	4.4.3	Added new BMP requirements for Priority Projects, including HMP requirements	Required by Municipal Permit
	4.4.4.4	Added table and description of planned updates for Model and Local SUSMP including HMP	Required by Municipal Permit
6.3	4.3	Updated description of the EIS checklist	Required by Municipal Permit
		Updated description of environmental review process to reflect current City procedure	Required by Municipal Permit
6.4	4.4.4.1	Updated outreach and staff training information	Not specifically required by Municipal Permit but is part of the City's implementation of the Development and Planning Component
-	4.4.4.3	Added criteria for granting of waivers for treatment control BMPs and option to development a mitigation program	Required by Municipal Permit
-	4.4.4.6	Added description of the new treatment control BMP maintenance tracking database	Required by Municipal Permit
-	4.4.4.6	Added treatment control BMP prioritization criteria	Required by Municipal Permit

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	Appendix B	Added prioritized inventory of development projects with approved treatment control BMPs	Required by Municipal Permit
-	4.4.4.5	Added inspection program for post-construction BMPs for SUSMP projects prior to occupancy of site	Required by Municipal Permit
-	4.4.4.7	Added annual inspection program for all projects with treatment control BMPs	Required by Municipal Permit
-	4.4.4.8	Added annual verification procedure for treatment control BMPs by responsible maintenance party	Required by Municipal Permit
-	4.4.4.9	Added enforcement measures for development projects	Required by Municipal Permit
-	4.6	Added effectiveness assessment	Required by Municipal Permit
-	4.7	Added program review and modification	Optional section presented in San Diego County's JURMP outline

14.5 CONSTRUCTION COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
Intro	5.1	Removed 10-step process and added a general introduction about the	Outdated; not required by Municipal Permit.
		Added general statement about the goals of the construction component	States goals of section.
7.1	-	Section removed	Section no longer required by Municipal Permit.
7.2	5.3	Added statement about updating City ordinances to comply with Municipal Permit	Required by Municipal Permit.
7.3	5.5.2	Added details regarding current review process and City departments involved	Old JURMP was vague, and specificity is required by Municipal Permit.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
7.4	Appendix B	Provided an updated site inventory	Required by Municipal Permit.
	5.2	Added requirement to update inventory at least once a month	
7.5	5.2.1.1	Updated TTWQ prioritization criteria	Now corresponds to the new inspection frequency requirements in Municipal Permit.
7.6	5.4.1 and Table 5-1	Updated minimum BMP requirements	Required by Municipal Permit.
		Reformatted listing of BMP requirements to better match Municipal Permit	
		Added pollution prevention concepts (formally section 7.1)	
	5.4.1.1	Updated seasonal BMP requirements	Allowed by Municipal Permit.
	5.4.2	Added additional controls for construction sites near sensitive water bodies	Required by Municipal Permit.
	5.4.3	Added maximum disturbed area limitations	Required by Municipal Permit.
	5.4.4	Added advanced treatment requirements	Required by Municipal Permit.
7.7	5.5.4	Updated minimum inspection frequencies	Required by Municipal Permit.
		Added tracking of inspections at each construction site	Required by Municipal Permit.
		Added language about implementing proper follow-up actions based on inspection findings	Required by Municipal Permit.
7.8	5.5.5	Added description of what actions will be performed by the City during inspections	Required by Municipal Permit.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
		Added requirement of inspectors having authority to implement immediate enforcement action	Required by Municipal Permit.
		Added description of escalating enforcement measures	Required by Municipal Permit.
7.9	5.5.8	Added reporting of high level enforcement actions to RWQCB	Required by Municipal Permit.
7.10	5.5.1	Added information regarding education and staff training and reference to education section of the JURMP	Required by Municipal Permit.
7.11	5.6	**NO MAJOR CHANGES**	-

14.6 MUNICIPAL COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
2.1	6.1.2	Discussion of pollution prevention measures and BMPs	Required by Municipal Permit
2.3	6.1.1	Updated source characterization, criteria, and prioritization	Required by Municipal Permit
2.2	6.2	Updated/added municipal fixed facilities	Required by Municipal Permit
	6.3	Updated/added description of roads, streets, highways, parking facilities	Required by Municipal Permit
	6.5	Updated/added sanitary sewer system	Required by Municipal Permit
-	6.6	Added mobile municipal activities, including power washing	Required by Municipal Permit
-	6.7	Added special events	Required by Municipal Permit
-	6.3.4	Added street sweeping prioritization	Required by Municipal Permit
-	6.4.2	Added information about the retrofitting of flood control	Required by Municipal Permit

Old JURMP Section	New JURMP Section	Change	Rationale for Change
		devices within the City	
-	6.5.4.1	Added controls and measures to prevent and eliminate seepage from sanitary sewers to MS4s	Required by Municipal Permit
-	6.7	Added controls and measures for special events	Required by Municipal Permit
2.4, Appendix C	6.1.2, Appendix C	Update to Minimum BMP requirements for all municipal areas and activities	Required by Municipal Permit
2.5	6.4	Updated MS4 maintenance and BMPs	Required by Municipal Permit
2.6	6.2.3.1	Updated management strategy for pesticides, herbicides, and fertilizers	Required by Municipal Permit
2.7	6.2.4	Updated inspection procedures and frequencies	Required by Municipal Permit

14.7 INDUSTRIAL AND COMMERCIAL COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
3, 4	7	Combined industrial and commercial sections into one section	Follows organization of the Municipal Permit and of the Copermittees' standard JURMP outline
4.2	7.2.2, 7.3.2	Added building material retailers and storage, animal facilities, food markets, and power washing to the list of inventoried commercial business categories	Requirement of the Municipal Permit
3.2, 4.2	7.2.2, Appendix B	Created a table for pollutants potentially generated by each category of site/source; added identification of whether the site/source is tributary to a Clean Water Act section 303(d) waterbody segment and generates pollutants for which the water body segment is impaired to the inventory tables	Requirement of the Municipal Permit

Old JURMP Section	New JURMP Section	Change	Rationale for Change
3.3, 4.2	7.2.2	Modified prioritization criteria for industrial and commercial	Municipal Permit allows for more flexibility; incorporation of knowledge from inspection experience provides more accurate prioritization
3.1, 4.1	7.2.3	Incorporated pollution prevention measures into the BMP section; removed the stand alone pollution prevention section.	Municipal Permit treats pollution prevention measures as a type of BMPs; this organization reduces potential for confusion based on trying to distinguish between what is a pollution prevention measure and what is a BMP
-	7.3	Added more specific description of BMPs to implemented for businesses (a) tributary to 303(d) listed water bodies and generating pollutants for which the water body is impaired and/or (b) within, directly adjacent to, or directly discharging to receiving waters within ESAs	Requirement of the Municipal Permit
3.5	N/A	Removed industrial monitoring component of the JURMP	Not required by the Municipal Permit
-	7.2.4	Added a commitment to notify businesses of updated BMP requirements within the first three years of program implementation	Requirement of the Municipal Permit
-	7.2.4	Added commitment to train City inspectors at least annually	Requirement of the Municipal Permit
3.6, 4.4	7.2.4	Inspection frequency requirements updated to 20 percent of inventoried sites in the first year first year and 25 percent in subsequent years, and 50 percent of high priority sites in the first year and 100 percent in subsequent years.	Requirement of the Municipal Permit
-	7.2.4	Added commitment to track the number of inspections during each reporting period to ensure the minimum inspection frequencies are achieved	Requirement of the Municipal Permit
3.6, 4.4	7.2.4, 7.3.4	Updated inspection procedure to match current status of program as implemented in the City	Requirement of the Municipal Permit, and City has modified its program based on lessons learned during the previous permit cycle

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	7.2.4, Appendix D	Added SWPPP review and monitoring review component to inspection form	Formally document review of SWPPP and monitoring results, actions which the Municipal Permit requires
-	7.2.4, Appendix B	Identified businesses that the City plans to inspect in 2007-2008	Requirement of the Municipal Permit
-	7.2.4	Added description of procedure to report industrial non-filers in JURMP Annual Reports	Requirement of the Municipal Permit
-	7.3	Added a new program element to regulate mobile businesses, including BMP requirements, education, inspections, and enforcement measures	Requirement of the Municipal Permit
-	7.3.2, Appendix B	Added a column to the inventories to identify which businesses are mobile	Requirement of the Municipal Permit
-	7.3.4	Added a description of potential regional collaboration effort related to mobile business regulation	Encouraged by the Municipal Permit and likely to be developed by Copermittees
-	7.4	Added reference to Effectiveness Assessment Section	Matches Copermittees' standard JURMP outline, clarifies location of effectiveness assessment discussion
-	7.5	Added place holder for future modifications to the JURMP	Matches Copermittees' standard JURMP outline, provides location for future updates to be recorded

14.8 RESIDENTIAL COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	8.2.1	Disposal of trash	Required by Municipal Permit
5.2.	8.2.2	High TTWQ areas updated	Required by Municipal Permit
5.1, 5.3	8.3	BMP section merged with Pollution Prevention methods, and updated	Required by Municipal Permit
5.3	8.3	Updated BMPs	Required by Municipal Permit
-	8.3.1	Added BMPs for disposal of trash	Required by Municipal Permit

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	8.3.2	Discussion of additional controls for areas tributary to 303(d) listed impaired waterbodies	Required by Municipal Permit
-	8.3.2	Implement BMPs in residential areas and for residential activities not considered a high threat.	Required by Municipal Permit
5.3.1	8.4.2	Updated Used Oil collection centers	State Certified Used Oil Recycling Centers Website
-	8.4.5	Regional Residential Education Program added	Required by Municipal Permit

14.9 ILLICIT DISCHARGE DETECTION AND ELIMINATION COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
8.6.1	9.3.1	Updated Sewer prevention and response plans to reflect changes in State Order	New State Order
-	9.3	Updated discussion of sewage spill response to include private laterals and failing septic systems	Required by Municipal Permit
8.8	9.3.4	Hazardous waste disposal section moved to Section 6 and 10	Consistency with Municipal Permit requirements
-	9.4.1	Added MS4 Outfall Monitoring section	Required by County standard format
-	9.4.2	Added Source Identification Monitoring	Required by County standard format
8.1.1	9.4.3	Revised locations for Dry Weather Monitoring Program sites	Based on past experience and to provide data to help address new requirements
8.1	9.4.3	Updated MS4 map	Required by Municipal Permit
-	9.4.3	Updated Dry Weather Monitoring Program procedures to include trash monitoring	Required by Municipal Permit
-	9.5.1	Dry weather monitoring criteria which exceed action levels will be screened in subsequent years	Required by Municipal Permit

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	9.5.1	Modified Dry Weather Monitoring follow-up investigation procedures to state that investigation must be initiated within two business days where dry weather results exceed action levels unless a rational can be provided	Required by Municipal Permit
8.9	1.3.1	Moved to discussion of controlling sanitary sewer system related infiltration to Section 6	Consistency with Municipal Permit requirements

14.10 EDUCATION COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
9.3.1	10.2.2	Updated municipal construction section	Required by Municipal Permit
13.2	10.2.4	Education of fire fighting staff	Required by Municipal Permit
-	10.3.5	Added discussions of educational programs targeting underserved audiences, high-risk behaviors, and allowable behaviors and discharges	Required by Municipal Permit
-	10.2, 10.3.1	Added discussion of education for LID BMP requirements	Required by Municipal Permit

14.11 PUBLIC PARTICIPATION COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
-	11.2	Added discussion of how public participation is encouraged in development and implementation of the JURMP	Required by Municipal Permit
10.1	11.2	Updated list of programs	Match most recent information

14.12 FISCAL ANALYSIS

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
12.1	-	Estimated implementation cost removed	No longer required by Municipal Permit
12.2	12.2.1	Updated financing mechanisms	Required by Municipal Permit
-	12.2.2	Added urban runoff programs	Required by Municipal Permit
-	12.2.3	Added current budget reporting information	Required by Municipal Permit
-	12.3	Added discussion of future fiscal analysis methods	Required by Municipal Permit

14.13 EFFECTIVENESS ASSESSMENT COMPONENT

This table identifies changes that have been made to the JURMP in this section.

Old JURMP Section	New JURMP Section	Change	Rationale for Change
11.1	13.1	Updated content to account for development of regionally accepted framework for effectiveness assessment	Update to most recent approach
-	13.2	Added discussion of assessments for overall program, individual program components, and significant activities for targeted outcome levels 1 through 6	Required by Municipal Permit
-	13.2	Added tables listing assessment metrics for significant activities for levels 1 through 6	Provide method for addressed Municipal Permit requirement

Section 15 Conclusions and Recommendations

Introduction 1

15.1 Conclusions 1

Table 1 – Challenges and Associated Strategies/Actions 3

15.2 Recommendations 4

SECTION 15 CONCLUSIONS & RECOMMENDATIONS

INTRODUCTION

To conclude PY1 and recommend changes for PY2, this Section focuses on the challenges overcome this last year that will help eliminate inaccuracy or uncertainty for subsequent permit years. To summarize, the City:

- Continued implementation of the BMP-based inspections by focusing efforts on ensuring full implementation of appropriate BMPs at all high priority commercial, industrial, construction and municipal facilities.
- Expanded the public education efforts by participating in the Fire Department/Safety Open House, giving presentations, hosting Pollution Prevention Days events and providing information to the mass public through the City newsletter.
- Continued efforts towards a Watershed-based program by conducting the fifth upstream/downstream water quality assessment of Forrester Creek.
- Refined the City's ability to track complaints, inspections, violations, and enforcement actions for accuracy and completeness.
- Opened contract for on-call analytical testing services to conduct follow-up responses to complaints, spills, and targeted investigations to identify potential pollutant source points.
- Hired consultant to assist with the review of storm water plans and requirements for proposed development and redevelopment projects.

15.1 CONCLUSIONS

A number of conclusions resulted from compiling the Annual Report information as follows:

The City is currently transitioning the activity-based requirements of Order No. 2001-001 to fulfill the requirements of Order No. R9-2007-001. The actions taken by the City to comply with these requirements are fully described in Sections 1 through 14 (particularly Section 11) of this Annual Report. The City will continue to meet the activity-based compliance requirements in future program years.

The City's focus on BMP implementation at high priority commercial and industrial facilities and at construction sites will reduce or prevent discharges of pollutants from those activities and sites. Once the City can reasonably assure that those priority activities are not discharging pollutants, the City will be able to focus more effort on identifying and eliminating other (unknown, unidentified) sources of pollutants that continue to impact water quality.

The City's program must continue to move forward, from an emphasis on the activity-based compliance actions to water-quality-based activities that will help the City achieve the goal of reducing discharges of pollutants and restoring the quality of the receiving waters. These activities include collecting, evaluating and incorporating sufficient water quality data to set priorities, better identify problem areas, and to be able to demonstrate reductions in pollutants and improvements in water quality.

Effectively integrating jurisdictional into watershed programs will be a continued focus for the future. The Permit establishes important obligations at both jurisdictional and watershed levels. To accomplish this transition and integration, the City continues to meet with East County Cities Workgroup (San Diego River Watershed Jurisdictions) to provide some direction concerning inland urban runoff issues. Taking advantage of successes at other Cities strengthens individual and watershed programs.

New Directions, New Challenges….

The City must still address a number of unresolved data and information collection issues. Monitoring data are especially important to quantify pollutant loads within the jurisdiction of El Cajon. Additional dry weather monitoring stations are needed to better identify illegal discharge sources. The need for additional data and information must be carefully balanced with the costs of obtaining those items.

Permit Year 1 of Order 2001-01(2001/2002) set a baseline for the 14 components with the primary goal to reduce or eliminate pollutants from entering the City's storm drain system, which flows to Forrester Creek, the San Diego River, and ultimately the Pacific Ocean. Permit Year 2 implemented those 14 components that required inspection, monitoring, education, and enforcement. Permit Year 3 spent over 17,000 staff hours and over two million dollars ($2,000,000) in meeting permit requirements and JURMP goals. Permit Years 4 and 5 continued the BMP implementation verification inspection program initiated in PY3. Permit Year 4 focused on the Automotive Repair Industry, while PY 5 focused on the Restaurants and other businesses preparing and serving food.

The solid base of protocols and procedures produced in 2001, continued into PY6 and into the current reporting period with refinement supported by seven years of experience in program implementation. An unending challenge is changing the behavior of the approximately 96,000 residents and 2,000 businesses and their views of urban runoff pollution. The City is predominantly a community of rental units, which identifies the population as more transient than the typical single-family residential population. This outreach and education challenge will be changing as more rental complexes turned into common living complexes with home

ownership. The following table summaries the City's storm water management strategy based on the challenges presented during the current reporting period, 2007/2008.

Table 1 – Challenges and Associated Strategies/Actions

Challenges	Strategies / Actions
Implementing the 14 components simultaneously	1. Prioritize implementation to maximize use of personnel, supplies, equipment, and budget. 2. Develop budget for PY1 to add watershed outreach, efforts, public participation events, additional outreach materials, GIS data development, staff training, and treatment controls for trash and debris.
Adequate Staffing and Equipment	Train as many City staff in storm water pollution prevention and Best Management Practices.
Incorporate Storm Water Concepts and Requirements at the Planning Stage	Work closely with Community Development staff to generate a Storm Water Information Packet to distribute to applicants.
Transition Jurisdictional Programs and activities into Watershed Activities.	1. Meet with WURMP Copermittees for implementation. 2. Explore strategies to fund watershed activities that go beyond the jurisdictional boundaries.
Tackle Inland City Issues	1. Coordinate with East County Cities on pollutant load reduction, training, and citizen educational efforts. 2. Develop East County City-specific materials.
Maintain Adequate Monitoring tasks	1. Review dry weather monitoring results. 2. Use GIS and the City's Business License database to focus on the most highly potentially pollution production areas. 3. Develop a basic wet weather monitoring program that is comparable with other Copermittee programs.

From July 1, 2003 through June 30, 2008, the City tackled a new set of challenges while maintaining the current level of provided services. In review, it was better to put resources towards implementing productive processes and procedures, rather than completing a task in the name of compliance. The City continues to brainstorm toward reaching higher standards in future program years, while quantifying pollutant reductions from jurisdictional actions that may have a watershed impact.

15.2 RECOMMENDATIONS

Specific recommended improvements are listed at the end of each component. Below are some general improvements for the City's Urban Runoff Strategy.

- Maintain adequately trained staff to implement JURMP activities,
- Increase budget and effort in creating a comprehensive Geographical Information System for the Jurisdictional and Watershed Storm Water Program efforts.
- Increase budget for watershed training, East County City Cooperative efforts, and electronic tracking of program information,
- Coordinate through City departments a cohesive urban runoff management program,
- Generate a schedule of outreach events for the next Permit Year according to JURMP requirements,
- Design a comprehensive program to collect and organize information for the Annual Report,
- Add sample collection sites and frequency to the dry weather monitoring program, and
- Focus on outreach and education activities for the most effective approach to managing storm water pollution.
- Develop a storm drain master plan map displaying MS4 infrastructure.

1.0 INTRODUCTION

A Storm Water Mitigation Plan (SWMitP) is required under the City of El Cajon Municipal Code 16.60 and Municipal Permit Order 2007-01. The purpose of this SWMitP is to address the water quantity and quality from the proposed project. Best Management Practices (BMPs) applied address long-term solutions to water quality. [Identify the source of the BMPs: Caltrans or CASQA or proprietary. Attach only proprietary BMPs. Provide specifications for all BMPs. Provide calculations and justifications for BMPs]. This SWMitP is also intended to ensure the effectiveness of the BMPs through proper maintenance that is based on long-term fiscal planning. The SWMitP is subject to revisions as needed by the engineer.

1.1 PROJECT DESCRIPTION

[Provide and discuss project location, topography, run-on and runoff issues, and unique conditions]
[Provide location map]

[Complete the following table for all applicable categories. Designations provided are highly recommended by the San Diego County Copermittees. There may also be others – provide explanation of pollutant sources]

TABLE 1-1 (Check all that apply)

Priority Project Categories	
>10 SFR	
>1 acre Commercial	
Automotive	
Restaurants	
Hillside Development > 5,000 sq ft	
Parking Lots > 5,000 sq ft or > 15 spaces	
Streets, roads, highways, freeways that create new paved surface > 5000 sq ft	
Retail Gas Outlets	

1.2 HYDROLOGIC UNIT CONTRIBUTION

Water Quantity

[The 10-year flood is the design storm used for calculating peak flows and the 100-year rain event is used to demonstrate flooding. Discuss the types of surfaces rain water that will flow over on the project and a general approach to minimizing impervious areas, directly connect impervious areas, retaining natural areas, and use of porous surfaces]

Water Quality

[Major channels/discharge points identified by the City are: Broadway Channel; Washington Channel, Third Street Lateral, County Ditch, and Fletcher Parkway which drain to Forester Creek AND Fanita Channel that directly discharge to the San Diego River. Both are 303(d) listed. The City considers the pollutants identified to be of concern for the entire length of the waterbodies. Discuss pollutants and how the project may affect water quality.]

2.0 WATER QUALITY ENVIRONMENT

Terms for Use in Calculations

% Impervious – the amount of square footage covered by pavement (concrete or asphalt, buildings, roofs, patios, and sidewalks. Includes future paved areas depending on size of lot such as proposed patio and RV parking.
Runoff Coefficient – calculate using % impervious and known soil type.
Time of Concentration – the amount of time for the first drop of water at the furthest point within a basin to travel to the discharge point without turning more than 45 degrees in a natural-lined conveyance.
Flow Length – the path water from the furthest point to discharge point without turning more than 45 degrees in a natural-lined conveyance.

2.1 PRE-CONSTRUCTION CONDITIONS AND FLOW

[Describe the pre-construction conditions such as: not paved, never developed, previously a gas station, etc.; grading requirements if applicable; how the site currently flows, direction of flow, the calculation used for flow.]

[Provide the total area and actual percent impervious for the project area.]

[Describe each parameter in the calculation and how the value used was chosen. Use runoff coefficients that reflect the true imperviousness of the project area and not the land use coefficients.]

[Use maps to indicate the parameter's location on the project site.]

[Calculate Q to the nearest 0.1 CFS.]

2.2 POST-CONSTRUCTION CONDITIONS AND FLOW

[Describe the post-construction conditions such as: paved, fully developed, development is a restaurant; final grading; how the site flows, direction of flow, the calculation used for flow.]

[Provide the percent impervious for the developed property.]

[Describe each parameter in the calculation and how the value used was chosen. Use runoff coefficients that reflect the true imperviousness of the project area and not the land use coefficients.]

[Use maps to indicate the above characteristics, detail schematics of post-construction BMPs (plan and cross-section views) and location of post-construction BMPs on the project site.]

[Summarize the affects of the project on the flow (increased, decreased, fully mitigated, etc.) and on downstream hydrology. Downstream assessments must address City of El Cajon discharge to the jurisdictional line at the City of Santee.]

[Compute rainfall runoff characteristics from the project area including, at a minimum, peak flow rates, flow velocity, runoff volume, time of concentration, and retention volume (All calculations may be provided as Attachment E).]

[Calculate Q to the nearest 0.1 CFS.]

[Provide formulas, actual calculations, and a table with pre- and post-construction flows without the incorporation of any post-construction BMPs. Then add the post-construction BMP detainment flows.]

[Complete the following tables. At the minimum, provide justification of implementation and when not feasible for design and source controls.]

SUSMP FORM

SUSMP Development or Re-Development (Circle)

SUSMP Triggers (list all applicable categories): _____

Address: _____

Pre-Q: _____ Post – Q: _____

Maintenance Plan/Notes:_____

Apply all General Site Design and at least one of each control. (Please note that all of the following General Site Design and control items have to be considered and applied to the

project. Explain what Best Management Practices (BMPs) were implemented to achieve the General Site Design and controls or justify why the item was not feasible for this project).

[Provide reasoning for how any Design, Source, or Treatment Controls were applied]
[Provide Justifications for any Design, Source, or Treatment Controls not applied]

General Site Design	Applied	Justification
1. Control Peak runoff rates (Required)		
2. Minimize impervious areas (Required)		
3. Conserve Natural Areas (Required)		
4. Protect\slopes\and channels (Required)		
5. Minimize effective imperviousness (Required)		
6. Construct low traffic areas (walkways, trails, patios, parking lots, alleys, etc.) of permeable surfaces		
7. Maximize canopy interception by preserving existing trees and shrubs		
8. Preserve natural drainage systems		
9. Minimize Directly Connected Impervious Areas (DCIAs) [Drain rooftops, sidewalks, walkways, trails and patios to landscaping]		
10. Other		

Source Controls[1]	Applied	Justification
1. Storm drain message and signage (Required)		
2. Outdoor storage area design (Required)		
3. Trash storage area design Must be secured, bermed, and covered. (Required and in accordance with California Fire Code section 1103.2.2)		
4. Use efficient irrigation systems & landscape design		
5. Incorporate requirements of the applicable priority project category: a. Loading/unloading dock area design (Required) b. Repair/maintenance bay design (Required) c. Vehicle/Equipment/Accessory washing area (Required) d. Fueling area design (Required) e. Private Roads f. Residential Driveways & Guest Parking g. Outdoor Processing Areas h. Parking Areas i. Roadways j. Hillside Landscaping		
6. Proof of control measure maintenance (Required)		
7. Other		

Treatment Controls (Require two controls, at a minimum) [1]	**Applied**	**Justification**
1. Inlet Filters[2]		
2. Grass strip filter		
3. Grass swale filter		
4. Extended detention basin		
5. Wet detention basin		
6. Constructed wetland		
7. Sand filter		
8. Hydrodynamic Separator		
9. Infiltration basin or trench		
10. Media filter		
11. Proprietary controls		
12. Other		

1. Proposed source and treatment controls need to be shown in the grading/drainage plan along with engineering details and/or specifications
2. Not to be used alone.

3.0 POLLUTANTS

3.1 POLLUTANTS GENERATED from AFTER CONSTRUCTION ACTIVITIES AND BMPs APPLIED TO MITIGATE

Terms

Activity – any action taking place outdoors or resultant liquid/solid is disposed outdoors.

Pollutants – sediment (dirt); metals (from dirt , paint, or chemicals); organic material (vegetation or food); grease; petroleum; sewage; detergents/soap; fertilizers; pesticides; trash/debris, and toxics (acids, corrosives).

Post-Construction BMPs – Design controls, Source controls, Treatment structures

Effectiveness – Based on manufacturer, industry; government; or other private studies. List Source.

TABLE 3-1 (Highlight Pollutants from Categories in Table 1-1)

Priority Project Categories	Sediment	Nutrient	Heavy Metals	Org Cpds	Trash & Debris	ODS	Oil & Grease	Bacteria & Viruses	Pesticides
>10 SFR	X	X			X	X	X	X	X
>1 Acre Commercial	P	P		P	X	P	X	P	P
Automotive			X	X	X		X		
Restaurants					X	X	X	X	
Hillside Development	X	X			X	X	X		X
Parking Lots	P	P	X		X	P	X		P
New Streets > 5000 sq. ft.	X	P	X		X	P	X		P
> 5,000 sq ft Redevelopment	X	P	P	P	X	P	P	P	P
Retail Gas Outlet			X	X	X		X		
X- anticipated P – Potential			ODS – Oxygen Demanding Substances						

TABLE 3-2 (Highlight the combination of BMPs for the Project that most effectively treats the Pollutants from Table 3-1) Efficiencies are in ()

	Infiltration Basins (High) Wet Ponds or Wetlands (High) Inlet Filters (Low) Filtration (Medium) Hydrodynamic Systems (Low)
Pesticides	Biofilters (Unknown) Detention Basins (Unknown) Infiltration Basins (Unknown) Wet Ponds or Wetlands (Low) Inlet Filters (Low) Filtration (Unknown) Hydrodynamic Systems (Low)

4.0 CONSTRUCTION AND POST-CONSTRUCTION BMPS

4.1 CONSTRUCTION BMPS

[Provide a table with the **ALL** the activities, pollutants, and BMPs for construction activities. An example is provided below.]

EXAMPLE TABLE 4-1

ACTIVITY	POLLUTANTS	CONSTRUCTION BMP	EFFECTIVENESS
Entrance/Exit of Project Site	Sediment	TC-1	High (CASQA)
Pouring Concrete	Metals; pH	WM-8	High (CASQA)
Port-o-Let	Bacteria; Organics	WM-9 (Modified with secondary containment and strapped to a secure source to prevent tipping	High (CASQA)

4.2 POST-CONSTRUCTION BMPS

[Describe the soil type and characteristics of that soil type.]

[List the post-construction BMPs that will be used.]

[Identify the pollutants associated with each BMP.]

[Describe the effectiveness of the BMP or Treatment Train (multiple BMPs) with the pollutants.]

[Provide a Table with this information. An example is provided below]

EXAMPLE TABLE 4-2

ACTIVITY	POLLUTANTS	POST-CONSTRUCTION BMP	EFFECTIVENESS
Residential -Car Washing	ODS; Sediment	Source control - Capture, Contain, Collect	Low or High (EPA)
Commercial – Power washing sidewalks/driveways	Sediment; oil&grease; bacteria	Source control - Capture, Contain, Collect	Low or High (Regional Board)
Commercial – Car rinsing	Sediment; oil&grease; metals	Source control - Capture, Contain, Collect	Low or High (County of San Diego)
Residential/Commercial – Over watering/Over spray	Nutrients; pesticides	Source Control – IPM Treatment control – Infiltration basin	Low or High (Caltrans)
Residential/Commercial – Landscaping Maintenance	ODS; sediment	Source control - Sweeping	Low or High

5.0 TREATMENT BMPS

Treatment BMPs are designed to treat to the 85th percentile of the design storm.

[List the Treatment BMPs incorporated into the site design in a Table. Provide Efficiencies. Show on BMP map with engineering details.]
[Show calculations to verify the treatment to the 85th percentile.]

6.0 LOW-IMPACT DEVELOPMENT (LID)

The project design must incorporate Low Impact Development (LID) Best Management Practices (BMPs) for compliance with the California Regional Water Quality Control Board (San Diego Region) Order No. R9-2007-0001. An electronic copy of the County of San Diego Low Impact Development Handbook can be found online at:

http://www.co.san-diego.ca.us/dplu/docs/LID-Handbook.pdf

7.0 MAINTENANCE

7.1 CONSTRUCTION BMPs

Maintenance of construction BMPs starts at the time of soil disturbance and continues through the life of the project, until a 70% coverage of disturbed areas is established.
[Describe how maintenance of BMPs will be accomplished]

7.2 POST-CONSTRUCTION BMPs

Post-construction BMPs are to remain with the property and be maintained in perpetuity to the engineered functionality.

[Discuss financial responsibility of maintenance]

[Provide BMP Facilities Agreement to be recorded with Grant Deed.]

[Provide a table listing each post-construction BMP, the responsible party, frequency of maintenance, any special conditions, verification of maintenance, fiscal responsibility. An example table is provided below]

TABLE 7-1

POST-CONSTRUCTION BMP	Responsible Party	Maintenance Frequency	Verification of Maintenance	Fiscally Responsible Party	Special Conditions
Trash Enclosure (Source Control)	Business Owner or Property Owner or HOA	Weekly	Daily	Business Owner or Property Owner or HOA	Use Mop to clean
Engineered Vegetative Detention Area	Business Owner or Property Owner or HOA	Quarterly	Monthly	Business Owner or Property Owner or HOA	Mulch grass; Use little to no fertilizers or pesticides
Storm Water Filter Insert	Business Owner or Property Owner or HOA	At least Semi-Annually (October 1st and April 30th)	Quarterly	Business Owner or Property Owner or HOA	Keep Clean
3-stage Clarifier	Business Owner or Property Owner	Semi-Annually (October 1st and April 30th) Or Determined by use	Quarterly	Business Owner or Property Owner or HOA	Discharge to Sanitary sewer with wastewater permit or to storm drain with approved monitoring plan.

8.0 SUMMARY/CONCLUSIONS

[Summarize the site conditions and flow before and after construction; the use of post-construction BMPs and their maintenance; and the fiscal responsibility of post construction BMPs.]

[Provide a table with pre-construction peak flow, post-construction flow without BMPs, and post-construction flow with post-construction BMPs.]

CERTIFICATION

This Storm Water Mitigation Plan has been prepared under the direction of the following Registered Civil Engineer. The Registered Civil Engineer attests to the technical information contained herein and the engineering data upon which recommendations, conclusions, and decisions are based.

Storm Water Requirements for Construction Sites

The City's storm drain system is composed of the street, gutter, inlet, catch basin, ditches, streams, and concrete-lined channels.

1. Perimeter Controls (fiber roll; silt fence; gravel or sand bags) must be installed and kept in place throughout the project to prohibit the discharge of sediment and pollution from entering the storm drain system. If controls are moved to complete work, they must be replaced when work is completed or at end of day, whichever comes first.
2. Erosion Controls as required by an erosion and sediment control plan must be installed as designed.
3. Tracking of sediment and dirt must be cleaned up at the end of each working day.
4. Building Materials must be stored under cover at the end of each working day.
5. Spills must be reported to the site manager once they occur and cleaned up immediately. Spills that enter the City's storm drain system must be reported to the City Storm Water staff immediately.
6. Wash waters (including paint, dry wall mud, stucco, and other water-based materials) must be captured on site and contained, then disposed of in the appropriate place.
7. Port-o-lets must be secured and bermed.
8. Trash and debris shall be placed in appropriate containers during the workday with a final clean-up completed before leaving the site. If rain is predicted, wastes shall be covered.
9. Equipment shall be stored in a bermed area or with appropriate sized drip pans.
10. Equipment repair, servicing, or fueling must be completed undercover or within a bermed area for tasks completed within the workday. Spill kits must be within the bermed or repair areas.
11. Vehicle and equipment washing is prohibited.
12. The site will be secured at the end of each working day.
13. Report any destroyed controls to the site manager, immediately.

Under the City of El Cajon's Municipal Code §13.10.00, Storm Water Management and Discharge Control, it is illegal to discharge construction debris and materials, into the storm water conveyance system or any body of water.

Failure to prevent illegal discharges can result in fines of up to $10,000 a day per violation.

Under the law, contractors, the construction company, business owner, and property owner may receive a Citation for the same violation.

EROSION AND SEDIMENT CONTROL NOTES
FOR EROSION CONTROL PLANS
(HIGH AND MEDIUM PRIORITY PROJECTS)

Add the following notes (both pages) to the Storm Water Erosion Control site plan and implement as a condition to the Erosion Control Plan:

1. In case emergency work is required, contact _____ at _____.
   (name)
   (telephone number)

2. Erosion control measures shown on plans shall not be moved or modified without the approval of the public works inspector.

3. The contractor shall maintain all erosion control devices in working order to the satisfaction of the city engineer throughout the construction phase of the project and until permanent ground cover and landscaping is established.

4. The contractor shall install additional erosion control measures as may be required by the City Engineer due to completed grading operations or unforeseen circumstances which may arise.

5. The contractor shall be responsible for and shall take necessary precautions to prevent public trespass onto areas where impounded waters create a hazardous condition.

6. Graded areas around the project perimeter must drain away from the face of slope at the conclusion of each working day.

7. All gravel bags shall have ¾ inch minimum aggregate (No burlap type bags allowed).

8. Existing streets shall be kept free of dirt and debris, and shall be maintained in good condition. Dust shall be controlled so that it is not a nuisance. The contractor shall be responsible for the repair of any street or property damaged, public or private, as a result of the work.

9. The plan shall provide that no sand, silt, or debris shall be allowed to enter the storm drain system including public streets.

10. The owner and/or the owner's contractor shall implement the plan and take remedial and preventive action immediately when pollutant discharge occurs and/or the City Engineer or the Building Division directs.

11. The above shall apply starting the 1st day of grading and/or construction and shall remain in effect until all grading and/or construction work has been completed.

ALL EROSION AND SEDIMENT CONTROL SHALL BE IMPLEMENTED IN ACCORDANCE WITH THE CITY OF EL CAJON'S JURISDICTIONAL URBAN RUNOFF MANAGEMENT PROGRAM (JURMP) AND SHALL INCLUDE THE FOLLOWING:

Dry Season (May 1 through September 30)

1. All exposed disturbed areas must have erosion prevention controls properly installed including building pads, unfinished roads and slopes. Slopes less than 33.3% or 1:3 (vertical vs. horizontal) may use properly designed and installed de-silting basins at all discharge points in lieu of this requirement.

2. Adequate perimeter protection BMPs must be installed and maintained.

3. Adequate sediment control BMPs must be installed and maintained.

4. Adequate BMPs designed to control off-site sediment tracking must be installed and maintained.

5. At a minimum, 125% of the materials needed to install standby BMPs necessary to completely protect exposed portions of the site from erosion and prevent sediment discharges must be stored on the site.

6. An approved "weather triggered" response plan is mandated for implementation in the event that a predicted storm event has at least a 50% chance of rain. The proponent must have the capacity to deploy the standby BMPs within 48 hours of the predicted storm event.

7. All slopes must be equipped with erosion prevention BMPs as soon as slopes are completed for any portion of the site.

8. Cleared or graded areas left exposed at any given time are limited to the amount of acreage that the project proponent can adequately protect prior to a predicted storm event.

Wet Season (October 1 through April 30)

In addition to the Dry Season Requirements:

1. Perimeter protection and sediment control BMPs must be upgraded if necessary to provide sufficient protection for storms.

2. Adequate erosion prevention BMPs must be installed and established for all completed slopes prior to October 1 and maintained throughout the wet season. If a BMP fails, it must be repaired, improved or replaced with an acceptable alternate as soon as it is safe to do so.

3. The amount of exposed soil allowed at one time shall not exceed standby erosion and sediment control BMP capacity.

4. An incomplete disturbed area that is not being actively graded must be fully protected from erosion if left for 10 days or more.

Project Name: _____

CITY OF EL CAJON SUSMP CHECKLIST

MS4: ☐ Forester Creek ☐ County Ditch Channel
☐ Broadway Channel ☐ Third Street Lateral
☐ Washington Channel ☐ Fletcher Parkway Lateral

City of El Cajon
STORMWATER
Protection Program

PROJECT INFORMATION

Project Name: _____ Public Private

Project Address: _____

Project Size: (acres) _____ Notice of Intent: Yes No

Completed a SWPPP: Yes No

SUSMP CATEGORY

Check all SUSMP categories that apply to the project

☐ Residential Development >100 units
☐ Residential Development > 10 units
☐ Commercial Development > 100,000 sq ft
☐ Automotive Repair
☐ Restaurants
☐ Hillside Development > 5,000 sq ft
☐ Parking Lots > 5,000 sq ft or > 15 spaces
☐ Streets, roads, highways, and freeways with >5,000 sq ft of new paved area
☐ Significant Redevelopment > 5,000 sq ft of paved area on an already developed site

IDENTIFY POLLUTANTS FROM THE PROJECT AREA

Check all that apply to the project

☐ Sediment (dirt; silt; clay)
☐ Nutrients (fertilizers, sewages)
☐ Metals (dirt, silt, clay, paints, liquid/solid chemicals)
☐ Organics (food, vegetation)
☐ Trash and Debris
☐ Oxygen Demand Substances (organic matter)
☐ Petroleum (oil, grease)
☐ Bacteria and Viruses (fecal coliform, pathogens)
☐ Pesticides/Herbicides
☐ Toxics (acids, corrosives, chemicals)

IDENTIFY RECEIVING WATERS AND THE POLLUTANT SOURCES

Does the project discharge directly to: ☐ San Diego River? or ☐ Forester Creek?

What are the primary sources contributing to SD River and Forester Creek impairments of:
TDS?_____ _____ _____

Fecal Coliform? _____ _____

Project Name: _____

pH?_____ _____

(SD River only) Oxygen Depleting Constituents? _____ _____

(SD River only) Chlorpyrifos and Diazinon? _____

(SD River only) Total and Dissolved Copper? _____

IDENTIFY CONDITIONS OF CONCERN

☐ Was a drainage study report prepared? Yes No

☐ Was a Storm Water Mitigation Plan prepared? Yes No

☐ Were the reports prepared by a registered Civil Engineer? Yes No Who?_____

☐ Are there field photographs? Yes No (Attached?)

☐ Are the following calculated according to actual % imperviousness for the 6-hour, 10-year and 100-year frequency storms?

- ☐ Peak flow rate (pre and post-construction)
- ☐ Flow velocity
- ☐ Runoff volume
- ☐ Time of concentration (minimum of 5 minutes as defined in the SD Hydrology Manual to calculate Intensity values)
- ☐ Retention volume

☐ Are conditions of concern adequately identified using:

Site Design?	Yes	No
Source Control?	Yes	No
Treatment Control?	Yes	No

ESTABLISH STORM WATER BMPS

☐ ***Site Design BMPs***

SUSMP Projects **must** consider, incorporate, and implement where determined applicable and feasible by City storm water staff. (Check all that were considered, incorporated, or implemented):

- ☐ Maintain Pre-Development Rainfall Runoff Conditions
  - ☐ Minimize project's impervious footprint
  - ☐ Conserve natural areas
  - ☐ Construct low traffic areas (walkways, trails, patios, parking lots, alleys, etc) of permeable surfaces
  - ☐ Construct streets, sidewalks, and parking lot aisles to minimum widths
  - ☐ Maximize canopy interception by preserving existing trees and shrubs
  - ☐ Preserve natural drainage systems
- ☐ Minimize Directly Connected Impervious Areas (DCIAs)
  - ☐ Drain rooftops into landscaping
  - ☐ Drain sidewalks, walkways, trails, and patios into landscaping
- ☐ Protect slopes and channels

Comments: _____

_____

Project Name: _____

☐ ***Source Control BMPs***

Does the project:

- ☐ Provide storm drain system stenciling and signage?
- ☐ Design outdoor material storage areas to reduce pollution introduction?
- ☐ Design trash storage areas to reduce pollution introduction (enclosed, covered, secured, and bermed)?
- ☐ Use efficient irrigations systems & landscape design (rain alert systems)?
- ☐ Incorporate requirements applicable to priority project categories such as:
  - ☐ Private Roads
  - ☐ Residential Driveways & Guest Parking
  - ☐ Dock Areas
  - ☐ Maintenance Bays
  - ☐ Vehicle Wash Areas
  - ☐ Outdoor Processing Areas
  - ☐ Equipment Wash Areas
  - ☐ Parking Areas
  - ☐ Roadways
  - ☐ Fueling Areas
  - ☐ Hillside Landscaping

☐ ***Treatment Control BMPs***

Check the treatment control(s) selected:

☐ Biofilters	☐ Detention Basin
☐ Infiltration basin/trench	☐ Filtration System
☐ Porous asphalt, concrete, other	☐ Hydrodynamic Separation System
☐ Filter Insert	☐ Sod-inlet Pre-treatment
☐ Grassy filter/swale	☐ Vegetated swale
☐ Proprietary Device	☐ Other: _____

☐ Do treatment controls effectively address primary pollutants of concern? Yes No

If No, describe corrective action: _____

_____

Verify the design of selected treatment controls:

☐ Was the control BMP designed for:	Volume	Flow
☐ Was the BMP design process described:	Yes	No
☐ Was the 85th percentile storm event used for design	Yes	No

If no, what design criteria was used: _____

☐ Was the BMP designed properly? If not, describe corrective actions: _____

_____

☐ Is the BMP(s) located near pollutant sources?	Yes	No
☐ Are there restrictions on use of infiltration BMPs?	Yes	No

Project Name: _____

Maintenance Requirements

☐ Was an O&M section attached? Yes No N/A

☐ Was a BMP Facilities Agreement signed by the property owner and filed with the Grant Deed? Yes No N/A

☐ Was a BMP Maintenance Agreement signed with the City to maintain BMPs located in the Right-of-Way? Yes No N/A

☐ Does this project require annual inspections and/or maintenance of BMPs by the City?

- Yes No N/A

☐ Was an access/easement agreement included? Yes No N/A

☐ Is there an HOA or other Common Interest planned for the project? Yes No N/A

☐ Were CC&Rs presented for review and acceptable? Yes No N/A

☐ Was a Storm Water Conveyance Maintenance Plan generated/received? Yes No N/A

Waiver of Structural Treatment BMP Requirements

☐ Was a waiver of infeasibility granted?

☐ Was the RWQCB notified?

Other Information

_____

_____

_____

Field Inspection

During BMP installation:

☐ Were the source control BMPs properly constructed in the field? ☐ Yes ☐ No

☐ Were the treatment control BMPs properly constructed in the field? ☐ Yes ☐ No

After project completion:

☐ Are all site design BMPs still in place? ☐ Yes ☐ No

☐ Are all source control BMPs still in place? ☐ Yes ☐ No

☐ Are treatment control BMPs still in place? ☐ Yes ☐ No

☐ Are all BMPs being maintained? ☐ Yes ☐ No

Erosion Control Plan

City of El Cajon

GENERAL STORM WATER NOTES

A. ALL OPERATION WILL COMPLY WITH THE CITY'S JURISDICTIONAL URBAN RUNOFF MANAGEMENT PLAN (JURMP).

B. THE OWNER AND THE OWNER'S CONTRACTOR ARE RESPONSIBLE FOR POLLUTION PREVENTION PRACTICES TO PREVENT THE DISCHARGE OF SEDIMENT AND POLLUTANTS TO THE PUBLIC STORM DRAIN SYSTEM.

C. OWNER AND THE OWNER'S CONTRACTOR ARE RESPONSIBLE FOR THE PREVENTION OF EROSION CAUSED BY CLEARING OF VEGETATION, GRADING, DEMOLITION OR CONSTRUCTION.

D. SEDIMENT, POLLUTION AND EROSION CONTROL MEASURES WILL BE IMPLEMENTED STARTING THE FIRST DAY OF CLEARING, GRADING OR SOIL DISTURBANCE, OR CONSTRUCTION. THESE CONTROLS WILL REMAIN IN EFFECT UNTIL ALL RELEVANT OPERATIONS HAVE BEEN COMPLETED AND DISTURBED SOILS HAVE EITHER: 1) ESTABLISHED VEGETATION, OR 2) OTHER PERMANENT EROSION CONTROL AT 70% COMPLETION.

EROSION AND SEDIMENT CONTROL NOTES

1. IN CASE OF EMERGENCY, CONTACT: NAME:_____ PHONE:_____

2. THE CONTRACTOR WILL MAINTAIN ALL SEDIMENT AND EROSION CONTROL DEVICES IN GOOD WORKING ORDER TO THE SATISFACTION OF THE CITY ENGINEER THROUGHOUT EVERY PHASE OF THE PROJECT.

3. THE CONTRACTOR WILL INSTALL ALL EROSION CONTROL MEASURE ADDITIONAL TO THOSE SPECIFIED BY THE APPROVED EROSION CONTROL PLAN IF REQUIRED TO DO SO BY THE CITY ENGINEER.

4. THE CONTRACTOR AND PROPERTY OWNER WILL PREVENT PUBLIC TRESPASS ONTO AREAS WHERE IMPOUNDED WATERS CREATE A HAZARDOUS CONDITION.

5. GRADED AREAS AROUND THE PROJECT PERIMETER WILL DRAIN AWAY FROM THE FACE OF SLOPES AT THE END OF EACH WORKING DAY.

6. ALL GRAVEL BAGS SHALL HAVE ¾ INCH MINIMUM AGGREGATE.

		Vicinity Map
_____	_____	Major roadways, geographic features or landmarks.
_____	_____	Site perimeter.
_____	_____	Geographic features.
_____	_____	General topography.

Date Completed	Not Applicable	

Site Characteristics

_____	_____	North arrow, scale, and site boundary. Indicate the name of adjacent streets or roadway.
_____	_____	Location of existing drainage ways, channels, swales, creeks, streams on or near the site.
_____	_____	Location of storm drain inlets, outlets, catch basins – proposed, existing, on-site, and within 100 feet of site.
_____	_____	Location of existing and proposed buildings and paved areas.
_____	_____	Show and label existing and proposed improvements (streets, sidewalks, curb/gutter, utilities, etc)
_____	_____	The limits of the proposed disturbed area on the lot.
_____	_____	Approximate gradient and direction of slopes before grading operations.
_____	_____	Approximate gradient and direction of slopes after final grading operations.
_____	_____	Disturbed area outlined and labeled. All sediment control devices must be shown within the disturbed limits.
_____	_____	Overland runoff (sheet flow) coming onto the site from adjacent areas.
_____	_____	Delineation of pre and post development drainage areas, number of acres, and the direction of flow for each drainage area before and after development must be shown. Use separate plan sheets for clarity.

Erosion Control Practices

_____	_____	Location of temporary soil piles
		Note: soil storage pile should be placed behind a sediment fence, 10-foot (minimum) wide vegetative strip should be covered with a tarp, or placed more than 25 feet from any down slope road or drainage way.
_____	_____	Location of gravel access drive(s).
		Note: Gravel drive should have 3 to 6 inch aggregate stone laid at least 10 feet wide and 12 inches thick. Drives should extend from the roadway 50 feet or to the house foundation (whichever is less).
_____	_____	Location of sediment controls (filter fabric fence, straw bale fence or 10-foot wide vegetative strips) that will prevent eroded soil from leaving the site.
_____	_____	Location of sediment barriers around on-site storm drain inlets.
_____	_____	Location of diversions.
		Note: Concentrated flow (drainage ways, ditches, channels, brow ditches) shall be diverted (re-directed) around disturbed areas. Overland runoff (sheet flow) from adjacent areas greater than 10,000 sq. ft. shall also be diverted around disturbed areas.
_____	_____	Location of practices that will be applied to control erosion on steep slopes that have been disturbed at any time by clearing, grading, or landscaping - slopes more than five feet in height, more than two hundred fifty square feet in total area, and steeper than three to one (run-to-rise).
		Note: Unstabilized drainage ways, ditches, channels, diversions, and inlets shall be protected from erosion through use of such practices as in-channel fabric or straw bale barriers, erosion control mats, staked sod, and rock riprap. When used, a given in-channel barrier should not receive drainage from more than two acres of unpaved area, or one acre of paved area. In-channel practices should not be installed in perennial streams (streams with year-round flow.)

Date Completed	Not Applicable	
_____	_____	Show Erosion Control Plan heading and standard notes.
_____	_____	Label all sediment control devices.
_____	_____	Show Standard details for sediment control devices.
_____	_____	No sediment control devices are to be located where water will damage building foundations.
_____	_____	Detail drawings and specifications for structural practices – any structural practices used must be illustrated with detailed drawings containing all dimensions and specifications. (i.e. de-silting basins)
_____	_____	Location of other planned practices not already noted. (Material Storage WM-1, Concrete Washout WM-8, Sanitary Waste WM-9, Solid Waste Storage WM-5)
_____	_____	Temporary stabilization of disturbed areas.
_____	_____	Note: disturbed areas and soil piles left inactive for more than 10 days be stabilized by seeding (between April 1st and September 1st), or by other cover, such as tarping or mulching. Permanent stabilization of site by re-vegetation or other means as soon as possible (lawn establishment).
		Indicate re-vegetation method: Seed ___ Sod ___ Other_____ Expect date of permanent re-vegetation: Re-vegetation responsibility of Builder ___ Owner/Buyer Is temporary seeding or mulching planned if site not seeded by September 1st or sodded by October 1st ? Yes ___ No ___
_____	_____	Use of downspouts and/or sump pump outlet extensions to direct runoff away from structures and onto sod or pavement until vegetation is stable. Downspouts shall be permanently to grass areas.
_____	_____	Proper disposal of building material waste so that pollutants and debris are not carried off-site by wind or water.
_____	_____	Maintenance of erosion control practices during construction:
		Name:_____
		Title:_____ Phone & Fax:_____

- Sediment will be removed from behind sediment fences and barriers before it reaches a depth that is equal to half the barrier's height.
- Breaks and gaps in sediment fences and barriers will be repaired immediately.
- All sediment that moves off-site due to construction activity will be cleaned up before the end of the same workday.
- All sediment that moves off-site due to storm events will be cleaned up before the end of the next workday.
- Gravel access drives will be maintained throughout construction.
- All installed erosion control practices will be maintained until the disturbed areas they protect are stabilized.

E. SPECIAL INVESTIGATIONS – FORRESTER CREEK IMPACT STUDY

For the third year, the City conducted upstream/downstream monitoring of dry weather constituents of concern in Forrester Creek. The monitoring was conducted on June 13, 2006 to assess the relative amount of pollutants discharged within the jurisdictional boundaries of El Cajon into Forrester Creek. The upstream location is at the County boundary, specifically at Fourth Street at Rancho Cajon, east side of the street. Flow at the upstream sample was approximately 3 gallons per minute. During rain events, flow from Crest and other unincorporated County areas discharge directly into the City of El Cajon without treatment. To date, no analytical data have been collected for wet weather flows.

Table 1

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Nitrate (mg/L NO_3-N)
Upstream	6/13/06	3.0	27.9	8.0	1.85	1.66	6.25
Downstream*	6/13/06	421	27.9	8.7	2.06	2.58	5.0

Table 2

Site	Date	Total Hardness (mg/LCaCO$_3$)	Oil & Grease (mg/L)	Total Coliform (MPN/100 mL)	Fecal Coliform (MPN/100 mlL)	Enterococcus (MPN/100 mL)	Total Dissolved Solids (mg/L)	Total Coliform (MPN/100 mL)
Upstream	6/13/06	48	nd	300,000	3,000	8,000	1,090	300,000
Downstream*	6/13/06	60	nd	170,000	500	70	1,600	170,000

The following is a summary of the upstream/downstream results:

- No detections of metals
- Reactive phosphorous upstream was 0.03 mg/L, downstream was 0.03 mg/L
- Detections of ammonia upstream was 0.04 mg/L, downstream was 0.8 mg/l
- Detergents were detected at 0.25 mg/L upstream, and 0.25 mg/L downstream

<u>Notable Results and Reasoning</u>

Increase in flow to 421 gallons per minute from upstream to downstream

Concentrations of many constituents decrease from upstream to downstream; this includes nitrate, total coliform, fecal coliform, enterococcus, total alkalinity, and total organic carbon. Increase in the concentrations (from upstream to downstream) of pH, turbidity, conductivity, ammonia, dissolved oxygen, total hardness, TDS, and sulfates.

The City does not have an explanation for the increase in flows or the significant increase in dry weather flow contributions within City boundaries. The City will need to conduct further dry weather investigations to develop enough data to establish baseline conditions (for current channel configurations) and to develop priorities for more detailed investigations for pollutant and dry weather flow sources.

Re: 2006 Forester Creek Impact Study
City of El Cajon, California

Dear Mr. Campos:

Enclosed please find our report for the City of El Cajon 2006 Forester Creek Impact Study. This project, also conducted in 2004 and 2005, is an additional study of the water quality in Forester Creek as it passes through El Cajon. The contents include field screening data, analytical laboratory test results, and analysis of the collected data.

It has been our pleasure working with the City of El Cajon on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering Inc.

Arsalan Dadkhah, Ph.D., P.E.

Forester Creek Impact Study

Forester Creek runs parallel to Interstate 8 as it enters the east side of the City of El Cajon (City). It then turns north after passing SR-67, flowing through the area around Gillespie Field before entering the City of Santee. Eventually, Forester Creek enters the San Diego River just east of the junction of SR-52 and SR-125, within the City of Santee.

The purpose of this study was to investigate how water quality in Forester Creek is affected as it flows through the City of El Cajon. To gauge this, one sample was collected from the creek near where it enters the City from the east (upstream), and another sample was taken where the creek exits the City in the north (downstream). Table 1 shows the locations of these two sites. This year, the creek was dry at the point where it enters the City of El Cajon. There was some flow observed just downstream of that point, where the upstream sample site was taken, but this flow was likely generated within the city at its southeastern limits. Water quality parameters in the upstream and downstream samples can be compared to see how the City itself contributes to pollutant loads. Also, it should be noted that the downstream location is the same as that used for dry weather Site 5. Therefore, the 2006 dry weather data from Site 5 was used in this study in order to alleviate the need to take an additional downstream sample and to minimize the costs of this study.

The same field and laboratory analyses employed during the standard dry weather program in El Cajon were conducted for the upstream and downstream samples. No constituents tested in the field at either of the two sites were measured above their respective dry weather action levels. The value for pH increased from 8.0 upstream to 8.7 downstream. While both values are within the acceptable range for pH (6.5 to 9.0), the higher downstream value is likely a result of the wide, shallow flow and significant amount of algal growth at that site. Typically, the pH increases during daylight hours in areas with those characteristics, as sunlight stimulates algal photosynthesis and carbon dioxide is removed from water. The ammonia concentration at the downstream site was higher than that at the upstream site: 0.4 mg/L and 0.8 mg/L, respectively.

As in 2005, levels of the three types of bacterial indicators evaluated were significantly lower at the downstream site than at the upstream site. Total coliform dropped from 300,000 MPN/100mL to 170,000 MPN/100 mL. Fecal coliform and enterococci were significantly lower at the downstream location than they were at the upstream site. Total Organic Carbon (TOC) was lower at the downstream site, while Total Dissolved Solids (TDS) was higher at the downstream site. Surfactants, oil and grease, and dissolved copper, cadmium, lead, and zinc were not detected by the laboratory at either location. Field analytical and laboratory data are presented in tables 2 and 3, respectively.

Additional laboratory analyses were conducted to analyze for the following total dissolved solids (TDS) components: total alkalinity, chloride, sulfate, calcium, potassium, magnesium, and sodium. The sample was first tested for TDS using the same procedure as in years past, and then the sample was passed through an additional filter with smaller pores. After additional filtration, which was conducted to remove any microparticles smaller than suspended solid particles but larger than most dissolved molecules, TDS was again tested to see if any microparticles were contributing to the original TDS value. TDS results are therefore given for both the standard TDS analysis of the sample water and for the TDS analysis of sample after additional filtration. The TDS components were all analyzed after the additional filtration step. This year, TDS was measured at 1,600 mg/L at the downstream site

and 1,090 at the upstream location. Potassium was not detected at either of the sites. Total alkalinity was higher upstream than downstream, dropping from 212 mg/L $CaCO_3$/L to 179 mg $CaCO_3$/L. The upstream and downstream levels of calcium were comparable, with the downstream level being only slightly higher than that measured upstream. Magnesium, sodium, chloride and sulfate were all present at higher concentrations downstream than upstream. The TDS component analysis data is presented in Table 4.

An obvious consideration when analyzing the results of this study is that Forester Creek has a flow of only a few gallons per minute (gpm) at the upstream site and a flow of several hundred gpm as it exits the City. As a result of this, a direct comparison of upstream and downstream constituent concentrations can be misleading. Since the TDS concentration is higher and the flow rate is higher at the downstream site, it seems that a fairly large volume of runoff with relatively high TDS levels continues to flow into Forester Creek within the boundaries of the City of El Cajon.

Neither this study nor the concurrent dry weather monitoring program, for which TDS component analyses were performed at a number of sites, specifically identifies one source of elevated TDS. The main TDS components, sulfate, chloride, sodium, calcium and total alkalinity, may leach into surface waters from naturally occurring mineral deposits in the ground. No point sources for TDS components have been observed within the City, and it is possible that elevated TDS levels are a result of natural background factors.

Table 1 Forester Creek Study Site Locations

Site ID	Location	Description	Primary Land Use	Secondary Land Use	Hydrologic Unit	Latitude	Longitude
Upstream	Greenfield Ave. and 8 west onramp intersection, behind southeast corner of Exxon station at 1699 E Main St	Concrete Channel	Commercial	Residential	907	32.81170	-116.91791
Downstream	Adjacent to the Weld Blvd. Trolley Station, SE. of the Marshall Ave./Cuyamaca St. intersection	Concrete Channel	Commercial	Industrial	907	32.82669	-116.98224

Table 2 Field Analytical Data for Forester Creek Sites

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Detergent (mg/L MBAS)	Ammonia (mg/L NH_3-N)	Nitrate (mg/L NO_3-N)	Reactive-Phosphorus (mg/L PO_4-P)	Dissolved Oxygen (mg/L)

City of El Cajon
Follow Up Investigation to Identify Source of Nitrates

A follow up monitoring investigation was conducted on November 9, 2007 to detect potential sources of nitrates at Monitoring Site 30 and 37. The photographs below document the investigation with the starting point at monitoring site 37 and continuing east (upstream) along the extension of the 66-inch corrugated steel pipe towards the reinforced concrete box under Jamacha Road. The investigation terminated east of Jamacha Road at the trapezoidal open channel.

Photo 1: Monitoring Site (Sample) # 37 – City of El Cajon's personnel preparing to be lowered into 66 inch corrugated steel pipe (CSP) to collect water samples. Samples were handled under the supervision of the consultant responsible for conducting the City's Dry Weather Monitoring Program. City of El Cajon Public Works Maintenance personnel facilitated testing by accessing confined spaces.

Photo 2: Photograph showing corroded invert elevation of the 66-inch CSP flow line. The pipe is in various forms of deterioration through out the extension of the pipe from monitoring site #37 to the western side of Jamacha Road. The deteriorated condition of the pipe may result in water seeping from outside the pipe.

Photo 3: (Sample 37-1) Lateral from professional offices at East Main Street. Minimal flow was observed at the time of the follow up investigation but the flow was sufficient to collect water sample.

Photo 4: Storm drain lateral from Grossmont Union High School District Work Training Facility lot. Minimal flow was observed at the time of investigation, the flow was not sufficient to collect water sample.

Photo 5: Catch basin at Grossmont Union High School District Work Training Facility. The catch basin drains directly to the 66" CSP. No flow was present at time of the investigation. (Sample 37-2) was collected from the 66" CSP below this catch basin grate.

Photo 6: Storm drain lateral from the Grossmont Union High School District Work Training Facility. Minimal flow was observed at the time of the investigation but not sufficient to gather water sample.

Photo 7: Curb inlet opening at the face of curb at Jamacha Road. No flow was visible during the investigation.

Photo 8: Arch steel pipe discharging water from north Jamacha Road. The pipe had minimal flow and insufficient to collect a water sample for analysis.

Photo 9: Reinforced concrete box (10 ft x 3.5 ft) extending east under Jamacha Road.

Photo 10: (Sample Site 37-3) transition between trapezoidal open channel and (72-inch x 44-inch) arch corrugated steel pipe. Photograph was taken looking westward, the corrugated pipe accepts flows from the open channel and continue to flow west (downstream) towards Jamacha Road and sampling site #37.

Photo 11: Trapezoidal open channel looking east of sampling site 37-3. Nitrate concentrations are below action levels on this channel.

CITY OF EL CAJON
INVENTORY OF MUNICIPAL FACILITIES

HIGH PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Civic Center, City Hall and Plaza	200 E. Main Street	Washington Channel
2.	Fire Station No. 9	1301 N. Marshall Avenue	Forester Creek
3.	Public Works Maintenance Division Office	1050 Vernon Way	Forester Creek
4.	Vehicle Maintenance Facility	1060 Vernon Way	Forester Creek

MEDIUM PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Animal Control	1275 N. Marshall Way	Forester Creek
2.	Fletcher Hills Park, Recreation Center and Pool	2345 Center Place	Fletcher
3.	Parks Office	154 Rea Avenue	Washington Channel
4.	Performing Arts Center	110 E. Main Street	Washington Channel
5.	Wells Park, Recreation Center and Maintenance	1153 E. Madison Avenue	Forester Creek
6.	Parks Storage Garage	148 Rea Avenue	Washington Channel

LOW PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Albert Van Zanten Park	1495 Greenfield Drive	Broadway Channel
2.	Bill Beck Park	Pierce Street and Wagner Drive	Broadway Channel
3.	Bostonia Park and Recreation Center	1049 Bostonia Street	Forester Creek/ Broadway Channel
4.	Cajon Valley Middle School Park	750 Park Avenue	Forester Creek/ County Ditch
5.	Community Policing Division	165 E. Park Avenue	Forester Creek
6.	El Cajon Community Center	195 E. Douglas Avenue	Forester Creek
7.	Fire Station No. 7	695 Tyrone Street	County Ditch
8.	Fire Station No. 8	842 N. Third Street	Forester Creek
9.	Fire Station Park	Tyrone Street and Westwind Drive	Forester Creek
10.	Fire Station/ Department Administration	100 E. Lexington Avenue	Forester Creek
11.	Hillside Park and Recreation Center	840 Buena Terrace	Fletcher Hills Parkway/ Fanita Channel Basin/ Forester Creek
12.	John F. Kennedy Park and Recreation Center	1675 E. Madison Avenue	County Ditch
13.	Judson Park	Magnolia Avenue and Park Avenue	Forester Creek
14.	Museum (Knox House)	280 N. Magnolia Avenue	Forester Creek
15.	Office	1034 Magnolia Avenue	Washington Channel
16.	Pistol Range	Gillespie Field	Washington Channel
17.	Police Department	100 Fletcher Parkway	North Forester Creek
18.	Police Department Detectives	1035 Pioneer Way	Forester Creek/ Broadway Channel
19.	Prescott Promenade Park	200 Block of Main Street	County Ditch
20.	Renette Park and Recreation Center	935 S. Emerald Avenue	County Ditch
21.	Tuttle Park	379 Chase Avenue	County Ditch

6.0 LAND-USE PLANNING FOR NEW DEVELOPMENT AND REDEVELOPMENT COMPONENT

Permit section F.1 requires each Copermittee to develop a plan to minimize the short and long-term impacts on receiving water quality from new development and redevelopment. As part of this plan, four main components must be addressed:

1) Assessment of General Plan
   Each Copermittee must assess its General Plan, and modify if necessary, to include water quality and watershed protection principles and policies to direct land-use decisions and require implementation of consistent water quality protection measures for development projects.

2) Modify Development Project Approval Process
   Prior to project approval and issuance of local permits, each Copermittee must require each proposed project to implement measures to ensure that pollutants and runoff from the development will be reduced to the maximum extent practicable and will not cause or contribute to an exceedance of receiving water quality objectives. This process involves developing the following:

   - Development Project Requirements
   - Standard Urban Storm Water Mitigation Plans (SUSMPs)

3) Revise Environmental Review Process
   Each Copermittee must review the current environmental review processes to include requirements of evaluation of water quality effects and identification of appropriate mitigation measures.

4) Conduct Education Efforts Focused on New Development and Redevelopment
   Each Copermittee must implement and education program to educate its planning and development review staffs and external project proponents.

The City of El Cajon has completed the requirements listed above. Descriptions of each component are presented below.

6.1 Assessment of General Plan

The City of El Cajon General Plan includes several objectives and policies related to water quality preservation and drainage among its basic goals and objectives. Additional policies are proposed to supplement the existing objectives and policies.

The following proposed amendment is in draft form with the proposed language underlined and it could change as a result of the public hearing process needed to consider a General Plan amendment. An amendment of the General Plan will be considered as soon as possible.

Objective 8-10. Achieve and maintain a level of water quality which protects affected watersheds by minimizing runoff which may cause erosion and pollution.

POLICIES

8-10.1. Minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment and where feasible slow runoff and maximize on-site infiltration of runoff.

8-10.2. Implement pollution prevention methods supplemented by pollutant source controls and treatment. Use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into a municipal separate storm sewer system. (MS4)

8-10.3. Preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. Encourage land acquisition of such areas.

8-10.4. Limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

8-10.5. Prior to making land use decisions, utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. Require incorporation of structural and non-structural best management practices to mitigate the projected increases in pollutant loads and flows.

8-10.6. Avoid development of areas that are particularly susceptible to erosion and sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss.

8-10.7. Reduce pollutants associated with vehicles and increasing traffic resulting from development. Coordinate local traffic management reduction efforts with the San Diego County Congestion Management Plan.

8-10.8. Implement the San Diego Association of Government's (SANDAG's) recommendations as found in the Water Quality Element of its Regional Growth Management Strategy.

8-10.9. Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

6.2 Modification of Development Project Approval Process

6.2.1 Development Project Approval Process

The City of El Cajon Municipal Code (ECMC) requires all new development or modifications of existing development involving three or more multiple family units, office uses, retail uses or industrial uses to obtain a site development plan (SDP). Chapter 17.56 of the ECMC outlines the SDP process and its requirements, and is included in Appendix A.5.

Other uses are determined to be special and are required to obtain a conditional use permit (CUP). That process is included in Chapter 17.70 of the ECMC and is attached hereto.

These processes ensure compliance with all City standards, including those relating to water quality, by requiring design modifications and imposing specific conditions of approval and are both considered to be adequate and are not proposed to be amended.

RESOLUTION NO. 10–03

A RESOLUTION APPROVING GENERAL PLAN AMENDMENT 2002-04 TO ADD STORM WATER RUNOFF POLICIES AND OBJECTIVES TO GENERAL PLAN TEXT.

WHEREAS, the El Cajon City Council duly advertised and held a public hearing on January 14, 2003, to consider an item which had been set for General Plan consideration; and

WHEREAS, to facilitate understanding by the public, the City Council took tentative or preliminary votes on this item, which vote was not binding until the public hearing was completed; and

WHEREAS, the City Council duly considered all information presented, and listened to all persons who appeared before it to speak.

NOW, THEREFORE, BE IT RESOLVED that the El Cajon City Council hereby approves General Plan Amendment 2002-04 to add storm water policies to the General Plan text as indicated in Planning Commission Resolution No. 9734, on file in the office of the City Clerk, and made a part hereof by this reference.

PASSED AND ADOPTED by the City Council of the City of El Cajon, California at a Regular Joint City Council/Redevelopment Agency Meeting held this 14th day of January, 2003, by the following vote to wit:

AYES : Lewis, Kendrick, McClellan, Ramos, Santos
NOES : None
ABSENT : None
DISQUALIFY : None

MARK LEWIS
Mayor of the City of El Cajon

ATTEST:

MARILYNN LINN, CMC
City Clerk

I hereby certify that the above and foregoing is a full and true copy of Resolution No. 10-03 of the Resolutions of the City of El Cajon, California, as adopted by the City Council at the Regular Joint Meeting of the City Council/Redevelopment Agency on the 14th day of January, 2003.

for M Steele
Marilynn Linn, CMC, City Clerk

1/14/03 (103)

STAFF REPORT AND RECOMMENDATION
PLANNING COMMISSION MEETING
DECEMBER 9, 2002 - 7:00 PM

COUNCIL CHAMBER
200 E. MAIN STREET
EL CAJON, CA 92020

AGENDA ITEM #3

PUBLIC HEARING ON
GENERAL PLAN AMENDMENT 2002-04 – Planning Commission

Request to add storm water policies to General Plan text.

******** ******** ******** ********

STAFF RECOMMENDATION: RECOMMEND APPROVAL

******** ******** ******** ********

ENVIRONMENTAL IMPACT INFORMATION

The proposed project is exempt from environmental review in accordance with Section 15308 of CEQA Guidelines.

DISCUSSION

As part of the local implementation of the federal Clean Water Act, the County of San Diego and its 18 cities have obtained a National Pollution Discharge Elimination System (NPDES) permit from the Regional Water Quality Control Board. The NPDES permit addresses the handling of storm water runoff by the 18 cities, their residents and businesses. Part of the NPDES permit includes a Jurisdictional Urban Runoff Management Program (JURMP) (Note: there are lots of acronyms used in the storm water runoff dictionary).

Although most of the City's storm water and drainage implementation is carried out by the Department of Public Works, there is a requirement in the NPDES and the JURMP that the General Plan include policies and principles which address water quality and storm water runoff. An attempt to add these policies and

principles to the General Plan last year was withdrawn when it was determined to be premature (GPA 2001-01).

Goal 8 of the El Cajon General Plan says, "The livability of El Cajon will be maintained and enhanced through respect for the environment." There are a number of policies under this goal which address other environmental issues and concerns and this is where the staff believes the policy and objectives (principles) for storm water runoff should be located within the City's general plan text.

RECOMMENDATION

It is recommended that the Planning Commission recommend approval of General Plan Amendment 2002-04 to add storm water runoff policy and objectives to the text of the General Plan as follows and for the following reasons:

Add the following objective and policies to Goal 8.

"Objective 8-10. Achieve and maintain a level of water quality which protects affected watersheds by minimizing runoff which may cause erosion and pollution.

POLICIES

8-10.1. The City shall minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment. Where feasible, the City will insure that new development or redevelopment slows runoff and maximizes on-site infiltration of runoff.

8-10.2. The City shall implement pollution prevention methods supplemented by pollutant source controls and treatment. The City will use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into a municipal separate storm sewer system. (MS4)

8-10.3. The City shall preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. The City will encourage land acquisition of such areas.

8-10.4. The City shall limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

8-10.5. Prior to making land use decisions, the City will utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City shall require incorporation of structural and non-

structural best management practices to mitigate the projected increases in pollutant loads and flows.

8-10.6. The City will avoid development of areas that are particularly susceptible to erosion and sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss.

8-10.7. The City will reduce pollutants associated with vehicles and increasing traffic resulting from development. The City will coordinate local traffic management reduction efforts with the San Diego County Congestion Management Plan.

8-10.8. The City will implement the San Diego Association of Government's (SANDAG's) recommendations as found in the Water Quality Element of its Regional Growth Management Strategy.

8-10.9. Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable."

Reasons for Recommendation

A. This amendment to the text of the City's general plan will add a policy and objectives addressing storm water runoff as required by the National Pollution Discharge Elimination System (NPDES) permit issued to the City.

B. This amendment will provide policy and objectives dealing with storm water runoff to guide decision-making in the city.

C. This amendment is consistent with the City's Jurisdictional Urban Runoff Management Program (JURMP).

Refer to staff for a resolution stating the decision of the Planning Commission.

JSG:co

EL CAJON GENERAL PLAN 2000

Text and Map adopted by
City Council Resolution No. 10-91
on January 8, 1991

Text and Map amended by
City Council Resolution No. 31-98
on February 10, 1998

January, 2001

OBJECTIVE

8-10. Achieve and maintain a level of water quality which protects affected watersheds by minimizing runoff which may cause erosion and pollution.

POLICIES

8-10.1. The City shall minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment. Where feasible, the City will insure that new development or redevelopment slows runoff and maximizes on-site infiltration of runoff.

8-10.2. The City shall implement pollution prevention methods supplemented by pollutant source controls and treatment. The City will use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants off site and into a municipal separate storm sewer system. (MS4)

8-10.3. The City shall preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. The City will encourage land acquisition of such areas.

8-10.4. The City shall limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

8-10.5. Prior to making land use decisions, the City will utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City shall require incorporation of structural and non-structural best management practices to mitigate the projected increases in pollutant loads and flows.

8-10.6. The City will avoid development of areas that are particularly susceptible to erosion and

sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss.

8-10.7. The City will reduce pollutants associated with vehicles and increasing traffic resulting from development. The City will coordinate local traffic management reduction efforts with the San Diego County Congestion Management Plan.

8-10.8. The City will implement the San Diego Association of Government's (SANDAG's) recommendations as found in the Water Quality Element of its Regional Growth Management Strategy.

8-10.9. Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

GOAL 9

A strong, competitive region-wide commercial base will be created and retained.

OBJECTIVE

9-1. Parkway Plaza and its immediate vicinity will be maintained as the City's regional shopping center.

POLICIES

9-1.1. Parkway Plaza shall be expanded from its original size and the number of major tenants and stores shall be increased.

9-1.2. The City shall continue to improve traffic circulation in the vicinity of Parkway Plaza.

9-1.3. The City shall cooperate with Parkway Plaza in the provision of parking facilities and may develop special

ORDINANCE NO. 4908

AN ORDINANCE REPEALING CHAPTERS 16.100, 16.101, 16.102, 16.103, 16.104, 16.105, 16.106, 16.107 AND 16.108 OF TITLE 16 OF THE EL CAJON MUNICIPAL CODE AND ADDING A NEW CHAPTER 16.60 TO TITLE 16 OF THE EL CAJON MUNICIPAL CODE REGARDING THE CITY OF EL CAJON STANDARD URBAN STORM WATER MITIGATION PLAN.

WHEREAS, the City of El Cajon, pursuant to its Water Quality Permit issued on February 21, 2001, is required to adopt certain implementation steps as mandated by the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, one of the implementation steps requires the adoption of an Urban Storm Water Mitigation Plan based upon a pre-approved Model adopted on June 10, 2002, by the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, this Ordinance shall be the Urban Storm Water Mitigation Plan adopted pursuant to the mandate of the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, this Ordinance shall allow for the adoption of resolutions and policies which shall implement the El Cajon Standard Urban Water Mitigation Plan not included in this Ordinance; and

WHEREAS, the adoption of this Ordinance, by the findings of the Regional Water Quality Control Board (San Diego Region), is exempt from the requirements of the California Environmental Quality Act; and

WHEREAS, the purpose of this Ordinance is to protect valuable water resources of the City of El Cajon and its surrounding environs from pollutants.

NOW, THEREFORE, BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF EL CAJON AS FOLLOWS:

Section 1: Chapters 16.100, 16.101, 16.102, 16.103, 16.104, 16.105, 16.106, 16.107, and 16.108 of the El Cajon Municipal Code are hereby repealed.

Section 2: Chapter 16.60 is hereby added to the El Cajon Municipal Code to read as follows:

16.60.010 Title.

The ordinance codified in this chapter shall be known as the "standard urban storm water mitigation plan (SUSMP) ordinance of the city of El Cajon."

16.60.020 Statutory Authority.

A. The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Order No. R9-2007-0001, NPDES No. CAS0108758, hereinafter referred to as "Municipal Permit") issued to San Diego County, San Diego County Regional Airport Authority, the Port of San Diego, and eighteen cities by the San Diego Regional Water Quality Control Board (Regional Board) on January 24, 2007, requires the development and implementation of a program addressing urban runoff pollution issues in development planning for public and private projects.

B. The requirement to implement a program for development planning is based on federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating urban runoff discharges from municipal, industrial, and construction activities under the NPDES program. The municipal permit requires the implementation of a Jurisdictional Urban Runoff Management Program (JURMP), which has been adopted by the city of El Cajon on February 12, 2002, as amended.

16.60.030 Purpose.

A. The primary objectives of this division are to:

1. Ensure that discharges from municipal urban runoff conveyance systems do not cause or contribute to a violation of water quality standards;

2. Effectively prohibit non-storm water discharges in urban runoff; and

3. Reduce the discharge of pollutants from urban runoff conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

B. The regulations of this division were developed to address post-construction urban runoff pollution from new development and redevelopment applications that fall under "priority project" categories. The goal of this division is to develop and implement practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from a project site and considers urban runoff flow rates, velocities and durations. This goal may be achieved through site-specific controls and/or drainage area-based or shared structural treatment controls.

16.60.040 Applicability of chapter.

The regulations set forth in this chapter shall apply to the development plan approval process for discretionary development applications, and prior to issuing development permits for ministerial projects. To allow flexibility in meeting the design

standards set forth in this division, structural treatment control BMPs may be located on- or off-site, used singly or in combination, or shared by multiple developments, provided certain conditions are met. All new development and significant redevelopment projects that fall into one of the following "priority project" categories are subject the requirements of this division, subject to the lawful prior approval provisions of the municipal permit. In the instance where a project feature, such as a parking lot, falls into a priority project category, the entire project footprint is subject to the requirements of this division. These categories are:

A. Residential development of ten (10) units or more;

B. Commercial development greater than one (1) acre;

C. Heavy industry industrial development greater than one (1) acre;

D. Automotive repair shops;

E. Restaurants;

F. Hillside development greater than 5,000 square feet;

G. Projects located within or directly adjacent to or directly discharging to receiving waters within environmentally sensitive areas that create 2,500 square feet or more of impervious surface or increase the area of imperviousness to ten percent (10%) or more of its naturally occurring conditions;

H. Projects having more than 2,500 square feet of impervious surface that discharge to receiving waters within or adjacent to environmentally sensitive areas;

I. Parking lots with 5,000 square feet or more of impervious surface, or with more than fifteen (15) parking spaces and potentially exposed to urban runoff;

J. Streets, roads, highways, and freeways, which would create a new paved surface that is 5,000 square feet or more of impervious surface; and

K. Retail gasoline outlets of 5,000 square feet or more in size, or having a projected average daily traffic ("ADT") count of at least 100 vehicles per day regardless of size.

16.60.050 Limited exclusion.

Trenching and resurfacing work associated with utility projects; resurfacing and reconfiguring surface parking lots and existing roadways; new sidewalk construction, pedestrian ramps, or bike lanes on existing roads; and routine replacement of damaged pavement, such as pothole repair, are not considered priority projects. Parking lots,

buildings and other structures associated with utility projects are subject to the requirements of this division if one or more of the criteria for the above categories are met.

16.60.060 Applicability of chapter 13.10.

The provisions of Chapter 13.10 (Storm Water Management and Discharge Control), including the definitions and enforcement provisions, shall be applicable to this chapter as though fully set forth herein.

16.60.070 Administration – limitations.

Where requirements of this division conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the city council may continue the local practice and modify this division to be consistent with the code, except that to the extent that the standards in this division are more stringent than those under local codes, such more stringent standards shall apply.

16.60.080 Administration – Provisions for SUSMP requirements.

The requirements of this division shall be incorporated into the project design and shown on the plans prior to approval of discretionary permits. For projects requiring only ministerial permits, the requirements of this division shall be incorporated into the project design and shown on the plans prior to the issuance of any ministerial permits. City departments carrying out public projects that are not required to obtain permits shall be responsible for ensuring the requirements of this division are incorporated into the project design and shown on the plans prior to bidding for construction contracts, or equivalent. For public projects the requirements of this division must be incorporated into the project design and shown on the plans before allowing the project to commence.

16.60.090 Administration – Implementation.

All priority projects shall implement one or a combination of storm water BMPs, including, (1) LID and site design BMPs, (2) source control BMPs and, (3) structural treatment BMPs after the pollutants and conditions of concern have been identified. Storm water BMPs shall be considered and implemented where expressly required by this division and if not so required where determined applicable and feasible by the Director of Public Works. The storm water BMPs shall adhere to the requirements of this division, and shall be correctly designed so as to remove pollutants to the maximum extent practicable. A flow chart summarizing the storm water BMP selection procedure is provided in Figure 1.

16.60.100 Administration – Site design storm water treatment credits.

Project proponents may develop and submit for public review and comment and city council approval a regional model site design storm water treatment credits program that allows reductions in the volume or flow of storm water that must be captured or treated on a project in return for the inclusion of specified project design features in the project. The model site design storm water treatment credits program shall be deemed to be a part of this division following city council approval. Any such model program shall specify the conditions under which project proponents can be credited for the use of site design features and low impact development techniques that can reduce the volume of storm water runoff, preserve natural areas, and minimize the pollutant loads generated and potentially discharged from the site. Any site design storm water treatment credits program implemented shall be consistent and compliant with this division and approved by the city council.

[Remainder of page intentionally left blank]

Figure 1. Storm Water BMP Selection Procedure Flow Chart

16.60.110 Identifying pollutants and conditions of concern.

A. Priority project proponents shall use this guidance to identify pollutants and conditions of concern, for which they need to mitigate or protect against. Site design and source control BMPs are required based on pollutants commonly associated with the proposed project type (see Table 2, "Standard Storm Water BMP Selection Matrix"). Treatment Control BMPs are also required for the project's expected pollutants of concern (see Table 3).

B. For private priority projects, the information shall be provided with the project application prior to being deemed complete.

C. For public priority projects, the information shall be provided by the Director of Public Works prior to bidding for construction contracts.

16.60.120 General categories of water pollution.

A. Sediments – Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

B. Nutrients – Nutrients are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

C. Metals – Metals are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary source of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

D. Organic Compounds – Organic compounds are carbon-based. Commercially available or naturally occurring organic compounds are found in

pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

E. Trash & Debris – Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfides.

F. Oxygen-Demanding Substances – This category includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

G. Oil and Grease – Oil and grease are characterized as high-molecular weight organic compounds. Primary sources of oil and grease are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

H. Bacteria and Viruses – Bacteria and viruses are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. Also, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

I. Pesticides – Pesticides (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

16.60.130 Identifying pollutants from the project area.

Using Table 1, pollutants shall be identified that are anticipated to be generated from the proposed priority project categories. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern.

16.60.140 Identifying pollutants of concern.

A. Pollutants generated by the proposed priority project that exhibit one or more of the following characteristics are considered primary pollutants of concern:

- Current loadings or historical deposits of the pollutant are impairing the beneficial uses of a receiving water;
- Elevated levels of the pollutant are found in water or sediments of a receiving water and/or have the potential to be toxic to or bioaccumulate in organisms therein; and
- Inputs of the pollutant are at a level high enough to be considered potentially toxic.

B. To identify primary pollutants of concern in receiving waters, each priority project shall, at a minimum, do the following:

1. For each of the proposed projects discharge points, identify the receiving water(s) that each discharge point proposes to discharge to, including hydrologic unit basin number(s), as identified in the most recent version of the *Water Quality Control Plan for the San Diego Basin*, prepared by the San Diego Regional Water Quality Control Board;

2. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies. List any and all pollutants for which the receiving waters are impaired;

3. Compare the list of pollutants for which the receiving waters are impaired with the pollutants anticipated to be generated by the project (as identified in Table 1). Any pollutants identified by Table 1 which are also causing impairment of receiving waters shall be considered primary pollutants of concern.

For projects where no primary pollutants of concern exist, those pollutants identified through the use of Table 1 shall be considered secondary pollutants of concern.

16.60.150 Identifying conditions of concern.

A. Common impacts to the hydrologic regime resulting from development typically include increased runoff volume and velocity; reduced infiltration; increased flow frequency, duration, and peaks; faster time to reach peak flow; and water quality degradation. These changes have the potential to permanently impact downstream

channels and habitat integrity. A change to a priority project site's hydrologic regime would be considered a condition of concern if the change would impact downstream channels and habitat integrity. Because of these potential impacts, a director, or his or her designee, may require that the following steps be followed for priority projects that, in their judgment, may impact the hydrologic regime:

1. Evaluate the project's conditions of concern in a drainage study report prepared by a registered civil engineer in the State of California, with experience in fluvial geomorphology and water resources management. The report shall consider the project area's location (from the larger watershed perspective), topography, soil and vegetation conditions, percent impervious area, natural and infrastructure drainage features, wet season groundwater depth, and any other relevant hydrologic and environmental factors to be protected specific to the project area's watershed;

2. As part of the drainage study, a qualified, licensed professional shall provide a report on proposed infiltration techniques (trenches, basins, dry wells, permeable pavements with underground reservoir for infiltration) regarding any potential adverse geotechnical concerns. Geotechnical conditions (such as slope stability, expansive soils, compressible soils, seepage, groundwater depth, and loss of foundation or pavement subgrade) should be addressed, and mitigation measures provided;

3. As part of the drainage study, the civil engineer shall conduct a field reconnaissance to observe and report on downstream conditions, including undercutting erosion, slope stability, vegetative stress (due to flooding, erosion, water quality degradation, or loss of water supplies) and the area's susceptibility to erosion or habitat alteration as a result of an altered flow regime;

4. The drainage study shall compute rainfall runoff characteristics from the project area including, at a minimum, peak flow rate, flow velocity, runoff volume, time of concentration, and retention volume. These characteristics shall be developed for the two-year and 10-year frequency, Type I storm, of six-hour or 24-hour duration (whichever is the closer approximation of the site's time of concentration), during critical hydrologic conditions for soil and vegetative cover[1]. The drainage study shall report the project's conditions of concern based on the hydrologic and downstream conditions discussed above. Where downstream conditions of concern have been identified, the drainage study shall establish that pre-project hydrologic conditions affecting downstream conditions of concern would be maintained by the proposed project, satisfactory to the Director of Public Works, by incorporating the site design, source control, and treatment control requirements identified in this division.

B. For priority development projects that disturb ("PDP") fifty (50) acres or more:

---

[1]. Design storms can be found at http://www.wrcc.dri.edu/pcpnfreq.html. Applicants may calculate the storm events using local rain data. In addition, isopluvial maps contained in the County of San Diego Hydrology Manual may be used to extrapolate rainfall data to areas where insufficient data exists. If isopluvial maps are used interpolations shall be linear.

1. PDP post project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations (interim hydromodification criteria) where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations.

2. PDPs disturbing fifty (50) acres or more shall implement hydrologic controls to manage post-project runoff flow rates and durations as required by the interim hydromodification criteria.

Table 1. Anticipated and Potential Pollutants Generated by Land Use Type.

	General Pollutant Categories								
Priority Project Categories	Sediments	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Detached Residential Development	X	X			X	X	X	X	X
Attached Residential Development	X	X			X	P(1)	P(2)	P	X
Commercial Development >100,000 ft^2	P(1)	P(1)		P(2)	X	P(5)	X	P(3)	P(5)
Heavy industry /industrial development	X		X	X	X	X	X		
Automotive Repair Shops			X	X(4)(5)	X		X		
Restaurants					X	X	X	X	
Hillside Development >5,000 ft^2	X	X			X	X	X		X
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Retail Gasoline Outlets			X	X	X	X	X		
Streets, Highways & Freeways	X	P(1)	X	X(4)	X	P(5)	X		

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

16.60.160 Progression of storm water BMPs.

Site design BMPs reduce the need for source and/or treatment control BMPs, and source control BMPs may reduce the amount of treatment control BMPs needed. Throughout all the following sections, all priority projects shall consider, and incorporate and implement where expressly required by this division and if not so required where determined applicable and feasible by the Director of Public Works, storm water BMPs into the project design, in the following progression:

- Site Design BMPs
- Source Control BMPs
- Treatment Control BMPs

16.60.170 Requirements to implement storm water BMPs.

Priority projects must implement LID site design BMPs and source control BMPs, and must also implement treatment control BMPs unless a waiver is granted based on the infeasibility of all treatment control BMPs. LID BMPs must meet the minimum requirements in section D.1.d.(4) of NPDES Permit No. CAS 0108758. BMPs must also achieve certain performance standards set out in section D.1.d. (5) and (6). Selection of BMPs from the menus included in this division, using the rules set out in this division, must fulfill these requirements. In addition, runoff treated by LID and site design or source control BMPs, such as rooftop runoff treated in landscaping, may be useful in reducing the quantity of runoff required to be treated in, "Treatment Control BMPs."

16.60.180 Selection of storm water BMPs.

Using the Treatment Control BMP Selection Matrix, each priority project shall select a structural treatment BMP by comparing the list of pollutants for which the downstream receiving waters are impaired (if any), with the pollutants anticipated to be generated by the project (as identified in Table 1). Any pollutants identified by Table 1 which are also causing a Clean Water Act section 303(d) impairment of the receiving waters of the project shall be considered primary pollutants of concern. Priority projects that are anticipated to generate a primary pollutant of concern shall meet all applicable requirements of establishing stormwater BMPs, and shall select a single or combination of storm water BMPs from Table 3 which maximizes pollutant removal for the particular primary pollutant(s) of concern.

Alternatively, a project proponent may elect to implement a combination of LID BMPs that either disperse and infiltrate, or direct to bioretention facilities, the flows from all impervious areas on-site. These BMPs are presumed to provide maximum extent practicable treatment for all pollutants of concern; therefore no further documentation of the treatment BMP selection process is required.

16.60.190 Storm water BMPs for projects not generating pollutants.

Priority projects that are not anticipated to generate a pollutant for which the receiving water is Clean Water Act Section 303(d) impaired shall meet applicable standard requirements of establishing stormwater BMPs, and shall select a single or combination of storm water BMPs from Table 3 which are effective for pollutant removal of the identified secondary pollutants of concern, consistent with the "maximum extent practicable" standard defined in Attachment D of the Municipal Permit.

16.60.200 Storm water BMPs for projects generating primary and secondary pollutants.

Where a site generates both primary and secondary pollutants of concern, primary pollutants of concern receive priority for BMP selection. For such sites, selected BMPs must only maximize pollutant removal for the primary pollutants of concern. Where a site generates only secondary pollutants of concern, selected BMPs shall target the secondary pollutant of concern determined to be most significant for the project. Selected BMPs must be effective for the widest range of pollutants of concern anticipated to be generated by a priority project (as identified in Table 1), consistent with the maximum extent practicable standard defined in Attachment D of the Municipal Permit.

Treatment control BMPs with a high or medium pollutant removal efficiency for the project's most significant pollutant of concern shall be selected. Treatment control BMPs with a low removal efficiency ranking shall only be approved by the city when a feasibility analysis has been conducted, which exhibits that implementation of treatment control BMPs with a high or medium removal efficiency ranking are infeasible. Treatment control BMPs shall not be constructed within a receiving water.

16.60.210 Alternative storm water BMPs.

Alternative storm water BMPs not identified in Table 3 may be approved at the discretion of the Director of Public Works, provided the alternative BMP is as effective in removal of pollutants of concern as other feasible BMPs listed in Table 3.

Table 2. Site Design and Source Control Storm Water BMP Selection Matrix.

Priority Project Category	*Site Design BMPs(1)*	*Source Control BMPs(2)*	*Requirements Applicable to Individual Priority Project Categories(3)*										
			a. Private Roads	b. Residential Driveways & Guest Parking	c. Dock Areas	d. Maintenance Bays	e. Vehicle Wash Areas	f. Outdoor Processing Areas	g. Equipment Wash Areas	h. Parking Areas	i. Roadways	j. Fueling Areas	k. Hillside Landscaping
Detached Residential Development	R	R	R	R									R
Attached Residential Development	R	R	R										
Commercial Development >100,000 ft^2	R	R			R	R	R	R					
Automotive Repair Shop	R	R			R	R	R		R			R	
Restaurants	R	R			R				R				
Hillside Development >5,000 ft^2	R	R	R										R
Parking Lots	R	R								R(4)			
Streets, Highways & Freeways	R	R									R		

R = Required; select BMPs as required from the applicable steps in Section VI.2.a & b, or equivalent as identified in Appendix A.
(1) Refer to Section VI.2.a.
(2) Refer to Section VI.2.b.
(3) Priority project categories must apply specific storm water BMP requirements, where applicable. Projects are subject to the requirements of all priority project categories that apply.
(4) Applies if the paved area totals >5,000 square feet or with >15 parking spaces and is potentially exposed to urban runoff.

Table 3. Treatment Control BMP Selection Matrix.

Pollutants of Concern	Bioretention Facilities (LID)	Settling Basins (Dry Ponds)	Wet Ponds and Wetlands	Infiltration Facilities or Practices (LID)	Media Filters	High-rate biofilters	High-rate media filters	Trash Racks & Hydro -dynamic Devices
Coarse Sediment and Trash	High	High	High	High	High	High	High	High
Pollutants that tend to associate with fine particles during treatment	High	High	High	High	High	Medium	Medium	Low
Pollutants that tend to be dissolved following treatment	Medium	Low	Medium	High	Low	Low	Low	Low

Notes on Treatment Control BMP Categories

All rankings are relative. Ranking of all facilities assumes proper sizing, design, and periodic maintenance. Following are general descriptions of each category.

- **Bioretention Facilities** (infiltration planters, flow-through planters, bioretention areas, and bioretention swales). Facilities are designed to capture runoff and infiltrate slowly through soil media, which also supports vegetation. Bioretention facilities, except for flow-through planters, effectively promote infiltration into native soils. In clay soils, facilities may capture excess treated runoff in an underdrain piped to the municipal storm drain system. Typical criteria: an infiltration surface area at least 4% of tributary impervious area, 6-inch average depth of top reservoir, 18-inch soil layer, 12-inch to 18-inch gravel subsurface storage layer.

- **Settling Basins and Wetlands** (extended detention basins, "wet" basins, decorative or recreational lakes or water features also used for storm water treatment, constructed wetlands). Facilities are designed to capture a minimum water quality volume of 80% of total runoff and detain for a minimum of 48 hours. Some wetland designs have proven effective in removing nutrients, but performance varies.

- **Infiltration Facilities or Practices** (infiltration basins, infiltration trenches, dry wells, dispersal of runoff to landscape, pervious pavements). These facilities and landscape designs capture, retain, and infiltrate a minimum of 80% of runoff into the ground. Infiltration facilities are generally only feasible in permeable (Hydrologic Soil Group A or B) soils. Volume and area of infiltration facilities depends on soil permeability and safety factor used. Typical criteria: Infiltration facilities should have pretreatment to remove silt to prolong life of the facility. A 10-foot vertical separation from average seasonal groundwater depth is required. Dispersal to landscape may be accomplished in any soil type and generally requires a maximum 2:1 ratio impervious:pervious and concave topography to ensure the first 1 inch of rainfall is retained.

- **Media Filters** (sand filters). Filters designed to treat runoff produced by a rainfall of 0.2 inches per hour (or 2×85th percentile hourly rainfall intensity) by slow infiltration through sand or other media. Typical criteria: Surface loading rate not to exceed 5 inches/hour. Entire surface of the sand must be accessible for maintenance.

- **High Rate Biofilters** (tree wells, typically proprietary). Biofilters with specially designed media to rapidly filter runoff while removing some pollutants. Filterra® (proprietary version) recommends surface loading rates of up to 100 inches/hour.

- **High-rate Media Filters** (typically proprietary). Vaults with replaceable cartridge filters filled with inorganic media.

- **Drainage Inserts** have low effectiveness in removing pollutants that tend to associate with fine particles and have medium effectiveness in removing coarse sediment and trash. They are sometimes used to augment more effective treatment facilities and are sometimes used alone when more effective facilities have been deemed infeasible.

Notes on Pollutants of Concern:
In Table 3, Pollutants of Concern are grouped as gross pollutants, pollutants that tend to associate with fine particles, and pollutants that remain dissolved.

Pollutant	Coarse Sediment and Trash	Pollutants that tend to associate with fine particles during treatment	Pollutants that tend to be dissolved following treatment
Sediment	X	X	
Nutrients		X	X
Heavy Metals		X	
Organic Compounds		X	
Trash & Debris	X		
Oxygen Demanding		X	
Bacteria		X	
Oil & Grease		X	
Pesticides		X	

16.60.220 Low Impact Development (LID) and site design BMP

A. Priority projects shall be designed so as to minimize directly connected impervious surfaces and to promote infiltration using LID techniques. Priority projects shall, to the maximum extent practicable, minimize the introduction of pollutants and conditions of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. Priority projects shall also control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion and to protect stream habitat. Priority projects can address these objectives through the creation of a hydrologically functional project design that attempts to mimic the natural hydrologic regime. Mimicking a site's natural hydrologic regime can be pursued by:

- Reducing imperviousness, conserving natural resources and areas, maintaining and using natural drainage courses in the storm water conveyance system, and minimizing clearing and grading.
- Providing runoff storage measures dispersed throughout a site's landscape with the use of bioretention facilities and detention, retention, and infiltration practices.

B. Site design BMPs shall offer an innovative approach to urban storm water management that does not rely on the conventional end-of-pipe or in-the-pipe structural methods but instead uniformly or strategically integrates storm water controls throughout the urban landscape. Examples of many of these methods may be found in the County of San Diego's LID Handbook, and its publications, *Start at the Source*, and *Low-Impact Development Design Strategies*, in the City of Portland, Oregon's *Stormwater Manual*, and in the Contra Costa (California) Clean Water Program's *Stormwater C.3 Guidebook*.

16.60.230 Maintaining pre-development rainfall runoff characteristics.

A. Priority projects shall control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion. In addition, projects should control runoff discharge volumes and durations to the maximum extent practicable using the site design, source control, and treatment control requirements.

B. Design Concept 1: Minimize Project's Impervious Footprint & Conserve Natural Areas. The following site design options shall be considered and, incorporated and implemented where determined applicable and feasible by the Director of Public Works, during the site planning and approval process, consistent with applicable General Plan policies and other development regulations.

1. Minimize and disconnect impervious surfaces. This can be achieved in various ways, including, but not limited to increasing building density (number of stories above or below ground) and developing land use regulations seeking to limit impervious surfaces. Decreasing the project's footprint can substantially reduce the project's impacts to water quality and hydrologic conditions.

2. Conserve natural areas, soils, and vegetation where feasible. This can be achieved by concentrating or clustering development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural, undisturbed condition. The following list provides a guideline for determining the least sensitive portions of the site, in order of increasing sensitivity. Jurisdictions should also refer to their Multiple Species Conservation Plans or other biological regulations, as appropriate.

a. Areas devoid of vegetation, including previously graded areas and agricultural fields.
b. Areas of non-native vegetation, disturbed habitats and eucalyptus woodlands.
c. Areas of chamise or mixed chaparral, and non-native grasslands.
d. Areas containing coastal scrub communities.
e. All other upland communities.
f. Occupied habitat of sensitive species and all wetlands.
g. All areas necessary to maintain the viability of wildlife

corridors. Within each of the previous categories, areas containing hillsides should be considered more sensitive than the same category without hillsides.

3. Construct walkways, trails, patios, overflow parking lots and alleys and other low-traffic areas with permeable surfaces, such as pervious concrete, permeable asphalt, unit pavers, and granular materials.

4. Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.

5. Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs.

6. Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.

7. Use natural drainage systems to the maximum extent practicable.

8. Other site design options that are comparable, and equally effective.

9. Minimize soil compaction.

C. Design Concept 2: Minimize Directly Connected Impervious Areas (DCIAs). Priority projects shall consider, and incorporate and implement the following design characteristics, where determined applicable and feasible by the Director of Public Works.

1. Where landscaping is proposed, drain rooftops into adjacent landscaping prior to discharging to the storm drain.

2. Where landscaping is proposed, drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping.

3. Other design characteristics that are comparable and equally effective.

16.60.240 Protection of slopes and channels.

Project plans shall include storm water BMPs to decrease the potential for erosion of slopes and/or channels, consistent with local codes and ordinances and with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers, the San Diego Regional Water Quality Control Board, and the California Department of Fish and Game. The following design principles shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public

Works:

A. Minimize disturbances to natural drainages.

B. Convey runoff safely from the tops of slopes.

C. Vegetate slopes with native or drought tolerant vegetation.

D. Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.

E. Stabilize permanent channel crossings.

F. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.

G. Other design principles that are comparable and equally effective.

16.60.250 Providing storm drain system stenciling and signage.

Storm drain stencils are highly visible source control messages, typically placed directly adjacent to storm drain inlets. The stencils contain a brief statement that prohibits the dumping of improper materials into the urban runoff conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message. Priority projects shall include the following requirements in the project design.

A. Provide stenciling or labeling of all storm drain inlets and catch basins within the project area with prohibitive language (such as: "NO DUMPING – I LIVE IN <<name receiving water>>") and/or graphical icons to discourage illegal dumping.

B. Post signs and prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

C. Maintain legibility of stencils and signs.

16.60.260 Designing outdoor material storage areas to reduce pollution introduction.

Improper storage of materials outdoors may increase the potential for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the urban runoff conveyance system. Where the priority project plans include outdoor areas for storage of hazardous materials that may contribute pollutants to the urban runoff conveyance system, the following storm water BMPs are

required:

A. Hazardous materials with the potential to contaminate urban runoff shall either be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

B. The storage area shall be paved and sufficiently impervious to contain leaks and spills.

C. The storage area shall have a roof or awning to minimize direct precipitation within the secondary containment area.

16.60.270 Designing trash storage areas to reduce pollution introduction.

All trash container areas shall meet the following requirements (limited exclusion: detached residential homes):

A. Paved with an impervious surface, designed not to allow run-on from adjoining areas, screened or walled to prevent off-site transport of trash; and

B. Provide attached lids on all trash containers that exclude rain, or roof or awning to minimize direct precipitation.

16.60.280 Using efficient irrigation systems and landscape design.

Priority projects shall design the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential homes.) In compliance with the Water Conservation in Landscaping Act (California Government Code sections 65591, *et seq.*), the following methods to reduce excessive irrigation runoff shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

A. Employing rain shutoff devices to prevent irrigation after precipitation.

B. Designing irrigation systems to each landscape area's specific water requirements.

C. Using flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.

D. Employing other comparable, equally effective, methods to reduce irrigation water runoff.

16.60.300 Incorporate requirements applicable to individual priority project categories.

Where identified in Table 2, the following requirements shall be incorporated into applicable priority projects during the storm water BMP selection and design process. Projects shall adhere to each of the individual priority project category requirements that apply to the project (e.g., a restaurant with more than 15 parking spaces would be required to incorporate the requirements for "g. Equipment Wash Areas" and "h. Parking Areas" into the project design).

A. Private Roads - The design of private roadway drainage shall use at least one of the following:

1. Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings;

2. Urban curb/swale system: street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter;

3. Dual drainage system: First flush captured in street catch basins and discharged to adjacent vegetated swale or gravel shoulder, high flows connect directly to storm water conveyance system;

4. Other methods, which are comparable and equally effective within the project.

B. Residential Driveways and Guest Parking. The design of driveways and private residential parking areas shall use at least one of the following features.

1. Design driveways with shared access, flared (single lane at street) or wheelstrips (paving only under tires); or, drain into landscaping prior to discharging to the storm water conveyance system;

2. Uncovered temporary or guest parking on private residential lots may be: paved with a permeable surface; or, designed to drain into landscaping prior to discharging to the storm water conveyance system;

3. Other features which are comparable and equally effective.

C. Dock Areas. Loading/unloading dock areas shall include the following:

1. Cover loading dock areas, or design drainage to preclude urban run-on and runoff;

2. Direct connections to storm drains from depressed loading docks (truck wells) are prohibited;

3. Other features which are comparable and equally effective.

D. Maintenance Bays. Maintenance bays shall include the following:

1. Repair/maintenance bays shall be indoors; or, designed to preclude urban run-on and runoff; and

2. Design a repair/maintenance bay drainage system to capture all wash water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit, or

3. Other features which are comparable and equally effective.

E. Vehicle Wash Areas. Priority projects that include areas for washing/steam cleaning of vehicles shall use the following:

1. Self-contained; or covered with a roof or overhang;

2. Equipped with a clarifier or other pretreatment facility;

3. Properly connected to a sanitary sewer;

4. Other features which are comparable and equally effective.

F. Outdoor Processing Areas. Outdoor process equipment operations, such as rock grinding or crushing, painting or coating, grinding or sanding, degreasing or parts cleaning, landfills, waste piles, and wastewater and solid waste treatment and disposal, and other operations determined to be a potential threat to water quality by the Copermittee shall adhere to the following requirements:

1. Cover or enclose areas that would be the most significant source of pollutants; or, slope the area toward a dead-end sump; or, discharge to the sanitary sewer system following appropriate treatment in accordance with conditions established by the applicable sewer agency;

2 Grade or berm area to prevent run-on from surrounding areas;

3. Installation of storm drains in areas of equipment repair is prohibited;

4. Other features which are comparable or equally effective.

G. Equipment Wash Areas. Outdoor equipment/accessory washing and steam cleaning activities at priority projects shall use the following:

1. Be self-contained; or covered with a roof or overhang;

2. Be equipped with a clarifier, grease trap or other pretreatment facility, as appropriate;

3. Properly connected to a sanitary sewer;

4. Other features which are comparable or equally effective.

H. Parking Areas. To minimize the offsite transport of pollutants from parking areas, the following design concepts shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

1. Where landscaping is proposed in parking areas, incorporate landscape areas into the drainage design;

2. Overflow parking (parking stalls provided in excess of the City's minimum parking requirements) should be constructed with permeable paving;

3. Other design concepts, which are comparable and equally effective.

I. Roadways. Priority roadway projects shall select treatment control BMPs following the treatment control selection procedure identified in this division entitled, "Establishing Storm Water BMPs."

J. Fueling Area. Non-retail fuel dispensing areas shall contain the following:

1. Overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area. The fueling area shall drain to the project's treatment control BMP(s) prior to discharging to the storm water conveyance system;

2. Paved with Portland cement concrete (or equivalent smooth impervious surface). The use of asphalt concrete shall be prohibited;

3. Have an appropriate slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of urban runoff;

4. At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

K. Hillside Landscaping. Hillside areas that are disturbed by project development shall be landscaped with deep-rooted, drought tolerant plant species selected for erosion control, satisfactory to the Director of Public Works.

16.60.310 Treatment control BMP objectives.

A. Minimizing a development's detrimental effects on water quality can be most effectively achieved through the use of a combination of site design, source and treatment control storm water BMPs. Where projects have been designed to minimize,

to the maximum extent practicable, the introduction of anticipated pollutants of concern that may result in significant impacts to the receiving waters through the implementation of site design and source control storm water BMPs, the development would still have the potential for pollutants of concern to enter the storm water conveyance system. Therefore, priority projects shall be designed to remove pollutants of concern from the storm water conveyance system to the maximum extent practicable through the incorporation and implementation of treatment control BMPs.

B. In meeting the requirements in this section, priority projects shall implement a single or combination of storm water BMPs that will remove anticipated pollutants of concern, as identified by the procedure of this division, in site runoff to the maximum extent practicable. Treatment control BMPs with a high or medium pollutant removal efficiency for the project's most significant pollutant of concern shall be selected. Treatment control BMPs with a low removal efficiency ranking shall only be approved by the Director of Public Works when a feasibility analysis has been conducted, which exhibits that implementation of treatment control BMPs with a high or medium removal efficiency ranking are infeasible. Treatment control BMPs must be implemented unless a waiver is granted to the project by the Director of Public Works based on the infeasibility of any treatment control BMP.

16.60.320 Design to treatment control BMP standards.

All priority projects shall design, construct and implement structural treatment control BMPs that meet the design standards of this section, unless specifically exempted by the limited exclusions. Structural treatment control BMPs required by this section shall be operational prior to the use of any dependent development, and shall be located and designed in accordance with the requirements of this division.

16.60.330 Structural treatment control volume based BMPs.

Volume-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- Volume of runoff produced from a 24-hour 85th percentile storm event, as determined from isoplovial maps contained in the County of San Diego Hydrology Manual. See County of San Diego's Isoplovial map at http://www.sdcounty.ca.gov/dpw/engineer/flood.htm; or

- Volume of runoff produced by the 85th percentile 24-hour runoff event, determined as the maximized capture urban runoff volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998*); or

- The volume of annual runoff based on unit basin storage volume, to achieve 90 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial, (1993)*, or

- The volume of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile 24-hour runoff event. Where this option is used, storm events shall be identified by their separation from one another by at least six hours of no rain.

16.60.340 Structural treatment control flow based BMPs.

As an alternative to volume-based BMPs, structural treatment controls may be designed as flow based BMPs. Flow-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- The maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour for each hour of a storm event; or

- The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity, as determined from the local historical rainfall record, multiplied by a factor of two, for each hour of a storm event; or

- The maximum flow rate of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile hourly rainfall intensity multiplied by a factor of two, for each hour of a storm event.

16.60.350 Limited exclusions.

A. Proposed restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical sizing criteria requirements listed for structural treatment control volume based BMPs.

B. Where significant redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development, and the existing development was not subject to SUSMP requirements, the numeric sizing criteria discussed for structural treatment control volume based apply only to the addition, and not to the entire development.

16.60.360 Locating BMPs near pollutant sources.

Structural treatment control storm water BMPs should be implemented close to pollutant sources to minimize costs and maximize pollutant removal prior to runoff entering receiving waters. Such BMPs may be located on- or off-site, used singly or in combination, or shared by multiple new developments, pursuant to the following requirements:

A. All structural treatment control BMPs shall be located so as to infiltrate, filter, and/or treat the required runoff volume or flow prior to its discharge to any receiving water body supporting beneficial uses;

B. Multiple post-construction structural treatment control BMPs for a single priority development project shall collectively be designed to comply with the design standards for structural treatment control volume based BMPs;

C. Shared storm water BMPs shall be operational prior to the use of any dependent development or phase of development. The shared BMPs shall only be required to treat the dependent developments or phases of development that are in use;

D. Interim storm water BMPs that provide equivalent or greater treatment than is required by structural treatment control volume based BMPs may be implemented by a dependent development until each shared BMP is operational. If interim BMPs are selected, the BMPs shall remain in use until permanent BMPs are operational.

16.60.370 Restrictions on use of infiltration BMPs.

At a minimum, use of structural treatment BMPs that are designed to primarily function as infiltration devices shall meet the following conditions[2]:

A. Urban runoff from commercial developments shall undergo pretreatment to remove both physical and chemical contaminants, such as sedimentation or filtration, prior to infiltration;

B. All dry weather flows shall be diverted from infiltration devices except for those non-storm water discharges authorized pursuant to 40 CFR 122.26(d)(2)(iv)(B)(1): diverted stream flows, rising ground waters, uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to storm water conveyance systems, uncontaminated pumped ground water, foundation drains, springs, water from crawl space pumps, footing drains, air conditioning condensation, flow from riparian habitats and wetlands, water line flushing, landscape irrigation, discharges from potable water sources other than water main breaks, irrigation water, individual residential car washing, and dechlorinated swimming pool discharges;

C. Pollution prevention and source control BMPs shall be implemented at a level appropriate to protect groundwater quality at sites where infiltration structural treatment BMPs are to be used;

D. The vertical distance from the base of any infiltration structural treatment BMP to the seasonal high groundwater mark shall be at least 10 feet or as determined on an individual, site-specific basis by the Director of Public Works. Where groundwater does not support beneficial uses, this vertical distance criterion may be reduced, provided groundwater quality is maintained;

---

[2]. These conditions do not apply to structural treatment BMPs which allow incidental infiltration and are not designed to primarily function as infiltration devices (such as grassy swales, detention basins, vegetated buffer strips, constructed wetlands, etc.)

E. The soil through which infiltration is to occur shall have physical and chemical characteristics (such as appropriate cation exchange capacity, organic content, clay content, and infiltration rate) that are adequate for proper infiltration durations and treatment of urban runoff for the protection of groundwater beneficial uses;

F. Infiltration structural treatment BMPs shall not be used for areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (bus, truck, etc.); nurseries; and other high threat to water quality land uses and activities as designated by the Director of Public Works;

G. The horizontal distance between the base of any infiltration structural BMP and any water supply wells shall be 100 feet or as determined on an individual, site-specific basis by the Director of Public Works.

16.60.380 Maintenance mechanism to be in place before acceptance.

Structural BMPs shall not be considered "effective," and shall not be accepted as meeting the MEP standard, unless a mechanism is in place that will ensure ongoing long-term maintenance of all structural BMPs. As part of project review, if a project proponent is required to include interim or permanent structural BMPs in project plans, and if the Director of Public Works does not provide a mechanism for BMP maintenance, the project proponent shall provide verification of maintenance requirements through such means as may be appropriate, at the discretion of the Director of Public Works, including, but not limited to covenants, legal agreements, maintenance agreements, and/or conditional use permits.

16.60.390 Maintenance mechanisms.

Public equity maintenance. The City Council may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the BMP. Unless acceptable to the City Council, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City Council may seek protection from liability by appropriate releases and indemnities. The City Council shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City Council shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the

facilities. The City Council must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

A. Project proponent agreement to maintain storm water BMPs: The City Council may enter into a contract with the project proponent obliging the project proponent to maintain, repair and replace the storm water BMP as necessary into perpetuity. Security may be required.

B. Assessment districts: The City Council may approve an Assessment District or other funding mechanism created by the project proponent to provide funds for storm water BMP maintenance, repair and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

C. Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City Council may assure storm water BMP maintenance, repair and replacement through conditions in the lease.

D. Conditional use permits: For discretionary projects only, the City Council may assure maintenance of storm water BMPs through the inclusion of maintenance conditions in the conditional use permit. Security may be required.

E. Alternative mechanisms: The City Council may accept alternative maintenance mechanisms if such mechanisms are as protective those listed above.

16.60.400 Verification mechanisms.

For discretionary projects, the City approved method of storm water BMP maintenance shall be incorporated into the project's permit, and shall be consistent with permits issued by resource agencies, before City approval of discretionary permits. For projects requiring only ministerial permits, the approved method of storm water BMP maintenance shall be incorporated into the permit conditions before the issuance of any ministerial permits. In all instances, the project proponent shall provide proof of execution of an approved method of maintenance repair and replacement before the issuance of construction approvals. Public projects that are not required to obtain permits shall be responsible for ensuring that an approved method of storm water BMP maintenance repair and replacement is executed prior to the commencement of construction. For all properties, the verification mechanism will include the project proponent's signed statement, as part of the project application, accepting responsibility for all structural BMP maintenance, repair and replacement, until a City approved entity agrees to assume responsibility for structural BMP maintenance, repair and replacement.

16.60.410 Maintenance requirements.

A. Operation & Maintenance (O&M) Plan: A copy of an Operation & Maintenance (O&M) plan, prepared by the project proponent satisfactory to the Director of Public Works shall be attached to the approved maintenance agreement, which describes the designated responsible party to manage the storm water BMP(s), employee's training program and duties, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities, copies of resource agency permits, and any other necessary activities. At a minimum, maintenance agreements shall require the inspection and servicing of all structural BMPs on an annual basis. The project proponent maintenance entity shall complete and maintain O&M forms to document all maintenance requirements. Parties responsible for the O&M plan shall retain records for at least 5 years. These documents shall be made available to the City for inspection upon request at any time.

B. Access Easement/Agreement: As part of the maintenance mechanism selected above, it shall include a copy of an executed access easement that shall be binding on the land throughout the life of the project, until such time that the storm water BMP requiring access is replaced, satisfactory to the Director of Public Works.

16.60.420 Waiver of structural treatment BMP requirements.

The requirement of implementing structural treatment BMPs may be waived if infeasibility can be established. A waiver of infeasibility shall be granted only when all available structural treatment BMPs have been considered and rejected as infeasible.

Waivers may only be granted from structural treatment BMP and structural treatment BMP sizing requirements. Priority development projects, whether or not granted a waiver may not cause or contribute to an exceedance of water quality objectives. Pollutants in runoff from projects granted a waiver must still be reduced to the maximum extent practicable.

Section 3: This Ordinance is adopted pursuant to the authority granted to the City of El Cajon under San Diego Regional Water Quality Control Board Order No. R9 2007-0001. This Ordinance encompasses a state-mandated requirement thereunder.

Section 4: This ordinance shall be effective thirty (30) days following its passage and adoption.

PASSED AND ADOPTED by the City Council of the City of El Cajon, California at a Regular Joint City Council/Redevelopment Agency Meeting held this 18th day of December, 2007, by the following vote to wit:

AYES	:	Lewis, Hanson-Cox, Kendrick, McClellan, Ramos
NOES	:	None
ABSENT	:	None
DISQUALIFY	:	None

Mark Lewis, Mayor of the City of El Cajon

ATTEST:

Kathie Rutledge, CMC, City Clerk

12/18/07 (Item 14.2)

ENVIRONMENTAL INFORMATION FORM
Part I - Initial Study
Filing Fee $400

Community Development Dept.
Planning Division
200 East Main Street
El Cajon CA 92020

The purpose of this form is to inform the City of the basic components of the proposed project so that the City may review the project pursuant to City Policies, Ordinances, and Guidelines; the California Environmental Quality Act; and the City's Rules and Procedures to Implement CEQA. It is important that the information requested in this application be provided in full.

The Initial Study is a requirement of the California Environmental Quality Act (CEQA) Guidelines and is used to determine whether further review of environmental factors of the project will be necessary, and, if so, whether a Negative Declaration (ND), Mitigated Negative Declaration (MND), or Environmental Impact Report (EIR) will be the most appropriate document. Accuracy and completeness in the preparation of this study is essential. Incomplete materials will only result in a delay for the applicant, as the study will be rejected until properly developed.

INSTRUCTIONS: Please complete the following statement by filling in the designated blank spaces. Responses should be printed or typed so as to be legible. All appropriate spaces must be filled in and the required maps, photos, and plans submitted with this form. Additional information may be attached. The applicant should provide as much information as possible in this submittal to allow reviewers to have a thorough understanding of the project. Please submit this form and all support documents with the appropriate filing fee to the Community Development Department to begin the environmental review process. All maps/site plans shall be folded to 8½" by 11."

A. General Information

1. Name, address, telephone number, fax number and email of person to be contacted concerning this project:

2. Name, address of legal property owner as shown on tax statement:

3. Address of project and/or description of location:

4. Assessor's Parcel Number(s) of project site:

5. List each project application which accompanies this form:

6. Have any preliminary documents been prepared for this projects (e.g. soil report or traffic impact analysis)? If yes, please identify name and date prepared:

7. List and describe any other related permits and other public approvals required for this project, including those required by city, regional, state or federal agencies (i.e., Corps of Engineers, CalTrans, Air Pollution Control District or LAFCO):

8. Existing zoning of project site:

9. Existing General Plan Designation:

10. Fully describe the nature and purpose of the proposed project including the ultimate use of the property:

B. Project Description

1. Site size in acres or square footage:

2. Highest and lowest elevations on site:

3. Number of floors of proposed construction:

4. Number of proposed off-street parking spaces provided:

5. Anticipated project schedule (timeline):

6. Is this project dependent on an existing or future project? If yes, please explain:

7. Anticipated future phases:

8. If residential, include the number of units, unit sizes, range of sale prices or rents, and gross density (units) acre:

9. If commercial and/or office, indicate the types, square footage of each type (i.e., office, sales area, restaurant), whether neighborhood, city or regionally oriented, and total square footage of building area:

10. If industrial, indicate type, estimated employment per shift, loading facilities, square footage of office area and total square footage of building area:

11. If institutional, indicate the major function, estimated employment per shift, estimated occupancy, and total square footage of building:

C. Existing Conditions

1. Number and species of existing trees 6 inches or larger in diameter:

2. Number, size, and species of trees to be removed:

3. Describe any power lines, water, sewer or storm drain mains, pipelines or other transmission lines which are located on or adjacent to the property:

4. Name of creeks and natural or man-made drainage channels through or adjacent to the property:

5. Primary vehicle access to property comes from which street(s):

6. Are any easements known to traverse the site? If yes, explain the type and purpose:

7. Provide details on existing uses of the site. Are there existing structures on the site? If yes, describe use and whether they will be demolished or relocated; if residential, give the number of current occupants:

8. Indicate service provider for:

    a. Water

    b. Sewer

    c. Fire protection

    d. Police protection

9. Is any portion of the site within the 100-year/500-year floodplain?

10. Is the site within an Airport Land Use plan?

11. If yes, what airport plan(s) is it within and do restrictions affect the proposal?

12. Is the site located within two miles of Gillespie Field general aviation airport?

13. Is the site located within close proximity of a freeway?

14. Is the site listed on California EPA's Hazardous Site List?

D. Environmental Analysis

Are the following items applicable to the project or its effects? Discuss all items checked "yes" or "maybe" on next page or attach additional sheets as necessary.

YES	MAYBE	NO	
☐	☐	☐	a. Change in existing features of any streams, lakes or hills, or substantial alteration of ground contours.
☐	☐	☐	b. Change in scenic views or vistas from existing residential areas or public lands or roads.
☐	☐	☐	c. Change in character of general area of project.
☐	☐	☐	d. Produce or involve large amounts of solid waste or litter.
☐	☐	☐	e. Disrupt or adversely affect an historic, cultural or archaeological site.
☐	☐	☐	f. Change in dust, ash, smoke, fumes or odors in vicinity.
☐	☐	☐	g. Change in stream, surface water, wetlands or ground water quality or quantity, or alteration of existing drainage patterns.
☐	☐	☐	h. Increase in impervious surfaces and associated increase runoff.
☐	☐	☐	i. Alteration in existing drainage patterns, runoff flow rates or volumes.

☐	☐	☐	j. Increased erosion.
☐	☐	☐	k. Use or disposal of heavy metals, pathogens, petroleum derivatives, synthetic organics, sediment, nutrients, or oxygen demanding substances.
☐	☐	☐	l. Potential to impact already sensitive conditions or environmentally sensitive areas.
☐	☐	☐	m. Substantial change in existing noise or vibration levels in the vicinity.
☐	☐	☐	n. Site on filled land or on slope of 10 percent or more.
☐	☐	☐	o. Use or disposal of potentially hazardous material such as toxic substances, flammables or explosives.
☐	☐	☐	p. Substantial change in demand for municipal services (police, fire, water, sewer, etc.).
☐	☐	☐	q. Substantial increase in fuel or energy consumption (electricity, oil, natural gas, etc.).
☐	☐	☐	r. Relationship to a larger project or series of projects.
☐	☐	☐	s. Potential impact to aquatic, wetland or riparian habitiat.

CERTIFICATION: I hereby certify that the statements furnished above and in the attached exhibits present the data and information required for this initial evaluation to the best of my ability, and that the facts, statements, and information presented are true and correct to the best of my knowledge and belief.

Date: Signature:

Section 711.4 of the Fish and Game Code, which became operative on January 1, 1991, authorizes the County Clerk to collect a filing fee of up to $1,275 for the review of environmental documents by the State Department of Fish and Game. Should the State Department of Fish and Game decide to review the environmental documents associated with this project, the project applicant will become liable for paying this fee.

The applicant certifies by his/her signature below that he/she has been informed of this information and is aware that a fee may be required by the County Clerk with the filing of the environmental documents associated with his/her project.

Failure to pay the required fee in a timely manner may result in the delay in the start of the project.

Date: Applicant's Signature:

Community Development Dept.
Planning Division
200 East Main Street
El Cajon CA 92020

ENVIRONMENTAL EVALUATION FORM
Initial Study Part 2

1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3) Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section XVII, "Earlier Analyses," may be cross-referenced).

5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
   a) Earlier Analysis Used. Identify and state where they are available for review.
   b) Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
   c) Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.

9) The explanation of each issue should identify:
   a) the significance criteria or threshold, if any, used to evaluate each question; and
   b) the mitigation measure identified, if any, to reduce the impact to less than significance

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
I. AESTHETICS -- Would the project:				
a) Have a substantial adverse effect on a scenic vista?	☐	☐	☐	☐
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?	☐	☐	☐	☐
c) Substantially degrade the existing visual character or quality of the site and its surroundings?	☐	☐	☐	☐
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?	☐	☐	☐	☐
II. AGRICULTURE RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Model (1997) prepared by the California Dept. of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:				

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?	☐	☐	☐	☐
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?	☐	☐	☐	☐
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?	☐	☐	☐	☐
III. AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the project:				
a) Conflict with or obstruct implementation of the applicable air quality plan?	☐	☐	☐	☐
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?	☐	☐	☐	☐
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?	☐	☐	☐	☐
d) Expose sensitive receptors to substantial pollutant concentrations?	☐	☐	☐	☐
e) Create objectionable odors affecting a substantial number of people?	☐	☐	☐	☐
IV. BIOLOGICAL RESOURCES -- Would the project:				
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?	☐	☐	☐	☐
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?	☐	☐	☐	☐
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?	☐	☐	☐	☐
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?	☐	☐	☐	☐
e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?	☐	☐	☐	☐
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?	☐	☐	☐	☐
V. CULTURAL RESOURCES -- Would the project:				
a) Cause a substantial adverse change in the significance of a historical resource as defined in '15064.5?	☐	☐	☐	☐
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to '15064.5?	☐	☐	☐	☐
c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
d) Disturb any human remains, including those interred outside of formal cemeteries?	☐	☐	☐	☐
VI. GEOLOGY AND SOILS -- Would the project:				
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:	☐	☐	☐	☐
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.	☐	☐	☐	☐
ii) Strong seismic ground shaking?	☐	☐	☐	☐
iii) Seismic-related ground failure, including liquefaction?	☐	☐	☐	☐
iv) Landslides?	☐	☐	☐	☐
b) Result in substantial soil erosion or the loss of topsoil?	☐	☐	☐	☐
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?	☐	☐	☐	☐
d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?	☐	☐	☐	☐
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?	☐	☐	☐	☐
VII. HAZARDS AND HAZARDOUS MATERIALS B Would the project:				
a) Create a significant hazard to the public or the environment through the routine	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
transport, use, or disposal of hazardous materials?				
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?	☐	☐	☐	☐
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?	☐	☐	☐	☐
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?	☐	☐	☐	☐
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☐
f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?	☐	☐	☐	☐
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?	☐	☐	☐	☐
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?	☐	☐	☐	☐
VIII. HYDROLOGY AND WATER QUALITY -- Would the project:				
a) Violate any water quality standards or waste discharge requirements?	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?	☐	☐	☐	☐
c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?	☐	☐	☐	☐
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?	☐	☐	☐	☐
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?	☐	☐	☐	☐
f) Otherwise substantially degrade water quality?	☐	☐	☐	☐
g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?	☐	☐	☐	☐
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?	☐	☐	☐	☐
i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?	☐	☐	☐	☐
j) Inundation by seiche, tsunami, or	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
mudflow?				
IX. LAND USE AND PLANNING - Would the project:				
a) Physically divide an established community?	☐	☐	☐	☐
b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?	☐	☐	☐	☐
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?	☐	☐	☐	☐
X. MINERAL RESOURCES -- Would the project:				
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?	☐	☐	☐	☐
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?	☐	☐	☐	☐
XI. NOISE B Would the project result in:				
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?	☐	☐	☐	☐
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?	☐	☐	☐	☐
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?	☐	☐	☐	☐
d) A substantial temporary or periodic increase in ambient noise levels in the	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
project vicinity above levels existing without the project?				
e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☐
f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?	☐	☐	☐	☐
XII. POPULATION AND HOUSING -- Would the project:				
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?	☐	☐	☐	☐
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☐
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?	☐	☐	☐	☐
XIII. PUBLIC SERVICES				
a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:	☐	☐	☐	☐
Fire protection?	☐	☐	☐	☐
Police protection?	☐	☐	☐	☐
Schools?	☐	☐	☐	☐
	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
Parks?				
Other public facilities?	☐	☐	☐	☐
XIV. RECREATION --				
a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?	☐	☐	☐	☐
b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?	☐	☐	☐	☐
XV. TRANSPORTATION/TRAFFIC -- Would the project:				
a) Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?	☐	☐	☐	☐
b) Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?	☐	☐	☐	☐
c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?	☐	☐	☐	☐
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?	☐	☐	☐	☐
e) Result in inadequate emergency access?	☐	☐	☐	☐
f) Result in inadequate parking capacity?	☐	☐	☐	☐
g) Conflict with adopted policies, plans, or programs supporting alternative	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
transportation (e.g., bus turnouts, bicycle racks)?				
XVI. UTILITIES AND SERVICE SYSTEMS B Would the project:				
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?	☐	☐	☐	☐
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☐	☐	☐
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?	☐	☐	☐	☐
d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?	☐	☐	☐	☐
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project=s projected demand in addition to the provider=s existing commitments?	☐	☐	☐	☐
f) Be served by a landfill with sufficient permitted capacity to accommodate the project=s solid waste disposal needs?	☐	☐	☐	☐
g) Comply with federal, state, and local statutes and regulations related to solid waste?	☐	☐	☐	☐
XVII. MANDATORY FINDINGS OF SIGNIFICANCE --				
a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal	☐	☐	☐	☐

	Potentially Significant Impact	Less Than Significant with Mitigation Incorporation	Less Than Significant Impact	No Impact
community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?				
b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?	☐	☐	☐	☐
c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?	☐	☐	☐	☐

El Cajon Pollution Prevention Program

What is a Watershed?

Although "Watershed" is a new term to many people,. its definition is almost as simple as the well-known phrase "water runs downhill." The drain board that carries rinse water into your kitchen sink can be compared to a watershed. On the land, water that does not evaporate or soak into the soil usually drains into ditches, storm drains, streams, rivers, lakes or the ocean. The contiguous area of land from which the water drains to a common point is a watershed.

When you were a child, you probably had a favorite mud puddle where you liked to play. The part of the yard from which the water drained into the puddle was its watershed. Possibly a small stream ran by your house. It may have been dry most of the year or it may have flowed continuously. Water from a few acres drained into that little stream. Those few acres were its watershed. This small stream and others like it ran into a larger one. The land areas drained by the small steams made up the watershed of the larger stream into which they flood. Small watersheds make up the larger ones. The Mississippi River, for example, drains a watershed of about 1,243,000 square miles or approximately 41% of the 48 states comprising the contiguous United States. This large watershed is made up of thousands of smaller ones, including the Tennessee, Ohio, Arkansas and Missouri Rivers.

As shown on Figure 1, the 14.1 square mile area comprising the City of El Cajon lies entirely within the 440 square mile area drained by the San Diego River . Lakes within the San Diego River Watershed include Lakes Murray, Jennings, San Vincente, El Capitan and Cuyamaca. All waters draining within the San Diego River Watershed drain directly into the Pacific Ocean just north of Ocean Beach.

Figure 1 - San Diego River Watershed

The tributary of the San Diego River that drains the El Cajon Valley, called Forester Creek, is our local watershed. So, wherever you live, you are in a watershed. It can be just your own backyard, or an area drained by a system of storm drains, a small creek or by a large river.

You and the other people who live in the watershed are part of the watershed community. So are the animals, the birds, and the fish that live within the watershed. All depend on the watershed, and they, in turn, influence what happens there. What happens within your smaller part of the bigger watershed also affects the larger watershed downstream.

If water runs off the land too fast, it cuts gullies and carries off topsoil. This soil along with other debris the water carries into streams and lakes will pollute the water, ultimately resulting in beach

closures and other problems. As soil fills the lakes or reservoirs, the amount of water they can hold is reduced. Therefore the water supply for your town and your home may be reduced. Although erosion is a natural process, accelerated erosion degrades productivity of the land. Such sediment carried downstream by runaway water may greatly increase the cost of filtering and treating the water you get from the your faucet.

If too much water runs away too rapidly, it causes a flood that damages businesses, homes, roadways and utilities. Flooding may even take lives. When the storm drains, channels and streams become choked with sediment, the flood is more serious because the choked-up channels carry less water.

Storm water runoff can be slowed down or caused to infiltrate into the soil when Storm Water Best Management Practices (BMPs) and other flood- and pollution-prevention measures are put into use throughout the watershed. Some useful Storm Water BMPs are:

- ✓ An overall reduction of paved areas or other surfaces where rainwater cannot soak in.
- ✓ Diversion of drainage of storm water through permeable, “grassy” vegetated swales, either in naturally vegetated areas or developed areas with watershed-friendly landscaping
- ✓ Construction of large or small retention areas can hold back storm water runoff that would otherwise cause flood damage.
- ✓ Installation of irrigation systems that distribute water efficiently, waste less water and thus leave more water for other uses.

City of El Cajon
STORM WATER
Protection Program

If overall runoff can be reduced, urban runoff pollution will also be reduced, and the remaining water will go into streams, lakes, or underground storage to be used in other ways. Since any water filtered through the soil doesn't carry sediment that would clog streams and pollute water supplies, more water will be available to everyone, including wildlife.

Storm Water Guidelines For Car Wash Fundraisers

Although car washing fundraisers are a popular means of raising money for worthwhile causes, there are important environmental issues that, if not properly managed, can negatively impact the aquatic environment and degrade local waterways. When conducting your fundraiser you should follow these guidelines in order to prevent the wash water from entering the storm drains where it flows without treatment of any kind to our streams, rivers and eventually into the ocean.

How does runoff from car wash fundraisers harm the environment?

During a car wash fundraiser, the soapy water used to wash the cars, combines with automotive fluids and residues from the engine, drive train and brakes, and the polluted water flows across the pavement and into nearby storm drains. Alone, one car wash fundraiser event may not create a significant adverse environmental impact. But, collectively, car wash fundraiser events can contribute significant amounts of badly polluted wash water to the storm drain system.

Before beginning your car wash fundraiser:

- ✓ Hold a meeting with all participants to explain the proper procedures that should be followed when conducting these activities.
- ✓ Remove all trash and debris from the car washing area.
- ✓ Use only soaps, cleaners or detergents labeled “non-toxic,” “phosphate free,” or “biodegradable.” The safest products for the environment are vegetable-based or citrus-based soaps.
- ✓ Do not use acid based wheel cleaners or engine degreasers.
- ✓ Select a washing site where the wash water can soak into grass, gravel, or be diverted to nearby landscaping. This will allow the wash water to filter through the vegetation and/or soil instead of flowing directly into a storm drain.
- ✓ If you select a site that drains into a street, block off the storm drain with sandbags and either divert the wash water to an area where the water can pool and evaporate throughout the day or arrange to dispose of the wash water down a sanitary sewer drain.

During the car wash fundraiser:

- ✓ Shake debris from car mats into a trash can or vacuum them. Do not shake dirt from car mats directly onto the ground.
- ✓ Use a bucket of soapy water to clean and re-soap rags or sponges throughout the wash rather than adding more soap directly to rags or sponges.
- ✓ Wring sponges and washrags into buckets, not the ground.
- ✓ Conserve water by using a spray nozzle with an automatic shut off and shutting off or kinking the hose when not in use.
- ✓ Always empty buckets into the sanitary sewer system (e.g., mop sinks or toilets).

After the car wash fundraiser:

- ✓ Remember to clean up and remove sand bags, if used. Have a volunteer walk the perimeter of the site to pick up trash and debris and dispose of it properly.
- ✓ Before you allow anything to go into the gutter or storm drain, stop and think. Storm drains do not go to the public sewer system; they flow directly into storm drains, channels and streams to the ocean.
- ✓ Remember that you are a **Valued Participant** in our City's **Pollution Solution**.

El Cajon Storm Water Protection Program

How You Can Prevent Storm Water Pollution

We can all make a big difference in stopping storm water pollution. Each year significant pollution is created due to careless work habits and lack of awareness about what pollutes our storm drain system. The Clean Water Act makes it illegal to allow any substance other than rainwater to enter the storm drain system. Doing so may lead to monetary fines or prosecution.

Pollution of our waterways will:

- make them unsafe for swimming and other recreational activities
- ruin their appearance
- kill plants and animals that live there

Storm drains should only drain rain.
The storm drain system collects rainwater from storms, and human-activity-related urban runoff from roofs, driveways, sidewalks and streets. All roadside gutters and drainage inlets lead to the storm drain system. And the storm drain water enters our streams, rivers, harbors and ocean. If you place waste near a roadside drainage inlet it will end up in the storm drain. Storm water is not treated – it will appear in the waterways in much the same condition as when you place it there. Remember, "Only Rain in the Drain!"

What pollutes our waterways?
Oil, grease, tar, silt, concrete cutting, cement wash water, water used in cleaning, paint, litter, cigarette butts, animal droppings, detergent and chemical cleaners are all pollutants. Remember that, just because a product is labeled as "biodegradable" does not mean it can be dumped into a storm drain. What can you or your business do to stop pollution?

You can stop pollution from getting into the storm drains by:

- ✓ not hosing waste away - instead sweep it up and dispose of it with your other trash.
- ✓ mopping up any spills immediately and not letting them flow into the storm drain system.
- ✓ making sure that driveways, sidewalks and gutters are clear of debris including leaves and grass clippings.
- ✓ making sure the contaminated water used for rinsing equipment such as paint brushes and containers does not flow into the storm drain system.
- ✓ putting litter in the trash bins - including cigarette butts.
- ✓ picking up all animal droppings.
- ✓ disposing of excess paint and chemicals in the hazardous waste area at landfills.
- ✓ washing your vehicles on the lawn or in a commercial car wash – this stops detergent, oils and grease from getting into the storm drain system.
- ✓ regularly servicing your vehicles - this stops leaking oil and other pollutants from getting into the storm drain system - it only takes one quart of oil to contaminate 250,000 gallons of water.

El Cajon Storm Water Protection Program

Major Causes of Urban Runoff Pollution

What day-to-day activities cause urban runoff pollution? Here are some of the biggest causes:

- **Using automobiles.** Particles in auto exhaust contain toxic organics and heavy metals. Dripping motor oil and wear from brake linings and tires deposit pollutants on streets and highways.
- **Maintaining vehicles.** Vehicle maintenance results in drips and spills of oil, coolant and other fluids. When performed outdoors, these fluids soak into asphalt and concrete pavements until they are washed away with the next storm. Water from washing vehicles outdoors carries pollutants directly to the nearest storm drain.
- **Allowing drainage from the shop floor to flow outside.** Allowing process or clean-up water to drain out onto the street is an often-seen practice that transports pollutants to the storm drain.
- **Cleaning tools or equipment outdoors.** Cleaning or rinsing containers, tools, floor mats or other items outdoors discharges pollutants such as chemicals, detergents, oils, etc.
- **Dumping wastes.** People looking for a "shortcut" to dispose of used oil, paint or other wastes dump them directly into storm drain inlets, causing pollution.
- **Landscaping and grounds maintenance.** Overuse, or indiscriminate use, of fertilizers and pesticides results in these materials running off landscaped areas into storm drains.
- **Allowing dumpster areas to become untidy.** Liquids that leak from dumpsters or garbage left outside the dumpster get washed away during a storm.
- **Building or remodeling facilities.** Disturbing soil and vegetation during construction greatly increases erosion; sediment is a pollutant. During construction, proper material handling and waste disposal is especially important because much of the work is performed in areas subject to rainfall.

Effects of Urban Runoff Pollution

What are the consequences of these activities? The most immediate effects can be seen: many creeks have an oily sheen near storm drain outfalls, litter is left behind by receding waters after a storm, layers of oil-and-grease-laden sediments accumulate, and dead animals are occasionally found on beaches.

But the most serious effects are more subtle. Some toxic substances affect critical life stages of certain organisms. Even if we do not usually see, or think about, these organisms (such as algae or mussels) they are part of the food supply for other plants and animals, including fish and birds. Pollutants in the aquatic environment disrupt the food chain. Some toxins bioaccumulate, which means organisms further up the food chain will concentrate the toxins in their tissues. This is why the State Health Department has recommended restrictions on human consumption of some species of fish and birds found in the Bay. Other effects of urban runoff pollution include contamination of water supply sources and loss of recreational activities such as fishing, swimming, and boating.

People can still stop storm water pollution because people cause it. By making small changes in the way we live and work, we can reduce the pollution we produce.

El Cajon Storm Water Protection Program

What is the El Cajon Storm Water Protection Program?

The City of El Cajon is involved in a program designed to ensure cleaner urban storm water runoff, thereby protecting our region's streams, rivers, beaches and the ocean. In that effort, we have entered into a partnership with nineteen other regional agencies in order to better:

- ✓ Educate and inform the public about urban runoff pollution
- ✓ Encourage public participation in community and clean-up events
- ✓ Work with industries and businesses to encourage pollution prevention
- ✓ Require construction activities to reduce soil erosion and water pollution
- ✓ Require developing projects to include pollution controls that will continue to operate after construction is complete

We also work within our own Municipal Departments and Divisions to ensure that our municipal maintenance and development projects are designed to reduce or eliminate pollution.

How is Our Program Funded?

Businesses and residents within the City of El Cajon fund the Storm Water Protection Program as part of our Wastewater Treatment Program. The Storm Water Protection Program also includes maintenance functions, like street sweeping and storm drain cleaning, to help keep our streams, rivers, beaches and ocean cleaner.

Debris in the Washington Channel

Why Are We Concerned About Urban Runoff?

Before the City of El Cajon area was developed, most rainfall fell onto natural areas and the water soaked into the ground. Over the last century, we've changed the landscape dramatically by adding roads, buildings and drainage pipes. Rainfall that once soaked into the ground now flows quickly along street gutters and into storm drains and drainage channel. These artificial rivers then discharge into our streams and rivers without treatment of any kind. Runoff from everyday urban and suburban activities also adds to this runoff. These activities include:

- ✓ Vehicle washing
- ✓ Landscape irrigation
- ✓ Cleaning around buildings, parking lots and streets

Along the way, the fast-moving urban runoff picks up pollutants such as pesticides, herbicides, fertilizers, eroded soil, and oil and grease from cars. These pollutants make their way into our streams and rivers where they pollute the water where they endanger the lives of both plants and animals. Eventually, this affects all of us, since we eat the fish and use the rivers, beaches and ocean for recreation. Some of us in the El Cajon area also drink treated river water.

How Can You Help?

There are many ways for El Cajon area residents, students, community groups and businesses to get involved in pollution prevention efforts. We need volunteers to help us get the word out. Take the first step by practicing pollution prevention in your own home or business. Then, join us in the many activities and events sponsored throughout the greater El Cajon area. Always remember, **"You Are the Pollution Solution."**

For More Information

Contact the El Cajon Storm Water Protection Program at (619) 441-1653, or visit our web site at www.ci.el-cajon.ca.us, and click on the Storm Water Information link.

El Cajon Storm Water Protection Program

Keeping Our Watershed Healthy

The health of a stream depends on the quality of the water that flows through it. To care for the stream, we must also care for all the land that drains to it. The name for the area or unit of land draining into a common stream or river is a *watershed*.

Everything in the watershed affects the water in the stream. Hazardous chemicals, automotive products, pesticides, herbicides, fertilizers, pet wastes, excessive soil erosion and air pollution all contribute to water pollution. These pollutants don't have to be dumped directly into the water to cause a problem. They can be washed from streets, lawns, roofs or outside storage areas by rainfall, eventually ending up in streams, rivers and the ocean.

The storm drain inlet or gutter in the street outside your home carries water into a network of storm drains that lead directly to the San Diego River or one of its tributary streams. Storm drains are completely separate from the sewer system, because sewer systems handle wastewater from your sinks, tubs and toilets. Storm drains do not go to a treatment plant but into our streams, rivers and ultimately the ocean.

Resulting impacts of water pollution can range from the obvious, such as oil floating on the water to the loss of wildlife due to habitat destruction that may go unnoticed.

Everyone in our community has a part in protecting our watershed and preventing water pollution. While the contribution of one home to water pollution may be small, the combined effect of an entire neighborhood can be substantial. Here are some suggestions that will help in keeping our watershed clean:

- ✓ Use chemical fertilizers and pesticides sparingly. When applied excessively, they can be washed into a nearby storm drain by your sprinklers or rain, thereby damaging aquatic life. Even lawn clippings contain these pollutants. Leave them on the lawn as natural fertilizer or compost them.
- ✓ Keep automobiles “drip-free” and in good operating condition. This helps keep oil and air pollution out of water sources. Wash cars at commercial car washes that drain to the sewage treatment plants instead of your driveway that drains to the storm drain system.
- ✓ Dispose of hazardous household wastes such as paints, solvents, used oil and cleaning products properly. The City of El Cajon contracts with Waste Management, Inc. to accept residential household hazardous waste for FREE on the second and fourth Saturday of each month and by APPOINTMENT ONLY. Residents can drop off no

more than 15 gallons or 125 pounds of household hazardous waste. Call (619) 596-5100 to schedule an appointment time.

The choice is ours. Do we want a watershed that keeps our steams, rivers, beaches and ocean healthy? Or do we want a watershed that struggles to survive?

Remember that, "**You are the Pollution Solution**." You play a very important role in keeping our streams, rivers, beaches and ocean clean. For more information, visit our web site at www.ci.el-cajon.ca.us and click on the "Storm Water Information" link.

Sewage Spill Reference Guide

Your Responsibilities as a Private Property Owner

How a Sewer System Works

A typical sanitary sewer system is constructed of a network of pipes, laterals and mains connecting to each building and transporting sewage to a wastewater treatment plant (see diagram to the right).

A property owner's sewer pipe is called a **sewer lateral** and connects to a larger city-maintained pipe called a sewer main typically located in the street.

As stated in the El Cajon Municipal Code, **sewer laterals are the responsibility of the property owner** and must be maintained by the property owner for the entire distance from the house to the sewer main.

What is a Sewage Spill?

Sewage spills occur when the wastewater being transported via underground pipes overflows through a manhole, cleanout, or broken pipe. Sewage spills can cause health hazards, damage to homes and businesses, and threaten the environment, local waterways, and beaches.

Common Causes of Sewage Spills

Grease builds up inside and eventually blocks sewer pipes. Grease gets into the sewer from food establishments, household drains, as well as from poorly maintained commercial grease traps and interceptors. Grease is a common cause of sewer pipe blockages, especially in commercial and industrial areas.

Large objects such as paper towels, rags, disposable diapers or children's toys can contribute to a blockage.

Structural problems caused by tree roots in the lines, broken or cracked pipes, missing or broken cleanout caps, or undersized sewers can cause blockages. Blockages by roots are a common cause of blockages in residential areas.

Infiltration and inflow impacts pipe capacity and is caused when groundwater or rainwater enters the sewer system through pipe defects and illegal connections.

You Are Responsible for a Sewage Spill Caused by a Blockage or Break in Your Sewer Lines!

Time is of the essence in dealing with sewage spills. You are required to **immediately:**

- ✓ **Control and minimize the spill.** Keep spills contained on private property and out of gutter, storm drains and public waterways by shutting off or not using the water.
- ✓ **Use sandbags, dirt or plastic sheeting** to prevent sewage from entering the storm drain system.
- ✓ **Clear the sewer blockage.** Always wear gloves and wash your hands. It is recommended that a plumbing professional be called for clearing blockages and making necessary repairs.
- ✓ **Notify the El Cajon Department of Public Works** by calling (619) 441-1653 during business hours, or call the Police Department Communications Center 24-hour number at (619) 579-3311.

You May Be Liable

Allowing sewage from your home, business or property to discharge to a gutter or storm drain may subject you to penalties and/or out-of-pocket costs to reimburse our city for clean-up efforts and enforcement actions.

What To Look For

Sewage spills can be a very noticeable gushing of water from a manhole or a slow water leak that may take time to be noticed. Investigate suspicious looking wet areas. Look for:

- ✓ Drain backups inside the building.
- ✓ Wet ground and water leaking around manhole lids on to your street.
- ✓ Leaking water from cleanouts or outside drains.
- ✓ Unusual strong offensive odors from wet areas near sidewalks, external walls, or landscaped areas.
- ✓ Slow draining or clogged sinks and toilets

Be Cautious

Keep people and pets away form the affected area. Untreated sewage has high levels of disease-causing viruses and bacteria.

How You Can Prevent Sewage Spills Before They Happen

- ✓ Never put grease down garbage disposals, drains or toilets.
- ✓ Perform periodic cleaning to eliminate grease, debris and roots in your house plumbing and sewer lateral.
- ✓ Repair any structural problems in your sewer system and eliminate any rainwater infiltration or inflow into your plumbing system.
- ✓ Do not dispose of paper towels, or other large objects in toilets.

El Cajon Public Works Department, and the Citywide Storm Water Protection Program

Working Together to Cope with Sewer Backups

GENERAL INFORMATION

Sewer backups create stressful and emotional situations for any homeowner or renter. In some cases sewer backups may cause health and safety concerns as well as significant property loss. A proper response to a sewer backup can greatly minimize damage to your property, diminish the threat of illness and help keep our stream, rivers, lakes and beaches clean.

The City of El Cajon makes every effort to be responsive to a resident's needs and concerns when a sewer backup occurs. The City has a sewer crew whose sole duty is to inspect, clean and maintain sewers on a daily basis. Sewer maintenance personnel are available on a 7-day-a-week, 24-hour-a-day basis to minimize the possibility of sewer problems. Unfortunately, because a sewer is not a closed system, many things put into the sewer can clog the system. Large amounts of grease from restaurants and disposable (and cloth) diapers are two common items that cause problems. Other factors can cause backups as well, such as tree roots, which can grow into and obstruct the system, or a broken or collapsed pipe.

Although the City of El Cajon has adopted rules prohibiting the discharge of any substance likely to cause a sewer obstruction, and distributes educational materials to the public about the problems they cause, there is really no way we can absolutely prevent blockages from happening.

Many homeowners' insurance policies exclude damage resulting from sewer backups. However, some insurance companies do provide sewer backup coverage**. If you are concerned about the possibility of a sewer backup and want to insure that you are covered, the City urges you to check with your home insurer regarding the availability of sewer backup insurance**.

CONTACT INFORMATION

If you experience a sewer problem, please call the Department of Public Works at (619) 441-1653 during normal business hours (M–F, 8am to 5pm), or call (619) 579-3311 on non-business weekday hours or on Saturday, Sunday and Holidays. When you call, please state that you are reporting a sewer backup or overflow emergency, and be prepared to provide the details. Backed up sewer lines, line breaks, sewage odors and overflowing manholes are considered an emergency.

If the problem is in the sewer lateral, the homeowner or business is responsible for correcting the problem. The owner of the property is responsible for maintaining and cleaning the sewer lateral from the building (or home) to the City's sewer main, including the connection on the sewer main. Locating the lateral is also the responsibility of the property owner. The City of El Cajon Public Works and Community Development Departments have records showing the location sewer main and lateral lines through public improvement plans or filed plumbing permits. Plumbers may also have special locating equipment, which may be very helpful to your task.

If the problem is in the sewer lateral, whom do you call for help? You will need to call a plumber or a sewer/drain cleaning service. Check your Yellow Pages or Business White Pages. You will need to contact and hire your own plumbing service. The City of El Cajon cannot make a recommendation. And although promptly correcting the plumbing problem is of great importance, it may be in your best interests to obtain several estimates.

REMEMBER TO CALL THE DEPARTMENT OF PUBLIC WORKS FIRST before calling a plumber. We will check the sewer main and inform you of our findings. If the problem is not in the City main you will be advised to contact a plumber or a sewer/drain cleaning service.

LATERAL vs. MAIN

What is a Sewer Lateral? A sewer lateral is the pipeline between the City-maintained sewer main, usually located in the street, and the building the sewer lateral serves. As it is defined in the El Cajon Municipal Code, the sewer lateral is owned, maintained and repaired by the property owner, including any part of the sewer lateral, which extends into streets, alleys or other public easements.

More often than not, the cause of a backup in your lateral is from items that the line is not meant to handle, such as kid's toys, underwear, towels, diapers, paper products (other than toilet paper), keys and even false teeth. To avoid flushing these items, remember to close the toilet lid. What you flush down your toilet may not affect you, but it might cause problems for your neighbors! Another possible cause would be roots in your lateral. The lateral is the responsibility of the owner of the property from the house to the sewer main.

WAYS TO PREVENT BACKUPS IN YOUR LATERAL AND IN THE CITY MAIN

The property owner can do many things to prevent his lateral from backing up. Remember too, that the very same things can help to prevent backups in the City main as well. If everyone would be careful about how they dispose of certain products, our systems would be a great deal more efficient, cause fewer backups, cost us all less money, and prevent a lot of misery. Here's a brief summary of some important sewer "Do's and Don'ts"

- ✓ **Grease:** Cooking oil should be poured into a heat-resistant container and properly disposed of in the trash after cooling to room temperature. Some people assume that washing grease down the drain with hot water is satisfactory. This grease goes down the drain, cools off, and solidifies either in the property owner's line, or in the main sewer. When this happens, the line constricts, and eventually clogs.
- ✓ **Paper Products:** Paper towels, disposable (and cloth) diapers, and feminine products cause a great deal of problems in the property owner's lateral as well as in City sewer mains. These products do not deteriorate quickly, as does bathroom tissue. They become lodged in portions of the lateral or main, eventually causing a sewer backups. These products should also be disposed of in the trash.
- ✓ **Roots:** Shrubs and trees, seeking moisture, will make their way into sewer line cracks. These roots can cause extensive damage. They may start out small, getting into a small crack in the pipe; but as the tree or shrub continues to grow, so does the root. After time, this causes your sewer line to break, which in turn allows debris to hang up in the line, thus causing a back up. One way to prevent roots from entering your line is to replace your line and tap with new plastic pipe. Another alternative is to be careful about planting shrubs or trees near your sewer line.
- ✓ **Sewer Odor:** Another concern that property owners have is that they can smell sewer odors inside their house or building. There are many ways to prevent this from occurring. Under each drain in your plumbing system, there is a loop of pipe called a "P-Trap". If there is water in this fitting, odors or gasses from the sewer cannot enter through the drain from either the property owner's lateral or

the City main. Periodically check to make sure that unused floor drains, sinks etc. have water in the "P-trap". Another way to prevent sewer odor is to ensure that the vents, which are located on your roof, are free from bird nests, leaves, or other debris. When these vents are clear, the sewer odors will escape through these vents.

- ✓ **Illegal Plumbing Connections:** Do not connect French drains, sump pumps and other flood control systems to your sanitary sewer. It is illegal, and debris and silt will clog your line. Consult a plumber to correct any illegal connections.
- ✓ **Needles:** Unfortunately, some people dispose of hypodermic needles in the sewer system. The presence of these needles in the wastewater collection system presents special and possible deadly problems for wastewater collection and wastewater treatment employees. **PLEASE DO NOT FLUSH NEEDLES.** The proper method of disposal is to re-cap the needle and put it into a "sharps container". This could be any rigid plastic container such as a bleach bottle. When it is full, tape the container securely, and call your local pharmacy for advice on proper disposal methods. **PLEASE DO NOT FLUSH THEM DOWN THE TOILET OR THROW THEM INTO THE TRASH!**
- ✓ **Install a Backwater Prevention Valve:** A backwater valve can prevent or greatly reduce the possibility of a sewer backup. A backwater valve is a fixture installed into a sewer line, and sometimes into a drain line, in the basement of your building to prevent sewer backflows. A properly installed and maintained backwater valve works on a one-way system, sewage can go out, but cannot come back in. Property owners are responsible for the installation and maintenance of backwater valves. The cost to install one is dependent upon the type of plumbing in your home and the difficulty of installation. A qualified plumber can assist you in determining your needs.

FREQUENTLY ASKED QUESTIONS

Q: What is the City's responsibility regarding private sewer laterals and private on-site sewer systems?

A: The property owner is fully responsible for maintaining adequate sewage flow to and through the sewer lateral and/or private on-site sewer system, from the property structure to and into the City-maintained sewer main. When failure or stoppage of a privately maintained sewer occurs, City crews will respond only to check the sewer main to verify that the main is open and sewage is flowing. If the sewer main is found to be clear, it is the responsibility of the property owner to call a licensed plumber or drain cleaning service to correct the problem. Verbal assistance and answers to questions can be received by calling the Department of Public Works at (619) 441-1653 during normal business hours (M-F 8am to 5pm), or (619) 579-3311 on other weekday hours, Saturdays, Sundays or Holidays.

Q: If I notice a foreign substance flowing into a storm drain inlet, whom should I call?

A: If you notice a foreign substance flowing into a storm drain inlet, please call the El Cajon Storm Water Protection Program at (619) 441-1653 to report the location, or call the 24-hour, 7-day-a-week San Diego Regional Storm Water Hotline at (888) 846-0800.

Q: What if my sewer backs up?

A: If you experience a sewer backup, call us at (619) 441-1653 during normal business hours (M-F 8am to 5pm), or (619) 579-3311 on other weekday hours, Saturdays, Sundays or Holidays. We will dispatch a maintenance crew to your address to determine if the stoppage is in the City main or your sewer lateral. If the City main is found to be clear, it is the responsibility of the property owner to call a plumber or sewer/drain cleaning service to correct the problem. The property owner is responsible for maintaining adequate flow to and through the sewer lateral from the property structure to and into the City sewer main. If the blockage is in the City main we will fix it as quickly as possible and keep you informed about what is being done.

Q: What about the mess?
A: A sewer backup can lead to disease, destruction of your valuables, damage to your house, and electrical malfunctions. Prompt cleanup of affected property can help minimize the inconvenience and damage.

After any sewer backup or overflow, you should immediately arrange for the cleanup of your property. Here are some useful things to remember:

- ✓ Take before-and-after photos of the affected areas
- ✓ Itemize any property losses
- ✓ Wet-vacuum or remove spillage
- ✓ Mop the floors and wipe walls with soap and disinfectant
- ✓ Flush out and disinfect plumbing fixtures
- ✓ Steam clean or remove carpet and drapes
- ✓ Repair or remove wallboard or wall covering
- ✓ Clean up appliances or ductwork

PRIVATE SEWER LATERAL and PRIVATE ON-SITE WASTEWATER SYSTEM

BEST MANAGEMENT PRACTICES (BMPs)

Private sewer laterals and privately maintained on-site wastewater systems, such as those owned and maintained by Homeowner Associations, carry untreated sewage containing numerous pollutants, including harmful bacteria and excessive nutrients. Improperly maintained private sewer laterals and on-site wastewater systems can break, clog, or malfunction, resulting in an overflow and discharge or raw sewage. Raw sewage poses an extremely high risk to the health of our streams, rivers, beaches and the oceans, as well as the health of members of our community.

Think before putting anything in the storm drain. Remember, the ocean starts at your front door.

Required BMPs:

- ✓ Dispose of grease in trash, not in the sink drain. Blockages caused by grease in sewer lines cause the majority of sewer main and lateral overflows.
- ✓ Private sewer laterals shall be cleaned, maintained or replaced to prevent seepage and spills.
- ✓ On-site wastewater systems, whether private or connected to public sewer systems, shall be flushed, maintained, repaired or replaced to the maximum extend practicable (MEP) to prevent seepage and spills.
- ✓ Spills from private sewer laterals and on-site wastewater systems shall be contained and cleaned up in a manner that minimizes any release of pollutants to the Storm Water Conveyance System or Receiving Waters.
- ✓ Any release from a private sewer lateral or on-site wastewater system that enters the Storm Water Conveyance System or Receiving Waters shall be immediately reported to the City.
- ✓ Failed sewer laterals or on-site wastewater systems must be immediately repaired or replaced. Contact the City for information concerning permits and approval requirements.

This information sheet is distributed as part of the El Cajon Storm Water Protection Program
For more information call the City at (619) 441-1653 or visit our web site at:
www.ci.el-cajon.ca.us and click on the "Storm Water Information" link

CITY OF EL CAJON
POLLUTION PREVENTION WEEK

LIST OF ACTIVITIES AND EVENTS

Date	Activity/Event	Estimated Number of Participants
04/25/05	Tire Recycling Day	Approximately 26 participants and collected between 18-21 tires for recycling
04/26/05	Dumpster Demonstration	Approximately 12 participants
04/27/06	Fundraising Car Wash Demonstration	7 participants and contacted approximately 9 people
04/28/06	St. Madeline's Cleanup Demonstration	Approximately 11 participants
04/29/06	A-1 Power Washing Demonstration	Approximately 8 participants

Business License and Storm Water Programs

Goal: Use information collected and stored in the Business License database to support the Storm Water Program inspection and public outreach components and potentially increase revenues for the Business License Program.

Process:

1. Business License database is provided to the Storm Water group in a read-only format to gather business address; type of business; SIC code; number of employees. (Support Storm Water inspection component)

2. Storm Water staff match information to Storm Water inspection database. Generate a list of corrections for the Business License database. (Potentially increase revenue)

3. Storm Water staff use Business License information to confirm Business License Database information. (Potentially increase revenue and Support Storm Water inspection component)

4. Develop a Storm Water informational sheet for Business License applicants. The Business License staff would hand out the informational sheet at the time. (Supports Storm Water outreach component)

Edit Rights (fields):

When errors are discovered in the Business License database, corrections can be made by either:

1. Printing out the data the correct for use by Business License staff to make the appropriate changes.

OR

2. Grant limited edit rights to the Storm Water staff for certain fields (Business Name; Address Number; Street Prefix (N, S, E or W); Street Name; Suite Number; Zip Code; Contact Person's Name; Contact Person's Telephone Number; Description of Business SIC; and Business License No.).

CITY OF EL CAJON
INVENTORY OF MUNICIPAL FACILITIES

HIGH PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Civic Center, City Hall and Plaza	200 E. Main Street	Washington Channel
2.	Fire Station No. 9	1301 N. Marshall Avenue	Forester Creek
3.	Public Works Maintenance Division Office	1050 Vernon Way	Forester Creek
4.	Vehicle Maintenance Facility	1060 Vernon Way	Forester Creek

MEDIUM PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Animal Control	1275 N. Marshall Way	Forester Creek
2.	Fletcher Hills Park, Recreation Center and Pool	2345 Center Place	Fletcher
3.	Parks Office	154 Rea Avenue	Washington Channel
4.	Performing Arts Center	110 E. Main Street	Washington Channel
5.	Wells Park, Recreation Center and Maintenance	1153 E. Madison Avenue	Forester Creek
6.	Parks Storage Garage	148 Rea Avenue	Washington Channel

LOW PRIORITY MUNICIPAL FACILITIES

	Municipal Facility	Address	Drainage Basin
1.	Albert Van Zanten Park	1495 Greenfield Drive	Broadway Channel
2.	Bill Beck Park	Pierce Street and Wagner Drive	Broadway Channel
3.	Bostonia Park and Recreation Center	1049 Bostonia Street	Forester Creek/ Broadway Channel
4.	Cajon Valley Middle School Park	750 Park Avenue	Forester Creek/ County Ditch
5.	Community Policing Division	165 E. Park Avenue	Forester Creek
6.	El Cajon Community Center	195 E. Douglas Avenue	Forester Creek
7.	Fire Station No. 7	695 Tyrone Street	County Ditch
8.	Fire Station No. 8	842 N. Third Street	Forester Creek
9.	Fire Station Park	Tyrone Street and Westwind Drive	Forester Creek
10.	Fire Station/ Department Administration	100 E. Lexington Avenue	Forester Creek
11.	Hillside Park and Recreation Center	840 Buena Terrace	Fletcher Hills Parkway/ Fanita Channel Basin/ Forester Creek
12.	John F. Kennedy Park and Recreation Center	1675 E. Madison Avenue	County Ditch
13.	Judson Park	Magnolia Avenue and Park Avenue	Forester Creek
14.	Museum (Knox House)	280 N. Magnolia Avenue	Forester Creek
15.	Office	1034 Magnolia Avenue	Washington Channel
16.	Pistol Range	Gillespie Field	Washington Channel
17.	Police Department	100 Fletcher Parkway	North Forester Creek
18.	Police Department Detectives	1035 Pioneer Way	Forester Creek/ Broadway Channel
19.	Prescott Promenade Park	200 Block of Main Street	County Ditch
20.	Renette Park and Recreation Center	935 S. Emerald Avenue	County Ditch
21.	Tuttle Park	379 Chase Avenue	County Ditch

Storm Water Quality Checklist
For Municipal Facilities

Site Name:_____ Location:_____

Contact:_____

Date:_____ Type of Inspection: ☐ Routine Site Inspection

Weather Information: ☐ Prior to Forecast of Rain Event

Storm Start Date and Time:_____ Storm Duration:_____hours ☐ 24-hr Period During Extended Storm Event

Time Since Last Storm:_____hrs/days Rainfall:_____inches ☐ After Rain Event

Inspector Name and Title:_____

Inspector Signature:_____

Pollution Prevention BMPs	N/A	Yes	No	Comments / Corrective Action
Erosion and Sediment Control				
Is existing vegetation preserved?				
Are seeding and planting of native plants and trees considered?				
Are geotextiles and organic mats used for soil stabilization?				
Roadway and Bridge Maintenance				
Are streets swept and clean?				
Is street sweeping frequency adequate for the area?				
Municipal Vehicle Maintenance Facilities				
Are vehicles/equipment parked/stored in designated areas?				
Are vehicles and equipment regularly inspected for leaks and spills?				
Are detected leaks/spills contained and repaired as soon as possible?				
Landscaping Maintenance				
Are safer, alternative products used or considered?				
Is weather considered for landscaping activities?				
Are certified professionals used to handle, apply, and distribute pesticides, herbicides, and fertilizers?				
Is there an IPM used?				
Maintenance of MS4				
Is the mechanism for detecting and removing IC/ID situations implemented?				
Is the MS4 inspected, maintained, and repaired?				
Is a stenciling and sign program used to warn of effects of illegal dumping?				
Sewer Blockage Response				
Is there mechanism for identifying, containing, controlling, and repairing sewage leaks and spills?				
Is hazardous waste disposed of properly?				
Waste Management				
Is there a waste reduction program in place?				
Are wastes segregated for proper storage and disposal?				

Are dewatering activities controlled and managed appropriately?				
Is groundwater tested prior to disposal?				
Is the public educated and encouraged to participate in appropriate stormwater activities?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Housekeeping				
Is the area clear of visible trash/debris and impervious surfaces free of sediment?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are points of ingress/egress to public and private roads free from sediment, debris and mud from tracking?				
Are materials stored in their designated areas?				
Are dry methods used to clean?				
Employee Training				
Have employees been trained in basic stormwater management and BMP implementation?				
Visual Inspections				
Are visual inspections of the site conducted and documented on a regular basis?				
Are the discharge locations free of significant erosion or sediment transport?				
Improved Operation and Maintenance				
Are drainage control structures free of litter and debris?				
Waste Disposal and Recycling				
Are there designated areas for recycling of metal, tires, antifreeze, and used oil?				
Are waste containers covered?				
Are areas near or around waste containers free of leaks or spills?				
Is timely service and removal provided to prevent waste containers and sanitary facilities from overflowing?				
Are hazardous wastes stored and disposed appropriately? (in labeled, secondary containment; 55-gallon drums in a secured, designated area)				
Is secondary containment free of spills and rainwater?				
Preventive Maintenance				
Are there procedures for replacing used or worn materials or equipment prior to failure?				
Record Keeping				
Is there onsite storage of documented inspections, BMP evaluations, and audits?				
Is there onsite documentation of employee training?				
Is there an onsite SWPPP or other Pollution Control Document?				
Does the SWPPP adequately reflect the current site conditions and the construction operations? If not, explain required SWPPP revisions.				
Spill Prevention and Response				
Are there spill kits near outside stored materials, wastes, and recycling areas?				
Are spill response procedures clearly posted?				
Are employees trained in preventing spills?				

Material Inventory Procedures				
Are inventories of 30 days materials onsite?				
Material Storage Practices				
Are outside stored materials stored off the ground and covered or in appropriate containers? (Flammables stored in a flammables cabinet; antifreeze in double-walled container or in secondary containment)				
Visual evidence of spills, staining, or leaks from outside stored materials are not evident				
Storage Tanks				
Are outside above ground storage tanks double-walled or in secondary containment?				
Visual evidence of leaks or spills in the area are not visible				
Outside Storage				
Are materials stored outside under cover or in containers?				
Maintenance BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are outside material storage areas free of visual evidence of spills or runoff?				
Loading and Unloading				
Are loading and unloading areas free of litter and visual evidence of spills?				
Sediment and Erosion Control				
If sandbags are used, are they placed appropriately for the conditions?				
Are temporary soil stabilization measures installed and in working order?				
Is dust control necessary and implemented?				
Are soil stockpiles properly stored?				
Is inlet protection available for all operational storm drain inlets?				
Vehicle and Equipment Maintenance				
Is there a covered or inside area designated for vehicle and equipment maintenance?				
Are leaking vehicles stored inside or drip pans used for outside storage?				
Vehicle and Equipment Washing				
Is there a designated covered or inside area or commercial facility for washing vehicles and equipment?				
Park BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Are grass clippings mulched or bagged for disposal?				
Are vegetation trimmings gathered and disposed as solid waste or recycled as mulch?				
Are sidewalks and parking lots cleaned using dry methods to collect and use as mulch or dispose as solid waste?				
Recreation BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Is pool water tested or treated for chlorine before discharge?				
Is pool filter backflush discharged to the sanitary sewer?				
Are pool chemicals stored inside and in appropriate				

containers?				
Non-Stormwater BMPs	**N/A**	**Yes**	**No**	**Comments / Corrective Action**
Non-Storm Water Management				
Is the site free of evidence of illegal connections and illicit discharges?				
Is the site free of evidence of unauthorized releases to storm drains?				
If not, have the appropriate authorities been notified?				
Other				
No other potential storm water pollution issues or concerns exist. If no, explain below.

STORM WATER ADMINISTRATIVE CITATION PROGRAM CRITERIA

1. Issue a Warning (followed by a letter, when possible)
   a. Whenever a discharge of pollutants is imminent or the potential exists, but the discharge has not yet entered the storm drain conveyance system (street, gutter, catch basin, etc.)
   b. Whenever a BMP is not effective for the pollutant or discharge and other BMP alternatives are available.
   c. Whenever a discharge origin cannot be determined through factual, investigative, or empirical evidence. Provide a cleanup schedule to be used as future enforcement.
   d. Small residential projects of less than 500 square feet of disturbed soil.
   e. An approved erosion and control plan has been issued and BMPs are partially implemented.
   f. Whenever activities are conducted in the right-of-way and no BMPs are implemented.
   g. Whenever a discharge of fully recoverable pollutants are discharged into the City's storm drain system (street and gutter only).

2. Issue a Citation
   a. Whenever there is a sewage overflow. (e.g. blockage; clean-out cap was removed to allow sewage to discharge into the street and storm drain).
   b. Whenever there is a discharge of unrecoverable pollutants into the storm drain conveyance system (street, gutter, catch basin, etc.)
   c. A Warning was previously issued (verbal or written).
   d. Any direct discharge into Forester Creek specifically any material which contains a 303(d) listed pollutant adopted by the State of California.(pH, TDS, and fecal coliform).
   e. An approved erosion and control plan has been issued and no BMPs are implemented.
   f. An egregious act of discharge (e.g. illegal dumping)

3. Issue a Penal Code Violation (PC374.3, 374.4, 374.7)
   a. When a First Citation was previously issued and this is a repeat violation.
   b. When the discharge is executed in the presence of any City Staff or after being told to cease operations. (waste, sewage, and litter discharges)
   c. Any direct discharge into Forester Creek, specifically material containing pollutants for which a 303(d) listing has been adopted by the State of California.(pH, TDS, and fecal coliform).

4. Issue a Stop Work Order
   a. For construction sites that received a warning and a first violation for discharging pollutants due to ineffective or proposed, but not yet implemented BMPs.
   b. A discharge of pollutants into the storm drain system, in addition to a citation, that requires immediate corrective action or mitigation.

5. Refer to Regional Board
   a. Repeated violations by a private citizen, property owner, or business for discharges to the storm drain system.
   b. A refusal to mitigate, remediate, or clean a spill or discharge of pollutants that will enter or have entered City MS4.

Home Based? ☐ Yes ☐ No Mobile Business? ☐ Yes ☐ No

Is this facility located in a multi-suite complex? ☐ Yes ☐ No

Facility personnel present:_____

B. FACILITY/SITE INFORMATION

Principal activity:_____

Assigned SIC code(s) _____ _____ _____ _____

Does SIC Code best represent principal activity: ☐ Yes ☐ No

Recommended change of SIC Code(s)?_____ _____ _____ _____

Existing SIC code(s) _____ _____ _____ _____

Status Update (if no longer active in City or does not need an inspection): ☐ Moved/Out of Business ☐ Duplicate ☐ Not Inventoried ☐ Out of Jurisdiction

Does facility have a current business certificate? ☐ Yes ☐ No #_____ Exp._____

Is facility subject to CA Statewide General Industrial Permit? ☐ Mandatory ☐ Conditional ☐ No

Does facility have a Notice of Non-Applicability (NONA/NEC)? ☐ Yes ☐ No

Has facility filed a Notice of Intent (NOI) to obtain coverage? ☐ Yes ☐ No WDID: 9 37I0_____

Has facility filed a Notice Of Termination (NOT) for the WDID# listed above? ☐ Yes ☐ No Approval date:_____ month/yr

Does facility maintain SWPPP or BMP Plan? ☐ Yes ☐ No

Does facility have a storm water monitoring program? ☐ Yes ☐ No

C. INITIAL OBSERVATIONS

Approximate distance to receiving water body: ☐ < 200 ft. ☐ 200 – 1000 ft. ☐ > 1000 ft.

Discharge points: _____

_____

Approximate area covered by industrial or commercial activities:_____square feet

Approximate % impervious surface of this area_____%

Exposed areas of significant outdoor activity or storage? ☐ Permanent ☐ Occasional ☐ No

D. BMP ASSESSMENT

BMPs	No Corrections Required		Corrections Required		Comments
	N/A	Fully Implemented	Partially Implemented	Not Implemented	
D.1 General					
Keep site free of litter, debris, and sediment using dry methods					
Keep parking lots, sidewalks, and streets free of sediment and debris using dry methods					
Keep outdoor areas free of spills and leaks					
Collect water from pressure washing or hosing and dispose of appropriately					☐ Unknown Performed by:
Direct roof downspouts away from areas of potential pollutants					
D.2 Landscaping					
Properly manage pesticides/fertilizer; use IPM when feasible					☐ Unknown Landscaping Co:
Employ adequate erosion prevention measures (vegetation or physical stabilization)					
Minimize over watering/over-irrigation					
Properly store stockpiles to prevent material transport					
Properly store and dispose of green waste					☐ Unknown
D.3 Materials and Wastes					
Protect trash area from contact with storm water					
Keep trash area free of litter and debris, liquids, powders, sediment					
Adequately cover materials stored outside					
Prevent run-on from contacting materials stored outdoors					
Properly label outdoor storage containers					
Provide an accessible, functional spill response kit					
Equip liquid storage containers with secondary containment					
Keep secondary containment free of spills and rainwater					
Properly store and dispose of hazardous materials					
Keep loading and unloading areas, including drains, free of debris					
Dispose of water generated by processing activities appropriately					
Dispose of pool, spa, fountain, and filter backwash water properly					☐ Unknown Performed by:
Clean floor mats in locations that do not drain to storm drain system					

BMPs	No Corrections Required		**Corrections Required**		Comments
	N/A	Fully Implemented	Partially Implemented	Not Implemented	
D.4 Equipment, Vehicles, and Outdoor Activities					
Conduct outdoor activities within contained areas (garage, under canopy, work shop)					
Use drip pans to collect leaks/spills					
Drain fluids from all non-operational vehicles stored outdoors					
Provide materials (berm, mat, etc.) to protect storm drain inlets from spills and leaks					
Perform vehicle/equipment washing in a contained area where runoff does not enter the MS4					
D.5 Other					
Manage animals and animal waste in a manner that prevents animal waste from being transported in runoff					
Keep grease bin and area surrounding grease bin free of grease stains/spills					
Keep storm drain inlets free of grease and other food debris					
Identify and eliminate illicit connections and illegal discharges					
Provide storm water training for appropriate employees					

D.6 ADDITIONAL REQUIRED ACTIONS

☐ Based on inspection findings, it appears likely that significant levels of _____ would be present in storm water discharges from this site. Take action to reduce the levels of _____ to the maximum extent practicable. Treatment control BMPs are likely necessary.

Owner/operator has been notified of recommended corrective actions both verbally and by: ☐ Hand ☐ Mail ☐ Fax

Please refer to http://www.ci.el-cajon.ca.us/dept/works/stormwater.html for more information on BMP implementation options.

D.7 Additional Questions	**Comments/Results**
Are there any potential air sources that could contribute to atmospheric deposition of pollutants?	☐ Painting ☐ Sandblasting ☐ Fuel Distribution ☐ Dust dispersion or mineral processing ☐ Metal smelting ☐ Metal plating or anodizing ☐ Chemical production or mixing ☐ Large fuel burning device ☐ Incinerator
Does facility have a grease trap or grease interceptor?	☐ No ☐ Grease Trap ☐ Grease Interceptor ☐ Unknown
Are there any treatment control BMPs on site?	☐ Filter insert ☐ Hydrodynamic separator ☐ Debris screen ☐ Sewer diversion ☐ Vegetated swale ☐ Vegetated filter strip ☐ Biofiltration ☐ Detention/sedimentation basin ☐ Containment and evaporation or reuse ☐ Filtration
Are treatment control BMPs regularly maintained?	☐ Yes ☐ No ☐ Unknown ☐ N/A
What is the approximate percentage of the site that drains to the treatment control BMPs?	☐ N/A
Do major potential pollutant sources drain to treatment BMP(s)?	☐ All ☐ Some ☐ None ☐ N/A

E. STATE GENERAL INDUSTRIAL PERMIT COMPLIANCE*

☐ Non-compliance with the State Industrial Storm Water General Permit noted.

☐ In the future, under a new Industrial Permit, which has not yet been adopted, this facility may be able to qualify for exemption from Permit coverage based on no outdoor exposure.

SPECIFIC ACTION(S) REQUIRED TO CORRECT THE VIOLATION DESCRIBED ABOVE*:

☐ File a Notice of Intent (NOI) with the State Water Resources Control Board (SWRCB) to obtain coverage under the Industrial Permit—see Attachment 3 of the Industrial Permit (www.waterboards.ca.gov/stormwtr/industrial.html).

☐ For "Conditional" facilities only: this site presently has outdoor exposure that requires filing for coverage under the Industrial Permit. If you implement all the recommended BMPs and eliminate outdoor exposure, you may be able to qualify for exemption from obtaining Industrial Permit coverage. Please contact the RWQCB for details.

☐ Develop and implement a Storm Water Pollution Prevention Plan (SWPPP)—see Section A of the Industrial Permit.

☐ Develop and implement a storm water monitoring program--see section B of the Industrial Permit for guidelines.

☐ Complete the provided Notice of Non-Applicability (NONA) and accompanying No Exposure Certification (NEC).

Additional notes and/or actions required:

F. CORRECTIVE ACTION SUMMARY

☐ **Corrective Actions Required.** Please refer to sections D.1-D.6 and E of this form and, if applicable, the Food Establishment Storm Water BMP Assessment form (if applicable, it is attached).

☐ No Corrective Actions Required at this Time.

G. RECOMMENDED CITY ACTIONS**

Follow Up Inspection Priority: ☐ **Priority 1** ☐ **Priority 2** ☐ **Priority 3**

ASSESSMENT

Level of knowledge regarding stormwater issues:	☐ 1	☐ 2	☐ 3	☐ 4	☐ 5
Level of cleanliness, BMP implementation, orderliness of site:	☐ 1	☐ 2	☐ 3	☐ 4	☐ 5

*Please note that the Regional Water Quality Control Board (RWQCB) is the final arbiter of Industrial Permit compliance; please contact the RWQCB at (858) 467-2952 for details of what is necessary to comply with the Industrial Permit.

**Recommended City actions listed at the time of inspection are subject to change based on later review by office staff.

No Exposure" Conditional Exemption For Industrial Facilities

The proposed USEPA rules will establish a conditional exemption called a "No Exposure Exemption" for owners and operators of industrial facilities who can show that industrial materials, material handling operations and industrial processes, are not exposed to stormwater. Essentially, this exemption replaces the previous exemption for "light industry" which was remanded to USEPA from federal court to further define and substantiate the justification for such an exemption. A written certification will be required to be submitted to the permitting authority every three years on a form supplied by the authority. This potential conditional exemption applies to all industrial categories regardless of type, except construction sites and sources individually designated. The conditions for qualifying for the No Exposure Exemption will include the following:

1. Notification to the permitting authority at the beginning of each permit term;
2. Must allow the permitting authority or municipality to inspect the facility and to make the results of inspection public;
3. Upon request, submit a copy of the certification to the municipality in which the facility is located; and
4. Sign and certify the certification.

The permitting authority will still retain the legal authority to require the owner or operator of an industrial facility to apply for an individual or general NPDES permit if it determines that the discharge is, or may reasonably be, causing or contributing to a violation of a water quality standard, or is or may be interfering with the attainment or maintenance of a water quality standard, including a designated use.
In connection with the No Exposure Exemption being considered, USEPA is seeking comments on the issue of how to define "no exposure." Several important issues are listed for further review (but are not part of this proposed rule), including:

1. How to account for stormwater runoff from parking lots, roof tops, lawns and other non-industrial areas of an industrial facility;
2. Whether the construction of impervious surfaces, such as roofs to achieve no exposure that significantly increase stormwater runoff volume should be regulated to prevent adverse impacts to the receiving water simply due to increased quantity of flow;
3. Whether air emissions from roof vents or stacks should be considered in the evaluation of no exposure; and
4. Whether tight non-leaking drums, barrels or dumpsters are sufficient to quality for the no exposure exemption, or should there be a "potential to leak" evaluation included.

EL CAJON STORM WATER PROTECTION PROGRAM

FLOOR MATS, GREASE, OUTDOOR CLEANING, AND DUMPSTERS

In California, the storm water and sanitary sewer systems are separate. **They are *NOT* connected**. The sanitary sewer takes wastes from sinks, showers, and toilets to a treatment plant. The storm drain system collects polluted urban runoff and discharges without treatment, to creeks and rivers leading to ocean bays causing beach closures.

En California, el sistema de drenaje pluvial y el alcantarillado sanitario de aguas negras son independientes. **Estos sistemas *NO* están conectados**. El sistema de alcantarillado sanitario de aguas negras aleja desperdicios de fregaderos, regaderas, y escusados a una planta de tratamiento. El sistema de drenaje pluvial atrapa aguas pluviales contaminada por urbanización y fluye sin tratamiento alguno directamente a nuestros ríos, arroyos, bahías y mar provocando el cierre de playas.

CLEANING FLOOR MATS

Clean floor mats, filters and garbage cans in a mop sink, floor drain or proper outside area. **DO NOT** wash them in a parking lot, alley, sidewalk or street.

Limpie los tapetes de piso, los filtros y los botes de basura en un fregadero para trapeadores, desagüe de piso o en algún sitio apropiado afuera. **NO** los lave en los estacionamientos, callejones, veredas o en la calle.

RECYCLE GREASE & OIL

Recycle Grease & Oil. **DO NOT** pour it into sinks, floor drains, or onto a parking lot or street.

Recicle grasa y aceite. **NO** los arroje en lavaderos o desagües de piso ni en estacionamientos o calles.

DRY CLEANING METHOD

Use dry methods for spill cleanup (sweeping, cat litter, etc.) **DO NOT** hose down spills.

Use métodos secos para limpiar los derrames (escobas, aserrín, etc.). **NO** utilize mangueras para limpiar los derrames.

KEEP DUMPSTER AREA CLEAN

Keep dumpster area clean and lid closed. **DO NOT** fill it with liquid waste or hose it out.

Mantega el área alrededor del basurero limpia y la tapa del basurero cerrada. **NO** lo llene con desperdicios líquidos ni utilice la manguera.

WASHWATER DISPOSAL

Pour washwater into a janitorial or mop sink. **DO NOT** pour it out onto a parking lot, alley, sidewalk or street.

Arroje el agua empleada en la limpieza al fregadero para trapeadores. **NO** la arroje en los estacionamientos, callejones, veredas o en la calle.

It is illegal to purposefully or accidentally discharge pollution (anything other than rain water) into the streets, gutters, creeks, rivers, and ocean. To do so is in violation of El Cajon's Municipal Code 13.10 and the Federal Clean Water Act. Monetary fines and criminal charges may be issued.

Es contra la ley descargar contaminantes intencionalmente o accidentalmente (excepto agua de lluvias) a las calles, orillas de calle, arroyos, ríos, y océano. La descarga de contaminantes al sistema de drenaje pluvial es una violación del Código Municipal de la Ciudad de El Cajon (13.10) y de leyes Federales del "Clean Water Act". Multas y otras acciones legales podrían ser generadas en su contra.

ADOPT GOOD HOUSEKEEPING PRACTICES AND HELP KEEP OUR STREAMS, RIVERS, AND BEACHES CLEAN. FOR MORE INFORMATION, CALL **(619) 441-1653**.

ADOPTE PRACTICAS EFECTIVAS PARA EL MANEJO DE AGUAS PLUVIALES QUE REDUSCEN LA CONTAMINACIÓN Y AYUDE A MANTENER NUESTROS ARROYOS, RIOS, Y PLAYAS MÁS LIMPIOS. PARA MAYOR INFORMACIÓN LLAME AL **(619) 441-1653**.

STORM WATER PROTECTION IS IN GOOD HANDS...YOURS!

Operate a clean, dry shop. Sweep, mop or vacuum instead of hosing down garage floors or outdoor work areas.

Opere un negocio seco y limpio. Barra, trapée, o limpie con aspiradora en vez de regar con manguera los pisos de los garajes o las áreas de trabajo exteriores.

Prevent spills and leaks. Develop spill prevention and response procedures. Use drip pans and ground cloths under vehicles. Drain and recycle fluids from wrecked or leaking vehicles as soon as possible.

Prevenga los derrames y las goteras. Desarolle un plan para prevenir y responder a estos derrames. Use recipientes recolectores y trapos debajo de los vehiculos. Tire y recicle los fluidos de los vehiculos chocados o de los que tengan goteras tan pronto que sea posible.

Prevent wash water from entering storm drains. Use a commercial car wash facility for cleaning vehicles. It is illegal to allow car wash runoff from commercial vehicles to enter the storm drain.

Prevenga que la agua sucia entre en las alcantarillas. Use un negocio comercial del lavado de auto. Es ilegal permitir que la agua usada del lavado de vehiculos comerciales entre en las alcantarillas.

Protect outdoor work and storage areas. Cover equipment/ materials and work/ storage areas. Place bulk fluids in secondary containment.

Proteja las áreas de trabajo y almacenamiento exteriores. Cubra estas áreas y también los equipos y materiales. Ponga los fluidos de grandes cantidades en recipientes secundarios.

Clean parts in a self-contained sink/drum unit when working with solvents. Inspect parts-washing units daily for leaks and make necessary repairs immediately. Use aqueous cleaning solutions instead of solvents when possible. Recycle used solutions through a licensed hazardous waste hauler.

Limpie las piezas y los repuestos en una unidad de fregadero/ tambor cuando trabaje con solventes. Inspeccione las partes de la unidad de limpieza diariamente para detectar goteras y haga los arreglos necesarios inmediatamente. Use soluciones a base de agua en vez de los solventes cuando sea posible. Recicle las soluciones usadas por medio de una compañia con licencia para transportar deshechos peligrosos.

Dispose of waste properly. Recycle oil, oil filters and antifreeze. Never pour liquids down the gutter or storm drain.

Disponga de los deshechos correctamente. Recicle el aceite, los filtros de aceite y los anticongelantes. Nunca debe tirar liquidos en las alcantarillas o rejillas.

Storm water and the pollutants it carries flow directly into the nearest creek, river, lake or lagoon, eventually reaching the ocean. Do your part to help keep our waters clean for you, your family and our environment.

Las aguas pluviales llevan los contaminantes directamente a los arroyos, rios, lagos y lagunas, y finalmente se desembocan al océano. Haga su parte ayudando a mantener nuestras aguas para usted, su familia y el medio ambiente.

This poster is brought to you by the San Diego Regional Copermittees. To report complaints or for more information, call the Regional Stormwater Hotline at 1-888-846-0800.

Storm Water Pollution Prevention Program
THINK BLUE
You're the solution to storm drain pollution.
Protecting our beaches, bays, and waterways

project clean water

VOL. 2

The Green Wrench Guide

Stormwater Best Management Practices for the Automotive Industry

Definitions

Best Management Practices (BMPs):	Techniques or controls used to prevent or reduce the discharge of pollutants into stormwater, receiving waters, or the stormwater conveyance system.
Dry Cleaning Methods:	Methods of cleaning surfaces that minimizes the use of water. Examples include sweeping, vacuuming, and using hydrophobic mops and rags.
Illegal Connection:	An unauthorized pipe, facility, or other device connected to the storm drain system or receiving waters. Devices that convey pollutants may be illegal even if they were permitted at the time of installation.
Illegal Discharge:	The unauthorized discharge of pollutants or non-stormwater into the stormwater conveyance system or receiving waters.
Pollutants:	Anything that can cause or contribute to water quality degradation.
Pollution Prevention:	Practices that minimize or eliminate the generation of pollutants at the source.
Receiving Waters:	Any water bodies including the Pacific Ocean, lakes, streams, lagoons, rivers, reservoirs, and intermittent waters such as vernal pools and seasonal dry creeks.
Stormwater Conveyance System (storm drain system):	Any public or private drainage system (non-sewage) including streets, curbs, gutters, inlets, ditches, pipes, channels, culverts, streams, etc.

Thank you to The City of San Francisco for the original Green Wrench Guide concept.

Background

What is Stormwater Pollution

When water flows over work areas, parking lots, streets, and other surfaces, it picks up pollutants and carries them into the storm drain system. This system is designed to prevent flooding by transporting water away from urban areas. Water and all the contaminants that it collects eventually flow without treatment through the storm drain system to our streams, lakes, and the ocean where we swim and fish. This polluted runoff harms inland freshwater wildlife and habitats, and in some cases causes, beach closures and makes our fish and shellfish unsafe to eat.

The Storm Drain System and the Sewer System are NOT Connected

In San Diego County, wastewater and surface runoff are discharged into two separate underground systems. Wastewater that is disposed to a toilet, sink, or a piped sewer drain flows into the sanitary sewer system where it is filtered and treated. Water runoff that leaves your business via driveways, sidewalks, parking lots, streets, gutters, storm drain inlets, drainage ditches, and concrete channels flows into a separate storm drain system. Anything that enters the storm drain system eventually flows untreated and unfiltered into our creeks, bays, lagoons – and ultimately the ocean. The things you do at work are directly connected to the health and safety of our citizens and the environment.

Your Responsibilities

As required by federal and state laws, the County of San Diego, the Unified Port District, and each of the 18 incorporated cities in the County have adopted local stormwater management ordinances to protect our water resources. *These ordinances prohibit the discharge of pollutants into the storm drain system.* Pollutants typically associated with automotive maintenance and repair activities include antifreeze, fuels, waste oils, solvents, and paints. Other pollutants commonly contributing to stormwater pollution include sediment, fertilizers, pesticides, and litter. As a business owner or operator, you are legally responsible for ensuring that these and any other potential stormwater pollutants are properly managed. To do so, you will need to select and use Best Management Practices that are specific to your business activities.

A storm drain outlet which flows unfiltered directly into a local stream.

Background

Best Management Practices (BMPs)

Best Management Practices, commonly called BMPs, are actions you can take to prevent pollutants from leaving your facility. In general, there are two main types of BMPs:

- **Source control BMPs** keep pollutants from entering runoff. Examples include preventive maintenance and routine sweeping.

- **Treatment control BMPs** remove pollutants from runoff before it reaches the storm drain system. Common examples are storm drain filters and oil / water separators.

Source control BMPs are often preferable because they are usually simpler and more cost-effective. One of the main types of source control BMPs is "pollution prevention". Pollution prevention methods (process changes, materials substitution, waste reduction) help to limit the amount of pollutants that are generated, thus eliminating the need to manage or remove them. Pollution prevention BMPs can help your business to run more efficiently and can save you money.

Using the BMPs described in this booklet will help you to satisfy regulatory requirements and to preserve and protect San Diego's waterways. Successfully meeting this challenge will require the active participation of all employees at your business. To assist your employees in understanding these requirements, please have them read and review this Green Wrench Guide. Also have your employees sign and date the training log included on pages 19 and 20 of this guide so that you will have a record of their training activities.

Background

BMPs and Your Business

This guide is designed to help you think about ways to manage potential stormwater pollutants associated with your business activities. It provides information on minimum requirements, and includes suggested pollution prevention tips for the automotive industry. It is organized according to the following activity types:

- **Facility Audits**
- **Employee Training**
- **Spill Management and Reporting**
- **Vehicles and Equipment**
- **Good Housekeeping**
- **Hazardous Waste Recycling and Treatment**

This guide is not intended to address all regulatory requirements pertaining to your business. Local jurisdictions may have additional, more specific stormwater BMP requirements. Pages 17 and 18 of this guide list additional contact information where you can obtain more information on stormwater and other regulatory requirements.

Thank you for helping to keep the San Diego region a great place for people to live and visit!

Facility Audits

Conducting your own facility audit is the best way to make sure that you stay in compliance with stormwater requirements. This can also save you money by identifying process and procedural improvements (waste prevention, etc.) to make your business activities more efficient. Be sure to address the following key areas during your audits:

- **Illegal Connections** - Inspect your business for connections that may convey pollutants to the storm drain system or receiving waters. An illegal connection is an unauthorized pipe, facility, or other device connected to the storm drain system, and may be illegal even if it was permitted at the time of installation.

- **Inlet and Discharge Points** - Identify the location of storm drain inlets on or down-gradient of your business or property. Mark these locations on a facility map and keep it posted in a common work area. Ensure that employees are shown these areas during training sessions.

- **Review of Activities** - Identify and use specific BMPs for activities with the potential to cause spills or releases of pollutants (oil, grease, fuel, etc.). Use the BMPs presented here as a guide for compliance, but don't stop there. Continue to seek out other sources of BMP information through the internet, professional associations, industry publications, etc. – you can never know too much.

- **Documentation** - Document any corrective action taken after your audit. Documentation is your key to demonstrating compliance. Be sure to include revised business practices and procedures in your employee training.

Employee Training

An effective stormwater management training program promotes employee ownership of problems and solutions. Employees are more likely to respond to training when they understand the impact of their daily activities on water quality. By involving your employees, their feedback will help implement needed actions to reduce stormwater pollution.

- Train all employees on stormwater BMPs and pollution prevention. Maintain training records on site; record the date of each training session and include a sign-in list of those who attended. Perform refresher trainings on a regular basis.

- Post signs around your shop reminding employees of BMPs and pollution prevention tips. This will also help to create awareness for your customers.

- Train employees about the proper use, handling, and disposal of all hazardous materials. Make sure all employees have current licensing and certification for their specific job duties.

- Teach employees how to control, contain, and clean up spills. Demonstrate how to properly use spill response kits.

You can stay informed about current regulations by joining trade associations and subscribing to trade journals and magazines. At trade association meetings and workshops, you will have the opportunity to learn about new pollution control practices and to network with others in your industry. Being involved will help you share ideas with others and will keep your training program up to date.

Spill Management and Reporting

It is always best to prevent spills, but be ready when they occur. Keep spill kits readily available, preferably near work areas where spills are most likely to occur. Make sure all employees know where these materials are kept and how to properly use them to contain and immediately clean up spills. Whenever possible, use dry methods such as sweeping, vacuuming, mopping or absorbents (if absorbents are used, they may have to be disposed of as a hazardous waste). Spilled hazardous materials (antifreeze, gasoline, solvents, etc.) need to be managed as hazardous wastes. Make sure your employees are aware of any special requirements that apply to hazardous material disposal.

Use the following guidelines within 24 hours of occurrence for reporting spills:

- Report any spill or discharge that cannot be completely contained or cleaned up prior to entering the storm drain system. To report spills and discharges, call the Regional Stormwater Hotline at **(888) 846-0800**.

- If the spill involves hazardous substances, call the Department of Environmental Health (DEH), Hazardous Materials Division at **(619) 338-2284**.

Always call **911** if the spill presents an immediate threat to public health or the environment.

Vehicles and Equipment

This section describes core BMPs for vehicle fluid management, engine and parts cleaning, vehicle and equipment washing, and body repair and painting. No matter which of these activities you are doing, it is important to always protect storm drain inlets on or down-gradient of work areas. Cover inlets with plastic or other impermeable material to prevent the entry of spilled fluids or wash water. Tape or weigh down the edges to keep the protective material in place.

Vehicle Fluid Management

Antifreeze, waste oil, and used solvents are hazardous wastes and must be stored, managed, and disposed of in accordance with all local, state, and federal laws.

- Whenever possible, drain vehicle fluids indoors or within covered areas, and only over floors that are constructed of a non-porous material such as concrete. Asphalt and dirt floors are not acceptable because they absorb spilled or leaked fluids.

- Use drip pans, containers, or other methods of drip and spill containment.
- Take extra precautions to prevent spills while draining fluids from vehicles. Transfer waste fluids to a labeled waste storage container as soon as possible.
- Provide drip pans under stored vehicles and those with known leaks. Drain fluids from disabled or stored vehicles as soon as possible to prevent leaks and spills.

- Transfer any fluids from drip pans or collection devices to designated waste storage areas regularly.
- Store vehicle fluids in separate, sealed, and leak-proof containers.

Vehicle & Equipment Washing

- Never discharge wash water or rinse water to a storm drain system or receiving water. Wash vehicles and equipment in designated areas. Use wash racks whenever possible.
- Use a spray nozzle or rinse bucket to conserve water and minimize discharge water.
- Whenever possible, use biodegradable soaps.
- Consider the use of a wash water recycling system to minimize wastewater from car washing.
- Use an oil / water separator or similar treatment system to remove oil, grease, and solids when discharging to the sanitary sewer.
- Use a commercial car wash facility if you are not able to meet the minimum standards described in this guide.
- Contact your local sewer agency for discharge information to the sanitary sewer. Use of oil / water separators and wash water recycling systems may have special discharge requirements.

OIL/WATER SEPARATOR

An oil / water separator is designed specifically to remove petroleum products, and can also remove solids. As the mixture enters the separator, the vehicle fluids float to a collection trough and the water flows into the sewer system. Solids settle to the bottom of the separator. Bottom sludges are often contaminated with heavy metals and other pollutants and must be managed as a hazardous waste.

Engine and Parts Cleaning

- Designate specific areas in your service bays for parts cleaning. Do not wash or rinse parts outdoors.
- Use aqueous cleaning solutions instead of solvents whenever possible. Recycle used solutions through a licensed hazardous waste hauler.
- Avoid using hose-off degreasers; never allow runoff to enter the storm drain system. Instead, brush off loose debris and use damp rags to wipe down parts. Manage used rags through a rag service or as hazardous waste.
- Clean parts in self-contained sinks or drum units when working with solvents. Inspect part washing units daily for leaks and make repairs immediately.

- Allow parts to drain over the solvent sink or drum, rather than allowing the solvents to drip or spill onto the floor. Never discharge the rinse solution into the sewer system.

- Recycle wastewater from steam cleaning or pressure washing activities. Discharges of wash water into the storm drain system are prohibited.

Body Repair and Painting

- Conduct work indoors or under cover when possible. If this cannot be done, take other precautions to prevent discharges from work areas.

- Inspect damaged vehicles for fluid leaks and use drip pans where necessary.

- Regularly clean work areas using dry methods. Use a shop vacuum or sweep up dust and debris. Do not vacuum flammable liquids.

- Allow wet sanding debris to dry overnight on the shop floor and sweep or vacuum it the next day. Liquid must not be discharged to the storm drain system. Consider investing in sanders with an attached vacuum system to capture dust at the source.

- Conduct painting only in approved, enclosed areas equipped with vacuum hoods and filters.
- Minimize paint and thinner waste by carefully calculating paint needs based on surface area and by using the proper sprayer cup size.
- Collect water used to control over-spray or dust in the paint booth and recycle or dispose of it properly. Clean spray guns in a self-contained unit and recycle or properly dispose of the cleaning solution.
- Check with your local fire agency and the Air Pollution Control District for additional information and permit requirements for spray booths, coatings, and emissions.

Good Housekeeping

"Good Housekeeping" refers to the routine practices you can use to maintain a clean work environment, and to prevent pollutants from entering our waterways. These practices include the use of dry cleaning methods for floor and paved surfaces, waste management practices, and grounds maintenance.

Floors and Paved Surfaces

- Sweep or vacuum your shop floors frequently. Use mops instead of hosing down work areas.
- Consider using a three mop system as described below:

1. Remove any spilled oil using a hydrophobic (oil absorbing) mop and wring out oil into a bucket labeled "Oil Only". Add the waste oil from this bucket to your waste oil drum or tank where it can be recycled. Keep the oil mop and the "Oil Only" bucket readily available in the work area for any future oil spills.
2. If antifreeze is spilled, use a regular mop and wring out the antifreeze into a bucket labeled "Coolant Only". Recycle the spilled material with other used antifreeze. Use rags sparingly for small spills or to dry a work area. Use a rag service or manage the rags as a hazardous waste.

3. Use a regular mop and bucket with detergent as a final rinse and use water sparingly. Dispose of wash water to an oil / water separator or the sewer.

- Never pour mop water onto paved areas, such as parking lots, sidewalks, street gutters, or storm drains.
- Oil / water separators must be regularly inspected and cleaned.
- Do not hose down fuel-dispensing islands; use only dry clean-up methods. Absorbent used for fuel spills should be promptly swept up and disposed of as hazardous waste.

Material and Waste Management

- Materials and waste such as fuels, solvents, batteries, and oils must be stored off the ground and in areas where they will not be exposed to rain water.
- If possible, provide overhead coverage for all outside hazardous materials or waste storage areas. If overhead coverage is not available, then cover stored materials with an impervious material such as a plastic tarp.
- Store batteries indoors and place used batteries in plastic trays to contain any potential leaks. Recycle used batteries regularly.
- Sweep parking lots and areas around your facility regularly. Do not hose down these areas. Provide trash cans with lids in your parking lot to discourage littering.
- Keep trash storage and disposal areas clean and free of debris. Inspect trash storage areas weekly. Maintain dumpsters and other containers in good condition and keep them securely closed when not in use.

- Contact your local solid waste hauler for recycling options and containers.
- Post "No Dumping or Littering" signs around your property.

Rooftops and Landscaped Areas

- Clean the rooftops of your buildings at least once before the rainy season. Cover any materials that are stored on the roof to protect them from rainwater.
- Maintain landscaped areas so that dirt and sediment do not reach the sidewalk or street.
- Apply pesticides and fertilizers according to label instructions and do not apply prior to rain. Consider using less toxic alternatives to pesticides and fertilizers whenever possible.
- Recycle or dispose of green waste properly.
- Properly berm and cover soil stockpiles.
- Ensure that sprinkler heads are adjusted properly to prevent over-irrigation and water runoff.

Hazardous Waste Recycling and Treatment

Please call the County of San Diego, DEH Hazardous Materials Duty Specialist at **(619) 338-2231** for incompatible waste storage and on-site hazardous waste treatment requirements.

Recycling

- Reuse and recycle solvents, paints, oil filters, antifreeze, motor oil, batteries, water, and lubricants whenever possible.
- Segregate wastes – it saves money! Combining different types of hazardous wastes will limit your recycling options and can be dangerous. A licensed hazardous waste hauler can provide information on hazardous waste storage and disposal costs.
- Label waste barrels and drums in accordance with all local, state, and federal laws and regulations. This will also help to remind employees to separate wastes and to recycle.

On-Site Waste Treatment

- Consider self-contained, zero discharge treatment alternatives that incorporate wastewater recycling.
- Choose treatment systems that are effective, but easy to maintain and repair.
- Properly maintain and service all pre-treatment equipment, including oil / water separators.

How to Reach Us

Regional Stormwater Hotline

To report spills and discharges to the storm drain system, call **(888) 846-0800**.

General Information

For additional information regarding water quality in the San Diego region, please use the resources listed below.

project clean water

THINK BLUE

You're the solution to storm drain pollution.

Protecting our beaches, bays, and watersheds

El Cajon Storm Water Protection Program
Residential Repair, Restoration and Remodeling

Residential repair, restoration and remodeling is a difficult and stressful time for home owners. In spite of these disruptions, you want to do your part in keeping your home, yard, neighborhood and community clean and healthy. Here are some ways that you can accomplish this while keeping our storm drains, creeks, rivers and beaches clean. These environmentally-friendly practices are called Best Management Practices, or BMPs. Please pass these tips along to anyone doing repair, restoration or remodeling at your home or property.

Concrete and Masonry Construction - Fresh concrete and mortar application materials can wash or blow into the street, gutter, or storm drain, posing a hazard to fish, wildlife, and people. To avoid polluting:

- NEVER dispose of cement washout or concrete dust onto driveways, streets, gutters, or storm drains.
- NEVER wash excess material from bricklaying, patio, driveway or sidewalk construction into a street or storm drain. Sweep up and dispose of small amounts of excess dry concrete, grout, and mortar in the trash.
- Wash concrete or brick areas ONLY when the wash water can flow onto a dirt area without further runoff, or drain onto a surface which has been bermed so that the water and solids can be pumped off or vacuumed up for disposal.
- DON'T mix up more fresh concrete or mortar than you will need for a project.
- PROTECT dry materials from wind. Secure bags of concrete mix and mortar after they are open.
- Set up and operate small mixers on tarps or heavy plastic drop cloths.
- Protect applications of fresh concrete and mortar from rainfall until the material has dried

Indoor and Outdoor Painting - All paints and solvents contain chemicals that are harmful to fish and wildlife. It is especially important to prevent these chemicals from entering storm drains.

- Keep all liquid paint products away from the street, gutter, and storm drains. Liquid residues from paints, thinners, solvents, glues, and cleaning fluids are hazardous wastes and should be disposed of properly. When thoroughly dry, used brushes, rags, drop cloths, and empty paints cans (lids off) may be disposed of as trash.
- Reuse paint thinner. Set used thinner aside in a closed jar to settle out paint particles. Then pour off clear liquid for future use.
- To dispose of the remaining paint sludge and any other household hazardous wastes that might result from your project, you can call Waste Management at (619) 596-5100 to

make an appointment. For additional options in disposing of residential waste including renting of waste dumpsters call at 1(800) DUMPSTER or (619) 596-5100

- Never put flammable products such as oil-based paint or thinner down any drain or into the garbage!

Paint Cleanup

- NEVER clean brushes or rinse paint containers into a street, gutter, or storm drain.
- For oil-based paints, paint out brushes as much as possible. Clean with thinner, filter, and reuse the thinner.
- For water based paints, paint out brushes as much as possible, then rinse in sink.

Paint Removal – Paint removal and the compounds used in its removal are hazardous wastes. You can call (619) 596-5100 to schedule an appointment for disposal.

- Chemical paint stripping residue, including saturated rags, chips and dust from paints containing lead or tributyl tin, are considered hazardous waste. Please collect all hazardous materials for proper disposal.
- When stripping or cleaning building exteriors with high-pressure water, use sandbags or berms, or seal the storm drain with plugs or rubber mats.

Construction - Sediment from excavation and other construction projects is the most common pollutant washed from work sites. Sediment entering the ocean through storm drains harms fish and other wildlife.

General Practices

- ALWAYS store both dry and wet materials under cover, protected from rainfall and runoff and away from storm drains or waterways.
- Keep all construction debris away from the street, gutter, and storm drain.
- Look for and clean up material that may have traveled away from your property after each days work.
- If you (or your contractor) keep a dumpster at your site, be sure it is securely covered with a lid or tarp when not in use.

Erosion Control

- Schedule grading and excavation projects during period when rain is not expected.
- Cover excavated material and stockpiles of asphalt, sand, etc., with plastic tarps.
- Prevent erosion by planting annual and perennial grasses. These will bind the soil, preventing erosion

Lumber - Cover chemically treated wood during rain events. This will prevent the chemicals from washing into storm drains.

Who Can You Contact? - For more information or to report illegal dumping you can contact the El Cajon Storm Water Protection Program at (619) 441-1653 or at www.ci.el-cajon.ca.us. Remember that through your efforts you are the Pollution Solution.

Our Environment:
It's a Living Thing!

El Cajon Storm Water Protection Program
Pet Pollution Can Be a Serious Problem!

When John and Gloria pause for a minute on their daily dog walk, they leave behind in public places a surprising amount of bacteria-filled waste. It seems like such a small amount when you think it's just your dog out there, but it really does add up. Many people don't realize how important it is to take care of their pet waste so it stays out of our storm drains, streams, rivers, beaches and ocean.

The act of John and Gloria walking with their dog is a very common residential activity. Studies show that about half of all dog owners walk their dogs in public places, and about 40 percent of them fail to clean up after their pets.

In a community the size of El Cajon (about 100,000 people and 10,000 dogs), dogs generate about two and a half tons (5,000 pounds) of feces per day. That's nearly two million pounds a year. Since a significant percentage is not properly disposed, that's a lot of bacteria in our neighborhoods, storm drains and watershed. According to even the most conservative estimates, all this pet waste can cause serious environmental harm unless it is properly controlled.

Dog and cat waste left on the ground can be washed into our neighborhood storm drains, all of which drain directly into natural water bodies without treatment of any kind. There the waste contributes to all sorts of problems, such as sick children and mucky waterways choked with algae that suffocates fish and can sometimes be poisonous to humans.

Dog Poetry

If taking care of number two
is number one to you,
then picking up your doggy doo
should matter lots to you.

So scoop the poop and bag it
and place it in the trash;
your doggy doo reflects on you,
It's what your puppy passed!

The same bacteria that make pet waste dangerous to people in parks can make the water unsafe for swimming or drinking. Children and others can get sick if they dunk their heads or accidentally get a mouthful of polluted water. And when waste gets into shellfish beds, it can make clams and oysters unsafe to eat.

Children and others who play in yards or in parks where pets eliminate waste can pick up illnesses from disease-causing bacteria and parasites. These include diarrhea, fever, muscle aches, headaches, vomiting, roundworms and toxoplasmosis (a parasite carried by cats that can cause birth defects if a woman becomes infected during pregnancy). Other pets can get sick too.

How You Can Make A Difference And Keep Our Water Clean!

When walking with your pet, take a plastic bag or paper cup along and dispose of the waste properly by:

- Flushing pet waste down the toilet, or
- Putting pet waste in the household trash after securely wrapping it. (Never put pet waste in a landscape waste container or the compost bin), and
- Be aware of and follow the Storm Water Management Ordinance that governs pet waste cleanup. The Storm Water Management Ordinance states, *"Pet waste shall not be disposed to the storm water conveyance system or receiving waters."* Remember that, if not cleaned up and disposed of properly, pet waste will eventually find its way into the storm drain system.

Pet Waste Pledge Card

I Pledge to do my part to protect water quality in El Cajon by:

- ✓ Picking up after my pet
- ✓ Properly disposing of pet waste by flushing it down the toilet or disposing of it in the trash
- ✓ Encouraging others to do the same

_____ _____

Signed by Date

Do You Know How Many Dogs Live In El Cajon?

- Around 10,000 registered dogs reside in the City of El Cajon.
- These dogs create approximately 5,000 pounds of pet waste per day!
- Pets, as well as humans, can catch diseases through coming into contact with infected pet waste.

The number of pets in El Cajon is much greater than the number of wild animals that once lived here. If we kept just a few pets their waste might not be much of a problem. However, we keep a lot of dogs and other pets and it is estimated that there are even more cats than dogs.

You wouldn't want to live in a city that lacked a public sewer system. With as many dogs living in the City of El Cajon, not cleaning up and properly disposing of pet waste can be a pollution problem. By cleaning up your pet waste and properly disposing of it, you can be an important part of the pollution solution. For more information or to report illegal dumping you can contact the El Cajon Storm Water Protection Program at (619) 441-1653 or at www.ci.el-cajon.ca.us.

El Cajon Storm Water Protection Program

What is Storm Water Runoff?

Storm water runoff occurs when precipitation from rain flows over the ground. Impervious surfaces like driveways, sidewalks, and streets prevent storm water from naturally soaking into the ground.

Why is Storm Water Runoff a Problem?

Storm water can pick up debris, chemicals, dirt, and other pollutants. Polluted runoff then flows into a storm drain system, eventually reaching our creeks, rivers, ocean, and beaches without treatment of any kind. Consequently, anything entering a storm drain system is discharged into the natural environment of our creeks, rivers, ocean, and beaches that we use for swimming, fishing and other recreational activities without treatment of any kind. People, especially children, can be harmed if they come in contact with these pollutants.

The Effects of Pollution

- Polluted storm water runoff can have many adverse effects on plants, fish, animals, and people.
- Sediment can cloud the water and make it difficult or impossible for aquatic plants to grow. Sediment also can destroy aquatic habitats.
- Excessive nutrients can cause excessive growth of algae and other aquatic plants. When these plants die, they sink to the bottom and decompose in a process that removes oxygen from the water. Fish and other aquatic organisms can't exist in water with low dissolved oxygen levels.

- Bacteria and other pathogens can wash into creek, river and beach recreational areas and create health hazards.
- Debris, plastic bags, six-pack rings, bottles, cigarette butts and yard waste washed into our storm drains, creeks and rivers can cause flooding, dump debris on neighboring lands and choke, suffocate, or harm aquatic life.
- Household hazardous wastes such as pesticides, paint, and other auto fluids can poison aquatic life. Land animals and people can become sick or die from eating diseased fish and shellfish or ingesting polluted water.
- Polluted storm water affects stream water quality and availability of natural areas for recreational uses. This, in turn, can affect human health and vastly increase the cost of our Storm Water Program.

To report illegal dumping contact the El Cajon Storm Water Protection Program at (619) 441-1653 (Mon. through Fri., 8:00 am to 5:00 pm), call the 24-hour Storm Water Hotline at 1-888-846-0800, or visit our web site at the www.ci.el-cajon.ca.us and click on the Storm Water link.

El Cajon Storm Water Protection Program

Storm Water Pollution Solutions

Recycle or properly dispose of products that contain chemicals, such as pesticides, paint, solvents, used motor oil and other automotive fluids. Don't pour them onto the ground or into storm drains. El Cajon residents can arrange for disposal of household hazardous materials and E-waste. Please contact Waste Management Customer Service at 1(800) DUMPSTER or (619) 596-5100 for more information or to schedule an appointment.

Residential Landscaping

- Permeable Pavement – Concrete and asphalt don't allow water to soak into the ground. These surfaces rely on storm drains to divert unwanted water. Permeable pavement systems such as turf block or paving stones allow rainwater to soak through, decreasing storm water runoff.
- Rain Gardens and Grassy Swales - Specially designed areas with native plants can provide natural places for rainwater to collect and soak into the ground. Rain from the rooftops or paved areas can be diverted into these natural areas rather than into storm drains.
- Vegetated Filter Strips – Filter strips are areas of native grasses and plants created along roadways or streams. These areas trap the pollutants that storm water picks up as it flows across driveways and streets.
- Swimming Pools – You can dechlorinate your pool by adding a dechlorination chemical such as Thio-Trine or other product using 100% sodium thiosulfate. Dechlorinated means having less than one part per million of chlorine. You can obtain the dechlorination chemicals and test kit from your local swimming pool supply store. Please contact the El Cajon Storm Water Protection Program at (619) 441-1653 for specific discharge requirements.

Lawn Care

Excess fertilizers and pesticides applied to lawns and gardens can wash off and pollute streams. Green waste, such as yard clippings and leaves, should be prevented from entering storm drains because they contain nutrients as well as herbicides, pesticides or fertilizers applied to your yard.

- Don’t over-water your lawn. Consider using a soaker hose instead of a sprinkler.
- Use pesticides and fertilizers sparingly and be sure and follow label instructions.
- If you live in a planned community with common area landscaping, notify your property manager immediately if you notice broken irrigation heads or over-watering occurring.
- Compost or mulch yard waste. Don’t leave it in the street or sweep it into storm drains or waterways.
- Cover piles of dirt or mulch being used in landscaping projects.

El Cajon Storm Water Protection Program

Auto Care

Washing your car and degreasing auto parts at home can send detergents and other contaminants into the storm drain system. Because the runoff flows so quickly downstream, dumping automotive fluids and other pollutants into storm drains has the same result as dumping the materials directly into Forrester Creek or the San Diego River.

- Use a commercial car wash that treats or recycles its wastewater, or wash your car on your yard so the water soaks into the ground.
- Repair leaks and dispose of used auto fluids and batteries at designated drop-off or recycling locations.

Pet Waste

Pet Waste is a major source of bacteria and excess nutrients in our local waterways. Unless our community can learn to manage pet waste more effectively, our Storm Water Program will be faced with a very expensive, State-mandated bacteria and nutrient pollution prevention program in the near future. Here are some ways that everyday citizens can effectively eliminate the pet waste problem:

- Flushing pet waste down the toilet, or
- Putting pet waste in the household trash after securely wrapping it. (Never put pet waste in a landscape waste container or the compost bin), and
- Be aware and tell others that cleaning up after your pet is the law in El Cajon. If not cleaned up and disposed of properly, pet waste will eventually find its way into the storm drain system.

Parking Lots and Trash Storage Areas

Dirt, oil, and debris that collect in parking lots and paved areas can easily be washed into the storm drain system and eventually enter our local creeks, rivers and beach areas.

- Sweep up litter and debris from sidewalks, driveways and parking lots, especially around storm drains.

- Cover grease storage bins and dumpsters and keep them clean.
- Report any chemical spill to the local hazardous waste cleanup team, please call the County Hazardous Waste Division at (619) 338-2231, Monday through Friday, 8:00am to 5:00 pm, or call the 24-hour Storm Water Hotline listed at the end of this article. They'll know the best way to keep spills from harming the environment.
- When employees or contractors are pressure washing outside, make sure all soapy or dirty wash water is collected and disposed of inside the facility to the sanitary sewer so it will be treated.

Think Waste Management

Water Pollution

Urban runoff is storm water and other sources such as irrigation sprinklers or hoses that are allowed to run too long. Water pollution can occur when runoff mixes and picks up pollutants as it travels over common surfaces (driveways, sidewalks, streets, and gutters) and then enters into the storm drains. Some of the most common pollutants consist of everyday household items generated from normal urban activities including: **litter, oil, dirt, yard trimmings, food, pet waste, debris, paint, and cleaning products**. This polluted runoff water can flow from the storm drains directly to our local creeks, lakes, and eventually to the ocean. The polluted water can have harmful effects on drinking water supplies, recreational use, and wildlife.

Storm Water Pollution Prevention

What is storm water?

Storm water is water that flows across the ground when it rains or snows. The water seeps into the ground or drains into what we call storm sewers, the drains you see at street corners or at low points on the sides of your streets. This water is called "storm water runoff" and is a concern not only in commercial and industrial sites, but neighborhoods as well, because of the pollutants it carries.

Storm water that does not seep into the ground drains into underground pipes and is eventually released into the ocean. Anything poured into a gutter or storm drain, such as used motor oil or antifreeze, flows directly into our water.

How can you help?

- Remember to recycle your used motor oil in a clean, sealed, plastic container, and properly dispose of other vehicle fluids such as antifreeze. Please call El Cajon's Solid Waste Hotline at (000) 000-0000 or Waste Management at (000) 000-0000 for questions regarding recycling used motor oil or proper disposal.
- Clean up after your pet. Pet waste left on the ground gets carried away by storm water, contributing harmful bacteria and parasites to our oceans.
- Sweep instead of hosing off pavement and washing pollutants into storm drains.
- Deliver paint, pesticides, batteries or solvents to your local Hazardous Waste drop off facilities.
- Keep trash bins covered and don't litter.
- Use yard trimmings as compost for fertilizer.

Water Conservation

How to Conserve Water

Now that you know how and what you recycle, you can learn how to conserve the valuable resources that we have available to us as El Cajon residents. Since we are so close to our beautiful beaches and ocean and water is so important, let's learn how to conserve it while keeping it free of pollutants!

- Water your lawn only when it needs it. Step on your grass. If it springs back, when you lift your foot, it doesn't need water. So set your sprinklers for more days in between watering. **Saves 750 to 1,500 gallons** per month. Better yet, especially in times of drought, water with a hose.
- Fix leaky faucets and plumbing joints. **Saves 20 gallons** per day for every leak stopped.
- Don't run the hose while washing your car. Use a bucket of water and a quick hose rinse at the end. **Saves 150 gallons** each time. For a two-car family that's **up to 1,200 gallons** a month. Install water-saving shower heads or flow restrictors. **Saves 500 to 800 gallons** per month.
- Run only full loads in the washing machine and dishwasher. **Saves 300 to 800 gallons** per month.
- Shorten your showers. Even a one or two minute reduction can **save up to 700 gallons** per month.
- Capture tap water. While you wait for hot water to come down the pipes, catch the flow in a watering can to use later on house plants or your garden. **Saves 200 to 300 gallons** per month.
- Check toilet for leaks. Put dye tablets or food coloring into the tank. If color appears in the bowl without flushing, there's a leak that should be repaired. **Saves 400 gallons** a month.
- Turn off the water while brushing your teeth. **Saves 3 gallons** each day.
- Turn off the water while shaving. Fill the bottom of the sink with a few inches of water to rinse your razor. **Saves 3 gallons** each day.

Made possible by a grant from the California Integrated Waste Management Board

City of El Cajon
Storm Water Residential Complaints

2007-2008

Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
07/24/07	Residential		1162	N Cuyamaca St #2	Raw sewage running into the street.	PW crew contanined and cleaned the spill. The property owner was notified to clean the area and repair the system.	Yes	Monetary Citation	Yes
07/27/07	Residential		1046	Cajon Greens Dr.	Motor oil leaking from containers at the bed of a truck	Upon arrival at site the leak was contained by using a bucket and absorbent material on the affected area	Yes	Verbal Warning	Yes
08/03/07	Residential		888	Salina St	Tree roots clogging the sewer line in front yard. Tree belongs to the City.	Met with the property owner on site. Palm tree in ROW. No Discharge. Clean out is in garage.	No	Verbal Warning	N/A
08/06/07	Residential		341	Coachwood	Grading without a permit and no BMPs installed.	City attorney letter mailed. Cited for grading and stormwater violations. Met with P/O this date to take updated photos	No	Verbal Warning	N/A
08/10/07	Residential		638	Raymond St	Pool plaster residue washed into the street and gutter.	Residue found to be dry, left door tag with instructions to clean the street and gutter. Property owner responded and cleaned the gutter and driveway	Yes	Verbal Warning	Yes
08/14/07	Residential		1581	Washington	Tenants throwing trash into the storm channel.	Contacted the Apt. manager on site and advised to instruct tenants to cease dumping in channel. PW crew to clean galss and trash. Educational materials issued.	Yes	Verbal Warning	N/A
08/14/07	Residential		2171	Madison	Water from neighbor running onto her property	Site inspection found no water, property is in county. Complainant notified	No	Verbal Warning	N/A
08/24/07	Residential		?	Chatham at Garfield	Concrete residue in the street and gutter	Contacted the contractor to have the street and sidewalk cleaned of all concrete residue	Yes	Verbal Warning	Yes
08/27/07	Residential		494	Tyrone St	Large gully in rear yard caused by erosion over time.	Prior encroachment permit issued for work. Rear alope covered in plastic. No significant erosion noted. Rear slope covered in plastic and netting on front bank. Neighboring lot is bare soil	No	Verbal Warning	N/A
08/27/07	Residential		1811	Dehesa Rd	Resident complained that the drainage ditch in front of property is filled with debris	Site ispection found that the property is within the County. The complainant was advised.	No	Verbal Warning	N/A
08/31/07	Residential		1600	Meadow	A truck with a concrete pump attached to it is leaking oil on the street.	The truck/ trailer combination was located and found to be leaking oil into a metal pan under the pump. Storm water educational materials were left at the door. A voice mail message was left for the complainant	Yes	Verbal Warning	N/A
08/31/07	Residential		449	S Mollison Ave	Broken sprinkle head shoots water into the street and sidewalk daily.	Site inspection found no evidence of sprinkler break or discharge.	No	Verbal Warning	N/A
09/04/07	Residential		2697	Carlow St	Drainage flow into the culvert next to the driveway is cracking and lifting it	No flow was observed and it was determined that the uplifting of the driveway was most likely caused by roots from a nearby tree	No	Verbal Warning	N/A
09/04/07	Residential		302	Westwind Dr	Water flowing from property onto neighbors and into the street	Property owner was contacted is in process of repairing irrigation line	Yes	Verbal Warning	N/A
09/14/07	Residential		1043	S Sunshine Ave	Retaining wall built with no permit with dirt on sidewalk and in street.	Building dept to handle follow-up. No storm water issues.	No	Verbal Warning	N/A
09/14/07	Residential		1504	Luke Ln	Materials from constructed block wall being washed into the street	No discharge or debris was located.	No	Verbal Warning	N/A
09/27/07	Residential		846	S Johnson	Water form broken irrigation pipe flowing into the storm drain.	Pastor of the Christian Fellowship Church contacted. Irrigation shut off. Management company contacted to clean the street of mud	Yes	Verbal Warning	Yes

City of El Cajon
Storm Water Residential Complaints

2007-2008

Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
10/01/07	Residential		?	Pfeifer Ln	Debris from tree trimming left in an area where it could possibly enter the storm drain system	The contractor was contacted who immediately cleared the street and sidewalk. All debris later removed.	No	Verbal Warning	N/A
10/04/07	Residential		800	S Anza	Raw sewage running into the storm drain	PW staff found no sewage flow or residue in the area. A plumber had responded and also found nothing	Yes	Verbal Warning	N/A
10/16/07	Residential		215	Dorado Ln	Water from sand blasting work leaving the property	Site inspection found water contained on site. Blasting work forming a cloud that did not leave the property	No	Verbal Warning	N/A
10/11/07	Residential		1166	Dawnridge	Pool water draining off property.	Water infiltrates before entering the street. Water is dechlorinated	No	Verbal Warning	N/A
11/26/07	Residential	(Mobile Business) Voltar Inc.	2462	Nielsen St	Waste water from carpet cleaning business being dumped into the stormdrain	Site inspection found no active discharge. Educational info left at residence. Owner called stating that he would cease all dumping	No	Verbal Warning	N/A
12/05/07	Residential		1510	Orange Ave	Hazardous materials being dumped in the dirt behid a makeshift paint booth	Complaint contacted on 12/5/07 to verify the location of the paint booth.	No	Verbal Warning	N/A
12/05/07	Residential		1204	Cuyamaca	Sewer overfow into the street and storm drain inlet.	PW crew contanined and cleaned the spill in the ROW. The property owner cleaned the other areas and was cited.	Yes	Monetary Citation	Yes
12/10/07	Residential		2388	Rippey Ct	Significant grading out in the canyon at the rear of property.	Property owner removed native vegetation for a fire break and cut approx. 20ft trerrace into the rear slope. No storm water issues	No	Verbal Warning	N/A
12/10/07	Residential		2364	Rippey Ct	Significant grading out in the canyon to the west.	Property owner removed native vegetation and replacing with trees and iceplant. No stormwater issues.	No	Verbal Warning	N/A
12/13/07	Residential		510	Pierce St	sHose from under house draining into front yard. Smells like sewage.	PW crew (PJ) inspected the site, contacted the propery owner. The hose is draining foundation water. The complainant was notified of City's action	No	Verbal Warning	N/A
12/14/07	Residential		1060	Aster	Discharge of raw sewage to the storm water conveyance system	Contacted the tenant to clean the property and contacted the proptery manager	Yes	Monetary Citation	Yes
12/14/07	Residential		1496	Lemon Ave	Discharge of sewage into the storm drain system.	Contacted the property owners son who turned of the water. The PW crew cleaned and vac. The street and sidewalk	Yes	Monetary Citation	Yes
12/18/07	Residential		181	Rea Ave	Using water and soap to clean the rear parking lot	Maintenance employee contacted and told to cease and use dry method	Yes	Written Warning	Yes
01/02/08	Residential		1107	Washington	Sewer overfow into the street and storm drain inlet	Paved areas washed and vac. from the street by PW crew.	Yes	Verbal Warning	Yes
01/02/08	Residential		1014	Taft St	Discharging pool backwash into the street	Pool water discharge is exempt.	No	Verbal Warning	N/A
01/07/08	Residential			Fanita and Weld	Yellow substance flowing in concrete channel.	Moderate flow in channel from recent rainfall is clear. No yellow discharge noted. Juan Cobas, Santee eng. Insp. on site	No	Verbal Warning	N/A
01/14/08	Residential		2400	Nielsen St	Vehicle parked in the visitor's parking stall leaking oil that is flowing to the street	PW crew placed absorbent material on spill. None entered the street. Complainant was contacted and advised of the city's actions	No	Verbal Warning	N/A
01/14/08	Residential		760	Carlow Ct	Water from Katherine st collecting behind her house and pooling. Requests that a storm drain be installed	Advised the complainant that she could install a pump or other drain system. This is not a stormwater issue.	No	Verbal Warning	N/A
01/18/08	Residential		1640	Dumar	Resident is using water to clean the trash and debris from curb in front of house	No violations noted 1-22-08. Educational materials left at door.Complainant advised. Educational materials left at door	No	Verbal Warning	N/A

City of El Cajon
Storm Water Residential Complaints

2007-2008

Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
01/22/08	Residential		1641	Don Carol	Concrete poured in curb for RV approach blocking srormwate flow.	Concrete poured at curb to allow for off street RV parking. Case referred to PW street crew.	Yes	Verbal Warning	N/A
01/25/08	Residential		1212	Cuyamaca	Sewage overflow in fornt of complex. Minor amount entered to curb line. None entered the drain inlet	PW crew cleaned the area and removed discharge. Property owner was present and immediately took action to prevent further discharges.	Yes	Verbal Warning	Yes
01/28/08	Residential		406	Horizon Ln	Site inspection per City manager office. Vegetation found growing in concrete swale at rear of property. No stormwater violations observed.	No action taken. City managers office notified of findings.	No	Verbal Warning	N/A
01/30/08	Residential		744	Chase Ave	Broken sewer cap in driveway allowing discharge of sewage into the stormwater conveyance system crossing the sidewalk and entering the curb. None entered drain inlet.	PW crew washed and vac. Area. A plumber was present to fix the damaged cap. The propery owner was also contacted.	Yes	Verbal Warning	Yes
01/30/08	Residential		1448	Marline Ave	Hose draining water from the back to front yard. Water crosses the sidewalk and into the street causing algae. Complainant	Appears that a hose located in the right front yard used to drain foundation from recent heavy rains. 2/5/08 reinspected due to continued complaints regarding the discharge of soapy water from the pipe. Instructed the P/O	No	Verbal Warning	N/A
02/21/08	Residential		113	Stephanie Ln	Draining green pool water into the street.	Contacted to tenant. Pool near completely drained. No algae residue at curb. Advised to drain remaining into vegetated area on property. Storm water educational materials were issued. The complainant was advised of	No	Verbal Warning	N/A
03/05/08	Residential		637	Blackthorne Ave	Foamy substance flowing in front of neighbors house gutter and driveway	Discharge found to be ground water percolating through pavement.	No	Verbal Warning	N/A
03/10/08	Residential		826	Medford	Sewer overoverflow from root intrusion during plumbing work. Property owner contacted the City. Flow did not enter a drain inlet.	PW crew responded, prevented discharge to storm drain inlet and cleaned	Yes	Verbal Warning	Yes
03/11/08	Residential		1738	Via del Valle	Soil erosion in driveway flowing onto roadway surface	This property is within the County of SanDiego	No	Verbal Warning	N/A
03/12/08	Residential		615	Galena St	Residents throwing cigarette butts in the gutter.	Left a door tag and contacted the complainant. There was no evidence of cigarette butts in the street or curb in front of the complainants residence	No	Verbal Warning	N/A
03/17/08	Residential		1566	Berenda Ct	Pool construction co. had no BMPs in place for concrete work being done in the street	Contacted the contractor and advised to implement the necessary BMPs to prevent a discharge to the storm water conveyance system	Yes	Verbal Warning	Yes
03/21/08	Residential		975	Second St	Soil erosion and open sewer cap in front yard	Site inspection found non-vegetated front yard(preexisting) and no open sewer	No	Verbal Warning	N/A
03/13/08	Residential		1921	Powell Dr	Extensive grading in rear yard into the canyon. SW concerns	Site inspection found no significant grading	No	Verbal Warning	N/A
04/02/08	Residential		555	Trenton St	Automotive fluids and concrete wash in the gutter in front of residence.	Contacted the property owner and advised to discontinue any future discharges. (via phone) He said the discharge was from a neighbor. Educational material was left at the door	Yes	Verbal Warning	Yes

City of El Cajon
Storm Water Residential Complaints

2007-2008

Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
04/04/08	Residential		725	Wichita	White pipe extending into the concrete storm channel next to property. Odor of urine	Contacted the property owner. Pipe from under concrete walkway drain. Recent discharge from pipe evident. No urine odor noted. Said they will remove the pipe.	No	Verbal Warning	Yes
04/10/08	Residential		404	Anza St	Open sewer cap with evidence of recent discharge along N/W wall of rear building	Site inspection found clean out area cleaned.	No	Verbal Warning	Yes
04/14/08	Residential		1686	Granite Hills Dr	Multi vehicle accident causing big rig to crash into residential pool filling it with oil and diesel fuel.	PW crew placed absorbent in gutter. The pool completely contained the fuel spill. Hazmat on site. There was no discharge to the storm water drain during vehicle removal to pool clean up	Yes	Verbal Warning	N/A
04/15/08	Residential		2037	Hacienda Circ	Pool plaster residue washed into the street and gutter. No BMPs in place	Contacted the contractor and advised to cease discharge and clean gutter. Educational materials were issued.	Yes	Verbal Warning	Yes
04/22/08	Residential		1329	Naranca	Dirt and trash regularly dumped in the street.	Conducted a site inspection and found no evidence of dumping. Storm water educational materials were left at the door	No	Verbal Warning	N/A
04/24/08	Residential		1702	Hacienda Pl	Dog feces being thrown onto rear slope and onto street. Excess number of dogs	Left stormwater educational information at door and referred to zoning enforcement.	No	Verbal Warning	N/A
04/25/08	Residential		1468	Lexington	Dirt in the street from and unfinished City roadway job.	The job was found to be a residential curb sidewalk and street improvement. The engineering department is working with three property owners on completion of the work	No	Verbal Warning	N/A
05/01/08	Residential		760	Carlow Ct	Water from pool discharge flowing down hill and pooling on Katherine St.	Site inspection found pooled water on Katherine St below the property. Zoning enforcement found faulty irrigation system and is working with the property owner.	No	Verbal Warning	N/A
05/08/08	Residential		646	Sandra Ln	Resident landscaping caused sediment discharge to rear concrete swale	Property owner was and advised to remove sediment from swale and install BMPs or plant the rear slope.	Yes	Verbal Warning	Yes
05/08/08	Residential		660	Sandra Ln	Front yard soil bare for relandscaping. No BMPs in place to prevent soil discharge	Propert owner was contacted and advised to install new BMPs or plant the front yard to prevent future sediment discharge	Yes	Verbal Warning	Yes
05/14/08	Residential		160	Ruth Ct	Discharge of concrete coloring residue into the curb and storm drain inlet.	Contacted the contractor and advised to clean the street and curb of a all remaining sediment using a dry method.	Yes	Monetary Citation	Yes
05/15/08	Residential		2053	Wedgemere Rd	Grading, backfilling with no permits of BMPs.	This property is being used as an access to the neighboring rear yard for pool filling(dirt). No grading observed. No BMPs required. The contractor cleans dirt from the street daily	No	Verbal Warning	N/A
05/20/08	Residential		1185	Peach Ave	Sewage discharge from backed up lateral	SW contacted the tenant and advised to contact a plumber to repair the lateral and clean area	Yes	Verbal Warning	Yes
05/20/08	Residential		724	Downer Ave	Strong sewer smell close to te house	Met with the tenant on site. Found no strong sewer odor nor any evidence of a discharge	No	Verbal Warning	N/A
05/29/08	Residential		1953	Estela Dr	Concrete sediment washed into the gutter and storm drain	Contacted the property owner and advised to clean the curb af all sediment. Will meet with him in 7 days	Yes	Monetary Citation	Yes
06/06/08	Residential		520	Main St	SD waste water referral regarding leaking above ground sewer latral located behind Main Tap Tavern now under renovation	Gate prevented access to property, viewed surface pooling along west side of building from rear of tavern, zoning enforcement also notified for building/zoning violations.	Yes	Verbal Warning	

City of El Cajon
Storm Water Residential Complaints

2007-2008

Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
06/12/08	Residential		283	Meadow Crest Dr	A 3 " pipe at the base of a block wall in front of the property is discharging gray water onto the sidewalk and street.	Contacted the property owner's daughter and gave her storm water and gray water discharge information to relay to her parents. She was told that the discharge must be relocated to on site vegetation or into the septic sewer. The discharge turned out to be from a dechlorinated pool	Yes	Verbal Warning	Yes
06/19/08	Residential		922	Chase Ave	Gray water draining from property ont to the street.	Contacted the property owner on site. No discharge observed. Tennis shoes were rinsed off in driveway and water entered the street. Storm water educational	No	Verbal Warning	Yes
07/01/08	Residential		2584	Katherine St	Metal drain pipe on slope across street causing erosion when it	Referred to PW street crew to evaluate position and condition of the pipe.	No	Verbal Warning	N/A
07/01/08	Residential		1043	Sunshine	Strong smell of sewage coming from under the house and ground is wet.	Met with the complainant's mother(tenent). Found no odor or sewage. No discharges observed. Most likely pooled water under very old house from deteriorated cast	No	Verbal Warning	N/A
07/09/08	Residential		244	Shady Lane	Large amount of dust and dirt in the street from road resurfacing.	No discharge observed o site. Roadway resurfacing underway. The contractor was contacted and advised to sweep all debris from the street and sidewalk. Storm	No	Verbal Warning	N/A
07/10/08	Residential		712	Garfield Ave	Citizen phone complaint of a broken irrigation line at the property with water running into the street.	Contacted the resident and advised to cut the water to the irrigation and repair it. The work was done the same day.	Yes	Verbal Warning	Yes
07/21/08	Residential		283	Meadow Crest Dr	Repeat complaint of gray water being drained onto the sidewalk in front of the residence.	Site inspection found minor evidence of a discharge at base of brick wall in front of property. Will arrange full inspection with owner. Discharge found to be pool water	No	Verbal Warning	N/A
07/24/08	Residential		757	Pierce St	Citizen's phone complaint that irrigation system has been continuously running for two days and no response at the door.	Inspection found front yard irrigation overflowing into the street. No response at door. Water was turned off to the system. Card left at door. Owner responded later.	Yes	Verbal Warning	Yes
07/24/08	Residential		1045	Terrace Crest Dr	Citizen's phone complaint that a brown liquid was being discharged	No discharge noted in front of the residence or in street.	No	Verbal Warning	N/A
07/30/08	Residential		636	Medford	Discharge of blackwater from and occupied camper in rear yard onto neighboring church property and entering the storm drain.	Notified zoning enforcement. The property owner and the occupant of the camper were contacted on site. A discharge pipe connected to the camper ended at the rear block wall . All other utilities were also attached to the camper. The owner was told to immedialtely remove all utilities and cease all discharges. The pipe was removed and capped. He was also instruced to clean the	Yes	Verbal Warning

PROCLAMATION

"POLLUTION PREVENTION DAYS"
June 4th and June 18th, 2008

WHEREAS, *storm water management services provided in our community are an integral part of our residents' everyday lives. The support of an understanding and informed citizenry is vital to the efficient operation of storm water management programs; and*

WHEREAS, *the health, safety and comfort of this community greatly depends on these services. The quality and effectiveness of these services, as well as their planning and implementation is vitally dependent upon the efforts and skill of storm water management staff; and*

WHEREAS, *the efficiency of the qualified and dedicated personnel who staff the storm water management division is materially influenced by the people's attitude and understanding of the importance of the work they perform.*

NOW, THEREFORE, *I, Mark Lewis, Mayor for the City of El Cajon, together with the City Council, do hereby proclaim the days of June 4th and June 18th, two thousand and eight to be "POLLUTION PREVENTION DAYS" in the City of El Cajon. We further call upon all residents and civic organizations to acquaint themselves with the issues involved in providing our services and to recognize the contributions which public works officials make every day to our health, safety, comfort, and quality of life.*

Signed this twenty-seventh day of May, two thousand and eight.

Mark Lewis

HELP!

Pollutants were found in your neighborhood storm drain.

Our field staff found the following pollutant(s)spilled or dumped into the storm drain system (curb, street, gutter) near your home:

- ❑ Over irrigation usage
- ❑ Motor Oil
- ❑ Antifreeze/Transmission Fluids
- ❑ Cooking grease
- ❑ Detergents
- ❑ Solvents/Degreaser
- ❑ Paint/paint products
- ❑ Home improvement waste
- ❑ Sewage
- ❑ Animal waste
- ❑ Yard waste (leaves, grass, etc.)
- ❑ Uncovered dirt and gravel pile(s).
- ❑ Construction debris
- ❑ Trash
- ❑ Other

Be a Clean Water Leader

Storm water pollution is a problem that affects all of us. With a growing population of more than 95,000 residents and approximately 14 square miles of urbanized development, keeping our waters clean from pollutants has become increasingly difficult. With thousands of storm drain inlets, and nearly 100 miles of storm drain pipes and channels to clean and maintain, we need your help.

When it rains, water flows over across our yards and into our streets carrying pollutants into our storm drains. The problem is that storm drains are not connected to the wastewater sewer treatment plant. So, what's in the streets flows directly into our creeks, rivers and the ocean, without treatment.

Last year, too many of our beaches and bays were closed or posted as unsafe for swimming. As our City

Be a Clean Water Leader

Storm water pollution is a problem that affects all of us. With a growing population of more than 95,000 residents and approximately 14 square miles of urbanized development, keeping our waters clean from pollutants has become increasingly difficult. With thousands of storm drain inlets, and nearly 100 miles of storm drain pipes and channels to clean and maintain, we need your help.

When it rains, water flows over across our yards and into our streets carrying pollutants into our storm drains. The problem is that storm drains are not connected to the wastewater sewer treatment plant. So, what's in the streets flows directly into our creeks, rivers and the ocean, without treatment.

Last year, too many of our beaches and bays were closed or posted as unsafe for swimming. As our City

Leaders have said, “this is more than an inconvenience; it is a civic embarrassment.” **Discharging pollutants to the City's storm drain system is in violation of Title 13.24 of the El Cajon Municipal Code and violations can result in substantial fines.**

But, as a City resident, you can make a difference. By becoming a Clean Water Leader, both on the job and in your community, you can help make our stream, rivers and beaches free of pollution. When you're at home, share your knowledge with neighbors and family. As you drive to work, be aware of any illegal discharges. And, if you do see an illegal discharge, report it. In the City of El Cajon you can **call the City of El Cajon at (619) 441-1653, or the 24-hour Storm Water Hotline at (888) 846-0800**.

Whether at home or at work, by adopting some simple Best Management Practices (BMPs), you can stop pollutants from being generated and entering our storm drain system.

- ✓ Use dry clean-up methods for spills and outdoor cleaning. Vacuum, sweep, and use rags or dry absorbants. Properly remove and dispose of this material when the spill is absorbed.
- ✓ Properly label, store and dispose of hazardous wastes. Rake, sweep up, and place all debris (dust, litter, sediment, etc.) from your yard or near your property into a trashcan.
- ✓ Use a mop only when water is needed.

As you perform your daily activities be proactive. Assess the activity from a storm water pollution point-of-view and ask yourself; “does this activity, directly or indirectly, generate pollution?” And, “how can I get the job done and prevent debris from entering into the storm drain collection system?”

PUBLIC WORKS DEPARTMENT

Natalie Roberts
I Love A Clean San Diego
4891 Pacific Highway, Suite 115
San Diego, CA 92110

December 21, 2007

LETTER OF PERMISSION FOR I LOVE A CLEAN SAN DIEGO (ILACSD) TO STENCIL STORM DRAIN INLETS IN THE CITY OF EL CAJON

This letter gives permission to ILACSD staff and volunteers to apply the message "No Dumping…I Live Downstream" and a depiction of a dolphin or duck to the curb area directly adjacent to storm drain inlets within the City of El Cajon. Validity of this letter of permission is for two years from the date of this letter, unless otherwise notified.

We strongly support and would like to thank I Love A Clean San Diego for their efforts in this important program, which will help the City of El Cajon in educating the public regarding storm water runoff and pollution prevention.

All storm water stenciling activities should be coordinated with our Storm Water Program staff, the City Manager's Office and the Police Department to properly identify neighborhoods within our city where inlets would benefit from being stenciled and to secure areas for volunteers to park cars and safely coordinate activities. City Storm Water staff can be contacted as described below.

Should you have any questions or require additional information, please contact Jaime Campos at (619) 441-5554, jcampos@ci.el-cajon.ca.us or Robert W. Griswold at (619) 441-1704, bgriswold@ci.el-cajon.ca.us.

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

Mission Statement:
The Public Works Department is a maintenance and engineering organization, and an integral part of the municipal government of the City of El Cajon. Dedicated to public service, we operate, maintain, repair and preserve the public assets, public buildings and parks and open lands owned by the residents of El Cajon. We do this to enhance the quality of life in El Cajon, facilitate commerce, and protect the safety of our residents and visitors.

Description:
Provide compliance with the Regional Water Quality Control Board's R9-2007-001 Municipal Permit. Major components include training of City personnel and citizenry, inspection of commercial and industrial businesses, inspection of construction sites, public outreach, dry weather, storm water testing, and conditioning of new development and redevelopment to comply with storm water regulations. Serve as the lead San Diego River Watershed Permittee and assure the development and implementation of a Watershed Urban Runoff Management Plan (WURMP), as required by the Permit

Prior Fiscal Year Highlights:
The goal of the Permit is to improve receiving water quality and determine the threat to human health and the environment using the maximum extent practicable controls. The Sixth Permit Year Annual Report listed the following major accomplishments:

- Updated the City Ordinances for Storm Water Management and Discharge Control (Ord. 4686) and Standard Urban Storm Water Management Plan (SUSMP) (Ord. 4717) in accordance to the new Permit.
- Continued with a strong Enforcement program of City Ordinances 4686 and 4717 requirements.
- As a City with little open space and a propensity for redevelopment, the City pursues common sense approaches to go beyond Permit compliance and achieve defensible, cost effective storm water management practices for businesses and citizens through the SUSMP conditioning process.
- Continued implementation of a City-Wide Integrated Pesticide Management Program.
- The City continued an expanded scope of its Dry Weather Monitoring Program. Additional information along concrete lined areas focuses on business districts or municipal areas. In doing so, it has made substantial strides in detecting and eliminating discharges and characterizing receiving waters and other conveyance discharges within its jurisdiction.
- Conducted upstream/downstream dry weather analysis in Forrester Creek to quantify the amounts of pollutants discharged within the City's jurisdiction.
- Inspected 185 commercial and industrial facilities for compliance with the City's Municipal Code. The City conducted monthly inspections at all priority construction sites during the dry season and weekly inspections during the wet season.
- The City issued a total of 10 warnings and 12 citations for various violations of the City's storm water ordinances.
- Conducted inspections at 14 high priority construction sites.
- Conducted inspections at 26 high priority industrial sites and issued two citations. The City also collected industrial storm water monitoring data from those industrial facilities subject to the State General Industrial Storm Water Permit and conducting the required annual storm water monitoring. The City intends to review the industrial storm water data to evaluate potential contributors to water quality problems.
- The City's inspection programs emphasized clean trash storage and disposal areas; power washing, Best Management Practices (BMPs); and maintenance of sewer laterals in addition to the minimum required BMPs.
- The City's comprehensive street sweeping program swept 18,781 miles of streets and collected

- The City's inspection programs emphasized clean trash storage and disposal areas; power washing, Best Management Practices (BMPs); and maintenance of sewer laterals in addition to the minimum required BMPs.
- The City's comprehensive street sweeping program swept 18,781 miles of streets and collected

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

3,459 cubic yards of materials from City streets. Sediment and silt account for 42% of the total, organic material accounted for 38%, trash accounted for 17% and the "Other" category accounted for 3%.

- Collected 1,654 cubic yards of materials from City inlets, culverts, concrete-lined channels, and catch basins.
- Actively participated in the Management Committee, Outreach Workgroup, Regional Monitoring Workgroup, and WURMP Development Workgroup.
- Continued active participation with San Diego River Watershed Workgroup.
- Continued its efforts to reach out to community members on a wide range of urban runoff and storm water quality topics through over 200,000 copies of articles, brochures, and mailers.
- Conducted over-the-counter assistance and provided personalized residential BMP information to homeowners for small additions and remodels, pools and retaining wall projects.

Goals:

- Expand existing and add new programs as necessary to comply with the significantly increased oversight, inspection, tracking, monitoring and reporting requirements contained in the new municipal permit and updated Jurisdictional Urban Runoff Management Program (JURMP) document.
- Create and adopt new activities and program upgrades to comply with the new Municipal Permit and JURMP document.
- Continue to achieve compliance on construction sites and industrial and commercial facilities.
- Work towards developing a GIS Enterprise System and Storm Water data layers.
- Maintain compliance with all requirements of the current Permit through continued implementation of the JURMP and the WURMP.

Municipal Component

- Conduct training for all City employees.
- Conduct comprehensive inspections at all municipal facilities.
- Implement and document Best Management Practices (BMPs) - street sweeping, storm drain cleaning, sewer and road maintenance.
- Develop City-specific environmental indicators for accurate measurement of Urban Runoff Program effectiveness.
- Establish defined measurements and actions to address watershed requirements, and develop watershed management procedures.
- Conduct a comprehensive review and evaluation of the Storm Water web page. Create and post all outreach documents and information brochures to ensure easy availability to all interested parties. Establish a process to periodically review and update the web page with the latest information and news pertaining to storm water requirements, BMPs and important contact information.
- Develop an inspection program to assure that post-construction BMPs are being maintained.

Industrial and Commercial Component

- Inspect approximately 1,200 businesses and establish prioritization for future oversight.
- Conduct follow-up inspection for facilities not in compliance.
- Educate facility owners and personnel.
- Focus on specific commercial/industrial activities for pollutant discharges and waste collection and handling BMPs.
- Develop and implement procedures (with other jurisdictions) to identify, educate and inspect mobile businesses (auto detailers, power washers, etc).
- Inspect and verify that any existing post-construction BMPs at the sites are being maintained.

ACTIVITY: PUBLIC WORKS NPDES COMPLIANCE **ACTIVITY NO: 650750**

Residential Component

- Expand the topics for educational and outreach materials for distribution to the public.
- Expand efforts to provide information brochures on BMPs used for yard care, auto repair, car washing, and pet waste.
- Investigate all storm water or spill complaints submitted from the public.
- Identify the actual or potential high priority water quality pollutant sources and develop source specific activities to reduce or eliminate those pollutant sources.
- Implement two short-term and one long-term water quality activity to address the highest priority water quality problems.

Construction Component

- Provide increased oversight on all grading projects to ensure compliance with erosion control plans.
- Provide education and outreach to all developers on new municipal and state requirements.
- Implement and enforce strict sediment and erosion control measures on all grading sites.
- Report and document sites of non-compliance.

Illicit Discharge Detection and Elimination Component

- Conduct dry weather field screening and analytical monitoring.
- Conduct follow-up investigations.

Land Development Review

- Review project development for compliance with SUSMP ordinance and JURMP.
- Coordinate conditions of approval to ensure permit compliance.
- Re-evaluate and develop protocol for the submittal and approval process of projects incorporating storm water requirements.

WURMP Program

- Provide leadership in the San Diego River Watershed.
- Create a mechanism to share costs amongst all the copermittees within the San Diego River Watershed.
- Collaborate with other jurisdictions on watershed-wide education and outreach events.
- Identify the actual or potential high-priority water quality pollutant sources and develop source specific activities to reduce or eliminate those pollutant sources.
- Implement two short-term and one long-term water quality activity to address the highest priority water quality problems.
- Serve as liaisons between the San Diego River Watershed copermittees and the regional board, where appropriate.

Financial Comments:

The $28,722 increase in salaries and benefits is due to increased employee benefit costs including PERS retirement benefits and workers compensation.

The decrease of $234,491 in materials, services and supplies is primarily due to updates to the Watershed Urban Runoff Management, and the Jurisdictional Urban Runoff Management Plans. Additionally, there is a proposed decrease in the amount budgeted for dry weather testing. This testing is required during the summer months. During the 2007/08 fiscal year, two years of dry weather testing was completed. In fiscal year 2008/09 only one year of testing will be completed; therefore, the budget has been reduced.

El Cajon, California 92020

Re: Sampling and Analyses of Groundwater in the City of El Cajon

Dear Jaime,

Per your request, D-MAX Engineering conducted groundwater sampling at two locations in the City of El Cajon. The purpose of the study was to evaluate the sources of nitrate detected at some of the City's dry weather monitoring sites. .

A brief summary of steps taken during this project is presented below

- Prepared a drilling application and submitted it to the County of San Diego, Department of Environmental Health, and coordinated with Digalert prior to drilling.
- Contracted with Tri-County Drilling Inc. to excavate two boreholes in the vicinity of existing dry weather Site 37, where nitrate exceedances have consistently been detected over the years. One borehole was located on the unpaved portion of South Second Street south of Site 37. The other borehole was drilled inside the School District parking lot at Jamacha Road. The City coordinated with the School District to obtain permission for drilling on its property. See the attached map for details of the location.
- The borings were drilled down past 20 feet. The groundwater table was estimated at nine to 10 feet deep, and hydropunch samples were collected and sent to EnviroMatrix to be analyzed for Nitrate, Total Nitrogen, Fecal and Total Coliform, *Enterococcus*, Total Dissolved Solids (TDS), and Total Phosphorous. The results are summarized below, and laboratory reports are attached.

Analyte	Reporting Limit	Site A	Site B	Units
Nitrate as N	0.05	**17.4**	**16.7**	mg/L
Nitrate/Nitrite as N	0.05	17.4	16.7	mg/L
Total Kjeldahl Nitrogen	0.5	ND	0.5	mg/L
Total Nitrogen	0.5	17.4	17.2	mg/L
Phosphorus, Total	0.05	0.26	0.1	mg/L
Total Dissolved Solids	20	1,200	1,590	mg/L
Total Coliforms	2	2	230	MPN/100 mL
Fecal Coliforms	2	ND	ND	MPN/100 mL
Enterococcus	2	ND	ND	MPN/100 mL

Notes
"ND" – Not detected at or above the reporting limit
Red, bold text indicates the result is above the Dry Weather Monitoring Program action level.

7220 Trade Street ■ Suite 119 ■ San Diego, CA 92121 ■ (858) 586-6600 ■ Fax (858) 586-6644

The Dry Weather Monitoring Program action level for nitrate is 10.0 mg/L. At both sites the results exceeded this action level, and the height of the groundwater was high enough that it could influence the storm drain system. Previous investigations by the City have found seepage into the storm drain pipes in these areas as well; that seepage was found to have high levels of nitrate as well. Additionally, previous Dry Weather Monitoring Program upstream investigations have found that the storm drain system upstream of the area in which seepage has been noted either is dry or has water with levels of nitrate well below the action level. These findings indicate that the main source of the nitrate exceedances at dry weather Site 37 is infiltration of groundwater with high levels of nitrate.

Sincerely,
D-MAX Engineering, Inc.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes and Definitions

W-02	The sample for nitrate analysis was preserved with H2SO4 after the nitrite portion of the analysis was completed to extend the holding time for the sample. Nitrate results are corrected for the nitrite contribution per the method.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Re: 2008 Forester Creek Impact Study
City of El Cajon, California

Dear Mr. Campos:

Enclosed please find our report for the City of El Cajon 2008 Forester Creek Impact Study. This project, conducted since 2004, is an additional study of the water quality in Forester Creek as it passes through El Cajon. The contents include field screening data, analytical laboratory test results, and analyses of the collected data.

It has been our pleasure working with the City of El Cajon on this project. If you have any questions regarding this report, please call me at (858) 586-6600 ext. 22.

Sincerely,
D-MAX Engineering, Inc.

John Quenzer
Project Scientist

Forester Creek Impact Study

Forester Creek runs parallel to Interstate 8 as it enters the east side of the City of El Cajon (City). The creek then curves northward after passing SR-67, flowing through the area around Gillespie Field before entering the City of Santee. Eventually, Forester Creek enters the San Diego River just east of the junction of SR-52 and SR-125, within the City of Santee.

The 2006 303(d) list designates Forester Creek as an impaired water body for fecal coliform, pH, total dissolved solids (TDS), low dissolved oxygen, and phosphorus. Bacterial indicators, including fecal coliforms; TDS, low dissolved oxygen, phosphorus, and turbidity have been identified as high priority water quality problems for the entire San Diego River watershed in the most recent Watershed Urban Runoff Management Program (WURMP) document.

The intent of this study was to investigate how water quality in Forester Creek is affected as it flows through the City of El Cajon. In an effort to assess this, one sample was collected from the creek near where it enters the City from the east (upstream) and another sample was taken where the creek exits the City in the north (downstream). Coordinates and site descriptions for both locations are listed in Table 1. In order to prevent duplicate sampling and to minimize the costs of this study, Site 5 from the City's Dry Weather Monitoring Program was used as the downstream sample location. The upstream sampling location has changed over the five years of this project due to the variable nature of the flow coming into the City. When Forester Creek receives no water from outside the city limits, the sampling location may be moved slightly downstream to the nearest location with flowing or ponded water (see Table 4).

Water quality parameters in the upstream and downstream samples can be compared to assess changes in water quality as the creek flows through the City. A direct comparison of upstream and downstream constituent concentrations may be misleading, as the flow is generally much greater at the downstream end. Nearly all of the water in Forester Creek as it exists the City of El Cajon at the downstream site is generated within the City.

The same field and laboratory analyses employed during the standard Dry Weather Monitoring Program in El Cajon were conducted for the upstream and downstream samples. This year, the value for pH increased from 7.5 upstream to 8.7 downstream. While both values are within the acceptable range for pH (6.5 to 9.0), the higher downstream value is likely a result of the wide, shallow flow promoting algal growth in the channel. Typically, pH increases during daylight hours as sunlight stimulates algal photosynthesis, and carbon dioxide is removed from water. Measurements for the ammonia concentration, conductivity, and turbidity were also higher at the downstream end.

The level of Total Dissolved Solids (TDS) was slightly higher at the upstream end, while the level of Total Organic Carbon (TOC) was significantly higher at the downstream site. Oil and grease, diazinon, chlorpyrifos, and dissolved copper, cadmium, lead, and zinc were not detected by the laboratory at either location. Field analytical and laboratory data are summarized in Table 2 and Table 3, respectively.

Historical data for the upstream site is presented in tables 5 and 6, and historical data for the downstream site is presented in tables 7 and 8. The data in these tables have been compared to Dry Weather Monitoring Program action levels and Water Quality Objectives (WQO) where available. The action levels were developed regionally by the Copermittee Dry Weather Monitoring Sub-Workgroup, and the WQO have been compiled from the Basin Plan and a guidance document prepared by the Copermittee Regional Monitoring Workgroup. Note that the field test ammonia, nitrate, surfactants, and phosphate data was collected using test kits,

which have much larger associated error than laboratory tests. The data from the test kits is useful in determining if major exceedances have occurred, but it is of less value in reporting and assessing lower levels of the constituents.

Overall, TDS levels have been consistently high over the years, although lower numbers have been observed recently. Bacteria measurements are fairly variable but have been lower in recent years. Although Forester Creek is 303(d) listed for pH and low dissolved oxygen, no values outside the acceptable ranges for these constituents have been observed in the history of this study.

Table 1 Forester Creek Study Site Locations

Site ID	Location	Description	Primary Land Use	Secondary Land Use	Hydrologic Unit	Latitude	Longitude
Upstream	Greenfield Avenue and I-8 west onramp intersection, behind southeast corner of Exxon station at 1699 East Main Street	Concrete Channel	Commercial	Residential	907	32.81185	-116.91795
Downstream*	Adjacent to the Weld Boulevard Trolley Station, southeast of the Marshall Avenue/Cuyamaca Street intersection	Concrete Channel	Commercial	Industrial	907	32.82665	-116.98226

Notes: * No established limit

** There is no clear WQO in the Basin Plan, but a comparison is not necessary since TDS has been measured directly. See the laboratory data tables for TDS results.

*** The criterion maximum concentration (salmonids absent), which varies based on pH, has been used because it applies to a one-hour maximum, and the ammonia level for this study was measured based on an instantaneous grab sample. See http://www.epa.gov/waterscience/criteria/ammonia.

**** Regional guidance suggests using the EPA's nutrient endpoint tool to determine the WQO. This tool requires more data than what has been collected within the scope of this study.

Notes and Definitions

QR-04	The RPD between the sample and sample duplicate is not valid since both results are below the reporting limit for this analyte.
QM-06	Due to noted non-homogeneity of the QC sample matrix, the MS/MSD did not provide reliable results for accuracy and precision. Sample results for the QC batch were accepted based on LCS/LCSD percent recoveries and RPD values.
GC-05	Results confirmed by GCMS.
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

APPENDIX B

Reports of Illicit Discharges/Complaints

2007-2008

	Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
1	07/12/07	Commercial	Anything Corvette	259	Marshall Ave	Vehicle washing outside in parking lot with no BMPs in place. No water entered the storm drain.	Advised to cease all vehice washing outside.	Yes	Verbal Warning	Yes
2	07/12/07	Commercial	Vacant	1677	Marshall	Homeless encampment in channel, broken fencing. (Dedication)	Met with the property agent, Jason 840-2131, on site to view concerns. F/U found that the fencing belongs to P/O. Adjacent property is in county	No	Verbal Warning	N/A
3	07/16/07	Commercial	Valvoline Oil Changers	610	Second St N	Large used oil storage container stored outside with no containment.	Advised manager to remove or relocate the container where it is covered and contained.	No	Verbal Warning	
4	07/24/07	Residential		1162	N Cuyamaca St #2	Raw sewage running into the street.	PW crew contanined and cleaned the spill. The property owner was notified to clean the area and repair the system.	Yes	Monetary Citation	Yes
5	07/27/07	Residential		1046	Cajon Greens Dr.	Motor oil leaking from containers at the bed of a truck	Upon arrival at site the leak was contained by using a bucket and absorbent material on the affected area	Yes	Verbal Warning	Yes
6	08/03/07	Residential		888	Salina St	Tree roots clogging the sewer line in front yard. Tree belongs to the City.	Met with the property owner on site. Palm tree in ROW. No Discharge. Clean out is in garage.	No	Verbal Warning	N/A
7	08/06/07	Residential		341	Coachwood	Grading without a permit and no BMPs installed.	City attorney letter mailed. Cited for grading and stormwater violations. Met with P/O this date to take updated photos	No	Verbal Warning	N/A
8	08/09/07	Commercial	Gene Townsend Enterpises	609 & 655	Marshall S.	Drain pipe running off property into the apartment parking lot on Millard	Met with the business owner on site and advied to submit plans for the removal of rain water from the vehicle wash area and the rear of the property	Yes	Verbal Warning	
9	08/09/07	Commercial	Belaire Hotel	638	El Cajon Blvd	Employee using water hose to clean the parking lot. Water discharged to street but did not enter the storm drain	Contacted the motel manager to cease washing. Advised to use a dry method. Hose was removed and manager to educate all tenants.	Yes	Verbal Warning	Yes
10	08/10/07	Residential		638	Raymond St	Pool plaster residue washed into the street and gutter.	Residue found to be dry, left door tag with instructions to clean the street and gutter. Property owner responded and cleaned the gutter and driveway	Yes	Verbal Warning	Yes
11	08/14/07	Residential		1581	Washington	Tenants throwing trash into the storm channel.	Contacted the Apt. manager on site and advised to instruct tenants to cease dumping in channel. PW crew to clean galss and trash. Educational materials issued.	Yes	Verbal Warning	N/A
12	08/14/07	Residential		2171	Madison	Water from neighbor running onto her property	Site inspection found no water, property is in county. Complainant notified	No	Verbal Warning	N/A
13	08/17/07	Commercial	Panda Xpress	131	Broadway	Water from over irrigation running into the street	Contacted the proprty manager and advised oto reset to timer for shorter duration	Yes	Verbal Warning	Yes
14	08/22/07	Municipal		2691	Navajo Rd	Sewage spill at Fletcher Hills Town Plaza running into the street and storm drain	The City contractor responsible for the overflow was contacted and cited. PW crew responded and cleaned the area	Yes	Monetary Citation	Yes
15	08/23/07	Commercial	Wendy's Lot		Washington and Jamacha	Water from over irrigation running into the street	Inspection found no current discharge. Manager notified to adjust irrigation timer	No	Verbal Warning	N/A
16	08/23/07	Construction	One Stop Construction	247	First	Sub-contractor using water ot clean pavement with water entering the street and drain	Contractor advised to cease using water to clean paved areas. Told to use a dry method.	Yes	Monetary Citation	Yes
17	08/24/07	Residential		?	Chatham at Garfield	Concrete residue in the street and gutter	Contacted the contractor to have the street and sidewalk cleaned of all concrete residue	Yes	Verbal Warning	Yes
18	08/27/07	Residential		494	Tyrone St	Large gully in rear yard caused by erosion over time.	Prior encroachment permit issued for work. Rear alope covered in plastic. No significant erosion noted. Rear slope covered in plastic and netting on front bank. No visible signs of sediment in the street	No	Verbal Warning	N/A
19	08/27/07	Residential		1811	Dehesa Rd	Resident complained that the drainage ditch in front of property is filled with debris	Site ispection found that the property is within the County. The complainant was advised.	No	Verbal Warning	N/A

Reports of Illicit Discharges/Complaints

2007-2008

	Date	Component	Business Name	Address Number	Street/Location	Complaint/ Observations	City Action	Valid Discharge	Enforcement Action	Was IC/ID Eliminated
20	08/28/07	Commercial	SuperStar RGO	1090	Main St	Business owner powerwashing the canopy with no BMPs in place to prevent water from entering the storm drain system.	The owner was told to cease and use another method to clean or implement proper BMPs to prevent a discharge.	Yes	Verbal Warning	Yes
21	08/31/07	Residential		1600	Meadow	A truck with a concrete pump attached to it is leaking oil on the street.	The truck/ trailer combination was located and found to be leaking oil into a metal pan under the pump. Storm water educational materials were left at the door. A voice mail message was left for the complainant.	Yes	Verbal Warning	N/A
22	08/31/07	Residential		449	S Mollison Ave	Broken sprinkle head shoots water into the street and sidewalk daily.	Site inspection found no evidence of sprinkler break or discharge.	No	Verbal Warning	N/A
23	09/04/07	Residential		2697	Carlow St	Drainage flow into the culvert next to the driveway is cracking and lifting it.	No flow was observed and it was determined that the uplifting of the driveway was most likely caused by roots from a nearby tree.	No	Verbal Warning	N/A
24	09/04/07	Residential		302	Westwind Dr	Water flowing from property onto neighbors and into the street.	Property owner was contacted is in process of repairing irrigation line.	Yes	Verbal Warning	N/A

City of El Cajon
As a Copermittee of the San Diego River Watershed

Jurisdictional Urban Runoff Management Program Annual Report
2008 – 2009

TABLE OF CONTENTS

Executive Summary

Certification

Section 1. Introduction

Section 2. Development Planning Component

Section 3. Construction Components

Section 4. Municipal Component

Section 5. Industrial and Commercial Component

Section 6. Residential Component

Section 7. (Place Holder – Section Due December 15, 2009) Illicit Discharge Detection and Elimination Component

Section 8. Education Component

Section 9. Public Participation Component

Section 10. Fiscal Analysis Component

Section 11. Effectiveness Assessment Component

Section 12. Special Investigations

Section 13. Non-Emergency Fire Fighting

Section 14. JURMP Revisions

Section 15. Conclusions and Recommendations

NOTE: Each Section contains its own Table of Contents with page numbers

APPENDICES

Appendix A 1. (No Content)

Appendix A 2. Resolution No. 10-03
New Development Ordinance Chapter
Sample SWMitP
New SUSMP Projects for 2008-2009
SUSMP Projects Under Review
Inventory of Priority Project Post-Construction Structural Treatment Control BMPs
Treatment Control BMP Maintenance Verification Letter and Form
Treatment Control BMP Inspection Form
Revised CEQA Forms
SUSMP Checklist

Appendix A 3. Storm Water Requirements for Construction Sites
Storm Water Notes for Erosion Control Plans and Site Maps
Construction BMP Inspection Form
Erosion Control Checklist (2008/2009) Minor Projects
Erosion Control Plan (Sample Minor Projects)
Erosion and Sediment Control Plan Review Checklist
Inventory of Construction Sites
Construction Updates to the City of El Cajon JURMP

Appendix A 4. Business License and the Storm Water Program
Inventory of Municipal Facilities
Storm Water Quality Checklist for Municipal Facilities

Appendix A 5. Industrial-Commercial Storm Water Inspection Facility Inventory
Enforcement Criteria
Administrative Citation Form
Storm Water Quality Inspection Form for Industrial-Commercial Facilities
City of El Cajon Attachment Form for Eating Establishments
"No Exposure" Conditional Exemption for Industrial Facilities
Restaurant BMP Poster
Automotive BMP Poster
General BMPs For Industrial/Commercial Facilities

Appendix A 6. Outreach Articles
Sewer Ordinance Changes
What You Can Do As A Business Owner To Keep Our Storm Drains Clean
What You Can Do As A Food Take-Out Customer To Keep Our Storm Drains Clean

EXECUTIVE SUMMARY

The City of El Cajon in the Context San Diego County and the San Diego River Watershed

The City of El Cajon (City), located in east San Diego County, is the eastern-most incorporated City within the San Diego River Watershed (Watershed). With 14.48 square miles and nearly 97,000 citizens, the City plans with other regional jurisdictions and acts locally to maintain the health of the San Diego River Watershed. A healthy watershed means thriving environmental communities and a state of well being among its constituency. Maintaining watershed health is achieved through compliance with Federal Clean Water Act requirements as stated in the San Diego County Municipal Storm Water Permit, Order No. R9-2007-0001, through water quality monitoring, biological assessments, and municipal vigilance to balance growing human demands with a healthy environment.

Permit Year 2008-2009 (PY 2008-09) marks Permit Year two (PY2) under the San Diego Region Order No. R9-2007-0001 (new municipal permit), which renewed Order No. 2001-001. The renewed municipal permit was adopted in January 24, 2007. Efforts started with jurisdictional planning and implementation, proceeded to local program assessment and continues to evolve into multi-jurisdictional and watershed actions. The City is transitioning to the new municipal permit and continued the Permit Year 2007-08 focus of assessing program component effectiveness from Best Management Practices (BMP) implementation and determining how preventive measures affect watershed health from a local perspective. Many of the program's components have developed into BMP programs, whereby inspections can determine effectiveness of pollution reduction measures.

This Annual Report presents the City's efforts during the 2008-09 reporting period. Covered in this Report is the move toward adaptive management of the updated Jurisdictional Urban Runoff Management Program (JURMP) implementation and integration of general watershed principles for the San Diego River Watershed into local planning. Both the San Diego River Watershed Urban Runoff Management Plan (WURMP) and the City's JURMP were updated and submitted to the San Diego Regional Water Quality Control Board (RWQCB) on March 24, 2007, as required by the new municipal permit and extension. It is the responsibility of the City to balance jurisdictional and watershed requirements and maintain a healthy watershed within its jurisdiction.

Critical for the rest of the new permit cycle are Watershed adjustments to the City's Storm Water Pollution Prevention Program and deciding where best to place City efforts that will minimize or eliminate polluted runoff. Forrester Creek, the main tributary drainage channel in El Cajon, is a listed 303(d) waterbody with impairments for pH in the upper part (El Cajon and San Diego County) and for total dissolved solids (TDS) and fecal coliform in the lower portion within the

City of Santee). El Cajon considers these three impairments to be the center of the Clean Water Act objective "to restore the Nations Waters" to a chemical balance able to support the State's Basin Plan designations for fishable and swimmable waters.

A *BMP to Pollutant Reduction Diagram* was developed to connect BMPs to pollutants that are targeted for reduction as a result of their listing as 303(d) pollutants in Forrester Creek. This diagram and discussion is provided in the Introduction in Section 1.

This JURMP Annual Report for PY2 consists of 15 Sections, and is organized as follows:

Section 1 - Introduction. Describes the purpose of this Annual Report, the overall vision of the City, goals and objectives of the Storm Water Pollution Prevention Program; the regional integration of Watershed Health; assessment of program effectiveness to guide future actions, and Forrester Creek-specific criterion that relate to San Diego River Watershed and River health.

Section 2 - Development Planning Component. Lists the planning actions reviewed and the role of storm water in re-defining new development designs and describes the ways of confirming that commitment to storm water becomes a design reality.

Section 3 - Construction Component. Summarizes reviews of Erosion Control Plans, inspections of high priority sites, interactions with other City departments, and conditions during rainfall events.

Section 4 - Municipal Component. Summarizes the activities for municipal facilities, the sanitary sewer program, capital improvement projects affecting storm water quality, and municipal staff training.

Section 5 – Industrial and Commercial Component

- **Industrial Component**. Summarizes the activities conducted to assess the effectiveness of implemented industrial BMPs and better define the pollutants affecting storm water quality.
- **Commercial Component.** Summarizes the inspections, enforcements, and educational efforts to assess the effectiveness of implemented BMPs and better define the pollutants affecting storm water quality by business type.

Section 6 - Residential Component. Summarizes the challenges with educating the public, interactions with citizens, educational efforts, and enforcement at the residential level.

Section 7 - Illicit Discharge Detection and Elimination Component. (This section will be part of a separate submittal due on December 15, 2009) Summarizes the City's dry weather program that identifies illegal dumping and illicit connections to the storm drain system. An upstream/downstream analytical assessment was completed for during the dry weather season.

Section 8 - Education Component. Summarizes programs implemented by the City to educate municipal employees, developers and contractors, business owners, the general public, and other priority groups

Section 9 - Public Participation Component. Summarizes the outreach efforts coordinated on a regional level through the Outreach Workgroup.

Section 10 - Fiscal Analysis Component. Reviews and compares previous storm water expenditures while projecting future program funding requirements.

Section 11 - Effectiveness Assessment Component. Provides summary tables for the existing and development components indicating estimated and actual pollutant-containing material reductions at the source or from preventive measures.

Section 12 – Special Investigations. Summarizes any special investigations that may have been conducted during the current reporting period.

Section 13 – Non-Emergency Fire Fighting. Summarizes non-emergency fire-fighting activities/training conducted during the current reporting period.

Section 14 – JURMP Revisions. Summarizes any changes or revisions to the JURMP that may have occurred during the current reporting period.

Section 15 - Conclusions and Recommendations. Summarizes the conclusions stated from each component and makes overall program conclusions and provides recommendations for future permit years.

Appendices contain City-developed checklists, guidance documents, outreach materials, lists of priority businesses or sites, and presentations to City staff and the local community. Additionally, the Dry Weather Monitoring report is provided as an attachment.

The City achieved a number of important accomplishments during this reporting period, both in its role as a Copermittee, and through participation (and eventual leadership role) in the implementation of general watershed principles. Across the City, businesses and citizens, together, function within the JURMP and watershed to assist in identifying storm water issues and help prevent pollution from being discharged.

City Action Highlights include:

- Continue with a strong Enforcement program for City Ordinances 4686 (JURMP) and 4717 (Standard Urban Storm Water Management Program (SUSMP) requirements).
- As a City with little open space and a propensity for redevelopment, the City pursues common sense approaches to go beyond Permit compliance and achieve defensible, cost-effective storm water management practices for businesses and citizens through the SUSMP conditioning process.
- Continued implementation of a City-Wide Integrated Pesticide Management Program.
- The City continued an expanded scope of its Dry Weather Monitoring Program. Additional information along concrete lined areas focuses on business districts or municipal areas. In doing so, it has made substantial strides in detecting and eliminating discharges and characterizing receiving waters and other conveyance discharges within its jurisdiction.
- Conducted upstream/downstream dry weather analysis in Forrester Creek to quantify the amounts of pollutants discharged within the City's jurisdiction.

- Inspected 628 High Treat to Water Quality (TTWQ) Commercial Facilities, Medium TTWQ Facilities, and Low TTWQ Facilities for compliance with the City's Municipal Code and issued 2 warnings and 4 citations to commercial business for various violations of the City's storm water ordinance.
- The City issued a total of 6 warnings and 17 citations for various violations of the City's storm water ordinances.
- Conducted inspections at 20 high priority construction sites. The City conducted monthly inspections at all high priority construction sites during the dry season and weekly inspections during the wet season. The inspections revealed several violations or compliance issues and the City issued 4 written warnings and 11 citations.
- Conducted inspections at 44 high priority industrial sites. The City also collected industrial storm water monitoring data from those industrial facilities subject to the State General Industrial Storm Water Permit and conducting the required annual storm water monitoring. The City intends to review the industrial storm water data to evaluate potential contributors to water quality problems.
- The City's inspection programs emphasized pollution prevention BMPs such as clean trash storage and disposal areas; power washing BMPs; and maintenance of sewer laterals in addition to the minimum required BMPs.
- The City's comprehensive street sweeping program swept 19,072 miles of streets and collected 3,188 cubic yards of materials from City streets. Sediment and silt account for 44% of the total, organic material accounted for 41%, and trash accounted for 15%.
- Collected 1,720 cubic yards of materials from City inlets, culverts, concrete-lined channels, and catch basins.
- Actively participated in the Management Committee, Regional Planning Workgroup, Outreach Workgroup, Regional Monitoring Workgroup, SUSMP/HMP Workgroup, Industrial/Commercial Workgroup and WURMP Leads Workgroup.
- Continued active participation with the San Diego River Watershed Workgroup.
- Continued efforts to reach out to community members on a wide range of urban runoff and storm water quality topics through approximately 305,000 copies of articles, brochures, and mailers.
- Conducted over-the-counter assistance and provided personalized residential BMP information to homeowners for small additions, remodels, pools and retaining wall projects.

This reporting period is one of continued program assessment and focus of local actions to move toward a watershed protection program. This last year, the City continued to meet the new challenges of working within a watershed. The City continues in the role of the Lead Copermittee for the San Diego River Watershed. The City feels strongly that it has made significant strides looking within its jurisdictional boundaries as well as organizing inter-jurisdictional programs. Continuing improvement and refinement is the name of this storm water pollution prevention program as we continue to gather information and experience about how City activities affect the local receiving waters and the health of the San Diego River Watershed.

This Annual Report provides programmatic information and further steps in connecting activities to a significant movement for improving receiving water quality by the City of El Cajon. Over the last year, the City has continued its effort at linking municipal activities to receiving water quality. Additional connections to receiving water quality from the implementation of BMPs will follow as information is gathered and assessed using a Long-Term Assessment process over the next several years.

A listing of storm water contact personnel is provided as part Appendix C to help facilitate communication within the City and for the public and outside agencies to contact the appropriate City staff.

CERTIFICATION

"I Certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete.

I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."

1.8 ORGANIZATION AND CONTENT OF ANNUAL REPORT 17

SECTION 1 INTRODUCTION

With each Permit Year (PY), the City of El Cajon reviews, assesses, and progresses towards a watershed approach to protect surface waters from urban runoff pollution. A continued emphasis towards identifying sources of pollutants and minimizing specific 303(d) impacts to Forrester Creek is the focus of this second year in the Permit Cycle (Order No. R9-2007-0001).

The typical steps for developing a pollution prevention and source control program are summarized below and discussed in more detail in Section 11, Effectiveness Assessment.

1. **Identify the issue.** Define each issue.
2. **Identify and assess sources.** Sources are identified by prioritizing based on location and type of business.
3. **Determine available control strategies**. To identify possible control strategies for each source.
4. **Evaluate control strategies**. To determine which control strategies are most likely to achieve measurable results.
5. **Establish a goal.** A goal may be set at any point during the development process. The goal is the desired outcome.
6. **Implement program.** Part of program implementation is selection of an effectiveness measurement tool to assess the program.
7. **Evaluate effectiveness.** Based on the effectiveness measurement, determine what has been learned.
8. **Modify program.** The results of the effectiveness measurement will help to determine the future direction for the program.

Described in this Second Permit Year (PY2) Annual Report is the implementation and collected information for each Permit component. Sections 2 through 11 highlight component accomplishments, activities, or areas of achievement for Development and Planning; Construction; Municipal; Industrial and Commercial Development; and Residential Development; Education and Outreach; Illicit Discharge, Detection and Elimination; Public Participation, Effectiveness Assessment; and Fiscal Analysis.

1.1 REGULATORY FRAMEWORK

Background

The City of El Cajon's (City) Jurisdictional Urban Runoff Management Plan (JURMP) was developed pursuant to Order No. 2001-001, National Pollutant Discharge Elimination System

(NPDES) Permit No. CAS0108758, the area-wide municipal separate storm sewer system (MS4) permit. The MS4 permit was established pursuant to Section 402(p) of the Federal Clean Water Act, which requires all point source discharges of pollutants into waters of the United States, including discharges from municipal separate storm sewer systems, to be regulated by a NPDES permit. On January 24, 2007, the California Regional Water Quality Control Board, San Diego Region (SDRWQCB), adopted Order No. R9-2007-0001, NPDES Permit No. CAS0108758 (Permit), to the City and 20 other Copermittees, for discharges of urban runoff from MS4s into the receiving waters within the SDRWQCB's jurisdiction.

The City is a participant and partner in the San Diego River Watershed along with the Cities of La Mesa, San Diego, Santee, and the County of San Diego. A watershed approach to storm water pollution provides the wider view of runoff impacts and requires jurisdictional approaches to include neighboring jurisdictions in future planning and reporting efforts.

The PYs are summarized as follows:

- PY4 – July 1, 2004 through June 30, 2005, implementation was taken to the next level of refinement based on performance.
- PY5 – July 1, 2005 through June 30, 2006, as the City's programs mature, the City focused on watershed issues, including pollution prevention and education and continued to refine and improve the City's programs.
- PY6 - July 1, 2006 through June 30, 2007, preparing for issuance of a new permit containing watershed/regional permit requirements supported and subsidized by jurisdictional efforts.
- PY1 - July 1, 2007 through June 30, 2008, modifying and enhancing the storm water program to comply with the new Municipal Permit, R9-2007-001. New comprehensive JURMP prepared to create a detail framework of the program under the new permit.

<u>Current and Future</u>

- PY2 – July 1, 2008 through June 30, 2009, reassessment of initial JURMP implementation with refinements and reimplementation, as necessary.

1.1.1 Water Courses and Receiving Waters

The definition of the City's Storm Drain System is broad enough to include streets, gutters, inlets, catch basins, channels (lined and unlined), creeks, and streams. Our storm drain system starts at a facility's property line to the public right-of-way. By making such a distinction, it is clear to maintenance and storm water crews when it is the responsibility of the City to clean spills or illegal dumping of materials. If such a discharge occurs on private property and the discharge enters the City storm drain system, the property and business owner/contractor is contacted and educated on storm water requirements for their type of business. Property and business owners are charged for cost-recovery of City staff involvement.

The goal of PY2 and future program years will be a continuing focus on impairment of Forrester Creek with the ultimate goal of eliminating the impairment on Forrester Creek, and meeting the

objective of the Clean Water Act to maintain and restore the chemical, physical, and biological integrity of the Nation's waters.

Table 2 lists the major storm water conveyance systems and describes the type of channel. Most conveyance systems are concrete-lined, making them easy to maintain, but present other types of challenges such as:

- Elevated pH (above 9)
- Shelter for homeless populations
- Trap for air blown trash and debris
- Easy target for illegal dumping

Table 2 – Storm Water Conveyance Systems

Water Courses	Type of Channel
Forrester Creek	• Open, concrete-lined trapezoidal channel • Underground culvert
Broadway Channel	• Open, concrete-lined channel • Underground culvert
Washington Channel	• Open, concrete-lined channel • Underground culvert
County Ditch	• Open, concrete-lined channel • Underground culvert • Open, natural-lined channel
Fanita Channel	• Underground culvert • Open, concrete-lined channel
Third Street Lateral	• Open, concrete-lined channel • Underground culvert
Fletcher Parkway Channel	• Open, concrete-lined channel • Underground culvert • Open, natural-lined channel

The picture to the left shows the City boundaries, Forrester Creek and the major channels within the City.

1.1.2 Approach and Changes to the Program

Approach

As the City becomes more experienced with its own programs and with what is working and what is not, the City modifies the implementation and management of its Storm Water Program. This Adaptive Management is a dynamic process of improving management activities incrementally, as decision makers learn from experience and better information and analytical tools become available. It involves checking progress made in achieving water quality goals, adjusting the management decisions accordingly, rechecking and readjusting – all the while incorporating new data and scientific knowledge. Beginning in early 2008 and continuing through PY2 (2008/2009), the City of El Cajon is developing a Storm Drain Master plan. Once complete, the Storm Drain Master Plan will provide the City with additional tools to assess and achieve water quality objectives. Adjustments to goals and objectives are expected to occur due to unforeseen circumstances and an unpredictable future.

One approach the City continues to implement (through education and training) is to change pollution prevention from the conventional recycle, reduce and reuse, to measures that target pollution prevention at the pollutant source. For Storm Water Pollution Prevention, consideration is given both to flow reduction measures and pollution source controls. Where water acts as the primary conveyor of pollution, pollution prevention measures can reduce pollution impacts by preventing pollutants from entering the flow, or by controlling the flow. In the development of an effective pollution prevention or management strategy, it is critical to understand how water cycles through the air and soil to ensure that measures are selected and implemented in an appropriate manner.

Changes to the Storm Water Program

Program Year 2 (PY2), and continuing into the next permit cycle, will be a continuing period of transition from purely jurisdictional to a jurisdictional/watershed approach. A few of the modifications include:

- Promoting a Clean Community, Healthy Watershed;
- Maintaining Watershed and River Health in the San Diego River Watershed;
- Focusing on 303(d) pollutants to restore Forrester Creek water quality;
- Continuing to assess the potential for increased flow from New or Re-Development projects and reduce flow from the current flow of approximately 108 gallons per minute during the dry season (one half last year's dry weather flow rate).

The San Diego River Flows Across Padre Dam

- Prioritizing activities in coordination with other East County Cities;
- Collecting information on upstream and downstream conditions to better assess areas (zones) where pollution is more probable or prevalent;
- Review of the analytical methods and a comparison to what information is actually needed to determine pollutant loads.

The City of El Cajon's Storm Water Pollution Prevention Program looks to pollution solutions in the form of Best Management Practices, proven procedures, or other new technologies. Table 1 (next page) lists the water quality and quantity issues in El Cajon and the possible solutions provided by the Jurisdictional Urban Runoff Management Plan (JURMP) components that comprise the Storm Water Pollution Prevention Program.

Table 1 – Storm Water Pollution Prevention Program Components

Water Quality or Quantity Issues	Pollution Solution
• Increased runoff (volume, frequency and duration) with impervious ground cover.	• Runoff control for flood and erosion protection (**New Development and Construction**) • Measures to maintain existing discharge rates. (**New Development/Redevelopment**)
• Increased base flows in streams due to changes in land use.	• Provide measures to maintain infiltration **(New Development/Redevelopment)** • Provide extended detention of runoff for low flows. (**New Development/Redevelopment**)
• Increased pollutant loadings with runoff.	• Provide measures to reduce pollutant sources, or remove pollutants, by settlement, absorption or filtration. (**Municipal, Industrial, Commercial, Residential Existing Development/Redevelopment**)
• Stream bed and bank changes due to erosion.	• Infiltration for control of runoff volume.(**New Development/Redevelopment**) • Rate of runoff control for erosion protection (**Construction/Redevelopment**)

Stronger move toward prevention of polluted discharges – distinguishing pollutant reduction from Pollution Prevention (recycle, reduce, reuse) activities, while connecting BMPs with the pollutant being reduced. A BMP to Pollutant Reduction Diagram is provided below and is the mainstay for the Existing and Development (including Construction) Components. This part of the transition occurred after Copermittees submitted a Framework for BMP Implementation in October 2003.

Inspection data collected under the original system designed by DMax Engineering was translated into BMP implementation results. The BMP implementation results data can be used to help prioritize follow-up actions, including inspections and education efforts in future program years.

BMP to Pollutant Reduction Diagram (See Following Page for Details)

Pollutant to BMP Table
BMPs target the reduction or elimination of a primary pollutant (sediment or fecal coliform) or pollutant group (oil & grease).

↓

Facilities and BMP Table
Individual Facilities are Required to Implement the Minimum BMPs

↓

Summarize Facility Types with Pollutant Reduced Table
Combines Table 1 and 2 to connect pollutant to (high priority) facility type, such as industrial, commercial/restaurants, municipal, residential area, or SUSMP/Parking Lot through the implementation of BMPs. Allows the calculation of percentages for implemented BMPs for high priority facilities.

↓

Transition to Effectiveness Assessment
Percentages between 80-100 overall implementation are used to calculate a quantity of pollutant(s) prevented from entering the storm drain system and thus reduction in pollutants ultimately discharged.
Reasonable Assumption: If inspection was impromptu, results observed on inspection day, in general, represent conditions at the facility for the entire year.
Calculations: Determine an *average* (typical for facility) discharge of the pollutant containing material.

The BMP to Pollutant Reduction Diagram demonstrates how BMPs are connected to pollutants that are connected to water quality. Our difficulty lies in quantifying those pollutant reductions with accurate and defensible results. In Section 11.0, estimates as well as empirical data are used to assess the effectiveness of the City's Storm Water Program by showing how much pollutant-containing materials were diverted toward a better disposal avenue.

1.2 COMMITMENT AND PARTICIPATION

The City of El Cajon is committed to promoting the concept and practice of preventing pollution at the source. Preventing pollution will prevent environmental problems. This saves the public and private sector from loss of resources and the costs to correct environmental damage. Urban runoff management requires the simultaneous pursuit of several objectives. The City is committed to:

- Enforcement of the Municipal Codes for Urban runoff (ECMC 13.10) and New or Site Re-Development (ECMC 16.100).
- Prevention of pollutant discharges into Forrester Creek as part of the San Diego River Watershed.
- Protection of water quality, aquatic species, and watershed ecosystems.
- Promotion of environmental quality and social well-being.

1.2.1 Jurisdictional Implementation

Pollution Prevention continues to be the focus of the City's JURMP and Storm Water Pollution Prevention Program for businesses and citizens. Compiled information on amounts of pollutants prevented from entering the storm drain system has a direct correlation to any decrease in pollutant loads from entering receiving waters. Pollutant amounts removed from streets, roadways and the storm drain system, or that have been recycled, have a direct correlation to water quality.

Land use consists of residential, commercial, industrial, municipal, and educational with recreational facilities. The City is at a "built-out" stage where most construction is redevelopment. Successful implementation of the City's Standard Urban Storm Water Management Program (SUSMP) supports the reduction in flow from a pollution prevention perspective. Development and redevelopment proposals that trigger the SUSMP requirements must submit plans consistent with reducing flow and impervious areas and must consider storm runoff treatment before the project will receive final City approval and proceeding to actual construction.

1.2.2 East County Cities Teamwork

Beginning in the Permit Year of 2002/2003 and continuing through this current Permit Year (PY2, 2008/2009), the East County Cities Workgroup gathered to discuss and tackle issues specifically affecting water quality issues in the East-County-Cities Area. Some of these "East County" challenges include:

- Tackling storm water issues from a "sand" perspective
- Highly transient populations
- Locally-focused City Management
- Boxed-in, built-out Development

1.2.3 Regional Teamwork

The City participated in regional efforts to promote storm water management practices and educate businesses and citizens to conduct business and daily lives with respect for water quality. When possible, the City attended or was an active participant in the following events.

- Management Committee Meetings
- Outreach Workgroup
- Residential Sources Workgroup
- East County Cities Workgroup (a.k.a., San Diego River Watershed Workgroup) **
- Regional Monitoring Workgroup
- Dry Weather Monitoring Workgroup

** - Chaired Workgroup

1.3 WATERSHED AND RIVER HEALTH

As stated in the Clean Water Act, the objective is to maintain and restore the chemical, physical, and biological integrity of the Nation's waters. To address this objective, watershed and river health for the San Diego River can be described in terms of unique biophysical, socio-cultural, and economic characteristics. Biophysiochemical components are a watershed's elements and functions (its chemical, physical, and biological processes), while socio-cultural and economic components are the values and benefits provided by a functioning healthy watershed. The water quality aspect and stream flow (as hydrological patterns) of the biophysiochemical component list and the recreational/esthetic values of the socio-cultural and economic components are the only subjects directly addressed in our City's permit under Order No. R9-2007-0001.

Biophysiochemical:

- Basin geomorphology
- Hydrological patterns (stream flow addressed in Municipal Permit)
- Water quality (addressed in Municipal Permit)
- Biotic community and habitat

Socio-Cultural and Economic:

- Breakdown and recycling of pollutants
- Regulation of storm water discharges
- Groundwater and aquifer recharge
- Recreational and esthetic values (addressed in the Basin Plan, but included in Municipal Permit by reference)
- Habitat values (protected species, fisheries, etc.)

In general, the factors that determine ecosystem and watershed health are universal. A healthy watershed is one in which these components are maintained with thriving and balanced communities. An immutable characteristic of upper Forrester Creek is the concrete lining of this channel. In the 1960's, Forrester Creek was modified with a concrete channel in order to provide flood control for the expansion of the Interstate Highway easterly toward El Centro.

In a built-out urban area such as the City of El Cajon, defining and achieving creek, river and watershed health is complicated by a highly altered landscape (concrete channelization of Forrester Creek, highly urbanized, little open-space) and continued urban-infill and growth within and upstream of its jurisdiction. Nonetheless, the City has a vision and initially a broad goal for watershed and river health. The vision states the desired future for the city with respect to watersheds and waterways. The goal states that the City ultimately aims at maintaining watershed and river health for water quality and hydrological patterns, quantitatively and qualitatively.

Although it is unrealistic and infeasible to re-create the environmental conditions that existed before the City's development, it is prudent to consider predevelopment conditions when assessing the health of Forrester Creek and the San Diego River. Information about historical conditions is useful in understanding current watershed processes and functions that are essential to downstream watershed and river health. In fact, healthy downstream conditions may best be served by continual efforts by the City to reduce and eliminate pollutant discharges to Forrester Creek, to the maximum extent practicable.

1.4 WATERSHED PLANNING

The City recognizes the importance of watershed management as a guiding principle for its water quality management of the San Diego River Watershed. As required by Permit Section J, a Watershed Urban Runoff Management Plan (WURMP) was developed during PY2 and refined during subsequent permit years. As a member of the San Diego River Watershed, the City attended and participated in establishing the Watershed program for the San Diego River area. There is a learning curve to transitioning certain activities from a jurisdictional to a watershed approach.

The picture to the right shows El Cajon as part of the inland watershed area. Much has been discussed during this permit year and an outline for the future watershed management is in place. The coming year will be one of implementation bringing new challenges to the storm water programs.

1.4.1 Water Quality and Stream Flow

Water quality has long since been the focus of many watershed programs. However, those programs and regulations have focused mostly on the chemical aspects of water quality, such as the concentrations of metals and organics, without considering how water quality is affected by the physical habitat in a stream or river. Water quality is greatly affected by the amount of large wood in the waterway, the river or stream's substrate (coarse gravel or fine sediment), the amount of native vegetation in floodplains and other aspects of physical habitat.

Physical habitat, in turn, is shaped in part by the larger forces of stream flow and hydrology. It has long been understood that the influence of stream flow, hydrology, physical habitat and water quality help determine which species are present within a watershed and the abundance, productivity and diversity of those species. For these reasons and others, the City defines its functional disposition in the watershed and river health as providing/conveying sustainable stream flow and hydrology and restoring and preserving water quality.

- **Stream Flow and Hydrology**: Maintain, or as necessary reduce, dry weather flow conditions using the Standard Urban Storm Water Management Plan to prevent an increase in runoff due to development and redevelopment projects, thereby protecting and improving watershed and stream health, channel function and public health and safety.
- **Water Quality:** Protect and improve surface water and groundwater quality and meet or surpass state and federal water quality standards and regulations.

Improving water quality within the City's jurisdiction will contribute to overall watershed health and will help keep the watershed as healthy as possible. John Muir said it best, "*When we try to pick out anything by itself, we find it hitched to everything else in the universe*".

1.5 GEOGRAPHICAL INFORMATION SYSTEM (GIS)

PY2 is the sixth year for using a Geographical Information System to present the location of El Cajon within the San Diego Watershed (See Figures following within this section). Base maps and information obtained from SanGIS provided the basic information to start layering jurisdictional and regional information. Deciding on the types of data and what needs to be shown are the biggest questions to answer.

In PY6 (2006/2007) the City created a new full-time GIS position to assist the Storm Water Program. The City is planning on implementing and developing an Enterprise GIS. To achieve this goal the City is currently dedicating more resources to a growing GIS staff and a new server.

One of the main benefits of GIS is improved management of your organization and resources. A GIS can link data sets together by common location data, such as parcel numbers, which helps departments and agencies share their data. Storm Water staff identified the Business License database as information easily integrated into a GIS to show and list the parcels within 200 feet of the five (5) major El Cajon drainage channels. The saying, "better information leads to better decisions" is true for GIS. A GIS is not just an automated decision making system but a tool to query, analyze, and map data in support of the decision making process.

The GIS maps presented in this PY2 Annual Report are used as tools by storm water staff to aid in the making of decisions that will be crucial to the direction of the Storm Water Program. Three maps follow this page showing:

- San Diego County Regional Watersheds
- San Diego River Watershed with a focus on El Cajon
- City of El Cajon showing Residential (green), Commercial (red), Industrial (pink), and School Districts (blue).

The information can be presented succinctly and clearly in the form of a map and accompanying report, allowing decision makers to focus on the real issues rather than trying to understand the data.

1.6 SIGNIFICANT ACCOMPLISHMENTS

The following significant accomplishments were completed and helped to maintain Watershed and River Health. Elimination of pollution is mainly due to routine scheduled municipal maintenance activities, municipal and commercial education efforts, outreach to the public and daily contact with citizens. The following is a summary of the major investments in reducing pollutant loads to receiving waters.

- Continued to implement and refine the Enforcement program for City Ordinances 4907 (JURMP) and 4908 (Standard Urban Storm Water Management Program (SUSMP) requirements). Streamlined enforcement activities with the inspection database to better coordinate and design correction actions.
- Continued to improve an inspection program for construction, commercial and industrial facilities based on Best Management Practices (BMP) implementation. Tracking BMP implementation and ensuring that all minimum required BMPs are installed and maintained properly helps ensure that pollutants are not discharges from those facilities. (List is continued following the three pages of GIS Maps).

Regional Watershed Map

SD River Watershed Map

El Cajon GIS Map

- Inspected and provided educational materials to well over 200 industrial and commercial businesses for compliance with the City's Municipal Code and the State's General Permits for construction and industrial activities.
- The City's comprehensive street sweeping program swept 19,072 miles of improved streets and collected 3,188 cubic yards of materials from City streets. About half (44%) of the material collected this year was sediment and silt. Many areas were swept twice per week.
- Collection of over 1,720 cubic yards of materials from City inlets, culverts, concrete-lined channels, and catch basins;
- The City formally trained 90 building, planning, middle management, and engineering staff on SUSMP requirements. Public Works staff completed before and after evaluations to assess the absorption of knowledge during retraining efforts
- Reached out to community members on a wide range of urban runoff and storm water quality topics through approximately 305,000 copies of articles, brochures, mailers, and over-the-counter sources.

1.7 RWQCB Compliance Reviews and Inspections

During this reporting period, the City and RWQCB staff met during March of 2009 to discuss the implementation of the new JURMP and to discuss comments on the PY1 (2007/2008) Annual Report. Formal comments for PY1 (2008/2009) Annual Report were received soon after and a Response to Comments sent to RWQCB staff on April 20, 2009.

1.8 Organization and Content of Annual Report

The Permit requires the submittal of an Annual Report to the SDRWQCB. This Annual Report covers the single permit year activities between July 1, 2008 and June 30, 2009. The Dry Weather Monitoring for 2009 will be submitted as a separate document on December 15, 2009.

The PY1 Annual Report presents and discusses implementation of the City's JURMP with a look at trends, BMP implementation, and overall JURMP effectiveness. Organization of the PY1 Annual Report is as follows:

- Executive Summary and Report Certification
- Section 1 - Introduction
- Section 2 - Development Planning Component
- Section 3 - Construction Component
- Section 4 - Municipal Component
- Section 5 - Industrial and Commercial Component
- Section 6 - Residential Component
- Section 7 - Illicit Discharge Detection and Elimination Component
- Section 8 - Education Component
- Section 9 - Public Participation Component
- Section 10 - Fiscal Analysis Component
- Section 11 - Effectiveness Assessment Component
- Section 12 - Special Investigations
- Section 13 - Non-Emergency Fire Fighting
- Section 14 - JURMP Revisions
- Section 15 - Conclusions and Recommendations

Charts, graphs, figures, and pictures are used to demonstrate the fulfillment of Permit and JURMP requirements or to highlight a special program accomplishment and event. Appendices provide additional information to validate activities or procedures.

Specific importance is placed on the assessment of JURMP implementation as this process is essential to determine if the City's program is reaching the Permit goal of improving receiving water quality. Some practices and structures (BMPs) listed in the JURMP to reduce or eliminate pollutants may prove to not be as effective as anticipated. An iterative process of BMP development, implementation, monitoring, and assessment focuses the JURMP such that JURMP programs are sufficiently comprehensive and effective to achieve Permit requirements and program objectives.

SECTION 2 DEVELOPMENT PLANNING COMPONENT

2.1 Introduction **2**

2.2 Assessment Of General Plan **2**

2.3 Modification Of Development **4**
2.3.1 Development Project Approval Process 4
2.3.2 Standard Urban Storm Water Mitigation Plan 4
2.3.3 Waiver Provisions 9

2.4 Treatment Control Bmp Maintenance Inspections **10**

2.5 Revised Environmental Review Process **11**

2.6 Development Planning Outreach Efforts **11**

2.7 Regulatory Comments **12**

SECTION 2 DEVELOPMENT PLANNING COMPONENT

2.1 INTRODUCTION

Over the last few years the City of El Cajon (City) implemented procedures to minimized the short and long-term impact on receiving water quality from new development and redevelopment. Major steps were taken to accomplish this goal under Order No. 2001-001. The City completed the requirements of the plan which include the following four components:

1. Assessment of General Plan
2. Modification of Development (Project Approval Process)
3. Revision of Environmental Review Process
4. Conducted Education Efforts Focused on New Development and Redevelopment

During PY2008-09 the process continued to evolve to incorporate requirements under new Municipal Permit Order No. R9-2007-0001 and Interim SUSMP requirements. The City adopted updated Ordinances in PY1 to comply with new requirements.

2.2 ASSESSMENT OF GENERAL PLAN

The General Plan provides a jurisdictional framework for directing land use and development decisions within the City of El Cajon. Therefore, it is important that the General Plan include provisions to address water quality. The City incorporates elements into the General Plan that provide an adequate foundation for controlling land use and development in a manner consistent with water quality objectives required by the Municipal Permit Order No. 2007- 001 (Permit).

On January 14, 2003, Resolution No. 10-03 was approved amending the General Plan and adding storm water runoff policies and objectives. The amendment is consistent with the City's Jurisdictional Urban Runoff Management Plan (JURMP) and provides policy and objectives dealing with storm water runoff to guide decision-making as mandated in the Permit. A copy of Resolution No. 10-30 is included in Appendix A.2. A copy of the General Plan is shown on the following page.

2.3 MODIFICATION OF DEVELOPMENT

2.3.1 Development Project Approval Process

Development becomes a project once the applicant completes planning action forms that describe the type of development proposed. The planning action is routed to many departments including Storm Water. Consolidated comments from Public Works are attached directly to the project as a list of conditions to the proposed planning action. Conditions are then reviewed and accepted by City Council making them enforceable. The City does not issue building permits until all requirements addressing water quality are fulfilled. Similarly, the City does not grant a final occupancy certificate until all storm water requirements are completed.

To protect our natural resource waterways, the City has continued ordinance development and implementation to address water quantity and quality. New and Redevelopment projects are reviewed for applicable BMPs to attain:

- Reduction in paved areas
- Maximize infiltration
- Detain or retain flows to reduce the speed at which water discharges to natural areas, and break Directly Connected Impervious Areas (DCIAs).
- Minimize potential pollutants from reaching the Municipal Separate Storm Sewer System (MS4) from grading and other construction activities by meeting the provision specified in Section D.2 of the Permit.
- Require Industrial applicants subject to California's statewide General NPDES Permit for Storm Water Discharges Associated with Industrial Activities to provide evidence of coverage under the General Industrial Permit.
- Require project proponents to provide proof ensuring ongoing long-term maintenance of structural Treatment Control BMPs.

2.3.2 Standard Urban Storm Water Mitigation Plan

The City participated with other Copermittees in revising and updating the BMP requirements that were listed in the Model Standard Urban Storm Water Mitigation Plan (SUSMP) that was submitted to the Regional Water Quality Control Board (RWQCB) in February 2002. Consequently, the City revised and updated Ordinance 4717 adopted on December 2002 to implement local SUSMP to reduce pollutants and runoff flows from all new development and significant redevelopment. The City recently adopted Ordinance 4908, which defines the enforceable Municipal Code 16.60 for New and Re-Development pursuant to Program R9-2007-0001.

The City will also incorporate a Hydromodification Management Plan (HMP) into the City's Local SUSMP. As of the writing of this annual report, the HMP is being developed by a consultant and regional workgroup and the draft HMP was submitted on January 24, 2009 with a revision submitted in May of 2009. After receiving comments from the RQWCB in June of 2009, the final HMP is being prepared along with the creation of an HMP Sizing Calculator. The final HMP will be added to the Local SUSMP after approval by the Regional Board. No

priority projects in the City of El Cajon have met HMP criteria as of yet, as no projects have disturbed more than fifty acres, and the City does not anticipate any projects that will in the future.

Projects triggering the New and Re-Development SUSMP requirements are:

- Housing projects with at least 10 units
- Commercial developments at least 1 acre in size
- Heavy Industry
- Automotive repair shops
- Restaurants
- Hillside developments that are 5,000 square feet or greater
- Developments within Environmental Sensitive Areas
- Parking lots 5,000 square feet or more or with 15 or more parking spaces potentially exposed to urban runoff
- Streets, roads, highways, and freeways with an area equal to or greater than 5,000 square feet
- Retail Gas Outlets

Projects trigger the SUSMP requirements during the initiation of a planning action or environmental investigation brought on by the California Environmental Quality Act (CEQA). The Storm Water section of Public Works reviewed a total of 49 planning actions, 13 of which were categorized as high priority SUSMP projects (please refer to Appendix A.2 for a list). The City also carried over 10 SUSMP projects that are in varying degrees of development, design, or construction from previous years. Planning actions and New Development projects are tracked using a MS Excel spreadsheet.

An example Storm Water Mitigation Plan (SWMitP) that includes a list of SUSMP conditioning requirements are given to SUSMP priority projects at the earliest planning stage (please refer to Appendix A.2 for sample SWMitP). BMPs and the pollutants that are targeted for reduction or elimination to the maximum extent practicable (MEP) are listed in Table 1.

Table 1 – BMP to Pollutants for New and Re-Development Projects

BMP	Primary Pollutants	303(d) Pollutants
Site and Facility Design	Flow	
Site Design and Landscape Planning – SD-10	Flow	
Efficient Irrigation – SD-12	Nutrients	**TDS** **Nutrients**
Storm Drain Signage – SD-13	Trash Oil & Grease Toxics	
Pervious Pavements – SD-20	Sediment Oil & Grease	**TDS**
Trash Storage Areas – SD-32	Trash Bacteria	**Bacteria**
Vehicle Washing Areas – SD-33	Metals Detergent	**TDS**
Detention Basin - TC-22	Trash Sediment Metals Bacteria Oil & Grease Organics	**TDS** **Bacteria** **Nutrients** **ODS (Oxygen Demanding Substance)**
Vegetated Swale – TC-30	Sediment Metals Oil & Grease Organics	**TDS** **Nutrients** **ODS**
Bioretention – TC-32	Sediment Oil & Grease Nutrients Trash Metals Bacteria Organics	**TDS** **Nutrients** **Bacteria** **ODS**
Media Filter – TC-40	Sediment Trash Metals Bacteria Oil & Grease Organics	**TDS** **Bacteria** **ODS**
Water Quality Inlet Filter – TC-50	Oil & Grease Trash	
Vortex Separator – MP-51	Trash Sediment	
Drain Inserts – MP-52	Trash Oil & Grease	
Underground Concrete Retention - Proprietary	Flow	

SUSMP projects must identify pollutants of concern based on anticipated and potential pollutants generated from the proposed project and implement BMPs that target the reduction or elimination of the identified pollutants to the MEP. Anticipated and potential pollutants generated by land use type are shown in Table 2.

Table 2 – Anticipated and Potential Pollutants Generated by Land Use Type

Priority Project Categories	Sediment	Nutrients	Heavy Metals	Org Cpds	Trash & Debris	ODS	Oil & Grease	Bacteria & Viruses	Pesticides
≥10 SFR	X	X			X	X	X	X	X
≥1 acre Commercial	P	P		P	X	P	X	P	P
Heavy Industry	X		X	X	X	X	X		
Automotive			X	X	X		X		
Restaurants					X	X	X	X	
Hillside Development	X	X			X	X	X		X
Parking Lots ≥5000 sq. ft.; ≥15 stalls	P	P	X		X	P	X		P
New Streets ≥ 5000 sq. ft.	X	P	X	X	X	P	X		P
Retail Gas Outlets			X	X	X	X	X		
≥ 5,000 sq ft Redevelopment	X	P	P	P	X	P	P	P	P
X- anticipated ODS – Oxygen Demanding Substances P – Potential									

Once potential pollutants of concern are identified for the proposed SUSMP project, BMPs must be selected from a list of required and project specific BMPs provided below in Table 3. All site design criteria are applied to every SUSMP project while source and treatment controls are dependent upon site location and type of pollutants.

Table 3 – Site Specific BMPs

	New Development (Including Re-Development)									
	Home Subdivisions ≥10 units	Heavy Industry ≥1 acre	Commercial Development ≥1 acre	Automotive Repair Shops	Restaurants	Hillside Development ≥ 5,000 sq ft	ESAs	Parking Lots ≥15spaces; ≥ 5,000 sq ft	Street, road, highways, and freeway ≥5,000 sq ft	Retail Gasoline Outlets
General Site Design (Apply All)										
Control Peak Runoff Rates	X	X	X	X	X	X	X	X	X	X
Minimize impervious Areas	X	X	X	X	X	X	X	X	X	X
Conserve Natural Areas	X	X	X	X	X	X	X	X	X	X
Protect/slopes/and channels	X	X	X	X	X	X	X	X	X	X
Minimize effective imperviousness	X	X	X	X	X	X	X	X	X	X
SOURCE CONTROLS (Apply all that are Applicable)										
Storm Drain Message and Signage*	X	X	X	X	X	X	X	X	X	X
Outdoor storage area design		X	X	X	X					X
Trash Storage Area Design		X	X	X	X					X
Loading/unloading dock area design		X	X							
Repair/maintenance bay design				X						
Vehicle/Equipment/Accessory washing area design				X						
Fueling Area Design										X
Proof of Control Measure Maintenance	X	X	X	X	X	X	X	X	X	X
TREATMENT CONTROLS (Apply at least two)										
Inlet Filters**	X	X	X	X	X	X	X	X	X	X
Grass Strip Filter	X	X	X	X	X	X	X	X	X	X
Grass Swale Filter	X			X		X	X	X	X	
Detention/Infiltration Basin	X		X	X	X	X			X	
Porous Pavement Detention	X		X		X	X		X		
Porous Landscape Detention	X	X	X		X			X	X	
Infiltration Trench	X		X				X	X		
Media Filter	X	X	X				X	X		
Proprietary Controls						X				X
Other										

For PY2008-09, three (3) projects completed construction and included Treatment Control Best Management Practices. Projects with SUSMP requirements that were completed and inspected for BMP implementation in 2008-09 are listed in Table 4. For the current inventory of all sites with Treatment Control BMPs and BMP implementation infeasibility analyses please refer to Appendix A.2.

Table 4 – Application of SUSMP Structural BMPs for Completed Projects

	Detention Basin/Area	Inlet Filters	Media Filter	Infiltration basin/swale	Hydrodynamic Separator	Proof of Maintenance
1053 Loma Portal Dr. Principato Residence	NA	X	NA	X	NA	X
670 El Cajon Blvd. New Car Dealership	X	NA	NA	NA	X	X
442-444 El Cajon Blvd. Performance Chopper	NA	NA	X	X	NA	X

The Performance Chopper project will be elaborated as an example of SUSMP BMP implementation. This project was an existing commercial property. The project had two SUSMP triggers; the parking reconstruction was greater than 5,000 square feet and the project was a new automotive servicing shop. The structural BMPs that were implemented consisted of treatment only, as the impervious footprint of the project remained the same. The property was connected to an alley on the lower side of the project and did not have a storm drain system in the vicinity, making it impossible to use a media filter system without a mechanical pump system. The parking lot flow was directed toward the north corner of the property where it would enter three 3'x3' sand media filters with 4" perforated pipes at the bottom. These pipes then connected to a 24"x24" catch basin directly after the sand media filters. The catch basin had a sump pump that discharges into a pervious, riprap swale. This swale also takes any higher flows that overtop the sand filter system. This whole system finally discharges through an opening in a wall to the contiguous alley.

2.3.3 Waiver Provisions

In the event that a Priority Project is unable to meet the treatment control BMP sizing requirements outlined in the City's SUSMP, the City has the authority to issue a wavier. In order to receive a waiver for treatment control BMP sizing requirements, the project must prove that all available treatment control BMPs have been determined to be infeasible for the site. If a waiver of infeasibility is issued, the City will notify the RWQCB within five days of granting the wavier. The following information will be provided to the Regional Board:

- The name of the City employee granting the waiver
- The name of the developer receiving the waiver
- The location of the site
- The reason for granting the waiver
- A description of the BMPs required for the site

The City has never granted such a wavier to a Priority Project in the past and does not anticipate granting waivers in the future; however, if waivers are necessary, the City may choose to

develop a waiver mitigation program. The waiver mitigation program would collect funds from projects that receive waivers and use the funds on programs to improve water quality in the projects' watershed.

Table 5 – BMP Implementation Summary

BMP	Percent Implemented	Pollutant Prevented
Control Peak Runoff Rates	100	Flow
Minimize Impervious Areas	100	Flow
Conserve Natural Areas	100	Flow
Protect Slopes and Channels	100	Sediment
Minimize effective imperviousness	100	Flow
Storm Drain Message and Signage	67	Trash, Oil & Grease
Trash Storage Areas	100	Trash, Oil & Grease
Repair/Maintenance Bay Design	100	Oil & Grease
Proof of Maintenance	100	Trash, Oil & Grease
Inlet Filter(s)	100	Sediment, Trash, Oil & Grease
Grass Strip or Swale (Biofiltration)	67	Flow, Sediment, Oil & Grease, Trash
Detention Basin/Area	100	Flow, Sediment, Oil & Grease, Trash
Hydrodynamic Separation System	100	Trash, Sediment, Oil & Grease
Infiltration Strip/Area	67	Flow, Sediment, Oil & Grease, Nutrients (**TDS**)

Note on Table 5: Percentages of BMPs implemented, shown in Table 5, are based on the number of applicable sites. For example, if there were three hillside Development projects and all three-implemented slope stabilization, that would be all of the applicable projects. A 100% implementation equates to those applicable sites and not to all sites.

2.4 TREATMENT CONTROL BMP MAINTENANCE INSPECTIONS

All treatment control BMPs installed at priority development projects are regularly inspected by the City to ensure treatment controls are operating effectively and are being properly maintained. Inspection frequencies are based on the project's assigned TTWQ priority as determined by the criteria outlined in the City's 2007 JURMP. Table 6 below presents treatment control BMP TTWQ priorities and their corresponding inspection frequencies.

Table 6 – Treatment Control BMP Inspection Frequencies

Development Project with Treatment Control BMPs TTWQ	Inspection Frequency
High	Annually (prior to the start of the rainy season)
Medium	Every two years
Low	As needed

As required by the Municipal Permit, a minimum of 20% of the total number of projects with approved treatment controls and a maximum of twice the average number of projects with treatment control BMPs approved per year are inspected annually. Additionally, 50% of all medium priority sites with drainage inserts are inspected annually. Inspections include examination of all treatment control BMPs at the site to verify that each treatment control BMP is working, being maintained properly, and is in compliance with all applicable City ordinances and permits. Inspection findings are documented by the inspector using the City of El Cajon Treatment Control BMP Inspection form in Appendix A.2. If any deficiencies in treatment control operation and maintenance are noted during the inspection, the responsible party is notified, and appropriate enforcement actions are taken to achieve compliance. The list of the sites inspected in PY2008-09 can be found in Appendix A.2. Inspection findings and follow-up actions for each development site with installed treatment controls are included in the City's treatment control BMP tracking database.

The City requires annual verification of proper maintenance of all priority development treatment control BMPs by the party responsible for maintenance prior to the start of the rainy season. The City mailed annual verification letters to the responsible party for each priority development site with treatment control BMPs in the City's electronic treatment control BMP inventory. The verification letter requires the responsible party to sign a statement verifying that the treatment control BMPs for which they are responsible are being properly maintained in accordance with the site's maintenance agreements. An example of the Annual Treatment Control BMP Maintenance Verification letter can be found in Appendix A.2. The annual maintenance verification of treatment controls by the responsible party for maintenance is unlike any previous program within the City. Because of this, the City anticipates having to closely re-evaluate its annual maintenance verification procedure in the coming years and modify the program where necessary.

2.5 REVISED ENVIRONMENTAL REVIEW PROCESS

The City of El Cajon revised CEQA forms and checklists to include questions related to water quality issues. The City reviews all projects for CEQA; four projects completed the revised forms for PY2008-09. The forms are attached in Appendix A.2.

2.6 DEVELOPMENT PLANNING OUTREACH EFFORTS

Education efforts for disseminating information to planners, developers, and contractors on the JURMP requirements for new and significant redevelopment is provided through one-on-one and group discussions at the time of the various discretionary plan reviews and checks, during BMP development, and at time of obtaining the building permit. Topics include:

- Federal, state, local water quality laws and regulations
- Connection between land use decision and water quality goals
- New and Redevelopment requirements
- Water quality impacts from development (urbanization)
- Methods for minimizing impacts of development on water quality.
- Implementation of SUSMP requirements

2.7 REGULATORY COMMENTS

As of the writing of this report, no regulatory comments have been received for JURMP Annual Report 2007-08.

SECTION 3 CONSTRUCTION COMPONENT

3.1	**Introduction**	**2**

SECTION 3 CONSTRUCTION COMPONENT

3.1 INTRODUCTION

Construction in the City of El Cajon is a constant activity. Whether it is a 500 square foot remodeling project or a multi-single family residential subdivision, a minimum list of construction BMPs must be in place prior to any earth disturbance or material storage. With a City built out to its current borders, the City experiences re-development activities more so than new development. However, clearing currently developed lands and re-development is at the heart of this community's construction and revitalization efforts.

Park Avenue Subdivision

3.2 PREVENTION OF POLLUTED RUNOFF

The City uses the CalTrans Construction Site BMP Manual together with the California Storm Water Quality Association Best Management Practices (BMPs) Handbook as guidance for the application of appropriate BMPs. An emphasis on pollution prevention is the easiest and most convenient set of BMPs to implement and achieve the elimination of polluted discharges. The following prevention practices are part of the minimum set of BMPs for construction sites.

- Prevent sediment and other polluted runoff – Design a sediment basin to trap runoff for zero discharge, specifically for larger construction sites with enough room for sizing adequate basins.
- Prevent bacteria discharges – Place portable sanitary facility in secondary containment and secure to the ground or stable structure. Prevents tipping and loss of bacteria (fecal coliform) containing material.
- Prevent alkaline (greater than 10.0 pH) runoff – Require properly designed and installed Concrete Washout areas and encourage concrete contractor to haul away concrete waste. Concrete waste disposal should be at an offsite location with adequate control measures.

The City works closely, often one-on-one, with developers at the counter and field discussing ways to prevent pollution from entering the storm drain. The pollution prevention practices are required for any applicant looking for a building permit.

Copies of construction handouts provided by the building department and additional information given to developers, contractors, and homeowners at the time of Erosion Control Plan submittal can be found in Appendix A.3.

3.3 UPDATES TO ORDINANCES

In accordance with Section D.2.a of the Permit, the City Municipal Code Title 13 Chapter 13.10 *Storm Water Management and Discharge Control* was updated in 2008 to comply with the new grading requirements. The City Municipal Code Title 13 Chapter 13.10, Section 13.10.140; and Chapter 15.64, *Grading*, work together in addressing land disturbance, demolition, and construction activities for the elimination of sediment and other pollutants from discharging into the City's storm drain system.

3.4 MODIFICATION OF CONSTRUCTION AND GRADING APPROVAL PROCESS

Shortly after the Chapter 13.10 was updated, the City assessed and modified the local construction permit and grading approval process to comply with Section D.2.a of the Permit. All construction projects are required to go through a storm water review process. Construction and grading projects are required to implement measures to ensure that pollutants from the construction site are reduced to the Maximum Extent Practicable (MEP) and will not cause or contribute to an exceedance of water quality objectives. The City does not allow clearing of vegetation matter or grading activities until all necessary environmental clearances, including water quality, are secured and a grading, drainage, and erosion/sediment control plan is prepared, reviewed and approved by the City. During the review process, the City ensures that all applicable grading and storm water ordinances are fully implemented as required per El Cajon City Code Title 13, Chapter 13.10, Section 13.10.140; grading ordinance Chapter 15.64 and Chapter 16.60. The City does not issue Building Permits until requirements addressing storm water and water quality have been fulfilled.

3.5 PRIORITY CONSTRUCTION SITES AND SOURCE IDENTIFICATION

Periodically the City reviews the list of high priority construction projects to update the list for close monitoring and inspection of construction activities and BMPs implementation for reducing or eliminating pollution from entering the City's storm drain system. High priority status is applied to projects that pose a potential threat to water quality or location. Priority is also given to SUSMP projects that are complete and need to have the storm water controls verified and the maintenance plans reviewed. Table 1 lists the selection of BMPs that must considered and the appropriate BMPs installed at all high priority projects. See Section 3.8 for any Enforcement Actions. In PY2 the City had 2 medium priority construction projects and 13 active high priority construction projects, including 11 SUSMP projects. Also in PY2 the City approved 93 low priority projects for construction. A list of all active high priority construction sites is given in Appendix B.2.c. No project was required to have advanced treatment during construction as none were classified as an exceptional TTWQ.

3.6 BMP IMPLEMENTATION AND REQUIREMENTS

The City established minimum BMPs that must be implemented at all construction sites regardless of the water quality prioritization. The City developed a list of BMPs required at all construction sites. This list first appeared in the JURMP as Appendix C, but has recently been revised and updated to comply with Order R9-2007-0001. BMPs specifically prevent, remove, or eliminate a pollutants or group of pollutants from entering the storm drain system.

Table 1, below, lists the minimum required BMPs for construction sites, the primary pollutant eliminated and the potentially affected 303(d) pollutant. Eliminating pollutants meets the Clean Water Act and Permit objectives for maintaining the biological, physical, and chemical integrity of the State's waters, while a "no impact" condition meets the restoring requirement of the Clean Water Act objective.

A first step toward connecting construction activities to water quality is shown in the following table. The next step is to quantify how many sites are compliant with the minimum BMP requirements. Table 1 summarizes the minimum BMP requirements and the pollutants that each targets for prevention (including minimization of grading activities), removal or elimination. Table 2 lists the different types of construction projects and the minimum BMPs required for each category. Table 3 connects and quantifies the number sites compliant with the required BMPs. In Section 11, the Effectiveness Assessment of the Construction Component will draw on this connection between BMP implemented and pollutant to determine if the program activities adequately reflect a move toward improving water quality or have little effect on water quality.

Table 1 – BMP to Pollutant

BMP	Application	Primary Pollutant Removed	303(d) Pollutant Impact
Silt Fence (SC-1)	Perimeter Control to remove sediment and debris in runoff	Sediment	TDS
Desiltation Basin (SC-2)	Captures sediment runoff and eliminates sediment runoff	Sediment	TDS
Gravel Bag Barrier (SC-6)	Perimeter Control for pavement to pavement. Removes sediment runoff	Sediment	TDS
Fiber Roll (SC-5) or Coconut Fiber Blankets	Erosion Control for slopes to prevent sediment runoff	Sediment	TDS
Stabilized Construction Entrance (TC-1)	Tracking control for imperviousness to pavement to prevent sediment tracking into streets	Sediment	TDS
Street Sweeping (SC-7)	Tracking control for paved areas. Collects/removes sediment tracked onto pavement	Sediment	TDS Phosphorus
Material Storage (WM-1)	Material coverage and containment or pavement or impervious surfaces to eliminate polluted runoff	Stucco, paints, concrete	pH TDS

BMP	Application	Primary Pollutant Removed	303(d) Pollutant Impact
Solid Waste (WM-5)	Trash/debris coverage and containment. Prevent trash runoff	Trash, debris*	Bacteria Phosphorus
Concrete Washout (WM-8)	Containment and disposal of concrete washout. Prevents concrete runoff	Concrete-laden waters	pH TDS
Sanitary Waste (WM-9)	Containment of sanitary waste. Prevents bacteria runoff	Bacteria	Fecal coliform
Vehicle/Equip Management (NS-8, NS-9, NS-10)	Containment of petroleum fluids. Prevents oil & grease runoff	Oil & Grease	TDS

***** Pollutant being monitored by East County Cities
"-" Designates "no impact" on levels of 303(d) pollutants; supports Clean Water Act objective to maintain or restore water quality

---

Implementation is measured through onsite inspections. Success of that implementation depends on stage of project at time of contact, materials presented, BMP selection, and developer motivation to comply with construction requirements. The City provides a Storm Water Guideline to developers for Construction Projects. This simple, easy to use guide lists the construction BMPs to use for construction activities that would occur outdoors and potentially affect storm water quality.

Associations, such as the Building Industry Association (BIA), have assisted in disseminating information to contractors and builders. Those construction personnel who do not belong to associations receive BMP information at the time of permit application or permit issuance. There is a noticeable difference between Storm Water savvy developers and those just starting their first storm water compliance experience. The City is working towards optimizing interactions at the Public Works counter. Landscaping as early as possible is emphasized regardless of season. This information is provided to contractors at permit issuance and during each scheduled inspection. BMPs must be appropriate for site-specific conditions. Installing BMPs for the sake of compliance is not complying with MEP.

There are four categories of construction projects:

1. Pools, remodels, and additions
2. Single Family Residences, Condo Conversions, and Subdivisions
3. Hillside Development
4. Commercial/Industrial

The minimum required BMPs per category of construction are shown in Table 2, on the next page.

The next steps complete the BMP cycle. By verifying during inspections that the BMP is:

a. Present as required – indicates changes in knowledge and awareness.
b. Implemented properly and functioning correctly – indicator of behavioral changes.

Printed materials are available at the Public Works Department making over-the-counter interactions into educational opportunities. A City BMP guide, edited summaries of application JURMP sections, and personalize service functions as the City's implementation tools. To prioritize effectiveness efforts, the City focuses on the prevention and elimination of the 303(d) pollutants to address the restoration requirement of the Clean Water Act and our Municipal Storm Water Permit. Overall Effectiveness of the Construction Component is provided in Section 11.

Table 2 – Required BMPs for Construction Sites

Required Construction BMP	Construction Type			
	Pools, Remodels, Additions	SFR Subdivisions	Hillside Development	Commercial and Industrial
Silt Fence - SC-1	X	X	X	X
Storm Drain Inlet Protection (+filter fabric) SC-10	X	X	X	X
Sediment Basin or Trap SC- 2 or 3		X	X	X
Check Dams - SC-4		X	X	X
Fiber Rolls - SC-5			X	
Gravel Bags - SC-6	X	X	X	X
Street Sweeping - SC-7	X	X	X	X
Stabilized Construction Entrance - TC-1	X	X	X	X
Dust Control - WE-1		X	X	X
Scheduling - SS-1	X	X	X	X
Velocity Dissipation Devices - SS-10			X	
Preservation of Existing Vegetation - SS-2		X	X	X
Coconut Fiber Blankets - SS-7			X	
Material Storage - WM-1	X	X	X	X
Solid Waste Storage - WM-5	X	X	X	X
Concrete Waste - WM-8	X	X	X	X
Employee Training - City of El Cajon		X	X	X

X = Required; Implemented; and Verified

3.7 INSPECTION

The City inspects all high priority projects monthly during the dry season and weekly during the wet season. Inspections are completed using the form provided in Appendix A.3. In PY2, the City had 20 high priority projects, all of which were fully or partly active construction sites during the permit year. SUSMP projects are considered high priority construction projects and are inspected on the same schedule. All projects are inspected prior to completion of the projects to verify proper and complete installation of storm water treatment controls and review any long-term maintenance plans. Two SUSMP projects were completed during PY2 and eight became or remained inactive.

All projects designated medium priority are inspected monthly during the Wet Season, on an as-needed basis during the Dry Season and in response to a complaint received from City staff or the general public. The City had 2 medium priority projects under construction during PY2. The City maintains a detail record for high and medium priority projects. A spreadsheet showing the period of time, in weeks, that each construction site was active within the rainy season and the number of inspections conducted during the rainy season and the dry season is attached in Appendix B.2. It is important to note that inspections in the spreadsheet account only for the inspections conducted by the Public Works Department; inspections conducted by other departments, such as Storm Water, are not included in the table.

In accordance to the Municipal Permit and the City's JURMP document, the City inspects low priority construction projects on an as needed basis. Building Department personnel constantly inspect all projects designated as low priority for there own Building Code requirements. For this reason, the Building Staff has been trained by the Storm Water Department to recognize when to contact Storm Water personnel due to improper construction BMPs. The City approved 93 low priority projects (consisting mostly of single family residential additions) for construction in PY2. During Permit Year 2008-09 the City continued to work toward creating a means of gathering more detailed information for low priority construction sites, including the period of time the site is active within the rainy and dry seasons.

It is important to note that only inspections that were documented are included in the spreadsheet mentioned above. Visual inspections, which did take place through out the permit year, are not tracked.

Table 3, on the following page, shows the percentages of minimum BMPs implemented at high priority constructions, verified through inspections. The percentages are calculated from the inspection reports. The percentage indicates the number of sites that implemented the required BMP at the time of inspection. A "Yes" under corrective action indicates that specific conditions noted during the inspection warranted actions by the contractor, such as maintenance or BMP improvements.

Table 3 – Percent Implemented and Verified for High Priority Sites

BMP	Percent Implemented	Discharge during Rain	Corrective Action	Citation
Silt Fence	87	No	Yes	Yes
Storm Drain Inlet Protection	83	No	Yes	Yes
Sediment Basin	69	No	Yes	No
Check Dams	55	No	Yes	Yes
Fiber Rolls	69	No	Yes	No
Gravel Bag Berm	79	No	Yes	Yes
Street Sweeping/Vacuum	86	No	Yes	No
Stabilized Construction Entrance	90	Yes	Yes	Yes
Hydroseeding	52	No	Yes	No
Geotextiles and Mats	25	No	Yes	No
Material Delivery and Storage	100	No	No	No
Stockpile Management	86	Yes	Yes	Yes
Solid Waste Management	100	No	No	No
Concrete Waste Management	97	No	Yes	Yes
Sanitary Waste Management	99	No	Yes	No

Inspection of construction sites in PY2 verified that most construction sites implemented BMPs. Unfortunately the statistics for this permit year are lower than usual. This is mostly due to the loss of funding for many of our high priority construction projects. The inability for our staff to locate anyone with responsible charge for projects that fell into receivership led to the extended periods of time where BMPs remained inadequate. However, no deficiency was left to cause an illicit discharge offsite to any water bodies. All other deficiencies were resolved through discussions between City staff, project construction personnel, corrective actions, and through enforcement actions. If corrective actions were needed, the construction site either completed the corrective action at the time of inspection or a follow-up visit was scheduled to verify the completion of corrective actions. When corrective actions are not completed in a timely manner, enforcement actions are issued. In PY2 the City had multiple enforcement actions related to construction inspections and follow-ups. Table 5 provides information about these enforcement actions. Enforcement actions are further discussed in Section 3.8 and a list of enforcement actions categorized by components (i.e. construction, commercial, industrial, etc) is attached in Appendix B.3.

Table 4 – Capital Improvement Project Assessment

2008-2009 CIP CONSTRUCTION SITE INSPECTIONS

Site Inspections		Enforcement Actions	
Job Site	**Minimum BMP's in place**	**Warning(s)**	**Administrative Citation(s)**
PCC Channel Repairs (JN 2996, Various Locations)	Y	N	N
E. Washington Ave. Street Resurfacing (JN 3133, Avocado to City Limits)	Y	N	N
Sewer and Storm Drain Rehabilitation (JN 3175, Various Locations)	Y	N	N
Washington Channel Emergency Repair (JN 3256, Civic Center Way)	Y	N	N
Emergency Sewer Repair (JN 3258, Fletcher Pkwy.)	Y	N	N
Street Resurfacing (JN 3265, Various Locations)	Y	N	N

Public Works inspectors inspect the CIP projects for Storm Water compliance on an as-needed basis. This may be as frequently as weekly, or even daily, but generally no less than twice per month (when the inspectors are on the job for non-storm water related inspections) while the project is active.

3.8 ENFORCEMENT

In PY2 the City had 16 enforcement actions pertaining to inspection follow-ups or complaints received for construction activities, 10 of which resulted in a monetary administrative citation. The City conducted follow-up inspections for all enforcement actions to verify that proper and complete corrective actions were taken in a timely manner. Corrective actions are needed to fix or improve a BMP even though that BMP may be implemented as written.

Administrative Citations are issued for discharges to the City's storm drain system. Most construction sites implement the minimum BMPs and inspections verified that the BMPs were effective in reducing or eliminating discharges to the storm water conveyance system. A list of enforcement actions categorized by components (i.e. construction, commercial, industrial, etc) is attached in Appendix B.3. A specific list of the construction related enforcements is on the following pages as Table 5.

Other non-compliance issues, except as described above, were not experienced during PY2, although some deficiencies were noted during construction inspections. Deficiencies were resolved through discussions between City staff, project construction personnel, corrective actions and through citations. All violations and deficiencies were corrected in a timely manner.

None of the violations resulted in threats to the environment or human health and notification to the Regional Board was not required.

Table 5 – Construction Enforcement Actions

	Date	Business Name	#	Street / Location	Complaint/ Observations	City Action	Enforcement Action	Corrections Completed
1	6/25/09	Starlett Construction Inc	965	Arnele Ave.	Discharge of concrete residue directly into the storm drain. No BMPs installed.	The on site supervisor for Toyota was contacted on site and issued a citation. He was directed to clean the curb line of any remaining residue.	First	Yes
2	7/31/08	Habitat For Humanity	801	Avocado Ave.	Inadequate construction entrance allowing tracking of sediment into the street.	Written warning issued to the contractor. Advised to cease tracking sediment and sweep the street and sidewalk of all sediment.	Warning	Yes
3	6/10/09	Habitat For Humanity	801	Avocado Ave.	Sediment tracking and failure to maintain a construction entrance	Contacted the site superintendent and issued a first citation for the violations	First	Yes
4	4/8/09	American Wrecking Inc.	1310	Broadway	Sediment tracking onto second St.	Contacted the site superintendent and advised to install proper entrance and to sweep all paved areas.	Verbal	Yes
5	9/29/08	Condo Conversion	360	North First St.	Failure to maintain BMPS, tracking sediment	Citation issued to contractor with instructions to install and maintain BMPs	First	Yes
6	6/19/09	Suncoast Homes	1341	East Main St.	Failure to maintain BMPs for all bare soil.	Contacted the business representative and advised to install and maintain the BMPs. Citation was issued	Third	Yes
7	1/7/09	San Diego Contracting, Inc.	1539	East Main St.	Contractor has failed to maintain a construction entrance allowing sediment tracking onto roadway	Superintendent and assist. Were contacted and advised to improve the entrance and daily sweep.	Verbal	No
8	10/10/08	Vacant	198	West Main St.	Water discharging from the west side of the building with no BMPs in place. Water appeared to have an oily sheen.	The contractor was contacted on site. Water found pool at curb on Sunshine Ave. Discharge had stopped. Agreed to drain any remaining into grass. No Oil found, however water had rust in it.	Verbal	Yes
9	4/3/09		132	Meadow Crest Dr.	Sediment tracking, failure to install and maintain the required BMPs.	Contacted the property owner/ contractor and advised to install and maintain the BMPs and to sweep all paved areas. Citation issued.	Warning	Yes
10	4/23/09		132	Meadow Crest Dr.	Failure to install and maintain minimum BMPs.	A citation was issued and posted on site for tracking and failure to maintain the required BMPs.	First	Yes

	Date	Business Name	#	Street / Location	Complaint/ Observations	City Action	Enforcement Action	Corrections Completed
11	10/3/08		560	South Mollison Ave.	Security motor home on site leaking sewage near lot drain inlet.	Contacted the security person on site and advised to correct the leak and discharge black water into sanitary sewer. Also instructed to install a filter in lot drain.	Verbal	Yes
12	9/29/08	Condo Conversion	642	South Mollison Ave.	Failure to maintain BMPs, Trash piles on site and no filters in lot drains.	Citation issued to contractor with instructions to install and maintain BMPs	First	Yes
13	11/5/08	Mike Snyder	1338	Naranca Ave	Failure to install construction entrance, silt fencing and maintain.	Corrected	Fourth	Yes
14	4/7/09	Countrywide Concrete Cutting	1189	Naranca Ave.	Employee sweeping water and sediment into the street and curb with no BMPs in place.	Contacted the business owner on site and advised to cease and reclaim all pollutants.	First	Yes
15	10/7/08		1338	Naranca Ave.	Sediment tracking and failure to maintain BMPs	Notified the property owner that a citation was being issued for the violations.	Third	Yes
16	8/21/08	Cajon Valley Union School Distr.	189	Roanoke Rd.	Sediment tracking, failure to maintain BMPs.	Corrected	Warning	Yes
17	12/16/08		189	Roanoke Rd.	Failure to provide adequate BMPs during a significant rain event. Failed construction entrance and uncovered soil piles causing a large amount of sediment discharge from the site.	Contacted the site superintendent to install drain protection and provide source protection.	First	Yes
18	9/29/08	Condo Conversion	921	Sunshine Ave.	Failure to maintain BMPs, debris piles and tracking.	Contractor instructed to install and maintain required BMPs.	Second	Yes

3.9 CONSTRUCTION OUTREACH AND EDUCATION

Education of construction contractors and developers is conducted primarily through the permitting and inspection processes. The City's building department has the first contact with contractors and developers when a building permit application is completed. The following steps are taken by Building Division and Public Works/Storm Water staff:

1. Building Permit Application.
2. A Storm Water "Hold" is placed on the property.
3. Developer or contractor is given a Storm Water handout.
4. Discuss with developer or contractor, in detail, minimum BMPs and implementation requirements.
5. Developer or contractor generates an Erosion Control Plan plus any additional storm water requirements as necessary.
6. Review Erosion Control Plan and any additional requirements, comment, direct developer or contractor to make changes prior to approval.
7. Inspect according to priority.
8. Address Corrective Actions.

In PY2, the City reviewed and commented on 12 SUSMP projects, 21 Storm Water Mitigation Plans, 7 condominium conversion projects and 93 Erosion Control Plans for small projects. The City inspects all completed SUSMP projects to confirm proper installation of storm water controls and review the long-term maintenance plans. Copies of the Construction handouts and an example Erosion Control Plan Checklist for additions and remodels (small projects) are included in Appendix A.3.

Compliance is assessed through inspections by storm water staff or a City contractor. Inspections are completed on a scheduled frequency depending on the season. As mentioned above, during the rainy season high priority construction projects are inspected on a weekly basis.

3.10 IMPROVEMENTS AND REGULATORY COMMENTS

- Generating improvements increases program efficiencies by harvesting those BMPs that work and discarding those that do not.

Improvements

Improvements to the Construction Component include:

- Road Work – Vacuum any water used; no filtering allowed
- All Construction Entrances must have adequate aggregate size (Minimum 2-3") or sufficient shaker-plate systems.
- Continue to focus inspection efforts on BMP implementation to facilitate Effectiveness Assessment.
- Continue to use BMP Implementation Inspection Checklist to list minimum required BMPs for construction.
- Continue to include SUSMP projects in the High Priority category.
- Continue to inspect construction of SUSMP projects as High Priority construction.
- Perimeter control – Use silt fence as primary perimeter control.

BMP improvements are needed as follows:

- The City is planning to conduct training sessions with our construction inspectors to make sure that reporting and compliance procedures are being followed appropriately.

Regulatory Comment

Provide information for Item J.2.b.VII "For each construction site within each priority category (high, medium, and low), identification of the period of time (weeks) the site was active within the rainy season, the number of inspections conducted during the rainy season, and the number of inspection conducted during the dry season, and the total number of inspections conducted for all sites."

Response

The spreadsheet mentioned in Section 3.7 above was created for Permit Year 2008-09 in response to Item J.2.b.VII. A similar spreadsheet was provided to the Regional Board for Permit Year 2007-08 as part of the City's response letter.

SECTION 4 MUNICIPAL COMPONENT

4.1 Introduction to Municipal Facility Activities 2
4.1.1 Prevention of Polluted Runoff 3

4.3.1 Pesticide Regulatory Program – Integrated Pest Management 19

4.4 Municipal Staff Training, Special Events and Notable Actions 20

4.5 Improvements and Regulatory Comments 21

SECTION 4 MUNICIPAL COMPONENT

4.1 INTRODUCTION TO MUNICIPAL FACILITY ACTIVITIES

As required by Section 4 of the Municipal Permit, existing municipal facilities must prevent or reduce pollutants in urban runoff by implementing a City-designed program to address specific outdoor activities that have the potential to impact water quality. Municipal facilities include streets, public parking lots, flood control devices, parks/recreation, administration and other public buildings, maintenance and storage areas, police, and fire/safety stations. Activities at any one of these facilities may have the potential for discharging pollutants as urban runoff or during a rain event. The Municipal Component of the JURMP defines a comprehensive program to reduce the potential for polluted discharges through:

- Pollution Prevention activities,
- Best Management Practice (BMP) implementation,
- Storm Water Inspections, and
- Recycling

Homeless

Of specific note are the Homeless that are not only a social problem, but become an uncontrollable water quality problem. Homeless encampments exist in storm water channels because of easy access and good outdoor weather conditions nearly year round. Although prevalent in the storm drain channels, the homeless are difficult to detect in the underground storm drain system comprised of reinforced concrete boxes and even more difficult to permanently remove. Detection is conducted through weekly/monthly inspections of popular entry places and complaints to the Storm Water Complaint Hotline. Removal is accomplished through police enforcement and the homeless have an option for other housing with the City's new interim housing project. The City cleans all of its channels at least twice annually and encampments are removed at that time, however, the encampments are often re-established once the channel maintenance in that area is finished.

The photograph above emphasizes the enormous amount of materials associated with homeless encampments in the storm drain channel. Other than the visible pollutants of trash and debris, there are also the less collectable, non-visible pollutants from human waste.

The list of major pollutants associated with the homeless living in these underground flood control devices are:

- trash, (a monitored pollutant for East County)
- debris, and
- fecal coliform (a listed 303(d) pollutant for Forester Creek).

Our dry weather-monitoring program is designed to capture information on the homeless and track elevated levels of fecal coliform. During PY2, D-Max Engineering undertook an investigation of fecal coliform and other constituents in the El-Cajon-area watershed. Results of the investigation were inconclusive, but did provide great insight into tracking bacteria in dry weather runoff. Specifics can be found in Section 7 of the Annual Report and Appendix A.7 of this Annual Report. The City will continue its efforts to reduce or eliminate the impacts caused by the homeless encampments within storm drain channels.

As in past years, Storm Water staff and City Maintenance crews teamed with Community Police and Interim Housing (a joint venture between Hammon Properties and Shadow Mountain Church) to move inhabitants into temporary housing, followed by clean up of storm drain channels. For those homeless willing to improve their situation, the Interim Housing group provides a "Hand Up" rather than a hand out. Those who wish to continue living in the City's storm drain system are detained, but eventually find new living places on the street. A County-wide, long-term solution to the homeless is not yet definable for storm water.

4.1.1 Prevention of Polluted Runoff

Anytime pollution is prevented from entering the storm drain system, less pollution must be managed at end-of-pipe. The following prevention activities and corresponding BMPs are fully implemented at one or more of the many municipal facilities located within the City. As noted in Introductory Section, the focus of PY2 is continued BMP implementation such that prevention of polluted runoff is achieved to the Maximum Extent Practicable (MEP). The primary pollutants of concern for this prevention effort are the 303(d) impairments of Forester Creek that include pH, total dissolved solids (TDS) as nitrates; and fecal coliforms. The only impairment associated with the City of El Cajon or the upper section of Forrester Creek is pH. Further discussion of pH origin and any corrective actions are presented at the end of this section. Trash and debris is a specific issue being addressed as part of a watershed effort with the City of Santee.

When pollution is prevented from entering the storm drain system, it is either collected or eliminated. Collection requires management of gathered wastes, while elimination is true prevention, but much more difficult to accomplish. The following municipal activities encompass collection and elimination activities.

1. Erosion and sediment control prevents soils and sediments from washing away during rain events. BMPs implemented for City Improvement Projects to control erosion and sediment during project activities are as follows:

- Preservation of existing vegetation
- Scheduling of projects
- Seeding and planting of native plants and trees that are draught resistant and do not contribute to discharges of vegetative matter to the City's MS4.
- Establish plant ground cover before removing erosion or sediment controls.

2. Roadway and street maintenance activities preserve these facilities for a longer, useful existence. Many maintenance activities keep pollutants from entering the storm drain system. Listed below are the maintenance activities with the gross amounts of pollutants collected. Pollution removed equates to preventing polluted runoff that could be transported in urban runoff or storm water discharges.

- Street sweeping and cleaning – Swept 19,030 miles of curbed streets and removed 3,463 cubic yards of materials that were disposed as solid waste. There is a total of 337 curb-miles of streets and a total of 483 lane-miles withinin the City. As stated in greater detail in the JURMP, some areas are swept on a more frequent basis. By collecting 3,463 cubic yards of trash, debris, and sediment, these pollutants did not enter the storm drain system and did not further impair Forrester Creek.
- Collected 52 cubic yards from spills and other miscellaneous operations
- Completed 58 special sweeps at the request of citizens or City staff, collecting 31 cubic yards of material. This is the same number of special sweeps, collecting slightly more material than collected during PY1 (i.e., 58 special sweeps and 29 cubic yards).

3. Municipal vehicle maintenance facilities provide a valuable service in keeping the City's vehicles in top running condition. Maintenance activities are conducted in a manner to keep pollutants from entering the storm drain system. Listed below are the activities and their designated areas.

- Conduct vehicle maintenance indoors or under canopies
- Area designated for washing vehicles is covered and wash water drains to an oil/water separator before discharging to the sanitary sewer
- Area designated for rinsing street sweepers directly discharges to the sanitary sewer
- Recycling motor fluids (oil and antifreeze), tires, batteries, and metal

4. Landscaping maintenance activities beautify our parks, recreation, and administration buildings. Pollution prevention maintenance activities include:

- Collection of grass clippings and discarded as solid waste
- Sweep or blow residual clippings onto turf areas
- Clean City-owned patio and plaza areas using a machine that contains the cleaning liquids.
- Aerate soil frequently to encourage rain penetration and infiltration
- Maintain an Integrated Pesticide Management (IPM) program

5. Maintenance Procedures for MS4s includes inspecting and maintaining MS4 by cleaning, removing sediment, debris and vegetation; repairing or replacing damaged and failing structures; and stenciling/posting signs at storm water inlets and conveyance systems. Approximately 1,720 cubic yards were collected during PY2. Maintenance crews responded to 71 requests by city staff and citizens to maintain the storm drain system. A work survey request (WSR) is completed for each of the requests and filed at the Maintenance Yard on Vernon Way.

- Storm Drain Inlet/ Catch Basin cleaning
- Storm Drain system repair and maintenance

6. Building Maintenance activities at Municipal facilities prevent pollution by collecting debris, dirt, and organic materials before rain events transport this material to the storm drain system. Wash water is disposed into the sanitary sewer and dry methods are used to collect materials to dispose as solid waste. The following are completed on a weekly schedule:

- Sweep and clean parking lots
- Clean sidewalks
- Sweep and clean entry ways
- Control irrigation runoff and over-spray

7. A Sewer Maintenance program assists in preventing sanitary sewer spills and prevents sewage from entering the storm drain system using the following plans and BMPs:

- Identify and respond to overflow spills and leaks
- Contain and properly dispose of spilled sewage for public and private sewer overflows

- Repair damaged and leaking public sewer lines
- Identify potential problem areas, such as sewer lines in isolated, hard-to-access canyons, or sewer lines at end-of-life condition, for inclusion in annual Capital Improvement Projects
- TV inspection of sewer main lines
- Annual cleaning of main sewer lines
- Quarterly (3-month) cleaning of sewer siphons, trouble spots and problem manholes
- Quarterly (3-month) rodding and descaling of problem sewer lines
- Cleaning and inspection of trunk and outfall sewer mains as part of the preventive and predictive program.

During PY2, the City cleaned 211.6 miles of sanitary sewer main line, while experiencing one public sanitary sewer overflow. As a result of this public sewer overflow, zero (0) gallon of sewage reached the storm drain. Of the 5 gallons involved in this spill, all 5 gallons were recovered and returned to public sewer. The City also responded to 9 private lateral sewage spills and recovered 166 gallons of sewage.

During PY1 (2007-2008), the City of El Cajon received the **Sewage Collection System of the Year Award** for collection systems under 250 miles in length by the **California Water Environment Association (CWEA)**. The award represents professional acknowledgement of decades of superior maintenance of the El Cajon Municipal Sewer System by many City workers. The City will continue to clean and maintain the Municipal Sewer to these standards.

4.1.2 Roads, Streets, Highways, & Bridges

The following are major City accomplishments during PY2 for roads, streets, highways, and bridges:

- Used the recently installed permanent wash rack for street sweepers to allow more time for cleaning equipment.
- Followed a strict preventive maintenance schedule for the new Elgin Crosswind street sweepers.
- Swept Downtown District twice per week.
- Swept non-Downtown Business and Commercial areas once per week
- Swept Residential areas and medians twice per month

Table 1 Summary of Street Sweeping Maintenance by Zone

Description	Silt (Yds)	Organic (Yds)	Trash (Yds)	Total (Yds)	Miles
Residential Streets	782	823	335	1940	9818
Residential Percentages	40.3%	42.4%	17.3%	100.0%	
Commercial Industrial Streets	623	470	155	1248	9254
Commercial Industrial Percentages	49.9%	37.7%	12.4%	100.0%	
Category Totals	1405	1293	490	3188	19072
Total Percentages	44.1%	40.6%	15.4%	100.0%	

City Maintenance crews collected a total of 3188 cubic yards of material from street sweeping. Figures 1 and 2 show the distribution of material by type, cubic yard amounts, and percentages for materials. Total cubic yards of materials decreased in PY2 although the City continues to increase the use of the Elgin Crosswind street sweepers. The total volume of trash, silt and organic material decreased, compared with PY1. Figure 2, below provides a summary chart for relative volumes and Figure 3 provides a comparison to amounts collected in previous years.

Figure 1

Comparing the percentages of materials collected in the streets with those from the channels, it is worth noting that about 250% more trash is collected in the street sweeping operations (490 cubic yards) than is recovered in channel cleaning operations (189 cubic yards). This difference may be due to the types of trash. The elimination of trash is best addressed at the source or

generator. For the City of El Cajon, street trash is typically generated in highly commercialized areas that include restaurants, convenient stores, and department-like stores. Continuing as a major priority into the next Permit Year will be an ongoing effort to keep the downtown areas trash-free and street-clean. These prevention efforts are a partnering effort with the El Cajon Community Development Corporation (ECCDC) and businesses in the downtown area.

Currently, ECCDC hires the St. Madaline Sophies students to pick up trash and cigarette butts in the downtown area. During PY2, the ECCDC and storm water staff organized community functions to increase public awareness and improve downtown areas. "Lend a Hand" days were scheduled throughout PY2.

Figure 2

Figure 3

4.1.3 MS4 Maintenance

The City's Municipal Separate Storm Sewer System (MS4) is comprised of 53.0 miles of storm drains, inlets and catch basins, and 23.7 miles of open channels and culverts. The MS4 System functions to collect and convey surface runoff. Maintenance of this system is necessary for continuous transport of rainwater to prevent flooding and to drain urban flows away from populated areas and prevent flooding.

Figure 4

Work Service Requests (WSRs) document maintenance activities on the storm drain and open channel system. For PY2, 20 WSRs were completed for both emergency and non-emergency repairs/maintenance to the MS4. WSRs cover any type of needed maintenance and are available to all contacting our Municipal Maintenance Yard, located at 1050 Vernon Way, El Cajon.

The City's MS4 includes:

- Streets
- Gutters
- Storm Drain Inlets/ Catch Basins
- Underground pipes
- Culverts
- Rock-lined channels
- Concrete channels
- Unlined Creeks

City maintenance crews inspect all open channels once a month and perform a complete cleaning at least once each year. Storm drain inlets and pipes are inspected at least once each year and cleaned as necessary. Table 2 summarizes the number of miles of channels and culverts inspected, together with a separate summary for drain inlets and pipes.We

are in the process of converting from a years-old paper map inventory of the MS4, to a GIS-centric inventory. The GIS conversion is in a transition year where we are endeavoring to make our summary of MS4 inspection and cleaning more complete. Although we are currently maintaining our storm drain and channel system as directed in the Municipal Storm Water Permit, it is anticipated that future annual report will include additional detail in the MS4 maintenance summary as our maps become more complete. Implementation of the JURMP Municipal Component in PY2 resulted in:

- Trash/debris removal from storm drain conveyance system (defined above) completed annually as specified in the JURMP. Total removed is 1,720 cubic yards. For types of pollutants removed see Figure 4.
- Maintained 51 storm drain inlet filters located in the public right of way.
- Met JURMP requirements by cleaning catch basins, culverts, and concrete channels once for PY2 in the major channels and once for the minor channels. The Conservation Corps completes the cleaning for Hunter's Run and Cypress Channel.
- Flow line vegetation maintenance completed one time during PY2 (tree maintenance along major channels and median maintenance).
- Cleaning of Homeless waste and trash completed two times during PY2.

Table 2 Summary of MS4 Inspection and Cleaning Activities

Drainage Structure Type	Inspection Cycle	Number Miles Inspected	Number Miles Cleaned	Number Miles > 30% Full
Channel and Channel Culverts	once per month	283.97	23.66	0
Drainage Structure Type	**Inspection Cycle**	**Number Inlets Inspected**	**Number Inlets Cleaned**	**Number Inlets > 30% Full**
Storm Drain Inlets/Catch Basins	once annually	2719	566	0
Drainage Structure Type	**Inspection Cycle**	**Number Miles Inspected**	**Number Miles Cleaned**	**Number Miles > 30% Full**
Storm Drain Pipes	once annually	53.01	0.36	0

4.1.4 Sanitary Sewer System

Continuity and consistency describes the City annual cleaning and maintenance of the sanitary sewer system. Few conditions occur when crews needed redirection from the normal routine. The El Cajon sewage collection system, consisting of nearly 195 miles of municipally owned sewer mains, is a transportation-only utility with the sewage treated at the Metro Wastewater Treatment Plant in Point Loma, San Diego. El Cajon's outfall sewer main transports sewage from the City, Wintergardens Sewer District, and Padre Dam/Lakeside/Alpine Sewer District.

The City of El Cajon has an aggressive maintenance program to prevent sewer overflows. An important maintenance goal is to flush and maintain the entire system at least once every 18 months which requires the flushing of 148 miles of sewer main each year. For PY2, maintenance crews cleaned 207.2 miles of sewer line in 12 months. Cleaning and televising of

larger trunk and outfall sewer mains as part of a condition assessment accounted for 4.41 miles of additional main cleaning for a grand total of 211.61 miles for PY2. Difficult areas, where solids and grease accumulate, or root intrusion is a problem, are on a more aggressive schedule of flushing and rodding every 3 months. A Summary of Sewer Operations and Maintenance Procedures is included as Appendix D.1. A complete summary of scheduled Municipal Sewer System Maintenance is included as Appendix D.2.

New-Generation Sewer Vactor Truck

An indispensable tool in preventing sewer blockages and overflows

As part of the aggressive preventive maintenance program, the City televises sewer mains when:

- A new sewer tap is installed
- New difficult areas are suspected
- Determining the type of maintenance or repair needed

Interior of Sewer Main Televising Van

There was one public sewer overflows from City-owned sewers for PY2. Sewer system activities and discharges are reported annually to the San Diego Regional Water Quality Control Board and the California Integrated Water Quality System (CIWQS), among others. In April of 2003, the City internally started tracking reported overflows from private sewer laterals, where homeowners or businesses require immediate system repair. Response to the private sewer overflow includes reimbursing the City for any storm drain cleanup costs due to the overflow into the public right-of-way.

For PY2, 9 private sewer spills were reported or detected by municipal staff. In all, 166 gallons of sewage liquids were recovered and disposed of in the municipal sanitary sewer. With private sewer spills, municipal crews estimate how long the spill was active and document an estimated number of unrecoverable gallons.

4.1.5 Corporate Yard

The City of El Cajon has one Corporate Yard located at 1050 Vernon Way. Four separate Public Works Divisions are located at this facility, as follows:

- Public Works Maintenance Division - coordinates maintenance for streets, storm drains, drainage channels and public sewers;
- Facility Maintenance Division – maintains City buildings and related facilities;
- Fleet Maintenance Division – maintains City vehicles, and
- City Parks Division – maintains City parks, median, landscapes and urban forest.

It takes coordination and collaboration for these crews to work in the public interest maintaining and improving the health, safety, convenience and quality of life for the City's citizens and visitors.

The Maintenance Division of Public Works maintains the city's infrastructure. Fleet and Facilities Management is part of Administrative Services and maintains the City's buildings, vehicles and equipment. The Parks Department controls and maintains parks, recreational areas, and other City-owned landscaped areas.

Annual inspections of each area is completed and corrective actions discussed with Department Management. An annual inspection was completed during June of 2009. Improvements at the Corporate Yard include:

New Vacuum Technology in Street Sweeping

Cleaning the Elgin Crosswind Sweeper in the City Wash-down Facility.

- New (Additional) Street Sweeper Wash-Down Area is now in service.
- Monthly visual inspections are conducted.
- Secondary containment is in place at all storage areas.
- Berms are in place around the wash and waste discharge areas.
- Employees are trained on storm water issues, dealing with the homeless, pesticide training, and managing hazardous materials.

The annual inspection of the Corporate Yard uncovered a few needed Corrective Actions as follows:

- Maintain recordkeeping for training and inspections as defined in the Corporate Yard SWPPP.
- Post procedures on use of Spill Kits.

The sample of the Checklist for Municipal Site Inspection is contained in Appendix A.4.

4.1.6 Municipal Airfield

Gillespie Field, located at 1720 Joe Crosson Drive, is the local airfield and governed by the San Diego County Airport Authority and the Federal Aviation Administration. The City of El Cajon inspects this facility for compliance with the Municipal Permit as well as the General Industrial Permit. Some of the new BMPs include:

Gillespie Field - A County Airport Facility

- Wash racks with discharges hooked to the sanitary sewer. Use of manually adjusted shut-off valves eliminating flows to the sanitary sewer during rain events.
- Spill kits are in place throughout the airport.

4.1.7 Parks and Recreation

The Parks Division maintains, improves, protects, and develops the City's parks, landscaped median islands, public building grounds, and the urban forest for the benefit and enjoyment of the community. Maintenance of these nearly 120 acres is overseen by a well-trained, full-time staff that performs any necessary maintenance on a daily basis. Attractive public open spaces and well-maintained parks help to make El Cajon a better place to live, and encourages civic pride. Staff continually strives to promote a Cleaner Community through maintaining a Healthy Watershed while providing the community the highest quality and level of service possible.

A City-Maintained Park Area Near City Hall

Parks and Recreation areas prevent pollutants from entering the storm drain system, by implementing BMPs such as:

- Providing Pet Waste Bags at Dog Park located at Wells Park
- Blowing organic cuttings and sediment onto grass and disposing collected wastes properly
- Use of mop and buckets to clean up after special City events (Cajon Classic Car Show and Friday Concerts on the Green)
- Requiring Qualified Applicator Certificates and 20 hours of training for the safe and effective use of pesticides.

- Requiring Contractors that steam-clean or power-wash to capture, collect, and contain wash liquids, then dispose into the sanitary sewer.

4.2 MUNICIPAL BMPS

The City has developed a list of minimum BMPs for Municipal crews to use while maintaining the following categories of municipal-owned and managed facilities. Not counting streets, alleys, storm drain or sewer easements, there are 31 separate municipally maintained facilities within the City. Overall, the categories of Municipal facilities are as follows:

- Roads, Streets, Parking Facilities
- The Multiple Separate Storm Sewer System (MS4)
- Corporate Yard
- Municipal Buildings, Parks, Recreational Facilities, and Landscaping

Each minimum required BMP is connected in some way to a primary pollutant that is reduced or eliminated to the maximum extent practicable (MEP) when that BMP is implemented as written. Table 3 lists the Municipal BMPs that may be applied to municipal activities and areas, the primary pollutant(s) either reduced or eliminated and the 303(d) pollutant that may also be prevented. Not all BMPs listed in Table 3 are required for the 31 Municipally-operated areas.

Table 4 lists the four major municipal areas with their minimum required BMPs and whether they were implemented. An “X” for the BMP indicates the BMP is required.

Inspections complete the BMP cycle by:

- Confirming proper BMP Implementation (present as written in the California BMP Handbooks or by City of El Cajon Storm Water Staff)
- Verifying that the BMPs are maintained (during inspection) (See Table 4 in Section 4.2.1 for inspection results)

This Annual Report takes an important step in connecting activities, BMPs, and pollutant reduction to support the Assessment of JURMP Effectiveness contained in Section 11. The connection is shown by the following diagram.

Table 3 BMPs to Pollutants for Municipal BMPs

BMP	Application	Primary Pollutant Reduced or Eliminated	303(d) Pollutant Reduced
Non-Storm Water Discharges – SC10	Addresses any discharge that is not storm water	Varies	pH; TDS; Fecal Coliform
Spill Prevention Control and Cleanup – SC11	Addresses spills	Varies	pH; TDS; Fecal Coliform
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22	Controls motor fluids	Oil & Grease Metals	-
Loading/Unloading – SC30	Controls the loading and unloading of materials	Varies Trash	-
Liquid Container Storage – SC31	Controls discharges from outdoor liquid containers	Oil & Grease pH	pH
Raw Material Storage – SC32	Controls the outdoor storage of raw materials.	Metals	-
Waste Handling and Disposal – SC34	Controls any discharges from the collection, storage, and disposal of waste materials.	Varies Trash	-
Safe Alternative Products – SC34	Encourages the use of less toxic materials	Pesticides Fertilizers	-
Building and Grounds Maintenance	Addresses General Housekeeping and preventative maintenance	Fertilizers Trash/debris	TDS
Parking Lot and Storage Maintenance – SC43	Addresses sweeping and general maintenance of parking lots	Trash/debris Sediment	-
Drainage System Maintenance – SC44	Requires routine cleaning of the storm drain system	Trash/debris Sediment	-
Employee Training	Requires employees be trained in specific topics	Trash/debris	-
Storm Drain System Signage	Requires signs at storm drains or receiving waters	Trash/debris Fecal Coliform	Fecal Coliform
Private Sewer Lateral Maintenance	Requires routine maintenance of the sewer lateral	Fecal Coliform	Fecal Coliform TDS
Over-watering of Landscape	Requires overspray and over watering to be eliminated	Nitrates	TDS

"-" indicates no impact, positive or negative, to the Forrester Creek 303(d) pollutants of TDS, fecal Coliform, and pH.

4.2.1 Municipal Site BMP Implementation and Verification

As defined in the JURMP, five of the 31 Municipal-maintained areas are considered high priority due to their location, size, and/or potential to impact water quality. This includes the Civic Center-City Hall Plaza complex, Fire Station No. 9, Parks Storage Garage, Public Works Maintenance Division Office, and the Vehicle Maintenance Facility. These five are inspected annually. Annual inspections of high priority municipal areas are conducted to verify if the minimum required BMPs are implemented. Table 4 lists the minimum required BMPs and Municipal Functions. An "X" under the minimum required BMP indicates the BMP is:

- A minimum Requirement
- Implemented per written or required specification
- Verified during inspection

Table 4: Required & Implemented BMPs for Municipally-Maintained Areas

MUNICIPALLY-MAINTAINED AREAS	Roads, Streets, Parking Facilities	MS4	Corporate Yards	Municipal Buildings, Parks, Recreational Facilities and Landscaping
Non-Storm-Water Discharges - SC10	X	X	X	X
Spill Prev/Contl/ Clean - SC11	X	X	X	X
Vehicle & Equipment Fueling - SC20				
Vehicle & Equipment Cleaning - SC21			X	
Vehicle & Equipment Repair - SC22			X	
Loading /Unloading - SC30			X	X
Liquid Container Storage - SC31				X
Raw Materials Storage – SC32	X		X	
Equip Operations - SC33			X	

MUNICIPALLY-MAINTAINED AREAS	Roads, Streets, Parking Facilities	MS4	Corporate Yards	Municipal Buildings, Parks, Recreational Facilities and Landscaping
Building Repair/ Construction - SC42				X
Parking/Storage Maintenance - SC43			X	X
Drainage System Maintenance - SC44	X	X	X	X
Employee Training - City of El Cajon	X	X	X	X
Storm Drain System Signage - City of El Cajon	X	X	X	X
Public Participation and Education			X	X
Street Sweeping - City of El Cajon	X		X	
Vegetation Controls - City of El Cajon				X
Preservation of Existing Vegetation - City of El Cajon				X

MUNICIPALLY-MAINTAINED AREAS

Safer/Alternative Products - SC35			X	X
Contam/Erod Areas - SC40			X	X
Building/Grounds Maintenance - SC41			X	X

MUNICIPALLY-MAINTAINED AREAS				
Seeding and Planting - City of El Cajon				X
Mulching - City of El Cajon				X
Over-water Activities - City of El Cajon				X

X = Minimum Requirements

4.2.2 Implementation Analysis and Further Assessment

Table 5 summarizes the implemented BMPs for the five high priority Municipal Facilities where formal inspection and BMP usage was verified. It is important to note that no illegal discharges or spills were reported for any of the 31 City-owned or maintained areas.

Table 5 Percent BMP Implemented

BMP	Percent Implemented	Pollutant Prevented
Non-SW Discharge	100	Various: Fecal Coliform
Spill Prevention/Control/Cleanup	100	Various
V&E Cleaning	100	Metals
V&E Repair	100	Oil & Grease
Loading/unloading	100	Various
Liquid Container Storage	100	Oil & Grease
Raw Materials Storage	100	Pesticides
Equipment Operations	100	Oil & Grease
Waste Handling/Disposal	100	Bacteria
Safer/Alternative Products	100	Pesticides
Contaminated/Erodible Areas	100	Sediment
Building/Grounds Maintenance	100	Trash, Debris
Building Repair/Construction	100	Metals
Parking/Storage Maintenance	100	Oil & Grease, Trash, Debris
Drainage System Maintenance	100	Sediment, Trash, Debris
Employee Training	100	All
Public Participation and Education	100	Trash, Debris
Street Sweeping	100	Sediment, Trash, Debris
Sewer System Maintenance	100	Fecal Coliform
Vegetation Controls	100	Sediment
Preservation of Existing Vegetation	100	Sediment
Seeding and Planting	100	Sediment
Mulching	100	Sediment
Over-watering Activities	97	TDS (Nitrate)

(Highlighted – 303(d) listed pollutants)

The City Hall complex has an ever-existing issue with irrigation over spray and broken sprinkler lines due to large public visitor population and the homeless. Problems are fixed immediately, although never eliminated

The above information is used in Section 11 to support an Effectiveness Assessment of the Municipal Component and further define areas where improvements can be made.

4.3 PESTICIDE, HERBICIDE, AND FERTILIZER MANAGEMENT

4.3.1 Pesticide Regulatory Program – Integrated Pest Management

The City has adopted a Pesticide, Herbicide, and Fertilizer Management program as follows:

- Maintain a running inventory of pesticides, herbicides, and fertilizers,
- Implement a schedule for application of pesticides, herbicides, and fertilizers,
- Use an Integrated Pesticide Management (IPM) approach,
- Track use of pesticides, herbicides, and fertilizers,
- Train or license (Qualified Applicator Certificate) City personnel who apply pesticides, and
- Continuously train City personnel on BMPs.

The City maintains 120 acres, including landscaped medians, parkway trees, parks and public grounds and performs scheduled maintenance of all areas on a daily basis. Weed control is conducted along public streets and along storm water channels. Crews use concentrated pesticides and herbicides, both solid and liquid, as follows: Pre-emergent (Pre-E) at 96 pounds, 8 gallons; Post-Emergent at 1.5 lbs., 142 gallons (including Roundup); Contact Chemicals at 8 lbs., 28 gallons; and Pool Chemicals (chlorine and muriatic acid) at 183 lbs., 5,725 gallons.

Figure 6

To maintain the City's Park and Recreation areas, 7,565 lbs. of fertilizer were used on turf and landscape. Fertilizer applications consisted of polymer coasted slow release fertilizer. All fertilizers are applied using professionally trained City personnel utilizing BMPs. Applications are documented with fertilizer use reports.

4.4 MUNICIPAL STAFF TRAINING, SPECIAL EVENTS AND NOTABLE ACTIONS

New hires for City municipal staff receive New Employee Orientation Training that includes a module on storm water quality issues and concerns. In PY2 all Public Works crewmembers attended storm water training sessions conducted during September and October of 2008. Additionally, all members of the El Cajon Police Department, Community Policing staff received storm water training in during April of 2009.

NATIONAL PUBLIC WORKS WEEK

Public Works Week emphasizes the importance of Street Maintenance, Sanitary Sewer and Storm Water system flushing, and other Emergency and Non-Emergency Services provided by Public Works Maintenance and Operations crews. Public Works

Week highlights the equipment used to complete these tasks. In PY2, Public Works was celebrated during the week of May 17, 2009. The public, including students from nearby schools, were invited to view equipment and speak with Public Works crewmembers.

TRASH FENCE

The City of El Cajon is the first major jurisdiction within Forrester Creek watershed. Consequently, pollutants and trash that enter the storm drain system are carried downstream to the City of Santee where the Creek has not been improved. In response to the City of Santee's Forrester Creek Restoration Project, the City of El Cajon completed a bid and initial scouting for the placement of a trash and debris fence. The trash fence must be able to withstand forces from flows reaching 22 feet per second and hold heavier floating debris. Installation was accomplished in the fall of 2005 and the trash fence has been in service since. The picture to the right shows trash and debris captured by the fence during a rainfall event.

Forrester Creek Trash Fence

WEB PAGE

The City of El Cajon added new content to a Storm Water Web Page that is part of the El Cajon, Municipal Web Site. The Hotline for the City and County plus reports, brochures, and guidance documents can be accessed from Portable Document Format files (PDF files) on the web site.

4.5 IMPROVEMENTS AND REGULATORY COMMENTS

The following are the major improvements completed for PY2.

- Installed 42 additional storm drain inlet filters throughout areas in the City where trash and debris has been identified to be a problem. This is in addition to the 51 existing storm drain inlet filters installed in previous years.
- Continued the improvement and functionality of the trash and debris fence for Forrester Creek, located upstream from Gillespie Field.
- Reviewed Storm Water Program for Capital Improvement Projects.
- Continued implementation of GIS to assist with maintenance of storm drain systems and the sanitary sewer system.
- Implemented a program for monthly self-inspection of Municipal Facilities and Operations.
- Continued to conduct maintenance of the existing storm drain inlet filters.
- Continued development of specific environmental indicators for accurate measurement of Urban Runoff Program effectiveness.
- Established defined measurements and actions to address watershed requirements and develop watershed management procedures.

The following regulatory comments were received for the Municipal Component of the JURMP for PY1.

Comment:

2. Provide information for Item J.3.c.IV "Identification of the total number of catch basins and inlets, the number of catch basins and inlets inspected, the number of catch basins and inlets found with accumulated waste exceeding cleaning criteria, and the number of catch basins and inlets cleaned."

Response:

During Permit Year 2007-08 the City of El Cajon identified a total of approximately 1,389 catch basins and inlets. The Public Works Maintenance Division inspected a total of 605 storm drain inlet boxes and catch basins. None of the inspected catch basins or inlets exceeded the cleaning criteria defined by the Municipal Permit as accumulated trash and debris exceeding 33% of the designed hydraulic capacity, hereafter referred as cleaning criteria, but all 605 catch basins and inlets were cleaned.

Comment:

3. Provide information for Item J.3.c.V "Identification of the total distance (miles) of the MS4, the distance of the MS4 inspected, the distance of the MS4 found with accumulated waste exceeding cleaning criteria, and the distance of the MS4 cleaned."

Response:

During Permit Year 2007-08 the City of El Cajon identified approximately a distance of 24.6 miles of Municipal Separate Storm Sewer System (MS4). The City is currently developing a Storm Drain Master Plan and when completed, the total distance of the MS4 is expected to change. The City inspected 20.1 miles of the MS4 and did not find exceedances of the cleaning criteria but 18.8 miles of the inspected distance was cleaned.

In many instances, segments of the MS4 were inspected and maintained more than one time during Permit Year 2007-08. The segments inspected did not exceed the cleaning criteria but were cleaned to prevent exceedances. By taking a cumulative approach for all the repeated segments, the gross distance of the MS4 inspected and maintained increases to 62.4 miles and 61.1 miles respectively.

Comment:

4. Provide information for Item J.3.c.VI "Identification of the total distance (miles) of open channels, the distance of open channels inspected, the distance of open channels found with anthropogenic litter, and the distance of open channels cleaned."

Response:

During Permit Year 2007-08 the City of El Cajon identified approximately a distance of 17.2 miles of open channels. The City inspected approximately a distance of 16.3 miles of open channels and did not find an exceedance of the cleaning criteria but cleaned the entire 16.3 miles of open channels inspected.

In many instances, segments of open channels were inspected and maintained more than one time during Permit Year 2007-08. The segments of open channels inspected did not exceed the cleaning criteria but were cleaned as a preventive measure. By taking a cumulative approach for all the repeated segments, the gross distance increases to 50.5 miles for both inspection and maintenance of open channels.

Comment:

5. Provide information for Item J.3.c.XVII "Identification of the number of sites requiring inspections, the number of sites inspected, and the frequency of the inspections."

Response:

In Permit Year 2007-08 a total of 19 municipal sites/facilities were identified for inspection and all 19 were inspected. With the exception of 4 facilities that required an additional follow up inspection, every site/facility was inspected one time during the Permit Year.

Comment:

6. Provide information for Item J.3.c.XVIII "A description of the general results of the inspections."

Response:

Municipal facility inspections were generally good. The inspections found that the majority of the sites were in full compliance. There were no major violations. However, several sites were noted for trash, vegetation debris, obstructed storm drain inlets, and irrigation over spray. The problems were fixed immediately.

SECTION 5 INDUSTRIAL & COMMERCIAL COMPONENT

5.1 INTRODUCTION

Industrial

The Industrial Component continued on its track of evaluating the implementation of Best Management Practices (BMPs). The component was originally revised at the end of 2004, adjusting the program to a BMP implementation and verification task and continued with the revision of the JURMP in 2008. Industrial inspections are the focus of the City's Industrial Component with the goal to verify the presence, proper implementation, and maintenance of BMPs. During the inspections, the City also checks that facilities have filed a Notice of Intent and has a Storm Water Pollution Prevention Plan pursuant to the General Industrial Permit, if required.

Proper implementation and maintenance of appropriate BMPs at industrial facilities will eliminate or reduce the discharge of pollutants from an Industrial site and prevent pollutants from entering the City's storm drain system. The City redesigned the inspection sheet to emphasize the use of BMPs for specific, potential pollutant producing activities. Industrial activities either have the potential to affect storm water runoff or have no direct or apparent affect. Industrial operations conducted in a manner that prevents the discharge of pollutants or pollutant contact with storm water should not have any impact on water quality. The City's focus is on identifying those industrial activities that have an actual or potential impact on water quality, requiring implementation of appropriate BMPs and periodic inspections of industrial facilities to verify compliance with City, state and federal water quality requirements.

Outdoor industrial activities have the greatest potential to impact receiving waters through outdoor storage, loading/unloading, fueling areas, vehicle/equipment maintenance, solid/hazardous waste storage, and parking lot runoff. A Storm Water Quality Inspection Form for Industrial-Commercial Facilities to document routine, follow-up, and compliance inspections is provided in Appendix A.5.

Commercial

Commercial facilities are those facilities that are designated by the County or by the City as a commercial facility with activities that may potentially affect the quality of receiving waters. In previous years, the City identified commercial facilities within its jurisdictional boundaries, and has categorized different commercial types for education, inspection and follow-up as

After the *Framework for BMP Implementation* was completed in October 2003, the Commercial Component was restructured into a BMP implementation program similar to other Existing Development (Municipal, Industrial, and Residential). Implementation, verified during onsite inspections, determines whether a BMP is either fully implemented or requires Corrective Action. A fully implemented BMP is counted towards preventing, eliminating, or reducing pollution discharged to the maximum extent practicable (MEP).

5.2 STATIONARY IND. & COMMERCIAL SALES/SOURCES/EQUIPMENT

5.2.1 Background

In 2002, the City developed a Jurisdictional Urban Runoff Management Program (JURMP) document as required by the San Diego Regional Water Quality Control Board (RWCQB) Order No. 2001-01. As part of this program, the City was required to conduct industrial and commercial storm water compliance inspections to assess the implementation of the minimum best management practices (BMPs) required in the industrial and commercial section of the JURMP. On January 24, 2007, the updated Municipal Permit, Order No. R9-2007-0001 was adopted. This new Municipal Permit required each Copermittee, including the City, to update its JURMP document, including the industrial and commercial component, to comply with the new requirements.

The requirements of the new Municipal Permit went into effect in March 2008. The new Municipal Permit required that all high Treat to Water Quality (TTWQ) sites be inspected after the year of implementation, the City of El Cajon chose to inspect all facilities in the commercial/industrial inventory designated as high TTWQ, as well as some medium and low TTWQ facilities. This helped the City meet an additional new Municipal Permit requirement that 25 percent of the total number of facilities on the City's inventory be inspected after the first year of program implementation. The City inspected all industrial facilities that are covered or are known to require coverage under the General Industrial Permit (Industrial Permit). Additional details on how the City met the requirements listed above are included in Section 5.2.2 of this report.

City staff prepared a Request for Proposal and contracted a consultant to assist with the required inspections for 2008-2009 reporting period. A total of 674 industrial and commercial facilities were selected to receive site visits, out of the 674 facilities 672 were inspected. Based on the site visits 544 facilities are listed in the updated facility list inventory composed of high, medium and low TTWQ. A detailed list of the facilities selected for inspections can be found in Appendix B.2.b of this report.

5.2.2 Source Characterization

The City's watershed-based inventory of all industrial and commercial facilities was reprioritized during the JURMP update in March 2008 and includes 1074 stationary commercial and industrial sites, of which 149 were recognized as being high TTWQ. Information was obtained from the City's business license listings and the California Department of Water Resources list

of Permittees covered under the General Industrial Permit. In PY 2008-09 the inventory for high TTWQ facilities increased to 233 as a result of business license record reviews and inspection results from PY2007-08. All 233 high TTWQ facilities and 439 medium and low TTWQ commercial and industrial facilities were inspected in PY 2008-09.

5.2.3 Best Management Practice Requirements

Pollution prevention for industrial and commercial facilities eliminates the management of pollution and ultimately leads to a cleaner, healthier watershed. Although Best Management Practices for Commercial Facilities are used as a primary mechanism for reducing commercial discharges of pollutants into regional MS4s, the educational effort to change the way businesses conduct business is the final objective. The City encourages industries to apply pollution prevention tactics, such as the BMPs listed in Table 1, below. Storm Water staff or city representatives disseminate this information during inspections, letters, and enforcement actions. The following pollution prevention methods shall be considered and implemented to the MEP where applicable:

- Reduce quantity of toxic materials used or substitute less-toxic materials
- Use minimal cleaning water to decrease the generation of wastewater
- Display pollution prevention methods prominently to remind or instruct employees and customers
- Implement a spill response plan
- Segregate and recycle wastes
- Provide a schedule of preventive maintenance procedures
- Reduce waste through more efficient production processes
- Recycle wastes as part of the production process (most preferred), off site or on site (least preferred)
- Treat wastes on site to decrease volume and/or toxicity
- Dispose of wastes properly
- Continually train employees as needed

Table 1 – Prevention BMPs

Prevention BMP	Prevention Mechanism	Primary Pollutant Prevented	Prevention of impact to 303(d) pollutant
Spill Prevention, response, control, and cleanup	Prevents spills, controls spills	Oil & Grease pH	pH
Raw Material Storage	Prevents pollutants on outdoor material storage from discharging	Oil & Grease	_
Safer Alternative Products	Encourages use of less toxic materials	Pesticides Fertilizers	TDS
Good housekeeping of	Prevents pollutants from		TDS

Prevention BMP	Prevention Mechanism	Primary Pollutant Prevented	Prevention of impact to 303(d) pollutant
outdoor activity areas	entering the storm drain system.	Oil & Grease	
Employee Training	Prevents discharges, spill response, over-watering	Oil & Grease Pesticides Fertilizers	pH Fecal Coliform TDS
Private Sewer Lateral Maintenance	Preventive maintenance of sewer lateral prevents sewage overflows	Fecal Coliform Enterococcus Nitrates	Fecal Coliform TDS

5.2.4 Program Implementation

5.2.4.1 Priority Industrial-Commercial Sources

Industrial
Each year, industrial sites are re-prioritized to get an accurate picture of the number and types of industrial sites within the City's jurisdiction. Prioritization involves two steps: initially classifying a facility as being a high TTWQ based on site information; and subsequently confirming or reclassifying it based on field observations and additional information. The former step has been accomplished administratively using the data provided in the inventory of industrial sites. The latter step was completed following inspection of each industrial facility.

Additionally, pollutants were listed with the activities associated with industrial outdoor activities to assist in the selection of the most appropriate BMPs. This initial connection of pollutants, BMPs, and activities will be used to correlate water quality with JURMP requirements in the Annual Report. Below, in Table 2, is the City's listing of activities with the potential pollutants.

Table 2 – BMPs to Pollutants for Industrial Facilities

BMP	Application	Primary Pollutant Addressed	303(d) Pollutant Impact
Non-Storm Water Discharges – SC10	Addresses any discharge that is not storm water	Varies depending on discharge	-
Spill Prevention Control and Cleanup – SC11	Addresses spills	Varies depending on spill	-
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22	Controls motor fluids	(Petroleum) Oil & Grease Metals	-
Loading/Unloading –	Controls the loading and	Varies depending on	-

BMP	Application	Primary Pollutant Addressed	303(d) Pollutant Impact
SC30	unloading of materials	the materials Trash	
Liquid Container Storage – SC31	Controls discharges associated with outdoor liquid containers	(Petroleum) Oil & Grease pH	pH
Raw Material Storage – SC32	Controls the outdoor storage of raw materials.	Metals	-
Waste Handling and Disposal – SC34	Controls any discharges from the collection, storage, and disposal of waste materials.	Varies depending on the waste material Trash	-
Safe Alternative Products – SC34	Encourages the use of less toxic materials for cleaning, disinfecting, or other functions	Pesticides Fertilizers	-
Building and Grounds Maintenance	Addresses General Housekeeping and preventative maintenance	Fertilizers Trash/debris Sediment	TDS
Parking Lot and Storage Maintenance – SC43		Trash/debris Sediment	-
Drainage System Maintenance – SC44		Trash/debris Sediment	-
Employee Training		Trash/debris	-
Storm Drain System Signage		Trash/debris Fecal Coliform	Fecal Coliform
Private Sewer Lateral Maintenance		Fecal Coliform Debris	Fecal Coliform TDS
Over-watering of Landscape		Nitrates	TDS

"-" indicates no impact positive or negative to the Forrester Creek 303(d) pollutants of TDS, fecal Coliform, and pH.

Commercial

A majority of the City's commercial sites can be categorized as shown in Table 3. Of specific concern are those businesses located near storm water channels. Activities from the commercial sites with the associated pollutants are shown in the following table.

Table 3 – Commercial BMPs to Specific Business Produced Pollutants

Business Type → **BMP ↓**	**Restaurants**	**Automotive Establishments**	**Retail Gasoline Outlets**	**Mobile Washing Businesses**
Non-Storm Water Discharges – SC10	Organics Trash	Oil & Grease Metals	Oil & Grease Metals	Oil & Grease, Metals
Spill Prevention Control and Cleanup – SC11	Trash Oil & Grease Organics/Bacteria	Trash Oil & Grease Metals	Trash Oil & Grease	TDS Metals
Vehicle or Equipment Cleaning, Fueling, or Repair – SC20; 21;22		Trash Oil & Grease Metals		Oil & Grease Metals TDS
Loading/Unloading – SC30	Organics/Bacteria Oil & Grease	Oil & Grease	Oil & Grease

5.2.4.2 Backgroud BMP Requirements and Implementation

Industrial

Commitment to BMP requirements is listed in the City's JURMP and meets the requirements of the Municipal Permit. Implementation includes selection/application, dissemination of information, and evaluation of implementation at the facility. An "X" indicates the BMP is: Required by the City of El Cajon as a minimum BMP – Level 1 by the Industrial facility – Level 2 (Provided BMP information). These two levels were completed in previous permit years.

The next steps include:

- Implementation as observed during the onsite inspection – Level 3 (Verified in pervious permits years under permit 2001-001.)
- Connection to a specific Primary pollutant and any 303(d) pollutants identified for Forrester Creek to support an Effectiveness Assessment – Level 4 (Verified in pervious permits years under permit 2001-001.)

In past years the City applied "A Framework for the Implementation of Best Management Practice (BMP) Programs at Commercial and Industrial Sites" to implement BMPs at industrial sites. BMP selection and application began at JURMP development with a minimum number of BMPs. These minimum requirements were used to develop the industrial/commercial inspection checklist.

Table 5 – Required Industrial BMPs

Required Industrial BMPs	
Non-SW Discharges - SC10	X
Spill Prevention/Control/Cleanup - SC11	X
V&E Fueling - SC20	X

Private Sewer Lateral Maintenance - City of El Cajon	X
Over-water Landscape - City of El Cajon	X

5.2.4.3 Updated BMP Requirements

Pollution prevention methods are cost-effective BMPs that eliminate or reduce the generation of pollutants at their sources. Industrial and commercial facilities produce a range of pollutants, both indoors and outdoors, that can threaten human and environmental health if washed into the storm drain system by way of urban runoff. Businesses can benefit from pollution prevention methods by reducing labor time associated with excess pollutant waste handling, thereby re-directing labor time more efficiently to production, as well as the accompanying costs of storage, disposal or treatment.

The following pollution prevention methods are considered and implemented to the MEP where applicable:

- Reduce quantity of toxic materials used or substitute less-toxic materials
- Use minimal cleaning water to decrease wastewater generation
- Display pollution prevention methods prominently to remind or instruct
- employees and customers
- Implement a spill response plan
- Segregate and recycle wastes
- Provide a schedule of preventive maintenance procedures
- Reduce waste through more efficient production processes
- Recycle wastes as part of the production process (most preferred), off site or on site (least preferred)
- Treat wastes on site to decrease volume and/or toxicity
- Dispose of wastes properly
- Continually train employees as needed

In addition to the methods listed above, the City of El Cajon also reserves the authority to require a Storm Water Pollution Prevention Plan (SWPPP) for any Industrial or Commercial facility within its jurisdiction that discharges significant pollutants into receiving water bodies.
In addition to the pollution prevention BMPs described above, the City has also established minimum BMPs for all industrial and commercial sites. Businesses are required to use an effective combination of general BMPs and activity-specific BMPs. General BMPs, including structural and non-structural BMPs, are required of all facilities and are included in Appendix A.5 (General BMPs for Industrial/Commercial Facilities). Businesses are required to use an effective combination of general BMPs and activity-specific BMPs. General BMPs and Activity-Specific BMPs are required where applicable and are briefly listed below.

- **General BMPs**
  - Non-Structural BMPs
    Non-Structural BMPs aim to prevent pollutants from coming into contact with storm water or authorized non-storm water discharges. Many of these methods already exist as part of the standard operating procedures for a site:
    - Good housekeeping
    - Preventive maintenance
    - Material handling and storage of materials
    - Employee training
    - Solid waste (non-hazardous) handling and recycling
    - Record keeping
    - Self inspection/quality assurance
    - Spill response
  - Structural BMPs
    Structural BMPs consist of specialized equipment, structural components, or engineered technologies that can be used when non-structural BMPs are ineffective. Structural BMPs are site specific; therefore the facility operator needs to evaluate each proposed use. Proper installation and regular maintenance of structural BMPs are imperative to their effectiveness. Examples are as follows:
    - Overhead coverage of outdoor work areas or chemical storage.
    - Retention ponds, basins, or surface impoundments that confine storm water to the site.
    - Berms and concrete swales or channels that divert run-on and runoff away from pollutant sources.
    - Secondary containment structures.
    - Treatment controls, e.g., infiltration devices and oil/water separators, to reduce pollutants in storm water or authorized non-storm water discharges.

- **Activity-Specific BMPs**
  Appropriate BMPs will depend on the type of activities, pollutants, and potential source of pollutants. The BMP requirements for the following activities and areas are relatively common at industrial and commercial sites and required by the City.

  - Hazardous materials storage (incl. tanks)
  - Solid waste storage
  - Loading/unloading
  - Fueling
  - Wastewater treatment
  - Landscaping/ grounds keeping
  - Vehicle maintenance
  - Parking lots
  - Process water pre-treatment
  - Equipment storage
  - Washing of Equipment/Vehicles
  - Rooftops

5.2.4.4 Additional Controls for Industrial & Commercial Sites/Sources

Forrester Creek, which flows through the City, is 303(d) listed for fecal coliform, low dissolved oxygen, phosphorus, and TDS. The City has not identified any industrial or commercial facilities that are likely to be significant sources of fecal coliform or TDS. As a proactive measure, however, the City has assigned higher priorities to concrete and stone cutting businesses, as they may contribute to elevated TDS levels. Similarly, the City assigned higher priorities to animal-related businesses, which may be sources of fecal coliform if animal waste is not disposed of properly. The City also assigned higher priorities to commercial businesses associated with fertilizer use (i.e. nurseries, greenhouses, etc.) since low dissolved oxygen and elevated phosphorus levels are commonly associated improper fertilizer use and/or storage.
As mentioned previously in this report, the City has chosen to designate major channels within the City as ESAs. Major channels within the City are typically concrete, and hold no significant environmental value, however. The City has chosen to designate these areas as ESAs as a proactive measure to protect downstream water quality. During inspections of businesses that drain to 303(d) listed receiving waters or other ESAs, the City will conduct more detailed investigations into whether the businesses are potential sources of the pollutants of concern or may otherwise negatively impact the ESA. If a business is believed to be a significant source of key pollutants and the standard BMPs listed above are not adequate, the City will require additional BMPs so that discharges of the key pollutants of concern will be reduced to the MEP.

5.2.4.5 Sites Selected for Inspection

To meet the requirements of the Municipal Permit, the City decided to inspect all 223 high TTWQ industrial and commercial facilities. The City also selected 441 additional sites to meet the Municipal Permit requirement that 25% of the City's inventory receive inspections during the second year of program implementation. Those additional sites were mainly chosen from the medium TTWQ, as well as some low TTWQ, inventory and were selected largely based on perceived potential for having relatively significant outdoor exposure. The overall TTWQ prioritization process is based on a number of factors including, but not limited to, history non-compliance with storm water regulations, whether or not the facility has significant outdoor exposure of storage or activities, distance to receiving water body, total area of the site, and whether the business is required to obtain coverage under the Industrial Permit. The TTWQ prioritization process is described in more detail in the City's JURMP document.

Out of the 674 sites selected for inspection, 672 were inspected. A summary of the total percentage of facilities inspected from the total inventory of 1074 facilities is listed in Table 6, below; a more detailed list of the facilities is included in Appendix B.2.b of this report. The sites selected for inspection include at least 25% of the City's industrial and commercial inventory and at 100% of the City's high TTWQ industrial and commercial facilities.

Based on experience, the inspection process for industrial and commercial facilities is often more efficient when appointments are not scheduled. This allows inspectors to inspect neighboring businesses rather than driving longer distances from business to business to meet scheduled appointments; it also eliminates time spent on the phone scheduling. In general, scheduling is conducted for industrial facilities that have or are required to have Industrial Permit coverage so

that the proper facility personnel can be present for the inspection and materials such as SWPPPs and monitoring plans are located and easily accessible for review when the inspector arrives.

Table 6 - Summary of inspected facilities

Facility Category	Inspected Facilities	Percentage of Total Inventory
High TTWQ Industrial	31	3%
High TTWQ Commercial	202	19%
Other sites initially selected for inspection	439	41%
Stationary Inventoried Sites Visited or Accounted For*	**672**	**63%**

* "Accounted For" means that the business was inspected, visited and found to not need an inspection, or found to not need an inspection when called to schedule a site visit.

5.2.4.6 Industrial Inspections and Implementation of BMPs

Industrial businesses were defined by 40 CFR §122.26(b) (14). Attachment 1 of the Industrial Permit lists those facilities whose principal activity is included under the Industrial Permit. All industrial facilities were assigned a high threat to water quality, consistent with the City's JURMP. Sites marked for the City to follow up on the initial inspection, and sites with a high TTWQ, including all industrial sites, require annual inspections. A breakdown of TTWQ ranks for industrial facilities is shown in Table 7. BMP implementation at industrial facilities is summarized in Table 8

- Approximately one half of the industrial facilities required a follow-up inspection to make sure BMPs had been implemented.
- A total of 25 out of 45 industrial facilities had submitted a Notice of Intent (NOI) under the Industrial Permit, had implemented stormwater monitoring programs, and maintained a Stormwater Pollution Prevention Plan (SWPPP).
- One business had a Notice of Termination (NOT).
- Two businesses obtained a Notice of Non-Applicability (NONA) or a No Exposure Certification (NEC).
- No IC/ID was observed.
- Fully implemented stormwater employee training was noted at 39 businesses.
- Out of the 813 applicable BMPs, 785 (96 percent) were fully or partially implemented.
- Only 3 percent of applicable BMPs were not implemented.

Table 7: Industrial Facilities

Threat	Number of Industrial Facilities
High TTWQ	44
Medium TTWQ	1
Low TTWQ	0

Table 8: Industrial Facility BMP Implementation

BMP Group[(a)]	Number of BMPs in Group	Fully Implemented	Partially Implemented	Not Implemented	N/A
D.1 General	5	156	23	2	44
D.2 Landscaping	5	85	7	0	133
D.3 Materials and Wastes	13	285	84	12	204
D.4 Equipment, Vehicles, and Outdoor Activities	5	72	21	11	121
D.5 Other	5	50	2	3	170
TOTAL	**33**	**648**	**137**	**28**	**672**

(a) Individual BMPs in each BMP group are located in Section D of the City of El Cajon Commercial and Industrial Stormwater Compliance Inspection Form, (Please refer to Appendix A.5).

5.2.4.7 Commercial Inspections and Implementation of BMPs

Commercial businesses were defined as those businesses not subject to the Industrial Permit, and that do not perform activities meeting the definition of industrial activity under 40 CFR §122.26(b)(14). Per the Municipal Permit, 25 percent of sites inventoried shall be inspected annually. Commercial businesses requiring annual inspections were those with a high TTWQ and those that warranted a follow-up inspection. A breakdown of TTWQs for commercial facilities is presented in Table 9. BMP implementation at commercial facilities is summarized in Table 10.

- Annual inspections were found to be of need for 16 commercial facilities that did not require follow-up inspections.
- A total of 318 commercial business sites were assigned a medium to low TTWQ and did not require a follow-up inspection.
- A total of 100 businesses were recommended to increase their employee stormwater training, as little to no training was noted during the inspection. Increasing business education and emphasizing the importance of employee training may increase the effectiveness of pollution prevention practices and BMPs.
- No illicit connections were observed. However, five potential illegal discharges were noted.

- Over 50 percent of the eating establishments needed improved grease handling and/or storage.
- Approximately 58 percent of the facilities with significant outdoor activity needed improved cover for outdoor storage, including trash.
- Approximately 21 percent of the businesses needed improved spill prevention and response materials, including spill kits; 56 percent needed secondary containment for liquid storage.
- Out of the 7,751 applicable BMPs, 7,323 (94%) were fully or partially implemented.
- Only 5 percent of applicable BMPs were not implemented.

Table 9: Commercial Facilities

Threat	Number of Commercial Facilities
High TTWQ	50
Medium TTWQ	215
Low TTWQ	234

Table 10: Commercial Facility BMPs Implementation

BMP Group[(a)]	Number of BMPs in Group	Fully Implemented	Partially Implemented	Not Implemented	N/A
D.1 General	5	1,791	112	44	523
D.2 Landscaping	5	845	36	7	1,582
D.3 Materials and Wastes	13	2,728	513	271	2,910
D.4 Equipment, Vehicles, and Outdoor Activities	5	501	65	39	1,865
D.5 Other	5	629	103	67	1,671
TOTAL	**33**	**6,494**	**829**	**428**	**8,551**

(a) Individual BMPs in each BMP group are located in Section D of the City of El Cajon Commercial and Industrial Stormwater Compliance Inspection Form, see Appendix A.5.

5.2.4.8 Compliance and Enforcement

The follow-up priority classification section on the inspection form was designed to classify the level of necessity to perform a follow-up inspection at the facility. “Priority 1” follow-ups are given to facilities for which an active illicit connection or illegal discharge was observed. In these cases City’s storm water personnel immediately instructed discharger to stop the discharge and an administrative citation was issued. “Priority 2” follow-ups typically have serious BMP-related issues. “Priority 3” follow-ups are given to facilities for which relatively minor BMP-related issues were observed.

A total of 19 businesses were found to be "Priority 1". Follow up inspections were scheduled and, whenever possible, investigations were conducted immediately.

As specified in the City Ordinance, the City is able to use various warnings and actions to correct a facility/activity and enforce the JURMP. For PY2, the City further coordinated and partnered with industry to implement and enforce the requirements of the JURMP and City Municipal Code. Enforcement generally is initiated with a verbal warning and followed up by a written warning. Enforcement using Administrative Citations was incorporated in May 2003. Appendix A.5 lists criteria for issuing Citations, document entitled "Storm Water Administrative Citation Program Criteria" and Appendix B.3 shows the list of enforcement actions taken by the City in PY2008-09.

5.2.4.9 Education

During inspections, business representatives were educated regarding storm water issues both through verbal interaction with the inspectors, and the distribution of printed storm water educational materials, when appropriate. In particular, the utilization of verbal interaction is extremely influential because it is individually tailored by the inspector to the specific issues and concerns of the facility and the facility representative. It prompts the facility representative to think about issues directly related to his or her daily actions as it applies to business activities. The inspector was able to provide information specific to the facility, which is beneficial to the facility representative due to the site-specific information. This information can help give the facility representative the proper tools to implement BMPs applicable to their business.

Printed educational materials were also distributed to businesses during inspections unless the facility representative declined to receive them. In addition to the educational materials distributed during inspections, the City drafted a letter notifying each business selected for inspection of the upcoming inspection and instructing them that they were required to implement the corrective actions recommended by the inspector. Educational materials distributed included storm water posters specifically designed for automotive and restaurant activities. Also provided, when necessary, were NONA/NEC paperwork and NOI paperwork. Each have a separate cover sheet with instructions on how to file, and contacts in case any questions arise. Samples of some of the educational materials distributed are included in Appendix A.5. In some cases, educational material was not applicable to the business activity and was therefore not provided.

5.2.5 Stationary Ind. & Commercial Sites/Sources Effectiveness Assessment

5.2.5.1 Common BMP Implementation Deficiencies

Most BMP-related deficiencies observed during the inspection process were minor. Some of the more common issues include uncontained litter, debris, and sediment around the site and in the parking lot and dumpster area. Another common BMP deficiency included open dumpsters, which were often times due to the dumpster lids being pinned against the enclosure by the waste disposal company or dumpsters lacking lids. The most common issues for restaurants were poorly maintained dumpster and grease recycling areas.

5.2.5.2 SIC Code Changes and Updated Inventory

Based on the SIC code corresponding with the current principal activity of the business, some inspections resulted in business category reclassifications. Assessment of whether the SIC code was considered industrial was based on SIC code of the Industrial Permit. Attachment 1 of the Industrial Permit lists SIC codes that require mandatory coverage under the Industrial Permit and SIC codes that require coverage under the Industrial Permit "conditionally", depending on potential outdoor exposure to stormwater. There are 147 businesses that required reclassification of their SIC codes; 10 were reclassified to an alternate business category and are listed below:

<u>Industrial Businesses Reclassified as Commercial</u>

- AA Equipment
- CCS Painting Services, now CCS Cleaning Services
- Dixieline Lumber
- Fatboy Fiberglass and Welding
- Olympic Carpet & Supplies
- San Diego Mobile Truck & Trailer Service
- U.S. Air Conditioning Distributors, Inc.

<u>Commercial Facilities Reclassified as Industrial</u>

- Hi-Tech Welding and Forming, Inc.
- Instrument Overhaul Service of San Diego, Inc.
- ITS Transmission Service, now Russell's Metal

A total of 51 industrial facilities were inspected out of the 674 total businesses listed. One industrial facility was vacant and one was a duplicate facility. Certain facilities categorized as industrial were revised to commercial based on the inspector's determination of the business's principal activity and appropriate SIC code. As a result, 45 industrial businesses were indentified on the City's list.

A total of 623 commercial facilities were initially inventoried to be inspected. A number of facilities were listed two or more times on the original list, often under different names. Many facilities were also vacant. The five businesses that refused inspection by the consultant,

MACTEC Engineering and Consulting, were subsequently inspected by the City. As a result, a total of 494 out of a possible 499 commercial businesses were inspected. Roy Wheeler Auto Repair was not inspected due to a recent stormwater compliance inspection by the City and their determination that the business is not within the City's jurisdiction. One facility (Bruce's Auto Repair, address listed as "Downtown El Cajon") did not exist. Certain facilities categorized as commercial were revised to be industrial based on the inspector's assessment of the business's principal activity and corresponding SIC code. The updated inventory list is located in Appendix A.5.

Table 11: Facility Inventory and Updated Numbers by Facility Category

Facility Category	Original Number of Facilities	Revised Number of Facilities
Industrial	51	45
Commercial	623	499
Total	674	544

5.3 MOBILE SOURCES ELEMENT

5.3.1 Background

Illegal discharges tend to be the major area of concern with mobile businesses. Due to the nature of their activities, mobile businesses are regulated somewhat differently than other businesses. Mobile businesses can be difficult to identify because many do not have City business licenses. Additionally, new mobile businesses are started and previously existing mobile businesses go out of business on a relatively regular basis. For the reasons listed above and also simply because they are not consistently present at a fixed location, regular inspections of mobile businesses are not a feasible option at this time.

5.3.2 Source Characterization

The mobile businesses known to operate within the City's jurisdiction are noted on the City's commercial inventory. The following business types are addressed by the mobile sources element of the City's industrial and commercial program.

- Mobile automobile or other vehicle washing
- Pest control services
- Mobile carpet, drape or furniture cleaning
- Mobile construction trades
  - Painting and coating
  - Cement mixing or cutting
  - Masonry
  - Other contractors
- Landscaping
- Pool and fountain cleaning
- Power washing services

Because not all mobile businesses have obtained business licenses in the City or have a base of operations in the City, the City expects that a continual process of refining and updating its inventory will be needed. Sources for such inventory updates will include reported incidents, general observations by City staff, and available business licenses. The City participated in a regional effort to inventory and/or track mobile businesses. The Industrial/Commercial Regional Workgroup developed a regional database that include mobile businesses across Jurisdictions.

5.3.3 Best Management Practice Requirements

5.3.3.1 Updated BMP Requirements

All BMPs required for stationary sources; listed in Section 5.2.4.1, 5.2.4.2, and 5.2.4.3 of this report; are also required for mobile business where applicable. The most important BMPs for most mobile businesses typically involve non-Storm water discharge control and spill prevention, control, and cleanup.

5.3.3.2 Additional Controls for Mobile Sources

Regardless of where the activity occurs, the City categorically prohibits illegal discharges from mobile businesses. Aside from washing, cleaning, or other activities that may cause illegal discharges, mobile businesses are not likely to conduct activities that produce significant pollutant discharges. If in the future the City finds that even in the absence of illegal discharges the activities of mobile businesses are contributing pollutants of concern to a CWA section 303(d) impaired water body segments or are negatively impacting ESAs, additional controls will be required for those activities. Further, if the City has reason to believe that mobile businesses are generating significant illegal discharges in a given area of the City that is tributary to a 303(d) listed water body (and the discharges contain pollutants causing the impairment) or is within, directly adjacent to, or directly discharges to a water body within an ESA, City staff may more regularly visit those areas and/or take other actions to address the illegal discharges.

5.3.4 Education and Outreach

The City of El Cajon provides information and outreach regarding storm water quality to mobile business owners and operators. A business license is not issued to the mobile businesses listed under Section 5.3.2 until the new business proponent has the opportunity to talk to Storm Water personnel about pollution prevention and BMP implementation. Mobile businesses are also provided with educational materials outlining pollution prevention methods and other BMPs related to their activities prior to issuance of a business license and during inspections. Inspectors also give recommendations to businesses, where appropriate. Because a specific element of the industrial and commercial program is being newly developed it is anticipated that some mobile businesses are not aware of storm water requirements and that education will need to be a significant portion of the program. The educational program is described in more detail in Section 8 of this report.

5.3.4.1 Owner/ Operator Notifications

As indicated in the City of El Cajon updated JURMP, the City continues to work towards notifying the owner/operator of each inventoried mobile business of applicable BMP requirements within the first three years of implementation of the updated JURMP.

5.3.4.2 Inter-Jurisdictional Cooperation

As of the writing of this report, an inter-jurisdictional program for the regulation of mobile businesses was completed during this Permit Year. The City of El Cajon was the Co-Chair in the regional effort to complete tasks under this regional workgroup. The program included the creation of a regional inventory of mobile businesses, standardization of BMP requirements across jurisdictions, and sharing of enforcement action information. Future tasks that remain to be completed are the development and distribution of standardized educational materials.

5.3.4.3 Staff Training

Staff responsible for conducting storm water compliance inspections and enforcement of mobile sources is trained on inspection and enforcement procedures and BMP implementation as they relate to mobile businesses. City staff is also encouraged to be vigilant for illegal discharges from mobile businesses when working in the City and to report businesses that are not in compliance to the storm water hotline.

5.3.4.4 Inspections

Mobile sites/sources are inspected by the City on as needed basis. The most common triggers for these inspections are anticipated to be receipts of incident reports and direct visual observations by City staff. The inspections generally follow the same procedure as stationary facilities, described in Section 7.2.4.4 of the updated JURMP, although the main focus of most mobile business inspections will be on discharge control BMPs.

5.3.4.5 Enforcement

Most violations associated with mobile businesses have been historically attributed to illegal discharges. The City's enforcement approach to such discharges will require the discharge to be stopped and cleanup of discharged materials when applicable and feasible. Education is also provided to operators who are not aware of the City's storm water requirements. Businesses that do not possess the materials necessary to implement the required BMPs are required to demonstrate to the City that they have obtained such materials and can properly use them before the City allows such businesses to resume operations in the City. Mobile businesses that do not have City business licenses are required to obtain licenses. A detailed list of all enforcement actions taken by the City is included at Appendix B.3 of this report.

5.4 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements to PY2 include:

- Make appropriate changes to the Industrial-Commercial Inspection Form.
- Continue to develop additional educational materials for distribution during inspections.

- Review dry weather monitoring and BMP implementation results to prioritize future commercial inspections.
- Continue to improve tracking of a continuously changing business inventory, both for stationary and mobile businesses.

No regulatory comments have been received for the Commercial and Industrial Component of the 2007/2008 Annual Report.

6.7 IMPROVEMENTS AND REGULATORY COMMENTS 11
6.7.1 Improvements 11
6.7.2 Regulatory Comments 11

SECTION 6 RESIDENTIAL COMPONENT

INTRODUCTION

Pollution prevention is the focus of the JURMP Residential Component to prevent pollutants from residential activities from entering the storm drain system. Education is the best approach to implementing this component of the JURMP as the goal is to change behavior and perceptions. The City is successful in implementing the collection of household wastes and promoting used oil recycling. Each pound of household waste and used oil collected equates to one pound less of waste/pollutants that could be disposed improperly and enter the storm drain system.

6.1 PREVENTION OF POLLUTED RUNOFF

Preventing pollution is easier and less costly than treating wastes at the end of the pipe. The following pollution prevention BMP information is sent to residents via brochures in sewer billings and during face-to-face contact when a complaint or referral is investigated.

- Conduct automobile repair and maintenance under cover or with drip pans; recycle oil.
- Divert automobile wash liquids to landscaping.
- Store unused automobiles under cover; use absorbent pads or drip pans for leakage.
- Maintain garden and yard using natural remedies and drought-tolerant plants.
- Use less toxic products for home care/maintenance.
- Dechlorinate swimming pool water before releasing.
- Dispose of pet waste in the trash.
- Don't use the street as your storage area for dirt, mulch, landscaping plants.
- The street is not a disposal area for concrete or paint washout, or hosing off driveway.

Table 1 – Prevention BMPs

Prevention BMP	Prevention Mechanism	Primary Pollutants Prevented	Prevention of 303(d) pollutant
Composting	Reduces the amount of waste in the trash	Organics	
Use of a Professional Car Wash	Eliminates dirty, soapy water from the storm drain	Metals Detergents	**TDS**
Organic gardening	Eliminates fertilizers and pesticides	Nutrients Pesticides	**TDS**
Take a bag when walking the dog.	Eliminates dog waste from the Public Right of Way	Fecal Coliform Enterococcus Nitrates	**Fecal Coliform** **TDS**

6.2 PRIORITY RESIDENTIAL SOURCES

Residential areas discharging directly to a major storm drain channel are the focus for pollution sources. Priority sources are directly related to 303(d) pollutants identified in Forrester Creek and the San Diego River. The following table connects sources with 303(d) pollutants. These same 303(d) pollutants are used in Section 11, Program Effectiveness Assessment to estimate the potential amounts of pollutant eliminated through prevention, intervention, and other BMP implementation.

6.3 BMP REQUIREMENTS

In addition to the pollution prevention BMPs, above, the following are encouraged in residential areas. Home improvement projects can cause side affects, like mud flowing into the street (see picture to the right). However, with an effective combination of BMPs applied to the maximum extent practicable, simple home projects can meet the City's BMP implementation requirements without much effort or expense.

Table 2 connects the use of BMPs with the prevention, reduction, or elimination of pollutants.

Table 2 – BMP to Pollutants for Residential Areas

BMP	Application	Primary Pollutants	303(d) Pollutants
Automobile Repair & Maintenance	Use Drip Pans Recycle Oil	Oil & Grease	
Automobile Washing	Use Commercial Car Wash	Metals Detergents	**TDS**
Automobile Parking	Use Drip Pans	Oil & Grease	
Garden and Yard Care	Compost or recycle waste	Organic Material	**TDS**
Home Care and Maintenance	Use Household Hazardous Waste Programs	Metals Toxic Substances	
Pet Waste Disposal	Take a bag when walking the dog	Fecal Coliform	**Fecal Coliform**
Private Lateral Maintenance*	Clean lateral every few years	Fecal Coliform Enterococcus Pathogens	**Fecal Coliform** **TDS**
RV Parking & Maintenance	Use a legal dump station	Fecal Coliform Enterococcus Pathogens	**Fecal Coliform** **TDS**

Some changes in behavior are noticed, but although the message has been out there for several years, it is still new to many citizens. The Clean Community; Healthy Watershed, and Healthy Garden; Healthy Home (Integrated Pest Management) concepts will be continuing messages for subsequent permit years.

6.4 BMP IMPLEMENTATION

Commitment to BMP requirements is listed in the City's JURMP and meets the requirements of Permit Section 6.3, BMP Implementation. Implementation includes selection/application, dissemination of information, and evaluation of implementation at the facility.

The list of minimum BMPs for residential areas tracks along with pollution prevention concepts. Understanding through education is the basis for changing behavior in the residential community. By changing the way the residential community completes tasks around the home, benefits to water quality will be realized through wet weather monitoring. The common major routes for educating the citizens and disseminating information is through newsletters, sewer billing inserts, and City "drive-abouts" where information is delivered directly to target audiences.

The following BMPs are provided to citizens through one-on-one visits, newsletters, sewer billing inserts and citizen complaints/referrals. Copies of brochures, newsletter articles, and flyers are included in Appendix A.6.

- Automotive Repair
- Car Washing
- How You Can Prevent Pollution from Entering the Storm Drain System
- Mobile Detailer BMPs
- PowerWashing
- Clean up After Your Pets
- Lawn and Garden Care
- Keeping Our Environment Clean!
- Over-Irrigation Can Cause Storm Water Pollution
- Washing Your Car
- What's the Problem with Pet Waste
- Keeping Our Yards and Our Storm Water Clean
- Trash and Street Sweeping Update
- Trash in Our Strom Drains
- Maintaining your Private Sewer Lateral
- Everything that goes into Our Storm Drains…Ends up in the Ocean
- Why It's Important to Keep Trash, Sediment and Debris Out of Storm Drains
- Pool Maintenance BMPs
- Creating Community by Keeping Our Storm Water Clean

Table 5 - Required BMPs for Residential Areas

		Automobile Repair Maintenance	Automobile Washing	Automobile Parking	Garden & Yard Care	Home Care & Maintenance	Pet Waste Disposal	Private Lateral Maintenance	RV Parking & Maintenance
RESIDENTIAL	Vehicles & Equipment	X	X	X					X
	Home and Garden				X	X	X	X	
	Pets						X		
	Private Sewer Lateral					X		X	

Minimum required BMPs for the Residential Component are grouped into four (4) basic categories as shown in Table 5. It is only through consistent, simple messages, will the citizens start to implement the BMP identified for the activities around their homes.

An area where Storm Water staff are collaborating with the police department is RV Parking and Maintenance. Police Department staff assist Storm Water staff in locating areas where dumping is occurring. The resulting outreach effort should help East County residents to reduce the number of illegal dumping events within this region of the watershed.

As illustrated above, over-watering from many different homeowners' landscaping can have an impact on the landscaping and may result in a significant source of water in the street. What seems of little importance from one home combines with runoff from other homes forming small rivers that can move materials stored in the right-of-way or pollutants illegally discharged. Homeowners are encouraged to save water and money by adjusting sprinkler heads to reduce or eliminate overspray. When over-watering is discovered, an attempt is made to contact the responsible party. Door hangers are left with instructions when homeowners are not home. Staff schedule a return date to discuss the measures that can be taken by homeowners. When over-watering discharges decrease, there is a reduction of:

- the amount of water discharged to Forrester Creek
- the amount of pollutants transported to Forrester Creek during "No Rain" days

Improvement in decreasing over-watering will be measured by the amount of Forrester Creek flow leaving the City of El Cajon at the jurisdictional boundary to Santee. Flows measured during the dry weather program are an indication of daily flows. The PY2008-09 dry weather flow into Santee was measured at 108 gallons per minute, as measured at Dry Weather Station No. 5. Overall flows have been on the decrease in all permit years since PY2004-05, inclusive, and may indicate that outreach and education efforts that discourage over-irrigation are becoming effective. Additional flow measurements may be taken during the next annual cycle. The full Forrester Creek Study is contained in Appendix A.12.

6.4.1 Outreach to Residents

The City used various types of educational materials to distribute information and discuss the JURMP requirements with residents when responding to complaints or investigating a discharge. Brochures were provided to residents during face-to-face discussions concerning complaints and referrals. The City newsletter has included five articles concerning routine activities where receiving waters may be impacted by pollutants. The newsletter is freely available for residents

and industrial/commercial business owners on a semi-annual basis. Two such printings were completed in PY2 and covered the following activities for residents:

- Sewer Ordinance Changes
- What You Can Do As A Business Owner To Keep Our Storm Drains Clean
- What You Can Do As A Food Take-Out Customer To Keep Our Storm Drains Clean
- Why Is All That Trash In The El Cajon Drainage Channels?
- Your City Works To Keep Trash Out Of The Storm Drains
- Over-Irrigation Can Cause Storm Water Pollution
- Parking Lot Best Management Practices
- What Is The Storm Water Program?

The City printed and distributed 38,000 copies, each, of the spring and fall newsletters with eight articles in total contained in both newsletters. Another article titled, "Flood Control on Patrol" was included on the front page of the El Cajon Gazette, a local newspaper with significant distribution numbers. As a result, residents are becoming more aware. An indication of this awareness is the increase in the number of complaints and referrals from the private sector. As the public and municipal staff gains more knowledge and awareness of urban runoff, additional increases in complaints and referrals are expected. Education of staff and residents is productive.

6.4.2 Recycling and Waste Collection Services

Keeping household wastes out of the storm drain system requires the implementation of a coordinated pickup program with a licensed facility to handle the wastes according to appropriate State and Local regulations. The City uses Waste Management to schedule routine and requested pickups for household wastes. Figures 1, 2, 3, and 4 show the total amount of household wastes, the type of wastes collected, recycled materials from curbside pickup (commercial and residential) and total amount of waste collected. There was 24 Household Hazardous Waste, Electronic Waste and Universal Waste Collection Event where a total of 3,259 participants dropped off over 246,081 pounds of materials. A total of 344,146 pounds of household hazardous waste was collected (Figure 1). Figure 2 shows the percentages of material types taken to the collection events. Waste Management collected a total of 83,243 tons of waste from residential, commercial and industrial areas (Figure 3). A total of 14,102 tons of materials were recycled from the curbside-recycling program, this program only includes residential areas.

The City of El Cajon works to promote and increase used oil collection through residential collections that include curbside pick-ups or encourages citizens to recycle used oil and filters. The City and Waste Management partnered for a second consecutive year to develop an advertisement that appeared in a local newspaper. A filter exchange program was advertised and offered a free oil filter to every citizen of El Cajon who took a used oil filter for recycling. A grand total of 21,196 gallons of used oil and 1,950 used oil filers were collected from within the City. A total of 105 gallons of used oil and 100 used oil filters were collected from residential areas. While a total of 21,091 gallons of used oil and 1,850 used oil filters were collected from certified collection centers located within the City of El Cajon's jurisdiction.

Figure 1 – Household Hazardous Waste Collection

Figure 2 Percentages of HHW Type

Figure 3

Figure 3 shows the amounts, in tons, of waste collected for Commercial and Residential. Waste collected equates to pollutants not discharged to the storm drain system.

6.4.3 Opportunities for Community Involvement

The El Cajon Community Development Center (ECCDC) prints and circulates a newsletter to the downtown area businesses on a quarterly basis. Additionally, the ECCDC prints a Clean & Safe report that covers actions to keep the downtown area clean and safe. The downtown Clean Team works to keep the community clean and performs daily litter removal, maintenance, and landscaping activities. Saint Madelines School provides the student workers who detail the downtown street and sidewalk areas by collecting cigarette butts, trash, and debris. Spills are reported directly to ECCDC for immediate removal and disposal.

Figure 4

Recycling is a community effort. A total of 18,215 tons of recyclables (includes used oil, newspapers, glass, plastic, tin and aluminum) were collected through residential pickups or deliveries in 2008-09. Figure 4 indicates the amounts, in tons, of materials recycled through residential, commercial, and industrial recycling efforts for 2008-09. Amounts recycled are not placed in landfills or available for discharge to the storm drain system.

6.5 COMPLIANCE AND ENFORCEMENT

The City has a variety of enforcement actions upon discovering a residential action that may potentially affect the quality of receiving waters. Verbal warnings (with written documentation), written warnings, orders to abate and correct, and monetary fines are in the legal authority of the City. There are two routes of discovering illegal residential activities. One is through complaint/referral process. Complaints are received through direct contact with City staff, through the City Manager's office and through the City's Website (via e-mail). The other is during scheduled City monitoring and observations of other routine City department activities.

Depending on whether an actual discharge has occurred or there is a potential to discharge, a written warning or Administrative Citation is issued. Corrective actions are verified and the resident re-contacted for any further questions.

6.5.1 Complaints Received

Complaints are received through the City's or County's Hotline number or funneled through the City Manager's office. Since the inception of the City's Enforcement Program, citizens take opportunities to inform municipal staff of their concerns during other routine activities. Investigations usually occur within 24 hours of complaint receipt with a follow-up phone call informing the complainant of the investigative results. Complaints were tracked using a simple table and software programs. A table in Appendix A.6 lists residential complaints tracked in PY2.

6.5.2 Investigation and Enforcement

Each complaint is investigated by Storm Water staff. Contact with the potential discharger is focused on stopping the polluting activity and educating the citizen about our storm drain system and water quality.

Table 6 – Enforcement Actions

BMP Violated	Written Warnings	Administrative Citations	Actions	Follow-up
Automobile Repair & Maintenance	0	0	No Action	None
Automobile Washing	0	0	No Action	None
Home Care and Maintenance	3	0	Stopped Activity	Completed
Private Lateral Maintenance	0	0	No Action	None
RV Parking and Maintenance	0	0	No Action	None
TOTAL	3	0		

Written warnings followed each verbal warning in the form of a letter requesting corrective action or enforcement by the Administrative Citation Form (See Appendix A.3b for Enforcement Criteria and Forms). Letters are used only when additional information and explanations are needed to get compliance from the potential discharger. A list of the enforcement actions issued to residents is included in Attachment D.

6.6 NOTABLE CITY ACTIONS

Pollution Prevention Days

The City of El Cajon hosted two "Pollution Prevention Days" events on June 4 and June 18, 2008 in downtown El Cajon. The events were scheduled to correspond with the "Cajon Classic Cruise" event, which attracts thousands of attendees each day. Of the thousands of people attending, hundreds of people approached our booth and received educational materials, flyers, and discussed issues related to the automotive-related event (e.g., tire recycling, waste management, fundraising car

The crowds gather at the Pollution Prevention Days Event at the Cajon Classic Cruise.

washes and power washing). See Appendix A.6 for additional photographs of this event.

Condominium Conversions

The next wave of residential communities is the conversion of apartment dwellings into Common Interest Developments or Condominiums. Restarting a small developed community is a perfect opportunity to introduce or reintroduce storm water protection activities at the development level. The following are required of condominium conversion projects

- A Storm Water Site Plan that includes a map of the current storm drain system and a list of the internal and external improvements proposed prior to sale. Control of materials, upgrades to the drainage system and treatment should be discussed.
- A Storm Water Maintenance Plan for Condominiums
- A Private Sewer Lateral Report, and
- Water Quality additions to the Covenants, Conditions, and Restrictions

6.7 IMPROVEMENTS AND REGULATORY COMMENTS

Throughout the year, the City adjusts JURMP Components based on experience and the need to correlate JURMP activities with water quality. As the Storm Water Pollution Prevention Program continues the move into a BMP implementation program and the reduction of pollutants discharged into the storm drain system, existing residential neighborhoods become a pivotal group to assist in making the water quality improvements a reality.

6.7.1 Improvements

Improvements for the Residential Component is more challenging as citizens view the storm water regulations as an infringement on individual rights. Choosing the correct approach and picking an area that is more beneficial to water quality takes thought and planning. Based on previous experience, the proposed actions for PY2 include:

- Continue partnering with the El Cajon Community Development Corporation in reaching out to the community
- Meet with new development Homeowner Associations to distribute storm water information
- Target apartment complexes for controlling trash and maintaining the Private Sewer Lateral.
- Follow up with condominium HOAs and apartment complex management companies to ensure that private satellite sewer systems are being maintained

6.7.2 Regulatory Comments

The following regulatory comment was received for the Residential Component of the JURMP Annual Report for PY1.

Comment:

8. Provide a description of efforts implemented to facilitate proper management and disposal of used oil.

Response:

The following language is included as an addendum to Section 6.4.2 of the JURMP Annual Report for 2007-08.

The City of El Cajon works to promote and increase used oil collection through residential collections that include curbside or door-to-door pick-ups. The City and Waste Management partnered to develop a flyer encouraging recycling of used oil and oil filters, a voucher for a new oil filter was included as part of the flyer. The flyer was mailed to every residence in El Cajon; a copy of the flyer is included as an attachment to this response. An increase of 8% in curbside recycling is attributed to the added publicity. A total of 620 gallons of used oil were collected from residential areas in permit year 2007-08. A copy of the flyer is attached as part of this response letter.

8.3 MEASURING CHANGES IN KNOWLEDGE AND BEHAVIOR 7

8.4 IMPROVEMENTS AND REGULATORY COMMENTS 8
8.4.1 Improvements 8
8.4.2 Regulatory Comments 8

SECTION 8 EDUCATION COMPONENT

8.1 EDUCATION AND OUTREACH

The goal of the education component is an informed and knowledgeable community. It is crucial to the success of a storm water management program for City staff and the community at large to have easy access to reliable and accurate storm water information. Without a shared, common knowledge base of local water quality and urban runoff information, it is difficult to obtain public support for local storm water quality programs. The storm water educational materials need to be detailed and comprehensive enough to support a shift in individual daily actions while allowing community groups to back specific water quality measures. As with all the other components of this storm water pollution prevention program, maintaining and restoring the chemical, physical and biological integrity of state waters is the ultimate outcome.

If reduction is the goal, then prevention is the theme for the Storm Water Pollution Prevention Program. The Education Component continues to emphasize the basics topics, such as:

- The difference between the sanitary sewer and the storm drain system; and
- The street and storm drainage system is not your garbage disposal system; and
- Making small changes individually, adds up to big changes in our rivers and at the beaches.

The other part of a successful storm water program is an involved and committed municipal staff that contacts the public about potentially damaging discharging activities. Storm Water staff diligently works to educate the citizens and businesses within the City jurisdiction on water quality and ways to prevent pollution from entering the storm drain system. The goals of the City's education and outreach program are to raise awareness of urban runoff and change the behavior of citizens and businesses. The progression of topics will lead to Watershed concepts as the basics in storm water are grasped by the general public.

8.1.1 Education and Outreach Events

Educating staff and the public is the best way to effect change in people's behavior. It is clear that there is broad-based public support for a cleaner and healthier environment. When people can connect with and learn more about our storm water program, our program earns the respect our citizens and community leaders for protecting our water quality. An effective "learn and earn" outreach program should be both regional and jurisdictional, since a pooled effort regionally is able to educate on a more impressive scale. Additionally, since we all live in a watershed, storm water pollution and the protection of receiving waters defy jurisdictional boundaries. As the San Diego River Watershed Copermittees move toward a Watershed-based approach to storm water management, education and outreach efforts will follow watershed strategies on a regional basis. As shown above, the City of El Cajon developed a Storm Water "Watershed" Logo to promote pollution prevention and protection of water quality.

8.1.2 Jurisdictional Accomplishments

Outreach accomplishments during P Y2 include the following list of education and outreach efforts.

- "Pollution Prevention Days" – Two Wednesdays in July and September of 2008 (July 9 and September 17, 2008). The events carried the "National Pollution Prevention Week" (P2 Week) theme and the events were scheduled to correspond to peak attendance days for a local automotive-related event called the "Cajon Classic Cruise." Information relating to the event was also posted to the City of El Cajon Website. Both residents and business owners were encouraged to attend
- Continue to work with the El Cajon Community Development Corporation (ECCDC) to close and protect dumpsters, keep trash areas clean, and encourage good housekeeping habits in the downtown area
- Storm Water Education and Outreach Document Portfolios were prepared and issued to selected municipal staff with high probability of contact with citizens on storm water pollution prevention issues. This included staff tasked with commercial and industrial site inspections, construct site inspections, complaint investigations and SUSMP plan review. The use of the storm water information portfolio has allowed the storm water program to connect with citizens, staff and other interested parties in a new and detailed manner
- "Fire Safety Open House" This day-long, Saturday event included booths, educational information and formal and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. It is estimated that approximately 3,000 visitors attended this event.
- SUSMP Training

8.1.3 City Staff Training

Municipal staff at the Public Works Department and the El Cajon Community Development Corporation Ambassador's staff were trained to refresh the basic storm water topics of pollution

prevention and use of BMPs. Planners and engineering staff were trained in topics regarding the updated interim SUSMP requirements. Continual training was also provided on low impact development (LID) topics. Additionally, other municipal staff was given the basics in storm water training including:

- What is a Watershed and what Watershed do we live in.
- Why is keeping our water clean important.
- The different types of pollutants and where these pollutants originate.
- The difference between the storm drain system and the sanitary sewer system.
- What can be done at work and at home to eliminate polluted runoff during rain events and all yearlong.

Municipal crews are given door hangers to use during their daily routine activities in the City. An example of a door hanger is provided in Appendix A.6. The door hanger alerts the resident to the potential discharge that exists on or near their property. Possible solutions and phone numbers for reporting discharges are provided.

8.1.4 Special Community Presentations

POLLUTION PREVENTION DAYS

The City of El Cajon hosted two "Pollution Prevention Days" (P2 Days) events on July 9, 2008 and September 17, 2008. Many thousands of people attended each of the P2 Day events. The two Wednesday events included booths, educational information and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. The El Cajon Community Development Corporation (El Cajon CDC) also participated in our P2 Days event and distributed information on revitalizing and keeping our community clean.

The crowds gather to enjoy the Pollution Prevention Days Event at the Cajon Classic Cruise.

EL CAJON FIRE DEPARTMENT FIRE AND SAFETY OPEN HOUSE

On October 4, 2008, the City participated in the El Cajon Fire Department "Fire and Safety Open House." This day-long, Saturday event included booths, educational information and formal and informal demonstrations and hands-on explanations on various activities that help prevent storm water pollution. It is estimated that approximately 3,000 visitors stopped by, many of them visiting the storm water booth as they passed through.

PRESENTATION TO EIA (**I**NDUSTRIAL **E**NVIRONMENTAL **A**SSOCIATION)

The City of El Cajon participated in the 2009 EIA Luncheon on February 18, 2009, by providing a presentation to the group. The session centered on the topic of water quality as it pertained to industrial facilities. The presentation was designed to inform the EIA about the activities and goals of the Commercial/Industrial Workgroup and its benefit to the Industrial Communty. The main topics of discussion were new municipal permit requirements, inspections, and the implementation of storm water BMPs. Over 60 representatives of major industrial facilities attended the workshop. A copy of the presentation for the EIA Luncheon is attached in Appendix A.8.

PRESENTATIONS TO MIDDLE SCHOOL STUDENTS

The Storm Water program provided residential BMP information and promotional items to junior high school students from Cajon Valley Middle School and Bostonia Middle School. The two events took place on May 19th and 20th and were coordinated through the City's Recreation Department. A total of 53 students attended the presentations.

8.1.5 Regional- and Watershed-Related Outreach

The Residential Sources Workgroup focused its budget of $105,700 towards in-kind contribution to develop a Regional Residential Outreach Program that would address regional issues and would aid in a transition from a jurisdictional- to a watershed-related program approach. All Copermittees contribute funds towards the outreach workgroup to benefit a coordinated regional pollution prevention program. PY2 funds were used to develop and implement a framework for the Regional Residential Outreach Program that would target audiences and provide information on barriers to, and benefits of changes in behaviors. The City of El Cajon served on the committee during development of the RFP, and continued in PY2 as a member of the interagency Committee developing the Regional Residential Outreach Program.

The events coordinated by the Outreach Workgroup and paid for by all Copermittees included a Storm-Water- and Watershed-related booth at the San Diego County Fair that displayed and provided information to those attending the San Diego County Fair.

8.1.6 Educational Materials Jurisdictional Distribution

The City developed brochures on the following subjects for distribution to the public:

- permit and ordinance requirements
- the difference between storm drains and sanitary sewers
- Pollution prevention strategies
- Car Washing. Including strategies for Car Wash Fundraisers
- Pet waste BMPs
- Equipment and vehicle maintenance and repair
- Maintenance of private sewer laterals.

The City printed 38,000 copies of two semiannual newsletters containing 8 articles and reaching potentially 304,000 different readers. A summary of the topics covered in the 8 articles is included in Section 6, Residential Component, of this report. Storm water logos assist the City in getting the attention of citizens and businesses. Logos are a way to make a lasting impression with citizens and businesses. One storm water logo used by the City is shown to the right.

Through the course of PY2, a number of contacts were made to the public using articles, newsletters, sewer bill inserts, brochures, mailers, radio and TV Ad's. Copies of brochures, fliers, and newsletter articles are contained in Appendix A.6. The following table indicates the types and quantity of outreach impressions.

Table 5

Material Type	Number Distributed
Articles/Newsletters	304,000
Brochures	480
Over-the-Counter	350
TOTAL	**304,830**

Commercial

Education of commercial facility owners and their employees occurs through the use of brochures oriented specifically to a type of activity. Written warnings are accompanied with a brochure on the activity as well as distribution of these brochures as outreach opportunities arise during business and construction site inspections, and complaint investigations. Approximately 385 brochures of various types were distributed as summarized below. More one-on-one distributions were completed this year as the City expanded its role in inspections, complaint investigations and the daily routines of residential communities. The following brochure topics were distributed during PY2.

- Vehicle and equipment washing and cleaning (35 copies)
- Vehicle and equipment operation, maintenance, and repairs (35 copies)
- Car Washing Guide (25 copies)
- What's Cookin Guide (125 copies)
- Green Wrench Guide (120 copies)
- Power Washing Guide (40 copies)
- Private Sewer Lateral maintenance (50 copies)
- Construction Best Management Practices (50 copies)

Industrial

Industrial facilities revise and refine their BMP requirements through the annual inspection process. The following are discussed and informational brochures are shared when necessary.

- Prevention of Non-Storm Water discharges
- Good Housekeeping Practices
- Vehicle and Equipment Washing, Repair, and Fueling
- Loading and Unloading of materials
- Solid and Hazardous Waste Management
- Spill Prevention and Response
- Building and grounds maintenance
- Parking Lot maintenance
- Storm drain system maintenance
- Private Sewer Lateral Maintenance

8.2 LEADERSHIP ACTIVITIES AND PARTNERSHIPS

The City's major roles for educ ating the community include:

- Provided direction and information to the local East County Construction Council on matters dealing with proper implementation of construction BMPs and LID.
- Continue in partnerships with the Cities of Santee and La Mesa as well as the County of San Diego in training staff on storm water management to incorporate storm water reviews at the beginning of the Planning level review.

- Maintain a relationship with the El Cajon Community Development Corporation and their Community Ambassadors and Clean Team. The Community Ambassadors are employees that develop connections with businesses and the community that will promote a cleaner and safer city. The Clean Team are students of St. Madelines Sophie school and are happy to assist in various community tasks. The Clean Team picks up cigarette butts along the sidewalk and gutter that the City's street sweeper cannot collect.
- Collaborated with the El Cajon Community Development Corporation to provide basic storm water rules to vendors at the Cajon Classic Cruise events.
- Conducted storm water training to El Cajon Community Development Corporation ambassadors.
- Established a collaborating relationship with "I Love a Clean San Diego" to conduct future storm drain stenciling, as needed
- Worked with the County of San Diego and others to oversee the preparation of a Residential Sources Outreach Program. Implementation of this program was a goal of the 2008/2009 joint Copermittee Outreach Workgroup. Further implementation will continue into the next reporting year.

8.3 MEASURING CHANGES IN KNOWLEDGE AND BEHAVIOR

A basic measurement of increased knowledge is a test of that knowledge. The City's test is an increase in referrals and reports from municipal staff. The number of complaints and referrals from citizens, staff, and county hotline was equivalent to last year. The Regional Outreach Program funded by this year's Copermittee Outreach budget will develop a very detailed baseline of community awareness, and the barriers to and the benefits of changes in behavior.

8.4 IMPROVEMENTS AND REGULATORY COMMENTS

Changes to the City's Storm Water Program are initiated through gathered experience and regulatory comments. Improvements are commitments generated by the City to modify the activities in ways dictated by direct or indirect experience. Regulatory comments are requests or directives to address potential deficiencies in the JURMP.

8.4.1 Improvements

The following are proposed improvements for the next Permit Year (July 1, 2009 through June 30, 2010).

- Continue to coordinate and expand outreach and education efforts to local public schools.
- Coordinate outreach and public participation activities for Public Works Week.
- Expand distribution of outreach materials in sewer bills.

8.4.2 Regulatory Comments

No regulatory comments have been received for the Education Component of the JURMP Annual Report for PY1.

SECTION 9 Public Participation Component

Introduction **1**

9.1 Regional Participation **1**
9.1.1 Regional and Local Storm Water Hotlines 2

9.2 Improvement and Regulatory Comments **3**
9.2.1 Improvements 3
9.2.2 Regulatory Comments 3

SECTION 9 PUBLIC PARTICIPATION

INTRODUCTION

Public participation is an essential element of a successful Urban Runoff Management Program, but is more highly effective as a Watershed Component. Due to the nature of participation by organizations such as "I Love a Clean San Diego", watershed concepts are more easily introduced to participants from the entire watershed and not just a small segment of the population in one particular community. Wherever Copermittees' efforts can be combined to produce better results, it is a win/win situation for jurisdictions, the watershed and the communities they contain.

Educational efforts set the stage for getting the public involved with scheduled Storm Water Pollution Prevention events or interested in following the minimum required BMPs at home or business. Since prevention through familiarity and participation is the best solution to pollution, the public fulfills participation requirements by:

- Participating in storm drain stenciling,
- Reporting of discharge incidents using the City Manager's Office or the City and County hotline,
- Participating in events that collect or recycle hazardous waste and used oil , and
- Participating in local and regional cleanup events

9.1 REGIONAL PARTICIPATION

On a regional basis, the City of El Cajon is the lead for the San Diego River Watershed Planning Group and is a member of the Watershed Lead Committee. A grant funded the San Diego River Watershed Planning Group where the stakeholders meet to discuss potential issues for the Watershed. A database of information is in progress for stakeholders to use during their planning efforts.

The City attends Project Clean Water meetings on the San Diego River Watershed to maintain contact with the stakeholders as well as participate in jurisdictional/local decision-making. The City of El Cajon also chairs the San Diego River Watershed Copermittee meetings, which are also opened to the public. In 2007/2008 the San Diego River Park Foundation and the San Diego River Conservancy had regular representation.

The City of El Cajon gave permission to Grossmont-Cuyaca Community College District students that volunteered to stencil the message "No Dumping . . I Live Downstream" and a depiction of a fish and duck to the curb area adjacent to storm drain inlets within the City. The City provided the stencil for the students to use. Also as in previous years, the City gave permission to the "I Love A Clean San Diego" staff and volunteers to provide stenciling to curb areas directly adjacent to storm drain inlets at the City. Copies of the letters of permission are included in Appendix A.9.

9.1.1 Regional and Local Storm Water Hotlines

The wastewater and sewage that drain from inside your house is treated and cleaned before it enters the ocean, but the storm drains in the street flow directly to the ocean, rivers, and lakes without any treatment. It is therefore very important that no one be allowed to dump waste of any kind onto street surfaces, drainage pipes and ditches, or into storm drains - they are only for rainwater.

The City and County have a Hotline used by the public to report potential illicit discharges and connections. The Hotline phone number is provided in informational brochures to residents and businesses and is posted on the City Website. Public participation is an essential part of an illicit discharge elimination program. Many illicit discharges are one-time occurrences that may not be observed by City staff. Concerned citizens can help stop illicit discharges by reporting them to the City. The following provides the details of those Hotlines.

- ✓ **City of El Cajon Storm Water Hotline, (619) 441-1653**

The City Storm Water Hotline provides access Monday through Friday 8 a.m. – 5 p.m. and complainants are directed to the appropriate staff person. The City's hotline currently provides information in English and Spanish.

The City continued updating its Storm Water Web Page to contain the most recent brochures and reports. Documents are retrieved and opened using Abode Acrobat to open the posted PDF files. The Storm Water Web Page is "Quick Linked" from the City of El Cajon Home Page with links to a list of documents and other important websites.

- ✓ **County Storm Water Hotline, 1-888-846-0800**

The County storm water hotline is answered Monday through Friday, 8:00 a.m. – 5:00 p.m. and provides services in both English and Spanish and a voice mail message for 24-hour public access. Relevant complaints received through the County hotline are forwarded to the City Storm Water Protection Program.

9.2 IMPROVEMENT AND REGULATORY COMMENTS

Changes and improvements to the City's Storm Water Participation Program are initiated through gathered experience and regulatory comments. Improvements are commitments generated by the City to modify the participatory activities in ways dictated by direct or indirect experience. As the focus of the program shifts to multi-jurisdictional participation on a watershed level, changes and improvements to the storm water program will be necessary. Regulatory comments are requests or directives to address potential deficiencies in the JURMP.

9.2.1 Improvements

The following are proposed improvements for the next Permit Year.

- Participate in additional Watershed-wide efforts.
- Focus the City's efforts on programs and activities that will have an impact on the watershed, its health, the 303(d) pollutants and their sources
- Participate in an expanded El Cajon Fire Department Open House by including a Storm Water Program informational booth and additional displays to inform and engage children on water quality issues.
- Coordinate the City's efforts with the other San Diego River Copermittees (City of La Mesa, City of San Diego, City of Santee and County of San Diego).

9.2.2 Regulatory Comments

No regulatory comments have been received for the Public Participation Component of the JURMP Annual Report for PY1.

SECTION 10 FISCAL ANALYSIS

INTRODUCTION 1

10.1 PROJECTED FISCAL YEAR 2008-09 EXPENDITURES 1

10.2 FUNDING SOURCES AND RESTRICTIONS 3

10.3 LONG-TERM FUNDING ISSUES AND STRATEGIES 3

10.4 IMPROVEMENTS AND REGULATORY COMMENTS 4

SECTION 10 FISCAL ANALYSIS

INTRODUCTION

A fiscal analysis of the JURMP provides a vital assessment of resources for the current and upcoming Permit Years. The analysis identifies adequate support and how resources are divided to support and fortify the JURMP and WURMP efforts. Fiscal years (FY) correlate with the same timeframe as permit years (PY). Beginning with PY 2003-04, the City Storm Water staff developed a separate budget from other Public Works activities and sufficient to run the Storm Water Program. The Program continues to be adequately funded through the City's Sewer Fund. This funding source has been used since PY 2004-05 and will continue to be used for PY 2009-10.

10.1 PROJECTED FISCAL YEAR 2009-10 EXPENDITURES

The following table shows actual expenditures from permit year 2002-03 through 2008-09 and the proposed 2009-10 budgets for the City's Urban Runoff Management Program.

Item	02-03	03-04	04-05	05-06	06-07	07-08	Estimated Actual 08-09	Proposed 09-10
Salaries (including benefits)	331.243	451,246	561,473	533,487	550,856	722,809	711,098	746,218
Materials, Services and Supplies	276,357	111,598	222,836	183,639	254,876	397,292	623,821	734,272
Capital Outlay	26,799	7,040	0	6,235	29,953	73,593		
TOTAL	**634,399**	**569,884**	**784,309**	**723,361**	**835,685**	**1,193,644**	**1,334,919**	**1,480,490**

Due to decreases in overall funding from the State of California, City department reduced budgets by 25% in PY 2002-03. Budgets increased steadily from 2003-04 through 2006-07 under Municipal Permit Order 2001-001. The increase in PY 2007-08 was a result of allocating resources in anticipation of fulfilling requirements for Municipal Permit R9-2007-001 (new permit). The budget to maintain the Storm Water Program in compliance with the New Permit continued to increase in PY 2008-09 and the proposed budget for 2009-10 is higher than in previous permit years. A copy of the budget is located in Appendix A.10.

The City's NPDES Urban Runoff Management Program funding was sufficient to meet the JURMP requirements in PY 2008-09 and will be sufficient to meet requirements in PY 2009-10. The City met its projected goal of continuously executing plans, procedures, and processes to implement JURMP requirements and assess the effectiveness of programs that were implemented.

PY 2002-03 was the first full year of implementation under Municipal Permit 2001-001 and the different components of the program written in the JURMP were tested in the field. Expenditures in PY 2002-03 were higher than in PY 2003-04 due to initial tasks that needed to be completed to help "jump start" the Storm Water Program. These initial expenditures were completed in PY 2002-03 and were not budgeted for PY 2003-04. Modifications to the program were made that resulted in an increase in expenditures in PY 2004-05 and a slight decrease in PY 2005-06. The budget for PY 2004-05 contained some capital expenditures that were started in PY 2002-03 and PY 2003-04 such as a Geographical Information System dataset for map generation and a trash debris fence to collect trash and debris in Forrester Creek before discharging to Santee. From PY 2005-06 through PY 2008-09 there has been a steady increase in the budget to support the Storm Water Program. Overall a general increasing trend of funds have been allocated from PY 2002-03 through PY 2008-09 to sustain a viable storm water program.

Listed in the following table are Additional Services and Projects supporting JURMP Permit requirements from PY 2002-03 through PY 2008-09. The substantial rises of PY 2006-07 through PY 2008-09 budgets are mostly attributed to increases in CIP projects related to storm drain pipe replacement, open channel repair, installation of water quality improvements, development of wastewater and storm drain master plans.

Service/Project	2002-03	2003-04	2004-05	2005-06	2006-07	2007-08	2008-09
Street Sweeping	313,000	319,000	368,930	420,739	450,385	472,092	474,801
Capital Improvements (Total) - Installation of Storm Drain Inlet Filters - Replace Drainage Pipe - Replace Sewer Pipe - Major Drainage Channel Repair - Road/Drainage Improvements - Drainage and Wastewater Master Plans	1,300,000	1,700,000	1,136,770	1,076,122	1,573,732	3,425,000	4,044,000
TOTAL	**$1,613,000**	**$2,019,000**	**$1,518,770**	**$1,496,861**	**$2,024,117**	**$3,897,092**	**$4,518,801**

10.2 Funding Sources and Restrictions

The budget for PY 2008-09 included a Storm Water Program Manager, 1 part-time senior engineering technician, 1 junior engineer, 1 GIS technician, 1 compliance officer, and 1 part-time Engineering Intern. The personnel for PY2009-10 will remain unchanged with the same number and job classification as in the reporting year of this annual report. The City also has an open contract with two consultants to provide as-needed services to ensure the City meets its JURMP implementation requirements.

10.3 Long-Term Funding Issues and Strategies

Each year the City evaluates and prioritizes the areas in the City where improvements are needed. Many improvements assist the JURMP in protecting receiving water quality. This past year, multiple CIPs improved storm water quality by preventing pollutants from entering the storm drain system. Amongst these projects are the following:

- Sewer main replacements and enlargements at various locations.
- Storm drain system repair at the animal shelter.
- Drainage Master Plan.
- Corrugated metal pipe repair and replacement in various locations.
- Storm drain repair and replacement in various locations.
- Street sweeper cleanout station.
- Water quality improvements.
- Sewer inflow and infiltration study.

The following are proposed improvements budgeted for the next Permit Year (July 1, 2009 through June 30, 2010). The following table lists major line items for the PY 2009-10 budget.

Item	Proposed Budget 2009/2010
City of El Cajon Urban Runoff Management Program	1,480,490
Street Sweeping	497,836
Capital Improvements	4,855,418
TOTAL	**$6,833,744**

In the long-term, funding for the Storm Water Program will continue to be even a bigger question with necessary increases required to maintain permit compliance. The City is constantly challenged with doing more with less after a continual decline in general fund budgets. For PY2008-09, the City completed all inspections with existing staff heavily complemented by a consultant to assist in meeting requirements under permit R9-2007-0001.

10.4 IMPROVEMENTS AND REGULATORY COMMENTS

Working efficiently is the goal of the jurisdictional urban runoff management program. Completing onsite inspections, tracking enforcement actions, and complaint/referral information allows the City to reduce the amount of time and paper to complete significant portions of the Municipal, Industrial, Commercial, Construction, and Land Use Planning JURMP Components.

For WURMP activities, the City will be coordinating with the other San Diego River Watershed Copermittees to complete watershed water quality activities and education activities. Working together eliminates duplicative efforts and enhances the effect across a wider range of people and geographical area. The City manages a contract with a consultant to assist with Watershed activities.

No regulatory comments were received during PY2007-08 for the City's Fiscal Analysis.

SECTION 11 PROGRAM ASSESSMENT

11.5 PROGRAM ASSESSMENT SUMMARY 17

11.6 IMPROVEMENTS AND REGULATORY COMMENTS 18

SECTION 11 PROGRAM ASSESSMENT

11.1 INTRODUCTION

The City began using the standardized program effectiveness assessment soon after it was developed by the Copermittees during the previous permit cycle. The City also participated in regional efforts to develop a standardized assessment approach and associated metrics from summer 2007 through winter 2008. The original goal of that group was to produce assessment work products that all Copermittees could use in their JURMPs. Due to a variety of complications on a regional level, that process could not be completed prior to the submittal of the City's JURMP, so the City prepared its own effectiveness assessment approach and measures.

Since the submittal of the JURMP in March 2008, no significant progress has been made on regionally standardized approaches to program effectiveness assessment. It is likely that the Copermittees' Fiscal, Reporting, and Assessment Workgroup will revisit the issue of standardized assessment metrics and procedures in the near future. The City anticipates participating in the process of developing such regional standards and incorporating work products produced into its own local program effectiveness assessment system.
Implementation of the City's JURMP is intended to reduce discharges of urban runoff related pollution to the MEP. The City regularly evaluates its program to make it as effective as possible. The overall structure of the City's storm water program is composed of three primary components:

- Program Planning
- Program Implementation
- Effectiveness Assessment

The process typically proceeds from planning to implementation to assessment, although in practice all three may be in progress at the same time. The initial step is program planning, which requires identifying potential pollutant sources, establishing BMP requirements, and establishing targeted outcomes and ways to measure those outcomes. Program implementation is assessed each year using the methods developed in the program planning stage and reported in JURMP annual reports. The conclusions from these assessments are used during the next round of program planning to incorporate improvements to the program and refine the assessment technique.

The City has identified a variety of metrics to assess progress toward targeted outcomes. At the end of each reporting year, the City uses selected metrics to assess the effectiveness of its program implementation. Example metrics were provided in Section 13 of the City's 2008 JURMP. The effectiveness assessment approach developed by the Copermittees during the last permit cycle includes six different levels of targeted outcomes. Each successive level represents a step up from more easily measured, activity-based outcomes to more difficult to measure, quality-based outcomes. The levels are listed below.

Level 1: Compliance with Activity-Based Permit Requirements
Level 2: Changes in Knowledge/Awareness
Level 3: Behavioral Change/BMP Implementation
Level 4: Load Reductions
Level 5: Changes in Discharge Quality
Level 6: Changes in Receiving Water Quality

11.2 EFFECTIVENESS ASSESSMENT RESULTS

The new Municipal Permit requires the City to assess the effectiveness of each significant activity for each program component, for each program component as a whole, and for the storm water program as a whole. Level 1 through Level 4 outcomes are discussed in the text below. At this time the City is not able to assess Level 5 or Level 6 outcomes for individual program activities or individual programs. As has been noted in the recently released CASQA effectiveness assessment guidance, methods for integrated assessment—assessment that combines both monitoring data and programmatic data—are still under development at regional and statewide levels (CASQA, 2007).

11.2.1 Level 1

Level 1 is documenting activities. Sections 1 through 10 of this PY2 Annual Report list activities, storm water controls, and when possible the quantity of pollutants collected and diverted from entering the storm drain system, viewed as a reduction in pollution-containing materials potentially available for discharge into the storm drain system. Existing and New Development, Construction, and Illicit Discharge Illegal Connection are the areas where quantifiable amounts of pollutants are reported as collected and removed from entering the storm drain system. By completing collection activities, the City maintains compliance with the Municipal Permit requirements.

11.2.2 Level 2 and 3

Refer to tables 11-3 through 11-8 at the end of this section for discussions of Level 2 and Level 3 outcomes for significant activities within each program component. Note that only a Level 1 assessment applies to fiscal analysis, so no table for fiscal analysis is included.

11.2.3 Level 4

The primary goal of BMP implementation is to reduce the loading of pollutants to urban and storm water discharges. Pollutant load estimation is the first direct characterization of water quality through JURMP activities. Regionally, San Diego River Watershed receiving water quality results are from the major outfall to the Pacific Ocean. In the future, Watershed monitoring at the jurisdictional lines will at least assign responsibility of pollutant loads, but will not determine a reduction in pollutants. The best approach is to make sure wet weather and dry weather results do not exceed action levels.

The tables at the end of this section provide information for Level 4 assessments where feasible. Assessment of Level 4 outcomes is feasible for some programs that directly measure the amounts of pollutant removal, such as MS4 cleaning. For most other programs reliable load estimation methods have not yet been developed.

11.3 ASSESSMENT OF PROGRAM MEASURES

Basic assessment of program measures begins with City-based questions. First, starting with what is known, then shifting to what is wished to be learned, and finally what was learned. During the first step, the "what is known" are the measurements compiled from each of the JURMP components. Measurements such as the amount of material removed during street sweeping or cleaning of catch basins are direct measurements of pollution diverted from entering waterways. At some point it may become appropriate to compare measurements to previous years, average measurements, or assess trends to assist with potential pollutant loads removed from a particular origin. Dry weather monitoring results are direct measurements of pollutants in urban runoff, but only partially address measurements of receiving water quality.

Sources, selected BMPs, measurements, and other indicators, identified in the previous Sections of this Annual Report for each of the Existing and New Development Components, report completed activities and achieved goals as required by Order No. R9-2007-0001 and the City's updated JURMP. In summary, the City completed program implementation as designed in the JURMP and is incompliance with the activity-based permit requirements.

11.3.1 Direct Measures of Program Activities

For many years, the City tracked efforts from various collection agencies with four types of direct measures, as follows:

- Street Sweeping,
- MS4 Cleaning/Maintenance,
- Oil Recycling, and
- Household Hazardous Waste Collection

In general, the City tracks these measures because they provide an important indication of the types and amounts of materials and wastes that are diverted from the MS4 through various means. Street Sweeping and MS4 Cleaning directly removes materials from the pathway of rainwater and urban runoff. Oil Recycling re-routes used oil from illegal disposal to refineries where it is ultimately reused. The Household Hazardous Waste program collects wastes that may otherwise be improperly disposed, potentially to the MS4.

a. Street Sweeping

The Department of Public Works collected an estimated 3,188 cubic yards of debris during its street sweeping activities (19,072 miles of curbed streets). This year, the City's street sweeping efforts have been consistent with previous years. Were it not for these efforts, the debris collected would otherwise be swept away during rain events. Collection provides important long-term water quality benefits.

b. MS4 Cleaning

In PY2008-09, all of the City's storm drains were cleaned by the Department of Public Works resulting in the removal and proper disposal of 1,720 cubic yards of material from the storm drain system. As a whole, the City's effort remained the same as last year.

c. Recycling of Household/Commercial Waste and Oil Recycling

Recycling in El Cajon has good participation, but could always do better when the numbers are compared for recycled materials (18,215 tons) and waste (83,243 tons). Trends in waste collection will continue to be tracked .

Oil recycling is tracked by independent recyclers that are certified collection centers (e.g. Jiffy Lube) and Waste Management for curbside pickup of used oil. A grand total of 21,196 gallons of used oil and 1,950 used oil filers were collected from within the City. A total of 105 gallons of used oil and 100 used oil filters were collected from residential areas. While a total of 21,091 gallons of used oil and 1,850 used oil filters were collected from certified collection centers located within the City of El Cajon's jurisdiction. Waste Management also recycled 18,123 tons of other recyclables (including newspapers, glass, plastic, tin, and aluminum).

d. Household Hazardous Waste Collection

Waste Management of El Cajon collects the Household hazard waste for the City's jurisdiction. In PY2008-09 an estimated 344,146 pounds of waste household waste were collected; as opposed to 268,323 pounds collected in PY2007-08; 236,890 pounds collected in PY2006-07; 198, 015 pounds in PY2005-06; and an estimated 277,000 pounds of household hazardous waste/recyclables were collected at 19 events in PY2004-05. As a whole, the City's effectiveness in collecting HHW from its residents has increased consistently and significantly over the years.

11.3.2 Indirect Measures

In most instances, changes to receiving water quality cannot be directly compared to collection activities. However, many indirect measures have value in tracking the effectiveness of specific program activities, and may have additional utility in assessing long-term water quality changes. Many of these measures are reported and discussed throughout this Annual Report. To track and evaluate the effectiveness of its program implementation over time, the City has compiled summary statistics for several of measures.

Table 11.1

Indirect Measure		2008-2009
Complaints	Total Number received	146
	Number of Referrals from Other Departments	77
	Number of Enforcement Actions	23
Staff Training	City Staff Trained	23
Outreach	Outreach events conducted	3
	Number of Presentations	3
	Audience @ presentations	120

a. Complaints and Referrals

In this reporting period, the City received a slightly lower number of complaints than last year from other City departments, citizen calls, and county referrals. The City and County hotlines are described in Section 6 (Residential Component). As previously discussed, this trend underscores the effectiveness of the City's outreach and staff training efforts. As in previous years, it is believed that more of the City's citizens and staff are aware of storm water violations and understood what to do when water quality concerns were observed.

b. Staff Training

Levels of staff training during this reporting period were expanded to those of previous years. Although the City has made an important commitment to staff training under the previous and current Permit (see JURMP Section 8, Education), the consistency of these numbers also demonstrates the City's past commitment to training its staff. Training of staff with implementation responsibilities is not a new part of the City's storm water programs. However, the scope and breadth of these and other programs has significantly increased.

c. Outreach

This year, the City conducted a number of one-on-one discussions at the Public Works front counter with building and planning applicants and with commercial businesses and industrial facilities during inspections and complaint follow-ups. Together, these increased face-to-face conversations demonstrate that the City is effectively implementing its outreach and education programs; details are provided in Section 8 (Education). The City also conducted training sessions targeting industrial facilities and private interest groups.

11.3.3 Program Activities and Water Quality

Presenting a direct connection between pollutant load reduction and Storm Water Pollution Prevention Program activities continues to move forward, but is very slow moving and is very much under development. Copermittees have created a Framework document containing the six (6) Levels of Assessment. The PY2002-03 Annual Report addressed Levels 1 through 4. However, forecasting only generates numbers that could not be supported by calculation or program actions. For PY2008-09, the City continued with the slightly modified approach used for PY2007-08 which brings the assessment much closer to connecting activities with water quality. Amounts of pollutant-containing materials prevented from entering the storm drain system provides solid numbers while adding percentages of facilities known (through inspection) to be implementing minimum required BMPs and reduces the estimation factor.

11.4 LONG-TERM ASSESSMENT

The Annual Assessment indicates the City is meeting the requirements specified in their JURMP and collecting data associated with those program activities. At some point, a connection between activity completed and pollutant load in receiving waters will become a reality.

A Long-Term Assessment must answer key questions to guide future activities and build into the current program, the additional reporting requirements in order to connect program activities with actual improvement in receiving water quality. The Long-Term Assessment is conducted once every five years (permit renewal cycle) as changes to permits may change approaches and programs.

Table 11.2

Program Activity	Annual Questions	Permit Questions (Every 5th year)
Water Quality Assessment	What are the high priority quality problems and where do they occur? What constituent(s) is(are) causing the problems?	What are the changes to discharge and receiving water quality in my Watershed?
Program Planning	What are the priority sources of pollutants?	Are the current programs providing the information

Program Activity	Annual Questions	Permit Questions (Every 5th year)
	What BMPs are needed to control these pollutants? What are the targeted outcomes for the BMP Implementation? What are the projected Load Reductions from these implemented BMPs?	necessary to produce targeted outcomes?
Program Assessment	Were targeted outcomes achieved? What BMPs should be changed or should other BMPs added? Are costs associated with implementation feasible?	Is the cost worth the water quality changes?
Integrated Assessment	How well are the parts of the program working together? What other links can be made?	What other relationships between activities and water quality are evident?

Answers to the above questions come from further analysis of each existing component area. Tables of estimated pollutant loads removed are provided below. Areas where pollutant removal rates are high will be the areas to focus program efforts. Modifications to JURMP activities will be the result of this assessment.

Level 4 Pollutant Load Reductions are provided in the following tables for existing development. Estimates of average load reduction per event was the most difficult to find support evidence. Using the best knowledge available, the magnitude of total pollutants reduced is the most powerful in assessing the degree of success for the City's storm water program.

LEVEL 4 Assessment

Each of the following tables provides an estimate (supported with empirical data) for the amount of pollutant-containing materials prevented from entering the MS4 due to the activities of the Storm Water Pollution Prevention Program implemented in the City of El Cajon. As there is only one receiving water body in El Cajon, Forester Creek impairments were used as the constituents of concern when estimating possible amounts of pollutant-containing material prevented or a reduction in the amount of pollutant that could have discharged into Forrester Creek. Only Existing Components were assessed through Level 4 as the most qualitative and quantitative information is available in these areas. The following paragraphs discuss assumptions incorporated into calculating the amounts provided as "Total" for each Existing Component.

Trash was added to the assessment due to the Forester Creek Improvement Project in Santee. The City of El Cajon installed a trash and debris fence in PY 2005-06 to capture trash from creek flows.

General Assumptions

There are a number of general assumptions within each table. Of most importance is the understanding that the amount (estimated or actual) removed or eliminated from discharging into the storm drain system is the amount of the material or liquid and does not equate to actual pollutant loads reduced. Secondly, the margin of error in these values is very high as most numbers were calculated using available information. Data quality is not necessarily a concern. This is an effort in determining where best to place education efforts and focus each program component.

Municipal

At 18 municipal maintained areas (parks, City Hall, recreation centers), staff cleaned area of pet waste, three times per year. Collection at each area was approximately one pound of pet waste. Pet waste does not equate to one pound of bacteria.

The City maintained 100% of laterals at approximately 24 buildings. No sewer overflows were experienced at City facilities. Pounds were estimated using 10 pounds (no factual basis other than one gallon of water equals 8 pounds) equaling one gallon of sewage. Private laterals not cleaned annually may experience stoppage depending on usage and care. Approximate gallons potentially dischargeable is 2 gallons times 10 equals 20 pounds time 24 buildings equals 480 pounds. The potential for error with this calculation is high.

Total dissolved solids from Municipal areas originate mainly from fertilizers applied by staff. There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation efforts that reduces overspray. All these activities reduce the amount of TDS available for discharge to the storm drain system.

Municipal activities do not use materials or generate waste that would increase pH and as such is listed as “not applicable”.

Trash reduction at City facilities is a consistent effort with approximately 80 to 90% of the 400 City employees ensuring trash is placed in appropriate containers. One pound of trash per year per person is estimated. This amount may be estimated too high.

One park within the City, Wells Park, has an area designated as a “Dog Park” where citizens can take their dogs to walk and bags to collect pet waste are provided for cleaning after their dogs. The Parks Department collected approximately 40 tons of pet waste during PY2008-09.

The total calculated amounts of pollution prevented from entering the storm drain system are possibly estimated high and do not fully equate to improved water quality.

Industrial

There were 45 industrial facilities that were inspected that are conducting industrial activities within the City of El Cajon. It is estimated that 100% of these facilities are maintaining their private laterals and do not spill portable container fluids. This information was noted during industrial inspections. If each facility is preventing one overflow of 5 gallons times 10 pounds,

then 50 pounds times 45 facilities equals 2,250 pounds of bacteria- containing materials did not discharge to the storm drain system.

Total dissolved solids from Industrial areas originate mainly from fertilizers applied by contracted staff to landscaped areas (usually a very small area compared to the total industrial site). There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation effort that reduces overspray. All activities reduce the amount of TDS available for discharge to the storm drain system.

Based on inspections and enforcement of the industrial community, pH-affecting substances are reduced from entering the storm drain system through the implementation of BMPs as required by the General Industrial Permit. Amounts estimated have no factual basis.

Trash reduction at Industrial facilities is based on industrial inspections, although no factual amounts are readily available.

Total amounts do not equate to reduction in receiving water body loads, as no empirical data is available. However, amounts reduced appear reasonable, based on observations during inspections and the two enforcement actions taken at industrial facilities during this Permit Year.

Commercial

There were at least 178 commercial facilities conducting activities with the high potential to discharge bacteria-containing liquids, mainly eating and drinking establishments. Of those facilities, it is estimated that 50% of these facilities are maintaining their private laterals and do not spill portable container fluids. This information was noted during commercial inspections. If each facility is preventing one overflow of 2 gallons times 10 pounds, then 20 pounds times 89 facilities equals 1,780 pounds of bacteria- containing materials that did not discharge to the storm drain system. This may be estimated high.

Total dissolved solids from 499 commercial facilities originate mainly from fertilizers applied by contracted staff or lease company personnel to landscaped areas (usually a very small area compared to the total area of the commercial site). There is an overall reduction in use of fertilizers, use of less hazardous applications and water conservation efforts that reduce irrigation overspray. All these activities also reduce the amount of TDS available for discharge to the storm drain system. Commercial activities observed during inspections do not use materials or generate waste that would increase pH and as such is listed as “not applicable”.

Trash reduction at Commercial facilities is based on inspections, although no factual amounts are readily available.

Total amounts do not equate to reduction in receiving water body loads, as no empirical data is available. However, amounts reduced appear reasonable, based on observations during inspections.

Residential

Bacteria source reductions for dog owners, homeowners, and Recreational Vehicles (RVs) is purely speculation, although the numbers of potential targets is accurate, based on circulated printed educational materials. Enforcement actions, however, indicate few reported sewage overflows from residential areas. Amounts calculated are estimated too high and should be adjusted with more factual information in future Permit Years.

Total Dissolved Solid and Trash reductions are also speculation based on information materials circulated throughout the City in the Spring and Fall newsletters. Amounts estimated are reasonable. Based on City observations, only a few neighborhoods have trash problems. These areas will continue to be targeted in future Permit Years.

* = Total amounts calculated appear reasonable with the exception of bacterial-containing materials. Factual information is not readily available for this element and estimations are high.

New Development

Only trash and TDS were assessed for New Development as a small-scale post-construction BMP data is not yet available. Speculations on the amount of trash are associated with post-construction BMPs provided, although no corroborating evidence could be found. Numbers calculated appear reasonable.

Construction

Most of the pollutant reductions at construction sites involve sediment. Based on the inspections completed, bacteria from Port-o-lets, pH from concrete washout, and trash rarely require a corrective action. Estimations of pollutant-containing material prevented are low and may be adjusted.

11.5 PROGRAM ASSESSMENT SUMMARY

Estimated Pollutant Load Tables indicate that Residential Areas continue to have the greatest potential for pollutant removal activities. Nearly three to seven times higher than the other areas, the residential community has the largest potential for reducing pollutants from entering the City's receiving waters.

Each component has been addressed as follows for strengths and improvements. Effective is viewed as meeting the Municipal Permit implementation and reporting requirements.

Component	Effective	Strength	Improvement
Municipal	Yes	Education (Training)	Continue to coordinate with other watershed Cities.
Industrial	Yes	Assessment of BMP Implementation	Revise Inspection Form and make changes accordingly.
Commercial	Yes	Assessment of BMP Implementation	Revise Inspection Form and make changes accordingly.
Residential	Yes*	Outreach and Education	Contact property owners directly by targeting specific problem areas. Conduct drive-abouts at problem Residential areas.
New and ReDevelopment	Yes	Process	Implement new Permit requirements such as LID and updated SUSMP.
Construction	Yes	Inspections	Continue to work with inactive sites to maintain BMPs in good condition when needed.
Illegal Discharge Detection and Elimination	Yes	Monitoring	Increase frequency of monitoring and monitoring points.
Education	Yes	Team Efforts	Target elementary and middle school children.
Public Participation	Yes	Team Efforts	Continue efforts to team with Region whenever possible.

* Face-to-face contact is effective but slow moving.

11.6 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements are discussed throughout the Program Assessment section and are summarized above. No regulatory comments were received during PY2008-09 for the City's Assessment and Jurisdictional URMP Effectiveness Component.

SECTION 12 SPECIAL INVESTIGATIONS

12.1 FORRESTER CREEK IMPACT STUDY 1

SECTION 12 SPECIAL INVESTIGATIONS

12.1 FORRESTER CREEK IMPACT STUDY

For the six years, the City has conducted upstream/downstream monitoring of dry weather constituents of concern in Forrester Creek. The monitoring was conducted on June 25, 2009 to assess the relative amount of pollutants discharged within the jurisdictional boundaries of El Cajon into Forrester Creek. The upstream location is at the County boundary, specifically at Greenfield Avenue and I-8 west onramp intersection, behind southeast corner of 1699 East Main Street. Flow at the upstream sample was approximately two (2) gallons per minute. During rain events, flow from Crest and other unincorporated County areas discharge directly into the City of El Cajon without treatment. To date, no analytical data have been collected for wet weather flows.

Table 1

Site ID	Date	Flow (gpm)	Temp (°C)	pH	Turbidity (NTU)	Conductivity (mS/cm)	Nitrate (mg/L NO_3-N)
Upstream	6/25/09	2	27.2	7.8	2.06	1.74	9.88
Downstream*	6/25/09	108	30.7	8.9	14.82	2.81	2.38

Table 2

Site	Date	Total Hardness (mg/L$CaCO_3$)	Oil & Grease (mg/L)	Total Coliform (MPN/100 mL)	Fecal Coliform (MPN/100 mlL)	Enterococcus (MPN/100 mL)	Total Dissolved Solids (mg/L)	Total Organic Carbon (mg/L)
Upstream	6/25/09	490	nd	14,000	1,300	3,000	1,080	3.5
Downstream*	6/25/09	616	nd	2,800	270	130	1,680	12

nd = not detected

The following is a summary of the upstream/downstream results:

- Nitrates were detected at 9.88 mg/L upstream, and 2.38 mg/L downstream
- Reactive phosphorous upstream was 0.07 mg/L, downstream was 0.08 mg/L
- Detections of ammonia upstream was 0.1 mg/L, downstream was 0.3 mg/L
- Surfactants were detected at 0.25 mg/L upstream, and 0.25 mg/L downstream

Notable Results and Reasoning

Increase in flow to 108 gallons per minute from upstream to downstream. Downstream flows have decreased for the past three years. Concentrations of many constituents decrease from upstream to downstream; this includes nitrate, total coliform, fecal coliform, and enterococcus. Increase in the concentrations (from upstream to downstream) of pH, turbidity, total dissolved solids (TDS), conductivity, ammonia, dissolved oxygen, total hardness, and reactive phosphorus.

The City does not have an explanation at this time for the increase in flows or the significant increase in dry weather flow contributions within City boundaries. The City will need to continue to conduct further dry weather investigations to develop enough data to establish baseline conditions (for current channel configurations) and to develop priorities for more detailed investigations for pollutant and dry weather flow sources.

SECTION 13 NON-EMERGENCY FIRE FIGHTING FLOWS

INTRODUCTION 1

13.1 BEST MANAGEMENT PRACTICES 1

13.2 EDUCATIONAL METHODS 2

13.3 IMPROVEMENTS AND REGULATORY COMMENTS 2

SECTION 13 NON-EMERGENCY FIRE FIGHTING

Introduction

Emergency fire fighting flows (i.e., flows necessary for the protection of life or property) do not require BMPs and need not be prohibited. BMPs and educational methods will be used to reduce the discharge of pollutants to the MEP.

13.1 BEST MANAGEMENT PRACTICES

The City has already developed and implemented a program to reduce pollutants from non-emergency fire fighting flows, in accordance with Section B.3. of the Permit. BMPs will be implemented when conducting the following activities:

- Regular Maintenance of Fire and Emergency Vehicles and Equipment
- Training Exercises
- Facilities Maintenance
- Post-Emergency Rehabilitation of Response Equipment

These activities will be conducted in a way to either minimize or eliminate the discharge of pollutants to the MS4. Detailed descriptions of BMPs are given for each activity below:

Regular Maintenance of Fire and Emergency Vehicles and Equipment

- Vehicles and equipment will be cleaned where runoff will be directed either to the sanitary sewer system or to a drain with an oil/water separator system
- Vehicles and equipment will be cleaned where runoff will pond and evaporate and/or where runoff will filter through landscaped areas
- Used-oil, hydraulic fluids, and antifreeze will be stored in containers for recycling or will be disposed as hazardous waste
- Spill kits will be available to promptly cleanup and contain leaking or spilled vehicle fluids
- Use of soaps, cleaners, and detergents will be minimized, and general cleaning solutions will be disposed of into the sanitary sewer system
- Caustics, flammables, and solvents will be contained and disposed of properly as hazardous waste

Training Exercises

- Water used in training exercises will be directed to landscaped areas whenever possible, and runoff from the training exercises will not be allowed to discharge to the MS4.
- Live fire training activities will be pre-planned to allow integration of barriers to off-site runoff that could contribute to non-storm water discharges

Facilities Maintenance

- Impervious areas such as apparatus floors, maintenance bays, driveways, patios, and walkways will be swept to remove debris. Debris will be placed in the trash. Interior

floors will be mopped as necessary, and the wastewater discharged into the sanitary sewer system or onto landscaped areas

- Landscaped areas will be maintained as required to reduce introduction of leaves and other landscape waste into the MS4
- Irrigation systems will be monitored and maintained as required to reduce irrigation water from going off-site
- Spills will be cleaned up using spill kits provided at the work site, and disposal of spilled material will be in accordance with applicable regulations
- Spills that require a cleanup beyond the ability of the on-site employees will be reported to the City Department of Public Works for assistance with appropriate resources
- Maintenance and repair of structures will be conducted using methods that do not contribute pollutants to the MS4
- General non-hazardous cleaning solutions will be disposed of in a utility sink that drains into the sanitary sewer system

Post-Emergency Rehabilitation of Response Equipment
Tools, fire hoses, ladders, and other equipment utilized at the scene of an emergency will be restored to a response-ready state in a manner that does not delay the ability of the apparatus to be available for another emergency response. The use of water that could contribute to storm water discharges may be used unless another practical and immediately available method is identified.

13.2 EDUCATIONAL METHODS

The Storm Water Division provided training to the Fire Department Personnel in PY2007-08 and for PY2008-09 the Storm Water group coordinated with the Fire Department on outreach materials on how to best conduct weed abatement prior to the fire season and remain in compliance with storm water regulations.

13.3 IMPROVEMENTS AND REGULATORY COMMENTS

Improvements from PY3 experience includes:

- Continue to coordinate with the Fire Department on outreach materials.
- Expanded maintenance Best Management Practices for fire fighting equipment and facilities.

Regulatory comments are not applicable to this portion of the JURMP update. Non-Emergency Fire Fighting is a new component of the annual update.

SECTION 14 JURMP REVISIONS

14.1 INTRODUCTION 1

14.2 CONSTRUCTION COMPONENT 1

14.3 MUNICIPAL COMPONENT 1

14.4 RESIDENTIAL COMPONENT 2

SECTION 14 JURMP REVISIONS

14.1 INTRODUCTION

This section identifies the location in the JURMP of any changes made to the JURMP for PY 2008-09 in order to meet the requirements of the new Municipal Permit.

Updated land use information and listings of ESAs based on more recent information have been provided in the introduction. The regulatory background discussion has been updated to provide information about the Municipal Permit.

14.2 CONSTRUCTION COMPONENT

This table identifies changes that have been made to the JURMP in this section. Excerpts from the updated JURMP language can be found in Appendix A.3.

JURMP Section	Change	Rationale for Change
5.2.1.1 and Figure 5-1	Criteria for high Treat to Water Quality (TTWQ) changed from 50 acres to 1 acre.	Required under comments received from the RWQCB – 03/17/2009
5.2.1.1	Included the criterion of maximum disturbed area of 17 acres into the high TTWQ for construction sites.	Required under comments received from the RWQCB – 03/17/2009.
5.2.1.1	Included the criterion of exceptional TTWQ for construction site into the high TTWQ for construction sites	Required under comments received from the RWQCB – 03/17/2009.

14.3 MUNICIPAL COMPONENT

This table identifies changes that have been made to the JURMP in this section. Please refer to Appendix D, entitled "Chapter 5 – Operations and Maintenance", for sample language that will be included in the Municipal Section.

JURMP Section	Change	Rationale for Change
6.5	Information about the inspection frequencies and procedures for sanitary sewer.	Required under comments received by the RWQCB – 03/17/2009

14.4 RESIDENTIAL COMPONENT

This table identifies changes that have been made to the JURMP in this section. Excerpts from the updated JURMP language can be found in Appendix A.6.

New JURMP Section	Change	Rationale for Change
8.2.2	Description of steps to require and verify the implementation of BMPs for the high residential TTWQ areas	Required under comments received by the RWQCB – 03/17/2009

Section 15 Conclusions and Recommendations

Introduction **1**

15.1 Conclusions **1**

Table 1 – Challenges and Associated Strategies/Actions 3

15.2 Recommendations **4**

SECTION 15 CONCLUSIONS & RECOMMENDATIONS

INTRODUCTION

To conclude PY2 and recommend changes for PY3, this Section focuses on the challenges overcome this last year that will help eliminate inaccuracy or uncertainty for subsequent permit years. To summarize, the City:

- Continued implementation of the BMP-based inspections by focusing efforts on ensuring full implementation of appropriate BMPs at all high priority commercial, industrial, construction and municipal facilities.
- Expanded public education efforts by targeting junior high school student population by conducting presentations; and continued participation in the Fire Department/Safety Open House, hosting Pollution Prevention Days events, and providing information to the mass public through the City newsletter.
- Continued efforts towards a Watershed-based program by conducting the fifth upstream/downstream water quality assessment of Forrester Creek.
- Refined the City's ability to track complaints, inspections, violations, and enforcement actions for accuracy and completeness.
- Opened contract for on-call analytical testing services to conduct follow-up responses to complaints, spills, and targeted investigations to identify potential pollutant source points.
- Hired consultant to assist with the review of storm water plans and requirements for proposed development and redevelopment projects.

15.1 CONCLUSIONS

A number of conclusions resulted from compiling the Annual Report information as follows:

The City continues to transition the activity-based requirements of Order No. 2001-001 to fulfill the requirements of Order No. R9-2007-001. The actions taken by the City to comply with these requirements are fully described in Sections 1 through 14 (particularly Section 11) of this Annual Report. The City will continue to meet the activity-based compliance requirements in future program years.

The City's focus on BMP implementation at high priority commercial and industrial facilities and at construction sites will reduce or prevent discharges of pollutants from those activities and sites. Once the City can reasonably assure that those priority activities are not discharging pollutants, the City will be able to focus more effort on identifying and eliminating other (unknown, unidentified) sources of pollutants that continue to impact water quality.

The City's program must continue to move forward, from an emphasis on the activity-based compliance actions to water-quality-based activities that will help the City achieve the goal of reducing discharges of pollutants and restoring the quality of the receiving waters. These activities include collecting, evaluating and incorporating sufficient water quality data to set priorities, better identify problem areas, and to be able to demonstrate reductions in pollutants and improvements in water quality.

Effectively integrating jurisdictional into watershed programs will be a continued focus for the future. The Permit establishes important obligations at both jurisdictional and watershed levels. To accomplish this transition and integration, the City continues to meet with East County Cities Workgroup (San Diego River Watershed Jurisdictions) to provide some direction concerning inland urban runoff issues. Taking advantage of successes at other Cities strengthens individual and watershed programs.

New Directions, New Challenges….

The City must still address a number of unresolved data and information collection issues. Monitoring data are especially important to quantify pollutant loads within the jurisdiction of El Cajon. Additional dry weather monitoring stations are needed to better identify illegal discharge sources. The need for additional data and information must be carefully balanced with the costs of obtaining those items.

Permit Year 1 of Order 2001-01(2001/2002) set a baseline for the 14 components with the primary goal to reduce or eliminate pollutants from entering the City's storm drain system, which flows to Forrester Creek, the San Diego River, and ultimately the Pacific Ocean. Permit Year 2 implemented those 14 components that required inspection, monitoring, education, and enforcement. Permit Year 3 spent over 17,000 staff hours and over two million dollars ($2,000,000) in meeting permit requirements and JURMP goals. Permit Years 4 and 5 continued the BMP implementation verification inspection program initiated in PY3. Permit Year 4 focused on the Automotive Repair Industry, while PY 5 focused on the Restaurants and other businesses preparing and serving food.

The solid base of protocols and procedures produced in 2001, continued into PY1 of the new permit and into the current reporting period with refinement supported by eight years of experience in program implementation. An unending challenge is changing the behavior of the approximately 96,000 residents and 2,000 businesses and their views of urban runoff pollution. The City is predominantly a community of rental units, which identifies the population as more transient than the typical single-family residential population. This outreach and education challenge will be changing as more rental complexes turned into common living complexes with

home ownership. The following table summaries the City's storm water management strategy based on the challenges presented during the current reporting period, 2007/2008.

Table 1 – Challenges and Associated Strategies/Actions

Challenges	Strategies / Actions
Implementing the 14 components simultaneously	1. Prioritize implementation to maximize use of personnel, supplies, equipment, and budget. 2. Develop budget for PY3 to add watershed outreach, efforts, public participation events, additional outreach materials, GIS data development, staff training, and treatment controls for trash and debris.
Adequate Staffing and Equipment	Train as many City staff in storm water pollution prevention and Best Management Practices.
Incorporate Storm Water Concepts and Requirements at the Planning Stage	Work closely with Community Development staff to generate a Storm Water Information Packet to distribute to applicants.
Transition Jurisdictional Programs and activities into Watershed Activities.	1. Meet with WURMP Copermittees for implementation. 2. Explore strategies to fund watershed activities that go beyond the jurisdictional boundaries.
Tackle Inland City Issues	1. Coordinate with East County Cities on pollutant load reduction, training, and citizen educational efforts. 2. Develop East County City-specific materials.
Maintain Adequate Monitoring tasks	1. Review dry weather monitoring results. 2. Use GIS and the City's Business License database to focus on the most highly potentially pollution production areas. 3. Develop a basic wet weather monitoring program that is comparable with other Copermittee programs.

From July 1, 2003 through June 30, 2009, the City tackled a new set of challenges while maintaining the current level of provided services. In review, it was better to put resources towards implementing productive processes and procedures, rather than completing a task in the name of compliance. The City continues to brainstorm toward reaching higher standards in future program years, while quantifying pollutant reductions from jurisdictional actions that may have a watershed impact.

15.2 RECOMMENDATIONS

Specific recommended improvements are listed at the end of each component. Below are some general improvements for the City's Urban Runoff Strategy.

- Continue to maintain adequately trained staff to implement JURMP activities,
- Create a comprehensive Geographical Information System for the Jurisdictional and Watershed Storm Water Program efforts.
- Increase emphasis on watershed training, San Diego River Watershed Copermittee cooperative efforts, and electronic tracking of program information,
- Coordinate through City departments a cohesive urban runoff management program,
- Generate a schedule of outreach events for the next Permit Year according to JURMP requirements,
- Continue to develop a comprehensive program to collect and organize information for the Annual Report,
- Add sample collection sites and frequency to the dry weather monitoring program, and
  focus on outreach and education activities for the most effective approach to managing storm water pollution.
- Complete development of a storm drain master plan map inventorying MS4 infrastructure.

Appendix A.2

RESOLUTION NO. 10–03

A RESOLUTION APPROVING GENERAL PLAN AMENDMENT 2002-04 TO ADD STORM WATER RUNOFF POLICIES AND OBJECTIVES TO GENERAL PLAN TEXT.

WHEREAS, the El Cajon City Council duly advertised and held a public hearing on January 14, 2003, to consider an item which had been set for General Plan consideration; and

WHEREAS, to facilitate understanding by the public, the City Council took tentative or preliminary votes on this item, which vote was not binding until the public hearing was completed; and

WHEREAS, the City Council duly considered all information presented, and listened to all persons who appeared before it to speak.

NOW, THEREFORE, BE IT RESOLVED that the El Cajon City Council hereby approves General Plan Amendment 2002-04 to add storm water policies to the General Plan text as indicated in Planning Commission Resolution No. 9734, on file in the office of the City Clerk, and made a part hereof by this reference.

PASSED AND ADOPTED by the City Council of the City of El Cajon, California at a Regular Joint City Council/Redevelopment Agency Meeting held this 14th day of January, 2003, by the following vote to wit:

AYES : Lewis, Kendrick, McClellan, Ramos, Santos
NOES : None
ABSENT : None
DISQUALIFY : None

MARK LEWIS
Mayor of the City of El Cajon

ATTEST:

MARILYNN LINN, CMC
City Clerk

I hereby certify that the above and foregoing is a full and true copy of Resolution No. 10-03 of the Resolutions of the City of El Cajon, California, as adopted by the City Council at the Regular Joint Meeting of the City Council/Redevelopment Agency on the 14th day of January, 2003.

for M Steele
Marilynn Linn, CMC, City Clerk

1/14/03 (103)

STAFF REPORT AND RECOMMENDATION
PLANNING COMMISSION MEETING
DECEMBER 9, 2002 - 7:00 PM

COUNCIL CHAMBER
200 E. MAIN STREET
EL CAJON, CA 92020

AGENDA ITEM #3

PUBLIC HEARING ON
GENERAL PLAN AMENDMENT 2002-04 – Planning Commission

Request to add storm water policies to General Plan text.

******** ******** ******** ********

STAFF RECOMMENDATION: RECOMMEND APPROVAL

******** ******** ******** ********

ENVIRONMENTAL IMPACT INFORMATION

The proposed project is exempt from environmental review in accordance with Section 15308 of CEQA Guidelines.

DISCUSSION

As part of the local implementation of the federal Clean Water Act, the County of San Diego and its 18 cities have obtained a National Pollution Discharge Elimination System (NPDES) permit from the Regional Water Quality Control Board. The NPDES permit addresses the handling of storm water runoff by the 18 cities, their residents and businesses. Part of the NPDES permit includes a Jurisdictional Urban Runoff Management Program (JURMP) (Note: there are lots of acronyms used in the storm water runoff dictionary).

Although most of the City's storm water and drainage implementation is carried out by the Department of Public Works, there is a requirement in the NPDES and the JURMP that the General Plan include policies and principles which address water quality and storm water runoff. An attempt to add these policies and

principles to the General Plan last year was withdrawn when it was determined to be premature (GPA 2001-01).

Goal 8 of the El Cajon General Plan says, "The livability of El Cajon will be maintained and enhanced through respect for the environment." There are a number of policies under this goal which address other environmental issues and concerns and this is where the staff believes the policy and objectives (principles) for storm water runoff should be located within the City's general plan text.

RECOMMENDATION

It is recommended that the Planning Commission recommend approval of General Plan Amendment 2002-04 to add storm water runoff policy and objectives to the text of the General Plan as follows and for the following reasons:

Add the following objective and policies to Goal 8.

"Objective 8-10. Achieve and maintain a level of water quality which protects affected watersheds by minimizing runoff which may cause erosion and pollution.

POLICIES

8-10.1. The City shall minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment. Where feasible, the City will insure that new development or redevelopment slows runoff and maximizes on-site infiltration of runoff.

8-10.2. The City shall implement pollution prevention methods supplemented by pollutant source controls and treatment. The City will use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants offsite and into a municipal separate storm sewer system. (MS4)

8-10.3. The City shall preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. The City will encourage land acquisition of such areas.

8-10.4. The City shall limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

8-10.5. Prior to making land use decisions, the City will utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City shall require incorporation of structural and non-

structural best management practices to mitigate the projected increases in pollutant loads and flows.

8-10.6. The City will avoid development of areas that are particularly susceptible to erosion and sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss.

8-10.7. The City will reduce pollutants associated with vehicles and increasing traffic resulting from development. The City will coordinate local traffic management reduction efforts with the San Diego County Congestion Management Plan.

8-10.8. The City will implement the San Diego Association of Government's (SANDAG's) recommendations as found in the Water Quality Element of its Regional Growth Management Strategy.

8-10.9. Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable."

Reasons for Recommendation

A. This amendment to the text of the City's general plan will add a policy and objectives addressing storm water runoff as required by the National Pollution Discharge Elimination System (NPDES) permit issued to the City.

B. This amendment will provide policy and objectives dealing with storm water runoff to guide decision-making in the city.

C. This amendment is consistent with the City's Jurisdictional Urban Runoff Management Program (JURMP).

Refer to staff for a resolution stating the decision of the Planning Commission.

JSG:co

EL CAJON GENERAL PLAN 2000

Text and Map adopted by
City Council Resolution No. 10-91
on January 8, 1991

Text and Map amended by
City Council Resolution No. 31-98
on February 10, 1998

January, 2001

OBJECTIVE

8-10. Achieve and maintain a level of water quality which protects affected watersheds by minimizing runoff which may cause erosion and pollution.

POLICIES

8-10.1. The City shall minimize the amount of impervious surfaces and directly connected impervious surfaces in areas of new development and redevelopment. Where feasible, the City will insure that new development or redevelopment slows runoff and maximizes on-site infiltration of runoff.

8-10.2. The City shall implement pollution prevention methods supplemented by pollutant source controls and treatment. The City will use small collection strategies located at, or as close as possible to, the source (i.e., the point where water initially meets the ground) to minimize the transport of urban runoff and pollutants off site and into a municipal separate storm sewer system. (MS4)

8-10.3. The City shall preserve, and where possible, create or restore areas that provide important water quality benefits, such as riparian corridors, wetlands, and buffer zones. The City will encourage land acquisition of such areas.

8-10.4. The City shall limit disturbances of natural water bodies and natural drainage systems caused by development including roads, highways, and bridges.

8-10.5. Prior to making land use decisions, the City will utilize methods available to estimate increases in pollutant loads and flows resulting from projected future development. The City shall require incorporation of structural and non-structural best management practices to mitigate the projected increases in pollutant loads and flows.

8-10.6. The City will avoid development of areas that are particularly susceptible to erosion and

sediment loss; or establish development guidance that identifies these areas and protects them from erosion and sediment loss.

8-10.7. The City will reduce pollutants associated with vehicles and increasing traffic resulting from development. The City will coordinate local traffic management reduction efforts with the San Diego County Congestion Management Plan.

8-10.8. The City will implement the San Diego Association of Government's (SANDAG's) recommendations as found in the Water Quality Element of its Regional Growth Management Strategy.

8-10.9. Post-development runoff from a site shall not contain pollutant loads which cause or contribute to an exceedance of receiving water quality objectives or which have not been reduced to the maximum extent practicable.

GOAL 9

A strong, competitive region-wide commercial base will be created and retained.

OBJECTIVE

9-1. Parkway Plaza and its immediate vicinity will be maintained as the City's regional shopping center.

POLICIES

9-1.1. Parkway Plaza shall be expanded from its original size and the number of major tenants and stores shall be increased.

9-1.2. The City shall continue to improve traffic circulation in the vicinity of Parkway Plaza.

9-1.3. The City shall cooperate with Parkway Plaza in the provision of parking facilities and may develop special

ORDINANCE NO. 4908

AN ORDINANCE REPEALING CHAPTERS 16.100, 16.101, 16.102, 16.103, 16.104, 16.105, 16.106, 16.107 AND 16.108 OF TITLE 16 OF THE EL CAJON MUNICIPAL CODE AND ADDING A NEW CHAPTER 16.60 TO TITLE 16 OF THE EL CAJON MUNICIPAL CODE REGARDING THE CITY OF EL CAJON STANDARD URBAN STORM WATER MITIGATION PLAN.

WHEREAS, the City of El Cajon, pursuant to its Water Quality Permit issued on February 21, 2001, is required to adopt certain implementation steps as mandated by the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, one of the implementation steps requires the adoption of an Urban Storm Water Mitigation Plan based upon a pre-approved Model adopted on June 10, 2002, by the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, this Ordinance shall be the Urban Storm Water Mitigation Plan adopted pursuant to the mandate of the Regional Water Quality Control Board (San Diego Region); and

WHEREAS, this Ordinance shall allow for the adoption of resolutions and policies which shall implement the El Cajon Standard Urban Water Mitigation Plan not included in this Ordinance; and

WHEREAS, the adoption of this Ordinance, by the findings of the Regional Water Quality Control Board (San Diego Region), is exempt from the requirements of the California Environmental Quality Act; and

WHEREAS, the purpose of this Ordinance is to protect valuable water resources of the City of El Cajon and its surrounding environs from pollutants.

NOW, THEREFORE, BE IT ORDAINED BY THE CITY COUNCIL OF THE CITY OF EL CAJON AS FOLLOWS:

Section 1: Chapters 16.100, 16.101, 16.102, 16.103, 16.104, 16.105, 16.106, 16.107, and 16.108 of the El Cajon Municipal Code are hereby repealed.

Section 2: Chapter 16.60 is hereby added to the El Cajon Municipal Code to read as follows:

16.60.010 Title.

The ordinance codified in this chapter shall be known as the "standard urban storm water mitigation plan (SUSMP) ordinance of the city of El Cajon."

16.60.020 Statutory Authority.

A. The municipal storm water National Pollutant Discharge Elimination System (NPDES) permit (Order No. R9-2007-0001, NPDES No. CAS0108758, hereinafter referred to as "Municipal Permit") issued to San Diego County, San Diego County Regional Airport Authority, the Port of San Diego, and eighteen cities by the San Diego Regional Water Quality Control Board (Regional Board) on January 24, 2007, requires the development and implementation of a program addressing urban runoff pollution issues in development planning for public and private projects.

B. The requirement to implement a program for development planning is based on federal and state statutes including: Section 402 (p) of the Clean Water Act, Section 6217 of the Coastal Zone Act Reauthorization Amendments of 1990 ("CZARA"), and the California Water Code. The Clean Water Act amendments of 1987 established a framework for regulating urban runoff discharges from municipal, industrial, and construction activities under the NPDES program. The municipal permit requires the implementation of a Jurisdictional Urban Runoff Management Program (JURMP), which has been adopted by the city of El Cajon on February 12, 2002, as amended.

16.60.030 Purpose.

A. The primary objectives of this division are to:

1. Ensure that discharges from municipal urban runoff conveyance systems do not cause or contribute to a violation of water quality standards;

2. Effectively prohibit non-storm water discharges in urban runoff; and

3. Reduce the discharge of pollutants from urban runoff conveyance systems to the Maximum Extent Practicable (MEP statutory standard).

B. The regulations of this division were developed to address post-construction urban runoff pollution from new development and redevelopment applications that fall under "priority project" categories. The goal of this division is to develop and implement practicable policies to ensure to the maximum extent practicable that development does not increase pollutant loads from a project site and considers urban runoff flow rates, velocities and durations. This goal may be achieved through site-specific controls and/or drainage area-based or shared structural treatment controls.

16.60.040 Applicability of chapter.

The regulations set forth in this chapter shall apply to the development plan approval process for discretionary development applications, and prior to issuing development permits for ministerial projects. To allow flexibility in meeting the design

standards set forth in this division, structural treatment control BMPs may be located on- or off-site, used singly or in combination, or shared by multiple developments, provided certain conditions are met. All new development and significant redevelopment projects that fall into one of the following "priority project" categories are subject the requirements of this division, subject to the lawful prior approval provisions of the municipal permit. In the instance where a project feature, such as a parking lot, falls into a priority project category, the entire project footprint is subject to the requirements of this division. These categories are:

A. Residential development of ten (10) units or more;

B. Commercial development greater than one (1) acre;

C. Heavy industry industrial development greater than one (1) acre;

D. Automotive repair shops;

E. Restaurants;

F. Hillside development greater than 5,000 square feet;

G. Projects located within or directly adjacent to or directly discharging to receiving waters within environmentally sensitive areas that create 2,500 square feet or more of impervious surface or increase the area of imperviousness to ten percent (10%) or more of its naturally occurring conditions;

H. Projects having more than 2,500 square feet of impervious surface that discharge to receiving waters within or adjacent to environmentally sensitive areas;

I. Parking lots with 5,000 square feet or more of impervious surface, or with more than fifteen (15) parking spaces and potentially exposed to urban runoff;

J. Streets, roads, highways, and freeways, which would create a new paved surface that is 5,000 square feet or more of impervious surface; and

K. Retail gasoline outlets of 5,000 square feet or more in size, or having a projected average daily traffic ("ADT") count of at least 100 vehicles per day regardless of size.

16.60.050 Limited exclusion.

Trenching and resurfacing work associated with utility projects; resurfacing and reconfiguring surface parking lots and existing roadways; new sidewalk construction, pedestrian ramps, or bike lanes on existing roads; and routine replacement of damaged pavement, such as pothole repair, are not considered priority projects. Parking lots,

buildings and other structures associated with utility projects are subject to the requirements of this division if one or more of the criteria for the above categories are met.

16.60.060 Applicability of chapter 13.10.

The provisions of Chapter 13.10 (Storm Water Management and Discharge Control), including the definitions and enforcement provisions, shall be applicable to this chapter as though fully set forth herein.

16.60.070 Administration – limitations.

Where requirements of this division conflict with established local codes, (e.g., specific language of signage used on storm drain stenciling), the city council may continue the local practice and modify this division to be consistent with the code, except that to the extent that the standards in this division are more stringent than those under local codes, such more stringent standards shall apply.

16.60.080 Administration – Provisions for SUSMP requirements.

The requirements of this division shall be incorporated into the project design and shown on the plans prior to approval of discretionary permits. For projects requiring only ministerial permits, the requirements of this division shall be incorporated into the project design and shown on the plans prior to the issuance of any ministerial permits. City departments carrying out public projects that are not required to obtain permits shall be responsible for ensuring the requirements of this division are incorporated into the project design and shown on the plans prior to bidding for construction contracts, or equivalent. For public projects the requirements of this division must be incorporated into the project design and shown on the plans before allowing the project to commence.

16.60.090 Administration – Implementation.

All priority projects shall implement one or a combination of storm water BMPs, including, (1) LID and site design BMPs, (2) source control BMPs and, (3) structural treatment BMPs after the pollutants and conditions of concern have been identified. Storm water BMPs shall be considered and implemented where expressly required by this division and if not so required where determined applicable and feasible by the Director of Public Works. The storm water BMPs shall adhere to the requirements of this division, and shall be correctly designed so as to remove pollutants to the maximum extent practicable. A flow chart summarizing the storm water BMP selection procedure is provided in Figure 1.

16.60.100 Administration – Site design storm water treatment credits.

Project proponents may develop and submit for public review and comment and city council approval a regional model site design storm water treatment credits program that allows reductions in the volume or flow of storm water that must be captured or treated on a project in return for the inclusion of specified project design features in the project. The model site design storm water treatment credits program shall be deemed to be a part of this division following city council approval. Any such model program shall specify the conditions under which project proponents can be credited for the use of site design features and low impact development techniques that can reduce the volume of storm water runoff, preserve natural areas, and minimize the pollutant loads generated and potentially discharged from the site. Any site design storm water treatment credits program implemented shall be consistent and compliant with this division and approved by the city council.

[Remainder of page intentionally left blank]

Figure 1. Storm Water BMP Selection Procedure Flow Chart

16.60.110 Identifying pollutants and conditions of concern.

A. Priority project proponents shall use this guidance to identify pollutants and conditions of concern, for which they need to mitigate or protect against. Site design and source control BMPs are required based on pollutants commonly associated with the proposed project type (see Table 2, "Standard Storm Water BMP Selection Matrix"). Treatment Control BMPs are also required for the project's expected pollutants of concern (see Table 3).

B. For private priority projects, the information shall be provided with the project application prior to being deemed complete.

C. For public priority projects, the information shall be provided by the Director of Public Works prior to bidding for construction contracts.

16.60.120 General categories of water pollution.

A. Sediments – Sediments are soils or other surficial materials eroded and then transported or deposited by the action of wind, water, ice, or gravity. Sediments can increase turbidity, clog fish gills, reduce spawning habitat, lower young aquatic organisms survival rates, smother bottom dwelling organisms, and suppress aquatic vegetation growth.

B. Nutrients – Nutrients are inorganic substances, such as nitrogen and phosphorus. They commonly exist in the form of mineral salts that are either dissolved or suspended in water. Primary sources of nutrients in urban runoff are fertilizers and eroded soils. Excessive discharge of nutrients to water bodies and streams can cause excessive aquatic algae and plant growth. Such excessive production, referred to as cultural eutrophication, may lead to excessive decay of organic matter in the water body, loss of oxygen in the water, release of toxins in sediment, and the eventual death of aquatic organisms.

C. Metals – Metals are raw material components in non-metal products such as fuels, adhesives, paints, and other coatings. Primary source of metal pollution in storm water are typically commercially available metals and metal products. Metals of concern include cadmium, chromium, copper, lead, mercury, and zinc. Lead and chromium have been used as corrosion inhibitors in primer coatings and cooling tower systems. At low concentrations naturally occurring in soil, metals are not toxic. However, at higher concentrations, certain metals can be toxic to aquatic life. Humans can be impacted from contaminated groundwater resources, and bioaccumulation of metals in fish and shellfish. Environmental concerns, regarding the potential for release of metals to the environment, have already led to restricted metal usage in certain applications.

D. Organic Compounds – Organic compounds are carbon-based. Commercially available or naturally occurring organic compounds are found in

pesticides, solvents, and hydrocarbons. Organic compounds can, at certain concentrations, indirectly or directly constitute a hazard to life or health. When rinsing off objects, toxic levels of solvents and cleaning compounds can be discharged to storm drains. Dirt, grease, and grime retained in the cleaning fluid or rinse water may also adsorb levels of organic compounds that are harmful or hazardous to aquatic life.

E. Trash & Debris – Trash (such as paper, plastic, polystyrene packing foam, and aluminum materials) and biodegradable organic matter (such as leaves, grass cuttings, and food waste) are general waste products on the landscape. The presence of trash & debris may have a significant impact on the recreational value of a water body and aquatic habitat. Excess organic matter can create a high biochemical oxygen demand in a stream and thereby lower its water quality. Also, in areas where stagnant water exists, the presence of excess organic matter can promote septic conditions resulting in the growth of undesirable organisms and the release of odorous and hazardous compounds such as hydrogen sulfides.

F. Oxygen-Demanding Substances – This category includes biodegradable organic material as well as chemicals that react with dissolved oxygen in water to form other compounds. Proteins, carbohydrates, and fats are examples of biodegradable organic compounds. Compounds such as ammonia and hydrogen sulfide are examples of oxygen-demanding compounds. The oxygen demand of a substance can lead to depletion of dissolved oxygen in a water body and possibly the development of septic conditions.

G. Oil and Grease – Oil and grease are characterized as high-molecular weight organic compounds. Primary sources of oil and grease are petroleum hydrocarbon products, motor products from leaking vehicles, esters, oils, fats, waxes, and high molecular-weight fatty acids. Introduction of these pollutants to the water bodies are very possible due to the wide uses and applications of some of these products in municipal, residential, commercial, industrial, and construction areas. Elevated oil and grease content can decrease the aesthetic value of the water body, as well as the water quality.

H. Bacteria and Viruses – Bacteria and viruses are ubiquitous microorganisms that thrive under certain environmental conditions. Their proliferation is typically caused by the transport of animal or human fecal wastes from the watershed. Water, containing excessive bacteria and viruses can alter the aquatic habitat and create a harmful environment for humans and aquatic life. Also, the decomposition of excess organic waste causes increased growth of undesirable organisms in the water.

I. Pesticides – Pesticides (including herbicides) are chemical compounds commonly used to control nuisance growth or prevalence of organisms. Excessive application of a pesticide may result in runoff containing toxic levels of its active component.

16.60.130 Identifying pollutants from the project area.

Using Table 1, pollutants shall be identified that are anticipated to be generated from the proposed priority project categories. Pollutants associated with any hazardous material sites that have been remediated or are not threatened by the proposed project are not considered a pollutant of concern.

16.60.140 Identifying pollutants of concern.

A. Pollutants generated by the proposed priority project that exhibit one or more of the following characteristics are considered primary pollutants of concern:

- Current loadings or historical deposits of the pollutant are impairing the beneficial uses of a receiving water;
- Elevated levels of the pollutant are found in water or sediments of a receiving water and/or have the potential to be toxic to or bioaccumulate in organisms therein; and
- Inputs of the pollutant are at a level high enough to be considered potentially toxic.

B. To identify primary pollutants of concern in receiving waters, each priority project shall, at a minimum, do the following:

1. For each of the proposed projects discharge points, identify the receiving water(s) that each discharge point proposes to discharge to, including hydrologic unit basin number(s), as identified in the most recent version of the *Water Quality Control Plan for the San Diego Basin*, prepared by the San Diego Regional Water Quality Control Board;

2. Identify any receiving waters, into which the developed area would discharge to, listed on the most recent list of Clean Water Act Section 303(d) impaired water bodies. List any and all pollutants for which the receiving waters are impaired;

3. Compare the list of pollutants for which the receiving waters are impaired with the pollutants anticipated to be generated by the project (as identified in Table 1). Any pollutants identified by Table 1 which are also causing impairment of receiving waters shall be considered primary pollutants of concern.

For projects where no primary pollutants of concern exist, those pollutants identified through the use of Table 1 shall be considered secondary pollutants of concern.

16.60.150 Identifying conditions of concern.

A. Common impacts to the hydrologic regime resulting from development typically include increased runoff volume and velocity; reduced infiltration; increased flow frequency, duration, and peaks; faster time to reach peak flow; and water quality degradation. These changes have the potential to permanently impact downstream

channels and habitat integrity. A change to a priority project site's hydrologic regime would be considered a condition of concern if the change would impact downstream channels and habitat integrity. Because of these potential impacts, a director, or his or her designee, may require that the following steps be followed for priority projects that, in their judgment, may impact the hydrologic regime:

1. Evaluate the project's conditions of concern in a drainage study report prepared by a registered civil engineer in the State of California, with experience in fluvial geomorphology and water resources management. The report shall consider the project area's location (from the larger watershed perspective), topography, soil and vegetation conditions, percent impervious area, natural and infrastructure drainage features, wet season groundwater depth, and any other relevant hydrologic and environmental factors to be protected specific to the project area's watershed;

2. As part of the drainage study, a qualified, licensed professional shall provide a report on proposed infiltration techniques (trenches, basins, dry wells, permeable pavements with underground reservoir for infiltration) regarding any potential adverse geotechnical concerns. Geotechnical conditions (such as slope stability, expansive soils, compressible soils, seepage, groundwater depth, and loss of foundation or pavement subgrade) should be addressed, and mitigation measures provided;

3. As part of the drainage study, the civil engineer shall conduct a field reconnaissance to observe and report on downstream conditions, including undercutting erosion, slope stability, vegetative stress (due to flooding, erosion, water quality degradation, or loss of water supplies) and the area's susceptibility to erosion or habitat alteration as a result of an altered flow regime;

4. The drainage study shall compute rainfall runoff characteristics from the project area including, at a minimum, peak flow rate, flow velocity, runoff volume, time of concentration, and retention volume. These characteristics shall be developed for the two-year and 10-year frequency, Type I storm, of six-hour or 24-hour duration (whichever is the closer approximation of the site's time of concentration), during critical hydrologic conditions for soil and vegetative cover[1]. The drainage study shall report the project's conditions of concern based on the hydrologic and downstream conditions discussed above. Where downstream conditions of concern have been identified, the drainage study shall establish that pre-project hydrologic conditions affecting downstream conditions of concern would be maintained by the proposed project, satisfactory to the Director of Public Works, by incorporating the site design, source control, and treatment control requirements identified in this division.

B. For priority development projects that disturb ("PDP") fifty (50) acres or more:

---

[1]. Design storms can be found at http://www.wrcc.dri.edu/pcpnfreq.html. Applicants may calculate the storm events using local rain data. In addition, isopluvial maps contained in the County of San Diego Hydrology Manual may be used to extrapolate rainfall data to areas where insufficient data exists. If isopluvial maps are used interpolations shall be linear.

1. PDP post project runoff flow rates and durations shall not exceed pre-project runoff flow rates and durations (interim hydromodification criteria) where the increased discharge flow rates and durations will result in increased potential for erosion or other significant adverse impacts to beneficial uses, attributable to changes in flow rates and durations.

2. PDPs disturbing fifty (50) acres or more shall implement hydrologic controls to manage post-project runoff flow rates and durations as required by the interim hydromodification criteria.

Table 1. Anticipated and Potential Pollutants Generated by Land Use Type.

	General Pollutant Categories								
Priority Project Categories	Sediments	Nutrients	Heavy Metals	Organic Compounds	Trash & Debris	Oxygen Demanding Substances	Oil & Grease	Bacteria & Viruses	Pesticides
Detached Residential Development	X	X			X	X	X	X	X
Attached Residential Development	X	X			X	P(1)	P(2)	P	X
Commercial Development >100,000 ft^2	P(1)	P(1)		P(2)	X	P(5)	X	P(3)	P(5)
Heavy industry /industrial development	X		X	X	X	X	X		
Automotive Repair Shops			X	X(4)(5)	X		X		
Restaurants					X	X	X	X	
Hillside Development >5,000 ft^2	X	X			X	X	X		X
Parking Lots	P(1)	P(1)	X		X	P(1)	X		P(1)
Retail Gasoline Outlets			X	X	X	X	X		
Streets, Highways & Freeways	X	P(1)	X	X(4)	X	P(5)	X		

X = anticipated
P = potential
(1) A potential pollutant if landscaping exists on-site.
(2) A potential pollutant if the project includes uncovered parking areas.
(3) A potential pollutant if land use involves food or animal waste products.
(4) Including petroleum hydrocarbons.
(5) Including solvents.

16.60.160 Progression of storm water BMPs.

Site design BMPs reduce the need for source and/or treatment control BMPs, and source control BMPs may reduce the amount of treatment control BMPs needed. Throughout all the following sections, all priority projects shall consider, and incorporate and implement where expressly required by this division and if not so required where determined applicable and feasible by the Director of Public Works, storm water BMPs into the project design, in the following progression:

- Site Design BMPs
- Source Control BMPs
- Treatment Control BMPs

16.60.170 Requirements to implement storm water BMPs.

Priority projects must implement LID site design BMPs and source control BMPs, and must also implement treatment control BMPs unless a waiver is granted based on the infeasibility of all treatment control BMPs. LID BMPs must meet the minimum requirements in section D.1.d.(4) of NPDES Permit No. CAS 0108758. BMPs must also achieve certain performance standards set out in section D.1.d. (5) and (6). Selection of BMPs from the menus included in this division, using the rules set out in this division, must fulfill these requirements. In addition, runoff treated by LID and site design or source control BMPs, such as rooftop runoff treated in landscaping, may be useful in reducing the quantity of runoff required to be treated in, "Treatment Control BMPs."

16.60.180 Selection of storm water BMPs.

Using the Treatment Control BMP Selection Matrix, each priority project shall select a structural treatment BMP by comparing the list of pollutants for which the downstream receiving waters are impaired (if any), with the pollutants anticipated to be generated by the project (as identified in Table 1). Any pollutants identified by Table 1 which are also causing a Clean Water Act section 303(d) impairment of the receiving waters of the project shall be considered primary pollutants of concern. Priority projects that are anticipated to generate a primary pollutant of concern shall meet all applicable requirements of establishing stormwater BMPs, and shall select a single or combination of storm water BMPs from Table 3 which maximizes pollutant removal for the particular primary pollutant(s) of concern.

Alternatively, a project proponent may elect to implement a combination of LID BMPs that either disperse and infiltrate, or direct to bioretention facilities, the flows from all impervious areas on-site. These BMPs are presumed to provide maximum extent practicable treatment for all pollutants of concern; therefore no further documentation of the treatment BMP selection process is required.

16.60.190 Storm water BMPs for projects not generating pollutants.

Priority projects that are not anticipated to generate a pollutant for which the receiving water is Clean Water Act Section 303(d) impaired shall meet applicable standard requirements of establishing stormwater BMPs, and shall select a single or combination of storm water BMPs from Table 3 which are effective for pollutant removal of the identified secondary pollutants of concern, consistent with the "maximum extent practicable" standard defined in Attachment D of the Municipal Permit.

16.60.200 Storm water BMPs for projects generating primary and secondary pollutants.

Where a site generates both primary and secondary pollutants of concern, primary pollutants of concern receive priority for BMP selection. For such sites, selected BMPs must only maximize pollutant removal for the primary pollutants of concern. Where a site generates only secondary pollutants of concern, selected BMPs shall target the secondary pollutant of concern determined to be most significant for the project. Selected BMPs must be effective for the widest range of pollutants of concern anticipated to be generated by a priority project (as identified in Table 1), consistent with the maximum extent practicable standard defined in Attachment D of the Municipal Permit.

Treatment control BMPs with a high or medium pollutant removal efficiency for the project's most significant pollutant of concern shall be selected. Treatment control BMPs with a low removal efficiency ranking shall only be approved by the city when a feasibility analysis has been conducted, which exhibits that implementation of treatment control BMPs with a high or medium removal efficiency ranking are infeasible. Treatment control BMPs shall not be constructed within a receiving water.

16.60.210 Alternative storm water BMPs.

Alternative storm water BMPs not identified in Table 3 may be approved at the discretion of the Director of Public Works, provided the alternative BMP is as effective in removal of pollutants of concern as other feasible BMPs listed in Table 3.

Table 2. Site Design and Source Control Storm Water BMP Selection Matrix.

Priority Project Category	*Site Design BMPs(1)*	*Source Control BMPs(2)*	*Requirements Applicable to Individual Priority Project Categories(3)*										
			a. Private Roads	b. Residential Driveways & Guest Parking	c. Dock Areas	d. Maintenance Bays	e. Vehicle Wash Areas	f. Outdoor Processing Areas	g. Equipment Wash Areas	h. Parking Areas	i. Roadways	j. Fueling Areas	k. Hillside Landscaping
Detached Residential Development	R	R	R	R									R
Attached Residential Development	R	R	R										
Commercial Development >100,000 ft^2	R	R			R	R	R	R					
Automotive Repair Shop	R	R			R	R	R		R			R	
Restaurants	R	R			R				R				
Hillside Development >5,000 ft^2	R	R	R										R
Parking Lots	R	R								R(4)			
Streets, Highways & Freeways	R	R									R		

R = Required; select BMPs as required from the applicable steps in Section VI.2.a & b, or equivalent as identified in Appendix A.
(1) Refer to Section VI.2.a.
(2) Refer to Section VI.2.b.
(3) Priority project categories must apply specific storm water BMP requirements, where applicable. Projects are subject to the requirements of all priority project categories that apply.
(4) Applies if the paved area totals >5,000 square feet or with >15 parking spaces and is potentially exposed to urban runoff.

Table 3. Treatment Control BMP Selection Matrix.

Pollutants of Concern	Bioretention Facilities (LID)	Settling Basins (Dry Ponds)	Wet Ponds and Wetlands	Infiltration Facilities or Practices (LID)	Media Filters	High-rate biofilters	High-rate media filters	Trash Racks & Hydro -dynamic Devices
Coarse Sediment and Trash	High	High	High	High	High	High	High	High
Pollutants that tend to associate with fine particles during treatment	High	High	High	High	High	Medium	Medium	Low
Pollutants that tend to be dissolved following treatment	Medium	Low	Medium	High	Low	Low	Low	Low

Notes on Treatment Control BMP Categories

All rankings are relative. Ranking of all facilities assumes proper sizing, design, and periodic maintenance. Following are general descriptions of each category.

- **Bioretention Facilities** (infiltration planters, flow-through planters, bioretention areas, and bioretention swales). Facilities are designed to capture runoff and infiltrate slowly through soil media, which also supports vegetation. Bioretention facilities, except for flow-through planters, effectively promote infiltration into native soils. In clay soils, facilities may capture excess treated runoff in an underdrain piped to the municipal storm drain system. Typical criteria: an infiltration surface area at least 4% of tributary impervious area, 6-inch average depth of top reservoir, 18-inch soil layer, 12-inch to 18-inch gravel subsurface storage layer.

- **Settling Basins and Wetlands** (extended detention basins, "wet" basins, decorative or recreational lakes or water features also used for storm water treatment, constructed wetlands). Facilities are designed to capture a minimum water quality volume of 80% of total runoff and detain for a minimum of 48 hours. Some wetland designs have proven effective in removing nutrients, but performance varies.

- **Infiltration Facilities or Practices** (infiltration basins, infiltration trenches, dry wells, dispersal of runoff to landscape, pervious pavements). These facilities and landscape designs capture, retain, and infiltrate a minimum of 80% of runoff into the ground. Infiltration facilities are generally only feasible in permeable (Hydrologic Soil Group A or B) soils. Volume and area of infiltration facilities depends on soil permeability and safety factor used. Typical criteria: Infiltration facilities should have pretreatment to remove silt to prolong life of the facility. A 10-foot vertical separation from average seasonal groundwater depth is required. Dispersal to landscape may be accomplished in any soil type and generally requires a maximum 2:1 ratio impervious:pervious and concave topography to ensure the first 1 inch of rainfall is retained.

- **Media Filters** (sand filters). Filters designed to treat runoff produced by a rainfall of 0.2 inches per hour (or 2×85th percentile hourly rainfall intensity) by slow infiltration through sand or other media. Typical criteria: Surface loading rate not to exceed 5 inches/hour. Entire surface of the sand must be accessible for maintenance.

- **High Rate Biofilters** (tree wells, typically proprietary). Biofilters with specially designed media to rapidly filter runoff while removing some pollutants. Filterra® (proprietary version) recommends surface loading rates of up to 100 inches/hour.

- **High-rate Media Filters** (typically proprietary). Vaults with replaceable cartridge filters filled with inorganic media.

- **Drainage Inserts** have low effectiveness in removing pollutants that tend to associate with fine particles and have medium effectiveness in removing coarse sediment and trash. They are sometimes used to augment more effective treatment facilities and are sometimes used alone when more effective facilities have been deemed infeasible.

Notes on Pollutants of Concern:
In Table 3, Pollutants of Concern are grouped as gross pollutants, pollutants that tend to associate with fine particles, and pollutants that remain dissolved.

Pollutant	Coarse Sediment and Trash	Pollutants that tend to associate with fine particles during treatment	Pollutants that tend to be dissolved following treatment
Sediment	X	X	
Nutrients		X	X
Heavy Metals		X	
Organic Compounds		X	
Trash & Debris	X		
Oxygen Demanding		X	
Bacteria		X	
Oil & Grease		X	
Pesticides		X	

16.60.220 Low Impact Development (LID) and site design BMP

A. Priority projects shall be designed so as to minimize directly connected impervious surfaces and to promote infiltration using LID techniques. Priority projects shall, to the maximum extent practicable, minimize the introduction of pollutants and conditions of concern that may result in significant impacts, generated from site runoff to the storm water conveyance system. Priority projects shall also control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion and to protect stream habitat. Priority projects can address these objectives through the creation of a hydrologically functional project design that attempts to mimic the natural hydrologic regime. Mimicking a site's natural hydrologic regime can be pursued by:

- Reducing imperviousness, conserving natural resources and areas, maintaining and using natural drainage courses in the storm water conveyance system, and minimizing clearing and grading.
- Providing runoff storage measures dispersed throughout a site's landscape with the use of bioretention facilities and detention, retention, and infiltration practices.

B. Site design BMPs shall offer an innovative approach to urban storm water management that does not rely on the conventional end-of-pipe or in-the-pipe structural methods but instead uniformly or strategically integrates storm water controls throughout the urban landscape. Examples of many of these methods may be found in the County of San Diego's LID Handbook, and its publications, *Start at the Source*, and *Low-Impact Development Design Strategies*, in the City of Portland, Oregon's *Stormwater Manual*, and in the Contra Costa (California) Clean Water Program's *Stormwater C.3 Guidebook*.

16.60.230 Maintaining pre-development rainfall runoff characteristics.

A. Priority projects shall control post-development peak storm water runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion. In addition, projects should control runoff discharge volumes and durations to the maximum extent practicable using the site design, source control, and treatment control requirements.

B. Design Concept 1: Minimize Project's Impervious Footprint & Conserve Natural Areas. The following site design options shall be considered and, incorporated and implemented where determined applicable and feasible by the Director of Public Works, during the site planning and approval process, consistent with applicable General Plan policies and other development regulations.

1. Minimize and disconnect impervious surfaces. This can be achieved in various ways, including, but not limited to increasing building density (number of stories above or below ground) and developing land use regulations seeking to limit impervious surfaces. Decreasing the project's footprint can substantially reduce the project's impacts to water quality and hydrologic conditions.

2. Conserve natural areas, soils, and vegetation where feasible. This can be achieved by concentrating or clustering development on the least environmentally sensitive portions of a site while leaving the remaining land in a natural, undisturbed condition. The following list provides a guideline for determining the least sensitive portions of the site, in order of increasing sensitivity. Jurisdictions should also refer to their Multiple Species Conservation Plans or other biological regulations, as appropriate.

a. Areas devoid of vegetation, including previously graded areas and agricultural fields.
b. Areas of non-native vegetation, disturbed habitats and eucalyptus woodlands.
c. Areas of chamise or mixed chaparral, and non-native grasslands.
d. Areas containing coastal scrub communities.
e. All other upland communities.
f. Occupied habitat of sensitive species and all wetlands.
g. All areas necessary to maintain the viability of wildlife

corridors. Within each of the previous categories, areas containing hillsides should be considered more sensitive than the same category without hillsides.

3. Construct walkways, trails, patios, overflow parking lots and alleys and other low-traffic areas with permeable surfaces, such as pervious concrete, permeable asphalt, unit pavers, and granular materials.

4. Construct streets, sidewalks and parking lot aisles to the minimum widths necessary, provided that public safety and a walkable environment for pedestrians are not compromised.

5. Maximize canopy interception and water conservation by preserving existing native trees and shrubs, and planting additional native or drought tolerant trees and large shrubs.

6. Minimize the use of impervious surfaces, such as decorative concrete, in the landscape design.

7. Use natural drainage systems to the maximum extent practicable.

8. Other site design options that are comparable, and equally effective.

9. Minimize soil compaction.

C. Design Concept 2: Minimize Directly Connected Impervious Areas (DCIAs). Priority projects shall consider, and incorporate and implement the following design characteristics, where determined applicable and feasible by the Director of Public Works.

1. Where landscaping is proposed, drain rooftops into adjacent landscaping prior to discharging to the storm drain.

2. Where landscaping is proposed, drain impervious sidewalks, walkways, trails, and patios into adjacent landscaping.

3. Other design characteristics that are comparable and equally effective.

16.60.240 Protection of slopes and channels.

Project plans shall include storm water BMPs to decrease the potential for erosion of slopes and/or channels, consistent with local codes and ordinances and with the approval of all agencies with jurisdiction, e.g., the U.S. Army Corps of Engineers, the San Diego Regional Water Quality Control Board, and the California Department of Fish and Game. The following design principles shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public

Works:

A. Minimize disturbances to natural drainages.

B. Convey runoff safely from the tops of slopes.

C. Vegetate slopes with native or drought tolerant vegetation.

D. Control and treat flows in landscaping and/or other controls prior to reaching existing natural drainage systems.

E. Stabilize permanent channel crossings.

F. Install energy dissipaters, such as riprap, at the outlets of new storm drains, culverts, conduits, or channels that enter unlined channels in accordance with applicable specifications to minimize erosion. Energy dissipaters shall be installed in such a way as to minimize impacts to receiving waters.

G. Other design principles that are comparable and equally effective.

16.60.250 Providing storm drain system stenciling and signage.

Storm drain stencils are highly visible source control messages, typically placed directly adjacent to storm drain inlets. The stencils contain a brief statement that prohibits the dumping of improper materials into the urban runoff conveyance system. Graphical icons, either illustrating anti-dumping symbols or images of receiving water fauna, are effective supplements to the anti-dumping message. Priority projects shall include the following requirements in the project design.

A. Provide stenciling or labeling of all storm drain inlets and catch basins within the project area with prohibitive language (such as: "NO DUMPING – I LIVE IN <<name receiving water>>") and/or graphical icons to discourage illegal dumping.

B. Post signs and prohibitive language and/or graphical icons, which prohibit illegal dumping at public access points along channels and creeks within the project area.

C. Maintain legibility of stencils and signs.

16.60.260 Designing outdoor material storage areas to reduce pollution introduction.

Improper storage of materials outdoors may increase the potential for toxic compounds, oil and grease, heavy metals, nutrients, suspended solids, and other pollutants to enter the urban runoff conveyance system. Where the priority project plans include outdoor areas for storage of hazardous materials that may contribute pollutants to the urban runoff conveyance system, the following storm water BMPs are

required:

A. Hazardous materials with the potential to contaminate urban runoff shall either be: (1) placed in an enclosure such as, but not limited to, a cabinet, shed, or similar structure that prevents contact with runoff or spillage to the storm water conveyance system; or (2) protected by secondary containment structures such as berms, dikes, or curbs.

B. The storage area shall be paved and sufficiently impervious to contain leaks and spills.

C. The storage area shall have a roof or awning to minimize direct precipitation within the secondary containment area.

16.60.270 Designing trash storage areas to reduce pollution introduction.

All trash container areas shall meet the following requirements (limited exclusion: detached residential homes):

A. Paved with an impervious surface, designed not to allow run-on from adjoining areas, screened or walled to prevent off-site transport of trash; and

B. Provide attached lids on all trash containers that exclude rain, or roof or awning to minimize direct precipitation.

16.60.280 Using efficient irrigation systems and landscape design.

Priority projects shall design the timing and application methods of irrigation water to minimize the runoff of excess irrigation water into the storm water conveyance system. (Limited exclusion: detached residential homes.) In compliance with the Water Conservation in Landscaping Act (California Government Code sections 65591, *et seq.*), the following methods to reduce excessive irrigation runoff shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

A. Employing rain shutoff devices to prevent irrigation after precipitation.

B. Designing irrigation systems to each landscape area's specific water requirements.

C. Using flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines.

D. Employing other comparable, equally effective, methods to reduce irrigation water runoff.

16.60.300 Incorporate requirements applicable to individual priority project categories.

Where identified in Table 2, the following requirements shall be incorporated into applicable priority projects during the storm water BMP selection and design process. Projects shall adhere to each of the individual priority project category requirements that apply to the project (e.g., a restaurant with more than 15 parking spaces would be required to incorporate the requirements for "g. Equipment Wash Areas" and "h. Parking Areas" into the project design).

A. Private Roads - The design of private roadway drainage shall use at least one of the following:

1. Rural swale system: street sheet flows to vegetated swale or gravel shoulder, curbs at street corners, culverts under driveways and street crossings;

2. Urban curb/swale system: street slopes to curb, periodic swale inlets drain to vegetated swale/biofilter;

3. Dual drainage system: First flush captured in street catch basins and discharged to adjacent vegetated swale or gravel shoulder, high flows connect directly to storm water conveyance system;

4. Other methods, which are comparable and equally effective within the project.

B. Residential Driveways and Guest Parking. The design of driveways and private residential parking areas shall use at least one of the following features.

1. Design driveways with shared access, flared (single lane at street) or wheelstrips (paving only under tires); or, drain into landscaping prior to discharging to the storm water conveyance system;

2. Uncovered temporary or guest parking on private residential lots may be: paved with a permeable surface; or, designed to drain into landscaping prior to discharging to the storm water conveyance system;

3. Other features which are comparable and equally effective.

C. Dock Areas. Loading/unloading dock areas shall include the following:

1. Cover loading dock areas, or design drainage to preclude urban run-on and runoff;

2. Direct connections to storm drains from depressed loading docks (truck wells) are prohibited;

3. Other features which are comparable and equally effective.

D. Maintenance Bays. Maintenance bays shall include the following:

1. Repair/maintenance bays shall be indoors; or, designed to preclude urban run-on and runoff; and

2. Design a repair/maintenance bay drainage system to capture all wash water, leaks and spills. Connect drains to a sump for collection and disposal. Direct connection of the repair/maintenance bays to the storm drain system is prohibited. If required by local jurisdiction, obtain an Industrial Waste Discharge Permit, or

3. Other features which are comparable and equally effective.

E. Vehicle Wash Areas. Priority projects that include areas for washing/steam cleaning of vehicles shall use the following:

1. Self-contained; or covered with a roof or overhang;

2. Equipped with a clarifier or other pretreatment facility;

3. Properly connected to a sanitary sewer;

4. Other features which are comparable and equally effective.

F. Outdoor Processing Areas. Outdoor process equipment operations, such as rock grinding or crushing, painting or coating, grinding or sanding, degreasing or parts cleaning, landfills, waste piles, and wastewater and solid waste treatment and disposal, and other operations determined to be a potential threat to water quality by the Copermittee shall adhere to the following requirements:

1. Cover or enclose areas that would be the most significant source of pollutants; or, slope the area toward a dead-end sump; or, discharge to the sanitary sewer system following appropriate treatment in accordance with conditions established by the applicable sewer agency;

2 Grade or berm area to prevent run-on from surrounding areas;

3. Installation of storm drains in areas of equipment repair is prohibited;

4. Other features which are comparable or equally effective.

G. Equipment Wash Areas. Outdoor equipment/accessory washing and steam cleaning activities at priority projects shall use the following:

1. Be self-contained; or covered with a roof or overhang;

2. Be equipped with a clarifier, grease trap or other pretreatment facility, as appropriate;

3. Properly connected to a sanitary sewer;

4. Other features which are comparable or equally effective.

H. Parking Areas. To minimize the offsite transport of pollutants from parking areas, the following design concepts shall be considered, and incorporated and implemented where determined applicable and feasible by the Director of Public Works:

1. Where landscaping is proposed in parking areas, incorporate landscape areas into the drainage design;

2. Overflow parking (parking stalls provided in excess of the City's minimum parking requirements) should be constructed with permeable paving;

3. Other design concepts, which are comparable and equally effective.

I. Roadways. Priority roadway projects shall select treatment control BMPs following the treatment control selection procedure identified in this division entitled, "Establishing Storm Water BMPs."

J. Fueling Area. Non-retail fuel dispensing areas shall contain the following:

1. Overhanging roof structure or canopy. The cover's minimum dimensions must be equal to or greater than the area within the grade break. The cover must not drain onto the fuel dispensing area and the downspouts must be routed to prevent drainage across the fueling area. The fueling area shall drain to the project's treatment control BMP(s) prior to discharging to the storm water conveyance system;

2. Paved with Portland cement concrete (or equivalent smooth impervious surface). The use of asphalt concrete shall be prohibited;

3. Have an appropriate slope to prevent ponding, and must be separated from the rest of the site by a grade break that prevents run-on of urban runoff;

4. At a minimum, the concrete fuel dispensing area must extend 6.5 feet (2.0 meters) from the corner of each fuel dispenser, or the length at which the hose and nozzle assembly may be operated plus 1 foot (0.3 meter), whichever is less.

K. Hillside Landscaping. Hillside areas that are disturbed by project development shall be landscaped with deep-rooted, drought tolerant plant species selected for erosion control, satisfactory to the Director of Public Works.

16.60.310 Treatment control BMP objectives.

A. Minimizing a development's detrimental effects on water quality can be most effectively achieved through the use of a combination of site design, source and treatment control storm water BMPs. Where projects have been designed to minimize,

to the maximum extent practicable, the introduction of anticipated pollutants of concern that may result in significant impacts to the receiving waters through the implementation of site design and source control storm water BMPs, the development would still have the potential for pollutants of concern to enter the storm water conveyance system. Therefore, priority projects shall be designed to remove pollutants of concern from the storm water conveyance system to the maximum extent practicable through the incorporation and implementation of treatment control BMPs.

B. In meeting the requirements in this section, priority projects shall implement a single or combination of storm water BMPs that will remove anticipated pollutants of concern, as identified by the procedure of this division, in site runoff to the maximum extent practicable. Treatment control BMPs with a high or medium pollutant removal efficiency for the project's most significant pollutant of concern shall be selected. Treatment control BMPs with a low removal efficiency ranking shall only be approved by the Director of Public Works when a feasibility analysis has been conducted, which exhibits that implementation of treatment control BMPs with a high or medium removal efficiency ranking are infeasible. Treatment control BMPs must be implemented unless a waiver is granted to the project by the Director of Public Works based on the infeasibility of any treatment control BMP.

16.60.320 Design to treatment control BMP standards.

All priority projects shall design, construct and implement structural treatment control BMPs that meet the design standards of this section, unless specifically exempted by the limited exclusions. Structural treatment control BMPs required by this section shall be operational prior to the use of any dependent development, and shall be located and designed in accordance with the requirements of this division.

16.60.330 Structural treatment control volume based BMPs.

Volume-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- Volume of runoff produced from a 24-hour 85th percentile storm event, as determined from isoplovial maps contained in the County of San Diego Hydrology Manual. See County of San Diego's Isoplovial map at http://www.sdcounty.ca.gov/dpw/engineer/flood.htm; or

- Volume of runoff produced by the 85th percentile 24-hour runoff event, determined as the maximized capture urban runoff volume for the area, from the formula recommended in *Urban Runoff Quality Management, WEF Manual of Practice No. 23/ ASCE Manual of Practice No. 87, (1998*); or

- The volume of annual runoff based on unit basin storage volume, to achieve 90 percent or more volume treatment by the method recommended in *California Stormwater Best Management Practices Handbook – Industrial/ Commercial, (1993)*, or

- The volume of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile 24-hour runoff event. Where this option is used, storm events shall be identified by their separation from one another by at least six hours of no rain.

16.60.340 Structural treatment control flow based BMPs.

As an alternative to volume-based BMPs, structural treatment controls may be designed as flow based BMPs. Flow-based BMPs shall be designed to mitigate (infiltrate, filter, or treat) either:

- The maximum flow rate of runoff produced from a rainfall intensity of 0.2 inch of rainfall per hour for each hour of a storm event; or

- The maximum flow rate of runoff produced by the 85th percentile hourly rainfall intensity, as determined from the local historical rainfall record, multiplied by a factor of two, for each hour of a storm event; or

- The maximum flow rate of runoff, as determined from the local historical rainfall record, that achieves approximately the same reduction in pollutant loads and flows as achieved by mitigation of the 85th percentile hourly rainfall intensity multiplied by a factor of two, for each hour of a storm event.

16.60.350 Limited exclusions.

A. Proposed restaurants, where the land area for development or redevelopment is less than 5,000 square feet, are excluded from the numerical sizing criteria requirements listed for structural treatment control volume based BMPs.

B. Where significant redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development, and the existing development was not subject to SUSMP requirements, the numeric sizing criteria discussed for structural treatment control volume based apply only to the addition, and not to the entire development.

16.60.360 Locating BMPs near pollutant sources.

Structural treatment control storm water BMPs should be implemented close to pollutant sources to minimize costs and maximize pollutant removal prior to runoff entering receiving waters. Such BMPs may be located on- or off-site, used singly or in combination, or shared by multiple new developments, pursuant to the following requirements:

A. All structural treatment control BMPs shall be located so as to infiltrate, filter, and/or treat the required runoff volume or flow prior to its discharge to any receiving water body supporting beneficial uses;

B. Multiple post-construction structural treatment control BMPs for a single priority development project shall collectively be designed to comply with the design standards for structural treatment control volume based BMPs;

C. Shared storm water BMPs shall be operational prior to the use of any dependent development or phase of development. The shared BMPs shall only be required to treat the dependent developments or phases of development that are in use;

D. Interim storm water BMPs that provide equivalent or greater treatment than is required by structural treatment control volume based BMPs may be implemented by a dependent development until each shared BMP is operational. If interim BMPs are selected, the BMPs shall remain in use until permanent BMPs are operational.

16.60.370 Restrictions on use of infiltration BMPs.

At a minimum, use of structural treatment BMPs that are designed to primarily function as infiltration devices shall meet the following conditions[2]:

A. Urban runoff from commercial developments shall undergo pretreatment to remove both physical and chemical contaminants, such as sedimentation or filtration, prior to infiltration;

B. All dry weather flows shall be diverted from infiltration devices except for those non-storm water discharges authorized pursuant to 40 CFR 122.26(d)(2)(iv)(B)(1): diverted stream flows, rising ground waters, uncontaminated ground water infiltration [as defined at 40 CFR 35.2005(20)] to storm water conveyance systems, uncontaminated pumped ground water, foundation drains, springs, water from crawl space pumps, footing drains, air conditioning condensation, flow from riparian habitats and wetlands, water line flushing, landscape irrigation, discharges from potable water sources other than water main breaks, irrigation water, individual residential car washing, and dechlorinated swimming pool discharges;

C. Pollution prevention and source control BMPs shall be implemented at a level appropriate to protect groundwater quality at sites where infiltration structural treatment BMPs are to be used;

D. The vertical distance from the base of any infiltration structural treatment BMP to the seasonal high groundwater mark shall be at least 10 feet or as determined on an individual, site-specific basis by the Director of Public Works. Where groundwater does not support beneficial uses, this vertical distance criterion may be reduced, provided groundwater quality is maintained;

---

[2]. These conditions do not apply to structural treatment BMPs which allow incidental infiltration and are not designed to primarily function as infiltration devices (such as grassy swales, detention basins, vegetated buffer strips, constructed wetlands, etc.)

E. The soil through which infiltration is to occur shall have physical and chemical characteristics (such as appropriate cation exchange capacity, organic content, clay content, and infiltration rate) that are adequate for proper infiltration durations and treatment of urban runoff for the protection of groundwater beneficial uses;

F. Infiltration structural treatment BMPs shall not be used for areas of industrial or light industrial activity; areas subject to high vehicular traffic (25,000 or greater average daily traffic on main roadway or 15,000 or more average daily traffic on any intersecting roadway); automotive repair shops; car washes; fleet storage areas (bus, truck, etc.); nurseries; and other high threat to water quality land uses and activities as designated by the Director of Public Works;

G. The horizontal distance between the base of any infiltration structural BMP and any water supply wells shall be 100 feet or as determined on an individual, site-specific basis by the Director of Public Works.

16.60.380 Maintenance mechanism to be in place before acceptance.

Structural BMPs shall not be considered "effective," and shall not be accepted as meeting the MEP standard, unless a mechanism is in place that will ensure ongoing long-term maintenance of all structural BMPs. As part of project review, if a project proponent is required to include interim or permanent structural BMPs in project plans, and if the Director of Public Works does not provide a mechanism for BMP maintenance, the project proponent shall provide verification of maintenance requirements through such means as may be appropriate, at the discretion of the Director of Public Works, including, but not limited to covenants, legal agreements, maintenance agreements, and/or conditional use permits.

16.60.390 Maintenance mechanisms.

Public equity maintenance. The City Council may approve a public or acceptable quasi-public entity (e.g., the County Flood Control District, or annex to an existing assessment district, an existing utility district, a state or federal resource agency, or a conservation conservancy) to assume responsibility for maintenance, repair and replacement of the BMP. Unless acceptable to the City Council, public entity maintenance agreements shall ensure estimated costs are front-funded or reliably guaranteed, (e.g., through a trust fund, assessment district fees, bond, letter of credit or similar means). In addition, the City Council may seek protection from liability by appropriate releases and indemnities. The City Council shall have the authority to approve storm water BMPs proposed for transfer to any other public entity within its jurisdiction before installation. The City Council shall be involved in the negotiation of maintenance requirements with any other public entities accepting maintenance responsibilities within their respective jurisdictions; and in negotiations with the resource agencies responsible for issuing permits for the construction and/or maintenance of the

facilities. The City Council must be identified as a third party beneficiary empowered to enforce any such maintenance agreement within their respective jurisdictions.

A. Project proponent agreement to maintain storm water BMPs: The City Council may enter into a contract with the project proponent obliging the project proponent to maintain, repair and replace the storm water BMP as necessary into perpetuity. Security may be required.

B. Assessment districts: The City Council may approve an Assessment District or other funding mechanism created by the project proponent to provide funds for storm water BMP maintenance, repair and replacement on an ongoing basis. Any agreement with such a District shall be subject to the Public Entity Maintenance Provisions above.

C. Lease provisions: In those cases where the City holds title to the land in question, and the land is being leased to another party for private or public use, the City Council may assure storm water BMP maintenance, repair and replacement through conditions in the lease.

D. Conditional use permits: For discretionary projects only, the City Council may assure maintenance of storm water BMPs through the inclusion of maintenance conditions in the conditional use permit. Security may be required.

E. Alternative mechanisms: The City Council may accept alternative maintenance mechanisms if such mechanisms are as protective those listed above.

16.60.400 Verification mechanisms.

For discretionary projects, the City approved method of storm water BMP maintenance shall be incorporated into the project's permit, and shall be consistent with permits issued by resource agencies, before City approval of discretionary permits. For projects requiring only ministerial permits, the approved method of storm water BMP maintenance shall be incorporated into the permit conditions before the issuance of any ministerial permits. In all instances, the project proponent shall provide proof of execution of an approved method of maintenance repair and replacement before the issuance of construction approvals. Public projects that are not required to obtain permits shall be responsible for ensuring that an approved method of storm water BMP maintenance repair and replacement is executed prior to the commencement of construction. For all properties, the verification mechanism will include the project proponent's signed statement, as part of the project application, accepting responsibility for all structural BMP maintenance, repair and replacement, until a City approved entity agrees to assume responsibility for structural BMP maintenance, repair and replacement.

16.60.410 Maintenance requirements.

A. Operation & Maintenance (O&M) Plan: A copy of an Operation & Maintenance (O&M) plan, prepared by the project proponent satisfactory to the Director of Public Works shall be attached to the approved maintenance agreement, which describes the designated responsible party to manage the storm water BMP(s), employee's training program and duties, operating schedule, maintenance frequency, routine service schedule, specific maintenance activities, copies of resource agency permits, and any other necessary activities. At a minimum, maintenance agreements shall require the inspection and servicing of all structural BMPs on an annual basis. The project proponent maintenance entity shall complete and maintain O&M forms to document all maintenance requirements. Parties responsible for the O&M plan shall retain records for at least 5 years. These documents shall be made available to the City for inspection upon request at any time.

B. Access Easement/Agreement: As part of the maintenance mechanism selected above, it shall include a copy of an executed access easement that shall be binding on the land throughout the life of the project, until such time that the storm water BMP requiring access is replaced, satisfactory to the Director of Public Works.

16.60.420 Waiver of structural treatment BMP requirements.

The requirement of implementing structural treatment BMPs may be waived if infeasibility can be established. A waiver of infeasibility shall be granted only when all available structural treatment BMPs have been considered and rejected as infeasible.

Waivers may only be granted from structural treatment BMP and structural treatment BMP sizing requirements. Priority development projects, whether or not granted a waiver may not cause or contribute to an exceedance of water quality objectives. Pollutants in runoff from projects granted a waiver must still be reduced to the maximum extent practicable.

Section 3: This Ordinance is adopted pursuant to the authority granted to the City of El Cajon under San Diego Regional Water Quality Control Board Order No. R9 2007-0001. This Ordinance encompasses a state-mandated requirement thereunder.
